cpan	Manage Perl modules using CPAN
cron	Work with cron
csf	Support for Config Server Firewall (CSF)
cyg	Manage cygwin packages.
daemontools	daemontools service module. This module will create daemontools type
data	Manage a local persistent data structure that can hold any arbitrary data
ddns	Support for RFC 2136 dynamic DNS updates.
deb_apache	Support for Apache
deb_postgres	Module to provide Postgres compatibility to salt for debian family specific tools.
debbuild	Debian Package builder system
debconfmod	Support for Debconf
debian_ip	The networking module for Debian based distros
debian_service	Service support for Debian systems (uses update-rc.d and /sbin/service)
defaults	
devmap	Device-Mapper module
dig	Compendium of generic DNS utilities.
disk	Module for managing disks and blockdevices
djangomod	Manage Django sites
dnsmasq	Module for managing dnsmasq
dnsutil	Compendium of generic DNS utilities.
dockercompose	Module to import docker-compose via saltstack
dockermod	Management of Docker Containers

Continued on next page

Table 19.9 -- continued from previous page

dpkg	Support for DEB packages
drac	Manage Dell DRAC
dracr	Manage Dell DRAC.
drbd	DRBD administration module
dummyproxy_package	Package support for the dummy proxy used by the test suite
dummyproxy_service	Provide the service module for the dummy proxy used in integration tests
ebuild	Support for Portage
eix	Support for Eix
elasticsearch	Elasticsearch - A distributed RESTful search and analytics server
environ	Support for getting and setting the environment variables of the current salt process.
eselect	Support for eselect, Gentoo's configuration and management tool.
esxi	Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.
etcd_mod	Execution module to work with etcd
ethtool	Module for running ethtool command
event	Use the *Salt Event System* to fire events from the master to the minion and vice-versa.
extfs	Module for managing ext2/3/4 file systems
file	Manage information about regular files, directories,
firewalld	Support for firewalld.
freebsd_sysctl	Module for viewing and modifying sysctl parameters
freebsd_update	Support for freebsd-update utility on FreeBSD.
freebsdjail	The jail module for FreeBSD
freebsdkmod	Module to manage FreeBSD kernel modules
freebsdpkg	Remote package support using `pkg_add(1)`
freebsdports	Install software from the FreeBSD `ports(7)` system
freebsdservice	The service module for FreeBSD
gem	Manage ruby gems.
genesis	Module for managing container and VM images
gentoo_service	Top level package command wrapper, used to translate the os detected by grains
gentoolkitmod	Support for Gentoolkit
git	Support for the Git SCM
github	Module for interacting with the GitHub v3 API.
glance	Module for handling openstack glance calls.
glusterfs	Manage a glusterfs pool
gnomedesktop	GNOME implementations
gpg	Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers.
grafana4	Module for working with the Grafana v4 API
grains	Return/control aspects of the grains data
groupadd	Manage groups on Linux, OpenBSD and NetBSD
grub_legacy	Support for GRUB Legacy
guestfs	Interact with virtual machine images via libguestfs

Continued on next page

Table 19.9 -- continued from previous page

hadoop	Support for hadoop
haproxyconn	Support for haproxy
hashutil	A collection of hashing and encoding functions
heat	Module for handling OpenStack Heat calls
hg	Support for the Mercurial SCM
hipchat	Module for sending messages to hipchat.
hosts	Manage the information in the hosts file
htpasswd	Support for htpasswd command.
http	Module for making various web calls.
ifttt	Support for IFTTT
ilo	Manage HP ILO
icinga2	Module to provide icinga2 compatibility to salt.
incron	Work with incron
influx	InfluxDB - A distributed time series database
influx08	InfluxDB - A distributed time series database
infoblox	Module for managing Infoblox
ini_manage	Edit ini files
inspectlib	
inspectlib.collector	
inspectlib.dbhandle	
inspectlib.entities	
inspectlib.exceptions	
inspectlib.fsdb	**codeauthor** Bo Maryniuk <bo@suse.de>
inspectlib.kiwiproc	
inspectlib.query	
inspector	Module for full system inspection.
introspect	Functions to perform introspection on a minion, and return data in a format
ipmi	Support IPMI commands over LAN.
ipset	Support for ipset
iptables	Support for iptables
iwtools	Support for Wireless Tools for Linux
jboss7	Module for managing JBoss AS 7 through the CLI interface.
jboss7_cli	Module for low-level interaction with JbossAS7 through CLI.
jenkinsmod	Module for controlling Jenkins
junos	Module to interact with Junos devices.
k8s	Salt module to manage Kubernetes cluster
kapacitor	Kapacitor execution module.
kerberos	Manage Kerberos KDC
key	Functions to view the minion's public key information
keyboard	Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.
keystone	Module for handling openstack keystone calls.
kmod	Module to manage Linux kernel modules
kubernetes	Module for handling kubernetes calls.

Continued on next page

Table 19.9 -- continued from previous page

launchctl	Module for the management of MacOS systems that use launchd/launchctl
layman	Support for Layman
ldap3	Query and modify an LDAP database (alternative interface)
ldapmod	Salt interface to LDAP commands
libcloud_dns	Connection module for Apache Libcloud DNS management
linux_acl	Support for Linux File Access Control Lists
linux_ip	The networking module for Non-RH/Deb Linux distros
linux_lvm	Support for Linux LVM2
linux_sysctl	Module for viewing and modifying sysctl parameters
localemod	Module for managing locales on POSIX-like systems.
locate	Module for using the locate utilities
logadm	Module for managing Solaris logadm based log rotations.
logmod	On-demand logging
logrotate	Module for managing logrotate.
lvs	Support for LVS (Linux Virtual Server)
lxc	Control Linux Containers via Salt
mac_assistive	This module allows you to manage assistive access on macOS minions with 10.9+
mac_brew	Homebrew for macOS
mac_defaults	Set defaults on Mac OS
mac_desktop	macOS implementations of various commands in the ``desktop'' interface
mac_group	Manage groups on Mac OS 10.7+
mac_keychain	Install certificates into the keychain on Mac OS
mac_package	Install pkg, dmg and .app applications on macOS minions.
mac_pkgutil	Installer support for macOS.
mac_ports	Support for MacPorts under macOS.
mac_power	Module for editing power settings on macOS
mac_service	The service module for macOS ..
mac_shadow	New in version 2016.3.0.
mac_softwareupdate	Support for the softwareupdate command on MacOS.
mac_sysctl	Module for viewing and modifying sysctl parameters
mac_system	New in version 2016.3.0.
mac_timezone	Module for editing date/time settings on macOS
mac_user	Manage users on Mac OS 10.7+
mac_xattr	This module allows you to manage extended attributes on files or directories
makeconf	Support for modifying make.conf under Gentoo
marathon	Module providing a simple management interface to a marathon cluster.
match	The match module allows for match routines to be run and determine target specs
mattermost	Module for sending messages to Mattermost
mdadm	Salt module to manage RAID arrays with mdadm
mdata	Module for managaging metadata in SmartOS Zones

Continued on next page

Table 19.9 -- continued from previous page

memcached	Module for Management of Memcached Keys
mine	The function cache system allows for data to be stored on the master so it can be easily read by other minions
minion	Module to provide information about minions
mod_random	Provides access to randomness generators.
modjk	Control Modjk via the Apache Tomcat ``Status'' worker
mongodb	Module to provide MongoDB functionality to Salt
monit	Monit service module.
moosefs	Module for gathering and managing information about MooseFS
mount	Salt module to manage Unix mounts and the fstab file
mssql	Module to provide MS SQL Server compatibility to salt.
msteams	Module for sending messages to MS Teams
munin	Run munin plugins/checks from salt and format the output as data.
mysql	Module to provide MySQL compatibility to salt.
nacl	This module helps include encrypted passwords in pillars, grains and salt state files.
nagios	Run nagios plugins/checks from salt and get the return as data.
nagios_rpc	Check Host & Service status from Nagios via JSON RPC.
namecheap_dns	Namecheap DNS Management
namecheap_domains	Namecheap Domain Management
namecheap_ns	Namecheap Nameserver Management
namecheap_ssl	Namecheap SSL Certificate Management
namecheap_users	Namecheap User Management
napalm	NAPALM helpers
napalm_acl	NAPALM ACL
napalm_bgp	NAPALM BGP
napalm_network	NAPALM Network
napalm_ntp	NAPALM NTP
napalm_probes	NAPALM Probes
napalm_route	NAPALM Route
napalm_snmp	NAPALM SNMP
napalm_users	NAPALM Users
napalm_yang_mod	NAPALM YANG
netaddress	Module for getting information about network addresses.
netbsd_sysctl	Module for viewing and modifying sysctl parameters
netbsdservice	The service module for NetBSD
netscaler	Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)
network	Module for gathering and managing network information
neutron	Module for handling OpenStack Neutron calls
nfs3	Module for managing NFS version 3.
nftables	Support for nftables
nginx	Support for nginx
nilrt_ip	The networking module for NI Linux Real-Time distro
nix	Work with Nix packages
nova	Module for handling OpenStack Nova calls
npm	Manage and query NPM packages.

Continued on next page

Table 19.9 -- continued from previous page

nspawn	Manage nspawn containers
nxos	Execution module for Cisco NX OS Switches Proxy minions
omapi	This module interacts with an ISC DHCP Server via OMAPI.
openbsd_sysctl	Module for viewing and modifying OpenBSD sysctl parameters
openbsdpkg	Package support for OpenBSD
openbsdrcctl	The rcctl service module for OpenBSD
openbsdservice	The service module for OpenBSD
openscap	
openstack_config	Modify, retrieve, or delete values from OpenStack configuration files.
openstack_mng	Module for OpenStack Management
openvswitch	Support for Open vSwitch - module with basic Open vSwitch commands.
opkg	Support for Opkg
oracle	Oracle DataBase connection module
osquery	Support for OSQuery - https://osquery.io.
pacman	A module to wrap pacman calls, since Arch is the best
pagerduty	Module for Firing Events via PagerDuty
pagerduty_util	Module for manageing PagerDuty resource
pam	Support for pam
parallels	Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`.
parted	Module for managing partitions on POSIX-like systems.
pcs	Configure a Pacemaker/Corosync cluster with PCS
pdbedit	Manage accounts in Samba's passdb using pdbedit
pecl	Manage PHP pecl extensions.
philips_hue	Philips HUE lamps module for proxy.
pillar	Extract the pillar data for this minion
pip	Install Python packages with pip to either the system or a virtualenv
pkg_resource	Resources needed by pkg providers
pkgin	Package support for pkgin based systems, inspired from freebsdpkg module
pkgng	Support for `pkgng`, the new package manager for FreeBSD
pkgutil	Pkgutil support for Solaris
portage_config	Configure `portage(5)`
postfix	Support for Postfix
postgres	Module to provide Postgres compatibility to salt.
poudriere	Support for poudriere
powerpath	powerpath support.
proxy	This module allows you to manage proxy settings
ps	A salt interface to psutil, a system and process library.
publish	Publish a command from a minion to a target
puppet	Execute puppet routines
pushbullet	Module for sending messages to Pushbullet (https://www.pushbullet.com)

Continued on next page

Table 19.9 -- continued from previous page

pushover_notify	Module for sending messages to Pushover (https://www.pushover.net)
pw_group	Manage groups on FreeBSD
pw_user	Manage users with the pw command
pyenv	Manage python installations with pyenv.
qemu_img	Qemu-img Command Wrapper
qemu_nbd	Qemu Command Wrapper
quota	Module for managing quotas on POSIX-like systems.
rabbitmq	Module to provide RabbitMQ compatibility to Salt.
raet_publish	Publish a command from a minion to a target
rallydev	Support for RallyDev
random_org	Module for retrieving random information from Random.org
rbac_solaris	Module for Solaris' Role-Based Access Control
rbenv	Manage ruby installations with rbenv.
rdp	Manage RDP Service on Windows servers
redismod	Module to provide redis functionality to Salt
reg	
rest_package	Package support for the REST example
rest_sample_utils	Utility functions for the rest_sample
rest_service	Provide the service module for the proxy-minion REST sample
restartcheck	checkrestart functionality for Debian and Red Hat Based systems
ret	Module to integrate with the returner system and retrieve data sent to a salt returner
rh_ip	The networking module for RHEL/Fedora based distros
rh_service	Service support for RHEL-based systems, including support for both upstart and sysvinit
riak	Riak Salt Module
rpm	Support for rpm
rpmbuild	RPM Package builder system
rsync	Wrapper for rsync
runit	runit service module
rvm	Manage ruby installations and gemsets with RVM, the Ruby Version Manager.
s3	Connection module for Amazon S3
s6	s6 service module
salt_proxy	Salt proxy module
saltcloudmod	Control a salt cloud system
saltutil	The Saltutil module is used to manage the state of the salt minion itself.
schedule	Module for managing the Salt schedule on a minion
scsi	SCSI administration module
sdb	Module for Manipulating Data via the Salt DB API
seed	Virtual machine image management tools
selinux	Execute calls on selinux
sensehat	Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.
sensors	Read lm-sensors

Continued on next page

Table 19.9 -- continued from previous page

serverdensity_device	Wrapper around Server Density API
service	If Salt's OS detection does not identify a different virtual service module, the minion will fall back to using this basic module, which simply wraps sysvinit scripts.
servicenow	Module for execution of ServiceNow CI (configuration items)
shadow	Manage the shadow file on Linux systems
slack_notify	Module for sending messages to Slack
slsutil	Utility functions for use with or in SLS files
smartos_imgadm	Module for running imgadm command on SmartOS
smartos_nictagadm	Module for running nictagadm command on SmartOS
smartos_virt	virst compatibility module for managing VMs on SmartOS
smartos_vmadm	Module for running vmadm command on SmartOS
smbios	Interface to SMBIOS/DMI
smf	Service support for Solaris 10 and 11, should work with other systems that use SMF also.
smtp	Module for Sending Messages via SMTP
solaris_fmadm	Module for running fmadm and fmdump on Solaris
solaris_group	Manage groups on Solaris
solaris_shadow	Manage the password database on Solaris systems
solaris_system	Support for reboot, shutdown, etc
solaris_user	Manage users with the useradd command
solarisips	IPS pkg support for Solaris
solarispkg	Package support for Solaris
solr	Apache Solr Salt Module
solrcloud	Module for solrcloud configuration
splunk	Module for interop with the Splunk API
splunk_search	Module for interop with the Splunk API
sqlite3	Support for SQLite3
ssh	Manage client ssh components
ssh_package	Service support for the REST example
ssh_service	Provide the service module for the proxy-minion SSH sample ..
snapper	Module to manage filesystem snapshots with snapper
state	Control the state system on the minion.
status	Module for returning various status data about a minion.
statuspage	StatusPage
stormpath	Support for Stormpath
supervisord	Provide the service module for system supervisord or supervisord in a
suse_apache	Support for Apache
svn	Subversion SCM
swift	Module for handling OpenStack Swift calls
sysbench	The `sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.
sysfs	Module for interfacing with SysFS
syslog_ng	Module for getting information about syslog-ng

Continued on next page

Table 19.9 -- continued from previous page

sysmod	The sys module provides information about the available functions on the minion
sysrc	sysrc module for FreeBSD
system	Support for reboot, shutdown, etc
system_profiler	System Profiler Module
systemd	Provides the service module for systemd
telemetry	Connection module for Telemetry
temp	Simple module for creating temporary directories and files
test	Module for running arbitrary tests
testinframod	This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions.
test_virtual	Module for running arbitrary tests with a __virtual__ function
timezone	Module for managing timezone on POSIX-like systems.
tls	A salt module for SSL/TLS.
tomcat	Support for Tomcat
trafficserver	Apache Traffic Server execution module.
travisci	Commands for working with travisci.
tuned	Interface to Red Hat tuned-adm module
twilio_notify	Module for notifications via Twilio
udev	Manage and query udev info
upstart	Module for the management of upstart systems.
uptime	Wrapper around uptime API
useradd	Manage users with the useradd command
uwsgi	uWSGI stats server https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html
varnish	Support for Varnish
vault	**maintainer** SaltStack
vbox_guest	VirtualBox Guest Additions installer
vboxmanage	Support for VirtualBox using the VBoxManage command
victorops	Support for VictorOps
virt	Work with virtual machines managed by libvirt
virtualenv_mod	Create virtualenv environments.
vsphere	Manage VMware vCenter servers and ESXi hosts.
win_autoruns	Module for listing programs that automatically run on startup
win_certutil	This module allows you to install certificates into the windows certificate manager.
win_dacl	Manage DACLs on Windows
win_disk	Module for gathering disk information on Windows
win_dism	Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows.
win_dns_client	Module for configuring DNS Client on Windows systems
win_dsc	This module is Alpha
win_file	Manage information about files on the minion, set/read user, group

Continued on next page

Table 19.9 -- continued from previous page

win_firewall	Module for configuring Windows Firewall using netsh
win_groupadd	Manage groups on Windows
win_iis	Microsoft IIS site management via WebAdministration powershell module
win_ip	The networking module for Windows based systems
win_lgpo	Manage Local Policy on Windows
win_license	This module allows you to manage windows licensing via slmgr.vbs
win_network	Module for gathering and managing network information
win_ntp	Management of NTP servers on Windows
win_path	Manage the Windows System PATH
win_pkg	A module to manage software on Windows
win_pki	Microsoft certificate management via the PKI Client PowerShell module.
win_powercfg	This module allows you to control the power settings of a windows minion via powercfg.
win_psget	Module for managing PowerShell through PowerShellGet (PSGet)
win_repo	Module to manage Windows software repo on a Standalone Minion
win_servermanager	Manage Windows features via the ServerManager powershell module
win_service	Windows Service module.
win_shadow	Manage the shadow file
win_smtp_server	Module for managing IIS SMTP server configuration on Windows servers.
win_snmp	Module for managing SNMP service settings on Windows servers.
win_status	Module for returning various status data about a minion.
win_system	Module for managing windows systems.
win_task	Windows Task Scheduler Module ..
win_timezone	Module for managing timezone on Windows systems.
win_update	Module for running windows updates.
win_useradd	Module for managing Windows Users
win_wua	Module for managing Windows Updates using the Windows Update Agent.
x509	Manage X509 certificates
xapi	This module (mostly) uses the XenAPI to manage Xen virtual machines.
xbpspkg	Package support for XBPS package manager (used by VoidLinux)
xfs	Module for managing XFS file systems.
xmpp	Module for Sending Messages via XMPP (a.k.a.
yumpkg	Support for YUM/DNF
zabbix	Support for Zabbix
zcbuildout	Management of zc.buildout
zenoss	Module for working with the Zenoss API
zfs	Salt interface to ZFS commands
zk_concurrency	Concurrency controls in zookeeper
znc	znc - An advanced IRC bouncer

Continued on next page

Table 19.9 -- continued from previous page

zoneadm	Module for Solaris 10's zoneadm
zonecfg	Module for Solaris 10's zonecfg
zpool	Module for running ZFS zpool command
zypper	Package support for openSUSE via the zypper package manager

19.9.6 salt.modules.acme module

ACME / Let's Encrypt module

This module currently looks for certbot script in the $PATH as - certbot, - lestsencrypt, - certbot-auto, - letsencrypt-auto eventually falls back to /opt/letsencrypt/letsencrypt-auto

Note: Installation & configuration of the Let's Encrypt client can for example be done using https://github.com/saltstack-formulas/letsencrypt-formula

Warning: Be sure to set at least accept-tos = True in cli.ini!

Most parameters will fall back to cli.ini defaults if None is given.

salt.modules.acme.**cert**(*name*, *aliases=None*, *email=None*, *webroot=None*, *test_cert=False*, *renew=None*, *keysize=None*, *server=None*, *owner='root'*, *group='root'*, *certname=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to use to use webroot. Otherwise use standalone mode
- **test_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with `server')
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of private key
- **group** -- group of private key
- **certname** -- Name of the certificate to save

Returns dict with `result' True/False/None, `comment' and certificate's expiry date (`not_after')

CLI example:

```
salt 'gitlab.example.com' acme.cert dev.example.com "[gitlab.example.com]" test_
↪cert=True renew=14 webroot=/opt/gitlab/embedded/service/gitlab-rails/public
```

salt.modules.acme.**certs**()
Return a list of active certificates

CLI example:

```
salt 'vhost.example.com' acme.certs
```

salt.modules.acme.**expires**(*name*)
The expiry date of a certificate in ISO format

Parameters **name** -- CommonName of cert

CLI example:

```
salt 'gitlab.example.com' acme.expires dev.example.com
```

salt.modules.acme.**has**(*name*)
Test if a certificate is in the Let's Encrypt Live directory

Parameters **name** -- CommonName of cert

Code example:

```
if __salt__['acme.has']('dev.example.com'):
    log.info('That is one nice certificate you have there!')
```

salt.modules.acme.**info**(*name*)
Return information about a certificate

Note: Will output tls.cert_info if that's available, or OpenSSL text if not

---

Parameters **name** -- CommonName of cert

CLI example:

```
salt 'gitlab.example.com' acme.info dev.example.com
```

salt.modules.acme.**needs_renewal**(*name*, *window=None*)
Check if a certificate needs renewal

Parameters

- **name** -- CommonName of cert
- **window** -- Window in days to renew earlier or True/force to just return True

Code example:

```
if __salt__['acme.needs_renewal']('dev.example.com'):
    __salt__['acme.cert']('dev.example.com', **kwargs)
else:
    log.info('Your certificate is still good')
```

salt.modules.acme.**renew_by**(*name*, *window=None*)
Date in ISO format when a certificate should first be renewed

Parameters

- **name** -- CommonName of cert
- **window** -- number of days before expiry when renewal should take place

19.9.7 salt.modules.aix_group module

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *`group.info' is not available*), see *here*.

salt.modules.aix_group.**add**(*name*, *gid=None*, *system=False*, *root=None*)
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.aix_group.**adduser**(*name*, *username*, *root=None*)
Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar' as a member of an existing group `foo', if not then adds it.

salt.modules.aix_group.**chgid**(*name*, *gid*)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.aix_group.**delete**(*name*)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.aix_group.**deluser**(*name*, *username*, *root=None*)
Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar' from a group `foo'. If group is not present then returns True.

salt.modules.aix_group.**getent**(*refresh=False*)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.aix_group.**info**(*name*)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.aix_group.**members**(*name*, *members_list*, *root=None*)
Replaces members of the group with a provided list.

CLI Example:
salt `*' group.members foo `user1,user2,user3,...'

Replaces a membership list for a local group `foo'. foo:x:1234:user1,user2,user3,...

19.9.8 salt.modules.aliases

Manage the information in the aliases file

salt.modules.aliases.**get_target**(*alias*)
Return the target associated with an alias

CLI Example:

```
salt '*' aliases.get_target alias
```

salt.modules.aliases.**has_target**(*alias*, *target*)
Return true if the alias/target is set

CLI Example:

```
salt '*' aliases.has_target alias target
```

salt.modules.aliases.**list_aliases**()
Return the aliases found in the aliases file in this format:

```
{'alias': 'target'}
```

CLI Example:

```
salt '*' aliases.list_aliases
```

salt.modules.aliases.**rm_alias**(*alias*)
Remove an entry from the aliases file

CLI Example:

```
salt '*' aliases.rm_alias alias
```

salt.modules.aliases.**set_target**(*alias*, *target*)
Set the entry in the aliases file for the given alias, this will overwrite any previous entry for the given alias or create a new one if it does not exist.

CLI Example:

```
salt '*' aliases.set_target alias target
```

19.9.9 salt.modules.alternatives

Support for Alternatives system

codeauthor Radek Rada <radek.rada@gmail.com>

salt.modules.alternatives.**auto**(*name*)
Trigger alternatives to set the path for <name> as specified by priority.

CLI Example:

```
salt '*' alternatives.auto name
```

salt.modules.alternatives.**check_exists**(*name*, *path*)
Check if the given path is an alternative for a name.

New in version 2015.8.4.

CLI Example:

```
salt '*' alternatives.check_exists name path
```

salt.modules.alternatives.**check_installed**(*name*, *path*)
Check if the current highest-priority match for a given alternatives link is set to the desired path

CLI Example:

```
salt '*' alternatives.check_installed name path
```

salt.modules.alternatives.**display**(*name*)
Display alternatives settings for defined command name

CLI Example:

```
salt '*' alternatives.display editor
```

salt.modules.alternatives.**install**(*name*, *link*, *path*, *priority*)
Install symbolic links determining default commands

CLI Example:

```
salt '*' alternatives.install editor /usr/bin/editor /usr/bin/emacs23 50
```

salt.modules.alternatives.**remove**(*name*, *path*)
Remove symbolic links determining the default commands.

CLI Example:

```
salt '*' alternatives.remove name path
```

salt.modules.alternatives.**set**(*name*, *path*)
Manually set the alternative <path> for <name>.

CLI Example:

```
salt '*' alternatives.set name path
```

salt.modules.alternatives.**show_current**(*name*)
Display the current highest-priority alternative for a given alternatives link

CLI Example:

```
salt '*' alternatives.show_current editor
```

salt.modules.alternatives.**show_link**(*name*)
Display master link for the alternative

New in version 2015.8.13,2016.3.4,2016.11.0.

CLI Example:

```
salt '*' alternatives.show_link editor
```

19.9.10 salt.modules.apache

Support for Apache

Note: The functions in here are generic functions designed to work with all implementations of Apache. Debian-specific functions have been moved into deb_apache.py, but will still load under the `apache` namespace when a Debian-based system is detected.

`salt.modules.apache.`**`config`**(*name*, *config*, *edit=True*)

Create VirtualHost configuration files

name File for the virtual host

config VirtualHost configurations

Note: This function is not meant to be used from the command line. Config is meant to be an ordered dict of all of the apache configs.

CLI Example:

```
salt '*' apache.config /etc/httpd/conf.d/ports.conf config="[{'Listen': '22'}]"
```

`salt.modules.apache.`**`directives`**()

Return list of directives together with expected arguments and places where the directive is valid (`apachectl -L`)

CLI Example:

```
salt '*' apache.directives
```

`salt.modules.apache.`**`fullversion`**()

Return server version (`apachectl -V`)

CLI Example:

```
salt '*' apache.fullversion
```

`salt.modules.apache.`**`modules`**()

Return list of static and shared modules (`apachectl -M`)

CLI Example:

```
salt '*' apache.modules
```

`salt.modules.apache.`**`server_status`**(*profile='default'*)

Get Information from the Apache server-status handler

Note: The server-status handler is disabled by default. In order for this function to work it needs to be enabled. See http://httpd.apache.org/docs/2.2/mod/mod_status.html

The following configuration needs to exists in pillar/grains. Each entry nested in `apache.server-status` is a profile of a vhost/server. This would give support for multiple apache servers/vhosts.

```
apache.server-status:
  default:
    url: http://localhost/server-status
    user: someuser
    pass: password
    realm: 'authentication realm for digest passwords'
    timeout: 5
```

CLI Examples:

```
salt '*' apache.server_status
salt '*' apache.server_status other-profile
```

`salt.modules.apache.`**`servermods`**`()`

Return list of modules compiled into the server (`apachectl -l`)

CLI Example:

```
salt '*' apache.servermods
```

`salt.modules.apache.`**`signal`**`(`*signal=None*`)`

Signals httpd to start, restart, or stop.

CLI Example:

```
salt '*' apache.signal restart
```

`salt.modules.apache.`**`useradd`**`(`*pwfile*, *user*, *password*, *opts=''*`)`

Add HTTP user using the `htpasswd` command. If the `htpasswd` file does not exist, it will be created. Valid options that can be passed are:

```
n  Don't update file; display results on stdout.
m  Force MD5 hashing of the password (default).
d  Force CRYPT(3) hashing of the password.
p  Do not hash the password (plaintext).
s  Force SHA1 hashing of the password.
```

CLI Examples:

```
salt '*' apache.useradd /etc/httpd/htpasswd larry badpassword
salt '*' apache.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

`salt.modules.apache.`**`userdel`**`(`*pwfile*, *user*`)`

Delete HTTP user from the specified `htpasswd` file.

CLI Example:

```
salt '*' apache.userdel /etc/httpd/htpasswd larry
```

`salt.modules.apache.`**`version`**`()`

Return server version (`apachectl -v`)

CLI Example:

```
salt '*' apache.version
```

salt.modules.apache.**vhosts**()
Show the settings as parsed from the config file (currently only shows the virtualhost settings) (apachectl -S). Because each additional virtual host adds to the execution time, this command may require a long timeout be specified by using -t 10.

CLI Example:

```
salt -t 10 '*' apache.vhosts
```

19.9.11 salt.modules.apcups

Module for apcupsd

salt.modules.apcups.**status**()
Return apcaccess output

CLI Example:

```
salt '*' apcups.status
```

salt.modules.apcups.**status_battery**()
Return true if running on battery power

CLI Example:

```
salt '*' apcups.status_battery
```

salt.modules.apcups.**status_charge**()
Return battery charge

CLI Example:

```
salt '*' apcups.status_charge
```

salt.modules.apcups.**status_load**()
Return load

CLI Example:

```
salt '*' apcups.status_load
```

19.9.12 salt.modules.apf

Support for Advanced Policy Firewall (APF)

maintainer Mostafa Hussein <mostafa.hussein91@gmail.com>

maturity new

depends python-iptables

platform Linux

salt.modules.apf.**allow**(*ip*, *port=None*)
Add host (IP/FQDN) to allow_hosts.rules and immediately load new rule into firewall CLI Example:

```
salt '*' apf.allow 127.0.0.1
```

salt.modules.apf.**deny**(*ip*)
Add host (IP/FQDN) to deny_hosts.rules and immediately load new rule into firewall CLI Example:

```
salt '*' apf.deny 1.2.3.4
```

salt.modules.apf.**disable**()
Stop (flush) all firewall rules CLI Example:

```
salt '*' apf.disable
```

salt.modules.apf.**enable**()
Load all firewall rules CLI Example:

```
salt '*' apf.enable
```

salt.modules.apf.**refresh**()
Refresh & resolve dns names in trust rules CLI Example:

```
salt '*' apf.refresh
```

salt.modules.apf.**reload**()
Stop (flush) & reload firewall rules CLI Example:

```
salt '*' apf.reload
```

salt.modules.apf.**remove**(*ip*)
Remove host from [glob]*_hosts.rules and immediately remove rule from firewall CLI Example:

```
salt '*' apf.remove 1.2.3.4
```

salt.modules.apf.**running**()
Check apf status CLI Example:

```
salt '*' apf.running
```

19.9.13 salt.modules.apk module

Support for apk

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

---

salt.modules.apk.**file_dict**(**packages*)
List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.apk.**file_list**(**packages*)
List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.apk.**install**(*name=None*, *refresh=False*, *pkgs=None*, *sources=None*, ***kwargs*)

Install the passed package, add refresh=True to update the apk database.

name The name of the package to be installed. Note that this parameter is ignored if either ``pkgs'' or ``sources'' is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources'' option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

sources A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
↪deb"}]'
```

install_recommends Whether to install the packages marked as recommended. Default is True.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

salt.modules.apk.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.apk.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.apk.**list_upgrades**(*refresh=True*)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.apk.**owner**(**paths*)

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version <salt.modules.apk.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

salt `*' pkg.owns /usr/bin/apachectl salt `*' pkg.owns /usr/bin/apachectl /usr/bin/basename

salt.modules.apk.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Alias to remove

salt.modules.apk.**refresh_db**()

Updates the package list

- `True`: Database updated successfully
- `False`: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.apk.**remove**(*name=None*, *pkgs=None*, *purge=False*, ***kwargs*)

Remove packages using `apk del`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.apk.**upgrade**(*name=None*, *pkgs=None*, *refresh=True*)

Upgrades all packages via `apk upgrade` or a specific package if name or pkgs is specified. Name is ignored if pkgs is specified

Returns a dict containing the changes.

{`<package>': {`old': `<old-version>', `new': `<new-version>'}}

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.apk.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.14 salt.modules.aptpkg

Support for APT (Advanced Packaging Tool)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

Note: For virtual package support, either the `python-apt` or `dctrl-tools` package must be installed.

For repository management, the `python-apt` package must be installed.

`salt.modules.aptpkg.`**`add_repo_key`**(*path=None*, *text=None*, *keyserver=None*, *keyid=None*, *saltenv='base'*)

New in version 2017.7.0.

Add a repo key using `apt-key add`.

Parameters

- **`path`** (*str*) -- The path of the key file to import.
- **`text`** (*str*) -- The key data to import, in string form.
- **`keyserver`** (*str*) -- The server to download the repo key specified by the keyid.
- **`keyid`** (*str*) -- The key id of the repo key to add.
- **`saltenv`** (*str*) -- The environment the key file resides in.

Returns A boolean representing whether the repo key was added.

Return type bool

CLI Examples:

```
salt '*' pkg.add_repo_key 'salt://apt/sources/test.key'

salt '*' pkg.add_repo_key text="'$KEY1'"

salt '*' pkg.add_repo_key keyserver='keyserver.example' keyid='0000AAAA'
```

`salt.modules.aptpkg.`**`autoremove`**(*list_only=False*, *purge=False*)

New in version 2015.5.0.

Remove packages not required by another package using `apt-get autoremove`.

list_only [False] Only retrieve the list of packages to be auto-removed, do not actually perform the auto-removal.

purge [False] Also remove package config data when autoremoving packages.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove list_only=True
salt '*' pkg.autoremove purge=True
```

salt.modules.aptpkg.**del_repo**(*repo*, ***kwargs*)

Delete a repo from the sources.list / sources.list.d

If the .list file is in the sources.list.d directory and the file that the repo exists in does not contain any other repo configuration, the file itself will be deleted.

The repo passed in must be a fully formed repository definition string.

CLI Examples:

```
salt '*' pkg.del_repo "myrepo definition"
```

salt.modules.aptpkg.**del_repo_key**(*name=None*, ***kwargs*)

New in version 2015.8.0.

Remove a repo key using `apt-key del`

name Repo from which to remove the key. Unnecessary if `keyid` is passed.

keyid The KeyID of the GPG key to remove

keyid_ppa [False] If set to `True`, the repo's GPG key ID will be looked up from ppa.launchpad.net and removed.

> **Note:** Setting this option to `True` requires that the `name` param also be passed.

CLI Examples:

```
salt '*' pkg.del_repo_key keyid=0123ABCD
salt '*' pkg.del_repo_key name='ppa:foo/bar' keyid_ppa=True
```

salt.modules.aptpkg.**expand_repo_def**(***kwargs*)

Take a repository definition and expand it to the full pkg repository dict that can be used for comparison. This is a helper function to make the Debian/Ubuntu apt sources sane for comparison in the pkgrepo states.

This is designed to be called from pkgrepo states and will have little use being called on the CLI.

salt.modules.aptpkg.**file_dict**(**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_dict httpd
salt '*' pkg.file_dict httpd postfix
salt '*' pkg.file_dict
```

salt.modules.aptpkg.**file_list**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.aptpkg.**get_repo**(*repo*, ***kwargs*)

Display a repo from the sources.list / sources.list.d

The repo passed in needs to be a complete repo entry.

CLI Examples:

```
salt '*' pkg.get_repo "myrepo definition"
```

salt.modules.aptpkg.**get_repo_keys**()

New in version 2017.7.0.

List known repo key details.

Returns A dictionary containing the repo keys.

Return type dict

CLI Examples:

```
salt '*' pkg.get_repo_keys
```

salt.modules.aptpkg.**get_selections**(*pattern=None*, *state=None*)

View package state from the dpkg database.

Returns a dict of dicts containing the state, and package names:

```
{'<host>':
    {'<state>': ['pkg1',
                 ...
                ]
    },
    ...
}
```

CLI Example:

```
salt '*' pkg.get_selections
salt '*' pkg.get_selections 'python-*'
salt '*' pkg.get_selections state=hold
salt '*' pkg.get_selections 'openssh*' state=hold
```

salt.modules.aptpkg.**hold**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

New in version 2014.7.0.

Set package in `hold' state, meaning it will not be upgraded.

name The name of the package, e.g., `tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.**info_installed**(**names*, ***kwargs*)

Return the information of the named package(s) installed on the system.

New in version 2015.8.1.

names The names of the packages for which to return information.

failhard Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> failhard=false
```

salt.modules.aptpkg.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *skip_verify=False*, *debconf=None*, *pkgs=None*, *sources=None*, *reinstall=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package, add refresh=True to update the dpkg database.

name The name of the package to be installed. Note that this parameter is ignored if either ``pkgs'' or ``sources'' is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources'' option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`:i386`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

fromrepo Specify a package repository to install from (e.g., `apt-get -t unstable install somepackage`)

skip_verify Skip the GPG verification check (e.g., `--allow-unauthenticated`, or `--force-bad-verify` for install from package file).

debconf Provide the path to a debconf answers file, processed before installation.

version Install a specific version of the package, e.g. 1.2.3~0ubuntu0. Ignored if ``pkgs'' or ``sources'' is passed.

reinstall [False] Specifying reinstall=True will use `apt-get install --reinstall` rather than simply `apt-get install` for requested packages that are already installed.

If a version is specified with the requested package, then `apt-get install --reinstall` will only be used if the installed version matches the requested version.

New in version 2015.8.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

sources A list of DEB packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`:i386`, etc.) to the end of the package name.

Changed in version 2014.7.0.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
 ↪deb"}]'
```

force_yes Passes `--force-yes` to the apt-get command. Don't use this unless you know what you're doing.

New in version 0.17.4.

install_recommends Whether to install the packages marked as recommended. Default is True.

New in version 2015.5.0.

only_upgrade Only upgrade the packages, if they are already installed. Default is False.

New in version 2015.5.0.

force_conf_new Always install the new version of any configuration files.

New in version 2015.8.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.aptpkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=unstable
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.aptpkg.`**`list_pkgs`**(*versions_as_list=False*, *removed=False*, *purge_desired=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

removed If `True`, then only packages which have been removed (but not purged) will be returned.

purge_desired If `True`, then only packages which have been marked to be purged, but can't be purged due to their status as dependencies for other installed packages, will be returned. Note that these packages will appear in installed

Changed in version 2014.1.1: Packages in this state now correctly show up in the output of this function.

Note: External dependencies

Virtual package resolution requires the `dctrl-tools` package to be installed. Virtual packages will show a version of `1`.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.aptpkg.**list_repo_pkgs**(**args*, ***kwargs*)

New in version 2017.7.0.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. For example:

```
{
    'bash': ['4.3-14ubuntu1.1',
             '4.3-14ubuntu1'],
    'nginx': ['1.10.0-0ubuntu0.16.04.4',
              '1.9.15-0ubuntu1']
}
```

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
```

salt.modules.aptpkg.**list_repos**()

Lists all repos in the sources.list (and sources.lists.d) files

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos disabled=True
```

salt.modules.aptpkg.**list_upgrades**(*refresh=True*, *dist_upgrade=True*, ***kwargs*)

List all available package upgrades.

refresh Whether to refresh the package database before listing upgrades. Default: True.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

dist_upgrade Whether to list the upgrades using dist-upgrade vs upgrade. Default is to use dist-upgrade.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.aptpkg.**mod_repo**(*repo*, *saltenv='base'*, ***kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the definition is well formed. For Ubuntu the `ppa:<project>/repo` format is acceptable. `ppa:` format can only be used to create a new repository.

The following options are available to modify a repo definition:

architectures a comma separated list of supported architectures, e.g. `amd64` If this option is not set, all architectures (configured in the system) will be used.

comps a comma separated list of components for the repo, e.g. `main`

file a file name to be used

keyserver keyserver to get gpg key from

keyid key id to load with the keyserver argument

key_url URL to a GPG key to add to the APT GPG keyring

key_text GPG key in string form to add to the APT GPG keyring

consolidate if `True`, will attempt to de-dup and consolidate sources

comments Sometimes you want to supply additional information, but not as enabled configuration. All comments provided here will be joined into a single string and appended to the repo configuration with a comment marker (#) before it.

New in version 2015.8.9.

Note: Due to the way keys are stored for APT, there is a known issue where the key won't be updated unless another change is made at the same time. Keys should be properly added on initial configuration.

CLI Examples:

```
salt '*' pkg.mod_repo 'myrepo definition' uri=http://new/uri
salt '*' pkg.mod_repo 'myrepo definition' comps=main,universe
```

`salt.modules.aptpkg.`**`owner`**(**paths*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like *`pkg.version`*, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /usr/bin/basename
```

`salt.modules.aptpkg.`**`purge`**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via `apt-get purge` along with all configuration files.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.**refresh_db**(*cache_valid_time=0*, *failhard=False*)

Updates the APT database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- `True`: Database updated successfully
- `False`: Problem updating database
- `None`: Database already up-to-date

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

failhard

If False, return results of Err lines as `False` for the package database that encountered the error.
If True, raise an error with a list of the package databases that encountered errors.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.aptpkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages using `apt-get remove`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.aptpkg.**set_selections**(*path=None*, *selection=None*, *clear=False*, *saltenv='base'*)

Change package state in the dpkg database.

The state can be any one of, documented in `dpkg(1)`:

- install
- hold
- deinstall
- purge

This command is commonly used to mark specific packages to be held from being upgraded, that is, to be kept at a certain version. When a state is changed to anything but being held, then it is typically followed by `apt-get -u dselect-upgrade`.

Note: Be careful with the `clear` argument, since it will start with setting all packages to deinstall state.

Returns a dict of dicts containing the package names, and the new and old versions:

```
{'<host>':
    {'<package>': {'new': '<new-state>',
                   'old': '<old-state>'}
    },
    ...
}
```

CLI Example:

```
salt '*' pkg.set_selections selection='{"install": ["netcat"]}'
salt '*' pkg.set_selections selection='{"hold": ["openssh-server", "openssh-client
 ↪"]}'
salt '*' pkg.set_selections salt://path/to/file
salt '*' pkg.set_selections salt://path/to/file clear=True
```

`salt.modules.aptpkg.`**`unhold`**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

New in version 2014.7.0.

Set package current in `hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., `tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.aptpkg.`**`upgrade`**(*refresh=True*, *dist_upgrade=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any apt-get/dpkg commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Upgrades all packages via `apt-get upgrade` or `apt-get dist-upgrade` if `dist_upgrade` is `True`.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

dist_upgrade Whether to perform the upgrade using dist-upgrade vs upgrade. Default is to use upgrade.

New in version 2014.7.0.

cache_valid_time

New in version 2016.11.0.

Skip refreshing the package database if refresh has already occurred within <value> seconds

force_conf_new Always install the new version of any configuration files.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.aptpkg.**upgrade_available**(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.aptpkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.aptpkg.**version_cmp**(*pkg1*, *pkg2*, *ignore_epoch=False*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0ubuntu1' '0.2.4.1-0ubuntu1'
```

19.9.15 salt.modules.archive

A module to wrap (non-Windows) archive calls

New in version 2014.1.0.

salt.modules.archive.**cmd_unzip**(*zip_file*, *dest*, *excludes=None*, *options=None*, *template=None*, *runas=None*, *trim_output=False*, *password=None*)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as `archive.unzip`.

Uses the `unzip` command to unpack zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply `unzip`.

zip_file Path of zip file to be unpacked

dest The destination directory into which the file should be unpacked

excludes [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_unzip template=jinja /tmp/zipfile.zip '/tmp/{{grains.id}}
↪' excludes=file_1,file_2
```

options Optional when using `zip` archives, ignored when usign other archives files. This is mostly used to overwrite exsiting files with `o`. This options are only used when `unzip` binary is used.

New in version 2016.3.1.

runas [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

trim_output [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

password Password to use with password protected zip files

> **Note:** This is not considered secure. It is recommended to instead use *archive.unzip* for password-protected ZIP files. If a password is used here, then the unzip command run to extract the ZIP file will not show up in the minion log like most shell commands Salt runs do. However, the password will still be present in the events logged to the minion log at the debug log level. If the minion is logging at debug (or more verbose), then be advised that the password will appear in the log.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.cmd_unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_
↪2
```

salt.modules.archive.**cmd_zip**(*zip_file*, *sources*, *template=None*, *cwd=None*, *runas=None*)

New in version 2015.5.0: In versions 2014.7.x and earlier, this function was known as archive.zip.

Uses the zip command to create zip files. This command is part of the Info-ZIP suite of tools, and is typically packaged as simply zip.

zip_file Path of zip file to be created

sources Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.cmd_zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/
↪tmp/{{grains.id}}.txt
```

cwd [None] Use this argument along with relative paths in sources to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was /, and creating a zip file of /foo/bar/baz.txt will contain the parent directories foo and bar. To create a zip file containing just baz.txt, the following command would be used:

```
salt '*' archive.cmd_zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

New in version 2014.7.1.

runas [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

New in version 2015.5.0.

CLI Example:

```
salt '*' archive.cmd_zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.cmd_zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

salt.modules.archive.**gunzip**(*gzipfile*, *template=None*, *runas=None*, *options=None*)

Uses the gunzip command to unpack gzip files

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gunzip template=jinja /tmp/{{grains.id}}.txt.gz
```

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt
salt '*' archive.gunzip /tmp/sourcefile.txt.gz
salt '*' archive.gunzip /tmp/sourcefile.txt options='--verbose'
```

salt.modules.archive.**gzip**(*sourcefile*, *template=None*, *runas=None*, *options=None*)

Uses the gzip command to create gzip files

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.gzip template=jinja /tmp/{{grains.id}}.txt
```

runas [None] The user with which to run the gzip command line

options [None] Pass any additional arguments to gzip

New in version 2016.3.4.

CLI Example:

```
# Create /tmp/sourcefile.txt.gz
salt '*' archive.gzip /tmp/sourcefile.txt
salt '*' archive.gzip /tmp/sourcefile.txt options='-9 --verbose'
```

salt.modules.archive.**is_encrypted**(*name*, *clean=False*, *saltenv='base'*)

New in version 2016.11.0.

Returns `True` if the zip archive is password-protected, `False` if not. If the specified file is not a ZIP archive, an error will be raised.

name The path / URL of the archive to check.

clean [False] Set this value to `True` to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

Note: If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

CLI Examples:

```
salt '*' archive.is_encrypted /path/to/myfile.zip
salt '*' archive.is_encrypted salt://foo.zip
salt '*' archive.is_encrypted salt://foo.zip saltenv=dev
salt '*' archive.is_encrypted https://domain.tld/myfile.zip clean=True
salt '*' archive.is_encrypted ftp://10.1.2.3/foo.zip
```

salt.modules.archive.**list**(*name*, *archive_format=None*, *options=None*, *strip_components=None*, *clean=False*, *verbose=False*, *saltenv='base'*)

New in version 2016.11.0.

Changed in version 2016.11.2: The rarfile Python module is now supported for listing the contents of rar archives. This is necessary on minions with older releases of the `rar` CLI tool, which do not support listing the contents in a parsable format.

List the files and directories in an tar, zip, or rar archive.

Note: This function will only provide results for XZ-compressed archives if the xz CLI command is available, as Python does not at this time natively support XZ compression in its tarfile module. Keep in mind however

that most Linux distros ship with xz already installed.

To check if a given minion has xz, the following Salt command can be run:

```
salt minion_id cmd.which xz
```

If None is returned, then xz is not present and must be installed. It is widely available and should be packaged as either `xz` or `xz-utils`.

---

name Path/URL of archive

archive_format Specify the format of the archive (`tar`, `zip`, or `rar`). If this argument is omitted, the archive format will be guessed based on the value of the `name` parameter.

options **For tar archives only.** This function will, by default, try to use the tarfile module from the Python standard library to get a list of files/directories. If this method fails, then it will fall back to using the shell to decompress the archive to stdout and pipe the results to `tar -tf -` to produce a list of filenames. XZ-compressed archives are already supported automatically, but in the event that the tar archive uses a different sort of compression not supported natively by tarfile, this option can be used to specify a command that will decompress the archive to stdout. For example:

```
salt minion_id archive.list /path/to/foo.tar.gz options='gzip --decompress --
↪stdout'
```

Note: It is not necessary to manually specify options for gzip'ed archives, as gzip compression is natively supported by tarfile.

---

strip_components This argument specifies a number of top-level directories to strip from the results. This is similar to the paths that would be extracted if `--strip-components` (or `--strip`) were used when extracting tar archives.

New in version 2016.11.2.

clean [False] Set this value to `True` to delete the path referred to by `name` once the contents have been listed. This option should be used with care.

Note: If there is an error listing the archive's contents, the cached file will not be removed, to allow for troubleshooting.

---

verbose [False] If `False`, this function will return a list of files/dirs in the archive. If `True`, it will return a dictionary categorizing the paths into separate keys containing the directory names, file names, and also directories/files present in the top level of the archive.

Changed in version 2016.11.2: This option now includes symlinks in their own list. Before, they were included with files.

saltenv [base] Specifies the fileserver environment from which to retrieve `archive`. This is only applicable when `archive` is a file from the `salt://` fileserver.

CLI Examples:

```
salt '*' archive.list /path/to/myfile.tar.gz
salt '*' archive.list /path/to/myfile.tar.gz strip_components=1
salt '*' archive.list salt://foo.tar.gz
salt '*' archive.list https://domain.tld/myfile.zip
salt '*' archive.list ftp://10.1.2.3/foo.rar
```

`salt.modules.archive.`**`rar`**(*rarfile*, *sources*, *template=None*, *cwd=None*, *runas=None*)

Uses rar for Linux to create rar files

rarfile Path of rar file to be created

sources Comma-separated list of sources to include in the rar file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

cwd [None] Run the rar command from the specified directory. Use this argument along with relative file paths to create rar files which do not contain the leading directories. If not specified, this will default to the home directory of the user under which the salt minion process is running.

New in version 2014.7.1.

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.rar template=jinja /tmp/rarfile.rar '/tmp/sourcefile1,/tmp/{
 ↪{grains.id}}.txt'
```

CLI Example:

```
salt '*' archive.rar /tmp/rarfile.rar /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.rar /tmp/rarfile.rar '/tmp/sourcefile*'
```

salt.modules.archive.**tar**(*options*, *tarfile*, *sources=None*, *dest=None*, *cwd=None*, *template=None*, *runas=None*)

Note: This function has changed for version 0.17.0. In prior versions, the `cwd` and `template` arguments must be specified, with the source directories/files coming as a space-separated list at the end of the command. Beginning with 0.17.0, `sources` must be a comma-separated list, and the `cwd` and `template` arguments are optional.

Uses the tar command to pack, unpack, etc. tar files

options Options to pass to the tar command

Changed in version 2015.8.0: The mandatory - prefixing has been removed. An options string beginning with a *--long-option*, would have uncharacteristically needed its first - removed under the former scheme.

Also, tar will parse its options differently if short options are used with or without a preceding -, so it is better to not confuse the user into thinking they're using the non-- format, when really they are using the with-- format.

tarfile The filename of the tar archive to pack/unpack

sources Comma delimited list of files to **pack** into the tarfile. Can also be passed as a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

dest The destination directory into which to **unpack** the tarfile

cwd [None] The directory in which the tar command should be executed. If not specified, will default to the home directory of the user under which the salt minion process is running.

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.tar cjvf /tmp/salt.tar.bz2 {{grains.saltpath}} template=jinja
```

CLI Examples:

```
# Create a tarfile
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 /tmp/file_1,/tmp/file_2
# Create a tarfile using globbing (2017.7.0 and later)
salt '*' archive.tar cjvf /tmp/tarfile.tar.bz2 '/tmp/file_*'
```

```
# Unpack a tarfile
salt '*' archive.tar xf foo.tar dest=/target/directory
```

salt.modules.archive.**unrar**(*rarfile*, *dest*, *excludes=None*, *template=None*, *runas=None*, *trim_output=False*)

Uses rar for Linux to unpack rar files

rarfile Name of rar file to be unpacked

dest The destination directory into which to **unpack** the rar file

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unrar template=jinja /tmp/rarfile.rar /tmp/{{grains.id}}/
↪excludes=file_1,file_2
```

trim_output [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```
salt '*' archive.unrar /tmp/rarfile.rar /home/strongbad/ excludes=file_1,file_2
```

salt.modules.archive.**unzip**(*zip_file*, *dest*, *excludes=None*, *options=None*, *template=None*, *runas=None*, *trim_output=False*, *password=None*, *extract_perms=True*)

Uses the `zipfile` Python module to unpack zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function *archive.cmd_unzip*. For versions 2014.7.x and earlier, see the *archive.cmd_zip* documentation.

zip_file Path of zip file to be unpacked

dest The destination directory into which the file should be unpacked

excludes [None] Comma-separated list of files not to unpack. Can also be passed in a Python list.

options This options are only used when `unzip` binary is used. In this function is ignored.

New in version 2016.3.1.

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.unzip template=jinja /tmp/zipfile.zip /tmp/{{grains.id}}/
↪excludes=file_1,file_2
```

runas [None] Unpack the zip file as the specified user. Defaults to the user under which the minion is running.

trim_output [False] The number of files we should output on success before the rest are trimmed, if this is set to True then it will default to 100

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ excludes=file_1,file_2
```

password Password to use with password protected zip files

Note: The password will be present in the events logged to the minion log file at the `debug` log level. If the minion is logging at `debug` (or more verbose), then be advised that the password will appear in the log.

New in version 2016.3.0.

extract_perms [True] The Python zipfile module does not extract file/directory attributes by default. When this argument is set to `True`, Salt will attempt to apply the file permission attributes to the extracted files/folders.

On Windows, only the read-only flag will be extracted as set within the zip file, other attributes (i.e. user/group permissions) are ignored.

Set this argument to `False` to disable this behavior.

New in version 2016.11.0.

CLI Example:

```
salt '*' archive.unzip /tmp/zipfile.zip /home/strongbad/ password='BadPassword'
```

salt.modules.archive.**zip**(*zip_file*, *sources*, *template=None*, *cwd=None*, *runas=None*)

Uses the `zipfile` Python module to create zip files

Changed in version 2015.5.0: This function was rewritten to use Python's native zip file support. The old functionality has been preserved in the new function *archive.cmd_zip*. For versions 2014.7.x and earlier, see the *archive.cmd_zip* documentation.

zip_file Path of zip file to be created

sources Comma-separated list of sources to include in the zip file. Sources can also be passed in a Python list.

Changed in version 2017.7.0: Globbing is now supported for this argument

template [None] Can be set to `jinja' or another supported template engine to render the command arguments before execution:

```
salt '*' archive.zip template=jinja /tmp/zipfile.zip /tmp/sourcefile1,/tmp/{
↪{grains.id}}.txt
```

cwd [None] Use this argument along with relative paths in `sources` to create zip files which do not contain the leading directories. If not specified, the zip file will be created as if the cwd was `/`, and creating a zip file of `/foo/bar/baz.txt` will contain the parent directories `foo` and `bar`. To create a zip file containing just `baz.txt`, the following command would be used:

```
salt '*' archive.zip /tmp/baz.zip baz.txt cwd=/foo/bar
```

runas [None] Create the zip file as the specified user. Defaults to the user under which the minion is running.

CLI Example:

```
salt '*' archive.zip /tmp/zipfile.zip /tmp/sourcefile1,/tmp/sourcefile2
# Globbing for sources (2017.7.0 and later)
salt '*' archive.zip /tmp/zipfile.zip '/tmp/sourcefile*'
```

19.9.16 salt.modules.artifactory

Module for fetching artifacts from Artifactory

salt.modules.artifactory.**get_latest_release**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets the latest release of the artifact

artifactory_url URL of artifactory instance

repository Release repository in artifactory to retrieve artifact from, for example: libs-releases

group_id Group Id of the artifact

artifact_id Artifact Id of the artifact

packaging Packaging type (jar,war,ear,etc)

target_dir Target directory to download artifact to (default: /tmp)

target_file Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)

classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

salt.modules.artifactory.**get_latest_snapshot**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets latest snapshot of the given artifact
artifactory_url URL of artifactory instance
repository Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
group_id Group Id of the artifact
artifact_id Artifact Id of the artifact
packaging Packaging type (jar,war,ear,etc)
target_dir Target directory to download artifact to (default: /tmp)
target_file Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

salt.modules.artifactory.**get_release**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *version*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets the specified release of the artifact
artifactory_url URL of artifactory instance
repository Release repository in artifactory to retrieve artifact from, for example: libs-releases
group_id Group Id of the artifact
artifact_id Artifact Id of the artifact
packaging Packaging type (jar,war,ear,etc)
version Version of the artifact
target_dir Target directory to download artifact to (default: /tmp)
target_file Target file to download artifact to (by default it is target_dir/artifact_id-version.packaging)
classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

salt.modules.artifactory.**get_snapshot**(*artifactory_url*, *repository*, *group_id*, *artifact_id*, *packaging*, *version*, *snapshot_version=None*, *target_dir='/tmp'*, *target_file=None*, *classifier=None*, *username=None*, *password=None*)

Gets snapshot of the desired version of the artifact
artifactory_url URL of artifactory instance
repository Snapshot repository in artifactory to retrieve artifact from, for example: libs-snapshots
group_id Group Id of the artifact
artifact_id Artifact Id of the artifact
packaging Packaging type (jar,war,ear,etc)
version Version of the artifact
target_dir Target directory to download artifact to (default: /tmp)
target_file Target file to download artifact to (by default it is target_dir/artifact_id-snapshot_version.packaging)
classifier Artifact classifier name (ex: sources,javadoc,etc). Optional parameter.
username Artifactory username. Optional parameter.
password Artifactory password. Optional parameter.

19.9.17 salt.modules.at

Wrapper module for at(1)

Also, a `tag' feature has been added to more easily tag jobs.

platform linux,openbsd,freebsd

Changed in version 2017.7.0.

salt.modules.at.**at**(**args*, ***kwargs*)
Add a job to the queue.

The `timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

salt.modules.at.**atc**(*jobid*)
Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

salt.modules.at.**atq**(*tag=None*)
List all queued and running jobs or only those with an optional `tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

salt.modules.at.**atrm**(**args*)
Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

salt.modules.at.**jobcheck**(***kwargs*)
Check the job from queue. The kwargs dict include `hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

19.9.18 salt.modules.at_solaris

Wrapper for at(1) on Solaris-like systems

Note: we try to mirror the generic at module where possible

maintainer jorge schrauwen <sjorge@blackdot.be>

maturity new

platform solaris,illumos,smartso

New in version 2017.7.0.

salt.modules.at_solaris.**at**(**args*, ***kwargs*)

Add a job to the queue.

The `timespec' follows the format documented in the at(1) manpage.

CLI Example:

```
salt '*' at.at <timespec> <cmd> [tag=<tag>] [runas=<user>]
salt '*' at.at 12:05am '/sbin/reboot' tag=reboot
salt '*' at.at '3:05am +3 days' 'bin/myscript' tag=nightly runas=jim
```

salt.modules.at_solaris.**atc**(*jobid*)

Print the at(1) script that will run for the passed job id. This is mostly for debugging so the output will just be text.

CLI Example:

```
salt '*' at.atc <jobid>
```

salt.modules.at_solaris.**atq**(*tag=None*)

List all queued and running jobs or only those with an optional `tag'.

CLI Example:

```
salt '*' at.atq
salt '*' at.atq [tag]
salt '*' at.atq [job number]
```

salt.modules.at_solaris.**atrm**(**args*)

Remove jobs from the queue.

CLI Example:

```
salt '*' at.atrm <jobid> <jobid> .. <jobid>
salt '*' at.atrm all
salt '*' at.atrm all [tag]
```

salt.modules.at_solaris.**jobcheck**(***kwargs*)

Check the job from queue. The kwargs dict include `hour minute day month year tag runas' Other parameters will be ignored.

CLI Example:

```
salt '*' at.jobcheck runas=jam day=13
salt '*' at.jobcheck day=13 month=12 year=13 tag=rose
```

19.9.19 salt.modules.augeas_cfg

Manages configuration files via augeas

This module requires the `augeas` Python module.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, but the functions in this execution module fail to run due to being unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.modules.augeas_cfg.`**`execute`**(*context=None*, *lens=None*, *commands=()*, *load_path=None*)

Execute Augeas commands

New in version 2014.7.0.

CLI Example:

```
salt '*' augeas.execute /files/etc/redis/redis.conf \
commands='["set bind 0.0.0.0", "set maxmemory 1G"]'
```

context The Augeas context
lens The Augeas lens to use
commands The Augeas commands to execute

New in version 2016.3.0.
load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`get`**(*path*, *value=''*, *load_path=None*)

Get a value for a specific augeas path

CLI Example:

```
salt '*' augeas.get /files/etc/hosts/1/ ipaddr
```

path The path to get the value of
value The optional value to get

New in version 2016.3.0.
load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

`salt.modules.augeas_cfg.`**`ls`**(*path*, *load_path=None*)

List the direct children of a node

CLI Example:

```
salt '*' augeas.ls /files/etc/passwd
```

path The path to list

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.**match**(*path*, *value=''*, *load_path=None*)

Get matches for path expression

CLI Example:

```
salt '*' augeas.match /files/etc/services/service-name ssh
```

path The path to match
value The value to match on

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.**remove**(*path*, *load_path=None*)

Get matches for path expression

CLI Example:

```
salt '*' augeas.remove \
/files/etc/sysctl.conf/net.ipv4.conf.all.log_martians
```

path The path to remove

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

salt.modules.augeas_cfg.**setvalue**(**args*)

Set a value for a specific augeas path

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/1/canonical localhost
```

This will set the first entry in /etc/hosts to localhost

CLI Example:

```
salt '*' augeas.setvalue /files/etc/hosts/01/ipaddr 192.168.1.1 \
                         /files/etc/hosts/01/canonical test
```

Adds a new host to /etc/hosts the ip address 192.168.1.1 and hostname test

CLI Example:

```
salt '*' augeas.setvalue prefix=/files/etc/sudoers/ \
         "spec[user = '%wheel']/user" "%wheel" \
         "spec[user = '%wheel']/host_group/host" 'ALL' \
         "spec[user = '%wheel']/host_group/command[1]" 'ALL' \
         "spec[user = '%wheel']/host_group/command[1]/tag" 'PASSWD' \
         "spec[user = '%wheel']/host_group/command[2]" '/usr/bin/apt-get' \
         "spec[user = '%wheel']/host_group/command[2]/tag" NOPASSWD
```

Ensures that the following line is present in /etc/sudoers:

```
%wheel ALL = PASSWD : ALL , NOPASSWD : /usr/bin/apt-get , /usr/bin/aptitude
```

salt.modules.augeas_cfg.**tree**(*path*, *load_path=None*)

Returns recursively the complete tree of a node

CLI Example:

```
salt '*' augeas.tree /files/etc/
```

path The base of the recursive listing

New in version 2016.3.0.

load_path A colon-spearated list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

19.9.20 salt.modules.aws_sqs

Support for the Amazon Simple Queue Service.

salt.modules.aws_sqs.**create_queue**(*name*, *region*, *opts=None*, *user=None*)

Creates a queue with the correct name.

name Name of the SQS queue to create

region Region to create the SQS queue in

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt `*' aws_sqs.create_queue <sqs queue> <region>

salt.modules.aws_sqs.**delete_message**(*queue*, *region*, *receipthandle*, *opts=None*, *user=None*)

Delete one or more messages from a queue in a region

queue The name of the queue to delete messages from

region Region where SQS queues exists

receipthandle The ReceiptHandle of the message to delete. The ReceiptHandle is obtained in the return from receive_message

opts [None] Any additional options to add to the command line

user [None] Run as a user other than what the minion runs as

CLI Example:

```
salt '*' aws_sqs.delete_message <sqs queue> <region> receipthandle='<sqs
↪ReceiptHandle>'
```

New in version 2014.7.0.

salt.modules.aws_sqs.**delete_queue**(*name*, *region*, *opts=None*, *user=None*)

Deletes a queue in the region.

name Name of the SQS queue to deletes

region Name of the region to delete the queue from

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt `*' aws_sqs.delete_queue <sqs queue> <region>

salt.modules.aws_sqs.**list_queues**(*region*, *opts=None*, *user=None*)

List the queues in the selected region.

region Region to list SQS queues for

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

salt `*' aws_sqs.list_queues <region>

salt.modules.aws_sqs.**queue_exists**(*name*, *region*, *opts=None*, *user=None*)
Returns True or False on whether the queue exists in the region
name Name of the SQS queue to search for
region Name of the region to search for the queue in
opts [None] Any additional options to add to the command line
user [None] Run hg as a user other than what the minion runs as
CLI Example:
salt `*' aws_sqs.queue_exists <sqs queue> <region>

salt.modules.aws_sqs.**receive_message**(*queue*, *region*, *num=1*, *opts=None*, *user=None*)
Receive one or more messages from a queue in a region
queue The name of the queue to receive messages from
region Region where SQS queues exists
num [1] The max number of messages to receive
opts [None] Any additional options to add to the command line
user [None] Run as a user other than what the minion runs as
CLI Example:

```
salt '*' aws_sqs.receive_message <sqs queue> <region>
salt '*' aws_sqs.receive_message <sqs queue> <region> num=10
```

New in version 2014.7.0.

19.9.21 salt.modules.bamboohr

Support for BambooHR

New in version 2015.8.0.

Requires a `subdomain` and an `apikey` in `/etc/salt/minion`:

salt.modules.bamboohr.**list_employees**(*order_by='id'*)
Show all employees for this company.

CLI Example:
salt myminion bamboohr.list_employees
By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:
salt myminion bamboohr.list_employees order_by=id salt myminion bamboohr.list_employees order_by=displayName salt myminion bamboohr.list_employees order_by=workEmail

salt.modules.bamboohr.**list_meta_fields**()
Show all meta data fields for this company.

CLI Example:
salt myminion bamboohr.list_meta_fields

salt.modules.bamboohr.**list_users**(*order_by='id'*)
Show all users for this company.

CLI Example:
salt myminion bamboohr.list_users
By default, the return data will be keyed by ID. However, it can be ordered by any other field. Keep in mind that if the field that is chosen contains duplicate values (i.e., location is used, for a company which only has

one location), then each duplicate value will be overwritten by the previous. Therefore, it is advisable to only sort by fields that are guaranteed to be unique.

CLI Examples:

salt myminion bamboohr.list_users order_by=id salt myminion bamboohr.list_users order_by=email

salt.modules.bamboohr.**show_employee**(*emp_id*, *fields=None*)

Show all employees for this company.

CLI Example:

salt myminion bamboohr.show_employee 1138

By default, the fields normally returned from bamboohr.list_employees are returned. These fields are:

- canUploadPhoto
- department
- displayName
- firstName
- id
- jobTitle
- lastName
- location
- mobilePhone
- nickname
- photoUploaded
- photoUrl
- workEmail
- workPhone
- workPhoneExtension

If needed, a different set of fields may be specified, separated by commas:

CLI Example:

salt myminion bamboohr.show_employee 1138 displayName,dateOfBirth

A list of available fields can be found at http://www.bamboohr.com/api/documentation/employees.php

salt.modules.bamboohr.**update_employee**(*emp_id*, *key=None*, *value=None*, *items=None*)

Update one or more items for this employee. Specifying an empty value will clear it for that employee.

CLI Examples:

salt myminion bamboohr.update_employee 1138 nickname Curly salt myminion bamboohr.update_employee 1138 nickname `' salt myminion bamboohr.update_employee 1138 items='{``nickname'': ``Curly''} salt myminion bamboohr.update_employee 1138 items='{``nickname'': ``'}

19.9.22 salt.modules.bcache module

Module for managing BCache sets

BCache is a block-level caching mechanism similar to ZFS L2ARC/ZIL, dm-cache and fscache. It works by formatting one block device as a cache set, then adding backend devices (which need to be formatted as such) to the set and activating them.

It's available in Linux mainline kernel since 3.10

https://www.kernel.org/doc/Documentation/bcache.txt

This module needs the bcache userspace tools to function.

salt.modules.bcache.**attach**(*dev=None*)

Attach a backing devices to a cache set If no dev is given, all backing devices will be attached.

CLI example:

```
salt '*' bcache.attach sdc
salt '*' bcache.attach /dev/bcache1
```

Returns bool or None if nuttin' happened

salt.modules.bcache.**back_make**(*dev*, *cache_mode='writeback'*, *force=False*, *attach=True*, *bucket_size=None*)

Create a backing device for attachment to a set. Because the block size must be the same, a cache set already needs to exist.

CLI example:

```
salt '*' bcache.back_make sdc cache_mode=writeback attach=True
```

Parameters

- **cache_mode** -- writethrough, writeback, writearound or none.
- **force** -- Overwrite existing bcaches
- **attach** -- Immediately attach the backing device to the set
- **bucket_size** -- Size of a bucket (see kernel doc)

salt.modules.bcache.**cache_make**(*dev*, *reserved=None*, *force=False*, *block_size=None*, *bucket_size=None*, *attach=True*)

Create BCache cache on a block device. If blkdiscard is available the entire device will be properly cleared in advance.

CLI example:

```
salt '*' bcache.cache_make sdb reserved=10% block_size=4096
```

Parameters

- **reserved** -- if dev is a full device, create a partition table with this size empty.

  Note: this increases the amount of reserved space available to SSD garbage collectors, potentially (vastly) increasing performance

- **block_size** -- Block size of the cache; defaults to devices' logical block size
- **force** -- Overwrite existing BCache sets
- **attach** -- Attach all existing backend devices immediately

salt.modules.bcache.**config**(*dev=None*, ***kwargs*)

Show or update config of a bcache device.

If no device is given, operate on the cache set itself.

CLI example:

```
salt '*' bcache.config
salt '*' bcache.config bcache1
salt '*' bcache.config errors=panic journal_delay_ms=150
salt '*' bcache.config bcache1 cache_mode=writeback writeback_percent=15
```

Returns config or True/False

salt.modules.bcache.**detach**(*dev=None*)

Detach a backing device(s) from a cache set If no dev is given, all backing devices will be attached.

Detaching a backing device will flush it's write cache. This should leave the underlying device in a consistent state, but might take a while.

CLI example:

```
salt '*' bcache.detach sdc
salt '*' bcache.detach bcache1
```

salt.modules.bcache.**device**(*dev*, *stats=False*, *config=False*, *internals=False*, *superblock=False*)

Check the state of a single bcache device

CLI example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc stats=True
```

Parameters

- **stats** -- include statistics
- **settings** -- include all settings
- **internals** -- include all internals
- **superblock** -- include superblock info

salt.modules.bcache.**start**()

Trigger a start of the full bcache system through udev.

CLI example:

```
salt '*' bcache.start
```

salt.modules.bcache.**status**(*stats=False*, *config=False*, *internals=False*, *superblock=False*, *alldevs=False*)

Show the full status of the BCache system and optionally all it's involved devices

CLI example:

```
salt '*' bcache.status
salt '*' bcache.status stats=True
salt '*' bcache.status internals=True alldevs=True
```

Parameters

- **stats** -- include statistics
- **config** -- include settings
- **internals** -- include internals
- **superblock** -- include superblock

salt.modules.bcache.**stop**(*dev=None*)

Stop a bcache device If no device is given, all backing devices will be detached from the cache, which will subsequently be stopped.

Warning: `Stop' on an individual backing device means hard-stop; no attempt at flushing will be done and the bcache device will seemingly `disappear' from the device lists

CLI example:

```
salt '*' bcache.stop
```

salt.modules.bcache.**super**(*dev*)
Read out BCache SuperBlock

CLI example:

```
salt '*' bcache.device bcache0
salt '*' bcache.device /dev/sdc
```

salt.modules.bcache.**uuid**(*dev=None*)
Return the bcache UUID of a block device. If no device is given, the Cache UUID is returned.

CLI example:

```
salt '*' bcache.uuid
salt '*' bcache.uuid /dev/sda
salt '*' bcache.uuid bcache0
```

19.9.23 salt.modules.beacons

Module for managing the Salt beacons on a minion

New in version 2015.8.0.

salt.modules.beacons.**add**(*name*, *beacon_data*, ***kwargs*)
Add a beacon on the minion

Parameters

- **name** -- Name of the beacon to configure
- **beacon_data** -- Dictionary or list containing configuration for beacon.

Returns Boolean and status message on success or failure of add.

CLI Example:

```
salt '*' beacons.add ps "{'salt-master': 'stopped', 'apache2': 'stopped'}"
```

salt.modules.beacons.**delete**(*name*, ***kwargs*)
Delete a beacon item

Parameters **name** -- Name of the beacon to delete

Returns Boolean and status message on success or failure of delete.

CLI Example:

```
salt '*' beacons.delete ps

salt '*' beacons.delete load
```

salt.modules.beacons.**disable**(***kwargs*)
Disable all beaconsd jobs on the minion

Returns Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable
```

salt.modules.beacons.**disable_beacon**(*name*, ***kwargs*)

Disable beacon on the minion

Name Name of the beacon to disable.

Returns Boolean and status message on success or failure of disable.

CLI Example:

```
salt '*' beacons.disable_beacon ps
```

salt.modules.beacons.**enable**(***kwargs*)

Enable all beacons on the minion

Returns Boolean and status message on success or failure of enable.

CLI Example:

```
salt '*' beacons.enable
```

salt.modules.beacons.**enable_beacon**(*name*, ***kwargs*)

Enable beacon on the minion

Name Name of the beacon to enable.

Returns Boolean and status message on success or failure of enable.

CLI Example:

```
salt '*' beacons.enable_beacon ps
```

salt.modules.beacons.**list**(*return_yaml=True*, *include_pillar=True*, *include_opts=True*)

List the beacons currently configured on the minion

Parameters

- **return_yaml** -- Whether to return YAML formatted output, default True
- **include_pillar** -- Whether to include beacons that are configured in pillar, default is True.
- **include_opts** -- Whether to include beacons that are configured in opts, default is True.

Returns List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list
```

salt.modules.beacons.**list_available**(*return_yaml=True*)

List the beacons currently available on the minion

Parameters **return_yaml** -- Whether to return YAML formatted output, default True

Returns List of currently configured Beacons.

CLI Example:

```
salt '*' beacons.list_available
```

salt.modules.beacons.**modify**(*name*, *beacon_data*, ***kwargs*)

Modify an existing beacon

Parameters

- **name** -- Name of the beacon to configure
- **beacon_data** -- Dictionary or list containing updated configuration for beacon.

Returns Boolean and status message on success or failure of modify.

CLI Example:

```
salt '*' beacons.modify ps "{'salt-master': 'stopped', 'apache2': 'stopped'}"
```

salt.modules.beacons.**save**()

Save all beacons on the minion

Returns Boolean and status message on success or failure of save.

CLI Example:

```
salt '*' beacons.save
```

19.9.24 salt.modules.bigip

An execution module which can manipulate an f5 bigip via iControl REST

maturity develop

platform f5_bigip_11.6

salt.modules.bigip.**add_pool_member**(*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and add a new member to an existing pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

member The name of the member to add i.e. 10.1.1.2:80

CLI Example:

```
salt '*' bigip.add_pool_members bigip admin admin my-pool 10.2.2.1:80
```

salt.modules.bigip.**commit_transaction**(*hostname*, *username*, *password*, *label*)

A function to connect to a bigip device and commit an existing transaction.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

label the label of this transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.commit_transaction bigip admin admin my_transaction
```

salt.modules.bigip.**create_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)

A function to connect to a bigip device and create a monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

CLI Example:

```
salt '*' bigip.create_monitor bigip admin admin http my-http-monitor timeout=10
↪interval=5
```

salt.modules.bigip.**create_node**(*hostname*, *username*, *password*, *name*, *address*, *trans_label=None*)

A function to connect to a bigip device and create a node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node

address The address of the node

trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.create_node bigip admin admin 10.1.1.2
```

salt.modules.bigip.**create_pool**(*hostname*, *username*, *password*, *name*, *members=None*, *allow_nat=None*, *allow_snat=None*, *description=None*, *gateway_failsafe_device=None*, *ignore_persisted_weight=None*, *ip_tos_to_client=None*, *ip_tos_to_server=None*, *link_qos_to_client=None*, *link_qos_to_server=None*, *load_balancing_mode=None*, *min_active_members=None*, *min_up_members=None*, *min_up_members_action=None*, *min_up_members_checking=None*, *monitor=None*, *profiles=None*, *queue_depth_limit=None*, *queue_on_connection_limit=None*, *queue_time_limit=None*, *reselect_tries=None*, *service_down_action=None*, *slow_ramp_time=None*)

A function to connect to a bigip device and create a pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to create.

members List of comma delimited pool members to add to the pool. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80

allow_nat [yes | no]

allow_snat [yes | no]

description [string]

gateway_failsafe_device [string]

ignore_persisted_weight [enabled | disabled]

ip_tos_to_client [pass-through | [integer]]

ip_tos_to_server [pass-through | [integer]]

link_qos_to_client [pass-through | [integer]]

link_qos_to_server [pass-through | [integer]]

load_balancing_mode [dynamic-ratio-member | dynamic-ratio-node | fastest-app-response | fastest-node | least-connections-members | least-connections-node | least-sessions | observed-member | observed-node | predictive-member | predictive-node | ratio-least-connections-member | ratio-least-connections-node | ratio-member | ratio-node | ratio-session | round-robin | weighted-least-connections-member | weighted-least-connections-node]

min_active_members [integer]

min_up_members [integer]

min_up_members_action [failover | reboot | restart-all]

min_up_members_checking [enabled | disabled]

monitor [name]

profiles [none | profile_name]

queue_depth_limit [integer]

queue_on_connection_limit [enabled | disabled]

queue_time_limit [integer]

reselect_tries [integer]

service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]
CLI Example:

```
salt '*' bigip.create_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.
↪1.3:80 monitor=http
```

salt.modules.bigip.**create_profile**(*hostname*, *username*, *password*, *profile_type*, *name*, ***kwargs*)

A function to connect to a bigip device and create a profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs `[ arg=val ] ... [arg=key1:val1,key2:val2] ...`

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists [i,i,i]: `param='item1,item2,item3'`

Dictionary [k:v,k:v,k,v]: `param='key-1:val-1,key-2:val2,key-3:va-3'`

List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]: `param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'`

JSON: 'j{ ... }j': `cert-key-chain='j{ "default": { "cert": "default.crt","chain": "default.crt","key": "default.key" } }j'`

Escaping Delimiters: Use `\,` or `\:` or `\|` to escape characters which shouldn't be treated as delimiters i.e. `ciphers='DEFAULT\:!SSLv3'`

CLI Examples:

```
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http'
salt '*' bigip.create_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http' \
   enforcement=maxHeaderCount:3200,maxRequests:10
```

salt.modules.bigip.**create_virtual**(*hostname*, *username*, *password*, *name*, *destination*, *pool=None*, *address_status=None*, *auto_lasthop=None*, *bwc_policy=None*, *cmp_enabled=None*, *connection_limit=None*, *dhcp_relay=None*, *description=None*, *fallback_persistence=None*, *flow_eviction_policy=None*, *gtm_score=None*, *ip_forward=None*, *ip_protocol=None*, *internal=None*, *twelve_forward=None*, *last_hop_pool=None*, *mask=None*, *mirror=None*, *nat64=None*, *persist=None*, *profiles=None*, *policies=None*, *rate_class=None*, *rate_limit=None*, *rate_limit_mode=None*, *rate_limit_dst=None*, *rate_limit_src=None*, *rules=None*, *related_rules=None*, *reject=None*, *source=None*, *source_address_translation=None*, *source_port=None*, *state=None*, *traffic_classes=None*, *translate_address=None*, *translate_port=None*, *vlans=None*)

A function to connect to a bigip device and create a virtual server.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create
destination [[virtual_address_name:port] | [ipv4:port] | [ipv6.port]]
pool [[pool_name] | none]
address_status [yes | no]
auto_lasthop [default | enabled | disabled]

CLI Examples:

```
salt '*' bigip.create_virtual bigip admin admin my-virtual-3 26.2.2.5:80 \
    pool=my-http-pool-http profiles=http,tcp

salt '*' bigip.create_virtual bigip admin admin my-virtual-3 43.2.2.5:80 \
    pool=test-http-pool-http profiles=http,websecurity persist=cookie,hash \
    policies=asm_auto_l7_policy__http-virtual \
```

```
    rules=_sys_APM_ExchangeSupport_helper,_sys_https_redirect \
    related_rules=_sys_APM_activesync,_sys_APM_ExchangeSupport_helper \
    source_address_translation=snat:my-snat-pool \
    translate_address=enabled translate_port=enabled \
    traffic_classes=my-class,other-class \
    vlans=enabled:external,internal
```

salt.modules.bigip.**delete_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*)

A function to connect to a bigip device and delete an existing monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to delete

name The name of the monitor to delete

CLI Example:

```
salt '*' bigip.delete_monitor bigip admin admin http my-http-monitor
```

salt.modules.bigip.**delete_node**(*hostname*, *username*, *password*, *name*, *trans_label=None*)

A function to connect to a bigip device and delete a specific node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node which will be deleted.

trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-node
```

salt.modules.bigip.**delete_pool**(*hostname*, *username*, *password*, *name*)

A function to connect to a bigip device and delete a specific pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool which will be deleted

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-pool
```

salt.modules.bigip.**delete_pool_member**(*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and delete a specific pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

member The name of the pool member to delete

CLI Example:

```
salt '*' bigip.delete_node bigip admin admin my-pool 10.2.2.2:80
```

salt.modules.bigip.**delete_profile**(*hostname*, *username*, *password*, *profile_type*, *name*)

A function to connect to a bigip device and delete an existing profile.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to delete
name The name of the profile to delete
CLI Example:

```
salt '*' bigip.delete_profile bigip admin admin http my-http-profile
```

salt.modules.bigip.**delete_transaction**(*hostname*, *username*, *password*, *label*)
A function to connect to a bigip device and delete an existing transaction.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
label The label of this transaction stored within the grain: `bigip_f5_trans:<label>`
CLI Example:

```
salt '*' bigip.delete_transaction bigip admin admin my_transaction
```

salt.modules.bigip.**delete_virtual**(*hostname*, *username*, *password*, *name*)
A function to connect to a bigip device and delete a specific virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to delete
CLI Example:

```
salt '*' bigip.delete_virtual bigip admin admin my-virtual
```

salt.modules.bigip.**list_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name=None*)
A function to connect to a bigip device and list an existing monitor. If no name is provided than all monitors of the specified type will be listed.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor(s) to list
name The name of the monitor to list
CLI Example:

```
salt '*' bigip.list_monitor bigip admin admin http my-http-monitor
```

salt.modules.bigip.**list_node**(*hostname*, *username*, *password*, *name=None*, *trans_label=None*)
A function to connect to a bigip device and list all nodes or a specific node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to list. If no name is specified than all nodes will be listed.
trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`
CLI Example:

```
salt '*' bigip.list_node bigip admin admin my-node
```

salt.modules.bigip.**list_pool**(*hostname*, *username*, *password*, *name=None*)
A function to connect to a bigip device and list all pools or a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to list. If no name is specified then all pools will be listed.

CLI Example:

```
salt '*' bigip.list_pool bigip admin admin my-pool
```

salt.modules.bigip.**list_profile**(*hostname*, *username*, *password*, *profile_type*, *name=None*)

A function to connect to a bigip device and list an existing profile. If no name is provided than all profiles of the specified type will be listed.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile(s) to list
name The name of the profile to list
CLI Example:

```
salt '*' bigip.list_profile bigip admin admin http my-http-profile
```

salt.modules.bigip.**list_transaction**(*hostname*, *username*, *password*, *label*)

A function to connect to a bigip device and list an existing transaction.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
label the label of this transaction stored within the grain: `bigip_f5_trans:<label>`
CLI Example:

```
salt '*' bigip.list_transaction bigip admin admin my_transaction
```

salt.modules.bigip.**list_virtual**(*hostname*, *username*, *password*, *name=None*)

A function to connect to a bigip device and list all virtuals or a specific virtual.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to list. If no name is specified than all virtuals will be listed.
CLI Example:

```
salt '*' bigip.list_virtual bigip admin admin my-virtual
```

salt.modules.bigip.**modify_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)

A function to connect to a bigip device and modify an existing monitor.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to modify
name The name of the monitor to modify
kwargs Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.
CLI Example:

```
salt '*' bigip.modify_monitor bigip admin admin http my-http-monitor  timout=16
↪interval=6
```

salt.modules.bigip.**modify_node**(*hostname*, *username*, *password*, *name*, *connection_limit=None*, *description=None*, *dynamic_ratio=None*, *logging=None*, *monitor=None*, *rate_limit=None*, *ratio=None*, *session=None*, *state=None*, *trans_label=None*)

A function to connect to a bigip device and modify an existing node.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to modify
connection_limit [integer]
description [string]
dynamic_ratio [integer]
logging [enabled | disabled]
monitor [[name] | none | default]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
state [user-down | user-up]
trans_label The label of the transaction stored within the grain: `bigip_f5_trans:<label>`
CLI Example:

```
salt '*' bigip.modify_node bigip admin admin 10.1.1.2 ratio=2 logging=enabled
```

salt.modules.bigip.**modify_pool**(*hostname*, *username*, *password*, *name*, *allow_nat=None*, *allow_snat=None*, *description=None*, *gateway_failsafe_device=None*, *ignore_persisted_weight=None*, *ip_tos_to_client=None*, *ip_tos_to_server=None*, *link_qos_to_client=None*, *link_qos_to_server=None*, *load_balancing_mode=None*, *min_active_members=None*, *min_up_members=None*, *min_up_members_action=None*, *min_up_members_checking=None*, *monitor=None*, *profiles=None*, *queue_depth_limit=None*, *queue_on_connection_limit=None*, *queue_time_limit=None*, *reselect_tries=None*, *service_down_action=None*, *slow_ramp_time=None*)

A function to connect to a bigip device and modify an existing pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify.
allow_nat [yes | no]
allow_snat [yes | no]
description [string]

queue_depth_limit [integer]
queue_time_limit [integer]
reselect_tries [integer]
service_down_action [drop | none | reselect | reset]
slow_ramp_time [integer]
CLI Example:

```
salt '*' bigip.modify_pool bigip admin admin my-pool 10.1.1.1:80,10.1.1.2:80,10.1.
↪1.3:80 min_active_members=1
```

salt.modules.bigip.**modify_pool_member**(*hostname*, *username*, *password*, *name*, *member*, *connection_limit=None*, *description=None*, *dynamic_ratio=None*, *inherit_profile=None*, *logging=None*, *monitor=None*, *priority_group=None*, *profiles=None*, *rate_limit=None*, *ratio=None*, *session=None*, *state=None*)

A function to connect to a bigip device and modify an existing member of a pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The name of the member to modify i.e. 10.1.1.2:80
connection_limit [integer]
description [string]
dynamic_ratio [integer]
inherit_profile [enabled | disabled]
logging [enabled | disabled]
monitor [name]
priority_group [integer]
profiles [none | profile_name]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
state [user-up | user-down]
CLI Example:

```
salt '*' bigip.modify_pool_member bigip admin admin my-pool 10.2.2.1:80 state=use-
↪down session=user-disabled
```

salt.modules.bigip.**modify_profile**(*hostname*, *username*, *password*, *profile_type*, *name*, ***kwargs*)

A function to connect to a bigip device and create a profile.

A function to connect to a bigip device and create a profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs `[ arg=val ] ... [arg=key1:val1,key2:val2] ...`

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

Creating Complex Args

Profiles can get pretty complicated in terms of the amount of possible config options. Use the following shorthand to create complex arguments such as lists, dictionaries, and lists of dictionaries. An option is also provided to pass raw json as well.

lists [i,i,i]: `param='item1,item2,item3'`

Dictionary [k:v,k:v,k,v]: `param='key-1:val-1,key-2:val2,key-3:va-3'`

List of Dictionaries [k:v,k:v|k:v,k:v|k:v,k:v]: `param='key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2|key-1:val-1,key-2:val-2'`

JSON: 'j{ ... }j': `cert-key-chain='j{ "default": { "cert": "default.crt","chain": "default.crt","key": "default.key" } }j'`

Escaping Delimiters: Use `\,` or `\:` or `\|` to escape characters which shouldn't be treated as delimiters i.e. `ciphers='DEFAULT\:!SSLv3'`

CLI Examples:

```
salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http'

salt '*' bigip.modify_profile bigip admin admin http my-http-profile defaultsFrom=
↪'/Common/http' \
   enforcement=maxHeaderCount:3200,maxRequests:10

salt '*' bigip.modify_profile bigip admin admin client-ssl my-client-ssl-1
↪retainCertificate=false \
   ciphers='DEFAULT\:!SSLv3'
   cert_key_chain='j{ "default": { "cert": "default.crt", "chain": "default.crt
↪", "key": "default.key" } }j'
```

salt.modules.bigip.**modify_virtual**(*hostname*, *username*, *password*, *name*, *destination=None*, *pool=None*, *address_status=None*, *auto_lasthop=None*, *bwc_policy=None*, *cmp_enabled=None*, *connection_limit=None*, *dhcp_relay=None*, *description=None*, *fallback_persistence=None*, *flow_eviction_policy=None*, *gtm_score=None*, *ip_forward=None*, *ip_protocol=None*, *internal=None*, *twelve_forward=None*, *last_hop_pool=None*, *mask=None*, *mirror=None*, *nat64=None*, *persist=None*, *profiles=None*, *policies=None*, *rate_class=None*, *rate_limit=None*, *rate_limit_mode=None*, *rate_limit_dst=None*, *rate_limit_src=None*, *rules=None*, *related_rules=None*, *reject=None*, *source=None*, *source_address_translation=None*, *source_port=None*, *state=None*, *traffic_classes=None*, *translate_address=None*, *translate_port=None*, *vlans=None*)

A function to connect to a bigip device and modify an existing virtual server.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to modify
destination [[virtual_address_name:port] | [ipv4:port] | [ipv6.port]]
pool [[pool_name] | none]

related_rules [none | [rule_one,rule_two ...]]
reject [yes | no]
source { [ipv4[/prefixlen]] | [ipv6[/prefixlen]] }
source_address_translation [none | snat:pool_name | lsn | automap]
source_port [change | preserve | preserve-strict]
state [enabled | disable]
traffic_classes [none | default | class_one,class_two ...]
translate_address [enabled | disabled]
translate_port [enabled | disabled]
vlans [none | default | [enabled|disabled]:vlan1,vlan2,vlan3 ...]
CLI Example:

```
salt '*' bigip.modify_virtual bigip admin admin my-virtual source_address_
↪translation=none
salt '*' bigip.modify_virtual bigip admin admin my-virtual rules=my-rule,my-other-
↪rule
```

salt.modules.bigip.**replace_pool_members**(*hostname*, *username*, *password*, *name*, *members*)
A function to connect to a bigip device and replace members of an existing pool with new members.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members List of comma delimited pool members to replace existing members with. i.e. 10.1.1.1:80,10.1.1.2:80,10.1.1.3:80
CLI Example:

```
salt '*' bigip.replace_pool_members bigip admin admin my-pool 10.2.2.1:80,10.2.2.
↪2:80,10.2.2.3:80
```

salt.modules.bigip.**start_transaction**(*hostname*, *username*, *password*, *label*)

A function to connect to a bigip device and start a new transaction.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
label The name / alias for this transaction. The actual transaction id will be stored within a grain called `bigip_f5_trans:<label>`
CLI Example:

```
salt '*' bigip.start_transaction bigip admin admin my_transaction
```

19.9.25 salt.modules.blockdev

Module for managing block devices

New in version 2014.7.0.

Deprecated since version 2016.11.0: Merged to *disk* module

salt.modules.blockdev.**format**(*device*, *fs_type='ext4'*, *inode_size=None*, *lazy_itable_init=None*, *force=False*)
Format a filesystem onto a block device

New in version 2015.8.2.

Deprecated since version 2016.11.0.
device The block device in which to create the new filesystem
fs_type The type of filesystem to create
inode_size Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_itable_init If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.
CLI Example:

```
salt '*' blockdev.format /dev/sdX1
```

salt.modules.blockdev.**fstype**(*device*)
Return the filesystem name of a block device

New in version 2015.8.2.

Deprecated since version 2016.11.0.
device The name of the block device
CLI Example:

```
salt '*' blockdev.fstype /dev/sdX1
```

19.9.26 salt.modules.bluez

Support for Bluetooth (using BlueZ in Linux).

The following packages are required packages for this module:

bluez >= 5.7 bluez-libs >= 5.7 bluez-utils >= 5.7 pybluez >= 0.18

`salt.modules.bluez.`**`address`**`()`
Get the many addresses of the Bluetooth adapter

CLI Example:

```
salt '*' bluetooth.address
```

`salt.modules.bluez.`**`block`**`(`*bdaddr*`)`
Block a specific bluetooth device by BD Address

CLI Example:

```
salt '*' bluetooth.block DE:AD:BE:EF:CA:FE
```

`salt.modules.bluez.`**`discoverable`**`(`*dev*`)`
Enable this bluetooth device to be discoverable.

CLI Example:

```
salt '*' bluetooth.discoverable hci0
```

`salt.modules.bluez.`**`noscan`**`(`*dev*`)`
Turn off scanning modes on this device.

CLI Example:

```
salt '*' bluetooth.noscan hci0
```

`salt.modules.bluez.`**`pair`**`(`*address*, *key*`)`
Pair the bluetooth adapter with a device

CLI Example:

```
salt '*' bluetooth.pair DE:AD:BE:EF:CA:FE 1234
```

Where DE:AD:BE:EF:CA:FE is the address of the device to pair with, and 1234 is the passphrase.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

`salt.modules.bluez.`**`power`**`(`*dev*, *mode*`)`
Power a bluetooth device on or off

CLI Examples:

```
salt '*' bluetooth.power hci0 on
salt '*' bluetooth.power hci0 off
```

`salt.modules.bluez.`**`scan`**`()`
Scan for bluetooth devices in the area

CLI Example:

```
salt '*' bluetooth.scan
```

salt.modules.bluez.**start**()
Start the bluetooth service.

CLI Example:

```
salt '*' bluetooth.start
```

salt.modules.bluez.**stop**()
Stop the bluetooth service.

CLI Example:

```
salt '*' bluetooth.stop
```

salt.modules.bluez.**unblock**(*bdaddr*)
Unblock a specific bluetooth device by BD Address

CLI Example:

```
salt '*' bluetooth.unblock DE:AD:BE:EF:CA:FE
```

salt.modules.bluez.**unpair**(*address*)
Unpair the bluetooth adapter from a device

CLI Example:

```
salt '*' bluetooth.unpair DE:AD:BE:EF:CA:FE
```

Where DE:AD:BE:EF:CA:FE is the address of the device to unpair.

TODO: This function is currently broken, as the bluez-simple-agent program no longer ships with BlueZ >= 5.0. It needs to be refactored.

salt.modules.bluez.**version**()
Return Bluez version from bluetoothd -v

CLI Example:

```
salt '*' bluetoothd.version
```

19.9.27 salt.modules.boto3_elasticache module

Execution module for Amazon Elasticache using boto3

New in version 2017.7.0.

configuration This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

salt.modules.boto3_elasticache.**add_tags_to_resource**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Add tags to an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
salt myminion boto3_elasticache.add_tags_to_resource                    name'=arn:aws:
 ↪elasticache:us-west-2:0123456789:snapshot:mySnapshot'                    Tags="[{
 ↪'Key': 'TeamOwner', 'Value': 'infrastructure'}]"
```

salt.modules.boto3_elasticache.**authorize_cache_security_group_ingress**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Authorize network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.authorize_cache_security_group_ingress                 
 ↪                              mycachesecgrp                                          
 ↪EC2SecurityGroupName=someEC2sg                                                
 ↪EC2SecurityGroupOwnerId=SOMEOWNERID
```

salt.modules.boto3_elasticache.**cache_cluster_exists**(*name*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a cache cluster exists.

Example:

```
salt myminion boto3_elasticache.cache_cluster_exists myelasticache
```

salt.modules.boto3_elasticache.**cache_security_group_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache security group exists.

Example:

```
salt myminion boto3_elasticache.cache_security_group_exists mysecuritygroup
```

salt.modules.boto3_elasticache.**cache_subnet_group_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache subnet group exists.

Example:

```
salt myminion boto3_elasticache.cache_subnet_group_exists my-subnet-group
```

salt.modules.boto3_elasticache.**copy_snapshot**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Make a copy of an existing snapshot.

Example:

```
salt myminion boto3_elasticache.copy_snapshot name=mySnapshot
 ↪                                  TargetSnapshotName=copyOfMySnapshot
```

salt.modules.boto3_elasticache.**create_cache_cluster**(*name*, *wait=600*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a cache cluster.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster
 ↪                                              Engine=redis
 ↪                                       CacheNodeType=cache.t2.micro
 ↪                                              NumCacheNodes=1
 ↪                                        SecurityGroupIds='[sg-11223344]'
 ↪
 ↪CacheSubnetGroupName=myCacheSubnetGroup
```

salt.modules.boto3_elasticache.**create_cache_parameter_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a cache parameter group.

Example:

```
salt myminion boto3_elasticache.create_cache_parameter_group
 ↪name=myParamGroup                CacheParameterGroupFamily=redis2.8
 ↪    Description="My Parameter Group"
```

salt.modules.boto3_elasticache.**create_cache_security_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a cache security group.

Example:

```
salt myminion boto3_elasticache.create_cache_security_group mycachesecgrp
 ↪Description='My Cache Security Group'
```

salt.modules.boto3_elasticache.**create_cache_subnet_group**(*name*, *subnets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.create_cache_subnet_group
 ↪                    name=my-subnet-group
 ↪     CacheSubnetGroupDescription="description"
 ↪           subnets='[myVPCSubnet1,myVPCSubnet2]'
```

salt.modules.boto3_elasticache.**create_replication_group**(*name*, *wait=600*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Create a replication group. Params are extensive and variable - see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group for in-depth usage documentation.

Example:

```
salt myminion boto3_elasticache.create_replication_group
 ↪                       name=myelasticache
 ↪          ReplicationGroupDescription=description
```

salt.modules.boto3_elasticache.**delete_cache_cluster**(*name*, *wait=600*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Delete a cache cluster.

Example:

```
salt myminion boto3_elasticache.delete myelasticache
```

salt.modules.boto3_elasticache.**delete_cache_parameter_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Delete a cache parameter group.

Example:

```
salt myminion boto3_elasticache.delete_cache_parameter_group myParamGroup
```

salt.modules.boto3_elasticache.**delete_cache_security_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Delete a cache security group.

Example:

```
salt myminion boto3_elasticache.delete_cache_security_group myelasticachesg
```

salt.modules.boto3_elasticache.**delete_cache_subnet_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Delete an ElastiCache subnet group.

Example:

```
salt myminion boto3_elasticache.delete_subnet_group my-subnet-group region=us-
↪east-1
```

salt.modules.boto3_elasticache.**delete_replication_group**(*name*, *wait=600*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Delete an ElastiCache replication group, optionally taking a snapshot first.

Example:

```
salt myminion boto3_elasticache.delete_replication_group my-replication-group
```

salt.modules.boto3_elasticache.**describe_cache_clusters**(*name=None*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_clusters
salt myminion boto3_elasticache.describe_cache_clusters myelasticache
```

salt.modules.boto3_elasticache.**describe_cache_parameter_groups**(*name=None*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_parameter_groups
salt myminion boto3_elasticache.describe_cache_parameter_groups myParameterGroup
```

salt.modules.boto3_elasticache.**describe_cache_security_groups**(*name=None*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return details about all (or just one) Elasticache cache clusters.

Example:

```
salt myminion boto3_elasticache.describe_cache_security_groups
salt myminion boto3_elasticache.describe_cache_security_groups mycachesecgrp
```

salt.modules.boto3_elasticache.**describe_cache_subnet_groups**(*name=None*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_cache_subnet_groups region=us-east-1
```

salt.modules.boto3_elasticache.**describe_replication_groups**(*name=None*, *conn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return details about all (or just one) Elasticache replication groups.

Example:

```
salt myminion boto3_elasticache.describe_replication_groups
salt myminion boto3_elasticache.describe_replication_groups myelasticache
```

salt.modules.boto3_elasticache.**list_cache_subnet_groups**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all cache subnet group names

Example:

```
salt myminion boto3_elasticache.list_cache_subnet_groups region=us-east-1
```

salt.modules.boto3_elasticache.**list_tags_for_resource**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

List tags on an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those handy, feel free to utilize this however...

Example:

```
salt myminion boto3_elasticache.list_tags_for_resource                    name'=arn:
↪aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'
```

salt.modules.boto3_elasticache.**modify_cache_cluster**(*name*, *wait=600*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Update a cache cluster in place.

Notes: {ApplyImmediately: False} is pretty danged silly in the context of salt. You can pass it, but for fairly obvious reasons the results over multiple runs will be undefined and probably contrary to your desired state. Reducing the number of nodes requires an EXPLICIT CacheNodeIdsToRemove be passed, which until a reasonable heuristic for programmatically deciding which nodes to remove has been established, MUST be decided and populated intentionally before a state call, and removed again before the next. In practice this is not particularly useful and should probably be avoided.

Example:

```
salt myminion boto3_elasticache.create_cache_cluster name=myCacheCluster          
↪                                                NotificationTopicStatus=inactive
```

salt.modules.boto3_elasticache.**modify_cache_subnet_group**(*name*, *subnets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Modify an ElastiCache subnet group

Example:

```
salt myminion boto3_elasticache.modify_cache_subnet_group                         
↪                    name=my-subnet-group                                         
↪     subnets='[myVPCSubnet3]'
```

salt.modules.boto3_elasticache.**modify_replication_group**(*name*, *wait=600*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Modify a replication group.

Example:

```
salt myminion boto3_elasticache.modify_replication_group                          
↪                         name=myelasticache                                      
↪          ReplicationGroupDescription=newDescription
```

salt.modules.boto3_elasticache.**remove_tags_from_resource**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Remove tags from an Elasticache resource.

Note that this function is essentially useless as it requires a full AWS ARN for the resource being operated on, but there is no provided API or programmatic way to find the ARN for a given object from its name or ID alone. It requires specific knowledge about the account number, AWS partition, and other magic details to generate.

If you happen to have those at hand though, feel free to utilize this function...

Example:

```
salt myminion boto3_elasticache.remove_tags_from_resource                    name
 ↪'=arn:aws:elasticache:us-west-2:0123456789:snapshot:mySnapshot'             
 ↪TagKeys="['TeamOwner']"
```

salt.modules.boto3_elasticache.**replication_group_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a replication group exists.

Example:

```
salt myminion boto3_elasticache.replication_group_exists myelasticache
```

salt.modules.boto3_elasticache.**revoke_cache_security_group_ingress**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Revoke network ingress from an ec2 security group to a cache security group.

Example:

```
salt myminion boto3_elasticache.revoke_cache_security_group_ingress          
 ↪                          mycachesecgrp                                     
 ↪EC2SecurityGroupName=someEC2sg                                              
 ↪EC2SecurityGroupOwnerId=SOMEOWNERID
```

19.9.28 salt.modules.boto3_route53 module

Execution module for Amazon Route53 written against Boto 3

New in version 2017.7.0.

configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
 ↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

Note that Route53 essentially ignores all (valid) settings for `region', since there is only one Endpoint (in us-east-1 if you care) and any (valid) region setting will just send you there. It is entirely safe to set it to None as well.

depends boto3

salt.modules.boto3_route53.**associate_vpc_with_hosted_zone**(*HostedZoneId=None*, *Name=None*, *VPCId=None*, *VPCName=None*, *VPCRegion=None*, *Comment=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Associates an Amazon VPC with a private hosted zone.

To perform the association, the VPC and the private hosted zone must already exist. You can't convert a public hosted zone into a private hosted zone. If you want to associate a VPC from one AWS account with a zone from a another, the AWS account owning the hosted zone must first submit a CreateVPCAssociationAuthorization (using create_vpc_association_authorization() or by other means, such as the AWS console). With that done, the account owning the VPC can then call associate_vpc_with_hosted_zone() to create the association.

Note that if both sides happen to be within the same account, associate_vpc_with_hosted_zone() is enough on its own, and there is no need for the CreateVPCAssociationAuthorization step.

Also note that looking up hosted zones by name (e.g. using the Name parameter) only works within a single account - if you're associating a VPC to a zone in a different account, as outlined above, you unfortunately MUST use the HostedZoneId parameter exclusively.

HostedZoneId The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

VPCName When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

VPCRegion When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

Comment Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.associate_vpc_with_hosted_zone
 ↪Name=example.org. VPCName=myVPC VPCRegion=us-east-1 Comment=
 ↪"Whoo-hoo!  I added another VPC."
```

salt.modules.boto3_route53.**change_resource_record_sets**(*HostedZoneId=None*, *Name=None*, *PrivateZone=None*, *ChangeBatch=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

See the AWS Route53 API docs as well as the Boto3 documentation for all the details...

The syntax for a ChangeBatch parameter is as follows, but note that the permutations of allowed parameters

and combinations thereof are quite varied, so perusal of the above linked docs is highly recommended for any non-trival configurations.

```
{
    "Comment": "string",
    "Changes": [
        {
            "Action": "CREATE"|"DELETE"|"UPSERT",
            "ResourceRecordSet": {
                "Name": "string",
                "Type": "SOA"|"A"|"TXT"|"NS"|"CNAME"|"MX"|"NAPTR"|"PTR"|"SRV"|"SPF
↪"|"AAAA",
                "SetIdentifier": "string",
                "Weight": 123,
                "Region": "us-east-1"|"us-east-2"|"us-west-1"|"us-west-2"|"ca-
↪central-1"|"eu-west-1"|"eu-west-2"|"eu-central-1"|"ap-southeast-1"|"ap-
↪southeast-2"|"ap-northeast-1"|"ap-northeast-2"|"sa-east-1"|"cn-north-1"|"ap-
↪south-1",
                "GeoLocation": {
                    "ContinentCode": "string",
                    "CountryCode": "string",
                    "SubdivisionCode": "string"
                },
                "Failover": "PRIMARY"|"SECONDARY",
                "TTL": 123,
                "ResourceRecords": [
                    {
                        "Value": "string"
                    },
                ],
                "AliasTarget": {
                    "HostedZoneId": "string",
                    "DNSName": "string",
                    "EvaluateTargetHealth": True|False
                },
                "HealthCheckId": "string",
                "TrafficPolicyInstanceId": "string"
            }
        },
    ]
}
```

CLI Example:

```
foo='{
       "Name": "my-cname.example.org.",
       "TTL": 600,
       "Type": "CNAME",
       "ResourceRecords": [
         {
           "Value": "my-host.example.org"
         }
       ]
     }'
foo=`echo $foo`  # Remove newlines
salt myminion boto3_route53.change_resource_record_sets DomainName=example.org.  
↪               keyid=A1234567890ABCDEF123 key=xblahblahblah                     
↪ChangeBatch="{'Changes': [{'Action': 'UPSERT', 'ResourceRecordSet': $foo}]}"
```

salt.modules.boto3_route53.**create_hosted_zone**(*Name*, *VPCId=None*, *VPCName=None*, *VPCRegion=None*, *CallerReference=None*, *Comment=''*, *PrivateZone=False*, *DelegationSetId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

VPCId When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName. Ignored if passed for a non-private zone.

VPCName When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId. Ignored if passed for a non-private zone.

VPCRegion When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

CallerReference A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This is a required parameter when creating new Hosted Zones. Maximum length of 128.

Comment Any comments you want to include about the hosted zone.

PrivateZone Boolean - Set to True if creating a private hosted zone.

DelegationSetId If you want to associate a reusable delegation set with this hosted zone, the ID that Amazon Route 53 assigned to the reusable delegation set when you created it. Note that XXX TODO create_delegation_set() is not yet implemented, so you'd need to manually create any delegation sets before utilizing this.

region Region endpoint to connect to.

key AWS key to bind with.

keyid AWS keyid to bind with.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.create_hosted_zone example.org.
```

salt.modules.boto3_route53.**delete_hosted_zone**(*Id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone.

CLI Example:

```
salt myminion boto3_route53.delete_hosted_zone Z1234567890
```

salt.modules.boto3_route53.**delete_hosted_zone_by_domain**(*Name*, *PrivateZone=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone by domain name, and PrivateZone status if provided.

CLI Example:

```
salt myminion boto3_route53.delete_hosted_zone_by_domain example.org.
```

salt.modules.boto3_route53.**disassociate_vpc_from_hosted_zone**(*HostedZoneId=None*, *Name=None*, *VPCId=None*, *VPCName=None*, *VPCRegion=None*, *Comment=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disassociates an Amazon VPC from a private hosted zone.

You can't disassociate the last VPC from a private hosted zone. You also can't convert a private hosted zone into a public hosted zone.

Note that looking up hosted zones by name (e.g. using the Name parameter) only works XXX FACTCHECK within a single AWS account - if you're disassociating a VPC in one account from a hosted zone in a different account you unfortunately MUST use the HostedZoneId parameter exclusively. XXX FIXME DOCU

HostedZoneId The unique Zone Identifier for the Hosted Zone.

Name The domain name associated with the Hosted Zone(s).

VPCId When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

VPCName When working with a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

VPCRegion When working with a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. If this fails, you'll need to provide an explicit value for VPCRegion.

Comment Any comments you want to include about the change being made.

CLI Example:

```
salt myminion boto3_route53.disassociate_vpc_from_hosted_zone
↪Name=example.org. VPCName=myVPC VPCRegion=us-east-1 Comment=
↪"Whoops! Don't wanna talk to this-here zone no more."
```

salt.modules.boto3_route53.**find_hosted_zone**(*Id=None*, *Name=None*, *PrivateZone=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Find a hosted zone with the given characteristics.

Id The unique Zone Identifier for the Hosted Zone. Exclusive with Name.

Name The domain name associated with the Hosted Zone. Exclusive with Id. Note this has the potential to match more then one hosted zone (e.g. a public and a private if both exist) which will raise an error unless PrivateZone has also been passed in order split the different.

PrivateZone Boolean - Set to True if searching for a private hosted zone.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.find_hosted_zone Name=salt.org. profile=
↪'{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'
```

salt.modules.boto3_route53.**get_hosted_zone**(*Id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return detailed info about the given zone.

Id The unique Zone Identifier for the Hosted Zone.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.
CLI Example:

```
salt myminion boto3_route53.get_hosted_zone Z1234567690                profile='{
↪"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'
```

salt.modules.boto3_route53.**get_hosted_zones_by_domain**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Find any zones with the given domain name and return detailed info about them. Note that this can return multiple Route53 zones, since a domain name can be used in both public and private zones.
Name The domain name associated with the Hosted Zone(s).
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.
CLI Example:

```
salt myminion boto3_route53.get_hosted_zones_by_domain salt.org.               
↪profile='{"region": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}
↪'
```

salt.modules.boto3_route53.**get_resource_records**(*HostedZoneId=None*, *Name=None*, *StartRecordName=None*, *StartRecordType=None*, *PrivateZone=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all resource records from a given zone matching the provided StartRecordName (if given) or all records in the zone (if not), optionally filtered by a specific StartRecordType. This will return any and all RRs matching, regardless of their special AWS flavors (weighted, geolocation, alias, etc.) so your code should be prepared for potentially large numbers of records back from this function - for example, if you've created a complex geolocation mapping with lots of entries all over the world providing the same server name to many different regional clients.

If you want EXACTLY ONE record to operate on, you'll need to implement any logic required to pick the specific RR you care about from those returned.

Note that if you pass in Name without providing a value for PrivateZone (either True or False), CommandExecutionError can be raised in the case of both public and private zones matching the domain. XXX FIXME DOCU

CLI example:

```
salt myminion boto3_route53.get_records test.example.org example.org A
```

salt.modules.boto3_route53.**list_hosted_zones**(*DelegationSetId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return detailed info about all zones in the bound account.
DelegationSetId If you're using reusable delegation sets and you want to list all of the hosted zones that are associated with a reusable delegation set, specify the ID of that delegation set.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

CLI Example:

```
salt myminion boto3_route53.describe_hosted_zones                profile='{"region
 ↪": "us-east-1", "keyid": "A12345678AB", "key": "xblahblahblah"}'
```

salt.modules.boto3_route53.**update_hosted_zone_comment**(*Id=None*, *Name=None*, *Comment=None*, *PrivateZone=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the comment on an existing Route 53 hosted zone.
Id The unique Zone Identifier for the Hosted Zone.
Name The domain name associated with the Hosted Zone(s).
Comment Any comments you want to include about the hosted zone.
PrivateZone Boolean - Set to True if changing a private hosted zone.
CLI Example:

```
salt myminion boto3_route53.update_hosted_zone_comment Name=example.org.
 ↪       Comment="This is an example comment for an example zone"
```

19.9.29 salt.modules.boto_apigateway module

Connection module for Amazon APIGateway

New in version 2016.11.0.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
 ↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
apigateway.keyid: GKTADJGHEIQSXMKKRBJ08H
apigateway.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
apigateway.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-west-2
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_apigateway*) return:

```
apigateway:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends boto3

salt.modules.boto_apigateway.**activate_api_deployment**(*restApiId*, *stageName*, *deploymentId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Activates previously deployed deployment for a given stage

CLI Example:

```
salt myminion boto_apigateway.activate_api_deployent restApiId stagename
↪deploymentId
```

salt.modules.boto_apigateway.**api_exists**(*name*, *description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if the given Rest API Name and optionlly description exists.

CLI Example:

```
salt myminion boto_apigateway.exists myapi_name
```

salt.modules.boto_apigateway.**api_model_exists**(*restApiId*, *modelName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if the given modelName exists in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.api_model_exists restApiId modelName
```

salt.modules.boto_apigateway.**associate_api_key_stagekeys**(*apiKey*, *stagekeyslist*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

associate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.associate_stagekeys_api_key \
        api_key '["restapi id/stage name", ...]'
```

salt.modules.boto_apigateway.**attach_usage_plan_to_apis**(*plan_id*, *apis*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attaches given usage plan to each of the apis provided in a list of apiId and stage values

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

apiId a string, which is the id of the created API in AWS ApiGateway

stage a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.attach_usage_plan_to_apis plan_id='usage plan id'
 ↪apis='[{"apiId": "some id 1", "stage": "some stage 1"}]'
```

salt.modules.boto_apigateway.**create_api**(*name*, *description*, *cloneFrom=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new REST API Service with the given name

Returns {created: True} if the rest api was created and returns {created: False} if the rest api was not created.

CLI Example:

```
salt myminion boto_apigateway.create_api myapi_name api_description
```

salt.modules.boto_apigateway.**create_api_deployment**(*restApiId*, *stageName*, *stageDescription=''*, *description=''*, *cacheClusterEnabled=False*, *cacheClusterSize='0.5'*, *variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a new API deployment.

CLI Example:

```
salt myminion boto_apigateway.create_api_deployent restApiId stagename
 ↪stageDescription='' \
description='' cacheClusterEnabled=True|False cacheClusterSize=0.5 variables='{
 ↪"name": "value"}'
```

salt.modules.boto_apigateway.**create_api_integration**(*restApiId*, *resourcePath*, *httpMethod*, *integrationType*, *integrationHttpMethod*, *uri*, *credentials*, *requestParameters=None*, *requestTemplates=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates an integration for a given method in a given API. If integrationType is MOCK, uri and credential parameters will be ignored.

uri is in the form of (substitute APIGATEWAY_REGION and LAMBDA_FUNC_ARN) ``arn:aws:apigateway:APIGATEWAY_REGION:lambda:path/2015-03-31/functions/LAMBDA_FUNC_ARN/invocations''

credentials is in the form of an iam role name or role arn.

CLI Example:

```
salt myminion boto_apigateway.create_api_integration restApiId resourcePath
 ↪httpMethod \
                    integrationType integrationHttpMethod uri credentials ['{}' ['
 ↪{}']]
```

salt.modules.boto_apigateway.**create_api_integration_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *selectionPattern*, *responseParameters=None*, *responseTemplates=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.create_api_integration_response restApiId
↪resourcePath httpMethod \
                    statusCode selectionPattern ['{}' ['{}']]
```

salt.modules.boto_apigateway.**create_api_key**(*name*, *description*, *enabled=True*, *stageKeys=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an API key given name and description.

An optional enabled argument can be provided. If provided, the valid values are True|False. This argument defaults to True.

An optional stageKeys argument can be provided in the form of list of dictionary with `restApiId' and `stageName' as keys.

CLI Example:

```
salt myminion boto_apigateway.create_api_key name description

salt myminion boto_apigateway.create_api_key name description enabled=False

salt myminion boto_apigateway.create_api_key name description \
     stageKeys='[{"restApiId": "id", "stageName": "stagename"}]'
```

salt.modules.boto_apigateway.**create_api_method**(*restApiId*, *resourcePath*, *httpMethod*, *authorizationType*, *apiKeyRequired=False*, *requestParameters=None*, *requestModels=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method restApiId resourcePath,
↪httpMethod, authorizationType, \
   apiKeyRequired=False, requestParameters='{"name", "value"}', requestModels='{
↪"content-type", "value"}'
```

salt.modules.boto_apigateway.**create_api_method_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *responseParameters=None*, *responseModels=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create API method response for a method on a given resource in the given API

CLI Example:

```
salt myminion boto_apigateway.create_api_method_response restApiId resourcePath
↪httpMethod \
      statusCode responseParameters='{"name", "True|False"}' responseModels='{
↪"content-type", "model"}'
```

salt.modules.boto_apigateway.**create_api_model**(*restApiId*, *modelName*, *modelDescription*, *schema*, *contentType='application/json'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new model in a given API with a given schema, currently only contentType supported is `application/json'

CLI Example:

```
salt myminion boto_apigateway.create_api_model restApiId modelName
↪modelDescription '<schema>' 'content-type'
```

salt.modules.boto_apigateway.**create_api_resources**(*restApiId*, *path*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given rest api id, and an absolute resource path, create all the resources and return all resources in the resourcepath, returns False on failure.

CLI Example:

```
salt myminion boto_apigateway.create_api_resources myapi_id resource_path
```

salt.modules.boto_apigateway.**create_api_stage**(*restApiId*, *stageName*, *deploymentId*, *description='`*, *cacheClusterEnabled=False*, *cacheClusterSize=`0.5'*, *variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a new API stage for a given restApiId and deploymentId.

CLI Example:

```
salt myminion boto_apigateway.create_api_stage restApiId stagename deploymentId \
    description='' cacheClusterEnabled=True|False cacheClusterSize='0.5'
↪variables='{"name": "value"}'
```

salt.modules.boto_apigateway.**create_usage_plan**(*name*, *description=None*, *throttle=None*, *quota=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a new usage plan with throttling and quotas optionally applied

New in version 2017.7.0.

name Name of the usage plan

throttle A dictionary consisting of the following keys:

rateLimit requests per second at steady rate, float

burstLimit maximum number of requests per second, integer

quota A dictionary consisting of the following keys:

limit number of allowed requests per specified quota period [required if quota parameter is present]

offset number of requests to be subtracted from limit at the beginning of the period [optional]

period quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```
salt myminion boto_apigateway.create_usage_plan name='usage plan name' throttle='{
↪"rateLimit": 10.0, "burstLimit": 10}'
```

salt.modules.boto_apigateway.**delete_api**(*name*, *description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete all REST API Service with the given name and an optional API description

Returns {deleted: True, count: deleted_count} if apis were deleted, and returns {deleted: False} if error or not found.

CLI Example:

```
salt myminion boto_apigateway.delete_api myapi_name

salt myminion boto_apigateway.delete_api myapi_name description='api description'
```

salt.modules.boto_apigateway.**delete_api_deployment**(*restApiId*, *deploymentId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes API deployment for a given restApiId and deploymentID

CLI Example:

```
salt myminion boto_apigateway.delete_api_deployent restApiId deploymentId
```

salt.modules.boto_apigateway.**delete_api_integration**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration restApiId resourcePath
↪httpMethod
```

salt.modules.boto_apigateway.**delete_api_integration_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_integration_response restApiId
↪resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.**delete_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a given apiKey

CLI Example:

```
salt myminion boto_apigateway.delete_api_key apikeystring
```

salt.modules.boto_apigateway.**delete_api_method**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method restApiId resourcePath httpMethod
```

salt.modules.boto_apigateway.**delete_api_method_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_method_response restApiId resourcePath
↪httpMethod statusCode
```

salt.modules.boto_apigateway.**delete_api_model**(*restApiId*, *modelName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a model identified by name in a given API

CLI Example:

```
salt myminion boto_apigateway.delete_api_model restApiId modelName
```

salt.modules.boto_apigateway.**delete_api_resources**(*restApiId*, *path*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given restApiId and an absolute resource path, delete the resources starting from the absoluate resource path. If resourcepath is the root resource `/', the function will return False. Returns False on failure.

CLI Example:

```
salt myminion boto_apigateway.delete_api_resources myapi_id, resource_path
```

salt.modules.boto_apigateway.**delete_api_stage**(*restApiId*, *stageName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes stage identified by stageName from API identified by restApiId

CLI Example:

```
salt myminion boto_apigateway.delete_api_stage restApiId stageName
```

salt.modules.boto_apigateway.**delete_usage_plan**(*plan_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes usage plan identified by plan_id

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.delete_usage_plan plan_id='usage plan id'
```

salt.modules.boto_apigateway.**describe_api_deployment**(*restApiId*, *deploymentId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get API deployment for a given restApiId and deploymentId.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployent restApiId deploymentId
```

salt.modules.boto_apigateway.**describe_api_deployments**(*restApiId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Gets information about the defined API Deployments. Return list of api deployments.

CLI Example:

```
salt myminion boto_apigateway.describe_api_deployments restApiId
```

salt.modules.boto_apigateway.**describe_api_integration**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an integration for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration restApiId resourcePath
↪httpMethod
```

salt.modules.boto_apigateway.**describe_api_integration_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an integration response for a given method in a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_integration_response restApiId
↪resourcePath httpMethod statusCode
```

salt.modules.boto_apigateway.**describe_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Gets info about the given api key

CLI Example:

```
salt myminion boto_apigateway.describe_api_key apigw_api_key
```

salt.modules.boto_apigateway.**describe_api_keys**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Gets information about the defined API Keys. Return list of apiKeys.

CLI Example:

```
salt myminion boto_apigateway.describe_api_keys
```

salt.modules.boto_apigateway.**describe_api_method**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get API method for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method restApiId resourcePath␣
↪httpMethod
```

salt.modules.boto_apigateway.**describe_api_method_response**(*restApiId*, *resourcePath*, *httpMethod*, *statusCode*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get API method response for a resource in the given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_method_response restApiId resourcePath␣
↪httpMethod statusCode
```

salt.modules.boto_apigateway.**describe_api_model**(*restApiId*, *modelName*, *flatten=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a model by name for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_model restApiId modelName [True]
```

salt.modules.boto_apigateway.**describe_api_models**(*restApiId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all models for a given API

CLI Example:

```
salt myminion boto_apigateway.describe_api_models restApiId
```

salt.modules.boto_apigateway.**describe_api_resource**(*restApiId*, *path*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given rest api id, and an absolute resource path, returns the resource id for the given path.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource myapi_id resource_path
```

salt.modules.boto_apigateway.**describe_api_resource_method**(*restApiId*, *resourcePath*, *httpMethod*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given rest api id, resource path, and http method (must be one of DELETE, GET, HEAD, OPTIONS, PATCH, POST, PUT), return the method for the api/resource path if defined. Return False if method is not defined.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resource_method myapi_id resource_path
↪httpmethod
```

salt.modules.boto_apigateway.**describe_api_resources**(*restApiId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given rest api id, return all resources for this api.

CLI Example:

```
salt myminion boto_apigateway.describe_api_resources myapi_id
```

salt.modules.boto_apigateway.**describe_api_stage**(*restApiId*, *stageName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get API stage for a given apiID and stage name

CLI Example:

```
salt myminion boto_apigateway.describe_api_stage restApiId stageName
```

salt.modules.boto_apigateway.**describe_api_stages**(*restApiId*, *deploymentId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all API stages for a given apiID and deploymentID

CLI Example:

```
salt myminion boto_apigateway.describe_api_stages restApiId deploymentId
```

salt.modules.boto_apigateway.**describe_apis**(*name=None*, *description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns all rest apis in the defined region. If optional parameter name is included, returns all rest apis matching the name in the defined region.

CLI Example:

```
salt myminion boto_apigateway.describe_apis

salt myminion boto_apigateway.describe_apis name='api name'

salt myminion boto_apigateway.describe_apis name='api name' description='desc str'
```

salt.modules.boto_apigateway.**describe_usage_plans**(*name=None*, *plan_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of existing usage plans, optionally filtered to match a given plan name

New in version 2017.7.0.

CLI Example:

```
salt myminion boto_apigateway.describe_usage_plans
salt myminion boto_apigateway.describe_usage_plans name='usage plan name'
salt myminion boto_apigateway.describe_usage_plans plan_id='usage plan id'
```

salt.modules.boto_apigateway.**detach_usage_plan_from_apis**(*plan_id*, *apis*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detaches given usage plan from each of the apis provided in a list of apiId and stage value

New in version 2017.7.0.

apis a list of dictionaries, where each dictionary contains the following:

apiId a string, which is the id of the created API in AWS ApiGateway

stage a string, which is the stage that the created API is deployed to.

CLI Example:

```
salt myminion boto_apigateway.detach_usage_plan_to_apis plan_id='usage plan id'
↪apis='[{"apiId": "some id 1", "stage": "some stage 1"}]'
```

salt.modules.boto_apigateway.**disable_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

disable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

salt.modules.boto_apigateway.**disassociate_api_key_stagekeys**(*apiKey*, *stagekeyslist*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

disassociate the given stagekeyslist to the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.disassociate_stagekeys_api_key \
        api_key '["restapi id/stage name", ...]'
```

salt.modules.boto_apigateway.**enable_api_key**(*apiKey*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

enable the given apiKey.

CLI Example:

```
salt myminion boto_apigateway.enable_api_key api_key
```

salt.modules.boto_apigateway.**flush_api_stage_cache**(*restApiId*, *stageName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Flushes cache for the stage identified by stageName from API identified by restApiId

CLI Example:

```
salt myminion boto_apigateway.flush_api_stage_cache restApiId stageName
```

salt.modules.boto_apigateway.**overwrite_api_stage_variables**(*restApiId*, *stageName*, *variables*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Overwrite the stage variables for the given restApiId and stage name with the given variables, variables must

be in the form of a dictionary. Overwrite will always remove all the existing stage variables associated with the given restApiId and stage name, follow by the adding of all the variables specified in the variables dictionary

CLI Example:

```
salt myminion boto_apigateway.overwrite_api_stage_variables restApiId stageName
↪variables='{"name": "value"}'
```

salt.modules.boto_apigateway.**update_api_key_description**(*apiKey*, *description*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

update the given apiKey with the given description.

CLI Example:

```
salt myminion boto_apigateway.update_api_key_description api_key description
```

salt.modules.boto_apigateway.**update_api_model_schema**(*restApiId*, *modelName*, *schema*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

update the schema (in python dictionary format) for the given model in the given restApiId

CLI Example:

```
salt myminion boto_apigateway.update_api_model_schema restApiId modelName schema
```

salt.modules.boto_apigateway.**update_usage_plan**(*plan_id*, *throttle=None*, *quota=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Updates an existing usage plan with throttling and quotas

New in version 2017.7.0.

plan_id Id of the created usage plan

throttle A dictionary consisting of the following keys:

rateLimit requests per second at steady rate, float

burstLimit maximum number of requests per second, integer

quota A dictionary consisting of the following keys:

limit number of allowed requests per specified quota period [required if quota parameter is present]

offset number of requests to be subtracted from limit at the beginning of the period [optional]

period quota period, must be one of DAY, WEEK, or MONTH. [required if quota parameter is present

CLI Example:

```
salt myminion boto_apigateway.update_usage_plan plan_id='usage plan id' throttle='
↪{"rateLimit": 10.0, "burstLimit": 10}'
```

19.9.30 salt.modules.boto_asg

Connection module for Amazon Autoscale Groups

New in version 2014.7.0.

configuration This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
asg.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

depends boto3

salt.modules.boto_asg.**create**(*name*, *launch_config_name*, *availability_zones*, *min_size*, *max_size*, *desired_capacity=None*, *load_balancers=None*, *default_cooldown=None*, *health_check_type=None*, *health_check_period=None*, *placement_group=None*, *vpc_zone_identifier=None*, *tags=None*, *termination_policies=None*, *suspended_processes=None*, *scaling_policies=None*, *scheduled_actions=None*, *region=None*, *notification_arn=None*, *notification_types=None*, *key=None*, *keyid=None*, *profile=None*)

Create an autoscale group.

CLI example:

```
salt myminion boto_asg.create myasg mylc '["us-east-1a", "us-east-1e"]' 1 10 load_
↪balancers='["myelb", "myelb2"]' tags='[{"key": "Name", value="myasg",
↪"propagate_at_launch": True}]'
```

salt.modules.boto_asg.**create_launch_configuration**(*name*, *image_id*, *key_name=None*, *vpc_id=None*, *vpc_name=None*, *security_groups=None*, *user_data=None*, *instance_type='m1.small'*, *kernel_id=None*, *ramdisk_id=None*, *block_device_mappings=None*, *instance_monitoring=False*, *spot_price=None*, *instance_profile_name=None*, *ebs_optimized=False*, *associate_public_ip_address=None*, *volume_type=None*, *delete_on_termination=True*, *iops=None*, *use_block_device_types=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a launch configuration.

CLI example:

```
salt myminion boto_asg.create_launch_configuration mylc image_id=ami-0b9c9f62 key_
↪name='mykey' security_groups='["mygroup"]' instance_type='c3.2xlarge'
```

salt.modules.boto_asg.**delete**(*name*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an autoscale group.

CLI example:

```
salt myminion boto_asg.delete myasg region=us-east-1
```

salt.modules.boto_asg.**delete_launch_configuration**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a launch configuration.

CLI example:

```
salt myminion boto_asg.delete_launch_configuration mylc
```

salt.modules.boto_asg.**describe_launch_configuration**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Dump details of a given launch configuration.

CLI example:

```
salt myminion boto_asg.describe_launch_configuration mylc
```

salt.modules.boto_asg.**enter_standby**(*name*, *instance_ids*, *should_decrement_desired_capacity=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Switch desired instances to StandBy mode

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.enter_standby my_autoscale_group_name '["i-xxxxxx"]'
```

salt.modules.boto_asg.**exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Check to see if an autoscale group exists.

CLI example:

```
salt myminion boto_asg.exists myasg region=us-east-1
```

salt.modules.boto_asg.**exit_standby**(*name*, *instance_ids*, *should_decrement_desired_capacity=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Exit desired instances from StandBy mode

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.exit_standby my_autoscale_group_name '["i-xxxxxx"]'
```

salt.modules.boto_asg.**get_all_groups**(*region=None*, *key=None*, *keyid=None*, *profile=None*)
Return all AutoScale Groups visible in the account (as a list of boto.ec2.autoscale.group.AutoScalingGroup).

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.get_all_groups region=us-east-1 --output yaml
```

salt.modules.boto_asg.**get_all_launch_configurations**(*region=None*, *key=None*, *keyid=None*, *profile=None*)
Fetch and return all Launch Configuration with details.

CLI example:

```
salt myminion boto_asg.get_all_launch_configurations
```

salt.modules.boto_asg.**get_cloud_init_mime**(*cloud_init*)
Get a mime multipart encoded string from a cloud-init dict. Currently supports scripts and cloud-config.

CLI Example:

```
salt myminion boto.get_cloud_init_mime <cloud init>
```

salt.modules.boto_asg.**get_config**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Get the configuration for an autoscale group.

CLI example:

```
salt myminion boto_asg.get_config myasg region=us-east-1
```

salt.modules.boto_asg.**get_instances**(*name*, *lifecycle_state='InService'*, *health_status='Healthy'*, *attribute='private_ip_address'*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
return attribute of all instances in the named autoscale group.

CLI example:

```
salt-call boto_asg.get_instances my_autoscale_group_name
```

salt.modules.boto_asg.**get_scaling_policy_arn**(*as_group*, *scaling_policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Return the arn for a scaling policy in a specific autoscale group or None if not found. Mainly used as a helper

method for boto_cloudwatch_alarm, for linking alarms to scaling policies.

CLI Example:

```
salt '*' boto_asg.get_scaling_policy_arn mygroup mypolicy
```

salt.modules.boto_asg.**launch_configuration_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check for a launch configuration's existence.

CLI example:

```
salt myminion boto_asg.launch_configuration_exists mylc
```

salt.modules.boto_asg.**list_groups**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return all AutoScale Groups visible in the account (as a list of names).

New in version 2016.11.0.

CLI example:

```
salt-call boto_asg.list_groups region=us-east-1
```

salt.modules.boto_asg.**list_launch_configurations**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all Launch Configurations.

CLI example:

```
salt myminion boto_asg.list_launch_configurations
```

salt.modules.boto_asg.**update**(*name*, *launch_config_name*, *availability_zones*, *min_size*, *max_size*, *desired_capacity=None*, *load_balancers=None*, *default_cooldown=None*, *health_check_type=None*, *health_check_period=None*, *placement_group=None*, *vpc_zone_identifier=None*, *tags=None*, *termination_policies=None*, *suspended_processes=None*, *scaling_policies=None*, *scheduled_actions=None*, *notification_arn=None*, *notification_types=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update an autoscale group.

CLI example:

```
salt myminion boto_asg.update myasg mylc '["us-east-1a", "us-east-1e"]' 1 10 load_
↪balancers='["myelb", "myelb2"]' tags='[{"key": "Name", value="myasg",
↪"propagate_at_launch": True}]'
```

19.9.31 salt.modules.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.5.0.

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cfn.keyid: GKTADJGHEIQSXMKKRBJ08H
cfn.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cfn.region: us-east-1
```

depends boto

salt.modules.boto_cfn.**create**(*name*, *template_body=None*, *template_url=None*, *parameters=None*, *notification_arns=None*, *disable_rollback=None*, *timeout_in_minutes=None*, *capabilities=None*, *tags=None*, *on_failure=None*, *stack_policy_body=None*, *stack_policy_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a CFN stack.

CLI example to create a stack:

```
salt myminion boto_cfn.create mystack template_url='https://s3.amazonaws.com/
↪bucket/template.cft'          region=us-east-1
```

salt.modules.boto_cfn.**delete**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a CFN stack.

CLI example to delete a stack:

```
salt myminion boto_cfn.delete mystack region=us-east-1
```

salt.modules.boto_cfn.**describe**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Describe a stack.

New in version 2015.8.0.

CLI example:

```
salt myminion boto_cfn.describe mystack region=us-east-1
```

salt.modules.boto_cfn.**exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a stack exists.

CLI example:

```
salt myminion boto_cfn.exists mystack region=us-east-1
```

salt.modules.boto_cfn.**get_template**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if attributes are set on a CFN stack.

CLI example:

```
salt myminion boto_cfn.get_template mystack
```

salt.modules.boto_cfn.**update_stack**(*name*, *template_body=None*, *template_url=None*, *parameters=None*, *notification_arns=None*, *disable_rollback=False*, *timeout_in_minutes=None*, *capabilities=None*, *tags=None*, *use_previous_template=None*, *stack_policy_during_update_body=None*, *stack_policy_during_update_url=None*, *stack_policy_body=None*, *stack_policy_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update a CFN stack.

New in version 2015.8.0.

CLI example to update a stack:

```
salt myminion boto_cfn.update_stack mystack template_url='https://s3.amazonaws.
↪com/bucket/template.cft'         region=us-east-1
```

salt.modules.boto_cfn.**validate_template**(*template_body=None*, *template_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Validate cloudformation template

New in version 2015.8.0.

CLI example:

```
salt myminion boto_cfn.validate_template mystack-template
```

19.9.32 salt.modules.boto_cloudtrail module

Connection module for Amazon CloudTrail

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudtrail.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudtrail.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudtrail.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

salt.modules.boto_cloudtrail.**add_tags**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Add tags to a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.add_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_cloudtrail.**create**(*Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=None*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=None*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.create my_trail my_bucket
```

salt.modules.boto_cloudtrail.**delete**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a trail name, delete it.

Returns {deleted: true} if the trail was deleted and returns {deleted: false} if the trail was not deleted.

CLI Example:

```
salt myminion boto_cloudtrail.delete mytrail
```

salt.modules.boto_cloudtrail.**describe**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

salt.modules.boto_cloudtrail.**exists**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a trail name, check to see if the given trail exists.

Returns True if the given trail exists and returns False if the given trail does not exist.

CLI Example:

```
salt myminion boto_cloudtrail.exists mytrail
```

salt.modules.boto_cloudtrail.**list**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all trails

Returns list of trails

CLI Example:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_cloudtrail.**list_tags**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List tags of a trail

Returns

- {...}
- {...}

Return type tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

salt.modules.boto_cloudtrail.**remove_tags**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_cloudtrail.**start_logging**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Start logging for a trail

Returns {started: true} if the trail was started and returns {started: False} if the trail was not started.

CLI Example:

```
salt myminion boto_cloudtrail.start_logging my_trail
```

salt.modules.boto_cloudtrail.**status**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a trail name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudtrail.describe mytrail
```

salt.modules.boto_cloudtrail.**stop_logging**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Stop logging for a trail

Returns {stopped: true} if the trail was stopped and returns {stopped: False} if the trail was not stopped.

CLI Example:

```
salt myminion boto_cloudtrail.stop_logging my_trail
```

salt.modules.boto_cloudtrail.**update**(*Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=None*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=None*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update a trail.

Returns {created: true} if the trail was created and returns {created: False} if the trail was not created.

CLI Example:

```
salt myminion boto_cloudtrail.update my_trail my_bucket
```

19.9.33 salt.modules.boto_cloudwatch

Connection module for Amazon CloudWatch

New in version 2014.7.0.

configuration This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_cloudwatch.**convert_to_arn**(*arns*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Convert a list of strings into actual arns. Converts convenience names such as `scaling_policy:...'

CLI Example:

```
salt '*' convert_to_arn 'scaling_policy:'
```

salt.modules.boto_cloudwatch.**create_or_update_alarm**(*connection=None*, *name=None*, *metric=None*, *namespace=None*, *statistic=None*, *comparison=None*, *threshold=None*, *period=None*, *evaluation_periods=None*, *unit=None*, *description=''*, *dimensions=None*, *alarm_actions=None*, *insufficient_data_actions=None*, *ok_actions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create or update a cloudwatch alarm.

Params are the same as: https://boto.readthedocs.io/en/latest/ref/cloudwatch.html#boto.ec2.cloudwatch.alarm.MetricAlarm.

Dimensions must be a dict. If the value of Dimensions is a string, it will be json decoded to produce a dict. alarm_actions, insufficient_data_actions, and ok_actions must be lists of string. If the passed-in value is a string, it will be split on "," to produce a list. The strings themselves for alarm_actions, insufficient_data_actions, and ok_actions must be Amazon resource names (ARN's); however, this method also supports an arn lookup notation, as follows:

arn:aws:.... ARN as per http://docs.aws.amazon.com/general/latest/gr/aws-arns-and-namespaces.html scaling_policy:<as_name>:<scaling_policy_name> The named autoscale group scaling policy, for the named group (e.g. scaling_policy:my-asg:ScaleDown)

This is convenient for setting up autoscaling as follows. First specify a boto_asg.present state for an ASG with scaling_policies, and then set up boto_cloudwatch_alarm.present states which have alarm_actions that reference the scaling_policy.

CLI example:

salt myminion boto_cloudwatch.create_alarm name=myalarm ... region=us-east-1

salt.modules.boto_cloudwatch.**delete_alarm**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a cloudwatch alarm

CLI example to delete a queue:

```
salt myminion boto_cloudwatch.delete_alarm myalarm region=us-east-1
```

salt.modules.boto_cloudwatch.**get_alarm**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get alarm details. Also can be used to check to see if an alarm exists.

CLI example:

```
salt myminion boto_cloudwatch.get_alarm myalarm region=us-east-1
```

salt.modules.boto_cloudwatch.**get_all_alarms**(*region=None*, *prefix=None*, *key=None*, *keyid=None*, *profile=None*)

Get all alarm details. Produces results that can be used to create an sls file.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

1. **Make a ``backup'' of all existing alarms** $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed ``s/local: //'' > legacy_alarms.sls

2. **Get all alarms with new prefixed names** $ salt-call boto_cloudwatch.get_all_alarms ``prefix=**MANAGED BY SALT** '' --out=txt | sed ``s/local: //'' > managed_alarms.sls
3. **Insert the managed alarms into cloudwatch** $ salt-call state.template managed_alarms.sls
4. Manually verify that the new alarms look right
5. Delete the original alarms $ sed s/present/absent/ legacy_alarms.sls > remove_legacy_alarms.sls $ salt-call state.template remove_legacy_alarms.sls
6. Get all alarms again, verify no changes $ salt-call boto_cloudwatch.get_all_alarms --out=txt | sed ``s/local: //'' > final_alarms.sls $ diff final_alarms.sls managed_alarms.sls

CLI example:

```
salt myminion boto_cloudwatch.get_all_alarms region=us-east-1 --out=txt
```

19.9.34 salt.modules.boto_cloudwatch_event module

Connection module for Amazon CloudWatch Events

New in version 2016.11.0.

configuration This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cloudwatch_event.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

salt.modules.boto_cloudwatch_event.**create_or_update**(*Name*, *ScheduleExpression=None*, *EventPattern=None*, *Description=None*, *RoleArn=None*, *State=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create an event rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_cloudwatch_event.create_or_update my_rule
```

salt.modules.boto_cloudwatch_event.**delete**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```
salt myminion boto_cloudwatch_event.delete myrule
```

salt.modules.boto_cloudwatch_event.**describe**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudwatch_event.describe myrule
```

salt.modules.boto_cloudwatch_event.**exists**(*Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI example:

```
salt myminion boto_cloudwatch_event.exists myevent region=us-east-1
```

salt.modules.boto_cloudwatch_event.**list_rules**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List, with details, all Cloudwatch Event rules visible in the current scope.

CLI example:

```
salt myminion boto_cloudwatch_event.list_rules region=us-east-1
```

salt.modules.boto_cloudwatch_event.**list_targets**(*Rule*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name list the targets of that rule.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_cloudwatch_event.list_targets myrule
```

salt.modules.boto_cloudwatch_event.**put_targets**(*Rule*, *Targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add the given targets to the given rule

Returns a dictionary describing any failures.

CLI Example:

```
salt myminion boto_cloudwatch_event.put_targets myrule [{'Id': 'target1', 'Arn':
↪'arn:***'}]
```

salt.modules.boto_cloudwatch_event.**remove_targets**(*Rule*, *Ids*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name remove the named targets from the target list

Returns a dictionary describing any failures.

CLI Example:

```
salt myminion boto_cloudwatch_event.remove_targets myrule ['Target1']
```

19.9.35 salt.modules.boto_cognitoidentity module

Connection module for Amazon CognitoIdentity

New in version 2016.11.0.

configuration This module accepts explicit CognitoIdentity credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cognitoidentity.keyid: GKTADJGHEIQSXMKKRBJ08H
cognitoidentity.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
cognitoidentity.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create, delete, set, and update methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_identity_pools*) return:

```
identity_pools:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends boto3

salt.modules.boto_cognitoidentity.**create_identity_pool**(*IdentityPoolName*, *AllowUnauthenticatedIdentities=False*, *SupportedLoginProviders=None*, *DeveloperProviderName=None*, *OpenIdConnectProviderARNs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a new identity pool. All parameters except for IdentityPoolName is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

Returns the created identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.create_identity_pool my_id_pool_name
 ↪                  DeveloperProviderName=custom_developer_provider
```

salt.modules.boto_cognitoidentity.**delete_identity_pools**(*IdentityPoolName*, *IdentityPoolId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Deletes all identity pools matching the given name, or the specific identity pool with the given identity pool id.

CLI Example:

```
salt myminion boto_cognitoidentity.delete_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.delete_identity_pools '' IdentityPoolId=my_id_
 ↪pool_id
```

salt.modules.boto_cognitoidentity.**describe_identity_pools**(*IdentityPoolName*, *IdentityPoolId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an identity pool name, (optionally if an identity pool id is given, the given name will be ignored)

Returns a list of matched identity pool name's pool properties

CLI Example:

```
salt myminion boto_cognitoidentity.describe_identity_pools my_id_pool_name
salt myminion boto_cognitoidentity.describe_identity_pools '' IdentityPoolId=my_
 ↪id_pool_id
```

salt.modules.boto_cognitoidentity.**get_identity_pool_roles**(*IdentityPoolName*, *IdentityPoolId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an identity pool name, (optionally if an identity pool id if given, the given name will be ignored)

Returns a list of matched identity pool name's associated roles

CLI Example:

```
salt myminion boto_cognitoidentity.get_identity_pool_roles my_id_pool_name
salt myminion boto_cognitoidentity.get_identity_pool_roles '' IdentityPoolId=my_
↪id_pool_id
```

salt.modules.boto_cognitoidentity.**set_identity_pool_roles**(*IdentityPoolId*, *AuthenticatedRole=None*, *UnauthenticatedRole=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an identity pool id, set the given AuthenticatedRole and UnauthenticatedRole (the Role can be an iam arn, or a role name) If AuthenticatedRole or UnauthenticatedRole is not given, the authenticated and/or the unauthenticated role associated previously with the pool will be cleared.

Returns set True if successful, set False if unsuccessful with the associated errors.

CLI Example:

```
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_roles  #
↪this clears the roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
↪  AuthenticatedRole=my_auth_role UnauthenticatedRole=my_unauth_role  # this set
↪both roles
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
↪  AuthenticatedRole=my_auth_role  # this will set the auth role and clear the
↪unauth role
salt myminion boto_cognitoidentity.set_identity_pool_roles my_id_pool_id
↪  UnauthenticatedRole=my_unauth_role  # this will set the unauth role and clear
↪the auth role
```

salt.modules.boto_cognitoidentity.**update_identity_pool**(*IdentityPoolId*, *IdentityPoolName=None*, *AllowUnauthenticatedIdentities=False*, *SupportedLoginProviders=None*, *DeveloperProviderName=None*, *OpenIdConnectProviderARNs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Updates the given IdentityPoolId's properties. All parameters except for IdentityPoolId, is optional. SupportedLoginProviders should be a dictionary mapping provider names to provider app IDs. OpenIdConnectProviderARNs should be a list of OpenID Connect provider ARNs.

To clear SupportedLoginProviders pass `{}'

To clear OpenIdConnectProviderARNs pass `[]'

boto3 api prevents DeveloperProviderName to be updated after it has been set for the first time.

Returns the updated identity pool if successful

CLI Example:

```
salt myminion boto_cognitoidentity.update_identity_pool my_id_pool_id my_id_pool_
↪name                                DeveloperProviderName=custom_developer_provider
```

19.9.36 salt.modules.boto_datapipeline module

Connection module for Amazon Data Pipeline

New in version 2016.3.0.

depends boto3

salt.modules.boto_datapipeline.**activate_pipeline**(*pipeline_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Start processing pipeline tasks. This function is idempotent.

CLI example:

```
salt myminion boto_datapipeline.activate_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.**create_pipeline**(*name*, *unique_id*, *description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new, empty pipeline. This function is idempotent.

CLI example:

```
salt myminion boto_datapipeline.create_pipeline my_name my_unique_id
```

salt.modules.boto_datapipeline.**delete_pipeline**(*pipeline_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a pipeline, its pipeline definition, and its run history. This function is idempotent.

CLI example:

```
salt myminion boto_datapipeline.delete_pipeline my_pipeline_id
```

salt.modules.boto_datapipeline.**describe_pipelines**(*pipeline_ids*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieve metadata about one or more pipelines.

CLI example:

```
salt myminion boto_datapipeline.describe_pipelines ['my_pipeline_id']
```

salt.modules.boto_datapipeline.**get_pipeline_definition**(*pipeline_id*, *version='latest'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the definition of the specified pipeline.

CLI example:

```
salt myminion boto_datapipeline.get_pipeline_definition my_pipeline_id
```

salt.modules.boto_datapipeline.**list_pipelines**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a list of pipeline ids and names for all pipelines.

CLI Example:

```
salt myminion boto_datapipeline.list_pipelines profile=myprofile
```

salt.modules.boto_datapipeline.**pipeline_id_from_name**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the pipeline id, if it exists, for the given name.

CLI example:

```
salt myminion boto_datapipeline.pipeline_id_from_name my_pipeline_name
```

salt.modules.boto_datapipeline.**put_pipeline_definition**(*pipeline_id*, *pipeline_objects*, *parameter_objects=None*, *parameter_values=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add tasks, schedules, and preconditions to the specified pipeline. This function is idempotent and will replace an existing definition.

CLI example:

```
salt myminion boto_datapipeline.put_pipeline_definition my_pipeline_id my_
↪pipeline_objects
```

19.9.37 salt.modules.boto_dynamodb

Connection module for Amazon DynamoDB

New in version 2015.5.0.

configuration This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_dynamodb.**create_global_secondary_index**(*table_name*, *global_index*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a single global secondary index on a DynamoDB table.

CLI Example: .. code-block:: bash
salt myminion boto_dynamodb.create_global_secondary_index table_name / index_name

salt.modules.boto_dynamodb.**create_table**(*table_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *read_capacity_units=None*, *write_capacity_units=None*, *hash_key=None*, *hash_key_data_type=None*, *range_key=None*, *range_key_data_type=None*, *local_indexes=None*, *global_indexes=None*)

Creates a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.create_table table_name /
region=us-east-1 /
hash_key=id /
hash_key_data_type=N /
range_key=created_at /
range_key_data_type=N /
read_capacity_units=1 /
write_capacity_units=1
```

salt.modules.boto_dynamodb.**delete**(*table_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a DynamoDB table.

CLI Example:

```
salt myminion boto_dynamodb.delete table_name region=us-east-1
```

salt.modules.boto_dynamodb.**describe**(*table_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Describe a DynamoDB table.

CLI example:

```
salt myminion boto_dynamodb.describe table_name region=us-east-1
```

salt.modules.boto_dynamodb.**exists**(*table_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a table exists.

CLI Example:

```
salt myminion boto_dynamodb.exists table_name region=us-east-1
```

salt.modules.boto_dynamodb.**extract_index**(*index_data*, *global_index=False*)

Instantiates and returns an AllIndex object given a valid index configuration

CLI Example: salt myminion boto_dynamodb.extract_index index

salt.modules.boto_dynamodb.**update**(*table_name*, *throughput=None*, *global_indexes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update a DynamoDB table.

CLI example:

```
salt myminion boto_dynamodb.update table_name region=us-east-1
```

salt.modules.boto_dynamodb.**update_global_secondary_index**(*table_name*, *global_indexes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Updates the throughput of the given global secondary indexes.

CLI Example: .. code-block:: bash

salt myminion boto_dynamodb.update_global_secondary_index table_name / indexes

19.9.38 salt.modules.boto_ec2

Connection module for Amazon EC2

New in version 2015.8.0.

configuration This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
ec2.keyid: GKTADJGHEIQSXMKKRBJ08H
ec2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
ec2.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

salt.modules.boto_ec2.**allocate_eip_address**(*domain=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Allocate a new Elastic IP address and associate it with your account.

domain (string) Optional param - if set to exactly `vpc', the address will be allocated to the VPC. The default simply maps the EIP to your account container.

returns (dict) dict of `interesting' information about the newly allocated EIP, with probably the most interesting keys being `public_ip'; and `allocation_id' iff `domain=vpc' was passed.

CLI Example:

```
salt-call boto_ec2.allocate_eip_address domain=vpc
```

New in version 2016.3.0.

salt.modules.boto_ec2.**assign_private_ip_addresses**(*network_interface_name=None*, *network_interface_id=None*, *private_ip_addresses=None*, *secondary_private_ip_address_count=None*, *allow_reassignment=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Assigns one or more secondary private IP addresses to a network interface.

network_interface_id (string) - ID of the network interface to associate the IP with (exclusive with `network_interface_name')

network_interface_name (string) - Name of the network interface to associate the IP with (exclusive with `network_interface_id')

private_ip_addresses (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface (exclusive with `secondary_private_ip_address_count')

secondary_private_ip_address_count (int) - The number of secondary IP addresses to assign to the network interface. (exclusive with `private_ip_addresses')

allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
↪private_ip_addresses=private_ip
salt myminion boto_ec2.assign_private_ip_addresses network_interface_name=my_eni
↪secondary_private_ip_address_count=2
```

New in version 2017.7.0.

salt.modules.boto_ec2.**associate_eip_address**(*instance_id=None*, *instance_name=None*, *public_ip=None*, *allocation_id=None*, *network_interface_id=None*, *network_interface_name=None*, *private_ip_address=None*, *allow_reassociation=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Associate an Elastic IP address with a currently running instance or a network interface. This requires exactly one of either `public_ip' or `allocation_id', depending on whether you're associating a VPC address or a plain EC2 address.

instance_id (string) – ID of the instance to associate with (exclusive with `instance_name')

instance_name (string) – Name tag of the instance to associate with (exclusive with `instance_id')

public_ip (string) – Public IP address, for standard EC2 based allocations.

allocation_id (string) – Allocation ID for a VPC-based EIP.

network_interface_id (string) - ID of the network interface to associate the EIP with

network_interface_name (string) - Name of the network interface to associate the EIP with

private_ip_address (string) – The primary or secondary private IP address to associate with the Elastic IP address.

allow_reassociation (bool) – Allow a currently associated EIP to be re-associated with the new instance or interface.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.associate_eip_address instance_name=bubba.ho.tep
 ↪allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

salt.modules.boto_ec2.**attach_network_interface**(*device_index*, *name=None*, *network_interface_id=None*, *instance_name=None*, *instance_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.attach_network_interface my_eni instance_name=salt-master
 ↪device_index=0
```

salt.modules.boto_ec2.**create_image**(*ami_name*, *instance_id=None*, *instance_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *description=None*, *no_reboot=False*, *dry_run=False*, *filters=None*)

Given instance properties that define exactly one instance, create AMI and return AMI-id.

CLI Examples:

```
salt myminion boto_ec2.create_image ami_name instance_name=myinstance
salt myminion boto_ec2.create_image another_ami_name tags='{"mytag": "value"}'
 ↪description='this is my ami'
```

salt.modules.boto_ec2.**create_key**(*key_name*, *save_path*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a key and saves it to a given path. Returns the private key.

CLI Example:

```
salt myminion boto_ec2.create_key mykey /root/
```

salt.modules.boto_ec2.**create_network_interface**(*name*, *subnet_id=None*, *subnet_name=None*, *private_ip_address=None*, *description=None*, *groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345
 ↪description=my_eni groups=['my_group']
```

salt.modules.boto_ec2.**create_tags**(*resource_ids*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create new metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.
tags (dict) – Dictionary of name/value pairs. To create only a tag name, pass `` as the value.
returns (bool) - True on success, False on failure.
CLI Example:

```
salt-call boto_ec2.create_tags vol-12345678 '{"Name": "myVolume01"}'
```

salt.modules.boto_ec2.**delete_key**(*key_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key. Always returns True

CLI Example:

```
salt myminion boto_ec2.delete_key mykey
```

salt.modules.boto_ec2.**delete_network_interface**(*name=None*, *network_interface_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.create_network_interface my_eni subnet-12345
↪description=my_eni groups=['my_group']
```

salt.modules.boto_ec2.**delete_tags**(*resource_ids*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete metadata tags for the specified resource ids.

New in version 2016.11.0.

resource_ids (string) or (list) – List of resource IDs. A plain string will be converted to a list of one element.
tags

(dict) or (list) – Either a dictionary containing name/value pairs or a list containing just tag names.
If you pass in a dictionary, the values must match the actual tag values or the tag will not be deleted. If you pass in a value of None for the tag value, all tags with that name will be deleted.

returns (bool) - True on success, False on failure.
CLI Example:

```
salt-call boto_ec2.delete_tags vol-12345678 '{"Name": "myVolume01"}'
salt-call boto_ec2.delete_tags vol-12345678 '["Name","MountPoint"]'
```

salt.modules.boto_ec2.**delete_volume**(*volume_id*, *instance_id=None*, *device=None*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.

volume_id (string) – The ID of the EBS volume to be deleted.
force (bool) – Forces deletion even if the device has not yet been detached from its instance.
returns (bool) - True on success, False on failure.
CLI Example:

```
salt-call boto_ec2.delete_volume vol-12345678
```

salt.modules.boto_ec2.**detach_network_interface**(*name=None*, *network_interface_id=None*, *attachment_id=None*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.detach_network_interface my_eni
```

salt.modules.boto_ec2.**detach_volume**(*volume_id*, *instance_id=None*, *device=None*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach an EBS volume from an EC2 instance.

New in version 2016.11.0.
volume_id (string) – The ID of the EBS volume to be detached.
instance_id (string) – The ID of the EC2 instance from which it will be detached.
device (string) – The device on the instance through which the volume is exposted (e.g. /dev/sdh)
force

(bool) – Forces detachment if the previous detachment attempt did not occur cleanly. This option can lead to data loss or a corrupted file system. Use this option only as a last resort to detach a volume from a failed instance. The instance will not have an opportunity to flush file system caches nor file system meta data. If you use this option, you must perform file system check and repair procedures.

returns (bool) - True on success, False on failure.
CLI Example:

```
salt-call boto_ec2.detach_volume vol-12345678 i-87654321
```

salt.modules.boto_ec2.**disassociate_eip_address**(*public_ip=None*, *association_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disassociate an Elastic IP address from a currently running instance. This requires exactly one of either `association_id' or `public_ip', depending on whether you're dealing with a VPC or EC2 Classic address.
public_ip (string) – Public IP address, for EC2 Classic allocations.
association_id (string) – Association ID for a VPC-bound EIP.
returns (bool) - True on success, False on failure.
CLI Example:

```
salt myminion boto_ec2.disassociate_eip_address association_id=eipassoc-e3ba2d16
```

New in version 2016.3.0.

salt.modules.boto_ec2.**exists**(*instance_id=None*, *name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *in_states=None*, *filters=None*)

Given a instance id, check to see if the given instance id exists.

Returns True if the given an instance with the given id, name, or tags exists; otherwise, False is returned.

CLI Example:

```
salt myminion boto_ec2.exists myinstance
```

salt.modules.boto_ec2.**find_images**(*ami_name=None*, *executable_by=None*, *owners=None*, *image_ids=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *return_objs=False*)

Given image properties, find and return matching AMI ids

CLI Examples:

```
salt myminion boto_ec2.find_images tags='{"mytag": "value"}'
```

salt.modules.boto_ec2.**find_instances**(*instance_id=None*, *name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *return_objs=False*, *in_states=None*, *filters=None*)

Given instance properties, find and return matching instance ids

CLI Examples:

```
salt myminion boto_ec2.find_instances # Lists all instances
salt myminion boto_ec2.find_instances name=myinstance
salt myminion boto_ec2.find_instances tags='{"mytag": "value"}'
salt myminion boto_ec2.find_instances filters='{"vpc-id": "vpc-12345678"}'
```

salt.modules.boto_ec2.**get_all_eip_addresses**(*addresses=None*, *allocation_ids=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get public addresses of some, or all EIPs associated with the current account.

addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

returns (list) - A list of the requested EIP addresses

CLI Example:

```
salt-call boto_ec2.get_all_eip_addresses
```

New in version 2016.3.0.

salt.modules.boto_ec2.**get_all_volumes**(*volume_ids=None*, *filters=None*, *return_objs=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a list of all EBS volumes, optionally filtered by provided `filters' param

New in version 2016.11.0.

volume_ids (list) - Optional list of volume_ids. If provided, only the volumes associated with those in the list will be returned.

filters (dict) - Additional constraints on which volumes to return. Valid filters are:

- attachment.attach-time - The time stamp when the attachment initiated.
- attachment.delete-on-termination - Whether the volume is deleted on instance termination.
- attachment.device - The device name that is exposed to the instance (for example, /dev/sda1).
- attachment.instance-id - The ID of the instance the volume is attached to.
- attachment.status - The attachment state (attaching | attached | detaching | detached).
- availability-zone - The Availability Zone in which the volume was created.
- create-time - The time stamp when the volume was created.
- encrypted - The encryption status of the volume.
- size - The size of the volume, in GiB.
- snapshot-id - The snapshot from which the volume was created.
- status - The status of the volume (creating | available | in-use | deleting | deleted | error).

- tag:key=value - The key/value combination of a tag assigned to the resource.
- volume-id - The volume ID.
- volume-type - The Amazon EBS volume type. This can be `gp2` for General Purpose SSD, `io1` for Provisioned IOPS SSD, `st1` for Throughput Optimized HDD, `sc1` for Cold HDD, or `standard` for Magnetic volumes.

return_objs (bool) - Changes the return type from list of volume IDs to list of boto.ec2.volume.Volume objects

returns (list) - A list of the requested values: Either the volume IDs or, if return_objs is `True`, boto.ec2.volume.Volume objects.

CLI Example:

```
salt-call boto_ec2.get_all_volumes filters='{"tag:Name": "myVolume01"}'
```

`salt.modules.boto_ec2.`**`get_attribute`**(*attribute*, *instance_name=None*, *instance_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Get an EC2 instance attribute.

CLI Example:

```
salt myminion boto_ec2.get_attribute sourceDestCheck instance_name=my_instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck
- groupSet
- ebsOptimized
- sriovNetSupport

`salt.modules.boto_ec2.`**`get_eip_address_info`**(*addresses=None*, *allocation_ids=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get `interesting' info about some, or all EIPs associated with the current account.

addresses (list) - Optional list of addresses. If provided, only the addresses associated with those in the list will be returned.

allocation_ids (list) - Optional list of allocation IDs. If provided, only the addresses associated with the given allocation IDs will be returned.

returns (list of dicts) - A list of dicts, each containing the info for one of the requested EIPs.

CLI Example:

```
salt-call boto_ec2.get_eip_address_info addresses=52.4.2.15
```

New in version 2016.3.0.

salt.modules.boto_ec2.**get_id**(*name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *in_states=None*, *filters=None*)

Given instance properties, return the instance id if it exists.

CLI Example:

```
salt myminion boto_ec2.get_id myinstance
```

salt.modules.boto_ec2.**get_key**(*key_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a key exists. Returns fingerprint and name if it does and False if it doesn't CLI Example:

```
salt myminion boto_ec2.get_key mykey
```

salt.modules.boto_ec2.**get_keys**(*keynames=None*, *filters=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Gets all keys or filters them by name and returns a list. keynames (list):: A list of the names of keypairs to retrieve. If not provided, all key pairs will be returned. filters (dict) :: Optional filters that can be used to limit the results returned. Filters are provided in the form of a dictionary consisting of filter names as the key and filter values as the value. The set of allowable filter names/values is dependent on the request being performed. Check the EC2 API guide for details.

CLI Example:

```
salt myminion boto_ec2.get_keys
```

salt.modules.boto_ec2.**get_network_interface**(*name=None*, *network_interface_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface name=my_eni
```

salt.modules.boto_ec2.**get_network_interface_id**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an Elastic Network Interface id from its name tag.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.get_network_interface_id name=my_eni
```

salt.modules.boto_ec2.**get_unassociated_eip_address**(*domain='standard'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return the first unassociated EIP
domain Indicates whether the address is a EC2 address or a VPC address (standard|vpc).
CLI Example:

```
salt-call boto_ec2.get_unassociated_eip_address
```

New in version 2016.3.0.

salt.modules.boto_ec2.**get_zones**(*region=None*, *key=None*, *keyid=None*, *profile=None*)
Get a list of AZs for the configured region.

CLI Example:

```
salt myminion boto_ec2.get_zones
```

salt.modules.boto_ec2.**import_key**(*key_name*, *public_key_material*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Imports the public key from an RSA key pair that you created with a third-party tool. Supported formats: - OpenSSH public key format (e.g., the format in ~/.ssh/authorized_keys) - Base64 encoded DER format - SSH public key file format as specified in RFC4716 - DSA keys are not supported. Make sure your key generator is set up to create RSA keys. Supported lengths: 1024, 2048, and 4096.

CLI Example:

```
salt myminion boto_ec2.import mykey publickey
```

salt.modules.boto_ec2.**modify_network_interface_attribute**(*name=None*, *network_interface_id=None*, *attr=None*, *value=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Modify an attribute of an Elastic Network Interface.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_ec2.modify_network_interface_attribute my_eni attr=description
↪value='example description'
```

salt.modules.boto_ec2.**release_eip_address**(*public_ip=None*, *allocation_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Free an Elastic IP address. Pass either a public IP address to release an EC2 Classic EIP, or an AllocationId to release a VPC EIP.
public_ip (string) - The public IP address - for EC2 elastic IPs.
allocation_id (string) - The Allocation ID - for VPC elastic IPs.
returns (bool) - True on success, False on failure
CLI Example:

```
salt myminion boto_ec2.release_eip_address allocation_id=eipalloc-ef382c8a
```

New in version 2016.3.0.

salt.modules.boto_ec2.**run**(*image_id*, *name=None*, *tags=None*, *key_name=None*, *security_groups=None*, *user_data=None*, *instance_type='m1.small'*, *placement=None*, *kernel_id=None*, *ramdisk_id=None*, *monitoring_enabled=None*, *vpc_id=None*, *vpc_name=None*, *subnet_id=None*, *subnet_name=None*, *private_ip_address=None*, *block_device_map=None*, *disable_api_termination=None*, *instance_initiated_shutdown_behavior=None*, *placement_group=None*, *client_token=None*, *security_group_ids=None*, *security_group_names=None*, *additional_info=None*, *tenancy=None*, *instance_profile_arn=None*, *instance_profile_name=None*, *ebs_optimized=None*, *network_interface_id=None*, *network_interface_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *network_interfaces=None*)

Create and start an EC2 instance.

Returns True if the instance was created; otherwise False.

CLI Example:

```
salt myminion boto_ec2.run ami-b80c2b87 name=myinstance
```

image_id (string) – The ID of the image to run.
name (string) - The name of the instance.
tags (dict of key: value pairs) - tags to apply to the instance.
key_name (string) – The name of the key pair with which to launch instances.
security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances
user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.
instance_type (string) – The type of instance to run. Note that some image types (e.g. hvm) only run on some instance types.
placement (string) – The Availability Zone to launch the instance into.
kernel_id (string) – The ID of the kernel with which to launch the instances.
ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.
monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.
vpc_id (string) - ID of a VPC to bind the instance to. Exclusive with vpc_name.
vpc_name (string) - Name of a VPC to bind the instance to. Exclusive with vpc_id.
subnet_id (string) – The subnet ID within which to launch the instances for VPC.
subnet_name (string) – The name of a subnet within which to launch the instances for VPC.
private_ip_address (string) – If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g. 10.0.0.25).
block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image. (string) - A string representation of a BlockDeviceMapping structure (dict) - A dict describing a BlockDeviceMapping structure

YAML example:

```
device-maps:
    /dev/sdb:
        ephemeral_name: ephemeral0
    /dev/sdc:
        ephemeral_name: ephemeral1
    /dev/sdd:
        ephemeral_name: ephemeral2
    /dev/sde:
        ephemeral_name: ephemeral3
    /dev/sdf:
```

```
        size: 20
        volume_type: gp2
```

disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are: stop, terminate

placement_group (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

client_token (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

security_group_ids (list of strings) – The ID(s) of the VPC security groups with which to associate instances.

security_group_names (list of strings) – The name(s) of the VPC security groups with which to associate instances.

additional_info (string) – Specifies additional information to make available to the instance(s).

tenancy (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are:"default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

instance_profile_arn (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

instance_profile_name (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

ebs_optimized (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types.

network_interfaces (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

network_interface_id (string) - ID of the network interface to attach to the instance

network_interface_name (string) - Name of the network interface to attach to the instance

`salt.modules.boto_ec2.`**`set_attribute`**(*attribute*, *attribute_value*, *instance_name=None*, *instance_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Set an EC2 instance attribute. Returns whether the operation succeeded or not.

CLI Example:

```
salt myminion boto_ec2.set_attribute sourceDestCheck False instance_name=my_
↪instance
```

Available attributes:

- instanceType
- kernel
- ramdisk
- userData
- disableApiTermination
- instanceInitiatedShutdownBehavior
- rootDeviceName
- blockDeviceMapping
- productCodes
- sourceDestCheck

- groupSet
- ebsOptimized
- sriovNetSupport

salt.modules.boto_ec2.**set_volumes_tags**(*tag_maps*, *authoritative=False*, *dry_run=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

tag_maps (list) List of dicts of filters and tags, where `filters' is a dict suitable for passing to the `filters' argument of get_all_volumes() above, and `tags' is a dict of tags to be set on volumes (via create_tags/delete_tags) as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function. If filtering by instance Name, You may additionally limit the instances matched by passing in a list of desired instance states. The default set of states is (`pending', `rebooting', `running', `stopping', `stopped').

YAML example fragment:

```
- filters:
    attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
    attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
  in_states:
  - stopped
  - terminated
- filters:
    instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
    volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative (bool) If true, any existing tags on the matched volumes, and not explicitly requested here, will be removed.

dry_run (bool) If true, don't change anything, just return a dictionary describing any changes which would have been applied.

returns (dict) A dict dsecribing status and any changes.

salt.modules.boto_ec2.**terminate**(*instance_id=None*, *name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Terminate the instance described by instance_id or name.

CLI Example:

```
salt myminion boto_ec2.terminate name=myinstance
salt myminion boto_ec2.terminate instance_id=i-a46b9f
```

salt.modules.boto_ec2.**unassign_private_ip_addresses**(*network_interface_name=None*, *network_interface_id=None*, *private_ip_addresses=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Unassigns one or more secondary private IP addresses from a network interface

network_interface_id (string) - ID of the network interface to associate the IP with (exclusive with `network_interface_name')

network_interface_name (string) - Name of the network interface to associate the IP with (exclusive with `network_interface_id')

private_ip_addresses (list) - Assigns the specified IP addresses as secondary IP addresses to the network interface.

returns (bool) - True on success, False on failure.

CLI Example:

```
salt myminion boto_ec2.unassign_private_ip_addresses network_interface_name=my_
↪eni private_ip_addresses=private_ip
```

New in version 2017.7.0.

19.9.39 salt.modules.boto_efs module

Connection module for Amazon EFS

New in version 2017.7.0.

configuration This module accepts explicit EFS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles or it can read them from the ~/.aws/credentials file or from these environment variables: AWS_ACCESS_KEY_ID, AWS_SECRET_ACCESS_KEY. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available at:

```
http://docs.aws.amazon.com/efs/latest/ug/
    access-control-managing-permissions.html

http://boto3.readthedocs.io/en/latest/guide/
    configuration.html#guide-configuration
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file

```
efs.keyid: GKTADJGHEIQSXMKKRBJ08H
efs.key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration

```
efs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to speficy key, keyid, and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askd+ghsdfjkghWupU/asdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto3

salt.modules.boto_efs.**create_file_system**(*name*, *performance_mode='generalPurpose'*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Creates a new, empty file system.

name (string) - The name for the new file system

performance_mode (string) - The PerformanceMode of the file system. Can be either generalPurpose or maxIO

returns (dict) - A dict of the data for the elastic file system

CLI Example:

```
salt 'my-minion' boto_efs.create_file_system efs-name generalPurpose
```

salt.modules.boto_efs.**create_mount_target**(*filesystemid*, *subnetid*, *ipaddress=None*, *securitygroups=None*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Creates a mount target for a file system. You can then mount the file system on EC2 instances via the mount target.

You can create one mount target in each Availability Zone in your VPC. All EC2 instances in a VPC within a given Availability Zone share a single mount target for a given file system.

If you have multiple subnets in an Availability Zone, you create a mount target in one of the subnets. EC2 instances do not need to be in the same subnet as the mount target in order to access their file system.

filesystemid (string) - ID of the file system for which to create the mount target.

subnetid (string) - ID of the subnet to add the mount target in.

ipaddress

(string) - Valid IPv4 address within the address range of the specified subnet.

securitygroups

(list[string]) - Up to five VPC security group IDs, of the form sg-xxxxxxxx. These must be for the same VPC as subnet specified.

returns (dict) - A dict of the response data

CLI Example:

```
salt 'my-minion' boto_efs.create_mount_target filesystemid subnetid
```

salt.modules.boto_efs.**create_tags**(*filesystemid*, *tags*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Creates or overwrites tags associated with a file system. Each tag is a key-value pair. If a tag key specified in the request already exists on the file system, this operation overwrites its value with the value provided in the request.

filesystemid (string) - ID of the file system for whose tags will be modified.

tags (dict) - The tags to add to the file system

CLI Example:

```
salt 'my-minion' boto_efs.create_tags
```

salt.modules.boto_efs.**delete_file_system**(*filesystemid*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Deletes a file system, permanently severing access to its contents. Upon return, the file system no longer exists and you can't access any contents of the deleted file system. You can't delete a file system that is in use. That is, if the file system has any mount targets, you must first delete them.

filesystemid (string) - ID of the file system to delete.

CLI Example:

```
salt 'my-minion' boto_efs.delete_file_system filesystemid
```

salt.modules.boto_efs.**delete_mount_target**(*mounttargetid*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Deletes the specified mount target.

This operation forcibly breaks any mounts of the file system via the mount target that is being deleted, which might disrupt instances or applications using those mounts. To avoid applications getting cut off abruptly, you might consider unmounting any mounts of the mount target, if feasible. The operation also deletes the associated network interface. Uncommitted writes may be lost, but breaking a mount target using this operation does not corrupt the file system itself. The file system you created remains. You can mount an EC2 instance in your VPC via another mount target.
mounttargetid (string) - ID of the mount target to delete
CLI Example:

```
salt 'my-minion' boto_efs.delete_mount_target mounttargetid
```

salt.modules.boto_efs.**delete_tags**(*filesystemid*, *tags*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Deletes the specified tags from a file system.
filesystemid (string) - ID of the file system for whose tags will be removed.
tags (list[string]) - The tag keys to delete to the file system
CLI Example:

```
salt 'my-minion' boto_efs.delete_tags
```

salt.modules.boto_efs.**get_file_systems**(*filesystemid=None*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Get all EFS properties or a specific instance property if filesystemid is specified
filesystemid (string) - ID of the file system to retrieve properties
returns (list[dict]) - list of all elastic file system properties
CLI Example:

```
salt 'my-minion' boto_efs.get_file_systems efs-id
```

salt.modules.boto_efs.**get_mount_targets**(*filesystemid=None*, *mounttargetid=None*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Get all the EFS mount point properties for a specific filesystemid or the properties for a specific mounttargetid. One or the other must be specified
filesystemid

(string) - ID of the file system whose mount targets to list Must be specified if mounttargetid is not

mounttargetid

(string) - ID of the mount target to have its properties returned Must be specified if filesystemid is not

returns (list[dict]) - list of all mount point properties
CLI Example:

```
salt 'my-minion' boto_efs.get_mount_targets
```

salt.modules.boto_efs.**get_tags**(*filesystemid*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Return the tags associated with an EFS instance.
filesystemid (string) - ID of the file system whose tags to list
returns (list) - list of tags as key/value pairs

CLI Example:

```
salt 'my-minion' boto_efs.get_tags efs-id
```

salt.modules.boto_efs.**set_security_groups**(*mounttargetid*, *securitygroup*, *keyid=None*, *key=None*, *profile=None*, *region=None*, ***kwargs*)

Modifies the set of security groups in effect for a mount target
mounttargetid (string) - ID of the mount target whose security groups will be modified
securitygroups (list[string]) - list of no more than 5 VPC security group IDs.
CLI Example:

```
salt 'my-minion' boto_efs.set_security_groups my-mount-target-id my-sec-group
```

19.9.40 salt.modules.boto_elasticache

Connection module for Amazon Elasticache

New in version 2014.7.0.

configuration This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elasticache.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_elasticache.**authorize_cache_security_group_ingress**(*name*, *ec2_security_group_name*, *ec2_security_group_owner_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Authorize network ingress from an ec2 security group to a cache security group.

CLI example:

```
salt myminion boto_elasticache.authorize_cache_security_group_ingress
↪myelasticachesg myec2sg 879879
```

salt.modules.boto_elasticache.**create**(*name*, *num_cache_nodes=None*, *engine=None*, *cache_node_type=None*, *replication_group_id=None*, *engine_version=None*, *cache_parameter_group_name=None*, *cache_subnet_group_name=None*, *cache_security_group_names=None*, *security_group_ids=None*, *snapshot_arns=None*, *preferred_availability_zone=None*, *preferred_maintenance_window=None*, *port=None*, *notification_topic_arn=None*, *auto_minor_version_upgrade=None*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a cache cluster.

CLI example:

```
salt myminion boto_elasticache.create myelasticache 1 redis cache.t1.micro
cache_security_group_names='["myelasticachesg"]'
```

salt.modules.boto_elasticache.**create_cache_security_group**(*name*, *description*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a cache security group.

CLI example:

```
salt myminion boto_elasticache.create_cache_security_group myelasticachesg 'My
↪Cache Security Group'
```

salt.modules.boto_elasticache.**create_replication_group**(*name*, *primary_cluster_id*, *replication_group_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create replication group.

CLI example:

```
salt myminion boto_elasticache.create_replication_group myelasticache
↪myprimarycluster description
```

salt.modules.boto_elasticache.**create_subnet_group**(*name*, *description*, *subnet_ids=None*, *subnet_names=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an ElastiCache subnet group

CLI example to create an ElastiCache subnet group:

```
salt myminion boto_elasticache.create_subnet_group my-subnet-group
 ↪"group description" subnet_ids='[subnet-12345678, subnet-87654321]'
 ↪region=us-east-1
```

salt.modules.boto_elasticache.**delete**(*name*, *wait=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a cache cluster.

CLI example:

```
salt myminion boto_elasticache.delete myelasticache
```

salt.modules.boto_elasticache.**delete_cache_security_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a cache security group.

CLI example:

```
salt myminion boto_elasticache.delete_cache_security_group myelasticachesg 'My
 ↪Cache Security Group'
```

salt.modules.boto_elasticache.**delete_replication_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an ElastiCache replication group.

CLI example:

```
salt myminion boto_elasticache.delete_replication_group my-replication-group
 ↪           region=us-east-1
```

salt.modules.boto_elasticache.**delete_subnet_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an ElastiCache subnet group.

CLI example:

```
salt myminion boto_elasticache.delete_subnet_group my-subnet-group
 ↪region=us-east-1
```

salt.modules.boto_elasticache.**describe_replication_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *parameter=None*)

Get replication group information.

CLI example:

```
salt myminion boto_elasticache.describe_replication_group mygroup
```

salt.modules.boto_elasticache.**exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a cache cluster exists.

CLI example:

```
salt myminion boto_elasticache.exists myelasticache
```

salt.modules.boto_elasticache.**get_all_cache_subnet_groups**(*name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all cache subnet groups with details

CLI example:

```
salt myminion boto_elasticache.get_all_subnet_groups region=us-east-1
```

salt.modules.boto_elasticache.**get_cache_subnet_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get information about a cache subnet group.

CLI example:

```
salt myminion boto_elasticache.get_cache_subnet_group mycache_subnet_group
```

salt.modules.boto_elasticache.**get_config**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the configuration for a cache cluster.

CLI example:

```
salt myminion boto_elasticache.get_config myelasticache
```

salt.modules.boto_elasticache.**get_group_host**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get hostname from replication cache group

CLI example:

```
salt myminion boto_elasticache.get_group_host myelasticachegroup
```

salt.modules.boto_elasticache.**get_node_host**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get hostname from cache node

CLI example:

```
salt myminion boto_elasticache.get_node_host myelasticache
```

salt.modules.boto_elasticache.**group_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if a replication group exists.

CLI example:

```
salt myminion boto_elasticache.group_exists myelasticache
```

salt.modules.boto_elasticache.**list_cache_subnet_groups**(*name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all cache subnet group names

CLI example:

```
salt myminion boto_elasticache.list_subnet_groups region=us-east-1
```

salt.modules.boto_elasticache.**revoke_cache_security_group_ingress**(*name*, *ec2_security_group_name*, *ec2_security_group_owner_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Revoke network ingress from an ec2 security group to a cache security group.

CLI example:

```
salt myminion boto_elasticache.revoke_cache_security_group_ingress
↪myelasticachesg myec2sg 879879
```

salt.modules.boto_elasticache.**subnet_group_exists**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ElastiCache subnet group exists.

CLI example:

```
salt myminion boto_elasticache.subnet_group_exists my-param-group
↪region=us-east-1
```

19.9.41 salt.modules.boto_elasticsearch_domain module

Connection module for Amazon Elasticsearch Service

New in version 2016.11.0.

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_function*) return:

```
domain:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

depends boto3

salt.modules.boto_elasticsearch_domain.**add_tags**(*DomainName=None*, *ARN=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Add tags to a domain

Returns {tagged: true} if the domain was tagged and returns {tagged: False} if the domain was not tagged.

CLI Example:

```
salt myminion boto_elasticsearch_domain.add_tags mydomain tag_a=tag_value tag_
↪b=tag_value
```

salt.modules.boto_elasticsearch_domain.**create**(*DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *ElasticsearchVersion=None*)

Given a valid config, create a domain.

Returns {created: true} if the domain was created and returns {created: False} if the domain was not created.

CLI Example:

```
salt myminion boto_elasticsearch_domain.create mydomain \
      {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
      'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
```

```
      {'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
      'Iops': 0} \
      {"Version": "2012-10-17", "Statement": [{"Effect": "Allow", "Principal": {
↪"AWS": "*"}, "Action": "es:*", \
       "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
       "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]} \
      {"AutomatedSnapshotStartHour": 0} \
      {"rest.action.multi.allow_explicit_index": "true"}
```

salt.modules.boto_elasticsearch_domain.**delete**(*DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a domain name, delete it.

Returns {deleted: true} if the domain was deleted and returns {deleted: false} if the domain was not deleted.

CLI Example:

```
salt myminion boto_elasticsearch_domain.delete mydomain
```

salt.modules.boto_elasticsearch_domain.**describe**(*DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a domain name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.describe mydomain
```

salt.modules.boto_elasticsearch_domain.**exists**(*DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a domain name, check to see if the given domain exists.

Returns True if the given domain exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_elasticsearch_domain.exists mydomain
```

salt.modules.boto_elasticsearch_domain.**list_tags**(*DomainName=None*, *ARN=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List tags of a trail

Returns

- {...}
- {...}

Return type tags

CLI Example:

```
salt myminion boto_cloudtrail.list_tags my_trail
```

salt.modules.boto_elasticsearch_domain.**remove_tags**(*TagKeys*, *DomainName=None*, *ARN=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove tags from a trail

Returns {tagged: true} if the trail was tagged and returns {tagged: False} if the trail was not tagged.

CLI Example:

```
salt myminion boto_cloudtrail.remove_tags my_trail tag_a=tag_value tag_b=tag_value
```

salt.modules.boto_elasticsearch_domain.**status**(*DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a domain name describe its status.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_elasticsearch_domain.status mydomain
```

salt.modules.boto_elasticsearch_domain.**update**(*DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the named domain to the configuration.

Returns {updated: true} if the domain was updated and returns {updated: False} if the domain was not updated.

CLI Example:

```
salt myminion boto_elasticsearch_domain.update mydomain \
      {'InstanceType': 't2.micro.elasticsearch', 'InstanceCount': 1, \
      'DedicatedMasterEnabled': false, 'ZoneAwarenessEnabled': false} \
      {'EBSEnabled': true, 'VolumeType': 'gp2', 'VolumeSize': 10, \
      'Iops': 0} \
      {"Version": "2012-10-17", "Statement": [{"Effect": "Allow", "Principal": {
↪"AWS": "*"}, "Action": "es:*", \
       "Resource": "arn:aws:es:us-east-1:111111111111:domain/mydomain/*", \
       "Condition": {"IpAddress": {"aws:SourceIp": ["127.0.0.1"]}}}]} \
      {"AutomatedSnapshotStartHour": 0} \
      {"rest.action.multi.allow_explicit_index": "true"}
```

19.9.42 salt.modules.boto_elb

Connection module for Amazon ELB

New in version 2014.7.0.

configuration This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
elb.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto >= 2.33.0

salt.modules.boto_elb.**apply_security_groups**(*name*, *security_groups*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Apply security groups to ELB.

CLI example:

```
salt myminion boto_elb.apply_security_groups myelb '["mysecgroup1"]'
```

salt.modules.boto_elb.**attach_subnets**(*name*, *subnets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach ELB to subnets.

CLI example:

```
salt myminion boto_elb.attach_subnets myelb '["mysubnet"]'
```

salt.modules.boto_elb.**create**(*name*, *availability_zones*, *listeners*, *subnets=None*, *security_groups=None*, *scheme='internet-facing'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an ELB

CLI example to create an ELB:

```
salt myminion boto_elb.create myelb '["us-east-1a", "us-east-1e"]' '{"elb_port":
↪443, "elb_protocol": "HTTPS", ...}' region=us-east-1
```

salt.modules.boto_elb.**create_listeners**(*name*, *listeners*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create listeners on an ELB.

CLI example:

```
salt myminion boto_elb.create_listeners myelb '[["HTTPS", "HTTP", 443, 80, "arn:
↪aws:iam::11  11111:server-certificate/mycert"]]'
```

salt.modules.boto_elb.**create_policy**(*name*, *policy_name*, *policy_type*, *policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an ELB policy.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.create_policy myelb mypolicy LBCookieStickinessPolicyType '
↪{"CookieExpirationPeriod": 3600}'
```

salt.modules.boto_elb.**delete**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an ELB.

CLI example to delete an ELB:

```
salt myminion boto_elb.delete myelb region=us-east-1
```

salt.modules.boto_elb.**delete_listeners**(*name*, *ports*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete listeners on an ELB.

CLI example:

```
salt myminion boto_elb.delete_listeners myelb '[80,443]'
```

salt.modules.boto_elb.**delete_policy**(*name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an ELB policy.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.delete_policy myelb mypolicy
```

salt.modules.boto_elb.**delete_tags**(*name*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add the tags on an ELB
name name of the ELB
tags list of tags to remove
CLI Example:

```
salt myminion boto_elb.delete_tags my-elb-name ['TagToRemove1', 'TagToRemove2']
```

salt.modules.boto_elb.**deregister_instances**(*name*, *instances*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deregister instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:

- `True`: instance(s) deregistered successfully
- `False`: instance(s) failed to be deregistered
- `None`: instance(s) not valid or not registered, no action taken

CLI example:

```
salt myminion boto_elb.deregister_instances myelb instance_id
salt myminion boto_elb.deregister_instances myelb "[instance_id, instance_id]"
```

salt.modules.boto_elb.**detach_subnets**(*name*, *subnets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach ELB from subnets.

CLI example:

```
salt myminion boto_elb.detach_subnets myelb '["mysubnet"]'
```

salt.modules.boto_elb.**disable_availability_zones**(*name*, *availability_zones*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disable availability zones for ELB.

CLI example:

```
salt myminion boto_elb.disable_availability_zones myelb '["us-east-1a"]'
```

salt.modules.boto_elb.**enable_availability_zones**(*name*, *availability_zones*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Enable availability zones for ELB.

CLI example:

```
salt myminion boto_elb.enable_availability_zones myelb '["us-east-1a"]'
```

salt.modules.boto_elb.**exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an ELB exists.

CLI example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

salt.modules.boto_elb.**get_all_elbs**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Return all load balancers associated with an account

CLI example:

```
salt myminion boto_elb.get_all_elbs region=us-east-1
```

salt.modules.boto_elb.**get_attributes**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if attributes are set on an ELB.

CLI example:

```
salt myminion boto_elb.get_attributes myelb
```

salt.modules.boto_elb.**get_elb_config**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an ELB configuration.

CLI example:

```
salt myminion boto_elb.exists myelb region=us-east-1
```

salt.modules.boto_elb.**get_health_check**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the health check configured for this ELB.

CLI example:

```
salt myminion boto_elb.get_health_check myelb
```

salt.modules.boto_elb.**get_instance_health**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *instances=None*)

Get a list of instances and their health state

CLI example:

```
salt myminion boto_elb.get_instance_health myelb
salt myminion boto_elb.get_instance_health myelb region=us-east-1 instances=
↪"[instance_id,instance_id]"
```

salt.modules.boto_elb.**list_elbs**(*region=None*, *key=None*, *keyid=None*, *profile=None*)
Return names of all load balancers associated with an account

CLI example:

```
salt myminion boto_elb.list_elbs region=us-east-1
```

salt.modules.boto_elb.**listener_dict_to_tuple**(*listener*)
Convert an ELB listener dict into a listener tuple used by certain parts of the AWS ELB API.

CLI example:

```
salt myminion boto_elb.listener_dict_to_tuple '{"elb_port":80,"instance_port":80,
↪"elb_protocol":"HTTP"}'
```

salt.modules.boto_elb.**register_instances**(*name*, *instances*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Register instances with an ELB. Instances is either a string instance id or a list of string instance id's.

Returns:

- `True`: instance(s) registered successfully
- `False`: instance(s) failed to be registered

CLI example:

```
salt myminion boto_elb.register_instances myelb instance_id
salt myminion boto_elb.register_instances myelb "[instance_id,instance_id]"
```

salt.modules.boto_elb.**set_attributes**(*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Set attributes on an ELB.
name (string) Name of the ELB instance to set attributes for
attributes A dict of attributes to set.

Valid attributes are:

access_log (dict)

enabled (bool) Enable storage of access logs.

s3_bucket_name (string) The name of the S3 bucket to place logs.

s3_bucket_prefix (string) Prefix for the log file name.

emit_interval (int) Interval for storing logs in S3 in minutes. Valid values are 5 and 60.

connection_draining (dict)

enabled (bool) Enable connection draining.

timeout (int) Maximum allowed time in seconds for sending existing connections to an instance that is deregistering or unhealthy. Default is 300.

cross_zone_load_balancing (dict)

enabled (bool) Enable cross-zone load balancing.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_attributes myelb '{"access_log": {"enabled": "true",
↪"s3_bucket_name": "mybucket", "s3_bucket_prefix": "mylogs/", "emit_interval": "5
↪"}}' region=us-east-1
```

salt.modules.boto_elb.**set_backend_policy**(*name*, *port*, *policies=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Set the policies of an ELB backend server.

CLI example:

salt myminion boto_elb.set_backend_policy myelb 443 ``[policy1,policy2]"

salt.modules.boto_elb.**set_health_check**(*name*, *health_check*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Set attributes on an ELB.

CLI example to set attributes on an ELB:

```
salt myminion boto_elb.set_health_check myelb '{"target": "HTTP:80/"}'
```

salt.modules.boto_elb.**set_instances**(*name*, *instances*, *test=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Set the instances assigned to an ELB to exactly the list given

CLI example:

```
salt myminion boto_elb.set_instances myelb region=us-east-1 instances="[instance_
↪id,instance_id]"
```

salt.modules.boto_elb.**set_listener_policy**(*name*, *port*, *policies=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Set the policies of an ELB listener.

New in version 2016.3.0.

CLI example:

```
salt myminion boto_elb.set_listener_policy myelb 443 "[policy1,policy2]"
```

salt.modules.boto_elb.**set_tags**(*name*, *tags*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add the tags on an ELB

New in version 2016.3.0.

name name of the ELB

tags dict of name/value pair tags

CLI Example:

```
salt myminion boto_elb.set_tags my-elb-name "{'Tag1': 'Value', 'Tag2': 'Another
↪Value'}"
```

19.9.43 salt.modules.boto_elbv2 module

Connection module for Amazon ALB

New in version 2017.7.0.

configuration This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

salt.modules.boto_elbv2.**deregister_targets**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deregister targets to a target froup of an ALB. `targets` is either a instance id string or a list of instance id's.

Returns:

- `True`: instance(s) deregistered successfully
- `False`: instance(s) failed to be deregistered

CLI example:

```
salt myminion boto_elbv2.deregister_targets myelb instance_id
salt myminion boto_elbv2.deregister_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.**describe_target_health**(*name*, *targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the curret health check status for targets in a target group.

CLI example:

```
salt myminion boto_elbv2.describe_target_health arn:aws:elasticloadbalancing:us-
↪west-2:644138682826:targetgroup/learn1give1-api/414788a16b5cf163 targets=["i-
↪isdf23ifjf"]
```

salt.modules.boto_elbv2.**register_targets**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Register targets to a target froup of an ALB. `targets` is either a instance id string or a list of instance id's.

Returns:

- `True`: instance(s) registered successfully
- `False`: instance(s) failed to be registered

CLI example:

```
salt myminion boto_elbv2.register_targets myelb instance_id
salt myminion boto_elbv2.register_targets myelb "[instance_id,instance_id]"
```

salt.modules.boto_elbv2.**target_group_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an target group exists.

CLI example:

```
salt myminion boto_elbv2.exists arn:aws:elasticloadbalancing:us-west-2:
↪644138682826:targetgroup/learn1give1-api/414788a16b5cf163
```

19.9.44 salt.modules.boto_iam

Connection module for Amazon IAM

New in version 2014.7.0.

configuration This module accepts explicit iam credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
iam.region: us-east-1
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_iam.**add_user_to_group**(*user_name*, *group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add user to group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.add_user_to_group myuser mygroup
```

salt.modules.boto_iam.**associate_profile_to_role**(*profile_name*, *role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Associate an instance profile with an IAM role.

CLI Example:

```
salt myminion boto_iam.associate_profile_to_role myirole myiprofile
```

salt.modules.boto_iam.**attach_group_policy**(*policy_name*, *group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.attach_group_policy mypolicy mygroup
```

salt.modules.boto_iam.**attach_role_policy**(*policy_name*, *role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.attach_role_policy mypolicy myrole
```

salt.modules.boto_iam.**attach_user_policy**(*policy_name*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.attach_user_policy mypolicy myuser
```

salt.modules.boto_iam.**build_policy**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Build a default assume role policy.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.build_policy
```

salt.modules.boto_iam.**create_access_key**(*user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create access key id for a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_access_key myuser
```

salt.modules.boto_iam.**create_group**(*group_name*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_group group
```

salt.modules.boto_iam.**create_instance_profile**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an instance profile.

CLI Example:

```
salt myminion boto_iam.create_instance_profile myiprofile
```

salt.modules.boto_iam.**create_login_profile**(*user_name*, *password*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a login profile for the specified user, give the user the ability to access AWS services and the AWS Management Console.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_login_profile user_name password
```

salt.modules.boto_iam.**create_policy**(*policy_name*, *policy_document*, *path=None*, *description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a policy.

CLI Example:

```
salt myminios boto_iam.create_policy mypolicy '{"Version": "2012-10-17",
↪"Statement": [{ "Effect": "Allow", "Action": ["s3:Get*", "s3:List*"], "Resource
↪": ["arn:aws:s3:::my-bucket/shared/*"]},]}'
```

salt.modules.boto_iam.**create_policy_version**(*policy_name*, *policy_document*, *set_as_default=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a policy version.

CLI Example:

```
salt myminios boto_iam.create_policy_version mypolicy '{"Version": "2012-10-17",
↪"Statement": [{ "Effect": "Allow", "Action": ["s3:Get*", "s3:List*"], "Resource
↪": ["arn:aws:s3:::my-bucket/shared/*"]},]}'
```

salt.modules.boto_iam.**create_role**(*name*, *policy_document=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an instance role.

CLI Example:

```
salt myminion boto_iam.create_role myrole
```

salt.modules.boto_iam.**create_role_policy**(*role_name*, *policy_name*, *policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create or modify a role policy.

CLI Example:

```
salt myminion boto_iam.create_role_policy myirole mypolicy '{"MyPolicy":
↪"Statement": [{"Action": ["sqs:*"], "Effect": "Allow", "Resource": ["arn:aws:
↪sqs:*:*:*"], "Sid": "MyPolicySqs1"}]}'
```

salt.modules.boto_iam.**create_saml_provider**(*name*, *saml_metadata_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create SAML provider

CLI Example:

```
salt myminion boto_iam.create_saml_provider my_saml_provider_name saml_metadata_
↪document
```

salt.modules.boto_iam.**create_user**(*user_name*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.create_user myuser
```

salt.modules.boto_iam.**deactivate_mfa_device**(*user_name*, *serial*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deactivates the specified MFA device and removes it from association with the user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.deactivate_mfa_device user_name serial_num
```

salt.modules.boto_iam.**delete_access_key**(*access_key_id*, *user_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete access key id from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_access_key myuser
```

salt.modules.boto_iam.**delete_group**(*group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a group policy.

CLI Example:

```
.. code-block:: bash
```

salt myminion boto_iam.delete_group mygroup

salt.modules.boto_iam.**delete_group_policy**(*group_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a group policy.

CLI Example:

```
.. code-block:: bash
```

salt myminion boto_iam.delete_group_policy mygroup mypolicy

salt.modules.boto_iam.**delete_instance_profile**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an instance profile.

CLI Example:

```
salt myminion boto_iam.delete_instance_profile myiprofile
```

salt.modules.boto_iam.**delete_login_profile**(*user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a login profile for the specified user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.delete_login_profile user_name
```

salt.modules.boto_iam.**delete_policy**(*policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a policy.

CLI Example:

```
salt myminion boto_iam.delete_policy mypolicy
```

salt.modules.boto_iam.**delete_policy_version**(*policy_name*, *version_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a policy version.

CLI Example:

```
salt myminion boto_iam.delete_policy_version mypolicy v1
```

salt.modules.boto_iam.**delete_role**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an IAM role.

CLI Example:

```
salt myminion boto_iam.delete_role myirole
```

salt.modules.boto_iam.**delete_role_policy**(*role_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a role policy.

CLI Example:

```
salt myminion boto_iam.delete_role_policy myirole mypolicy
```

salt.modules.boto_iam.**delete_saml_provider**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete SAML provider

CLI Example:

```
salt myminion boto_iam.delete_saml_provider my_saml_provider_name
```

salt.modules.boto_iam.**delete_server_cert**(*cert_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a certificate from Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_server_cert mycert_name
```

salt.modules.boto_iam.**delete_user**(*user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.delete_user myuser
```

salt.modules.boto_iam.**delete_user_policy**(*user_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a user policy.

CLI Example:

```
salt myminion boto_iam.delete_user_policy myuser mypolicy
```

salt.modules.boto_iam.**describe_role**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get information for a role.

CLI Example:

```
salt myminion boto_iam.describe_role myirole
```

salt.modules.boto_iam.**detach_group_policy**(*policy_name*, *group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach a managed policy to a group.

CLI Example:

```
salt myminion boto_iam.detach_group_policy mypolicy mygroup
```

salt.modules.boto_iam.**detach_role_policy**(*policy_name*, *role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach a managed policy to a role.

CLI Example:

```
salt myminion boto_iam.detach_role_policy mypolicy myrole
```

salt.modules.boto_iam.**detach_user_policy**(*policy_name*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach a managed policy to a user.

CLI Example:

```
salt myminion boto_iam.detach_user_policy mypolicy myuser
```

salt.modules.boto_iam.**disassociate_profile_from_role**(*profile_name*, *role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disassociate an instance profile from an IAM role.

CLI Example:

```
salt myminion boto_iam.disassociate_profile_from_role myirole myiprofile
```

salt.modules.boto_iam.**export_roles**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all IAM role details. Produces results that can be used to create an sls file.

CLI Example:

salt-call boto_iam.export_roles --out=txt | sed ``s/local: //'' > iam_roles.sls

salt.modules.boto_iam.**export_users**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all IAM user details. Produces results that can be used to create an sls file.

New in version 2016.3.0.

CLI Example:

salt-call boto_iam.export_users --out=txt | sed ``s/local: //'' > iam_users.sls

salt.modules.boto_iam.**get_account_id**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a the AWS account id associated with the used credentials.

CLI Example:

```
salt myminion boto_iam.get_account_id
```

salt.modules.boto_iam.**get_account_policy**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

Get account policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_account_policy
```

salt.modules.boto_iam.**get_all_access_keys**(*user_name*, *marker=None*, *max_items=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all access keys from a user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_all_access_keys myuser
```

salt.modules.boto_iam.**get_all_group_policies**(*group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a list of policy names from a group.

CLI Example:

```
salt myminion boto_iam.get_all_group_policies mygroup
```

salt.modules.boto_iam.**get_all_groups**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get and return all IAM group details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

salt-call boto_iam.get_all_groups

salt.modules.boto_iam.**get_all_instance_profiles**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get and return all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

salt-call boto_iam.get_all_instance_profiles

salt.modules.boto_iam.**get_all_mfa_devices**(*user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all MFA devices associated with an IAM user.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.get_all_mfa_devices user_name
```

salt.modules.boto_iam.**get_all_roles**(*path_prefix=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get and return all IAM role details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

salt-call boto_iam.get_all_roles

salt.modules.boto_iam.**get_all_user_policies**(*user_name*, *marker=None*, *max_items=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get all user policies.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

salt.modules.boto_iam.**get_all_users**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get and return all IAM user details, starting at the optional path.

New in version 2016.3.0.

CLI Example:

salt-call boto_iam.get_all_users

salt.modules.boto_iam.**get_group**(*group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get group information.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

salt.modules.boto_iam.**get_group_members**(*group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get group information.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_iam.get_group mygroup
```

salt.modules.boto_iam.**get_group_policy**(*group_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieves the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_group_policy mygroup policyname
```

salt.modules.boto_iam.**get_policy**(*policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.**get_policy_version**(*policy_name*, *version_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.**get_role_policy**(*role_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a role policy.

CLI Example:

```
salt myminion boto_iam.get_role_policy myirole mypolicy
```

salt.modules.boto_iam.**get_saml_provider**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get SAML provider document.

CLI Example:

```
salt myminion boto_iam.get_saml_provider arn
```

salt.modules.boto_iam.**get_saml_provider_arn**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get SAML provider

CLI Example:

```
salt myminion boto_iam.get_saml_provider_arn my_saml_provider_name
```

salt.modules.boto_iam.**get_server_certificate**(*cert_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns certificate information from Amazon

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_server_certificate mycert_name
```

salt.modules.boto_iam.**get_user**(*user_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get user information.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_user myuser
```

salt.modules.boto_iam.**get_user_policy**(*user_name*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Retrieves the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.get_user_policy myuser mypolicyname
```

salt.modules.boto_iam.**instance_profile_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an instance profile exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.**list_attached_group_policies**(*group_name*, *path_prefix=None*, *entity_filter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List entities attached to the given group.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.**list_attached_role_policies**(*role_name*, *path_prefix=None*, *entity_filter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List entities attached to the given role.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.**list_attached_user_policies**(*user_name*, *path_prefix=None*, *entity_filter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List entities attached to the given user.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.**list_entities_for_policy**(*policy_name*, *path_prefix=None*, *entity_filter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List entities that a policy is attached to.

CLI Example:

```
salt myminion boto_iam.list_entities_for_policy mypolicy
```

salt.modules.boto_iam.**list_instance_profiles**(*path_prefix='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List all IAM instance profiles, starting at the optional path.

New in version 2016.11.0.

CLI Example:

salt-call boto_iam.list_instance_profiles

salt.modules.boto_iam.**list_policies**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List policies.

CLI Example:

```
salt myminion boto_iam.list_policies
```

salt.modules.boto_iam.**list_policy_versions**(*policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List versions of a policy.

CLI Example:

```
salt myminion boto_iam.list_policy_versions mypolicy
```

salt.modules.boto_iam.**list_role_policies**(*role_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a list of policy names from a role.

CLI Example:

```
salt myminion boto_iam.list_role_policies myirole
```

salt.modules.boto_iam.**list_saml_providers**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List SAML providers.

CLI Example:

```
salt myminion boto_iam.list_saml_providers
```

salt.modules.boto_iam.**policy_exists**(*policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.**policy_version_exists**(*policy_name*, *version_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if policy exists.

CLI Example:

```
salt myminion boto_iam.instance_profile_exists myiprofile
```

salt.modules.boto_iam.**profile_associated**(*role_name*, *profile_name*, *region*, *key*, *keyid*, *profile*)

Check to see if an instance profile is associated with an IAM role.

CLI Example:

```
salt myminion boto_iam.profile_associated myirole myiprofile
```

salt.modules.boto_iam.**put_group_policy**(*group_name*, *policy_name*, *policy_json*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Adds or updates the specified policy document for the specified group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_group_policy mygroup policyname policyrules
```

salt.modules.boto_iam.**put_user_policy**(*user_name*, *policy_name*, *policy_json*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Adds or updates the specified policy document for the specified user.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.put_user_policy myuser policyname policyrules
```

salt.modules.boto_iam.**remove_user_from_group**(*group_name*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove user from group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.remove_user_from_group mygroup myuser
```

salt.modules.boto_iam.**role_exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an IAM role exists.

CLI Example:

```
salt myminion boto_iam.role_exists myirole
```

salt.modules.boto_iam.**set_default_policy_version**(*policy_name*, *version_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Set the default version of a policy.

CLI Example:

```
salt myminion boto_iam.set_default_policy_version mypolicy v1
```

salt.modules.boto_iam.**update_account_password_policy**(*allow_users_to_change_password=None*, *hard_expiry=None*, *max_password_age=None*, *minimum_password_length=None*, *password_reuse_prevention=None*, *require_lowercase_characters=None*, *require_numbers=None*, *require_symbols=None*, *require_uppercase_characters=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the password policy for the AWS account.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_account_password_policy True
```

salt.modules.boto_iam.**update_assume_role_policy**(*role_name*, *policy_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update an assume role policy for a role.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.update_assume_role_policy myrole '{"Statement":"..."}'
```

salt.modules.boto_iam.**update_saml_provider**(*name*, *saml_metadata_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update SAML provider.

CLI Example:

```
salt myminion boto_iam.update_saml_provider my_saml_provider_name saml_metadata_
↪document
```

salt.modules.boto_iam.**upload_server_cert**(*cert_name*, *cert_body*, *private_key*, *cert_chain=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Upload a certificate to Amazon.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.upload_server_cert mycert_name crt priv_key
```

Parameters

- **cert_name** -- The name for the server certificate. Do not include the path in this value.
- **cert_body** -- The contents of the public key certificate in PEM-encoded format.
- **private_key** -- The contents of the private key in PEM-encoded format.
- **cert_chain** -- The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
- **path** -- The path for the server certificate.
- **region** -- The name of the region to connect to.
- **key** -- The key to be used in order to connect
- **keyid** -- The keyid to be used in order to connect
- **profile** -- The profile that contains a dict of region, key, keyid

Returns True / False

salt.modules.boto_iam.**user_exists_in_group**(*user_name*, *group_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if user exists in group.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_iam.user_exists_in_group myuser mygroup
```

19.9.45 salt.modules.boto_iot module

Connection module for Amazon IoT

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
iot.keyid: GKTADJGHEIQSXMKKRBJ08H
iot.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
iot.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

salt.modules.boto_iot.**attach_principal_policy**(*policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach the specified policy to the specified principal (certificate or other credential.)

Returns {attached: true} if the policy was attached {attached: False} if the policy was not attached.

CLI Example:

```
salt myminion boto_iot.attach_principal_policy mypolicy mycognitoID
```

salt.modules.boto_iot.**create_policy**(*policyName*, *policyDocument*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a policy.

Returns {created: true} if the policy was created and returns {created: False} if the policy was not created.

CLI Example:

```
salt myminion boto_iot.create_policy my_policy \
      '{"Version":"2015-12-12",\
      "Statement":[{"Effect":"Allow",\
```

```
                    "Action":["iot:Publish"],\
                    "Resource":["arn:::::topic/foo/bar"]}]}'
```

salt.modules.boto_iot.**create_policy_version**(*policyName*, *policyDocument*, *setAsDefault=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a new version of a policy.

Returns {created: true} if the policy version was created and returns {created: False} if the policy version was not created.

CLI Example:

```
salt myminion boto_iot.create_policy_version my_policy \
      '{"Statement":[{"Effect":"Allow","Action":["iot:Publish"],"Resource":["arn:
↪::::topic/foo/bar"]}]}'
```

salt.modules.boto_iot.**create_thing_type**(*thingTypeName*, *thingTypeDescription*, *searchableAttributesList*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a thing type.

Returns {created: true} if the thing type was created and returns {created: False} if the thing type was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.create_thing_type mythingtype \
     thingtype_description_string '["searchable_attr_1", "searchable_attr_2"]'
```

salt.modules.boto_iot.**create_topic_rule**(*ruleName*, *sql*, *actions*, *description*, *ruleDisabled=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create a topic rule.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.create_topic_rule my_rule "SELECT * FROM 'some/thing'" \
    '[{"lambda":{"functionArn":"arn:::::something"}},{"sns":{\
    "targetArn":"arn:::::something","roleArn":"arn:::::something"}}]'
```

salt.modules.boto_iot.**delete_policy**(*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name, delete it.

Returns {deleted: true} if the policy was deleted and returns {deleted: false} if the policy was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy mypolicy
```

salt.modules.boto_iot.**delete_policy_version**(*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name and version, delete it.

Returns {deleted: true} if the policy version was deleted and returns {deleted: false} if the policy version was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_policy_version mypolicy version
```

salt.modules.boto_iot.**delete_thing_type**(*thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name, delete it.

Returns {deleted: true} if the thing type was deleted and returns {deleted: false} if the thing type was not deleted.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.delete_thing_type mythingtype
```

salt.modules.boto_iot.**delete_topic_rule**(*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name, delete it.

Returns {deleted: true} if the rule was deleted and returns {deleted: false} if the rule was not deleted.

CLI Example:

```
salt myminion boto_iot.delete_rule myrule
```

salt.modules.boto_iot.**deprecate_thing_type**(*thingTypeName*, *undoDeprecate=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name, deprecate it when undoDeprecate is False and undeprecate it when undoDeprecate is True.

Returns {deprecated: true} if the thing type was deprecated and returns {deprecated: false} if the thing type was not deprecated.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.deprecate_thing_type mythingtype
```

salt.modules.boto_iot.**describe_policy**(*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_policy mypolicy
```

salt.modules.boto_iot.**describe_policy_version**(*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name and version describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_policy_version mypolicy version
```

salt.modules.boto_iot.**describe_thing_type**(*thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name describe its properties.

Returns a dictionary of interesting properties.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.describe_thing_type mythingtype
```

salt.modules.boto_iot.**describe_topic_rule**(*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a topic rule name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_iot.describe_topic_rule myrule
```

salt.modules.boto_iot.**detach_principal_policy**(*policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Detach the specified policy from the specified principal (certificate or other credential.)

Returns {detached: true} if the policy was detached {detached: False} if the policy was not detached.

CLI Example:

```
salt myminion boto_iot.detach_principal_policy mypolicy mycognitoID
```

salt.modules.boto_iot.**list_policies**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all policies

Returns list of policies

CLI Example:

```
salt myminion boto_iot.list_policies
```

Example Return:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_iot.**list_policy_versions**(*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the versions available for the given policy.

CLI Example:

```
salt myminion boto_iot.list_policy_versions mypolicy
```

Example Return:

```
policyVersions:
  - {...}
  - {...}
```

salt.modules.boto_iot.**list_principal_policies**(*principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the policies attached to the given principal.

CLI Example:

```
salt myminion boto_iot.list_principal_policies myprincipal
```

Example Return:

```
policies:
  - {...}
  - {...}
```

salt.modules.boto_iot.**list_topic_rules**(*topic=None*, *ruleDisabled=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List all rules (for a given topic, if specified)

Returns list of rules

CLI Example:

```
salt myminion boto_iot.list_topic_rules
```

Example Return:

```
rules:
  - {...}
  - {...}
```

salt.modules.boto_iot.**policy_exists**(*policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name, check to see if the given policy exists.

Returns True if the given policy exists and returns False if the given policy does not exist.

CLI Example:

```
salt myminion boto_iot.policy_exists mypolicy
```

salt.modules.boto_iot.**policy_version_exists**(*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a policy name and version ID, check to see if the given policy version exists.

Returns True if the given policy version exists and returns False if the given policy version does not exist.

CLI Example:

```
salt myminion boto_iot.policy_version_exists mypolicy versionid
```

salt.modules.boto_iot.**replace_topic_rule**(*ruleName*, *sql*, *actions*, *description*, *ruleDisabled=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, replace a topic rule with the new values.

Returns {created: true} if the rule was created and returns {created: False} if the rule was not created.

CLI Example:

```
salt myminion boto_iot.replace_topic_rule my_rule 'SELECT * FROM some.thing' \
    '[{"lambda":{"functionArn":"arn:::::something"}},{"sns":{\
    "targetArn":"arn:::::something","roleArn":"arn:::::something"}}]'
```

salt.modules.boto_iot.**set_default_policy_version**(*policyName*, *policyVersionId*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Sets the specified version of the specified policy as the policy's default (operative) version. This action affects all certificates that the policy is attached to.

Returns {changed: true} if the policy version was set {changed: False} if the policy version was not set.

CLI Example:

```
salt myminion boto_iot.set_default_policy_version mypolicy versionid
```

salt.modules.boto_iot.**thing_type_exists**(*thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a thing type name, check to see if the given thing type exists

Returns True if the given thing type exists and returns False if the given thing type does not exist.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_iot.thing_type_exists mythingtype
```

salt.modules.boto_iot.**topic_rule_exists**(*ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a rule name, check to see if the given rule exists.

Returns True if the given rule exists and returns False if the given rule does not exist.

CLI Example:

```
salt myminion boto_iot.topic_rule_exists myrule
```

19.9.46 salt.modules.boto_kinesis module

Connection module for Amazon Kinesis

New in version 2017.7.0.

configuration This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance trough Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kinesis.keyid: GKTADJGHEIQSXMKKRBJ08H
kinesis.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kinesis.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

salt.modules.boto_kinesis.**create_stream**(*stream_name*, *num_shards*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a stream with name stream_name and initial number of shards num_shards.

CLI example:

```
salt myminion boto_kinesis.create_stream my_stream N region=us-east-1
```

salt.modules.boto_kinesis.**decrease_stream_retention_period**(*stream_name*, *retention_hours*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Decrease stream retention period to retention_hours

CLI example:

```
salt myminion boto_kinesis.decrease_stream_retention_period my_stream N region=us-
↪east-1
```

salt.modules.boto_kinesis.**delete_stream**(*stream_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the stream with name stream_name. This cannot be undone! All data will be lost!!

CLI example:

```
salt myminion boto_kinesis.delete_stream my_stream region=us-east-1
```

salt.modules.boto_kinesis.**disable_enhanced_monitoring**(*stream_name*, *metrics*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:

```
salt myminion boto_kinesis.disable_enhanced_monitoring my_stream ["metrics", "to
↪", "disable"] region=us-east-1
```

salt.modules.boto_kinesis.**enable_enhanced_monitoring**(*stream_name*, *metrics*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Enable enhanced monitoring for the specified shard-level metrics on stream stream_name

CLI example:

```
salt myminion boto_kinesis.enable_enhanced_monitoring my_stream ["metrics", "to",
↪"enable"] region=us-east-1
```

salt.modules.boto_kinesis.**exists**(*stream_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if the stream exists. Returns False and the error if it does not.

CLI example:

```
salt myminion boto_kinesis.exists my_stream region=us-east-1
```

salt.modules.boto_kinesis.**get_info_for_reshard**(*stream_details*)

Collect some data: number of open shards, key range, etc. Modifies stream_details to add a sorted list of OpenShards. Returns (min_hash_key, max_hash_key, stream_details)

CLI example:

```
salt myminion boto_kinesis.get_info_for_reshard existing_stream_details
```

salt.modules.boto_kinesis.**get_stream_when_active**(*stream_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get complete stream info from AWS, returning only when the stream is in the ACTIVE state. Continues to retry when stream is updating or creating. If the stream is deleted during retries, the loop will catch the error and break.

CLI example:

```
salt myminion boto_kinesis.get_stream_when_active my_stream region=us-east-1
```

salt.modules.boto_kinesis.**increase_stream_retention_period**(*stream_name*, *retention_hours*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Increase stream retention period to retention_hours

CLI example:

```
salt myminion boto_kinesis.increase_stream_retention_period my_stream N region=us-
↪east-1
```

salt.modules.boto_kinesis.**long_int**(*hash_key*)

The hash key is a 128-bit int, sent as a string. It's necessary to convert to int/long for comparison operations. This helper method handles python 2/3 incompatibility

CLI example:

```
salt myminion boto_kinesis.long_int some_MD5_hash_as_string
```

Returns long object if python 2.X, int object if python 3.X

salt.modules.boto_kinesis.**reshard**(*stream_name*, *desired_size*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Reshard a kinesis stream. Each call to this function will wait until the stream is ACTIVE, then make a single split or merge operation. This function decides where to split or merge with the assumption that the ultimate goal is a balanced partition space.

For safety, user must past in force=True; otherwise, the function will dry run.

CLI example:

```
salt myminion boto_kinesis.reshard my_stream N True region=us-east-1
```

Returns True if a split or merge was found/performed, False if nothing is needed

19.9.47 salt.modules.boto_kms

Connection module for Amazon KMS

New in version 2015.8.0.

configuration This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
kms.keyid: GKTADJGHEIQSXMKKRBJ08H
kms.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
kms.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

myprofile: keyid: GKTADJGHEIQSXMKKRBJ08H key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs region: us-east-1

depends boto

salt.modules.boto_kms.**create_alias**(*alias_name*, *target_key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a display name for a key.

CLI example:

```
salt myminion boto_kms.create_alias 'alias/mykey' key_id
```

salt.modules.boto_kms.**create_grant**(*key_id*, *grantee_principal*, *retiring_principal=None*, *operations=None*, *constraints=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Adds a grant to a key to specify who can access the key and under what conditions.

CLI example:

```
salt myminion boto_kms.create_grant 'alias/mykey' 'arn:aws:iam::1111111:/role/
↪myrole' operations='["Encrypt","Decrypt"]'
```

salt.modules.boto_kms.**create_key**(*policy=None*, *description=None*, *key_usage=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a master key.

CLI example:

```
salt myminion boto_kms.create_key '{"Statement":...}' "My master key"
```

salt.modules.boto_kms.**decrypt**(*ciphertext_blob*, *encryption_context=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Decrypt ciphertext.

CLI example:

```
salt myminion boto_kms.decrypt encrypted_ciphertext
```

salt.modules.boto_kms.**describe_key**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get detailed information about a key.

CLI example:

```
salt myminion boto_kms.describe_key 'alias/mykey'
```

salt.modules.boto_kms.**disable_key**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Mark key as disabled.

CLI example:

```
salt myminion boto_kms.disable_key 'alias/mykey'
```

salt.modules.boto_kms.**disable_key_rotation**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disable key rotation for specified key.

CLI example:

```
salt myminion boto_kms.disable_key_rotation 'alias/mykey'
```

salt.modules.boto_kms.**enable_key**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Mark key as enabled.

CLI example:

```
salt myminion boto_kms.enable_key 'alias/mykey'
```

salt.modules.boto_kms.**enable_key_rotation**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Disable key rotation for specified key.

CLI example:

```
salt myminion boto_kms.enable_key_rotation 'alias/mykey'
```

salt.modules.boto_kms.**encrypt**(*key_id*, *plaintext*, *encryption_context=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Encrypt plaintext into cipher text using specified key.

CLI example:

```
salt myminion boto_kms.encrypt 'alias/mykey' 'myplaindata' '{"aws:username":
↪"myuser"}'
```

salt.modules.boto_kms.**generate_data_key**(*key_id*, *encryption_context=None*, *number_of_bytes=None*, *key_spec=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Generate a secure data key.

CLI example:

```
salt myminion boto_kms.generate_data_key 'alias/mykey' number_of_bytes=1024 key_
↪spec=AES_128
```

salt.modules.boto_kms.**generate_data_key_without_plaintext**(*key_id*, *encryption_context=None*, *number_of_bytes=None*, *key_spec=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Generate a secure data key without a plaintext copy of the key.

CLI example:

```
salt myminion boto_kms.generate_data_key_without_plaintext 'alias/mykey' number_
↪of_bytes=1024 key_spec=AES_128
```

salt.modules.boto_kms.**generate_random**(*number_of_bytes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Generate a random string.

CLI example:

```
salt myminion boto_kms.generate_random number_of_bytes=1024
```

salt.modules.boto_kms.**get_key_policy**(*key_id*, *policy_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get the policy for the specified key.

CLI example:

```
salt myminion boto_kms.get_key_policy 'alias/mykey' mypolicy
```

salt.modules.boto_kms.**get_key_rotation_status**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get status of whether or not key rotation is enabled for a key.

CLI example:

```
salt myminion boto_kms.get_key_rotation_status 'alias/mykey'
```

salt.modules.boto_kms.**key_exists**(*key_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check for the existence of a key.

CLI example:

```
salt myminion boto_kms.key_exists 'alias/mykey'
```

salt.modules.boto_kms.**list_grants**(*key_id*, *limit=None*, *marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List grants for the specified key.

CLI example:

```
salt myminion boto_kms.list_grants 'alias/mykey'
```

salt.modules.boto_kms.**list_key_policies**(*key_id*, *limit=None*, *marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List key_policies for the specified key.

CLI example:

```
salt myminion boto_kms.list_key_policies 'alias/mykey'
```

salt.modules.boto_kms.**put_key_policy**(*key_id*, *policy_name*, *policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Attach a key policy to the specified key.

CLI example:

```
salt myminion boto_kms.put_key_policy 'alias/mykey' default '{"Statement":...}'
```

salt.modules.boto_kms.**re_encrypt**(*ciphertext_blob*, *destination_key_id*, *source_encryption_context=None*, *destination_encryption_context=None*, *grant_tokens=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Reencrypt encrypted data with a new master key.

CLI example:

```
salt myminion boto_kms.re_encrypt 'encrypted_data' 'alias/mynewkey' default '{
↪"Statement":...}'
```

salt.modules.boto_kms.**revoke_grant**(*key_id*, *grant_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Revoke a grant from a key.

CLI example:

```
salt myminion boto_kms.revoke_grant 'alias/mykey' 8u89hf-j09j...
```

salt.modules.boto_kms.**update_key_description**(*key_id*, *description*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update a key's description.

CLI example:

```
salt myminion boto_kms.update_key_description 'alias/mykey' 'My key'
```

19.9.48 salt.modules.boto_lambda module

Connection module for Amazon Lambda

New in version 2016.3.0.

depends

- boto

- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
lambda.keyid: GKTADJGHEIQSXMKKRBJ08H
lambda.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
lambda.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_function*) return:

```
function:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

salt.modules.boto_lambda.**add_permission**(*FunctionName*, *StatementId*, *Action*, *Principal*, *SourceArn=None*, *SourceAccount=None*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add a permission to a lambda function.

Returns {added: true} if the permission was added and returns {added: False} if the permission was not added.

CLI Example:

```
salt myminion boto_lamba.add_permission my_function my_id "lambda:*" \
                  s3.amazonaws.com aws:arn::::bucket-name \
                  aws-account-id
```

salt.modules.boto_lambda.**alias_exists**(*FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and alias name, check to see if the given alias exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```
salt myminion boto_lambda.alias_exists myfunction myalias
```

salt.modules.boto_lambda.**create_alias**(*FunctionName*, *Name*, *FunctionVersion*, *Description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create an alias to a function.

Returns {created: true} if the alias was created and returns {created: False} if the alias was not created.

CLI Example:

```
salt myminion boto_lamba.create_alias my_function my_alias $LATEST "An alias"
```

salt.modules.boto_lambda.**create_event_source_mapping**(*EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Identifies a stream as an event source for a Lambda function. It can be either an Amazon Kinesis stream or an Amazon DynamoDB stream. AWS Lambda invokes the specified function when records are posted to the stream.

Returns {created: true} if the event source mapping was created and returns {created: False} if the event source mapping was not created.

CLI Example:

```
salt myminion boto_lamba.create_event_source_mapping arn::::eventsource
↪myfunction LATEST
```

salt.modules.boto_lambda.**create_function**(*FunctionName*, *Runtime*, *Role*, *Handler*, *ZipFile=None*, *S3Bucket=None*, *S3Key=None*, *S3ObjectVersion=None*, *Description=''*, *Timeout=3*, *MemorySize=128*, *Publish=False*, *WaitForRole=False*, *RoleRetries=5*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *VpcConfig=None*, *Environment=None*)

New in version 2017.7.0.

Given a valid config, create a function.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns {'created': True} if the function was created and {created: False} if the function was not created.

CLI Example:

```
salt myminion boto_lamba.create_function my_function python2.7 my_role my_file.my_
↪function my_function.zip
```

salt.modules.boto_lambda.**delete_alias**(*FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and alias name, delete the alias.

Returns {deleted: true} if the alias was deleted and returns {deleted: false} if the alias was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_alias myfunction myalias
```

salt.modules.boto_lambda.**delete_event_source_mapping**(*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, delete the event source mapping

Returns {deleted: true} if the mapping was deleted and returns {deleted: false} if the mapping was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_event_source_mapping 260c423d-e8b5-4443-8d6a-
↪5e91b9ecd0fa
```

salt.modules.boto_lambda.**delete_function**(*FunctionName*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and optional version qualifier, delete it.

Returns {deleted: true} if the function was deleted and returns {deleted: false} if the function was not deleted.

CLI Example:

```
salt myminion boto_lambda.delete_function myfunction
```

salt.modules.boto_lambda.**describe_alias**(*FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name and alias name describe the properties of the alias.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_alias myalias
```

salt.modules.boto_lambda.**describe_event_source_mapping**(*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, obtain the current settings of that mapping.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_event_source_mapping uuid
```

salt.modules.boto_lambda.**describe_function**(*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_lambda.describe_function myfunction
```

salt.modules.boto_lambda.**event_source_mapping_exists**(*UUID=None*, *EventSourceArn=None*, *FunctionName=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source mapping ID or an event source ARN and FunctionName, check whether the mapping exists.

Returns True if the given alias exists and returns False if the given alias does not exist.

CLI Example:

```
salt myminion boto_lambda.alias_exists myfunction myalias
```

salt.modules.boto_lambda.**function_exists**(*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a function name, check to see if the given function name exists.

Returns True if the given function exists and returns False if the given function does not exist.

CLI Example:

```
salt myminion boto_lambda.function_exists myfunction
```

salt.modules.boto_lambda.**get_event_source_mapping_ids**(*EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given an event source and function name, return a list of mapping IDs

CLI Example:

```
salt myminion boto_lambda.get_event_source_mapping_ids arn:::: myfunction
```

salt.modules.boto_lambda.**get_permissions**(*FunctionName*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get resource permissions for the given lambda function

Returns dictionary of permissions, by statement ID

CLI Example:

```
salt myminion boto_lamba.get_permissions my_function

permissions: {...}
```

salt.modules.boto_lambda.**list_function_versions**(*FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List the versions available for the given function.

Returns list of function versions

CLI Example:

```
versions:
  - {...}
  - {...}
```

salt.modules.boto_lambda.**list_functions**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all Lambda functions visible in the current scope.

CLI Example:

```
salt myminion boto_lambda.list_functions
```

salt.modules.boto_lambda.**remove_permission**(*FunctionName*, *StatementId*, *Qualifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove a permission from a lambda function.

Returns {removed: true} if the permission was removed and returns {removed: False} if the permission was not removed.

CLI Example:

```
salt myminion boto_lamba.remove_permission my_function my_id
```

salt.modules.boto_lambda.**update_alias**(*FunctionName*, *Name*, *FunctionVersion=None*, *Description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the named alias to the configuration.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lamba.update_alias my_lambda my_alias $LATEST
```

salt.modules.boto_lambda.**update_event_source_mapping**(*UUID*, *FunctionName=None*, *Enabled=None*, *BatchSize=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update the event source mapping identified by the UUID.

Returns {updated: true} if the alias was updated and returns {updated: False} if the alias was not updated.

CLI Example:

```
salt myminion boto_lamba.update_event_source_mapping uuid FunctionName=new_
↪function
```

salt.modules.boto_lambda.**update_function_code**(*FunctionName*, *ZipFile=None*, *S3Bucket=None*, *S3Key=None*, *S3ObjectVersion=None*, *Publish=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Upload the given code to the named lambda function.

Returns {updated: true} if the function was updated and returns {updated: False} if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_code my_function ZipFile=function.zip
```

salt.modules.boto_lambda.**update_function_config**(*FunctionName*, *Role=None*, *Handler=None*, *Description=None*, *Timeout=None*, *MemorySize=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *VpcConfig=None*, *WaitForRole=False*, *RoleRetries=5*, *Environment=None*)

New in version 2017.7.0.

Update the named lambda function to the configuration.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

Returns {'updated': True} if the function was updated, and {'updated': False} if the function was not updated.

CLI Example:

```
salt myminion boto_lamba.update_function_config my_function my_role my_file.my_
↪function "my lambda function"
```

19.9.49 salt.modules.boto_rds

Connection module for Amazon RDS

New in version 2015.8.0.

configuration This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
rds.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto3

salt.modules.boto_rds.**create**(*name*, *allocated_storage*, *db_instance_class*, *engine*, *master_username*, *master_user_password*, *db_name=None*, *db_security_groups=None*, *vpc_security_group_ids=None*, *availability_zone=None*, *db_subnet_group_name=None*, *preferred_maintenance_window=None*, *db_parameter_group_name=None*, *backup_retention_period=None*, *preferred_backup_window=None*, *port=None*, *multi_az=None*, *engine_version=None*, *auto_minor_version_upgrade=None*, *license_model=None*, *iops=None*, *option_group_name=None*, *character_set_name=None*, *publicly_accessible=None*, *wait_status=None*, *tags=None*, *db_cluster_identifier=None*, *storage_type=None*, *tde_credential_arn=None*, *tde_credential_password=None*, *storage_encrypted=None*, *kms_key_id=None*, *domain=None*, *copy_tags_to_snapshot=None*, *monitoring_interval=None*, *monitoring_role_arn=None*, *domain_iam_role_name=None*, *region=None*, *promotion_tier=None*, *key=None*, *keyid=None*, *profile=None*)

Create an RDS

CLI example to create an RDS:

```
salt myminion boto_rds.create myrds 10 db.t2.micro MySQL sqlusr sqlpassw
```

salt.modules.boto_rds.**create_option_group**(*name*, *engine_name*, *major_engine_version*, *option_group_description*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an RDS option group

CLI example to create an RDS option group:

```
salt myminion boto_rds.create_option_group my-opt-group mysql 5.6
 ↪"group description"
```

salt.modules.boto_rds.**create_parameter_group**(*name*, *db_parameter_group_family*, *description*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an RDS parameter group

CLI example to create an RDS parameter group:

```
salt myminion boto_rds.create_parameter_group my-param-group mysql5.6
 ↪   "group description"
```

salt.modules.boto_rds.**create_read_replica**(*name*, *source_name*, *db_instance_class=None*, *availability_zone=None*, *port=None*, *auto_minor_version_upgrade=None*, *iops=None*, *option_group_name=None*, *publicly_accessible=None*, *tags=None*, *db_subnet_group_name=None*, *storage_type=None*, *copy_tags_to_snapshot=None*, *monitoring_interval=None*, *monitoring_role_arn=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an RDS read replica

CLI example to create an RDS read replica:

```
salt myminion boto_rds.create_read_replica replicaname source_name
```

salt.modules.boto_rds.**create_subnet_group**(*name*, *description*, *subnet_ids*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an RDS subnet group

CLI example to create an RDS subnet group:

```
salt myminion boto_rds.create_subnet_group my-subnet-group "group
↪description" '[subnet-12345678, subnet-87654321]' region=us-east-1
```

salt.modules.boto_rds.**delete**(*name*, *skip_final_snapshot=None*, *final_db_snapshot_identifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *tags=None*, *wait_for_deletion=True*, *timeout=180*)

Delete an RDS instance.

CLI example:

```
salt myminion boto_rds.delete myrds skip_final_snapshot=True
↪region=us-east-1
```

salt.modules.boto_rds.**delete_option_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an RDS option group.

CLI example:

```
salt myminion boto_rds.delete_option_group my-opt-group region=us-
↪east-1
```

salt.modules.boto_rds.**delete_parameter_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an RDS parameter group.

CLI example:

```
salt myminion boto_rds.delete_parameter_group my-param-group
↪region=us-east-1
```

salt.modules.boto_rds.**delete_subnet_group**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an RDS subnet group.

CLI example:

```
salt myminion boto_rds.delete_subnet_group my-subnet-group
↪region=us-east-1
```

salt.modules.boto_rds.**describe**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return RDS instance details.

CLI example:

```
salt myminion boto_rds.describe myrds
```

salt.modules.boto_rds.**describe_parameter_group**(*name*, *Filters=None*, *MaxRecords=None*, *Marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of *DBParameterGroup* descriptions. CLI example to description of parameter group:

```
salt myminion boto_rds.describe_parameter_group parametergroupname
↪region=us-east-1
```

salt.modules.boto_rds.**describe_parameters**(*name*, *Source=None*, *MaxRecords=None*, *Marker=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns a list of *DBParameterGroup* parameters. CLI example to description of parameters

```
salt myminion boto_rds.describe_parameters parametergroupname
↪region=us-east-1
```

salt.modules.boto_rds.**exists**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an RDS exists.

CLI example:

```
salt myminion boto_rds.exists myrds region=us-east-1
```

salt.modules.boto_rds.**get_endpoint**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return the endpoint of an RDS instance.

CLI example:

```
salt myminion boto_rds.get_endpoint myrds
```

salt.modules.boto_rds.**modify_db_instance**(*name*, *allocated_storage=None*, *allow_major_version_upgrade=None*, *apply_immediately=None*, *auto_minor_version_upgrade=None*, *backup_retention_period=None*, *ca_certificate_identifier=None*, *character_set_name=None*, *copy_tags_to_snapshot=None*, *db_cluster_identifier=None*, *db_instance_class=None*, *db_name=None*, *db_parameter_group_name=None*, *db_port_number=None*, *db_security_groups=None*, *db_subnet_group_name=None*, *domain=None*, *domain_iam_role_name=None*, *engine_version=None*, *iops=None*, *kms_key_id=None*, *license_model=None*, *master_user_password=None*, *monitoring_interval=None*, *monitoring_role_arn=None*, *multi_az=None*, *new_db_instance_identifier=None*, *option_group_name=None*, *preferred_backup_window=None*, *preferred_maintenance_window=None*, *promotion_tier=None*, *publicly_accessible=None*, *storage_encrypted=None*, *storage_type=None*, *tde_credential_arn=None*, *tde_credential_password=None*, *vpc_security_group_ids=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Modify settings for a DB instance. CLI example to description of parameters

```
salt myminion boto_rds.modify_db_instance db_instance_identifier region=us-east-1
```

salt.modules.boto_rds.**option_group_exists**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an RDS option group exists.

CLI example:

```
salt myminion boto_rds.option_group_exists myoptiongr region=us-east-1
```

salt.modules.boto_rds.**parameter_group_exists**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an RDS parameter group exists.

CLI example:

```
salt myminion boto_rds.parameter_group_exists myparametergroup
↪region=us-east-1
```

salt.modules.boto_rds.**subnet_group_exists**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check to see if an RDS subnet group exists.

CLI example:

```
salt myminion boto_rds.subnet_group_exists my-param-group
 ↪region=us-east-1
```

salt.modules.boto_rds.**update_parameter_group**(*name*, *parameters*, *apply_method='pending-reboot'*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Update an RDS parameter group.

CLI example:

```
salt myminion boto_rds.update_parameter_group my-param-group
 ↪parameters='{"back_log":1, "binlog_cache_size":4096}'
 ↪east-1
```

19.9.50 salt.modules.boto_route53

Connection module for Amazon Route53

New in version 2014.7.0.

configuration This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
 ↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
route53.region: us-east-1
```

If a region is not specified, the default is `universal', which is what the boto_route53 library expects, rather than None.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

depends boto

salt.modules.boto_route53.**add_record**(*name*, *value*, *zone*, *record_type*, *identifier=None*, *ttl=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*, *retry_on_rate_limit=True*, *rate_limit_retries=5*)

Add a record to a zone.

CLI example:

```
salt myminion boto_route53.add_record test.example.org 1.1.1.1 example.org A
```

salt.modules.boto_route53.**create_hosted_zone**(*domain_name*, *caller_ref=None*, *comment=''*, *private_zone=False*, *vpc_id=None*, *vpc_name=None*, *vpc_region=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a new Route53 Hosted Zone. Returns a Python data structure with information about the newly created Hosted Zone.

domain_name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request.

caller_ref A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. You want to provide this where possible, since additional calls while the first is in PENDING status will be accepted and can lead to multiple copies of the zone being created in Route53.

comment Any comments you want to include about the hosted zone.

private_zone Set True if creating a private hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_name. Ignored if passed for a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_id. Ignored if passed for a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

region Region endpoint to connect to

key AWS key to bind with

keyid AWS keyid to bind with

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid

CLI Example:

```
salt myminion boto_route53.create_hosted_zone example.org
```

salt.modules.boto_route53.**create_zone**(*zone*, *private=False*, *vpc_id=None*, *vpc_region=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a Route53 hosted zone.

New in version 2015.8.0.

zone DNS zone to create

private True/False if the zone will be a private zone

vpc_id VPC ID to associate the zone to (required if private is True)

vpc_region VPC Region (required if private is True)

region region endpoint to connect to

key AWS key

keyid AWS keyid

profile AWS pillar profile

CLI Example:

```
salt myminion boto_route53.create_zone example.org
```

salt.modules.boto_route53.**delete_record**(*name*, *zone*, *record_type*, *identifier=None*, *all_records=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*, *retry_on_rate_limit=True*, *rate_limit_retries=5*)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.delete_record test.example.org example.org A
```

salt.modules.boto_route53.**delete_zone**(*zone*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.delete_zone example.org
```

salt.modules.boto_route53.**describe_hosted_zones**(*zone_id=None*, *domain_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return detailed info about one, or all, zones in the bound account. If neither zone_id nor domain_name is provided, return all zones. Note that the return format is slightly different between the `all' and `single' description types.

zone_id The unique identifier for the Hosted Zone

domain_name The FQDN of the Hosted Zone (including final period)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.describe_hosted_zones domain_name=foo.bar.com.
↪        profile='{"region": "us-east-1", "keyid": "A12345678AB", "key":
↪"xblahblahblah"}'
```

salt.modules.boto_route53.**get_record**(*name*, *zone*, *record_type*, *fetch_all=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *split_dns=False*, *private_zone=False*, *identifier=None*, *retry_on_rate_limit=True*, *rate_limit_retries=5*)

Get a record from a zone.

CLI example:

```
salt myminion boto_route53.get_record test.example.org example.org A
```

salt.modules.boto_route53.**list_all_zones_by_id**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List, by their IDs, all hosted zones in the bound account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_id
```

salt.modules.boto_route53.**list_all_zones_by_name**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List, by their FQDNs, all hosted zones in the bound account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_route53.list_all_zones_by_name
```

salt.modules.boto_route53.**update_record**(*name*, *value*, *zone*, *record_type*, *identifier=None*, *ttl=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*, *retry_on_rate_limit=True*, *rate_limit_retries=5*)

Modify a record in a zone.

CLI example:

```
salt myminion boto_route53.modify_record test.example.org 1.1.1.1 example.org A
```

salt.modules.boto_route53.**zone_exists**(*zone*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *retry_on_rate_limit=True*, *rate_limit_retries=5*)

Check for the existence of a Route53 hosted zone.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_route53.zone_exists example.org
```

19.9.51 salt.modules.boto_s3_bucket module

Connection module for Amazon S3 Buckets

New in version 2016.3.0.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

configuration This module accepts explicit Lambda credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
s3.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

salt.modules.boto_s3_bucket.**create**(*Bucket*, *ACL=None*, *LocationConstraint=None*, *GrantFullControl=None*, *GrantRead=None*, *GrantReadACP=None*, *GrantWrite=None*, *GrantWriteACP=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, create an S3 Bucket.

Returns {created: true} if the bucket was created and returns {created: False} if the bucket was not created.

CLI Example:

```
salt myminion boto_s3_bucket.create my_bucket \
                 GrantFullControl='emailaddress=example@example.com' \
                GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"' \
                 GrantReadACP='emailaddress="exampl@example.com",id=
↪"2345678909876432"' \
                 LocationConstraint=us-west-1
```

salt.modules.boto_s3_bucket.**delete**(*Bucket*, *MFA=None*, *RequestPayer=None*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a bucket name, delete it, optionally emptying it first.

Returns {deleted: true} if the bucket was deleted and returns {deleted: false} if the bucket was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete mybucket
```

salt.modules.boto_s3_bucket.**delete_cors**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the CORS configuration for the given bucket

Returns {deleted: true} if CORS was deleted and returns {deleted: False} if CORS was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_cors my_bucket
```

salt.modules.boto_s3_bucket.**delete_lifecycle_configuration**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the lifecycle configuration for the given bucket

Returns {deleted: true} if Lifecycle was deleted and returns {deleted: False} if Lifecycle was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_lifecycle_configuration my_bucket
```

salt.modules.boto_s3_bucket.**delete_objects**(*Bucket*, *Delete*, *MFA=None*, *RequestPayer=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.delete_objects mybucket '{Objects: [Key: myobject]}'
```

salt.modules.boto_s3_bucket.**delete_policy**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the policy from the given bucket

Returns {deleted: true} if policy was deleted and returns {deleted: False} if policy was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_policy my_bucket
```

salt.modules.boto_s3_bucket.**delete_replication**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the replication config from the given bucket

Returns {deleted: true} if replication configuration was deleted and returns {deleted: False} if replication configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_replication my_bucket
```

salt.modules.boto_s3_bucket.**delete_tagging**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the tags from the given bucket

Returns {deleted: true} if tags were deleted and returns {deleted: False} if tags were not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_tagging my_bucket
```

salt.modules.boto_s3_bucket.**delete_website**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove the website configuration from the given bucket

Returns {deleted: true} if website configuration was deleted and returns {deleted: False} if website configuration was not deleted.

CLI Example:

```
salt myminion boto_s3_bucket.delete_website my_bucket
```

salt.modules.boto_s3_bucket.**describe**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a bucket name describe its properties.

Returns a dictionary of interesting properties.

CLI Example:

```
salt myminion boto_s3_bucket.describe mybucket
```

salt.modules.boto_s3_bucket.**empty**(*Bucket*, *MFA=None*, *RequestPayer=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete all objects in a given S3 bucket.

Returns {deleted: true} if all objects were deleted and {deleted: false, failed: [key, ...]} otherwise

CLI Example:

```
salt myminion boto_s3_bucket.empty mybucket
```

salt.modules.boto_s3_bucket.**exists**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a bucket name, check to see if the given bucket exists.

Returns True if the given bucket exists and returns False if the given bucket does not exist.

CLI Example:

```
salt myminion boto_s3_bucket.exists mybucket
```

salt.modules.boto_s3_bucket.**list**(*region=None*, *key=None*, *keyid=None*, *profile=None*)

List all buckets owned by the authenticated sender of the request.

Returns list of buckets

CLI Example:

```
Owner: {...}
Buckets:
  - {...}
  - {...}
```

salt.modules.boto_s3_bucket.**list_object_versions**(*Bucket*, *Delimiter=None*, *EncodingType=None*, *Prefix=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_object_versions mybucket
```

salt.modules.boto_s3_bucket.**list_objects**(*Bucket*, *Delimiter=None*, *EncodingType=None*, *Prefix=None*, *FetchOwner=False*, *StartAfter=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

List objects in a given S3 bucket.

Returns a list of objects.

CLI Example:

```
salt myminion boto_s3_bucket.list_objects mybucket
```

salt.modules.boto_s3_bucket.**put_acl**(*Bucket*, *ACL=None*, *AccessControlPolicy=None*, *GrantFullControl=None*, *GrantRead=None*, *GrantReadACP=None*, *GrantWrite=None*, *GrantWriteACP=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the ACL for a bucket.

Returns {updated: true} if the ACL was updated and returns {updated: False} if the ACL was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_acl my_bucket 'public' \
                GrantFullControl='emailaddress=example@example.com' \
              GrantRead='uri="http://acs.amazonaws.com/groups/global/AllUsers"' \
                GrantReadACP='emailaddress="exampl@example.com",id=
↪"2345678909876432"'
```

salt.modules.boto_s3_bucket.**put_cors**(*Bucket*, *CORSRules*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the CORS rules for a bucket.

Returns {updated: true} if CORS was updated and returns {updated: False} if CORS was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_cors my_bucket '[{\
      "AllowedHeaders":[],\
      "AllowedMethods":["GET"],\
      "AllowedOrigins":["*"],\
      "ExposeHeaders":[],\
      "MaxAgeSeconds":123,\
}]'
```

salt.modules.boto_s3_bucket.**put_lifecycle_configuration**(*Bucket*, *Rules*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the Lifecycle rules for a bucket.

Returns {updated: true} if Lifecycle was updated and returns {updated: False} if Lifecycle was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_lifecycle_configuration my_bucket '[{\
      "Expiration": {...},\
      "ID": "idstring",\
      "Prefix": "prefixstring",\
      "Status": "enabled",\
      "Transitions": [{...},],\
      "NoncurrentVersionTransitions": [{...},],\
      "NoncurrentVersionExpiration": {...},\
}]'
```

salt.modules.boto_s3_bucket.**put_logging**(*Bucket*, *TargetBucket=None*, *TargetPrefix=None*, *TargetGrants=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the logging parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_logging my_bucket log_bucket '[{...}]' prefix
```

salt.modules.boto_s3_bucket.**put_notification_configuration**(*Bucket*, *TopicConfigurations=None*, *QueueConfigurations=None*, *LambdaFunctionConfigurations=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the notification parameters for a bucket.

Returns {updated: true} if parameters were updated and returns {updated: False} if parameters were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_notification_configuration my_bucket
        [{...}] \
        [{...}] \
        [{...}]
```

salt.modules.boto_s3_bucket.**put_policy**(*Bucket*, *Policy*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the policy for a bucket.

Returns {updated: true} if policy was updated and returns {updated: False} if policy was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_policy my_bucket {...}
```

salt.modules.boto_s3_bucket.**put_replication**(*Bucket*, *Role*, *Rules*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the replication configuration for a bucket.

Returns {updated: true} if replication configuration was updated and returns {updated: False} if replication configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_replication my_bucket my_role [...]
```

salt.modules.boto_s3_bucket.**put_request_payment**(*Bucket*, *Payer*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the request payment configuration for a bucket.

Returns {updated: true} if request payment configuration was updated and returns {updated: False} if request payment configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_request_payment my_bucket Requester
```

salt.modules.boto_s3_bucket.**put_tagging**(*Bucket*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Given a valid config, update the tags for a bucket.

Returns {updated: true} if tags were updated and returns {updated: False} if tags were not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_tagging my_bucket my_role [...]
```

salt.modules.boto_s3_bucket.**put_versioning**(*Bucket*, *Status*, *MFADelete=None*, *MFA=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the versioning configuration for a bucket.

Returns {updated: true} if versioning configuration was updated and returns {updated: False} if versioning configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_versioning my_bucket Enabled
```

salt.modules.boto_s3_bucket.**put_website**(*Bucket*, *ErrorDocument=None*, *IndexDocument=None*, *RedirectAllRequestsTo=None*, *RoutingRules=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid config, update the website configuration for a bucket.

Returns {updated: true} if website configuration was updated and returns {updated: False} if website configuration was not updated.

CLI Example:

```
salt myminion boto_s3_bucket.put_website my_bucket IndexDocument='{"Suffix":
↪"index.html"}'
```

19.9.52 salt.modules.boto_secgroup

Connection module for Amazon Security Groups

New in version 2014.7.0.

configuration This module accepts explicit ec2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
secgroup.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_secgroup.**authorize**(*name=None*, *source_group_name=None*, *source_group_owner_id=None*, *ip_protocol=None*, *from_port=None*, *to_port=None*, *cidr_ip=None*, *group_id=None*, *source_group_group_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_id=None*, *vpc_name=None*, *egress=False*)

Add a new rule to an existing security group.

CLI example:

```
salt myminion boto_secgroup.authorize mysecgroup ip_protocol=tcp from_port=80 to_
↪port=80 cidr_ip='['10.0.0.0/8', '192.168.0.0/24']'
```

salt.modules.boto_secgroup.**convert_to_group_ids**(*groups*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a list of security groups and a vpc_id, convert_to_group_ids will convert all list items in the given list to security group ids.

CLI example:

```
salt myminion boto_secgroup.convert_to_group_ids mysecgroup vpc-89yhh7h
```

salt.modules.boto_secgroup.**create**(*name*, *description*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a security group.

CLI example:

```
salt myminion boto_secgroup.create mysecgroup 'My Security Group'
```

salt.modules.boto_secgroup.**delete**(*name=None*, *group_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_id=None*, *vpc_name=None*)

Delete a security group.

CLI example:

```
salt myminion boto_secgroup.delete mysecgroup
```

salt.modules.boto_secgroup.**delete_tags**(*tags*, *name=None*, *group_id=None*, *vpc_name=None*, *vpc_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

deletes tags from a security group

New in version 2016.3.0.

tags a list of tags to remove
name the name of the security group
group_id the group id of the security group (in lie of a name/vpc combo)
vpc_name the name of the vpc to search the named group for
vpc_id the id of the vpc, in lieu of the vpc_name
region the amazon region
key amazon key

keyid amazon keyid
profile amazon profile
CLI example:

```
salt myminion boto_secgroup.delete_tags ['TAG_TO_DELETE1','TAG_TO_DELETE2']
↪security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

salt.modules.boto_secgroup.**exists**(*name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_id=None*, *vpc_name=None*, *group_id=None*)

Check to see if a security group exists.

CLI example:

```
salt myminion boto_secgroup.exists mysecgroup
```

salt.modules.boto_secgroup.**get_all_security_groups**(*groupnames=None*, *group_ids=None*, *filters=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a list of all Security Groups matching the given criteria and filters.

Note that the `groupnames' argument only functions correctly for EC2 Classic and default VPC Security Groups. To find groups by name in other VPCs you'll want to use the `group-name' filter instead.

Valid keys for the filters argument are: description - The description of the security group. egress.ip-permission.prefix-list-id - The ID (prefix) of the AWS service to which the security group allows access. group-id - The ID of the security group. group-name - The name of the security group. ip-permission.cidr - A CIDR range that has been granted permission. ip-permission.from-port - The start of port range for the TCP and UDP protocols, or an ICMP type number. ip-permission.group-id - The ID of a security group that has been granted permission. ip-permission.group-name - The name of a security group that has been granted permission. ip-permission.protocol - The IP protocol for the permission (tcp | udp | icmp or a protocol number). ip-permission.to-port - The end of port range for the TCP and UDP protocols, or an ICMP code. ip-permission.user-id - The ID of an AWS account that has been granted permission. owner-id - The AWS account ID of the owner of the security group. tag-key - The key of a tag assigned to the security group. tag-value - The value of a tag assigned to the security group. vpc-id - The ID of the VPC specified when the security group was created.

CLI example:

```
salt myminion boto_secgroup.get_all_security_groups filters='{group-name: mygroup}
↪'
```

salt.modules.boto_secgroup.**get_config**(*name=None*, *group_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_id=None*, *vpc_name=None*)

Get the configuration for a security group.

CLI example:

```
salt myminion boto_secgroup.get_config mysecgroup
```

salt.modules.boto_secgroup.**get_group_id**(*name*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get a Group ID given a Group Name or Group Name and VPC ID

CLI example:

```
salt myminion boto_secgroup.get_group_id mysecgroup
```

salt.modules.boto_secgroup.**revoke**(*name=None*, *source_group_name=None*, *source_group_owner_id=None*, *ip_protocol=None*, *from_port=None*, *to_port=None*, *cidr_ip=None*, *group_id=None*, *source_group_group_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_id=None*, *vpc_name=None*, *egress=False*)

Remove a rule from an existing security group.

CLI example:

```
salt myminion boto_secgroup.revoke mysecgroup ip_protocol=tcp from_port=80 to_
↪port=80 cidr_ip='10.0.0.0/8'
```

salt.modules.boto_secgroup.**set_tags**(*tags*, *name=None*, *group_id=None*, *vpc_name=None*, *vpc_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

sets tags on a security group

New in version 2016.3.0.

tags a dict of key:value pair of tags to set on the security group
name the name of the security group
group_id the group id of the security group (in lie of a name/vpc combo)
vpc_name the name of the vpc to search the named group for
vpc_id the id of the vpc, in lieu of the vpc_name
region the amazon region
key amazon key
keyid amazon keyid
profile amazon profile
CLI example:

```
salt myminion boto_secgroup.set_tags "{'TAG1': 'Value1', 'TAG2': 'Value2'}"
↪security_group_name vpc_id=vpc-13435 profile=my_aws_profile
```

19.9.53 salt.modules.boto_sns

Connection module for Amazon SNS

configuration This module accepts explicit sns credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sns.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_sns.**create**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Create an SNS topic.

CLI example to create a topic:

```
salt myminion boto_sns.create mytopic region=us-east-1
```

salt.modules.boto_sns.**delete**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Delete an SNS topic.

CLI example to delete a topic:

```
salt myminion boto_sns.delete mytopic region=us-east-1
```

salt.modules.boto_sns.**exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Check to see if an SNS topic exists.

CLI example:

```
salt myminion boto_sns.exists mytopic region=us-east-1
```

salt.modules.boto_sns.**get_all_subscriptions_by_topic**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Get list of all subscriptions to a specific topic.

CLI example to delete a topic:

```
salt myminion boto_sns.get_all_subscriptions_by_topic mytopic region=us-east-1
```

salt.modules.boto_sns.**get_all_topics**(*region=None*, *key=None*, *keyid=None*, *profile=None*)
Returns a list of the all topics..

CLI example:

```
salt myminion boto_sns.get_all_topics
```

salt.modules.boto_sns.**get_arn**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Returns the full ARN for a given topic name.

CLI example:

```
salt myminion boto_sns.get_arn mytopic
```

salt.modules.boto_sns.**subscribe**(*topic*, *protocol*, *endpoint*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Subscribe to a Topic.

CLI example to delete a topic:

```
salt myminion boto_sns.subscribe mytopic https https://www.example.com/sns-
↪endpoint region=us-east-1
```

salt.modules.boto_sns.**unsubscribe**(*topic*, *subscription_arn*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Unsubscribe a specific SubscriptionArn of a topic.

CLI Example:

```
salt myminion boto_sns.unsubscribe my_topic my_subscription_arn region=us-east-1
```

New in version 2016.11.0.

19.9.54 salt.modules.boto_sqs

Connection module for Amazon SQS

New in version 2014.7.0.

configuration This module accepts explicit sqs credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
sqs.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

depends boto

salt.modules.boto_sqs.**create**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an SQS queue.

CLI Example:

```
salt myminion boto_sqs.create myqueue region=us-east-1
```

salt.modules.boto_sqs.**delete**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an SQS queue.

CLI Example:

```
salt myminion boto_sqs.delete myqueue region=us-east-1
```

salt.modules.boto_sqs.**exists**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Check to see if a queue exists.

CLI Example:

```
salt myminion boto_sqs.exists myqueue region=us-east-1
```

salt.modules.boto_sqs.**get_all_queues**(*prefix=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Return a list of Queue() objects describing all visible queues.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_sqs.get_all_queues region=us-east-1 --output yaml
```

salt.modules.boto_sqs.**get_attributes**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Return attributes currently set on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.get_attributes myqueue
```

salt.modules.boto_sqs.**list**(*prefix=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Return a list of the names of all visible queues.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_sqs.list region=us-east-1
```

salt.modules.boto_sqs.**set_attributes**(*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Set attributes on an SQS queue.

CLI Example:

```
salt myminion boto_sqs.set_attributes myqueue '{ReceiveMessageWaitTimeSeconds: 20}
↪' region=us-east-1
```

19.9.55 salt.modules.boto_vpc

Connection module for Amazon VPC

New in version 2014.7.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.6

configuration This module accepts explicit VPC credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available here.

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

A region may also be specified in the configuration:

```
vpc.region: us-east-1
```

If a region is not specified, the default is us-east-1.

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Changed in version 2015.8.0: All methods now return a dictionary. Create and delete methods return:

```
created: true
```

or

```
created: false
error:
  message: error message
```

Request methods (e.g., *describe_vpc*) return:

```
vpcs:
  - {...}
  - {...}
```

or

```
error:
  message: error message
```

New in version 2016.11.0.

Functions to request, accept, delete and describe VPC peering connections. Named VPC peering connections can be requested using these modules. VPC owner accounts can accept VPC peering connections (named or otherwise).

Examples showing creation of VPC peering connection

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
 ↪name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
 ↪region=us-west-2
```

Check to see if VPC peering connection is pending

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
# Specify a region
```

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

Accept VPC peering connection

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

Deleting VPC peering connection via this module

```
# Delete a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection name=salt-vpc region=us-west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.**accept_vpc_peering_connection**(*conn_id=''*, *name=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *dry_run=False*)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

Parameters

- **conn_id** -- The ID to use. String type.
- **name** -- The name of this VPC peering connection. String type.
- **region** -- The AWS region to use. Type string.
- **key** -- The key to use for this connection. Type string.
- **keyid** -- The key id to use.
- **profile** -- The profile to use.
- **dry_run** -- The dry_run flag to set.

Returns dict

Warning: Please specify either the `vpc_peering_connection_id` or `name` but not both. Specifying both will result in an error!

CLI Example:

```
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc
# Specify a region
salt myminion boto_vpc.accept_vpc_peering_connection name=salt-vpc region=us-west-
↪2
# specify an id
salt myminion boto_vpc.accept_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.**associate_dhcp_options_to_vpc**(*dhcp_options_id*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given valid DHCP options id and a valid VPC id, associate the DHCP options record with the VPC.

Returns True if the DHCP options record were associated and returns False if the DHCP options record was not associated.

CLI Example:

```
salt myminion boto_vpc.associate_dhcp_options_to_vpc 'dhcp-a0bl34pp' 'vpc-6b1fe402
↪'
```

salt.modules.boto_vpc.**associate_network_acl_to_subnet**(*network_acl_id=None*, *subnet_id=None*, *network_acl_name=None*, *subnet_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a network acl and subnet ids or names, associate a network acl to a subnet.

CLI Example:

```
salt myminion boto_vpc.associate_network_acl_to_subnet \
        network_acl_id='acl-5fb85d36' subnet_id='subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_network_acl_to_subnet \
        network_acl_id='myacl' subnet_id='mysubnet'
```

salt.modules.boto_vpc.**associate_route_table**(*route_table_id=None*, *subnet_id=None*, *route_table_name=None*, *subnet_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a route table and subnet name or id, associates the route table with the subnet.

CLI Example:

```
salt myminion boto_vpc.associate_route_table 'rtb-1f382e7d' 'subnet-6a1fe403'
```

```
salt myminion boto_vpc.associate_route_table route_table_name='myrtb' \
        subnet_name='mysubnet'
```

salt.modules.boto_vpc.**check_vpc**(*vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check whether a VPC with the given name or id exists. Returns the vpc_id or None. Raises SaltInvocationError if both vpc_id and vpc_name are None. Optionally raise a CommandExecutionError if the VPC does not exist.

New in version 2016.3.0.

CLI Example:

```
salt myminion boto_vpc.check_vpc vpc_name=myvpc profile=awsprofile
```

salt.modules.boto_vpc.**create**(*cidr_block*, *instance_tenancy=None*, *vpc_name=None*, *enable_dns_support=None*, *enable_dns_hostnames=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid CIDR block, create a VPC.

An optional instance_tenancy argument can be provided. If provided, the valid values are `default' or `dedicated'

An optional vpc_name argument can be provided.

Returns {created: true} if the VPC was created and returns {created: False} if the VPC was not created.

CLI Example:

```
salt myminion boto_vpc.create '10.0.0.0/24'
```

salt.modules.boto_vpc.**create_customer_gateway**(*vpn_connection_type*, *ip_address*, *bgp_asn*, *customer_gateway_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid VPN connection type, a static IP address and a customer gateway's Border Gateway Protocol (BGP) Autonomous System Number, create a customer gateway.

Returns the customer gateway id if the customer gateway was created and returns False if the customer gateway was not created.

CLI Example:

```
salt myminion boto_vpc.create_customer_gateway 'ipsec.1', '12.1.2.3', 65534
```

salt.modules.boto_vpc.**create_dhcp_options**(*domain_name=None*, *domain_name_servers=None*, *ntp_servers=None*, *netbios_name_servers=None*, *netbios_node_type=None*, *dhcp_options_name=None*, *tags=None*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given valid DHCP options, create a DHCP options record, optionally associating it with an existing VPC.

Returns True if the DHCP options record was created and returns False if the DHCP options record was not deleted.

Changed in version 2015.8.0: Added vpc_name and vpc_id arguments

CLI Example:

```
salt myminion boto_vpc.create_dhcp_options domain_name='example.com' \
        domain_name_servers='[1.2.3.4]' ntp_servers='[5.6.7.8]' \
        netbios_name_servers='[10.0.0.1]' netbios_node_type=1 \
        vpc_name='myvpc'
```

salt.modules.boto_vpc.**create_internet_gateway**(*internet_gateway_name=None*, *vpc_id=None*, *vpc_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create an Internet Gateway, optionally attaching it to an existing VPC.

Returns the internet gateway id if the internet gateway was created and returns False if the internet gateways was not created.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.create_internet_gateway \
        internet_gateway_name=myigw vpc_name=myvpc
```

salt.modules.boto_vpc.**create_nat_gateway**(*subnet_id=None*, *subnet_name=None*, *allocation_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Create a NAT Gateway within an existing subnet. If allocation_id is specified, the elastic IP address it references is associated with the gateway. Otherwise, a new allocation_id is created and used.

This function requires boto3 to be installed.

Returns the nat gateway id if the nat gateway was created and returns False if the nat gateway was not created.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.create_nat_gateway subnet_name=mysubnet
```

salt.modules.boto_vpc.**create_network_acl**(*vpc_id=None*, *vpc_name=None*, *network_acl_name=None*, *subnet_id=None*, *subnet_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a vpc_id, creates a network acl.

Returns the network acl id if successful, otherwise returns False.

Changed in version 2015.8.0: Added vpc_name, subnet_id, and subnet_name arguments

CLI Example:

```
salt myminion boto_vpc.create_network_acl 'vpc-6b1fe402'
```

salt.modules.boto_vpc.**create_network_acl_entry**(*network_acl_id=None*, *rule_number=None*, *protocol=None*, *rule_action=None*, *cidr_block=None*, *egress=None*, *network_acl_name=None*, *icmp_code=None*, *icmp_type=None*, *port_range_from=None*, *port_range_to=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a network acl entry.

CLI Example:

```
salt myminion boto_vpc.create_network_acl_entry 'acl-5fb85d36' '32767' \
        'all' 'deny' '0.0.0.0/0' egress=true
```

salt.modules.boto_vpc.**create_route**(*route_table_id=None*, *destination_cidr_block=None*, *route_table_name=None*, *gateway_id=None*, *internet_gateway_name=None*, *instance_id=None*, *interface_id=None*, *vpc_peering_connection_id=None*, *vpc_peering_connection_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *nat_gateway_id=None*, *nat_gateway_subnet_name=None*, *nat_gateway_subnet_id=None*)

Creates a route.

If a nat gateway is specified, boto3 must be installed

CLI Example:

```
salt myminion boto_vpc.create_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-
↪a1b2c3'
```

salt.modules.boto_vpc.**create_route_table**(*vpc_id=None*, *vpc_name=None*, *route_table_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Creates a route table.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_route_table vpc_id='vpc-6b1fe402' \
        route_table_name='myroutetable'
salt myminion boto_vpc.create_route_table vpc_name='myvpc' \
        route_table_name='myroutetable'
```

salt.modules.boto_vpc.**create_subnet**(*vpc_id=None*, *cidr_block=None*, *vpc_name=None*, *availability_zone=None*, *subnet_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a valid VPC ID or Name and a CIDR block, create a subnet for the VPC.

An optional availability zone argument can be provided.

Returns True if the VPC subnet was created and returns False if the VPC subnet was not created.

Changed in version 2015.8.0: Added vpc_name argument

CLI Examples:

```
salt myminion boto_vpc.create_subnet vpc_id='vpc-6b1fe402' \
        subnet_name='mysubnet' cidr_block='10.0.0.0/25'
salt myminion boto_vpc.create_subnet vpc_name='myvpc' \
        subnet_name='mysubnet', cidr_block='10.0.0.0/25'
```

salt.modules.boto_vpc.**customer_gateway_exists**(*customer_gateway_id=None*, *customer_gateway_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a customer gateway ID, check if the customer gateway ID exists.

Returns True if the customer gateway ID exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.customer_gateway_exists cgw-b6a247df
salt myminion boto_vpc.customer_gateway_exists customer_gatway_name=mycgw
```

salt.modules.boto_vpc.**delete**(*vpc_id=None*, *name=None*, *vpc_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a VPC ID or VPC name, delete the VPC.

Returns {deleted: true} if the VPC was deleted and returns {deleted: false} if the VPC was not deleted.

CLI Example:

```
salt myminion boto_vpc.delete vpc_id='vpc-6b1fe402'
salt myminion boto_vpc.delete name='myvpc'
```

salt.modules.boto_vpc.**delete_customer_gateway**(*customer_gateway_id=None*, *customer_gateway_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a customer gateway ID or name, delete the customer gateway.

Returns True if the customer gateway was deleted and returns False if the customer gateway was not deleted.

Changed in version 2015.8.0: Added customer_gateway_name argument

CLI Example:

```
salt myminion boto_vpc.delete_customer_gateway 'cgw-b6a247df'
```

salt.modules.boto_vpc.**delete_dhcp_options**(*dhcp_options_id=None*, *dhcp_options_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete dhcp options by id or name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.delete_dhcp_options 'dopt-b6a247df'
```

salt.modules.boto_vpc.**delete_internet_gateway**(*internet_gateway_id=None*, *internet_gateway_name=None*, *detach=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete an internet gateway (by name or id).

Returns True if the internet gateway was deleted and otherwise False.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.delete_internet_gateway internet_gateway_id=igw-1a2b3c
salt myminion boto_vpc.delete_internet_gateway internet_gateway_name=myigw
```

salt.modules.boto_vpc.**delete_nat_gateway**(*nat_gateway_id*, *release_eips=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_delete=False*, *wait_for_delete_retries=5*)

Delete a nat gateway (by id).

Returns True if the internet gateway was deleted and otherwise False.

This function requires boto3 to be installed.

New in version 2016.11.0.

nat_gateway_id Id of the NAT Gateway

releaes_eips whether to release the elastic IPs associated with the given NAT Gateway Id

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_delete whether to wait for delete of the NAT gateway to be in failed or deleted state after issuing the delete call.

wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding.

CLI Examples:

```
salt myminion boto_vpc.delete_nat_gateway nat_gateway_id=igw-1a2b3c
```

salt.modules.boto_vpc.**delete_network_acl**(*network_acl_id=None*, *network_acl_name=None*, *disassociate=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete a network acl based on the network_acl_id or network_acl_name provided.

CLI Examples:

```
salt myminion boto_vpc.delete_network_acl network_acl_id='acl-5fb85d36' \
        disassociate=false
```

```
salt myminion boto_vpc.delete_network_acl network_acl_name='myacl' \
        disassociate=true
```

salt.modules.boto_vpc.**delete_network_acl_entry**(*network_acl_id=None*, *rule_number=None*, *egress=None*, *network_acl_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a network acl entry.

CLI Example:

```
salt myminion boto_vpc.delete_network_acl_entry 'acl-5fb85d36' '32767'
```

salt.modules.boto_vpc.**delete_route**(*route_table_id=None*, *destination_cidr_block=None*, *route_table_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a route.

CLI Example:

```
salt myminion boto_vpc.delete_route 'rtb-1f382e7d' '10.0.0.0/16'
```

salt.modules.boto_vpc.**delete_route_table**(*route_table_id=None*, *route_table_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a route table.

CLI Examples:

```
salt myminion boto_vpc.delete_route_table route_table_id='rtb-1f382e7d'
salt myminion boto_vpc.delete_route_table route_table_name='myroutetable'
```

salt.modules.boto_vpc.**delete_subnet**(*subnet_id=None*, *subnet_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a subnet ID or name, delete the subnet.

Returns True if the subnet was deleted and returns False if the subnet was not deleted.

Changed in version 2015.8.0: Added subnet_name argument

CLI Example:

```
salt myminion boto_vpc.delete_subnet 'subnet-6a1fe403'
```

salt.modules.boto_vpc.**delete_vpc_peering_connection**(*conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *dry_run=False*)

Delete a VPC peering connection.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

dry_run If True, skip application and simply return projected status.

CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.delete_vpc_peering_connection conn_name=salt-vpc region=us-
↪west-2
# specify an id
salt myminion boto_vpc.delete_vpc_peering_connection conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.**describe**(*vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a VPC ID describe its properties.

Returns a dictionary of interesting properties.

Changed in version 2015.8.0: Added vpc_name argument

CLI Example:

```
salt myminion boto_vpc.describe vpc_id=vpc-123456
salt myminion boto_vpc.describe vpc_name=myvpc
```

salt.modules.boto_vpc.**describe_nat_gateways**(*nat_gateway_id=None*, *subnet_id=None*, *subnet_name=None*, *vpc_id=None*, *vpc_name=None*, *states=(`pending', `available')*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a description of nat gateways matching the selection criteria

This function requires boto3 to be installed.

CLI Example:

```
salt myminion boto_vpc.describe_nat_gateways nat_gateway_id='nat-03b02643b43216fe7
↪'
salt myminion boto_vpc.describe_nat_gateways subnet_id='subnet-5b05942d'
```

salt.modules.boto_vpc.**describe_route_table**(*route_table_id=None*, *route_table_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given route table properties, return route table details if matching table(s) exist.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_table route_table_id='rtb-1f382e7d'
```

salt.modules.boto_vpc.**describe_route_tables**(*route_table_id=None*, *route_table_name=None*, *vpc_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given route table properties, return details of all matching route tables.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.describe_route_tables vpc_id='vpc-a6a9efc3'
```

salt.modules.boto_vpc.**describe_subnet**(*subnet_id=None*, *subnet_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a subnet id or name, describe its properties.

Returns a dictionary of interesting properties.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnet subnet_id=subnet-123456
salt myminion boto_vpc.describe_subnet subnet_name=mysubnet
```

salt.modules.boto_vpc.**describe_subnets**(*subnet_ids=None*, *subnet_names=None*, *vpc_id=None*, *cidr=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a VPC ID or subnet CIDR, returns a list of associated subnets and their details. Return all subnets if VPC ID or CIDR are not provided. If a subnet id or CIDR is provided, only its associated subnet details will be returned.

New in version 2015.8.0.

CLI Examples:

```
salt myminion boto_vpc.describe_subnets
```

```
salt myminion boto_vpc.describe_subnets subnet_ids=['subnet-ba1987ab', 'subnet-
↪ba1987cd']
```

```
salt myminion boto_vpc.describe_subnets vpc_id=vpc-123456
```

```
salt myminion boto_vpc.describe_subnets cidr=10.0.0.0/21
```

salt.modules.boto_vpc.**describe_vpc_peering_connection**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Returns any VPC peering connection id(s) for the given VPC peering connection name.

VPC peering connection ids are only returned for connections that are in the `active`, `pending-acceptance` or `provisioning` state.

New in version 2016.11.0.

Parameters

- **name** -- The string name for this VPC peering connection
- **region** -- The aws region to use

- **key** -- Your aws key
- **keyid** -- The key id associated with this aws account
- **profile** -- The profile to use

Returns dict

CLI Example:

```
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc
# Specify a region
salt myminion boto_vpc.describe_vpc_peering_connection salt-vpc region=us-west-2
```

salt.modules.boto_vpc.**describe_vpcs**(*vpc_id=None*, *name=None*, *cidr=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Describe all VPCs, matching the filter criteria if provided.

Returns a a list of dictionaries with interesting properties.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.describe_vpcs
```

salt.modules.boto_vpc.**dhcp_options_exists**(*dhcp_options_id=None*, *name=None*, *dhcp_options_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if a dhcp option exists.

Returns True if the dhcp option exists; Returns False otherwise.

CLI Example:

```
salt myminion boto_vpc.dhcp_options_exists dhcp_options_id='dhcp-a0bl34pp'
```

salt.modules.boto_vpc.**disassociate_network_acl**(*subnet_id=None*, *vpc_id=None*, *subnet_name=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a subnet ID, disassociates a network acl.

CLI Example:

```
salt myminion boto_vpc.disassociate_network_acl 'subnet-6a1fe403'
```

salt.modules.boto_vpc.**disassociate_route_table**(*association_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Dissassociates a route table.

association_id The Route Table Association ID to disassociate

CLI Example:

```
salt myminion boto_vpc.disassociate_route_table 'rtbassoc-d8ccddba'
```

salt.modules.boto_vpc.**exists**(*vpc_id=None*, *name=None*, *cidr=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a VPC ID, check to see if the given VPC ID exists.

Returns True if the given VPC ID exists and returns False if the given VPC ID does not exist.

CLI Example:

```
salt myminion boto_vpc.exists myvpc
```

salt.modules.boto_vpc.**get_dhcp_options**(*dhcp_options_name=None*, *dhcp_options_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Return a dict with the current values of the requested DHCP options set

CLI Example:

```
salt myminion boto_vpc.get_dhcp_options 'myfunnydhcpoptionsname'
```

New in version 2016.3.0.

salt.modules.boto_vpc.**get_id**(*name=None*, *cidr=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given VPC properties, return the VPC id if a match is found.

CLI Example:

```
salt myminion boto_vpc.get_id myvpc
```

salt.modules.boto_vpc.**get_resource_id**(*resource*, *name=None*, *resource_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Get an AWS id for a VPC resource by type and name.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.get_resource_id internet_gateway myigw
```

salt.modules.boto_vpc.**get_subnet_association**(*subnets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a subnet (aka: a vpc zone identifier) or list of subnets, returns vpc association.

Returns a VPC ID if the given subnets are associated with the same VPC ID. Returns False on an error or if the given subnets are associated with different VPC IDs.

CLI Examples:

```
salt myminion boto_vpc.get_subnet_association subnet-61b47516
```

```
salt myminion boto_vpc.get_subnet_association ['subnet-61b47516','subnet-2cb9785b
↪']
```

salt.modules.boto_vpc.**is_peering_connection_pending**(*conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if a VPC peering connection is in the pending state.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc
# Specify a region
salt myminion boto_vpc.is_peering_connection_pending conn_name=salt-vpc region=us-
 ↪west-2
# specify an id
salt myminion boto_vpc.is_peering_connection_pending conn_id=pcx-8a8939e3
```

salt.modules.boto_vpc.**nat_gateway_exists**(*nat_gateway_id=None*, *subnet_id=None*, *subnet_name=None*, *vpc_id=None*, *vpc_name=None*, *states=(`pending', `available')*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Checks if a nat gateway exists.

This function requires boto3 to be installed.

New in version 2016.11.0.

CLI Example:

```
salt myminion boto_vpc.nat_gateway_exists nat_gateway_id='nat-03b02643b43216fe7'
salt myminion boto_vpc.nat_gateway_exists subnet_id='subnet-5b05942d'
```

salt.modules.boto_vpc.**network_acl_exists**(*network_acl_id=None*, *name=None*, *network_acl_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Checks if a network acl exists.

Returns True if the network acl exists or returns False if it doesn't exist.

CLI Example:

```
salt myminion boto_vpc.network_acl_exists network_acl_id='acl-5fb85d36'
```

salt.modules.boto_vpc.**peering_connection_pending_from_vpc**(*conn_id=None*, *conn_name=None*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if a VPC peering connection is in the pending state, and requested from the given VPC.

New in version 2016.11.0.

conn_id The connection ID to check. Exclusive with conn_name.

conn_name The connection name to check. Exclusive with conn_id.

vpc_id Is this the ID of the requesting VPC for this peering connection. Exclusive with vpc_name.

vpc_name Is this the Name of the requesting VPC for this peering connection. Exclusive with vpc_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

CLI Example:

```
salt myminion boto_vpc.is_peering_connection_pending name=salt-vpc
```

salt.modules.boto_vpc.**replace_network_acl_entry**(*network_acl_id=None*, *rule_number=None*, *protocol=None*, *rule_action=None*, *cidr_block=None*, *egress=None*, *network_acl_name=None*, *icmp_code=None*, *icmp_type=None*, *port_range_from=None*, *port_range_to=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Replaces a network acl entry.

CLI Example:

```
salt myminion boto_vpc.replace_network_acl_entry 'acl-5fb85d36' '32767' \
        'all' 'deny' '0.0.0.0/0' egress=true
```

salt.modules.boto_vpc.**replace_route**(*route_table_id=None*, *destination_cidr_block=None*, *route_table_name=None*, *gateway_id=None*, *instance_id=None*, *interface_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_peering_connection_id=None*)

Replaces a route.

CLI Example:

```
salt myminion boto_vpc.replace_route 'rtb-1f382e7d' '10.0.0.0/16' gateway_id='vgw-
↪a1b2c3'
```

salt.modules.boto_vpc.**replace_route_table_association**(*association_id*, *route_table_id*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Replaces a route table association.

CLI Example:

```
salt myminion boto_vpc.replace_route_table_association 'rtbassoc-d8ccddba' 'rtb-
↪1f382e7d'
```

salt.modules.boto_vpc.**request_vpc_peering_connection**(*requester_vpc_id=None*, *requester_vpc_name=None*, *peer_vpc_id=None*, *peer_vpc_name=None*, *name=None*, *peer_owner_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *dry_run=False*)

Request a VPC peering connection between two VPCs.

New in version 2016.11.0.

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.

peer_vpc_id ID of the VPC tp crete VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

peer_vpc_name Name tag of the VPC tp crete VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will almost certainly fail. Exclusive with peer_vpc_id.

name The name to use for this VPC peering connection.

peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
dry_run If True, skip application and return status.
CLI Example:

```
# Create a named VPC peering connection
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
 ↪name=my_vpc_connection
# Without a name
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
# Specify a region
salt myminion boto_vpc.request_vpc_peering_connection vpc-4a3e622e vpc-be82e9da
 ↪region=us-west-2
```

salt.modules.boto_vpc.**resource_exists**(*resource*, *name=None*, *resource_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Given a resource type and name, return {exists: true} if it exists, {exists: false} if it does not exist, or {error: {message: error text} on error.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.resource_exists internet_gateway myigw
```

salt.modules.boto_vpc.**route_exists**(*destination_cidr_block*, *route_table_name=None*, *route_table_id=None*, *gateway_id=None*, *instance_id=None*, *interface_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *vpc_peering_connection_id=None*)

Checks if a route exists.

New in version 2015.8.0.

CLI Example:

```
salt myminion boto_vpc.route_exists destination_cidr_block='10.0.0.0/20' gateway_
 ↪id='local' route_table_name='test'
```

salt.modules.boto_vpc.**route_table_exists**(*route_table_id=None*, *name=None*, *route_table_name=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Checks if a route table exists.

CLI Example:

```
salt myminion boto_vpc.route_table_exists route_table_id='rtb-1f382e7d'
```

salt.modules.boto_vpc.**subnet_exists**(*subnet_id=None*, *name=None*, *subnet_name=None*, *cidr=None*, *tags=None*, *zones=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Check if a subnet exists.

Returns True if the subnet exists, otherwise returns False.

Changed in version 2015.8.0: Added subnet_name argument Deprecated name argument

CLI Example:

```
salt myminion boto_vpc.subnet_exists subnet_id='subnet-6a1fe403'
```

19.9.56 salt.modules.bower

Manage and query Bower packages

This module manages the installed packages using Bower. Note that npm, git and bower must be installed for this module to be available.

salt.modules.bower.**install**(*pkg*, *dir*, *pkgs=None*, *runas=None*, *env=None*)

Install a Bower package.

If no package is specified, the dependencies (from bower.json) of the package in the given directory will be installed.

pkg A package name in any format accepted by Bower, including a version identifier

dir The target directory in which to install the package

pkgs A list of package names in the same format as the pkg parameter

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same env format as the *cmd.run* execution function.

CLI Example:

```
salt '*' bower.install underscore /path/to/project

salt '*' bower.install jquery#2.0 /path/to/project
```

salt.modules.bower.**list**(*dir*, *runas=None*, *env=None*)

List installed Bower packages.

dir The directory whose packages will be listed

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same env format as the *cmd.run* execution function.

CLI Example:

```
salt '*' bower.list /path/to/project
```

salt.modules.bower.**prune**(*dir*, *runas=None*, *env=None*)

New in version 2017.7.0.

Remove extraneous local Bower packages, i.e. those not referenced in bower.json

dir The directory whose packages will be pruned

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same env format as the *cmd.run* execution function.

CLI Example:

```
salt '*' bower.prune /path/to/project
```

salt.modules.bower.**uninstall**(*pkg*, *dir*, *runas=None*, *env=None*)

Uninstall a Bower package.

pkg A package name in any format accepted by Bower

dir The target directory from which to uninstall the package

runas The user to run Bower with

env Environment variables to set when invoking Bower. Uses the same env format as the *cmd.run* execution function.

CLI Example:

```
salt '*' bower.uninstall underscore /path/to/project
```

19.9.57 salt.modules.bridge

Module for gathering and managing bridging information

salt.modules.bridge.**add**(*br=None*)

Creates a bridge

CLI Example:

```
salt '*' bridge.add br0
```

salt.modules.bridge.**addif**(*br=None*, *iface=None*)

Adds an interface to a bridge

CLI Example:

```
salt '*' bridge.addif br0 eth0
```

salt.modules.bridge.**delete**(*br=None*)

Deletes a bridge

CLI Example:

```
salt '*' bridge.delete br0
```

salt.modules.bridge.**delif**(*br=None*, *iface=None*)

Removes an interface from a bridge

CLI Example:

```
salt '*' bridge.delif br0 eth0
```

salt.modules.bridge.**find_interfaces**(**args*)

Returns the bridge to which the interfaces are bond to

CLI Example:

```
salt '*' bridge.find_interfaces eth0 [eth1...]
```

salt.modules.bridge.**interfaces**(*br=None*)

Returns interfaces attached to a bridge

CLI Example:

```
salt '*' bridge.interfaces br0
```

salt.modules.bridge.**list**()

Returns the machine's bridges list

CLI Example:

```
salt '*' bridge.list
```

salt.modules.bridge.**show**(*br=None*)
Returns bridges interfaces along with enslaved physical interfaces. If no interface is given, all bridges are shown, else only the specified bridge values are returned.

CLI Example:

```
salt '*' bridge.show
salt '*' bridge.show br0
```

salt.modules.bridge.**stp**(*br=None*, *state='disable'*, *iface=None*)
Sets Spanning Tree Protocol state for a bridge

CLI Example:

```
salt '*' bridge.stp br0 enable
salt '*' bridge.stp br0 disable
```

For BSD-like operating systems, it is required to add the interface on which to enable the STP.

CLI Example:

```
salt '*' bridge.stp bridge0 enable fxp0
salt '*' bridge.stp bridge0 disable fxp0
```

19.9.58 salt.modules.bsd_shadow

Manage the password database on BSD systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *`shadow.info' is not available*), see *here*.

salt.modules.bsd_shadow.**default_hash**()
Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.bsd_shadow.**del_password**(*name*)
New in version 2015.8.2.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.bsd_shadow.**info**(*name*)
Return information for the specified user

CLI Example:

```
salt '*' shadow.info someuser
```

salt.modules.bsd_shadow.**set_change**(*name*, *change*)
Sets the time at which the password expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of `0` sets the password to never expire.

CLI Example:

```
salt '*' shadow.set_change username 1419980400
```

salt.modules.bsd_shadow.**set_expire**(*name*, *expire*)

Sets the time at which the account expires (in seconds since the UNIX epoch). See `man 8 usermod` on NetBSD and OpenBSD or `man 8 pw` on FreeBSD.

A value of `0` sets the account to never expire.

CLI Example:

```
salt '*' shadow.set_expire username 1419980400
```

salt.modules.bsd_shadow.**set_password**(*name*, *password*)

Set the password for a named user. The password must be a properly defined hash. The password hash can be generated with this command:

```
python -c "import crypt; print crypt.crypt('password',ciphersalt)"
```

Note: When constructing the `ciphersalt` string, you must escape any dollar signs, to avoid them being interpolated by the shell.

`'password'` is, of course, the password for which you want to generate a hash.

`ciphersalt` is a combination of a cipher identifier, an optional number of rounds, and the cryptographic salt. The arrangement and format of these fields depends on the cipher and which flavor of BSD you are using. For more information on this, see the manpage for `crpyt(3)`. On NetBSD, additional information is available in `passwd.conf(5)`.

It is important to make sure that a supported cipher is used.

CLI Example:

```
salt '*' shadow.set_password someuser '$1$UYCIxa628.9qXjpQCjM4a..'
```

19.9.59 salt.modules.btrfs

Module for managing BTRFS file systems.

salt.modules.btrfs.**add**(*mountpoint*, **devices*, ***kwargs*)

Add a devices to a BTRFS filesystem.

General options:

- **nodiscard**: Do not perform whole device TRIM
- **force**: Force overwrite existing filesystem on the disk

CLI Example:

```
salt '*' btrfs.add /mountpoint /dev/sda1 /dev/sda2
```

salt.modules.btrfs.**convert**(*device*, *permanent=False*, *keeplf=False*)

Convert ext2/3/4 to BTRFS. Device should be mounted.

Filesystem can be converted temporarily so the further processing and rollback is possible, or permanently, where previous extended filesystem image gets deleted. Please note, permanent conversion takes a while as BTRFS filesystem needs to be properly rebalanced afterwards.

General options:

- **permanent**: Specify if the migration should be permanent (false by default)
- **keeplf**: Keep **lost+found** of the partition (removed by default, but still in the image, if not permanent migration)

CLI Example:

```
salt '*' btrfs.convert /dev/sda1
salt '*' btrfs.convert /dev/sda1 permanent=True
```

salt.modules.btrfs.**defragment**(*path*)

Defragment mounted BTRFS filesystem. In order to defragment a filesystem, device should be properly mounted and writable.

If passed a device name, then defragmented whole filesystem, mounted on in. If passed a moun tpoint of the filesystem, then only this mount point is defragmented.

CLI Example:

```
salt '*' btrfs.defragment /dev/sda1
salt '*' btrfs.defragment /path/on/filesystem
```

salt.modules.btrfs.**delete**(*mountpoint*, **devices*, ***kwargs*)

Remove devices from a BTRFS filesystem.

CLI Example:

```
salt '*' btrfs.delete /mountpoint /dev/sda1 /dev/sda2
```

salt.modules.btrfs.**devices**()

Get known BTRFS formatted devices on the system.

CLI Example:

```
salt '*' btrfs.devices
```

salt.modules.btrfs.**features**()

List currently available BTRFS features.

CLI Example:

```
salt '*' btrfs.mkfs_features
```

salt.modules.btrfs.**info**(*device*)

Get BTRFS filesystem information.

CLI Example:

```
salt '*' btrfs.info /dev/sda1
```

salt.modules.btrfs.**mkfs**(**devices*, ***kwargs*)

Create a file system on the specified device. By default wipes out with force.

General options:

- **allocsize**: Specify the BTRFS offset from the start of the device.
- **bytecount**: Specify the size of the resultant filesystem.
- **nodesize**: Node size.
- **leafsize**: Specify the nodesize, the tree block size in which btrfs stores data.
- **noforce**: Prevent force overwrite when an existing filesystem is detected on the device.
- **sectorsize**: Specify the sectorsize, the minimum data block allocation unit.

- **nodiscard**: Do not perform whole device TRIM operation by default.
- **uuid**: Pass UUID or pass True to generate one.

Options:

- **dto**: **(raid0|raid1|raid5|raid6|raid10|single|dup)** Specify how the data must be spanned across the devices specified.
- **mto**: **(raid0|raid1|raid5|raid6|raid10|single|dup)** Specify how metadata must be spanned across the devices specified.
- **fts**: Features (call `salt <host> btrfs.features` for full list of available features)

See the `mkfs.btrfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' btrfs.mkfs /dev/sda1
salt '*' btrfs.mkfs /dev/sda1 noforce=True
```

`salt.modules.btrfs.`**`properties`**(*obj*, *type=None*, *set=None*)

List properties for given btrfs object. The object can be path of BTRFS device, mount point, or any directories/files inside the BTRFS filesystem.

General options:

- **type**: Possible types are s[ubvol], f[ilesystem], i[node] and d[evice].
- **force**: Force overwrite existing filesystem on the disk
- **set**: <key=value,key1=value1...> Options for a filesystem properties.

CLI Example:

```
salt '*' btrfs.properties /mountpoint
salt '*' btrfs.properties /dev/sda1 type=subvol set='ro=false,label="My Storage"'
```

`salt.modules.btrfs.`**`resize`**(*mountpoint*, *size*)

Resize filesystem.

General options:

- **mountpoint**: Specify the BTRFS mountpoint to resize.
- **size**: ([+/-]<newsize>[kKmMgGtTpPeE]|max) Specify the new size of the target.

CLI Example:

```
salt '*' btrfs.resize /mountpoint size=+1g
salt '*' btrfs.resize /dev/sda1 size=max
```

`salt.modules.btrfs.`**`usage`**(*path*)

Show in which disk the chunks are allocated.

CLI Example:

```
salt '*' btrfs.usage /your/mountpoint
```

`salt.modules.btrfs.`**`version`**()

Return BTRFS version.

CLI Example:

```
salt '*' btrfs.version
```

19.9.60 salt.modules.cabal

Manage and query Cabal packages

New in version 2015.8.0.

salt.modules.cabal.**install**(*pkg=None*, *pkgs=None*, *user=None*, *install_global=False*, *env=None*)

Install a cabal package.

pkg A package name in format accepted by cabal-install. See: https://wiki.haskell.org/Cabal-Install

pkgs A list of packages names in same format as pkg

user The user to run cabal install with

install_global Install package globally instead of locally

env Environment variables to set when invoking cabal. Uses the same env format as the *cmd.run* execution function

CLI Example:

```
salt '*' cabal.install shellcheck
salt '*' cabal.install shellcheck-0.3.5
```

salt.modules.cabal.**list**(*pkg=None*, *user=None*, *installed=False*, *env=None*)

List packages matching a search string.

pkg Search string for matching package names

user The user to run cabal list with

installed If True, only return installed packages.

env Environment variables to set when invoking cabal. Uses the same env format as the *cmd.run* execution function

CLI example:

```
salt '*' cabal.list
salt '*' cabal.list ShellCheck
```

salt.modules.cabal.**uninstall**(*pkg*, *user=None*, *env=None*)

Uninstall a cabal package.

pkg The package to uninstall

user The user to run ghc-pkg unregister with

env Environment variables to set when invoking cabal. Uses the same env format as the *cmd.run* execution function

CLI Example:

```
salt '*' cabal.uninstall ShellCheck
```

salt.modules.cabal.**update**(*user=None*, *env=None*)

Updates list of known packages.

user The user to run cabal update with

env Environment variables to set when invoking cabal. Uses the same env format as the *cmd.run* execution function.

CLI Example:

```
salt '*' cabal.update
```

19.9.61 salt.modules.capirca_acl module

Capirca ACL

Generate ACL (firewall) configuration for network devices.

New in version 2017.7.0.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Robert Ankeny <robankeny@google.com>

maturity new

depends capirca

platform unix

Dependencies

The firewall configuration is generated by Capirca.

Capirca is not yet available on PyPI threrefore it has to be installed directly form Git: `pip install -e git+git@github.com:google/capirca.git#egg=aclgen`.

salt.modules.capirca_acl.**get_filter_config**(*platform*, *filter_name*, *filter_options=None*, *terms=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*)

Return the configuration of a policy filter.

platform The name of the Capirca platform.

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

terms List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`** Merge the CLI variables with the pillar. Default: `True`.

only_lower_merge: **`False`** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`.

revision_id Add a comment in the filter config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_filter_config ciscoxr my-filter pillar_key=netacl
```

Output Example:

```
! $Id:$
! $Date:$
! $Revision:$
no ipv4 access-list my-filter
ipv4 access-list my-filter
 remark $Id:$
 remark my-term
 deny ipv4 any eq 1234 any
 deny ipv4 any eq 1235 any
 remark my-other-term
 permit tcp any range 5678 5680 any
exit
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      terms:
        - my-term:
            source_port: [1234, 1235]
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
```

salt.modules.capirca_acl.**get_filter_pillar**(*filter_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

filter_name The name of the filter.

pillar_key The root key of the whole policy config.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

salt.modules.capirca_acl.**get_policy_config**(*platform*, *filters=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*)

Return the configuration of the whole policy.

platform The name of the Capirca platform.

filters List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

merge_pillar: **True** Merge the CLI variables with the pillar. Default: True.

only_lower_merge: **False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: False.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: **True** Boolean flag: display the date when the policy configuration was generated. Default: True.

revision_date_format: **%Y/%m/%d** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

CLI Example:

```
salt '*' capirca.get_policy_config juniper pillar_key=netacl
```

Output Example:

```
firewall {
    family inet {
        replace:
        /*
        ** $Id:$
        ** $Date:$
        ** $Revision:$
        **
        */
        filter my-filter {
            term my-term {
                from {
                    source-port [ 1234 1235 ];
                }
                then {
                    reject;
                }
            }
            term my-other-term {
                from {
                    protocol tcp;
                    source-port 5678-5680;
                }
                then accept;
            }
        }
    }
}
firewall {
    family inet {
        replace:
        /*
        ** $Id:$
        ** $Date:$
        ** $Revision:$
        **
        */
        filter my-other-filter {
            interface-specific;
            term dummy-term {
```

```
                from {
                    protocol [ tcp udp ];
                }
                then {
                    reject;
                }
            }
        }
    }
}
```

The policy configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      options:
        - not-interface-specific
      terms:
        - my-term:
            source_port: [1234, 1235]
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
  - my-other-filter:
      terms:
        - dummy-term:
            protocol:
              - tcp
              - udp
            action: reject
```

salt.modules.capirca_acl.**get_term_config**(*platform*, *filter_name*, *term_name*, *filter_options=None*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=True*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *source_service=None*, *destination_service=None*, ***term_fields*)

Return the configuration of a single policy term.

platform The name of the Capirca platform.

filter_name The name of the policy filter.

term_name The name of the term.

filter_options Additional filter options. These options are platform-specific. E.g.: `inet6`, `bridge`, `object-group`, See the complete list of options.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: 1234
            source_address:
```

```
                - 1.2.3.4/32
                - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`** Merge the CLI variables with the pillar. Default: `True`.

revision_id Add a comment in the term config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

source_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from `/etc/services`.

If the user requires additional shortcuts to be referenced, they can add entries under `/etc/services`, which can be managed using the *`file state`*.

destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

Note: The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance

- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude

- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - [1000, 2000]
    - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt '*' capirca.get_term_config arista filter-name term-name source_address=1.2.
 ↪3.4 destination_address=5.6.7.8 action=accept
```

Output Example:

```
! $Date: 2017/03/22 $
no ip access-list filter-name
ip access-list filter-name
 remark term-name
```

```
 permit ip host 1.2.3.4 host 5.6.7.8
exit
```

salt.modules.capirca_acl.**get_term_pillar**(*filter_name*, *term_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

filter_name The name of the filter.

term_name The name of the term.

pillar_key: **acl** The root key of the whole policy config. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

19.9.62 salt.modules.cassandra

Cassandra NoSQL Database Module

depends

- pycassa Cassandra Python adapter

configuration The location of the `nodetool' command, host, and thrift port needs to be specified via pillar:

```
cassandra.nodetool: /usr/local/bin/nodetool
cassandra.host: localhost
cassandra.thrift_port: 9160
```

salt.modules.cassandra.**column_families**(*keyspace=None*)

Return existing column families for all keyspaces or just the provided one.

CLI Example:

```
salt '*' cassandra.column_families
salt '*' cassandra.column_families <keyspace>
```

salt.modules.cassandra.**column_family_definition**(*keyspace*, *column_family*)

Return a dictionary of column family definitions for the given keyspace/column_family

CLI Example:

```
salt '*' cassandra.column_family_definition <keyspace> <column_family>
```

salt.modules.cassandra.**compactionstats**()

Return compactionstats info

CLI Example:

```
salt '*' cassandra.compactionstats
```

salt.modules.cassandra.**info**()

Return cassandra node info

CLI Example:

```
salt '*' cassandra.info
```

salt.modules.cassandra.**keyspaces**()
Return existing keyspaces

CLI Example:

```
salt '*' cassandra.keyspaces
```

salt.modules.cassandra.**netstats**()
Return netstats info

CLI Example:

```
salt '*' cassandra.netstats
```

salt.modules.cassandra.**ring**()
Return cassandra ring info

CLI Example:

```
salt '*' cassandra.ring
```

salt.modules.cassandra.**tpstats**()
Return tpstats info

CLI Example:

```
salt '*' cassandra.tpstats
```

salt.modules.cassandra.**version**()
Return the cassandra version

CLI Example:

```
salt '*' cassandra.version
```

19.9.63 salt.modules.cassandra_cql

Cassandra Database Module

New in version 2015.5.0.

depends DataStax Python Driver for Apache Cassandra https://github.com/datastax/python-driver pip install cassandra-driver

referenced by Salt's cassandra_cql returner

configuration The Cassandra cluster members and connection port can either be specified in the master or minion config, the minion's pillar or be passed to the module.

Example configuration in the config for a single node:

```
cassandra:
  cluster: 192.168.50.10
  port: 9000
```

Example configuration in the config for a cluster:

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin
```

Changed in version 2016.11.0.

Added support for `ssl_options` and `protocol_version`.

Example configuration with ssl options:

If `ssl_options` are present in cassandra config the cassandra_cql returner will use SSL. SSL isn't used if `ssl_options` isn't specified.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  ssl_options:
    ca_certs: /etc/ssl/certs/ca-bundle.trust.crt

    # SSL version should be one from the ssl module
    # This is an optional parameter
    ssl_version: PROTOCOL_TLSv1
```

Additionally you can also specify the `protocol_version` to use.

```
cassandra:
  cluster:
    - 192.168.50.10
    - 192.168.50.11
    - 192.168.50.12
  port: 9000
  username: cas_admin

  # defaults to 4, if not set
  protocol_version: 3
```

`salt.modules.cassandra_cql.`**`cql_query`**(*query*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Run a query on a Cassandra cluster and return a dictionary.

Parameters

- **`query`** (*str*) -- The query to execute.
- **`contact_points`** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **`cql_user`** (*str*) -- The Cassandra user if authentication is turned on.
- **`cql_pass`** (*str*) -- The Cassandra user password if authentication is turned on.
- **`port`** (*int*) -- The Cassandra cluster port, defaults to None.

- **params** (*str*) -- The parameters for the query, optional.

Returns A dictionary from the return values of the query

Return type list[dict]

CLI Example:

```
salt '*' cql_query "SELECT * FROM users_by_name WHERE first_name = 'jane'"
```

salt.modules.cassandra_cql.**cql_query_with_prepare**(*query*, *statement_name*, *statement_arguments*, *async=False*, *callback_errors=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Run a query on a Cassandra cluster and return a dictionary.

This function should not be used asynchronously for SELECTs -- it will not return anything and we don't currently have a mechanism for handling a future that will return results.

Parameters

- **query** (*str*) -- The query to execute.
- **statement_name** (*str*) -- Name to assign the prepared statement in the __context__ dictionary
- **statement_arguments** (*list[str]*) -- Bind parameters for the SQL statement
- **async** (*bool*) -- Run this query in asynchronous mode
- **callback_errors** (*Function callable*) -- Function to call after query runs if there is an error
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **params** (*str*) -- The parameters for the query, optional.

Returns A dictionary from the return values of the query

Return type list[dict]

CLI Example:

```
# Insert data asynchronously
salt this-node cassandra_cql.cql_query_with_prepare "name_insert" "INSERT INTO
 ↪USERS (first_name, last_name) VALUES (?, ?)"            statement_arguments=[
 ↪'John','Doe'], async=True

# Select data, should not be asynchronous because there is not currently a
 ↪facility to return data from a future
salt this-node cassandra_cql.cql_query_with_prepare "name_select" "SELECT * FROM
 ↪USERS WHERE first_name=?"            statement_arguments=['John']
```

salt.modules.cassandra_cql.**create_keyspace**(*keyspace*, *replication_strategy='SimpleStrategy'*, *replication_factor=1*, *replication_datacenters=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Create a new keyspace in Cassandra.

Parameters

- **keyspace** (*str*) -- The keyspace name
- **replication_strategy** (*str*) -- either *SimpleStrategy* or *NetworkTopologyStrategy*
- **replication_factor** (*int*) -- number of replicas of data on multiple nodes. not used if using NetworkTopologyStrategy
- **replication_datacenters** (*str | dict[str, int]*) -- string or dict of datacenter names to replication factors, required if using NetworkTopologyStrategy (will be a dict if coming from state file).
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns The info for the keyspace or False if it does not exist.

Return type dict

CLI Example:

```
# CLI Example:
salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace

salt 'minion1' cassandra_cql.create_keyspace keyspace=newkeyspace replication_
↪strategy=NetworkTopologyStrategy          replication_datacenters='{"datacenter_1
↪": 3, "datacenter_2": 2}'
```

salt.modules.cassandra_cql.**create_user**(*username*, *password*, *superuser=False*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Create a new cassandra user with credentials and superuser status.

Parameters

- **username** (*str*) -- The name of the new user.
- **password** (*str*) -- The password of the new user.
- **superuser** (*bool*) -- Is the new user going to be a superuser? default: False
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret
```

```
salt 'minion1' cassandra_cql.create_user username=joe password=secret
 ↪superuser=True

salt 'minion1' cassandra_cql.create_user username=joe password=secret
 ↪superuser=True contact_points=minion1
```

salt.modules.cassandra_cql.**drop_keyspace**(*keyspace*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Drop a keyspace if it exists in a Cassandra cluster.

Parameters

- **keyspace** (*str*) -- The keyspace to drop.
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns The info for the keyspace or False if it does not exist.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.drop_keyspace keyspace=test

salt 'minion1' cassandra_cql.drop_keyspace keyspace=test contact_points=minion1
```

salt.modules.cassandra_cql.**grant_permission**(*username*, *resource=None*, *resource_type='keyspace'*, *permission=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Grant permissions to a user.

Parameters

- **username** (*str*) -- The name of the user to grant permissions to.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are granted.
- **resource_type** (*str*) -- The resource_type (keyspace or table), defaults to `keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are granted.
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns

Return type

CLI Example:

```
salt 'minion1' cassandra_cql.grant_permission

salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_keyspace
 ↪permission=select

salt 'minion1' cassandra_cql.grant_permission username=joe resource=test_table
 ↪resource_type=table         permission=select contact_points=minion1
```

salt.modules.cassandra_cql.**info**(*contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Show the Cassandra information for this cluster.

Parameters

- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns The information for this Cassandra cluster.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.info

salt 'minion1' cassandra_cql.info contact_points=minion1
```

salt.modules.cassandra_cql.**keyspace_exists**(*keyspace*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Check if a keyspace exists in a Cassandra cluster.

:param keyspace The keyspace name to check for. :type keyspace: str :param contact_points: The Cassandra cluster addresses, can either be a string or a list of IPs. :type contact_points: str | list[str] :param cql_user: The Cassandra user if authentication is turned on. :type cql_user: str :param cql_pass: The Cassandra user password if authentication is turned on. :type cql_pass: str :param port: The Cassandra cluster port, defaults to None. :type port: int :return: The info for the keyspace or False if it does not exist. :rtype: dict

CLI Example:

```
salt 'minion1' cassandra_cql.keyspace_exists keyspace=system

salt 'minion1' cassandra_cql.list_keyspaces keyspace=system contact_points=minion1
```

salt.modules.cassandra_cql.**list_column_families**(*keyspace=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List column families in a Cassandra cluster for all keyspaces or just the provided one.

Parameters

- **keyspace** (*str*) -- The keyspace to provide the column families for, optional.
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.

- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns The column families in this Cassandra cluster.

Return type list[dict]

CLI Example:

```
salt 'minion1' cassandra_cql.list_column_families

salt 'minion1' cassandra_cql.list_column_families contact_points=minion1

salt 'minion1' cassandra_cql.list_column_families keyspace=system
```

salt.modules.cassandra_cql.**list_keyspaces**(*contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List keyspaces in a Cassandra cluster.

Parameters

- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns The keyspaces in this Cassandra cluster.

Return type list[dict]

CLI Example:

```
salt 'minion1' cassandra_cql.list_keyspaces

salt 'minion1' cassandra_cql.list_keyspaces contact_points=minion1 port=9000
```

salt.modules.cassandra_cql.**list_permissions**(*username=None*, *resource=None*, *resource_type='keyspace'*, *permission=None*, *contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List permissions.

Parameters

- **username** (*str*) -- The name of the user to list permissions for.
- **resource** (*str*) -- The resource (keyspace or table), if None, permissions for all resources are listed.
- **resource_type** (*str*) -- The resource_type (keyspace or table), defaults to `keyspace'.
- **permission** (*str*) -- A permission name (e.g. select), if None, all permissions are listed.
- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns Dictionary of permissions.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.list_permissions

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_keyspace
↪permission=select

salt 'minion1' cassandra_cql.list_permissions username=joe resource=test_table
↪resource_type=table           permission=select contact_points=minion1
```

salt.modules.cassandra_cql.**list_users**(*contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

List existing users in this Cassandra cluster.

Parameters

- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.

Returns The list of existing users.

Return type dict

CLI Example:

```
salt 'minion1' cassandra_cql.list_users

salt 'minion1' cassandra_cql.list_users contact_points=minion1
```

salt.modules.cassandra_cql.**version**(*contact_points=None*, *port=None*, *cql_user=None*, *cql_pass=None*)

Show the Cassandra version.

Parameters

- **contact_points** (*str | list[str]*) -- The Cassandra cluster addresses, can either be a string or a list of IPs.
- **cql_user** (*str*) -- The Cassandra user if authentication is turned on.
- **cql_pass** (*str*) -- The Cassandra user password if authentication is turned on.
- **port** (*int*) -- The Cassandra cluster port, defaults to None.

Returns The version for this Cassandra cluster.

Return type str

CLI Example:

```
salt 'minion1' cassandra_cql.version

salt 'minion1' cassandra_cql.version contact_points=minion1
```

19.9.64 salt.modules.celery module

Support for scheduling celery tasks. The worker is independent of salt and thus can run in a different virtualenv or on a different python version, as long as broker, backend and serializer configurations match. Also note that celery

and packages required by the celery broker, e.g. redis must be installed to load the salt celery execution module.

Note: A new app (and thus new connections) is created for each task execution

salt.modules.celery.**run_task**(*task_name*, *args=None*, *kwargs=None*, *broker=None*, *backend=None*, *wait_for_result=False*, *timeout=None*, *propagate=True*, *interval=0.5*, *no_ack=True*, *raise_timeout=True*, *config=None*)

Execute celery tasks. For celery specific parameters see celery documentation.

CLI Example:

```
salt '*' celery.run_task tasks.sleep args=[4] broker=redis://localhost \
backend=redis://localhost wait_for_result=true
```

task_name The task name, e.g. tasks.sleep
args Task arguments as a list
kwargs Task keyword arguments
broker Broker for celeryapp, see celery documentation
backend Result backend for celeryapp, see celery documentation
wait_for_result Wait until task result is read from result backend and return result, Default: False
timeout Timeout waiting for result from celery, see celery AsyncResult.get documentation
propagate Propagate exceptions from celery task, see celery AsyncResult.get documentation, Default: True
interval Interval to check for task result, see celery AsyncResult.get documentation, Default: 0.5
no_ack see celery AsyncResult.get documentation. Default: True
raise_timeout Raise timeout exception if waiting for task result times out. Default: False
config Config dict for celery app, See celery documentation

19.9.65 salt.modules.ceph module

Module to provide ceph control with salt.

depends

- ceph_cfg Python module

New in version 2016.11.0.

salt.modules.ceph.**ceph_version**()

Get the version of ceph installed

CLI Example:

```
salt '*' ceph.ceph_version
```

salt.modules.ceph.**cluster_quorum**(***kwargs*)

Get the cluster's quorum status

CLI Example:

```
salt '*' ceph.cluster_quorum \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**cluster_status**(***kwargs*)
Get the cluster status, including health if in quorum

CLI Example:

```
salt '*' ceph.cluster_status \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_auth_add**(***kwargs*)
Add keyring to authorized list

CLI Example:

```
salt '*' ceph.keyring_auth_add \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_auth_del**(***kwargs*)
Remove keyring from authorised list

CLI Example:

```
salt '*' ceph.keyring_osd_auth_del \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_auth_list**(***kwargs*)
List all cephx authorization keys

CLI Example:

```
salt '*' ceph.keyring_auth_list \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.**keyring_create**(***kwargs*)
Create keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_create \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_present**(***kwargs*)
Returns True if the keyring is present on disk, otherwise False

CLI Example:

```
salt '*' ceph.keyring_present \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**keyring_purge**(***kwargs*)
Delete keyring for cluster

CLI Example:

```
salt '*' ceph.keyring_purge \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

If no ceph config file is found, this command will fail.

salt.modules.ceph.**keyring_save**(***kwargs*)
Create save keyring locally

CLI Example:

```
salt '*' ceph.keyring_save \
        'keyring_type'='admin' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

keyring_type (required) One of admin, mon, osd, rgw, mds
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**mds_create**(***kwargs*)
Create a mds

CLI Example:

```
salt '*' ceph.mds_create \
        'name' = 'mds.name' \
        'port' = 1000, \
        'addr' = 'fqdn.example.org' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with mds.)

port (required) Port to which the MDS will listen
addr (required) Address or IP address for the MDS to listen
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`mds_destroy`**`(`*`**kwargs`*`)`
Remove a mds

CLI Example:

```
salt '*' ceph.mds_destroy \
        'name' = 'mds.name' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The MDS name (must start with `mds.`)
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`mon_active`**`(`*`**kwargs`*`)`
Returns `True` if the mon daemon is running, otherwise `False`

CLI Example:

```
salt '*' ceph.mon_active \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`mon_create`**`(`*`**kwargs`*`)`
Create a mon node

CLI Example:

```
salt '*' ceph.mon_create \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to `ceph`.

`salt.modules.ceph.`**`mon_is`**`(`*`**kwargs`*`)`
Returns `True` if the target is a mon node, otherwise `False`

CLI Example:

```
salt '*' ceph.mon_is \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to `ceph`.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

`salt.modules.ceph.`**`mon_quorum`**`(`*`**kwargs`*`)`
Returns `True` if the mon daemon is in the quorum, otherwise `False`

CLI Example:

```
salt '*' ceph.mon_quorum \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**mon_status**(***kwargs*)
Get status from mon daemon

CLI Example:

```
salt '*' ceph.mon_status \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**osd_activate**(***kwargs*)
Activate an OSD

CLI Example:

```
salt '*' ceph.osd_activate 'osd_dev'='/dev/vdc'
```

salt.modules.ceph.**osd_discover**()
List all OSD by cluster

CLI Example:

```
salt '*' ceph.osd_discover
```

salt.modules.ceph.**osd_prepare**(***kwargs*)
Prepare an OSD

CLI Example:

```
salt '*' ceph.osd_prepare 'osd_dev'='/dev/vdc' \
        'journal_dev'='device' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid' \
        'osd_fs_type'='xfs' \
        'osd_uuid'='2a143b73-6d85-4389-a9e9-b8a78d9e1e07' \
        'journal_uuid'='4562a5db-ff6f-4268-811d-12fd4a09ae98'
```

cluster_uuid The device to store the osd data on.
journal_dev The journal device. defaults to osd_dev.
cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster date will be added too. Defaults to the value found in local config.
osd_fs_type set the file system to store OSD data with. Defaults to ``xfs''.
osd_uuid set the OSD data UUID. If set will return if OSD with data UUID already exists.
journal_uuid set the OSD journal UUID. If set will return if OSD with journal UUID already exists.

salt.modules.ceph.**partition_is**(*dev*)
Check whether a given device path is a partition or a full disk.

CLI Example:

```
salt '*' ceph.partition_is /dev/sdc1
```

salt.modules.ceph.**partition_list**()
List partitions by disk

CLI Example:

```
salt '*' ceph.partition_list
```

salt.modules.ceph.**partition_list_journal**()
List all OSD journal partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_journal
```

salt.modules.ceph.**partition_list_osd**()
List all OSD data partitions by partition

CLI Example:

```
salt '*' ceph.partition_list_osd
```

salt.modules.ceph.**pool_add**(*pool_name*, ***kwargs*)
Create a pool

CLI Example:

```
salt '*' ceph.pool_add pool_name \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
pg_num Default to 8
pgp_num Default to pg_num
pool_type can take values ``replicated'' or ``erasure''
erasure_code_profile The ``erasure_code_profile''
crush_ruleset The crush map rule set

salt.modules.ceph.**pool_del**(*pool_name*, ***kwargs*)
Delete a pool

CLI Example:

```
salt '*' ceph.pool_del pool_name \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.**pool_list**(***kwargs*)
List all pools

CLI Example:

```
salt '*' ceph.pool_list \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

```
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.**purge**(***kwargs*)
purge ceph configuration on the node

CLI Example:

```
salt '*' ceph.purge \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

salt.modules.ceph.**rgw_create**(***kwargs*)
Create a rgw

CLI Example:

```
salt '*' ceph.rgw_create \
        'name' = 'rgw.name' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The RGW client name. Must start with rgw.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**rgw_destroy**(***kwargs*)
Remove a rgw

CLI Example:

```
salt '*' ceph.rgw_destroy \
        'name' = 'rgw.name' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

name (required) The RGW client name (must start with rgw.)
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**rgw_pools_create**(***kwargs*)
Create pools for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_create
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**rgw_pools_missing**(***kwargs*)
Show pools missing for rgw

CLI Example:

```
salt '*' ceph.rgw_pools_missing
```

cluster_uuid The cluster UUID. Defaults to value found in ceph config file.
cluster_name The cluster name. Defaults to ceph.

salt.modules.ceph.**zap**(*target=None*, ***kwargs*)
Destroy the partition table and content of a given disk.

```
salt '*' ceph.osd_prepare 'dev'='/dev/vdc' \
        'cluster_name'='ceph' \
        'cluster_uuid'='cluster_uuid'
```

dev The block device to format.
cluster_name The cluster name. Defaults to ceph.
cluster_uuid The cluster UUID. Defaults to value found in ceph config file.

19.9.66 salt.modules.chassis

Glue execution module to link to the *fx2 proxymodule*.

Depends: *iDRAC Remote execution module (salt.modules.dracr)*

For documentation on commands that you can direct to a Dell chassis via proxy, look in the documentation for *salt.modules.dracr*.

This execution module calls through to a function in the fx2 proxy module called chconfig. That function looks up the function passed in the cmd parameter in *salt.modules.dracr* and calls it.

New in version 2015.8.2.

19.9.67 salt.modules.chef

Execute chef in server or solo mode

salt.modules.chef.**client**(*whyrun=False*, *localmode=False*, *logfile=None*, ***kwargs*)
Execute a chef client run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.client server=https://localhost
```

server The chef server URL
client_key Set the client key file location
config The configuration file to use
config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
localmode Point chef-client at local repository if True
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
pid Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.

runlist Permanently replace current run list with specified items
user User to set privilege to
validation_key Set the validation key file location, used for registering new clients
whyrun Enable whyrun mode when set to True

salt.modules.chef.**solo**(*whyrun=False*, *logfile=None*, ***kwargs*)
Execute a chef solo run and return a dict with the stderr, stdout, return code, and pid.

CLI Example:

```
salt '*' chef.solo override-runlist=test
```

config The configuration file to use
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user User to set privilege to
whyrun Enable whyrun mode when set to True

19.9.68 salt.modules.chocolatey

A dead simple module wrapping calls to the Chocolatey package manager (http://chocolatey.org)

New in version 2014.1.0.

salt.modules.chocolatey.**add_source**(*name*, *source_location*, *username=None*, *password=None*)
Instructs Chocolatey to add a source.
name The name of the source to be added as a chocolatey repository.
source Location of the source you want to work with.
username Provide username for chocolatey sources that need authentication credentials.
password Provide password for chocolatey sources that need authentication credentials.
CLI Example:

```
salt '*' chocolatey.add_source <source name> <source_location>
salt '*' chocolatey.add_source <source name> <source_location> user=<user>
 ↪password=<password>
```

salt.modules.chocolatey.**bootstrap**(*force=False*)
Download and install the latest version of the Chocolatey package manager via the official bootstrap.

Chocolatey requires Windows PowerShell and the .NET v4.0 runtime. Depending on the host's version of Windows, chocolatey.bootstrap will attempt to ensure these prerequisites are met by downloading and executing the appropriate installers from Microsoft.

Note that if PowerShell is installed, you may have to restart the host machine for Chocolatey to work.
force Run the bootstrap process even if Chocolatey is found in the path.
CLI Example:

```
salt '*' chocolatey.bootstrap
salt '*' chocolatey.bootstrap force=True
```

salt.modules.chocolatey.**chocolatey_version**()

Returns the version of Chocolatey installed on the minion.

CLI Example:

```
salt '*' chocolatey.chocolatey_version
```

salt.modules.chocolatey.**disable_source**(*name*)

Instructs Chocolatey to disable a source.

name Name of the source repository to disable.

CLI Example:

```
salt '*' chocolatey.disable_source <name>
```

salt.modules.chocolatey.**enable_source**(*name*)

Instructs Chocolatey to enable a source.

name Name of the source repository to enable.

CLI Example:

```
salt '*' chocolatey.enable_source <name>
```

salt.modules.chocolatey.**install**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*, *allow_multiple=False*)

Instructs Chocolatey to install a package.

Parameters

- **name** (*str*) -- The name of the package to be installed. Only accepts a single argument. Required.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version. Default is None.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.

  Alternate Sources:

  - cygwin
  - python
  - ruby
  - webpi
  - windowsfeatures
- **force** (*bool*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **pre_versions** (*bool*) -- Include pre-release packages. Default is False.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process i.e product key or feature list. Default is None.
- **override_args** (*bool*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is None.

- **force_x86** (*bool*) -- Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package_args** (*str*) -- Arguments you want to pass to the package. Default is None.
- **allow_multiple** (*bool*) -- Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

  New in version 2017.7.0.

Returns The output of the `chocolatey` command

Return type str

CLI Example:

```
salt '*' chocolatey.install <package name>
salt '*' chocolatey.install <package name> version=<package version>
salt '*' chocolatey.install <package name> install_args=<args> override_args=True
```

`salt.modules.chocolatey.`**`install_cygwin`**(*name*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Cygwin.

name The name of the package to be installed. Only accepts a single argument.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_cygwin <package name>
salt '*' chocolatey.install_cygwin <package name> install_args=<args> override_
↪args=True
```

`salt.modules.chocolatey.`**`install_gem`**(*name*, *version=None*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Ruby's Gems.

name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_gem <package name>
salt '*' chocolatey.install_gem <package name> version=<package version>
salt '*' chocolatey.install_gem <package name> install_args=<args> override_
↪args=True
```

`salt.modules.chocolatey.`**`install_missing`**(*name*, *version=None*, *source=None*)

Instructs Chocolatey to install a package if it doesn't already exist.

Changed in version 2014.7.0: If the minion has Chocolatey >= 0.9.8.24 installed, this function calls *chocolatey.install* instead, as `installmissing` is deprecated as of that version and will be removed in Chocolatey 1.0.

name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

source Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

CLI Example:

```
salt '*' chocolatey.install_missing <package name>
salt '*' chocolatey.install_missing <package name> version=<package version>
```

salt.modules.chocolatey.**install_python**(*name*, *version=None*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via Python's easy_install.

name The name of the package to be installed. Only accepts a single argument.

version Install a specific version of the package. Defaults to latest version available.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_python <package name>
salt '*' chocolatey.install_python <package name> version=<package version>
salt '*' chocolatey.install_python <package name> install_args=<args> override_
↪args=True
```

salt.modules.chocolatey.**install_webpi**(*name*, *install_args=None*, *override_args=False*)

Instructs Chocolatey to install a package via the Microsoft Web PI service.

name The name of the package to be installed. Only accepts a single argument.

install_args A list of install arguments you want to pass to the installation process i.e product key or feature list

override_args Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.install_webpi <package name>
salt '*' chocolatey.install_webpi <package name> install_args=<args> override_
↪args=True
```

salt.modules.chocolatey.**install_windowsfeatures**(*name*)

Instructs Chocolatey to install a Windows Feature via the Deployment Image Servicing and Management tool.

name The name of the feature to be installed. Only accepts a single argument.

CLI Example:

```
salt '*' chocolatey.install_windowsfeatures <package name>
```

salt.modules.chocolatey.**list**(*narrow=None*, *all_versions=False*, *pre_versions=False*, *source=None*, *local_only=False*, *exact=False*)

Instructs Chocolatey to pull a vague package list from the repository.

Parameters

- **narrow** (*str*) -- Term used to narrow down results. Searches against name/description/tag. Default is None.
- **all_versions** (*bool*) -- Display all available package versions in results. Default is False.
- **pre_versions** (*bool*) -- Display pre-release packages in results. Default is False.

- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed if None is passed. Default is None.
- **local_only** (*bool*) -- Display packages only installed locally. Default is False.
- **exact** (*bool*) -- Display only packages that match `narrow` exactly. Default is False.

  New in version 2017.7.0.

Returns A dictionary of results.

Return type dict

CLI Example:

```
salt '*' chocolatey.list <narrow>
salt '*' chocolatey.list <narrow> all_versions=True
```

salt.modules.chocolatey.**list_webpi**()

Instructs Chocolatey to pull a full package list from the Microsoft Web PI repository.

Returns List of webpi packages

Return type str

CLI Example:

```
salt '*' chocolatey.list_webpi
```

salt.modules.chocolatey.**list_windowsfeatures**()

Instructs Chocolatey to pull a full package list from the Windows Features list, via the Deployment Image Servicing and Management tool.

Returns List of Windows Features

Return type str

CLI Example:

```
salt '*' chocolatey.list_windowsfeatures
```

salt.modules.chocolatey.**uninstall**(*name*, *version=None*, *uninstall_args=None*, *override_args=False*)

Instructs Chocolatey to uninstall a package.

name The name of the package to be uninstalled. Only accepts a single argument.

version Uninstalls a specific version of the package. Defaults to latest version installed.

uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller) in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

CLI Example:

```
salt '*' chocolatey.uninstall <package name>
salt '*' chocolatey.uninstall <package name> version=<package version>
salt '*' chocolatey.uninstall <package name> version=<package version> uninstall_
↪args=<args> override_args=True
```

salt.modules.chocolatey.**update**(*name*, *source=None*, *pre_versions=False*)

Instructs Chocolatey to update packages on the system.

name The name of the package to update, or ``all'' to update everything installed on the system.

source Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.

pre_versions Include pre-release packages in comparison. Defaults to False.
CLI Example:

```
salt "*" chocolatey.update all
salt "*" chocolatey.update <package name> pre_versions=True
```

salt.modules.chocolatey.**upgrade**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*)

New in version 2016.3.4.

Instructs Chocolatey to upgrade packages on the system. (update is being deprecated)

Parameters

- **name** (*str*) -- The name of the package to update, or ``all'' to update everything installed on the system.
- **version** (*str*) -- Install a specific version of the package. Defaults to latest version.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed.
- **force** (*bool*) -- Reinstall the **same** version already installed
- **pre_versions** (*bool*) -- Include pre-release packages in comparison. Defaults to False.
- **install_args** (*str*) -- A list of install arguments you want to pass to the installation process i.e product key or feature list
- **override_args** (*str*) -- Set to true if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments
- **force_x86** -- Force x86 (32bit) installation on 64 bit systems. Defaults to false.
- **package_args** -- A list of arguments you want to pass to the package

Returns Results of the `chocolatey` command

Return type str

CLI Example:

```
salt "*" chocolatey.upgrade all
salt "*" chocolatey.upgrade <package name> pre_versions=True
```

salt.modules.chocolatey.**version**(*name*, *check_remote=False*, *source=None*, *pre_versions=False*)

Instructs Chocolatey to check an installed package version, and optionally compare it to one available from a remote feed.

Parameters

- **name** (*str*) -- The name of the package to check. Required.
- **check_remote** (*bool*) -- Get the version number of the latest package from the remote feed. Default is False.
- **source** (*str*) -- Chocolatey repository (directory, share or remote URL feed) the package comes from. Defaults to the official Chocolatey feed. Default is None.
- **pre_versions** (*bool*) -- Include pre-release packages in comparison. Default is False.

Returns A dictionary of currently installed software and versions

Return type dict

CLI Example:

```
salt "*" chocolatey.version <package name>
salt "*" chocolatey.version <package name> check_remote=True
```

19.9.69 salt.modules.chronos module

Module providing a simple management interface to a chronos cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

`salt.modules.chronos.`**`has_job`**(*name*)

Return whether the given job is currently configured.

CLI Example:

```
salt chronos-minion-id chronos.has_job my-job
```

`salt.modules.chronos.`**`job`**(*name*)

Return the current server configuration for the specified job.

CLI Example:

```
salt chronos-minion-id chronos.job my-job
```

`salt.modules.chronos.`**`jobs`**()

Return a list of the currently installed job names.

CLI Example:

```
salt chronos-minion-id chronos.jobs
```

`salt.modules.chronos.`**`rm_job`**(*name*)

Remove the specified job from the server.

CLI Example:

```
salt chronos-minion-id chronos.rm_job my-job
```

`salt.modules.chronos.`**`update_job`**(*name*, *config*)

Update the specified job with the given configuration.

CLI Example:

```
salt chronos-minion-id chronos.update_job my-job '<config yaml>'
```

19.9.70 salt.modules.cisconso

Execution module for Cisco Network Services Orchestrator Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for *salt.proxy.cisconso*.

`salt.modules.cisconso.`**`apply_rollback`**(*datastore*, *name*)

Apply a system rollback

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (str) -- an ID of the rollback to restore

```
salt cisco-nso cisconso.apply_rollback 52
```

salt.modules.cisconso.**get_data**(*datastore*, *path*)

Get the configuration of the device tree at the given path

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated

Returns The network configuration at that tree

Return type dict

```
salt cisco-nso cisconso.get_data running 'devices/ex0'
```

salt.modules.cisconso.**get_rollback**(*name*)

Get the backup of stored a configuration rollback

Parameters **name** (str) -- Typically an ID of the backup

Return type str

Returns the contents of the rollback snapshot

```
salt cisco-nso cisconso.get_rollback 52
```

salt.modules.cisconso.**get_rollbacks**()

Get a list of stored configuration rollbacks

```
salt cisco-nso cisconso.get_rollbacks
```

salt.modules.cisconso.**info**()

Return system information for grains of the NSO proxy minion

```
salt '*' cisconso.info
```

salt.modules.cisconso.**set_data_value**(*datastore*, *path*, *data*)

Get a data entry in a datastore

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
- **data** (dict) -- The new value at the given path

Return type bool

Returns True if successful, otherwise error.

```
salt cisco-nso cisconso.set_data_value running 'devices/ex0/routes' 10.0.0.20/24
```

19.9.71 salt.modules.cloud

Salt-specific interface for calling Salt Cloud directly

salt.modules.cloud.**action**(*fun=None*, *cloudmap=None*, *names=None*, *provider=None*, *instance=None*, ***kwargs*)

Execute a single action on the given provider/instance

CLI Example:

```
salt minionname cloud.action start instance=myinstance
salt minionname cloud.action stop instance=myinstance
salt minionname cloud.action show_image provider=my-ec2-config image=ami-1624987f
```

salt.modules.cloud.**create**(*provider*, *names*, *opts=None*, ***kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.create my-ec2-config myinstance image=ami-1624987f size='t1.
↪micro' ssh_username=ec2-user securitygroup=default delvol_on_destroy=True
```

salt.modules.cloud.**destroy**(*names*)

Destroy the named VM(s)

CLI Example:

```
salt minionname cloud.destroy myinstance
```

salt.modules.cloud.**full_query**(*query_type='list_nodes_full'*)

List all available cloud provider data

CLI Example:

```
salt minionname cloud.full_query
```

salt.modules.cloud.**get_instance**(*name*, *provider=None*)

Return details on an instance.

Similar to the cloud action show_instance but returns only the instance details.

CLI Example:

```
salt minionname cloud.get_instance myinstance
```

SLS Example:

```
{{ salt['cloud.get_instance']('myinstance')['mac_address'] }}
```

salt.modules.cloud.**has_instance**(*name*, *provider=None*)

Return true if the instance is found on a provider

CLI Example:

```
salt minionname cloud.has_instance myinstance
```

salt.modules.cloud.**list_images**(*provider='all'*)
List cloud provider images for the given providers

CLI Example:

```
salt minionname cloud.list_images my-gce-config
```

salt.modules.cloud.**list_locations**(*provider='all'*)
List cloud provider locations for the given providers

CLI Example:

```
salt minionname cloud.list_locations my-gce-config
```

salt.modules.cloud.**list_sizes**(*provider='all'*)
List cloud provider sizes for the given providers

CLI Example:

```
salt minionname cloud.list_sizes my-gce-config
```

salt.modules.cloud.**map_run**(*path=None*, ***kwargs*)
Execute a salt cloud map file

CLI Examples:

```
salt minionname cloud.map_run /path/to/cloud.map
salt minionname cloud.map_run map_data='<actual map data>'
```

salt.modules.cloud.**network_create**(*provider*, *names*, ***kwargs*)
Create private network

CLI Example:

```
salt minionname cloud.network_create my-nova names=['salt'] cidr='192.168.100.0/24
↪'
```

salt.modules.cloud.**network_list**(*provider*)
List private networks

CLI Example:

```
salt minionname cloud.network_list my-nova
```

salt.modules.cloud.**profile**(*profile*, *names*, *vm_overrides=None*, *opts=None*, ***kwargs*)
Spin up an instance using Salt Cloud

CLI Example:

```
salt minionname cloud.profile my-gce-config myinstance
```

salt.modules.cloud.**query**(*query_type='list_nodes'*)
List cloud provider data for all providers

CLI Examples:

```
salt minionname cloud.query
salt minionname cloud.query list_nodes_full
salt minionname cloud.query list_nodes_select
```

salt.modules.cloud.**select_query**(*query_type='list_nodes_select'*)
List selected nodes

CLI Example:

```
salt minionname cloud.select_query
```

salt.modules.cloud.**virtual_interface_create**(*provider*, *names*, ***kwargs*)
Attach private interfaces to a server

CLI Example:

```
salt minionname cloud.virtual_interface_create my-nova names=['salt-master'] net_
↪name='salt'
```

salt.modules.cloud.**virtual_interface_list**(*provider*, *names*, ***kwargs*)
List virtual interfaces on a server

CLI Example:

```
salt minionname cloud.virtual_interface_list my-nova names=['salt-master']
```

salt.modules.cloud.**volume_attach**(*provider*, *names*, ***kwargs*)
Attach volume to a server

CLI Example:

```
salt minionname cloud.volume_attach my-nova myblock server_name=myserver device='/
↪dev/xvdf'
```

salt.modules.cloud.**volume_create**(*provider*, *names*, ***kwargs*)
Create volume

CLI Example:

```
salt minionname cloud.volume_create my-nova myblock size=100 voltype=SSD
```

salt.modules.cloud.**volume_delete**(*provider*, *names*, ***kwargs*)
Delete volume

CLI Example:

```
salt minionname cloud.volume_delete my-nova myblock
```

salt.modules.cloud.**volume_detach**(*provider*, *names*, ***kwargs*)
Detach volume from a server

CLI Example:

```
salt minionname cloud.volume_detach my-nova myblock server_name=myserver
```

salt.modules.cloud.**volume_list**(*provider*)
List block storage volumes

CLI Example:

```
salt minionname cloud.volume_list my-nova
```

19.9.72 salt.modules.cmdmod

A module for shelling out.

Keep in mind that this module is insecure, in that it can give whomever has access to the master root execution access to all salt minions.

`salt.modules.cmdmod.`**`exec_code`**(*lang*, *code*, *cwd=None*)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. The stdout will be returned.

CLI Example:

```
salt '*' cmd.exec_code ruby 'puts "cheese"'
```

`salt.modules.cmdmod.`**`exec_code_all`**(*lang*, *code*, *cwd=None*)

Pass in two strings, the first naming the executable language, aka - python2, python3, ruby, perl, lua, etc. the second string containing the code you wish to execute. All cmd artifacts (stdout, stderr, retcode, pid) will be returned.

CLI Example:

```
salt '*' cmd.exec_code_all ruby 'puts "cheese"'
```

`salt.modules.cmdmod.`**`has_exec`**(*cmd*)

Returns true if the executable is available on the minion, false otherwise

CLI Example:

```
salt '*' cmd.has_exec cat
```

`salt.modules.cmdmod.`**`powershell`**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='debug'*, *quiet=False*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *password=None*, *depth=None*, *encode_cmd=False*, ***kwargs*)

Execute the passed PowerShell command and return the output as a dictionary.

Other `cmd.*` functions return the raw text output of the command. This function appends `| ConvertTo-JSON` to the command and then parses the JSON into a Python dictionary. If you want the raw textual result of your PowerShell command you should use `cmd.run` with the `shell=powershell` option.

For example:

```
salt '*' cmd.run '$PSVersionTable.CLRVersion' shell=powershell
salt '*' cmd.run 'Get-NetTCPConnection' shell=powershell
```

New in version 2016.3.0.

> **Warning:** This passes the cmd argument directly to PowerShell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

Note that `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

In addition to the normal `cmd.run` parameters, this command offers the `depth` parameter to change the Windows default depth for the `ConvertTo-JSON` powershell command. The Windows default is 2. If you need more depth, set that here.

Note: For some commands, setting the depth to a value greater than 4 greatly increases the time it takes for the command to return and in many cases returns useless data.

Parameters

- **cmd** (*str*) -- The powershell command to run.
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

  Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

  One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
 ↪usr/bin') %}
```

```
mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↪') }}
```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **reset_system_locale** (*bool*) -- Resets the system locale
- **ignore_retcode** (*bool*) -- Ignore the return code
- **saltenv** (*str*) -- The salt environment to use. Default is `base'
- **depth** (*int*) -- The number of levels of contained objects to be included. Default is 2. Values greater than 4 seem to greatly increase the time it takes for the command to complete for some commands. eg: `dir`

  New in version 2016.3.4.
- **encode_cmd** (*bool*) -- Encode the command before executing. Use in cases where characters may be dropped or incorrectly converted when executed. Default is False.

Returns

dict A dictionary of data returned by the powershell command.

CLI Example:

```
salt '*' cmd.powershell "$PSVersionTable.CLRVersion"
```

`salt.modules.cmdmod.`**`retcode`**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *password=None*, ***kwargs*)

Execute a shell command and return the command's return code.

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home'
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.

- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (`list`) -- A list of environment variables to be set prior to execution.

  Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

  One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
 ↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
 ↪') }}
```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Note: env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

Return type int

Return type None

Returns Return Code as an int or None if there was an exception.

CLI Example:

```
salt '*' cmd.retcode "file /bin/bash"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.retcode template=jinja "file {{grains.pythonpath[0]}}/python"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.retcode "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.**run**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *bg=False*, *password=None*, *encoded_cmd=False*, ***kwargs*)

Execute the passed command and return the output as a string

Note that env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home`
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If `False`, let python handle the positional arguments. Set to `True` to use shell features, such as pipes or redirection.
- **bg** (*bool*) -- If `True`, run command in background and do not await or deliver it's results

  New in version 2016.3.0.

- **env** (*list*) -- A list of environment variables to be set prior to execution.

  Example:

  ```
  salt://scripts/foo.sh:
    cmd.script:
      - env:
        - BATCH: 'yes'
  ```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

  ```
  salt://scripts/bar.sh:
    cmd.script:
      - env: "PATH=/some/path:$PATH"
  ```

  One can still use the existing $PATH by using a bit of Jinja:

  ```
  {% set current_path = salt['environ.get']('PATH', '/bin:/
  ↪usr/bin') %}

  mycommand:
    cmd.run:
      - name: ls -l /
      - env:
        - PATH: {{ [current_path, '/my/special/bin']|join(':
  ↪') }}
  ```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.
- **encoded_cmd** (*bool*) -- Specify if the supplied command is encoded. Only applies to shell `powershell'.

Warning: This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as `echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as `good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True

CLI Example:

```
salt '*' cmd.run "ls -l | awk '/foo/{print \\$2}'"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \\$2}
↪'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run "Get-ChildItem C:\\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.run "grep f" stdin='one\\ntwo\\nthree\\nfour\\nfive\\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run cmd='sed -e s/=/:/g'
```

salt.modules.cmdmod.**run_all**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *redirect_stderr=False*, *password=None*, ***kwargs*)

Execute the passed command and return a dict of return data

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home'
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (`list`) -- A list of environment variables to be set prior to execution.

  Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

  One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↪') }}
```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Note: env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

Parameters

- **redirect_stderr** (*bool*) -- If set to True, then stderr will be redirected to stdout. This is helpful for cases where obtaining both the retcode and output is desired, but it is not desired to have the output separated into both stdout and stderr.

  New in version 2015.8.2.

- **password** (*str*) -- Windows only. Required when specifying runas. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.

- **bg** (*bool*) -- If True, run command in background and do not await or deliver it's results

  New in version 2016.3.6.

CLI Example:

```
salt '*' cmd.run_all "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_all template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↪$2}'"
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.run_all "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.**run_bg**(*cmd*, *cwd=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *umask=None*, *timeout=None*, *output_loglevel='debug'*, *log_callback=None*, *reset_system_locale=True*, *saltenv='base'*, *password=None*, ***kwargs*)

Execute the passed command in the background and return it's PID

Note that env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

Note: If the init system is systemd and the backgrounded task should run even if the salt-minion process is restarted, prepend systemd-run --scope to the command. This will reparent the process in its own scope separate from salt-minion, and will not be affected by restarting the minion service.

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home'

- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

  Example:

  ```
  salt://scripts/foo.sh:
    cmd.script:
      - env:
        - BATCH: 'yes'
  ```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

  ```
  salt://scripts/bar.sh:
    cmd.script:
      - env: "PATH=/some/path:$PATH"
  ```

  One can still use the existing $PATH by using a bit of Jinja:

  ```
  {% set current_path = salt['environ.get']('PATH', '/bin:/
   ↪usr/bin') %}

  mycommand:
    cmd.run:
      - name: ls -l /
      - env:
        - PATH: {{ [current_path, '/my/special/bin']|join(':
   ↪') }}
  ```
- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.

Warning: This function does not process commands through a shell unless the python_shell flag is set to True. This means that any shell-specific functionality such as `echo' or the use of pipes, redirection or &&, should either be migrated to cmd.shell or have the python_shell=True flag set here.

The use of python_shell=True means that the shell will accept _any_ input including potentially malicious commands such as `good_command;rm -rf /'. Be absolutely certain that you have sanitized your input prior to using python_shell=True

CLI Example:

```
salt '*' cmd.run_bg "fstrim-all"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_bg template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \\
↪$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.run_bg "Get-ChildItem C:\\ " shell='powershell'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.run_bg cmd='ls -lR / | sed -e s/=/:/g > /tmp/dontwait'
```

`salt.modules.cmdmod.`**`run_chroot`**(*root*, *cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=True*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='quiet'*, *log_callback=None*, *quiet=False*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *bg=False*, ***kwargs*)

New in version 2014.7.0.

This function runs *cmd.run_all* wrapped within a chroot, with dev and proc mounted in the chroot

root Path to the root of the jail to use.

cmd The command to run. ex: `ls -lart /home'

cwd The current working directory to execute the command in. defaults to /root

stdin A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

runas User to run script as.

shell Shell to execute under. Defaults to the system default shell.

python_shell If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection

env

A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
```

```
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

clean_env: Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

rstrip Strip all whitespace off the end of output before it is returned.

umask The umask (in octal) to use when running the command.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

timeout A timeout in seconds for the executed process to return.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.run_chroot /var/lib/lxc/container_name/rootfs 'sh /tmp/bootstrap.sh'
```

salt.modules.cmdmod.**run_stderr**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *password=None*, ***kwargs*)

Execute a command and only return the standard error

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home'
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.

- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (`list`) -- A list of environment variables to be set prior to execution.

  Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

  One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
 ↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
 ↪') }}
```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.

- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Note: env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:

```
salt '*' cmd.run_stderr "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stderr template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
↪{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.run_stderr "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.**run_stdout**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *password=None*, ***kwargs*)

Execute a command, and only return the standard out

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home'
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↪') }}
```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Note: `env` represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:

```
salt '*' cmd.run_stdout "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.run_stdout template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/
 ↪{print \$2}'"
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.run_stdout "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.**script**(*source*, *args=None*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *template=None*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *quiet=False*, *timeout=None*, *reset_system_locale=True*, *saltenv='base'*, *use_vt=False*, *bg=False*, *password=None*, ***kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3''
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run script as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **bg** (*bool*) -- If True, run script in background and do not await or deliver it's results
- **env** (*list*) -- A list of environment variables to be set prior to execution.

  Example:

  ```
  salt://scripts/foo.sh:
    cmd.script:
      - env:
        - BATCH: 'yes'
  ```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
 ↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
 ↪') }}
```

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG)regardless, unless `quiet` is used for this value.
- **quiet** (*bool*) -- The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the **2014.1.0** release, and is being replaced with `output_loglevel: quiet`.
- **timeout** (*int*) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.script salt://scripts/runme.sh
salt '*' cmd.script salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script salt://scripts/windows_task.ps1 args=' -Input c:\tmp\infile.
 ↪txt' shell='powershell'
```

```
salt '*' cmd.script salt://scripts/runme.sh stdin='one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.**script_retcode**(*source*, *args=None*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *python_shell=None*, *env=None*, *template='jinja'*, *umask=None*, *timeout=None*, *reset_system_locale=True*, *saltenv='base'*, *output_loglevel='debug'*, *log_callback=None*, *use_vt=False*, *password=None*, ***kwargs*)

Download a script from a remote location and execute the script locally. The script can be located on the salt master file server or on an HTTP/FTP server.

The script will be executed directly, so it can be written in any available programming language.

The script can also be formatted as a template, the default is jinja.

Only evaluate the script return code and do not block for terminal output

Parameters

- **source** (*str*) -- The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs
- **args** (*str*) -- String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3''
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:
- **runas** (*str*) -- User to run script as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*str*) -- Shell to execute under. Defaults to the system default shell.
- **python_shell** (*bool*) -- If False, let python handle the positional arguments. Set to True to use shell features, such as pipes or redirection
- **env** (*list*) -- A list of environment variables to be set prior to execution.

  Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

  One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↪') }}
```

- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.
- **quiet** (*bool*) -- The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the **2014.1.0** release, and is being replaced with `output_loglevel: quiet`.
- **timeout** (*int*) -- If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

CLI Example:

```
salt '*' cmd.script_retcode salt://scripts/runme.sh
salt '*' cmd.script_retcode salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt '*' cmd.script_retcode salt://scripts/windows_task.ps1 args=' -Input c:
↪\tmp\infile.txt' shell='powershell'
```

A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.script_retcode salt://scripts/runme.sh stdin=
↪'one\ntwo\nthree\nfour\nfive\n'
```

salt.modules.cmdmod.**shell**(*cmd*, *cwd=None*, *stdin=None*, *runas=None*, *shell='/bin/sh'*, *env=None*, *clean_env=False*, *template=None*, *rstrip=True*, *umask=None*, *output_loglevel='debug'*, *log_callback=None*, *quiet=False*, *timeout=None*, *reset_system_locale=True*, *ignore_retcode=False*, *saltenv='base'*, *use_vt=False*, *bg=False*, *password=None*, ***kwargs*)

Execute the passed command and return the output as a string.

New in version 2015.5.0.

Parameters

- **cmd** (*str*) -- The command to run. ex: `ls -lart /home'
- **cwd** (*str*) -- The current working directory to execute the command in. Defaults to the home directory of the user specified by `runas`.
- **stdin** (*str*) -- A string of standard input can be specified for the command to be run using the `stdin` parameter. This can be useful in cases where sensitive information must be read from standard input.

- **runas** (*str*) -- User to run command as. If running on a Windows minion you must also pass a password. The target user account must be in the Administrators group.
- **password** (*str*) -- Windows only. Required when specifying `runas`. This parameter will be ignored on non-Windows platforms.

  New in version 2016.3.0.
- **shell** (*int*) -- Shell to execute under. Defaults to the system default shell.
- **bg** (*bool*) -- If True, run command in background and do not await or deliver its results
- **env** (`list`) -- A list of environment variables to be set prior to execution.

  Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

  Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

  Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

  One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/
↪usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':
↪') }}
```

- **clean_env** (*bool*) -- Attempt to clean out all other shell environment variables and set only those provided in the `env' argument to this function.
- **template** (*str*) -- If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported
- **rstrip** (*bool*) -- Strip all whitespace off the end of output before it is returned.
- **umask** (*str*) -- The umask (in octal) to use when running the command.
- **output_loglevel** (*str*) -- Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

- **timeout** (*int*) -- A timeout in seconds for the executed process to return.
- **use_vt** (*bool*) -- Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

Warning: This passes the cmd argument directly to the shell without any further processing! Be absolutely sure that you have properly sanitized the command passed to this function and do not use untrusted inputs.

Note: env represents the environment variables for the command, and should be formatted as a dict, or a YAML string which resolves to a dict.

CLI Example:

```
salt '*' cmd.shell "ls -l | awk '/foo/{print \$2}'"
```

The template arg can be set to `jinja' or another supported template engine to render the command arguments before execution. For example:

```
salt '*' cmd.shell template=jinja "ls -l /tmp/{{grains.id}} | awk '/foo/{print \
↪$2}'"
```

Specify an alternate shell with the shell parameter:

```
salt '*' cmd.shell "Get-ChildItem C:\ " shell='powershell'
```

A string of standard input can be specified for the command to be run using the stdin parameter. This can be useful in cases where sensitive information must be read from standard input.:

```
salt '*' cmd.shell "grep f" stdin='one\ntwo\nthree\nfour\nfive\n'
```

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format key=val. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' cmd.shell cmd='sed -e s/=/:/g'
```

salt.modules.cmdmod.**shell_info**(*shell*, *list_modules=False*)

New in version 2016.11.0.

Provides information about a shell or script languages which often use #!. The values returned are dependent on the shell or scripting languages all return the installed, path, version, version_raw

Parameters

- **shell** (*str*) -- Name of the shell. Support shells/script languages include
- **cmd, perl, php, powershell, python, ruby and zsh** (*bash,*) --
- **list_modules** (*bool*) -- True to list modules available to the shell.
- **only lists powershell modules.** (*Currently*) --

Returns A dictionary of information about the shell

Return type dict

```
{'version': '<2 or 3 numeric components dot-separated>',
 'version_raw': '<full version string>',
 'path': '<full path to binary>',
 'installed': <True, False or None>,
 '<attribute>': '<attribute value>'}
```

Note:

- `installed` is always returned, if `None` or `False` also returns error and may also return `stdout` for diagnostics.
- `version` is for use in determine if a shell/script language has a particular feature set, not for package management.
- The shell must be within the executable search path.

CLI Example:

```
salt '*' cmd.shell_info bash
salt '*' cmd.shell_info powershell
```

Codeauthor Damon Atkins <https://github.com/damon-atkins>

`salt.modules.cmdmod.`**`shells`**`()`

Lists the valid shells on this system via the /etc/shells file

New in version 2015.5.0.

CLI Example:

```
salt '*' cmd.shells
```

`salt.modules.cmdmod.`**`tty`**`(`*device*, *echo=''*`)`

Echo a string to a specific tty

CLI Example:

```
salt '*' cmd.tty tty0 'This is a test'
salt '*' cmd.tty pts3 'This is a test'
```

`salt.modules.cmdmod.`**`which`**`(`*cmd*`)`

Returns the path of an executable available on the minion, None otherwise

CLI Example:

```
salt '*' cmd.which cat
```

`salt.modules.cmdmod.`**`which_bin`**`(`*cmds*`)`

Returns the first command found in a list of commands

CLI Example:

```
salt '*' cmd.which_bin '[pip2, pip, pip-python]'
```

19.9.73 salt.modules.composer

Use composer to install PHP dependencies for a directory

salt.modules.composer.**did_composer_install**(*dir*)

Test to see if the vendor directory exists in this directory

dir Directory location of the composer.json file

CLI Example:

```
salt '*' composer.did_composer_install /var/www/application
```

salt.modules.composer.**install**(*directory*, *composer=None*, *php=None*, *runas=None*, *prefer_source=None*, *prefer_dist=None*, *no_scripts=None*, *no_plugins=None*, *optimize=None*, *no_dev=None*, *quiet=False*, *composer_home='/root'*)

Install composer dependencies for a directory.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

directory Directory location of the composer.json file.

composer Location of the composer.phar file. If not set composer will just execute ``composer'' as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

prefer_source --prefer-source option of composer.

prefer_dist --prefer-dist option of composer.

no_scripts --no-scripts option of composer.

no_plugins --no-plugins option of composer.

optimize --optimize-autoloader option of composer. Recommended for production.

no_dev --no-dev option for composer. Recommended for production.

quiet --quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

CLI Example:

```
salt '*' composer.install /var/www/application

salt '*' composer.install /var/www/application            no_dev=True optimize=True
```

salt.modules.composer.**selfupdate**(*composer=None*, *php=None*, *runas=None*, *quiet=False*, *composer_home='/root'*)

Update composer itself.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.

composer Location of the composer.phar file. If not set composer will just execute ``composer'' as if it is installed globally. (i.e. /path/to/composer.phar)

php Location of the php executable to use with composer. (i.e. /usr/bin/php)

runas Which system user to run composer as.

quiet --quiet option for composer. Whether or not to return output from composer.

composer_home $COMPOSER_HOME environment variable

CLI Example:

```
salt '*' composer.selfupdate
```

salt.modules.composer.**update**(*directory*, *composer=None*, *php=None*, *runas=None*, *prefer_source=None*, *prefer_dist=None*, *no_scripts=None*, *no_plugins=None*, *optimize=None*, *no_dev=None*, *quiet=False*, *composer_home='/root'*)

Update composer dependencies for a directory.

If *composer install* has not yet been run, this runs *composer install* instead.

If composer has not been installed globally making it available in the system PATH & making it executable, the `composer` and `php` parameters will need to be set to the location of the executables.
directory Directory location of the composer.json file.
composer Location of the composer.phar file. If not set composer will just execute ``composer'' as if it is installed globally. (i.e. /path/to/composer.phar)
php Location of the php executable to use with composer. (i.e. /usr/bin/php)
runas Which system user to run composer as.
prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.
no_scripts --no-scripts option of composer.
no_plugins --no-plugins option of composer.
optimize --optimize-autoloader option of composer. Recommended for production.
no_dev --no-dev option for composer. Recommended for production.
quiet --quiet option for composer. Whether or not to return output from composer.
composer_home $COMPOSER_HOME environment variable
CLI Example:

```
salt '*' composer.update /var/www/application

salt '*' composer.update /var/www/application            no_dev=True optimize=True
```

19.9.74 salt.modules.config

Return config information

`salt.modules.config.`**`backup_mode`**(*backup=''*)
Return the backup mode

CLI Example:

```
salt '*' config.backup_mode
```

`salt.modules.config.`**`dot_vals`**(*value*)
Pass in a configuration value that should be preceded by the module name and a dot, this will return a list of all read key/value pairs

CLI Example:

```
salt '*' config.dot_vals host
```

`salt.modules.config.`**`gather_bootstrap_script`**(*bootstrap=None*)
Download the salt-bootstrap script, and return its location
bootstrap URL of alternate bootstrap script
CLI Example:

```
salt '*' config.gather_bootstrap_script
```

`salt.modules.config.`**`get`**(*key*, *default=''*, *delimiter=':'*, *merge=None*)
Attempt to retrieve the named value from the minion config file, pillar, grains or the master config. If the named value is not available, return the value specified by `default`. If not specified, the default is an empty string.

Values can also be retrieved from nested dictionaries. Assume the below data structure:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key, in the sub-dictionary corresponding to the pkg key, the following command can be used:

```
salt myminion config.get pkg:apache
```

The : (colon) is used to represent a nested dictionary level.

Changed in version 2015.5.0: The delimiter argument was added, to allow delimiters other than : to be used.

This function traverses these data stores in this order, returning the first match found:

- Minion configuration
- Minion's grains
- Minion's pillar data
- Master configuration (requires pillar_opts to be set to True in Minion config file in order to work)

This means that if there is a value that is going to be the same for the majority of minions, it can be configured in the Master config file, and then overridden using the grains, pillar, or Minion config file.

Adding config options to the Master or Minion configuration file is easy:

```
my-config-option: value
cafe-menu:
  - egg and bacon
  - egg sausage and bacon
  - egg and spam
  - egg bacon and spam
  - egg bacon sausage and spam
  - spam bacon sausage and spam
  - spam egg spam spam bacon and spam
  - spam sausage spam spam bacon spam tomato and spam
```

Note: Minion configuration options built into Salt (like those defined *here*) will *always* be defined in the Minion configuration and thus *cannot be overridden by grains or pillar data.* However, additional (user-defined) configuration options (as in the above example) will not be in the Minion configuration by default and thus can be overridden using grains/pillar data by leaving the option out of the minion config file.

Arguments

delimiter New in version 2015.5.0.

Override the delimiter used to separate nested levels of a data structure.

merge New in version 2015.5.0.

If passed, this parameter will change the behavior of the function so that, instead of traversing each data store above in order and returning the first match, the data stores are first merged together and then searched. The pillar data is merged into the master config data, then the grains are merged, followed by the Minion config data. The resulting data structure is then searched for a match. This allows for configurations to be more flexible.

Note: The merging described above does not mean that grain data will end up in the Minion's pillar data, or pillar data will end up in the master config data, etc. The data is just combined for the purposes of searching an amalgam of the different data stores.

The supported merge strategies are as follows:

- **recurse** - If a key exists in both dictionaries, and the new value is not a dictionary, it is replaced. Otherwise, the sub-dictionaries are merged together into a single dictionary, recursively on down,

following the same criteria. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'bar': 1, 'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

- **overwrite** - If a key exists in the top level of both dictionaries, the new value completely overwrites the old. For example:

```
>>> dict1 = {'foo': {'bar': 1, 'qux': True},
             'hosts': ['a', 'b', 'c'],
             'only_x': None}
>>> dict2 = {'foo': {'baz': 2, 'qux': False},
             'hosts': ['d', 'e', 'f'],
             'only_y': None}
>>> merged
{'foo': {'baz': 2, 'qux': False},
 'hosts': ['d', 'e', 'f'],
 'only_dict1': None,
 'only_dict2': None}
```

CLI Example:

```
salt '*' config.get pkg:apache
salt '*' config.get lxc.container_profile:centos merge=recurse
```

salt.modules.config.**manage_mode**(*mode*)

Return a mode value, normalized to a string

CLI Example:

```
salt '*' config.manage_mode
```

salt.modules.config.**merge**(*value*, *default=''*, *omit_opts=False*, *omit_master=False*, *omit_pillar=False*)

Retrieves an option based on key, merging all matches.

Same as `option()` except that it merges all matches, rather than taking the first match.

CLI Example:

```
salt '*' config.merge schedule
```

salt.modules.config.**option**(*value*, *default=''*, *omit_opts=False*, *omit_master=False*, *omit_pillar=False*)

Pass in a generic option and receive the value that will be assigned

CLI Example:

```
salt '*' config.option redis.host
```

salt.modules.config.**valid_fileproto**(*uri*)
Returns a boolean value based on whether or not the URI passed has a valid remote file protocol designation

CLI Example:

```
salt '*' config.valid_fileproto salt://path/to/file
```

19.9.75 salt.modules.consul

Interact with Consul

https://www.consul.io

salt.modules.consul.**acl_clone**(*consul_url=None*, ***kwargs*)
Information about an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

Returns Boolean, message of success or failure, and new ID of cloned ACL.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**acl_create**(*consul_url=None*, ***kwargs*)
Create a new ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to create leave it blank to let consul server generate one
- **name** -- Meaningful indicator of the ACL's purpose.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_create
```

salt.modules.consul.**acl_delete**(*consul_url=None*, ***kwargs*)
Delete an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_delete id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**acl_info**(*consul_url=None*, ***kwargs*)

Information about an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **id** -- Unique identifier for the ACL to update.

Returns Information about the ACL requested.

CLI Example:

```
salt '*' consul.acl_info id='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**acl_list**(*consul_url=None*, ***kwargs*)

List the ACL tokens.

Parameters **consul_url** -- The Consul server URL.

Returns List of ACLs

CLI Example:

```
salt '*' consul.acl_list
```

salt.modules.consul.**acl_update**(*consul_url=None*, ***kwargs*)

Update an ACL token.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- Meaningful indicator of the ACL's purpose.
- **id** -- Unique identifier for the ACL to update.
- **type** -- Type is either client or management. A management token is comparable to a root user and has the ability to perform any action including creating, modifying, and deleting ACLs.
- **rules** -- The Consul server URL.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.acl_update
```

salt.modules.consul.**agent_check_deregister**(*consul_url=None*, *checkid=None*)

The agent will take care of deregistering the check from the Catalog.

Parameters

- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_deregister checkid='Memory Utilization'
```

salt.modules.consul.**agent_check_fail**(*consul_url=None*, *checkid=None*, ***kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to critical and the TTL clock is reset.

Parameters

- **consul_url** -- The Consul server URL.

- **checkid** -- The ID of the check to deregister from Consul.
- **note** -- A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_fail checkid='redis_check1' note='Forcing check into
↪critical state.'
```

salt.modules.consul.**agent_check_pass**(*consul_url=None*, *checkid=None*, ***kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to passing and the TTL clock is reset.

Parameters

- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to mark as passing.
- **note** -- A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_pass checkid='redis_check1' note='Forcing check into
↪passing state.'
```

salt.modules.consul.**agent_check_register**(*consul_url=None*, ***kwargs*)

The register endpoint is used to add a new check to the local agent.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- The description of what the check is for.
- **id** -- The unique name to use for the check, if not provided `name' is used.
- **notes** -- Human readable description of the check.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **interval** -- Interval at which the check should run.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_register name='Memory Utilization' script='/usr/local/
↪bin/check_mem.py' interval='15s'
```

salt.modules.consul.**agent_check_warn**(*consul_url=None*, *checkid=None*, ***kwargs*)

This endpoint is used with a check that is of the TTL type. When this is called, the status of the check is set to warning and the TTL clock is reset.

Parameters

- **consul_url** -- The Consul server URL.
- **checkid** -- The ID of the check to deregister from Consul.

- **note** -- A human-readable message with the status of the check.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_check_warn checkid='redis_check1' note='Forcing check into
↪warning state.'
```

salt.modules.consul.**agent_checks**(*consul_url=None*)

Returns the checks the local agent is managing

Parameters **consul_url** -- The Consul server URL.

Returns Returns the checks the local agent is managing

CLI Example:

```
salt '*' consul.agent_checks
```

salt.modules.consul.**agent_join**(*consul_url=None*, *address=None*, ***kwargs*)

Triggers the local agent to join a node

Parameters

- **consul_url** -- The Consul server URL.
- **address** -- The address for the agent to connect to.
- **wan** -- Causes the agent to attempt to join using the WAN pool.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_join address='192.168.1.1'
```

salt.modules.consul.**agent_leave**(*consul_url=None*, *node=None*)

Used to instruct the agent to force a node into the left state.

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node the agent will force into left state

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_leave node='web1.example.com'
```

salt.modules.consul.**agent_maintenance**(*consul_url=None*, ***kwargs*)

Manages node maintenance mode

Parameters

- **consul_url** -- The Consul server URL.
- **enable** -- The enable flag is required. Acceptable values are either true (to enter maintenance mode) or false (to resume normal operation).
- **reason** -- If provided, its value should be a text string explaining the reason for placing the node into maintenance mode.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_maintenance enable='False' reason='Upgrade in progress'
```

salt.modules.consul.**agent_members**(*consul_url=None*, ***kwargs*)

Returns the members as seen by the local serf agent

Parameters **consul_url** -- The Consul server URL.

Returns Returns the members as seen by the local serf agent

CLI Example:

```
salt '*' consul.agent_members
```

salt.modules.consul.**agent_self**(*consul_url=None*)

Returns the local node configuration

Parameters **consul_url** -- The Consul server URL.

Returns Returns the local node configuration

CLI Example:

```
salt '*' consul.agent_self
```

salt.modules.consul.**agent_service_deregister**(*consul_url=None*, *serviceid=None*)

Used to remove a service.

Parameters

- **consul_url** -- The Consul server URL.
- **serviceid** -- A serviceid describing the service.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis'
```

salt.modules.consul.**agent_service_maintenance**(*consul_url=None*, *serviceid=None*, ***kwargs*)

Used to place a service into maintenance mode.

Parameters

- **consul_url** -- The Consul server URL.
- **serviceid** -- A name of the service.
- **enable** -- Whether the service should be enabled or disabled.
- **reason** -- A human readable message of why the service was enabled or disabled.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_deregister serviceid='redis' enable='True' reason=
↪'Down for upgrade'
```

salt.modules.consul.**agent_service_register**(*consul_url=None*, ***kwargs*)

The used to add a new service, with an optional health check, to the local agent.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- A name describing the service.
- **address** -- The address used by the service, defaults to the address of the agent.
- **port** -- The port used by the service.

- **id** -- Unique ID to identify the service, if not provided the value of the name parameter is used.
- **tags** -- Identifying tags for service, string or list.
- **script** -- If script is provided, the check type is a script, and Consul will evaluate that script based on the interval parameter.
- **http** -- Check will perform an HTTP GET request against the value of HTTP (expected to be a URL) based on the interval parameter.
- **check_ttl** -- If a TTL type is used, then the TTL update endpoint must be used periodically to update the state of the check.
- **check_interval** -- Interval at which the check should run.

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.agent_service_register name='redis' tags='["master", "v1"]'
↪address="127.0.0.1" port="8080" check_script="/usr/local/bin/check_redis.py"
↪interval="10s"
```

salt.modules.consul.**agent_services**(*consul_url=None*)

Returns the services the local agent is managing

Parameters **consul_url** -- The Consul server URL.

Returns Returns the services the local agent is managing

CLI Example:

```
salt '*' consul.agent_services
```

salt.modules.consul.**catalog_datacenters**(*consul_url=None*)

Return list of available datacenters from catalog.

Parameters **consul_url** -- The Consul server URL.

Returns The list of available datacenters.

CLI Example:

```
salt '*' consul.catalog_datacenters
```

salt.modules.consul.**catalog_deregister**(*consul_url=None*, ***kwargs*)

Deregisters a node, service, or check

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node to deregister.
- **datacenter** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.
- **checkid** -- The ID of the health check to deregister.
- **serviceid** -- The ID of the service to deregister.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' serviceid='redis_server1' checkid=
↪'redis_check1'
```

salt.modules.consul.**catalog_node**(*consul_url=None*, *node=None*, ***kwargs*)

Information about the registered node.

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node to request information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns Information about the requested node.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

salt.modules.consul.**catalog_nodes**(*consul_url=None*, ***kwargs*)

Return list of available nodes from catalog.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns The list of available nodes.

CLI Example:

```
salt '*' consul.catalog_nodes
```

salt.modules.consul.**catalog_register**(*consul_url=None*, ***kwargs*)

Registers a new node, service, or check

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.
- **node** -- The node to register.
- **address** -- The address of the node.
- **service** -- The service that will be registered.
- **service_address** -- The address that the service listens on.
- **service_port** -- The port for the service.
- **service_id** -- A unique identifier for the service, if this is not provided ``name'' will be used.
- **service_tags** -- Any tags associated with the service.
- **check** -- The name of the health check to register
- **check_status** -- The initial status of the check, must be one of unknown, passing, warning, or critical.
- **check_service** -- The service that the check is performed against.
- **check_id** -- Unique identifier for the service.
- **check_notes** -- An opaque field that is meant to hold human-readable text.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.catalog_register node='node1' address='192.168.1.1' service='redis
↪' service_address='127.0.0.1' service_port='8080' service_id='redis_server1'
```

salt.modules.consul.**catalog_service**(*consul_url=None*, *service=None*, ***kwargs*)

Information about the registered service.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.
- **tag** -- Filter returned services with tag parameter.

Returns Information about the requested service.

CLI Example:

```
salt '*' consul.catalog_service service='redis'
```

salt.modules.consul.**catalog_services**(*consul_url=None*, ***kwargs*)

Return list of available services rom catalog.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns The list of available services.

CLI Example:

```
salt '*' consul.catalog_services
```

salt.modules.consul.**delete**(*consul_url=None*, *key=None*, ***kwargs*)

Delete values from Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **recurse** -- Delete values recursively beginning at the value of key.
- **cas** -- This flag is used to turn the DELETE into a Check-And-Set operation.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.delete key='web'
salt '*' consul.delete key='web' recurse='True'
```

salt.modules.consul.**event_fire**(*consul_url=None*, *name=None*, ***kwargs*)

List the ACL tokens.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- The name of the event to fire.

- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.
- **node** -- Filter by node name.
- **service** -- Filter by service name.
- **tag** -- Filter by tag name.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_fire name='deploy'
```

salt.modules.consul.**event_list**(*consul_url=None*, ***kwargs*)

List the recent events.

Parameters

- **consul_url** -- The Consul server URL.
- **name** -- The name of the event to fire.

Returns List of ACLs

CLI Example:

```
salt '*' consul.event_list
```

salt.modules.consul.**get**(*consul_url=None*, *key=None*, *recurse=False*, *decode=False*, *raw=False*)

Get key from Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **recurse** -- Return values recursively beginning at the value of key.
- **decode** -- By default values are stored as Base64 encoded values, decode will return the whole key with the value decoded.
- **raw** -- Simply return the decoded value of the key.

Returns The keys in Consul.

CLI Example:

```
salt '*' consul.get key='web/key1'
salt '*' consul.get key='web' recurse=True
salt '*' consul.get key='web' recurse=True decode=True
```

By default values stored in Consul are base64 encoded, passing the decode option will show them as the decoded values.

```
salt '*' consul.get key='web' recurse=True decode=True raw=True
```

By default Consult will return other information about the key, the raw option will return only the raw value.

salt.modules.consul.**health_checks**(*consul_url=None*, *service=None*, ***kwargs*)

Health information about the registered service.

Parameters

- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.

- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns Health information about the requested node.

CLI Example:

```
salt '*' consul.health_checks service='redis1'
```

salt.modules.consul.**health_node**(*consul_url=None*, *node=None*, ***kwargs*)

Health information about the registered node.

Parameters

- **consul_url** -- The Consul server URL.
- **node** -- The node to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns Health information about the requested node.

CLI Example:

```
salt '*' consul.health_node node='node1'
```

salt.modules.consul.**health_service**(*consul_url=None*, *service=None*, ***kwargs*)

Health information about the registered service.

Parameters

- **consul_url** -- The Consul server URL.
- **service** -- The service to request health information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.
- **tag** -- Filter returned services with tag parameter.
- **passing** -- Filter results to only nodes with all checks in the passing state.

Returns Health information about the requested node.

CLI Example:

```
salt '*' consul.health_service service='redis1'

salt '*' consul.health_service service='redis1' passing='True'
```

salt.modules.consul.**health_state**(*consul_url=None*, *state=None*, ***kwargs*)

Returns the checks in the state provided on the path.

Parameters

- **consul_url** -- The Consul server URL.
- **state** -- The state to show checks for. The supported states are any, unknown, passing, warning, or critical. The any state is a wildcard that can be used to return all checks.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns The checks in the provided state.

CLI Example:

```
salt '*' consul.health_state state='redis1'

salt '*' consul.health_state service='redis1' passing='True'
```

salt.modules.consul.**list**(*consul_url=None*, *key=None*, ***kwargs*)

List keys in Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.

Returns The list of keys.

CLI Example:

```
salt '*' consul.list
salt '*' consul.list key='web'
```

salt.modules.consul.**put**(*consul_url=None*, *key=None*, *value=None*, ***kwargs*)

Put values into Consul

Parameters

- **consul_url** -- The Consul server URL.
- **key** -- The key to use as the starting point for the list.
- **value** -- The value to set the key to.
- **flags** -- This can be used to specify an unsigned value between 0 and 2^64-1. Clients can choose to use this however makes sense for their application.
- **cas** -- This flag is used to turn the PUT into a Check-And-Set operation.
- **acquire** -- This flag is used to turn the PUT into a lock acquisition operation.
- **release** -- This flag is used to turn the PUT into a lock release operation.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.put key='web/key1' value="Hello there"

salt '*' consul.put key='web/key1' value="Hello there" acquire='d5d371f4-c380-
↪5280-12fd-8810be175592'

salt '*' consul.put key='web/key1' value="Hello there" release='d5d371f4-c380-
↪5280-12fd-8810be175592'
```

salt.modules.consul.**session_create**(*consul_url=None*, ***kwargs*)

Used to create a session.

Parameters

- **consul_url** -- The Consul server URL.
- **lockdelay** -- Duration string using a ``s'' suffix for seconds. The default is 15s.
- **node** -- Must refer to a node that is already registered, if specified. By default, the agent's own node name is used.
- **name** -- A human-readable name for the session
- **checks** -- A list of associated health checks. It is highly recommended that, if you override this list, you include the default ``serfHealth''.

- **behavior** -- Can be set to either release or delete. This controls the behavior when a session is invalidated. By default, this is release, causing any locks that are held to be released. Changing this to delete causes any locks that are held to be deleted. delete is useful for creating ephemeral key/value entries.
- **ttl** -- Session is invalidated if it is not renewed before the TTL expires

Returns Boolean and message indicating success or failure.

CLI Example:

```
salt '*' consul.session_create node='node1' name='my-session' behavior='delete'
↪ttl='3600s'
```

salt.modules.consul.**session_destroy**(*consul_url=None*, *session=None*, ***kwargs*)

Destroy session

Parameters

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to destroy.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_destroy session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**session_info**(*consul_url=None*, *session=None*, ***kwargs*)

Information about a session

Parameters

- **consul_url** -- The Consul server URL.
- **session** -- The ID of the session to return information about.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.

Returns Boolean & message of success or failure.

CLI Example:

```
salt '*' consul.session_info session='c1c4d223-91cb-3d1f-1ee8-f2af9e7b6716'
```

salt.modules.consul.**session_list**(*consul_url=None*, *return_list=False*, ***kwargs*)

Used to list sessions.

Parameters

- **consul_url** -- The Consul server URL.
- **dc** -- By default, the datacenter of the agent is queried; however, the dc can be provided using the ``dc'' parameter.
- **return_list** -- By default, all information about the sessions is returned, using the return_list parameter will return a list of session IDs.

Returns A list of all available sessions.

CLI Example:

```
salt '*' consul.session_list
```

salt.modules.consul.**status_leader**(*consul_url=None*)
Returns the current Raft leader
Parameters **consul_url** -- The Consul server URL.
Returns The address of the Raft leader.
CLI Example:

```
salt '*' consul.status_leader
```

salt.modules.consul.**status_peers**(*consul_url*)
Returns the current Raft peer set
Parameters **consul_url** -- The Consul server URL.
Returns Retrieves the Raft peers for the datacenter in which the the agent is running.
CLI Example:

```
salt '*' consul.status_peers
```

19.9.76 salt.modules.container_resource

Common resources for LXC and systemd-nspawn containers

New in version 2015.8.0.

These functions are not designed to be called directly, but instead from the *lxc*, *nspawn*, and docker execution modules. They provide for common logic to be re-used for common actions.

salt.modules.container_resource.**cache_file**(*source*)
Wrapper for cp.cache_file which raises an error if the file was unable to be cached.
CLI Example:

```
salt myminion container_resource.cache_file salt://foo/bar/baz.txt
```

salt.modules.container_resource.**copy_to**(**args*, ***kwargs*)
Common logic for copying files to containers
path path to the container parent (for LXC only) default: /var/lib/lxc (system default)
CLI Example:

```
salt myminion container_resource.copy_to mycontainer /local/file/path /container/
↪file/path container_type=docker exec_driver=nsenter
```

salt.modules.container_resource.**run**(**args*, ***kwargs*)
Common logic for running shell commands in containers
path path to the container parent (for LXC only) default: /var/lib/lxc (system default)
CLI Example:

```
salt myminion container_resource.run mycontainer 'ps aux' container_type=docker
↪exec_driver=nsenter output=stdout
```

19.9.77 salt.modules.cp

Minion side functions for salt-cp

salt.modules.cp.**cache_dir**(*path*, *saltenv='base'*, *include_empty=False*, *include_pat=None*, *exclude_pat=None*)
Download and cache everything under a directory from the master

include_pat [None] Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

New in version 2014.7.0.

exclude_pat [None] Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with E@, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

New in version 2014.7.0.

CLI Examples:

```
salt '*' cp.cache_dir salt://path/to/dir
salt '*' cp.cache_dir salt://path/to/dir include_pat='E@*.py$'
```

`salt.modules.cp.`**`cache_file`**(*path*, *saltenv='base'*)

Used to cache a single file on the Minion

Returns the location of the new cached file on the Minion.

CLI Example:

```
salt '*' cp.cache_file salt://path/to/file
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_file salt://foo/bar.conf saltenv=config
salt '*' cp.cache_file salt://foo/bar.conf?saltenv=config
```

If the path being cached is a `salt://` URI, and the path does not exist, then `False` will be returned.

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_files`**(*paths*, *saltenv='base'*)

Used to gather many files from the Master, the gathered files will be saved in the minion cachedir reflective to the paths retrieved from the Master

CLI Example:

```
salt '*' cp.cache_files salt://pathto/file1,salt://pathto/file1
```

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to cache the files. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.cache_files salt://foo/bar.conf,salt://foo/baz.conf saltenv=config
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config,salt://foo/baz.conf?
↪saltenv=config
```

The querystring method is less useful when all files are being cached from the same environment, but is a good way of caching files from multiple different environments in the same command. For example, the below

command will cache the first file from the `config1` environment, and the second one from the `config2` environment.

```
salt '*' cp.cache_files salt://foo/bar.conf?saltenv=config1,salt://foo/bar.conf?
↪saltenv=config2
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

`salt.modules.cp.`**`cache_local_file`**(*path*)

Cache a local file on the minion in the localfiles cache

CLI Example:

```
salt '*' cp.cache_local_file /etc/hosts
```

`salt.modules.cp.`**`cache_master`**(*saltenv='base'*)

Retrieve all of the files on the master and cache them locally

CLI Example:

```
salt '*' cp.cache_master
```

`salt.modules.cp.`**`get_dir`**(*path*, *dest*, *saltenv='base'*, *template=None*, *gzip=None*, ***kwargs*)

Used to recursively copy a directory from the salt master

CLI Example:

```
salt '*' cp.get_dir salt://path/to/dir/ /minion/dest
```

get_dir supports the same template and gzip arguments as get_file.

`salt.modules.cp.`**`get_file`**(*path*, *dest*, *saltenv='base'*, *makedirs=False*, *template=None*, *gzip=None*, ***kwargs*)

Used to get a single file from the salt master

CLI Example:

```
salt '*' cp.get_file salt://path/to/file /minion/dest
```

Template rendering can be enabled on both the source and destination file names like so:

```
salt '*' cp.get_file "salt://{{grains.os}}/vimrc" /etc/vimrc template=jinja
```

This example would instruct all Salt minions to download the vimrc from a directory with the same name as their os grain and copy it to /etc/vimrc

For larger files, the cp.get_file module also supports gzip compression. Because gzip is CPU-intensive, this should only be used in scenarios where the compression ratio is very high (e.g. pretty-printed JSON or YAML files).

Use the *gzip* named argument to enable it. Valid values are 1..9, where 1 is the lightest compression and 9 the heaviest. 1 uses the least CPU on the master (and minion), 9 uses the most.

There are two ways of defining the fileserver environment (a.k.a. `saltenv`) from which to retrieve the file. One is to use the `saltenv` parameter, and the other is to use a querystring syntax in the `salt://` URL. The below two examples are equivalent:

```
salt '*' cp.get_file salt://foo/bar.conf /etc/foo/bar.conf saltenv=config
salt '*' cp.get_file salt://foo/bar.conf?saltenv=config /etc/foo/bar.conf
```

Note: It may be necessary to quote the URL when using the querystring method, depending on the shell being used to run the command.

salt.modules.cp.**get_file_str**(*path*, *saltenv='base'*)

Download a file from a URL to the Minion cache directory and return the contents of that file

Returns `False` if Salt was unable to cache a file from a URL.

CLI Example:

```
salt '*' cp.get_file_str salt://my/file
```

salt.modules.cp.**get_template**(*path*, *dest*, *template='jinja'*, *saltenv='base'*, *makedirs=False*, ***kwargs*)

Render a file as a template before setting it down. Warning, order is not the same as in fileclient.cp for non breaking old API.

CLI Example:

```
salt '*' cp.get_template salt://path/to/template /minion/dest
```

salt.modules.cp.**get_url**(*path*, *dest=''*, *saltenv='base'*, *makedirs=False*)

Used to get a single file from a URL.

path A URL to download a file from. Supported URL schemes are: `salt://`, `http://`, `https://`, `ftp://`, `s3://`, `swift://` and `file://` (local filesystem). If no scheme was specified, this is equivalent of using `file://`. If a `file://` URL is given, the function just returns absolute path to that file on a local filesystem. The function returns `False` if Salt was unable to fetch a file from a `salt://` URL.

dest The default behaviour is to write the fetched file to the given destination path. If this parameter is omitted or set as empty string (`''`), the function places the remote file on the local filesystem inside the Minion cache directory and returns the path to that file.

Note: To simply return the file contents instead, set destination to `None`. This works with `salt://`, `http://`, `https://` and `file://` URLs. The files fetched by `http://` and `https://` will not be cached.

saltenv [base] Salt fileserver envrionment from which to retrieve the file. Ignored if `path` is not a `salt://` URL.

CLI Example:

```
salt '*' cp.get_url salt://my/file /tmp/this_file_is_mine
salt '*' cp.get_url http://www.slashdot.org /tmp/index.html
```

salt.modules.cp.**hash_file**(*path*, *saltenv='base'*)

Return the hash of a file, to get the hash of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.hash_file salt://path/to/file
```

salt.modules.cp.**is_cached**(*path*, *saltenv='base'*)
Return a boolean if the given path on the master has been cached on the minion

CLI Example:

```
salt '*' cp.is_cached salt://path/to/file
```

salt.modules.cp.**list_master**(*saltenv='base'*, *prefix=''*)
List all of the files stored on the master

CLI Example:

```
salt '*' cp.list_master
```

salt.modules.cp.**list_master_dirs**(*saltenv='base'*, *prefix=''*)
List all of the directories stored on the master

CLI Example:

```
salt '*' cp.list_master_dirs
```

salt.modules.cp.**list_master_symlinks**(*saltenv='base'*, *prefix=''*)
List all of the symlinks stored on the master

CLI Example:

```
salt '*' cp.list_master_symlinks
```

salt.modules.cp.**list_minion**(*saltenv='base'*)
List all of the files cached on the minion

CLI Example:

```
salt '*' cp.list_minion
```

salt.modules.cp.**list_states**(*saltenv='base'*)
List all of the available state modules in an environment

CLI Example:

```
salt '*' cp.list_states
```

salt.modules.cp.**push**(*path*, *keep_symlinks=False*, *upload_path=None*, *remove_source=False*)
WARNING Files pushed to the master will have global read permissions..

Push a file from the minion up to the master, the file will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

Since this feature allows a minion to push a file up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.
keep_symlinks Keep the path value without resolving its canonical form
upload_path Provide a different path inside the master's minion files cachedir
remove_source Remove the source file on the minion

New in version 2016.3.0.

CLI Example:

```
salt '*' cp.push /etc/fstab
salt '*' cp.push /etc/system-release keep_symlinks=True
salt '*' cp.push /etc/fstab upload_path='/new/path/fstab'
salt '*' cp.push /tmp/filename remove_source=True
```

```
```

salt.modules.cp.**push_dir**(*path*, *glob=None*, *upload_path=None*)
Push a directory from the minion up to the master, the files will be saved to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`). It also has a glob for matching specific files using globbing.

New in version 2014.7.0.

Since this feature allows a minion to push files up to the master server it is disabled by default for security purposes. To enable, set `file_recv` to `True` in the master configuration file, and restart the master.
upload_path Provide a different path and directory name inside the master's minion files cachedir
CLI Example:

```
salt '*' cp.push /usr/lib/mysql
salt '*' cp.push /usr/lib/mysql upload_path='/newmysql/path'
salt '*' cp.push_dir /etc/modprobe.d/ glob='*.conf'
```

salt.modules.cp.**recv**(*files*, *dest*)
Used with salt-cp, pass the files dict, and the destination.

This function receives small fast copy files from the master via salt-cp. It does not work via the CLI.

salt.modules.cp.**recv_chunked**(*dest*, *chunk*, *append=False*, *compressed=True*, *mode=None*)
This function receives files copied to the minion using `salt-cp` and is not intended to be used directly on the CLI.

salt.modules.cp.**stat_file**(*path*, *saltenv='base'*, *octal=True*)
Return the permissions of a file, to get the permissions of a file on the salt master file server prepend the path with salt://<file on server> otherwise, prepend the file with / for a local file.

CLI Example:

```
salt '*' cp.stat_file salt://path/to/file
```

19.9.78 salt.modules.cpan

Manage Perl modules using CPAN

New in version 2015.5.0.

salt.modules.cpan.**install**(*module*)
Install a Perl module from CPAN

CLI Example:

```
salt '*' cpan.install Template::Alloy
```

salt.modules.cpan.**list**()
List installed Perl modules, and the version installed

CLI Example:

```
salt '*' cpan.list
```

salt.modules.cpan.**remove**(*module*, *details=False*)
Attempt to remove a Perl module that was installed from CPAN. Because the `cpan` command doesn't actually support ``uninstall''-like functionality, this function will attempt to do what it can, with what it has from CPAN.

Until this function is declared stable, USE AT YOUR OWN RISK!

CLI Example:

```
salt '*' cpan.remove Old::Package
```

salt.modules.cpan.**show**(*module*)
Show information about a specific Perl module

CLI Example:

```
salt '*' cpan.show Template::Alloy
```

salt.modules.cpan.**show_config**()
Return a dict of CPAN configuration values

CLI Example:

```
salt '*' cpan.show_config
```

19.9.79 salt.modules.cron

Work with cron

Note: Salt does not escape cron metacharacters automatically. You should backslash-escape percent characters and any other metacharacters that might be interpreted incorrectly by the shell.

salt.modules.cron.**list_tab**(*user*)
Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

salt.modules.cron.**ls**(*user*)
This function is an alias of `list_tab`.
Return the contents of the specified user's crontab

CLI Example:

```
salt '*' cron.list_tab root
```

salt.modules.cron.**raw_cron**(*user*)
Return the contents of the user's crontab

CLI Example:

```
salt '*' cron.raw_cron root
```

salt.modules.cron.**rm**(*user*, *cmd*, *minute=None*, *hour=None*, *daymonth=None*, *month=None*, *dayweek=None*, *identifier=None*)
This function is an alias of `rm_job`.
Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

salt.modules.cron.**rm_env**(*user*, *name*)

Remove cron environment variable for a specified user.

CLI Example:

```
salt '*' cron.rm_env root MAILTO
```

salt.modules.cron.**rm_job**(*user*, *cmd*, *minute=None*, *hour=None*, *daymonth=None*, *month=None*, *dayweek=None*, *identifier=None*)

Remove a cron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' cron.rm_job root /usr/local/weekly
salt '*' cron.rm_job root /usr/bin/foo dayweek=1
```

salt.modules.cron.**rm_special**(*user*, *cmd*, *special=None*, *identifier=None*)

Remove a special cron job for a specified user.

CLI Example:

```
salt '*' cron.rm_special root /usr/bin/foo
```

salt.modules.cron.**set_env**(*user*, *name*, *value=None*)

Set up an environment variable in the crontab.

CLI Example:

```
salt '*' cron.set_env root MAILTO user@example.com
```

salt.modules.cron.**set_job**(*user*, *minute*, *hour*, *daymonth*, *month*, *dayweek*, *cmd*, *commented=False*, *comment=None*, *identifier=None*)

Sets a cron job up for a specified user.

CLI Example:

```
salt '*' cron.set_job root '*' '*' '*' '*' 1 /usr/local/weekly
```

salt.modules.cron.**set_special**(*user*, *special*, *cmd*, *commented=False*, *comment=None*, *identifier=None*)

Set up a special command in the crontab.

CLI Example:

```
salt '*' cron.set_special root @hourly 'echo foobar'
```

salt.modules.cron.**write_cron_file**(*user*, *path*)

Writes the contents of a file to a user's crontab

CLI Example:

```
salt '*' cron.write_cron_file root /tmp/new_cron
```

Changed in version 2015.8.9.

Note: Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

salt.modules.cron.**write_cron_file_verbose**(*user*, *path*)
Writes the contents of a file to a user's crontab and return error message on error

CLI Example:

```
salt '*' cron.write_cron_file_verbose root /tmp/new_cron
```

Changed in version 2015.8.9.

Note: Some OS' do not support specifying user via the *crontab* command i.e. (Solaris, AIX)

19.9.80 salt.modules.csf

Support for Config Server Firewall (CSF)

maintainer Mostafa Hussein <mostafa.hussein91@gmail.com>

maturity new

platform Linux

salt.modules.csf.**allow**(*ip*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='s'*, *ttl=None*, *comment=''*)
Add an rule to csf allowed hosts See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.allow 127.0.0.1
salt '*' csf.allow 127.0.0.1 comment="Allow localhost"
```

salt.modules.csf.**allow_port**(*port*, *proto='tcp'*, *direction='both'*)
Like allow_ports, but it will append to the existing entry instead of replacing it. Takes a single port instead of a list of ports.

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.**allow_ports**(*ports*, *proto='tcp'*, *direction='in'*)
Fully replace the incoming or outgoing ports line in the csf.conf file - e.g. TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc.

CLI Example:

```
salt '*' csf.allow_ports ports="[22,80,443,4505,4506]" proto='tcp' direction='in'
```

salt.modules.csf.**deny**(*ip*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='d'*, *ttl=None*, *comment=''*)
Add an rule to csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.deny 127.0.0.1
salt '*' csf.deny 127.0.0.1 comment="Too localhosty"
```

salt.modules.csf.**disable**()
Disable csf permanently CLI Example:

```
salt '*' csf.disable
```

salt.modules.csf.**enable**()
Activate csf if not running CLI Example:

```
salt '*' csf.enable
```

salt.modules.csf.**exists**(*method*, *ip*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='d'*, *ttl=None*, *comment=''*)
Returns true a rule for the ip already exists based on the method supplied. Returns false if not found. CLI Example:

```
salt '*' csf.exists allow 1.2.3.4
salt '*' csf.exists tempdeny 1.2.3.4
```

salt.modules.csf.**get_ports**(*proto='tcp'*, *direction='in'*)
Lists ports from csf.conf based on direction and protocol. e.g. - TCP_IN, TCP_OUT, UDP_IN, UDP_OUT, etc..

CLI Example:

```
salt '*' csf.allow_port 22 proto='tcp' direction='in'
```

salt.modules.csf.**reload**()
Restart csf CLI Example:

```
salt '*' csf.reload
```

salt.modules.csf.**running**()
Check csf status CLI Example:

```
salt '*' csf.running
```

salt.modules.csf.**tempallow**(*ip=None*, *ttl=None*, *port=None*, *direction=None*, *comment=''*)
Add an rule to the temporary ip allow list. See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.tempallow 127.0.0.1 3600 port=22 direction='in' comment='# Temp dev
↪ssh access'
```

salt.modules.csf.**tempdeny**(*ip=None*, *ttl=None*, *port=None*, *direction=None*, *comment=''*)
Add a rule to the temporary ip deny list. See `_access_rule()`. 1- Add an IP: CLI Example:

```
salt '*' csf.tempdeny 127.0.0.1 300 port=22 direction='in' comment='# Brute force
↪attempt'
```

salt.modules.csf.**unallow**(*ip*)
Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.unallow 127.0.0.1
```

salt.modules.csf.**undeny**(*ip*)
Remove a rule from the csf denied hosts See `_access_rule()`. 1- Deny an IP: CLI Example:

```
salt '*' csf.undeny 127.0.0.1
```

19.9.81 salt.modules.cyg

Manage cygwin packages.

Module file to accompany the cyg state.

salt.modules.cyg.**check_valid_package**(*package*, *cyg_arch='x86_64'*, *mirrors=None*)

Check if the package is valid on the given mirrors.

Parameters

- **package** -- The name of the package
- **cyg_arch** -- The cygwin architecture
- **mirrors** -- any mirrors to check

Returns (bool): True if Valid, otherwise False

CLI Example:

```
salt '*' cyg.check_valid_package <package name>
```

salt.modules.cyg.**install**(*packages=None*, *cyg_arch='x86_64'*, *mirrors=None*)

Install one or several packages.

packages [None] The packages to install

cyg_arch [x86_64] Specify the architecture to install the package under Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.install dos2unix
salt '*' cyg.install dos2unix mirrors="[{'http://mirror': 'http://url/to/public/
↪key}]'
```

salt.modules.cyg.**list**(*package=''*, *cyg_arch='x86_64'*)

List locally installed packages.

package [``] package name to check. else all

cyg_arch : Cygwin architecture to use Options are x86 and x86_64

CLI Example:

```
salt '*' cyg.list
```

salt.modules.cyg.**uninstall**(*packages*, *cyg_arch='x86_64'*, *mirrors=None*)

Uninstall one or several packages.

packages The packages to uninstall.

cyg_arch [x86_64] Specify the architecture to remove the package from Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.uninstall dos2unix
salt '*' cyg.uninstall dos2unix mirrors="[{'http://mirror': 'http://url/to/public/
↪key}]"
```

salt.modules.cyg.**update**(*cyg_arch='x86_64'*, *mirrors=None*)

Update all packages.

cyg_arch [x86_64] Specify the cygwin architecture update Current options are x86 and x86_64

CLI Example:

```
salt '*' cyg.update
salt '*' cyg.update dos2unix mirrors="[{'http://mirror': 'http://url/to/public/
↪key}]"
```

19.9.82 salt.modules.daemontools

daemontools service module. This module will create daemontools type service watcher.

This module is compatible with the *service* states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service.running:
    - provider: daemontools
```

salt.modules.daemontools.**available**(*name*)
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' daemontools.available foo
```

salt.modules.daemontools.**disabled**(*name*)
Return True if the named service is enabled, false otherwise

New in version 2015.5.6.

CLI Example:

```
salt '*' daemontools.disabled <service name>
```

salt.modules.daemontools.**enabled**(*name*, ***kwargs*)
Return True if the named service is enabled, false otherwise A service is considered enabled if in your service directory: - an executable ./run file exist - a file named ``down'' does not exist

New in version 2015.5.7.
name Service name
CLI Example:

```
salt '*' daemontools.enabled <service name>
```

salt.modules.daemontools.**full_restart**(*name*)
Calls daemontools.restart() function

CLI Example:

```
salt '*' daemontools.full_restart <service name>
```

salt.modules.daemontools.**get_all**()
Return a list of all available services

CLI Example:

```
salt '*' daemontools.get_all
```

salt.modules.daemontools.**missing**(*name*)
The inverse of daemontools.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' daemontools.missing foo
```

salt.modules.daemontools.**reload**(*name*)
Wrapper for term()

CLI Example:

```
salt '*' daemontools.reload <service name>
```

salt.modules.daemontools.**restart**(*name*)
Restart service via daemontools. This will stop/start service

CLI Example:

```
salt '*' daemontools.restart <service name>
```

salt.modules.daemontools.**start**(*name*)
Starts service via daemontools

CLI Example:

```
salt '*' daemontools.start <service name>
```

salt.modules.daemontools.**status**(*name*, *sig=None*)
Return the status for a service via daemontools, return pid if running

CLI Example:

```
salt '*' daemontools.status <service name>
```

salt.modules.daemontools.**stop**(*name*)
Stops service via daemontools

CLI Example:

```
salt '*' daemontools.stop <service name>
```

salt.modules.daemontools.**term**(*name*)
Send a TERM to service via daemontools

CLI Example:

```
salt '*' daemontools.term <service name>
```

19.9.83 salt.modules.data

Manage a local persistent data structure that can hold any arbitrary data specific to the minion

salt.modules.data.**cas**(*key*, *value*, *old_value*)
Check and set a value in the minion datastore

CLI Example:

```
salt '*' data.cas <key> <value> <old_value>
```

salt.modules.data.**clear**()
Clear out all of the data in the minion datastore, this function is destructive!

CLI Example:

```
salt '*' data.clear
```

salt.modules.data.**dump**(*new_data*)
Replace the entire datastore with a passed data structure

CLI Example:

```
salt '*' data.dump '{'eggs': 'spam'}'
```

salt.modules.data.**get**(*key*, *default=None*)
Get a (list of) value(s) from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.get key
salt '*' data.get '["key1", "key2"]'
```

salt.modules.data.**has_key**(*key*)
Check if key is in the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.has_key <mykey>
```

salt.modules.data.**items**()
Get items from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.items
```

salt.modules.data.**keys**()
Get all keys from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.keys
```

salt.modules.data.**load**()
Return all of the data in the minion datastore

CLI Example:

```
salt '*' data.load
```

salt.modules.data.**pop**(*key*, *default=None*)
Pop (return & delete) a value from the minion datastore

New in version 2015.5.2.

CLI Example:

```
salt '*' data.pop <key> "there was no val"
```

salt.modules.data.**update**(*key*, *value*)

Update a key with a value in the minion datastore

CLI Example:

```
salt '*' data.update <key> <value>
```

salt.modules.data.**values**()

Get values from the minion datastore

New in version 2015.8.0.

CLI Example:

```
salt '*' data.values
```

19.9.84 salt.modules.ddns

Support for RFC 2136 dynamic DNS updates.

depends

- dnspython Python module

configuration If you want to use TSIG authentication for the server, there are a couple of optional configuration parameters made available to support this (the keyname is only needed if the keyring contains more than one key):

```
keyfile: keyring file (default=None)
keyname: key name in file (default=None)
keyalgorithm: algorithm used to create the key
              (default='HMAC-MD5.SIG-ALG.REG.INT').
    Other possible values: hmac-sha1, hmac-sha224, hmac-sha256,
        hmac-sha384, hmac-sha512
```

The keyring file needs to be in json format and the key name needs to end with an extra period in the file, similar to this:

```
{"keyname.": "keycontent"}
```

salt.modules.ddns.**add_host**(*zone*, *name*, *ttl*, *ip*, *nameserver=`127.0.0.1'*, *replace=True*, *timeout=5*, *port=53*, ***kwargs*)

Add, replace, or update the A and PTR (reverse) records for a host.

CLI Example:

```
salt ns1 ddns.add_host example.com host1 60 10.1.1.1
```

salt.modules.ddns.**delete**(*zone*, *name*, *rdtype=None*, *data=None*, *nameserver=`127.0.0.1'*, *timeout=5*, *port=53*, ***kwargs*)

Delete a DNS record.

CLI Example:

```
salt ns1 ddns.delete example.com host1 A
```

salt.modules.ddns.**delete_host**(*zone*, *name*, *nameserver=`127.0.0.1'*, *timeout=5*, *port=53*, ***kwargs*)
Delete the forward and reverse records for a host.

Returns true if any records are deleted.

CLI Example:

```
salt ns1 ddns.delete_host example.com host1
```

salt.modules.ddns.**update**(*zone*, *name*, *ttl*, *rdtype*, *data*, *nameserver=`127.0.0.1'*, *timeout=5*, *replace=False*, *port=53*, ***kwargs*)
Add, replace, or update a DNS record. nameserver must be an IP address and the minion running this module must have update privileges on that server. If replace is true, first deletes all records for this name and type.

CLI Example:

```
salt ns1 ddns.update example.com host1 60 A 10.0.0.1
```

19.9.85 salt.modules.deb_apache

Support for Apache

Please note: The functions in here are Debian-specific. Placing them in this separate file will allow them to load only on Debian-based systems, while still loading under the `apache` namespace.

salt.modules.deb_apache.**a2disconf**(*conf*)
New in version 2016.3.0.

Runs a2disconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2disconf security
```

salt.modules.deb_apache.**a2dismod**(*mod*)
Runs a2dismod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dismod vhost_alias
```

salt.modules.deb_apache.**a2dissite**(*site*)
Runs a2dissite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2dissite example.com
```

salt.modules.deb_apache.**a2enconf**(*conf*)
New in version 2016.3.0.

Runs a2enconf for the given conf.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enconf security
```

salt.modules.deb_apache.**a2enmod**(*mod*)

Runs a2enmod for the given mod.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2enmod vhost_alias
```

salt.modules.deb_apache.**a2ensite**(*site*)

Runs a2ensite for the given site.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.a2ensite example.com
```

salt.modules.deb_apache.**check_conf_enabled**(*conf*)

New in version 2016.3.0.

Checks to see if the specific conf symlink is in /etc/apache2/conf-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_conf_enabled security
salt '*' apache.check_conf_enabled security.conf
```

salt.modules.deb_apache.**check_mod_enabled**(*mod*)

Checks to see if the specific mod symlink is in /etc/apache2/mods-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_mod_enabled status
salt '*' apache.check_mod_enabled status.load
salt '*' apache.check_mod_enabled status.conf
```

salt.modules.deb_apache.**check_site_enabled**(*site*)

Checks to see if the specific site symlink is in /etc/apache2/sites-enabled.

This will only be functional on Debian-based operating systems (Ubuntu, Mint, etc).

CLI Examples:

```
salt '*' apache.check_site_enabled example.com
salt '*' apache.check_site_enabled example.com.conf
```

19.9.86 salt.modules.deb_postgres

Module to provide Postgres compatibility to salt for debian family specific tools.

salt.modules.deb_postgres.**cluster_create**(*version*, *name='main'*, *port=None*, *locale=None*, *encoding=None*, *datadir=None*)

Adds a cluster to the Postgres server.

CLI Example:

```
salt '*' postgres.cluster_create '9.3'

salt '*' postgres.cluster_create '9.3' 'main'

salt '*' postgres.cluster_create '9.3' locale='fr_FR'
```

salt.modules.deb_postgres.**cluster_exists**(*version*, *name='main'*)

Checks if a given version and name of a cluster exists.

CLI Example:

```
salt '*' postgres.cluster_exists '9.3'

salt '*' postgres.cluster_exists '9.3' 'main'
```

salt.modules.deb_postgres.**cluster_list**(*verbose=False*)

Return a list of cluster of Postgres server (tuples of version and name).

CLI Example:

```
salt '*' postgres.cluster_list

salt '*' postgres.cluster_list verbose=True
```

salt.modules.deb_postgres.**cluster_remove**(*version*, *name='main'*, *stop=False*)

Remove a cluster on a Postgres server. By default it doesn't try to stop the cluster.

CLI Example:

```
salt '*' postgres.cluster_remove '9.3'

salt '*' postgres.cluster_remove '9.3' 'main'

salt '*' postgres.cluster_remove '9.3' 'main' stop=True
```

19.9.87 salt.modules.debbuild

Debian Package builder system

New in version 2015.8.0.

This system allows for all of the components to build debs safely in chrooted environments. This also provides a function to generate debian repositories

This module implements the pkgbuild interface

salt.modules.debbuild.**build**(*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Given the package destination directory, the tarball containing debian files (e.g. control) and package sources, use pbuilder to safely build the platform package

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg deb-8-x86_64 /var/www/html https://raw.
↪githubusercontent.com/saltstack/libnacl/master/pkg/deb/python-libnacl.control
↪https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for Debian using pbuilder and place it in /var/www/html/ on the minion

salt.modules.debbuild.**make_repo**(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

Given the repodir (directory to create repository in), create a Debian repository and optionally sign it and packages present. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data. Leverages gpg-agent and gpg-preset-passphrase for caching keys, etc.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQO+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R5OmgHqvydEnO4pWbn8JzQO9YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vlZcN4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html
```

salt.modules.debbuild.**make_src_pkg**(*dest_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*)

Create a platform specific source package from the given platform spec/control file and sources

CLI Example:

Debian

```
salt '*' pkgbuild.make_src_pkg /var/www/html/ https://raw.githubusercontent.com/
↪saltstack/libnacl/master/pkg/deb/python-libnacl.control.tar.xz https://pypi.
↪python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

19.9.88 salt.modules.debconfmod

Support for Debconf

salt.modules.debconfmod.**get_selections**(*fetchempty=True*)

Answers to debconf questions for all packages in the following format:

```
{'package': [['question', 'type', 'value'], ...]}
```

CLI Example:

```
salt '*' debconf.get_selections
```

salt.modules.debconfmod.**set**(*package*, *question*, *type*, *value*, **extra*)

Set answers to debconf questions for a package.

CLI Example:

```
salt '*' debconf.set <package> <question> <type> <value> [<value> ...]
```

salt.modules.debconfmod.**set_file**(*path*, *saltenv='base'*, ***kwargs*)

Set answers to debconf questions from a file.

CLI Example:

```
salt '*' debconf.set_file salt://pathto/pkg.selections
```

salt.modules.debconfmod.**set_template**(*path*, *template*, *context*, *defaults*, *saltenv='base'*, ***kwargs*)

Set answers to debconf questions from a template.

path location of the file containing the package selections
template template format
context variables to add to the template environment
default default values for the template environment
CLI Example:

```
salt '*' debconf.set_template salt://pathto/pkg.selections.jinja jinja None None
```

salt.modules.debconfmod.**show**(*name*)
Answers to debconf questions for a package in the following format:

```
[['question', 'type', 'value'], ...]
```

If debconf doesn't know about a package, we return None.

CLI Example:

```
salt '*' debconf.show <package name>
```

19.9.89 salt.modules.debian_ip

The networking module for Debian based distros

References:

- http://www.debian.org/doc/manuals/debian-reference/ch05.en.html

salt.modules.debian_ip.**apply_network_settings**(***settings*)
Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

salt.modules.debian_ip.**build_bond**(*iface*, ***settings*)
Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

salt.modules.debian_ip.**build_interface**(*iface*, *iface_type*, *enabled*, ***settings*)
Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.debian_ip.**build_network_settings**(***settings*)
Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.debian_ip.**build_routes**(*iface*, ***settings*)
Add route scripts for a network interface using up commands.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.debian_ip.**down**(*iface*, *iface_type*)
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0 eth
```

salt.modules.debian_ip.**get_bond**(*iface*)
Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

salt.modules.debian_ip.**get_interface**(*iface*)
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.debian_ip.**get_network_settings**()
Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.debian_ip.**get_routes**(*iface*)
Return the routes for the interface

CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.debian_ip.**up**(*iface*, *iface_type*)
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0 eth
```

19.9.90 salt.modules.debian_service

Service support for Debian systems (uses update-rc.d and /sbin/service)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

salt.modules.debian_service.**available**(*name*)
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.debian_service.**disable**(*name*, ***kwargs*)
Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.debian_service.**disabled**(*name*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.debian_service.**enable**(*name*, ***kwargs*)
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.debian_service.**enabled**(*name*, ***kwargs*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.debian_service.**force_reload**(*name*)
Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.debian_service.**get_all**()
Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.debian_service.**get_disabled**()
Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.debian_service.**get_enabled**()
Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.debian_service.**missing**(*name*)
The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.debian_service.**reload**(*name*)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.debian_service.**restart**(*name*)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.debian_service.**start**(*name*)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.debian_service.**status**(*name*, *sig=None*)
Return the status for a service, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.debian_service.**stop**(*name*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.91 salt.modules.defaults

salt.modules.defaults.**get**(*key*, *default=''*)
defaults.get is used much like pillar.get except that it will read a default value for a pillar from defaults.json or defaults.yaml files that are stored in the root of a salt formula.

CLI Example:

```
salt '*' defaults.get core:users:root
```

The defaults is computed from pillar key. The first entry is considered as the formula namespace.

For example, querying `core:users:root` will try to load `salt://core/defaults.yaml` and `salt://core/defaults.json`.

salt.modules.defaults.**merge**(*dest*, *upd*)
Allows deep merging of dicts in formulas.
CLI Example: .. code-block:: bash

salt `*' default.merge a=b d=e
It is more typical to use this in a templating language in formulas, instead of directly on the command-line.

19.9.92 salt.modules.devmap

Device-Mapper module

salt.modules.devmap.**multipath_flush**(*device*)
Device-Mapper Multipath flush

CLI Example:

```
salt '*' devmap.multipath_flush mpath1
```

salt.modules.devmap.**multipath_list**()
Device-Mapper Multipath list

CLI Example:

```
salt '*' devmap.multipath_list
```

19.9.93 salt.modules.dig

Compendium of generic DNS utilities. The `dig' command line tool must be installed in order to use this module.

salt.modules.dig.**A**(*host*, *nameserver=None*)
Return the A record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.A www.google.com
```

salt.modules.dig.**AAAA**(*host*, *nameserver=None*)
Return the AAAA record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.AAAA www.google.com
```

salt.modules.dig.**MX**(*domain*, *resolve=False*, *nameserver=None*)
Return a list of lists for the MX of `domain`.

If the `resolve` argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dig.MX google.com
```

salt.modules.dig.**NS**(*domain*, *resolve=True*, *nameserver=None*)
Return a list of IPs of the nameservers for `domain`

If `resolve` is False, don't resolve names.

CLI Example:

```
salt ns1 dig.NS google.com
```

salt.modules.dig.**SPF**(*domain*, *record='SPF'*, *nameserver=None*)
Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dig.SPF google.com
```

salt.modules.dig.**TXT**(*host*, *nameserver=None*)
Return the TXT record for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dig.TXT google.com
```

salt.modules.dig.**check_ip**(*addr*)
Check if address is a valid IP. returns True if valid, otherwise False.

CLI Example:

```
salt ns1 dig.check_ip 127.0.0.1
salt ns1 dig.check_ip 1111:2222:3333:4444:5555:6666:7777:8888
```

19.9.94 salt.modules.disk

Module for managing disks and blockdevices

salt.modules.disk.**blkid**(*device=None*)
Return block device attributes: UUID, LABEL, etc. This function only works on systems where blkid is available.

CLI Example:

```
salt '*' disk.blkid
salt '*' disk.blkid /dev/sda
```

salt.modules.disk.**dump**(*device*, *args=None*)
Return all contents of dumpe2fs for a specified device

CLI Example: .. code-block:: bash
salt `*' disk.dump /dev/sda1

salt.modules.disk.**format**(*device*, *fs_type='ext4'*, *inode_size=None*, *lazy_itable_init=None*, *force=False*)

Format a filesystem onto a device

New in version 2016.11.0.

device The device in which to create the new filesystem

fs_type The type of filesystem to create

inode_size Size of the inodes

This option is only enabled for ext and xfs filesystems

lazy_itable_init If enabled and the uninit_bg feature is enabled, the inode table will not be fully initialized by mke2fs. This speeds up filesystem initialization noticeably, but it requires the kernel to finish initializing the filesystem in the background when the filesystem is first mounted. If the option value is omitted, it defaults to 1 to enable lazy inode table zeroing.

This option is only enabled for ext filesystems

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

CLI Example:

```
salt '*' disk.format /dev/sdX1
```

salt.modules.disk.**fstype**(*device*)

Return the filesystem name of the specified device

New in version 2016.11.0.

device The name of the device

CLI Example:

```
salt '*' disk.fstype /dev/sdX1
```

salt.modules.disk.**hdparms**(*disks*, *args=None*)

Retrieve all info's for all disks parse `em into a nice dict (which, considering hdparms output, is quite a hassle)

New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt `*' disk.hdparms /dev/sda

salt.modules.disk.**hpa**(*disks*, *size=None*)

Get/set Host Protected Area settings

T13 INCITS 346-2001 (1367D) defines the BEER (Boot Engineering Extension Record) and PARTIES (Protected Area Run Time Interface Extension Services), allowing for a Host Protected Area on a disk.

It's often used by OEMS to hide parts of a disk, and for overprovisioning SSD's

Warning: Setting the HPA might clobber your data, be very careful with this on active disks!

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.hpa /dev/sda
salt '*' disk.hpa /dev/sda 5%
salt '*' disk.hpa /dev/sda 10543256
```

salt.modules.disk.**inodeusage**(*args=None*)
Return inode usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.inodeusage
```

salt.modules.disk.**iostat**(*interval=1*, *count=5*, *disks=None*)
Gather and return (averaged) IO stats.

New in version 2016.3.0.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' disk.iostat 1 5 disks=sda
```

salt.modules.disk.**percent**(*args=None*)
Return partition information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.percent /var
```

salt.modules.disk.**resize2fs**(*device*)
Resizes the filesystem.

CLI Example: .. code-block:: bash
salt `*' disk.resize2fs /dev/sda1

salt.modules.disk.**smart_attributes**(*dev*, *attributes=None*, *values=None*)
Fetch SMART attributes Providing attributes will deliver only requested attributes Providing values will deliver only requested values for attributes

Default is the Backblaze recommended set (https://www.backblaze.com/blog/hard-drive-smart-stats/): (5,187,188,197,198)

New in version 2016.3.0.

CLI Example:

```
salt '*' disk.smart_attributes /dev/sda
salt '*' disk.smart_attributes /dev/sda attributes=(5,187,188,197,198)
```

salt.modules.disk.**tune**(*device*, ***kwargs*)
Set attributes for the specified device

CLI Example:

```
salt '*' disk.tune /dev/sda1 read-ahead=1024 read-write=True
```

Valid options are: `read-ahead`, `filesystem-read-ahead`, `read-only`, `read-write`.

See the `blockdev(8)` manpage for a more complete description of these options.

salt.modules.disk.**usage**(*args=None*)
Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

salt.modules.disk.**wipe**(*device*)
Remove the filesystem information

CLI Example:

```
salt '*' disk.wipe /dev/sda1
```

19.9.95 salt.modules.djangomod

Manage Django sites

salt.modules.djangomod.**collectstatic**(*settings_module*, *bin_env=None*, *no_post_process=False*, *ignore=None*, *dry_run=False*, *clear=False*, *link=False*, *no_default_ignore=False*, *pythonpath=None*, *env=None*)
Collect static files from each of your applications into a single location that can easily be served in production.

CLI Example:

```
salt '*' django.collectstatic <settings_module>
```

salt.modules.djangomod.**command**(*settings_module*, *command*, *bin_env=None*, *pythonpath=None*, *env=None*, **args*, ***kwargs*)
Run arbitrary django management command

CLI Example:

```
salt '*' django.command <settings_module> <command>
```

salt.modules.djangomod.**createsuperuser**(*settings_module*, *username*, *email*, *bin_env=None*, *database=None*, *pythonpath=None*, *env=None*)
Create a super user for the database. This function defaults to use the `--noinput` flag which prevents the creation of a password for the superuser.

CLI Example:

```
salt '*' django.createsuperuser <settings_module> user user@example.com
```

salt.modules.djangomod.**loaddata**(*settings_module*, *fixtures*, *bin_env=None*, *database=None*, *pythonpath=None*, *env=None*)
Load fixture data
Fixtures: comma separated list of fixtures to load
CLI Example:

```
salt '*' django.loaddata <settings_module> <comma delimited list of fixtures>
```

salt.modules.djangomod.**syncdb**(*settings_module*, *bin_env=None*, *migrate=False*, *database=None*, *pythonpath=None*, *env=None*, *noinput=True*)
Run syncdb

Execute the Django-Admin syncdb command, if South is available on the minion the `migrate` option can be passed as `True` calling the migrations to run after the syncdb completes

CLI Example:

```
salt '*' django.syncdb <settings_module>
```

19.9.96 salt.modules.dnsmasq

Module for managing dnsmasq

salt.modules.dnsmasq.**fullversion**()

Shows installed version of dnsmasq and compile options.

CLI Example:

```
salt '*' dnsmasq.fullversion
```

salt.modules.dnsmasq.**get_config**(*config_file='/etc/dnsmasq.conf'*)

Dumps all options from the config file.

config_file The location of the config file from which to obtain contents. Defaults to `/etc/dnsmasq.conf`.

CLI Examples:

```
salt '*' dnsmasq.get_config
salt '*' dnsmasq.get_config config_file=/etc/dnsmasq.conf
```

salt.modules.dnsmasq.**set_config**(*config_file='/etc/dnsmasq.conf'*, *follow=True*, ***kwargs*)

Sets a value or a set of values in the specified file. By default, if conf-dir is configured in this file, salt will attempt to set the option in any file inside the conf-dir where it has already been enabled. If it does not find it inside any files, it will append it to the main config file. Setting follow to False will turn off this behavior.

If a config option currently appears multiple times (such as dhcp-host, which is specified at least once per host), the new option will be added to the end of the main config file (and not to any includes). If you need an option added to a specific include file, specify it as the config_file.

Parameters

- **config_file** (`string`) -- config file where settings should be updated / added.
- **follow** (*bool*) -- attempt to set the config option inside any file within the `conf-dir` where it has already been enabled.
- **kwargs** -- key value pairs that contain the configuration settings that you want set.

CLI Examples:

```
salt '*' dnsmasq.set_config domain=mydomain.com
salt '*' dnsmasq.set_config follow=False domain=mydomain.com
salt '*' dnsmasq.set_config config_file=/etc/dnsmasq.conf domain=mydomain.com
```

salt.modules.dnsmasq.**version**()

Shows installed version of dnsmasq.

CLI Example:

```
salt '*' dnsmasq.version
```

19.9.97 salt.modules.dnsutil

Compendium of generic DNS utilities.

Note: Some functions in the `dnsutil` execution module depend on `dig`.

salt.modules.dnsutil.**A**(*host*, *nameserver=None*)
Return the A record(s) for `host`.

Always returns a list.

CLI Example:

```
salt ns1 dnsutil.A www.google.com
```

salt.modules.dnsutil.**AAAA**(*host*, *nameserver=None*)
Return the AAAA record(s) for `host`.

Always returns a list.

New in version 2014.7.5.

CLI Example:

```
salt ns1 dnsutil.AAAA www.google.com
```

salt.modules.dnsutil.**MX**(*domain*, *resolve=False*, *nameserver=None*)
Return a list of lists for the MX of `domain`.

If the `resolve' argument is True, resolve IPs for the servers.

It's limited to one IP, because although in practice it's very rarely a round robin, it is an acceptable configuration and pulling just one IP lets the data be similar to the non-resolved version. If you think an MX has multiple IPs, don't use the resolver here, resolve them in a separate step.

CLI Example:

```
salt ns1 dnsutil.MX google.com
```

salt.modules.dnsutil.**NS**(*domain*, *resolve=True*, *nameserver=None*)
Return a list of IPs of the nameservers for `domain`

If `resolve' is False, don't resolve names.

CLI Example:

```
salt ns1 dnsutil.NS google.com
```

salt.modules.dnsutil.**SPF**(*domain*, *record='SPF'*, *nameserver=None*)
Return the allowed IPv4 ranges in the SPF record for `domain`.

If record is SPF and the SPF record is empty, the TXT record will be searched automatically. If you know the domain uses TXT and not SPF, specifying that will save a lookup.

CLI Example:

```
salt ns1 dnsutil.SPF google.com
```

salt.modules.dnsutil.**check_ip**(*ip_addr*)
Check that string ip_addr is a valid IP

CLI Example:

```
salt ns1 dnsutil.check_ip 127.0.0.1
```

salt.modules.dnsutil.**hosts_append**(*hostsfile='/etc/hosts'*, *ip_addr=None*, *entries=None*)
Append a single line to the /etc/hosts file.

CLI Example:

```
salt '*' dnsutil.hosts_append /etc/hosts 127.0.0.1 ad1.yuk.co,ad2.yuk.co
```

salt.modules.dnsutil.**hosts_remove**(*hostsfile='/etc/hosts'*, *entries=None*)

Remove a host from the /etc/hosts file. If doing so will leave a line containing only an IP address, then the line will be deleted. This function will leave comments and blank lines intact.

CLI Examples:

```
salt '*' dnsutil.hosts_remove /etc/hosts ad1.yuk.co
salt '*' dnsutil.hosts_remove /etc/hosts ad2.yuk.co,ad1.yuk.co
```

salt.modules.dnsutil.**parse_hosts**(*hostsfile='/etc/hosts'*, *hosts=None*)

Parse /etc/hosts file.

CLI Example:

```
salt '*' dnsutil.parse_hosts
```

salt.modules.dnsutil.**parse_zone**(*zonefile=None*, *zone=None*)

Parses a zone file. Can be passed raw zone data on the API level.

CLI Example:

```
salt ns1 dnsutil.parse_zone /var/lib/named/example.com.zone
```

salt.modules.dnsutil.**serial**(*zone=''*, *update=False*)

Return, store and update a dns serial for your zone files.

zone: a keyword for a specific zone

update: store an updated version of the serial in a grain

If `update` is False, the function will retrieve an existing serial or return the current date if no serial is stored. Nothing will be stored

If `update` is True, the function will set the serial to the current date if none exist or if the existing serial is for a previous date. If a serial for greater than the current date is already stored, the function will increment it.

This module stores the serial in a grain, you can explicitly set the stored value as a grain named `dnsserial_<zone_name>`.

CLI Example:

```
salt ns1 dnsutil.serial example.com
```

19.9.98 salt.modules.dockercompose module

Module to import docker-compose via saltstack

New in version 2016.3.0.

maintainer Jean Praloran <jeanpralo@gmail.com>

maturity new

depends docker-compose>=1.5

platform all

Introduction

This module allows one to deal with docker-compose file in a directory.

This is a first version only, the following commands are missing at the moment but will be built later on if the community is interested in this module:

- run
- logs
- port
- scale

Installation Prerequisites

This execution module requires at least version 1.4.0 of both docker-compose and Docker. docker-compose can easily be installed using *pip.install*:

```
salt myminion pip.install docker-compose>=1.5.0
```

How to use this module?

In order to use the module if you have no docker-compose file on the server you can issue the command create, it takes two arguments the path where the docker-compose.yml will be stored and the content of this latter:

```
# salt-call -l debug dockercompose.create /tmp/toto '
database:
image: mongo:3.0
command: mongod --smallfiles --quiet --logpath=/dev/null
'
```

Then you can execute a list of method defined at the bottom with at least one argument (the path where the docker-compose.yml will be read) and an optional python list which corresponds to the services names:

```
# salt-call -l debug dockercompose.up /tmp/toto
# salt-call -l debug dockercompose.restart /tmp/toto '[database]'
# salt-call -l debug dockercompose.stop /tmp/toto
# salt-call -l debug dockercompose.rm /tmp/toto
```

Docker-compose method supported

- up
- restart
- stop
- start
- pause
- unpause
- kill
- rm

- ps
- pull
- build

Functions

- **docker-compose.yml management**
  - *dockercompose.create*
  - *dockercompose.get*
- **Manage containers**
  - *dockercompose.restart*
  - *dockercompose.stop*
  - *dockercompose.pause*
  - *dockercompose.unpause*
  - *dockercompose.start*
  - *dockercompose.kill*
  - *dockercompose.rm*
  - *dockercompose.up*
- **Manage containers image**:
  - *dockercompose.pull*
  - *dockercompose.build*
- **Gather information about containers**:
  - *dockercompose.ps*

Detailed Function Documentation

salt.modules.dockercompose.**build**(*path*, *service_names=None*)

Build image for containers in the docker-compose file, service_names is a python list, if omitted build images for all containers. Please note that at the moment the module does not allow you to upload your Dockerfile, nor any other file you could need with your docker-compose.yml, you will have to make sure the files you need are actually in the directory specified in the *build* keyword
path Path where the docker-compose file is stored on the server
service_names If specified will pull only the image for the specified services
CLI Example:

```
salt myminion dockercompose.build /path/where/docker-compose/stored
salt myminion dockercompose.build /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**create**(*path*, *docker_compose*)

Create and validate a docker-compose file into a directory
path Path where the docker-compose file will be stored on the server
docker_compose docker_compose file
CLI Example:

```
salt myminion dockercompose.create /path/where/docker-compose/stored content
```

salt.modules.dockercompose.**get**(*path*)

Get the content of the docker-compose file into a directory

path Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.get /path/where/docker-compose/stored
```

salt.modules.dockercompose.**kill**(*path*, *service_names=None*)

Kill containers in the docker-compose file, service_names is a python list, if omitted kill all containers

path Path where the docker-compose file is stored on the server

service_names If specified will kill only the specified services

CLI Example:

```
salt myminion dockercompose.kill /path/where/docker-compose/stored
salt myminion dockercompose.kill /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**pause**(*path*, *service_names=None*)

Pause running containers in the docker-compose file, service_names is a python list, if omitted pause all containers

path Path where the docker-compose file is stored on the server

service_names If specified will pause only the specified services

CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**ps**(*path*)

List all running containers and report some information about them

path Path where the docker-compose file is stored on the server

CLI Example:

```
salt myminion dockercompose.ps /path/where/docker-compose/stored
```

salt.modules.dockercompose.**pull**(*path*, *service_names=None*)

Pull image for containers in the docker-compose file, service_names is a python list, if omitted pull all images

path Path where the docker-compose file is stored on the server

service_names If specified will pull only the image for the specified services

CLI Example:

```
salt myminion dockercompose.pull /path/where/docker-compose/stored
salt myminion dockercompose.pull /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**restart**(*path*, *service_names=None*)

Restart container(s) in the docker-compose file, service_names is a python list, if omitted restart all containers

path Path where the docker-compose file is stored on the server

service_names If specified will restart only the specified services

CLI Example:

```
salt myminion dockercompose.restart /path/where/docker-compose/stored
salt myminion dockercompose.restart /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**rm**(*path*, *service_names=None*)

Remove stopped containers in the docker-compose file, service_names is a python list, if omitted remove all stopped containers

path Path where the docker-compose file is stored on the server
service_names If specified will remove only the specified stopped services
CLI Example:

```
salt myminion dockercompose.rm /path/where/docker-compose/stored
salt myminion dockercompose.rm /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**start**(*path*, *service_names=None*)
Start containers in the docker-compose file, service_names is a python list, if omitted start all containers
path Path where the docker-compose file is stored on the server
service_names If specified will start only the specified services
CLI Example:

```
salt myminion dockercompose.start /path/where/docker-compose/stored
salt myminion dockercompose.start /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**stop**(*path*, *service_names=None*)
Stop running containers in the docker-compose file, service_names is a python list, if omitted stop all containers
path Path where the docker-compose file is stored on the server
service_names If specified will stop only the specified services
CLI Example:

```
salt myminion dockercompose.stop /path/where/docker-compose/stored
salt myminion dockercompose.stop  /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**unpause**(*path*, *service_names=None*)
Un-Pause containers in the docker-compose file, service_names is a python list, if omitted unpause all containers
path Path where the docker-compose file is stored on the server
service_names If specified will un-pause only the specified services
CLI Example:

```
salt myminion dockercompose.pause /path/where/docker-compose/stored
salt myminion dockercompose.pause /path/where/docker-compose/stored '[janus]'
```

salt.modules.dockercompose.**up**(*path*, *service_names=None*)
Create and start containers defined in the the docker-compose.yml file located in path, service_names is a python list, if omitted create and start all containers
path Path where the docker-compose file is stored on the server
service_names If specified will create and start only the specified services
CLI Example:

```
salt myminion dockercompose.up /path/where/docker-compose/stored
salt myminion dockercompose.up /path/where/docker-compose/stored '[janus]'
```

19.9.99 salt.modules.dockermod

Management of Docker Containers

New in version 2015.8.0.

Changed in version 2017.7.0: This module has replaced the legacy docker execution module.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

Authentication

If you have previously performed a `docker login` from the minion, then the credentials saved in `~/.docker/config.json` will be used for any actions which require authentication. If not, then credentials can be configured in Pillar data. The configuration schema is as follows:

```
docker-registries:
  <registry_url>:
    username: <username>
    password: <password>
```

For example:

```
docker-registries:
  hub:
    username: foo
    password: s3cr3t
```

Note: As of the 2016.3.7, 2016.11.4, and 2017.7.0 releases of Salt, credentials for the Docker Hub can be configured simply by specifying `hub` in place of the registry URL. In earlier releases, it is necessary to specify the actual registry URL for the Docker Hub (i.e. `https://index.docker.io/v1/`).

More than one registry can be configured. Salt will look for Docker credentials in the `docker-registries` Pillar key, as well as any key ending in `-docker-registries`. For example:

```
docker-registries:
  'https://mydomain.tld/registry:5000':
    username: foo
    password: s3cr3t

foo-docker-registries:
  https://index.foo.io/v1/:
    username: foo
    password: s3cr3t

bar-docker-registries:
  https://index.bar.io/v1/:
    username: foo
    password: s3cr3t
```

To login to the configured registries, use the *docker.login* function. This only needs to be done once for a given registry, and it will store/update the credentials in `~/.docker/config.json`.

Note: For Salt releases before 2016.3.7 and 2016.11.4, *docker.login* is not available. Instead, Salt will try to authenticate using each of your configured registries for each push/pull, behavior which is not correct and has been resolved in newer releases.

Configuration Options

The following configuration options can be set to fine-tune how Salt uses Docker:

- `docker.url`: URL to the docker service (default: local socket).
- `docker.version`: API version to use (should not need to be set manually in the vast majority of cases)
- `docker.exec_driver`: Execution driver to use, one of `nsenter`, `lxc-attach`, or `docker-exec`. See the *Executing Commands Within a Running Container* section for more details on how this config parameter is used.

These configuration options are retrieved using *config.get* (click the link for further information).

Executing Commands Within a Running Container

Note: With the release of Docker 1.13.1, the Execution Driver has been removed. Starting in versions 2016.3.6, 2016.11.4, and 2017.7.0, Salt defaults to using `docker exec` to run commands in containers, however for older Salt releases it will be necessary to set the `docker.exec_driver` config option to either `docker-exec` or `nsenter` for Docker versions 1.13.1 and newer.

Multiple methods exist for executing commands within Docker containers:

- lxc-attach: Default for older versions of docker
- nsenter: Enters container namespace to run command
- docker-exec: Native support for executing commands in Docker containers (added in Docker 1.3)

Adding a configuration option (see *config.get*) called `docker.exec_driver` will tell Salt which execution driver to use:

```
docker.exec_driver: docker-exec
```

If this configuration option is not found, Salt will use the appropriate interface (either nsenter or lxc-attach) based on the `Execution Driver` value returned from `docker info`. docker-exec will not be used by default, as it is presently (as of version 1.6.2) only able to execute commands as the effective user of the container. Thus, if a `USER` directive was used to run as a non-privileged user, docker-exec would be unable to perform the action as root. Salt can still use docker-exec as an execution driver, but must be explicitly configured (as in the example above) to do so at this time.

If possible, try to manually specify the execution driver, as it will save Salt a little work.

This execution module provides functions that shadow those from the *cmd* module. They are as follows:

- *docker.retcode*
- *docker.run*
- *docker.run_all*
- *docker.run_stderr*

- *docker.run_stdout*
- *docker.script*
- *docker.script_retcode*

Detailed Function Documentation

salt.modules.dockermod.**build**(*path=None*, *image=None*, *cache=True*, *rm=True*, *api_response=False*, *fileobj=None*, *dockerfile=None*, *buildargs=None*)

Builds a docker image from a Dockerfile or a URL

path Path to directory on the Minion containing a Dockerfile

image Image to be built, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed. If building from a URL, this parameted can be omitted.

cache [True] Set to `False` to force the build process not to use the Docker image cache, and pull all required intermediate image layers

rm [True] Remove intermediate containers created during build

api_response [False] If `True`: an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

fileobj Allows for a file-like object containing the contents of the Dockerfile to be passed in place of a file `path` argument. This argument should not be used from the CLI, only from other Salt code.

dockerfile Allows for an alternative Dockerfile to be specified. Path to alternative Dockefile is relative to the build path for the Docker container.

New in version develop.

buildargs A dictionary of build arguments provided to the docker build process.

RETURN DATA

A dictionary containing one or more of the following keys:

- `Id` - ID of the newly-built image
- `Time_Elapsed` - Time in seconds taken to perform the build
- `Intermediate_Containers` - IDs of containers created during the course of the build process

(Only present if rm=False)

- **`Images` - A dictionary containing one or more of the following keys:**
  - `Already_Pulled` - Layers that that were already present on the Minion
  - `Pulled` - Layers that that were pulled

(Only present if the image specified by the ``image'' argument was not present on the Minion, or if cache=False)

- `Status` - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).

(Only present if the image specified by the ``image'' argument was not present on the Minion, or if cache=False)

CLI Example:

```
salt myminion docker.build /path/to/docker/build/dir image=myimage:dev
salt myminion docker.build https://github.com/myuser/myrepo.git image=myimage:
↪latest

.. versionadded:: develop

salt myminion docker.build /path/to/docker/build/dir dockerfile=Dockefile.
↪different image=myimage:dev
```

salt.modules.dockermod.**call**(*name*, *function*, **args*, ***kwargs*)

Executes a Salt function inside a running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

name Container name or ID

function Salt execution module function

CLI Example:

```
salt myminion docker.call test.ping
salt myminion test.arg arg1 arg2 key1=val1
salt myminion dockerng.call compassionate_mirzakhani test.arg arg1 arg2 key1=val1
```

salt.modules.dockermod.**commit**(*name*, *image*, *message=None*, *author=None*)

Commits a container, thereby promoting it to an image. Equivalent to running the `docker commit` Docker CLI command.

name Container name or ID to commit

image Image to be committed, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

message Commit message (Optional)

author Author name (Optional)

RETURN DATA

A dictionary containing the following keys:

- `Id` - ID of the newly-created image
- `Image` - Name of the newly-created image
- `Time_Elapsed` - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.commit mycontainer myuser/myimage
salt myminion docker.commit mycontainer myuser/myimage:mytag
```

salt.modules.dockermod.**compare_container**(*first*, *second*, *ignore=None*)

New in version 2017.7.0.

Compare two containers' Config and and HostConfig and return any differences between the two.

first Name or ID of first container

second Name or ID of second container

ignore A comma-separated list (or Python list) of keys to ignore when comparing. This is useful when comparing two otherwise identical containers which have different hostnames.

salt.modules.dockermod.**connect_container_to_network**(*container*, *network_id*, *ipv4_address=None*)

Connect container to network.

container Container name or ID

network_id ID of network

ipv4_address The IPv4 address to connect to the container

New in version 2017.7.0.

CLI Example:

```
salt myminion docker.connect_container_from_network web-1␘
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.**copy_from**(*name*, **args*, ***kwargs*)

Copy a file from inside a container to the Minion

name Container name

source Path of the file on the container's filesystem
dest Destination on the Minion. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.
overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.
makedirs [False] Create the parent directory on the container if it does not already exist.
RETURN DATA

A boolean (`True` if successful, otherwise `False`)

CLI Example:

```
salt myminion docker.copy_from mycontainer /var/log/nginx/access.log /home/myuser
```

`salt.modules.dockermod.`**`copy_to`**(*name*, **args*, ***kwargs*)
Copy a file from the host into a container
name Container name
source File to be copied to the container. Can be a local path on the Minion or a remote file from the Salt fileserver.
dest Destination on the container. Must be an absolute path. If the destination is a directory, the file will be copied into that directory.
exec_driver [None] If not passed, the execution driver will be detected as described *above*.
overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.
makedirs [False] Create the parent directory on the container if it does not already exist.
RETURN DATA

A boolean (`True` if successful, otherwise `False`)

CLI Example:

```
salt myminion docker.copy_to mycontainer /tmp/foo /root/foo
```

`salt.modules.dockermod.`**`create`**(**args*, ***kwargs*)
Create a new container
image Image from which to create the container
name Name for the new container. If not provided, Docker will randomly generate one for you (it will be included in the return data).
skip_translate This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping tranlsation allows for arguments to be formatted directly in the format which docker-py expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

```
salt myminion docker.create image=centos:7.3.1611 skip_translate=environment
 ↪environment="{'FOO': 'bar'}"
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

ignore_collisions [False] Since many of docker-py`s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

client_timeout [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

CONTAINER CONFIGURATION ARGUMENTS

auto_remove (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

Examples:

- `auto_remove=True`
- `rm=True`

binds Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `ro` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

Note: When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a Python list, however in cases where both ro/rw and an selinux context are specified, the binds *must* be specified as a Python list.

Examples:

- `binds=/srv/www:/var/www:ro`
- `binds=/srv/www:/var/www:rw`
- `binds=/srv/www:/var/www`
- `binds="['/srv/www:/var/www:ro,Z']"`

- `binds="['/srv/www:/var/www:rw,Z']"`
- `binds=/srv/www:/var/www:Z`

Note: The second and third examples above are equivalent to each other, as are the last two examples.

blkio_weight Block IO weight (relative weight), accepts a weight value between 10 and 1000.

Example: `blkio_weight=100`

blkio_weight_device Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:WEIGHT`

Example: `blkio_weight_device=/dev/sda:100`

cap_add List of capabilities to add within the container. Can be passed as a comma-separated list or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_add=SYS_ADMIN,MKNOD`
- `cap_add="[SYS_ADMIN,MKNOD]"`

cap_drop List of capabilities to drop within the container. Can be passed as a comma-separated string or a Python list. Requires Docker 1.2.0 or newer.

Examples:

- `cap_drop=SYS_ADMIN,MKNOD`,
- `cap_drop="[SYS_ADMIN,MKNOD]"`

command (or *cmd*) Command to run in the container

Example: `command=bash` or `cmd=bash`

Changed in version 2015.8.1: `cmd` is now also accepted

cpuset_cpus (or *cpuset*) CPUs on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

Examples:

- `cpuset_cpus="0-3"`
- `cpuset="0,1"`

cpuset_mems Memory nodes on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

Examples:

- `cpuset_mems="0-3"`
- `cpuset_mems="0,1"`

cpu_group The length of a CPU period in microseconds

Example: `cpu_group=100000`

cpu_period Microseconds of CPU time that the container can get in a CPU period

Example: `cpu_period=50000`

cpu_shares CPU shares (relative weight), specified as an integer between 2 and 1024.

Example: `cpu_shares=512`

detach [False] If `True`, run the container's command in the background (daemon mode)

Example: `detach=True`

devices List of host devices to expose within the container

Examples:

- `devices="/dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r"`
- `devices="['/dev/net/tun','/dev/xvda1:/dev/xvda1','/dev/xvdb1:/dev/xvdb1:r']"`

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`.

Examples:

- `device_read_bps="/dev/sda:1mb,/dev/sdb:5mb"`
- `device_read_bps="['/dev/sda:100mb','/dev/sdb:5mb']"`

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops="['/dev/sda:1000','/dev/sdb:500']"`

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb` or `gb`.

Examples:

- `device_write_bps="/dev/sda:100mb,/dev/sdb:50mb"`
- `device_write_bps="['/dev/sda:100mb','/dev/sdb:50mb']"`

device_read_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations.

Examples:

- `device_read_iops="/dev/sda:1000,/dev/sdb:500"`
- `device_read_iops="['/dev/sda:1000','/dev/sdb:500']"`

dns List of DNS nameservers. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns=8.8.8.8,8.8.4.4`
- `dns="['8.8.8.8','8.8.4.4']"`

Note: To skip IP address validation, use `validate_ip_addrs=False`

---

dns_opt Additional options to be added to the container's `resolv.conf` file

Example: `dns_opt=ndots:9`

dns_search List of DNS search domains. Can be passed as a comma-separated list or a Python list.

Examples:

- `dns_search=foo1.domain.tld,foo2.domain.tld`
- `dns_search="[foo1.domain.tld,foo2.domain.tld]"`

domainname The domain name to use for the container

Example: `domainname=domain.tld`

entrypoint Entrypoint for the container. Either a string (e.g. `"mycmd --arg1 --arg2"`) or a Python list (e.g. `"['mycmd','--arg1','--arg2']"`)

Examples:

- `entrypoint="cat access.log"`
- `entrypoint="['cat','access.log']"`

environment (or *env*) Either a dictionary of environment variable names and their values, or a Python list of strings in the format `VARNAME=value`.

Examples:

- `environment='VAR1=value,VAR2=value'`
- `environment="['VAR1=value','VAR2=value']"`
- `environment="{'VAR1': 'value','VAR2': 'value'}"`

extra_hosts Additional hosts to add to the container's /etc/hosts file. Can be passed as a comma-separated list or a Python list. Requires Docker 1.3.0 or newer.

Examples:

- `extra_hosts=web1:10.9.8.7,web2:10.9.8.8`
- `extra_hosts="['web1:10.9.8.7','web2:10.9.8.8']"`
- `extra_hosts="{'web1': '10.9.8.7','web2': '10.9.8.8'}"`

Note: To skip IP address validation, use `validate_ip_addrs=False`

---

group_add List of additional group names and/or IDs that the container process will run as

Examples:

- `group_add=web,network`
- `group_add="['web','network']"`

hostname Hostname of the container. If not provided, and if a `name` has been provided, the `hostname` will default to the `name` that was passed.

Example: `hostname=web1`

> **Warning:** If the container is started with `network_mode=host`, the hostname will be overridden by the hostname of the Minion.

interactive (or *stdin_open*): False Leave stdin open, even if not attached

Examples:

- `interactive=True`
- `stdin_open=True`

ipc_mode (or *ipc*) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues
- `host`: use the host's shared memory, semaphores and message queues

Examples:

- `ipc_mode=container:foo`
- `ipc=host`

> **Warning:** Using `host` gives the container full access to local shared memory and is therefore considered insecure.

isolation Specifies the type of isolation technology used by containers

Example: `isolation=hyperv`

Note: The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

---

labels (or *label*) Add metadata to the container. Labels can be set both with and without values:

Examples (*with* values):

- `labels="label1=value1,label2=value2"`
- `labels="['label1=value1','label2=value2']"`
- `labels="{'label1': 'value1','label2': 'value2'}"`

Examples (*without* values):

- `labels=label1,label2`
- `labels="['label1','label2']"`

links Link this container to another. Links should be specified in the format `<container_name_or_id>:<link_alias>`. Multiple links can be passed, ether as a comma separated list or a Python list.

Examples:

- `links=web1:link1,web2:link2,`
- `links="['web1:link1','web2:link2']"`
- `links="{'web1': 'link1','web2': 'link2'}"`

log_driver Set container's logging driver. Requires Docker 1.6 or newer.

Example:

- `log_driver=syslog`

Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

---

log_opt Config options for the `log_driver` config option. Requires Docker 1.6 or newer.

Example:

- `log_opt="syslog-address=tcp://192.168.0.42,syslog-facility=daemon"`
- `log_opt="['syslog-address=tcp://192.168.0.42','syslog-facility=daemon']"`
- `log_opt="{'syslog-address': 'tcp://192.168.0.42','syslog-facility': 'daemon'}"`

lxc_conf Additional LXC configuration parameters to set before starting the container.

Examples:

- `lxc_conf="lxc.utsname=docker,lxc.arch=x86_64"`
- `lxc_conf="['lxc.utsname=docker','lxc.arch=x86_64']"`
- `lxc_conf="{'lxc.utsname': 'docker','lxc.arch': 'x86_64'}"`

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

---

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

Example: `mac_address=01:23:45:67:89:0a`

mem_limit (or *memory*) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. `512M`, `2G`, etc.). A value of `0` (the default) means no memory limit.

Examples:

- `mem_limit=512M`
- `memory=1073741824`

mem_swappiness Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

Example: `mem_swappiness=60`

memswap_limit (or *memory_swap*) [-1] Total memory limit (memory plus swap). Set to `-1` to disable swap. A value of `0` means no swap limit.

Examples:

- `memswap_limit=1G`
- `memory_swap=2147483648`

network_disabled [False] If `True`, networking will be disabled within the container

Example: `network_disabled=True`

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container

> **Warning:** Using `host` mode gives the container full access to the hosts system's services (such as D-Bus), and is therefore considered insecure.

Examples:

- `network_mode=null`
- `network_mode=container:web1`

oom_kill_disable Whether to disable OOM killer

Example: `oom_kill_disable=False`

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

Example: `oom_score_adj=500`

pid_mode Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

Example: `pid_mode=host`

pids_limit Set the container's PID limit. Set to `-1` for unlimited.

Example: `pids_limit=2000`

port_bindings (or *publish*) Bind exposed ports which were exposed using the `ports` argument to *docker.create*. These should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or passed as a Python list. The below two examples are equivalent:

- `port_bindings="5000:5000,2123:2123/udp,8080"`
- `port_bindings="['5000:5000','2123:2123/udp',8080]"`

Port bindings can also include ranges:

- `port_bindings="14505-14506:4505-4506"`

Note: When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

ports A list of ports to expose on the container. Can be passed as comma-separated list or a Python list. If the protocol is omitted, the port will be assumed to be a TCP port.

Examples:

- `ports=1111,2222/udp`
- `ports="[1111,'2222/udp']"`

privileged [False] If `True`, runs the exec process with extended privileges

Example: `privileged=True`

publish_all_ports (or *publish_all*): False Publish all ports to the host

Example: `publish_all_ports=True`

read_only [False] If `True`, mount the container's root filesystem as read only

Example: `read_only=True`

restart_policy (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

Examples:

- `restart_policy=on-failure:5`
- `restart_policy=always`

security_opt Security configuration for MLS systems such as SELinux and AppArmor. Can be passed as a comma-separated list or a Python list.

Examples:

- `security_opt=apparmor:unconfined,param2:value2`
- `security_opt='["apparmor:unconfined","param2:value2"]'`

Important: Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

---

shm_size Size of /dev/shm

Example: `shm_size=128M`

stop_signal The signal used to stop the container. The default is `SIGTERM`.

Example: `stop_signal=SIGRTMIN+3`

stop_timeout Timeout to stop the container, in seconds

Example: `stop_timeout=5`

storage_opt Storage driver options for the container

Examples:

- `storage_opt='dm.basesize=40G'`
- `storage_opt="['dm.basesize=40G']"`
- `storage_opt="{'dm.basesize': '40G'}"`

sysctls (or *sysctl*) Set sysctl options for the container

Examples:

- `sysctl='fs.nr_open=1048576,kernel.pid_max=32768'`
- `sysctls="['fs.nr_open=1048576','kernel.pid_max=32768']"`
- `sysctls="{'fs.nr_open': '1048576','kernel.pid_max': '32768'}"`

tmpfs A map of container directories which should be replaced by tmpfs mounts, and their corresponding mount options. Can be passed as Python list of PATH:VALUE mappings, or a Python dictionary. However, since commas usually appear in the values, this option *cannot* be passed as a comma-separated list.

Examples:

- `tmpfs="['/run:rw,noexec,nosuid,size=65536k','/var/lib/mysql:rw,noexec,nosuid,s`
- `tmpfs="{'/run': 'rw,noexec,nosuid,size=65536k','/var/lib/mysql': 'rw,noexec,nosuid,size=600m'}"`

tty [False] Attach TTYs

Example: `tty=True`

ulimits (or *ulimit*) List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be passed as a comma-separated list or a Python list.

Examples:

- `ulimits="nofile=1024:1024,nproc=60"`
- `ulimits="['nofile=1024:1024','nproc=60']"`

user User under which to run exec process

Example: `user=foo`

userns_mode (or *user_ns_mode*) Sets the user namsepace mode, when the user namespace remapping option is enabled.

Example: `userns_mode=host`

volumes (or *volume*) List of directories to expose as volumes. Can be passed as a comma-separated list or a Python list.

Examples:

- `volumes=/mnt/vol1,/mnt/vol2`
- `volume="['/mnt/vol1','/mnt/vol2']"`

volumes_from Container names or IDs from which the container will get volumes. Can be passed as a comma-separated list or a Python list.

Example: `volumes_from=foo`, `volumes_from=foo,bar`, `volumes_from="[foo,bar]"`

volume_driver Sets the container's volume driver

Example: `volume_driver=foobar`

working_dir (or *workdir*) Working directory inside the container

Examples:

- `working_dir=/var/log/nginx`
- `workdir=/var/www/myapp`

RETURN DATA

A dictionary containing the following keys:
•`Id` - ID of the newly-created container
•`Name` - Name of the newly-created container

CLI Example:

```
# Create a data-only container
salt myminion docker.create myuser/mycontainer volumes="/mnt/vol1,/mnt/vol2"
# Create a CentOS 7 container that will stay running once started
salt myminion docker.create centos:7 name=mycent7 interactive=True tty=True
 ↪command=bash
```

`salt.modules.dockermod.`**`create_network`**(*name*, *driver=None*)

Create a new network

network_id ID of network

driver Driver of the network

CLI Example:

```
salt myminion docker.create_network web_network driver=bridge
```

`salt.modules.dockermod.`**`create_volume`**(*name*, *driver=None*, *driver_opts=None*)

Create a new volume

New in version 2015.8.4.
name name of volume
driver Driver of the volume
driver_opts Options for the driver volume
CLI Example:

```
salt myminion docker.create_volume my_volume driver=local
```

salt.modules.dockermod.**dangling**(*prune=False*, *force=False*)
Return top-level images (those on which no other images depend) which do not have a tag assigned to them. These include:
- Images which were once tagged but were later untagged, such as those which were superseded by committing a new copy of an existing tagged image.
- Images which were loaded using *docker.load* (or the `docker load` Docker CLI command), but not tagged.

prune [False] Remove these images
force [False] If `True`, and if `prune=True`, then forcibly remove these images.

RETURN DATA

If `prune=False`, the return data will be a list of dangling image IDs.

If `prune=True`, the return data will be a dictionary with each key being the ID of the dangling image, and the following information for each image:
- `Comment` - Any error encountered when trying to prune a dangling image

(Only present if prune failed)
- `Removed` - A boolean (`True` if prune was successful, `False` if not)

CLI Example:

```
salt myminion docker.dangling
salt myminion docker.dangling prune=True
```

salt.modules.dockermod.**depends**(*name*)
Returns the containers and images, if any, which depend on the given image
name Name or ID of image
RETURN DATA

A dictionary containing the following keys:
- `Containers` - A list of containers which depend on the specified image
- `Images` - A list of IDs of images which depend on the specified image

CLI Example:

```
salt myminion docker.depends myimage
salt myminion docker.depends 0123456789ab
```

salt.modules.dockermod.**diff**(*name*, **args*, ***kwargs*)
Get information on changes made to container's filesystem since it was created. Equivalent to running the `docker diff` Docker CLI command.
name Container name or ID
RETURN DATA

A dictionary containing any of the following keys:
- `Added` - A list of paths that were added.
- `Changed` - A list of paths that were changed.
- `Deleted` - A list of paths that were deleted.

These keys will only be present if there were changes, so if the container has no differences the return dict will be empty.

CLI Example:

```
salt myminion docker.diff mycontainer
```

salt.modules.dockermod.**disconnect_container_from_network**(*container*, *network_id*)

Disconnect container from network.

container Container name or ID

network_id ID of network

CLI Example:

```
salt myminion docker.disconnect_container_from_network web-1␣
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.**exists**(*name*)

Check if a given container exists

name Container name or ID

RETURN DATA

A boolean (`True` if the container exists, otherwise `False`)

CLI Example:

```
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.**export**(*name*, **args*, ***kwargs*)

Exports a container to a tar archive. It can also optionally compress that tar archive, and push it up to the Master.

name Container name or ID

path Absolute path on the Minion where the container will be exported

overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `path` argument, an error will be raised.

makedirs [False] If `True`, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

compression [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires xz-utils, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as backports.lzma)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

push [False] If `True`, the container will be pushed to the master using *`cp.push`*.

> **Note:** This requires *`file_recv`* to be set to `True` on the Master.

RETURN DATA

A dictionary will containing the following keys:

- `Path` - Path of the file that was exported
- `Push` - Reports whether or not the file was successfully pushed to the Master

(Only present if push=True)

- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units
- `Time_Elapsed` - Time in seconds taken to perform the export

CLI Examples:

```
salt myminion docker.export mycontainer /tmp/mycontainer.tar
salt myminion docker.export mycontainer /tmp/mycontainer.tar.xz push=True
```

salt.modules.dockermod.**get_client_args**()

New in version 2016.3.6,2016.11.4,2017.7.0.

Changed in version 2017.7.0: Replaced the container config args with the ones from the API's `create_container` function.

Returns the args for docker-py's low-level API, organized by args for container creation, host config, and networking config.

CLI Example:

```
salt myminion docker.get_client_args
```

salt.modules.dockermod.**history**(*name*, *quiet=False*)

Return the history for an image. Equivalent to running the `docker history` Docker CLI command.

name Container name or ID

quiet [False] If `True`, the return data will simply be a list of the commands run to build the container.

```
$ salt myminion docker.history nginx:latest quiet=True
myminion:
    - FROM scratch
    - ADD file:
 ↪ef063ed0ae9579362871b9f23d2bc0781ef7cd4de6ac822052cf6c9c5a12b1e2 in /
    - CMD [/bin/bash]
    - MAINTAINER NGINX Docker Maintainers "docker-maint@nginx.com"
    - apt-key adv --keyserver pgp.mit.edu --recv-keys
 ↪573BFD6B3D8FBC641079A6ABABF5BD827BD9BF62
    - echo "deb http://nginx.org/packages/mainline/debian/ wheezy nginx" >> /
 ↪etc/apt/sources.list
    - ENV NGINX_VERSION=1.7.10-1~wheezy
    - apt-get update &&     apt-get install -y ca-certificates nginx=${NGINX_
 ↪VERSION} &&     rm -rf /var/lib/apt/lists/*
    - ln -sf /dev/stdout /var/log/nginx/access.log
    - ln -sf /dev/stderr /var/log/nginx/error.log
    - VOLUME [/var/cache/nginx]
    - EXPOSE map[80/tcp:{} 443/tcp:{}]
    - CMD [nginx -g daemon off;]
           https://github.com/saltstack/salt/pull/22421
```

RETURN DATA

If `quiet=False`, the return value will be a list of dictionaries containing information about each step taken to build the image. The keys in each step include the following:

- `Command` - The command executed in this build step
- `Id` - Layer ID
- `Size` - Cumulative image size, in bytes
- `Size_Human` - Cumulative image size, in human-readable units
- `Tags` - Tag(s) assigned to this layer
- `Time_Created_Epoch` - Time this build step was completed (Epoch time)
- `Time_Created_Local` - Time this build step was completed (Minion's local timezone)

CLI Example:

```
salt myminion docker.exists mycontainer
```

salt.modules.dockermod.**images**(*verbose=False*, ***kwargs*)

Returns information about the Docker images on the Minion. Equivalent to running the `docker images` Docker CLI command.

all [False] If `True`, untagged images will also be returned

verbose [False] If `True`, a `docker inspect` will be run on each image returned.

RETURN DATA

A dictionary with each key being an image ID, and each value some general info about that image (time created, size, tags associated with the image, etc.)

CLI Example:

```
salt myminion docker.images
salt myminion docker.images all=True
```

salt.modules.dockermod.**import**(*source*, *image*, *api_response=False*)

Imports content from a local tarball or a URL as a new docker image

source Content to import (URL or absolute path to a tarball). URL can be a file on the Salt fileserver (i.e. `salt://path/to/rootfs/tarball.tar.xz`. To import a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

image Image to be created by the import, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

api_response [False] If `True` an `api_response` key will be present in the return data, containing the raw output from the Docker API.

RETURN DATA

A dictionary containing the following keys:

- `Id` - ID of the newly-created image
- `Image` - Name of the newly-created image
- `Time_Elapsed` - Time in seconds taken to perform the commit

CLI Example:

```
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos
salt myminion docker.import /tmp/cent7-minimal.tar.xz myuser/centos:7
salt myminion docker.import salt://dockerimages/cent7-minimal.tar.xz myuser/
↪centos:7
```

salt.modules.dockermod.**info**()

Returns a dictionary of system-wide information. Equivalent to running the `docker info` Docker CLI command.

CLI Example:

```
salt myminion docker.info
```

salt.modules.dockermod.**inspect**(*name*)

Changed in version 2017.7.0: Volumes and networks are now checked, in addition to containers and images.

This is a generic container/image/volume/network inspecton function. It will run the following functions in order:

- *docker.inspect_container*
- *docker.inspect_image*
- *docker.inspect_volume*
- *docker.inspect_network*

The first of these to find a match will be returned.

name Container/image/volume/network name or ID

RETURN DATA

A dictionary of container/image/volume/network information

CLI Example:

```
salt myminion docker.inspect mycontainer
salt myminion docker.inspect busybox
```

salt.modules.dockermod.**inspect_container**(*name*, **args*, ***kwargs*)

Retrieves container information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for container information.

name Container name or ID

RETURN DATA

A dictionary of container information

CLI Example:

```
salt myminion docker.inspect_container mycontainer
salt myminion docker.inspect_container 0123456789ab
```

salt.modules.dockermod.**inspect_image**(*name*)

Retrieves image information. Equivalent to running the `docker inspect` Docker CLI command, but will only look for image information.

Note: To inspect an image, it must have been pulled from a registry or built locally. Images on a Docker registry which have not been pulled cannot be inspected.

---

name Image name or ID

RETURN DATA

A dictionary of image information

CLI Examples:

```
salt myminion docker.inspect_image busybox
salt myminion docker.inspect_image centos:6
salt myminion docker.inspect_image 0123456789ab
```

salt.modules.dockermod.**inspect_network**(*network_id*)

Inspect Network

network_id ID of network

CLI Example:

```
salt myminion docker.inspect_network
↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.**inspect_volume**(*name*)

Inspect Volume

New in version 2015.8.4.

name Name of volume

CLI Example:

```
salt myminion docker.inspect_volume my_volume
```

salt.modules.dockermod.**kill**(**args*, ***kwargs*)

Kill all processes in a running container instead of performing a graceful shutdown

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be killed

CLI Example:

```
salt myminion docker.kill mycontainer
```

salt.modules.dockermod.**layers**(*name*)

Returns a list of the IDs of layers belonging to the specified image, with the top-most layer (the one corresponding to the passed name) appearing last.

name Image name or ID

CLI Example:

```
salt myminion docker.layers centos:7
```

salt.modules.dockermod.**list_containers**(***kwargs*)

Returns a list of containers by name. This is different from `docker.ps` in that `docker.ps` returns its results organized by container ID.

all [False] If `True`, stopped containers will be included in return data

CLI Example:

```
salt myminion docker.inspect_image <image>
```

salt.modules.dockermod.**list_tags**()

Returns a list of tagged images

CLI Example:

```
salt myminion docker.list_tags
```

salt.modules.dockermod.**load**(*path*, *image=None*)

Load a tar archive that was created using *docker.save* (or via the Docker CLI using `docker save`).

path Path to docker tar archive. Path can be a file on the Minion, or the URL of a file on the Salt fileserver (i.e. `salt://path/to/docker/saved/image.tar`). To load a file from a saltenv other than `base` (e.g. `dev`), pass it at the end of the URL (ex. `salt://path/to/rootfs/tarball.tar.xz?saltenv=dev`).

image [None] If specified, the topmost layer of the newly-loaded image will be tagged with the specified repo and tag using `docker.tag`. The image name should be specified in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

RETURN DATA

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Layers` - A list containing the IDs of the layers which were loaded. Any layers in the file that was loaded, which were already present on the Minion, will not be included.
- `Image` - Name of tag applied to topmost layer

  (Only present if tag was specified and tagging was successful)
- `Time_Elapsed` - Time in seconds taken to load the file
- `Warning` - Message describing any problems encountered in attemp to tag the topmost layer

  (Only present if tag was specified and tagging failed)

CLI Example:

```
salt myminion docker.load /path/to/image.tar
salt myminion docker.load salt://path/to/docker/saved/image.tar image=myuser/
↪myimage:mytag
```

salt.modules.dockermod.**login**(**registries*)

New in version 2016.3.7,2016.11.4,2017.7.0.

Performs a `docker login` to authenticate to one or more configured repositories. See the documentation at the top of this page to configure authentication credentials.

Multiple registry URLs (matching those configured in Pillar) can be passed, and Salt will attempt to login to *just* those registries. If no registry URLs are provided, Salt will attempt to login to *all* configured registries.

RETURN DATA

A dictionary containing the following keys:

- `Results` - A dictionary mapping registry URLs to the authentication result. `True` means a successful login, `False` means a failed login.
- `Errors` - A list of errors encountered during the course of this function.

CLI Example:

```
salt myminion docker.login
salt myminion docker.login hub
salt myminion docker.login hub https://mydomain.tld/registry/
```

salt.modules.dockermod.**logs**(*name*)

Returns the logs for the container. Equivalent to running the `docker logs` Docker CLI command.

name Container name or ID

CLI Example:

```
salt myminion docker.logs mycontainer
```

salt.modules.dockermod.**networks**(*names=None*, *ids=None*)

Changed in version 2017.7.0: The `names` and `ids` can be passed as a comma-separated list now, as well as a Python list.

List existing networks

names Filter by name

ids Filter by id

CLI Example:

```
salt myminion docker.networks names=network-web
salt myminion docker.networks
↪ids=1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.**pause**(**args*, ***kwargs*)

Pauses a container

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be paused

CLI Example:

```
salt myminion docker.pause mycontainer
```

salt.modules.dockermod.**pid**(*name*, **args*, ***kwargs*)

Returns the PID of a container

name Container name or ID

CLI Example:

```
salt myminion docker.pid mycontainer
salt myminion docker.pid 0123456789ab
```

salt.modules.dockermod.**port**(*name*, **args*, ***kwargs*)

Returns port mapping information for a given container. Equivalent to running the `docker port` Docker CLI command.

name Container name or ID

private_port [None] If specified, get information for that specific port. Can be specified either as a port number (i.e. `5000`), or as a port number plus the protocol (i.e. `5000/udp`).

If this argument is omitted, all port mappings will be returned.

RETURN DATA

A dictionary of port mappings, with the keys being the port and the values being the mapping(s) for that port.

CLI Examples:

```
salt myminion docker.port mycontainer
salt myminion docker.port mycontainer 5000
salt myminion docker.port mycontainer 5000/udp
```

salt.modules.dockermod.**ps**(*filters=None*, ***kwargs*)

Returns information about the Docker containers on the Minion. Equivalent to running the `docker ps` Docker CLI command.

all [False] If `True`, stopped containers will also be returned

host: **False** If `True`, local host's network topology will be included

verbose [False] If `True`, a `docker inspect` will be run on each container returned.

filters: **None** A dictionary of filters to be processed on the container list. Available filters:

- exited (int): Only containers with specified exit code
- status (str): One of restarting, running, paused, exited
- label (str): format either ``key'' or ``key=value''

RETURN DATA

A dictionary with each key being an container ID, and each value some general info about that container (time created, name, command, etc.)

CLI Example:

```
salt myminion docker.ps
salt myminion docker.ps all=True
salt myminion docker.ps filters="{'label': 'role=web'}"
```

salt.modules.dockermod.**pull**(*image*, *insecure_registry=False*, *api_response=False*, *client_timeout=60*)

Pulls an image from a Docker registry

image Image to be pulled, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

insecure_registry [False] If `True`, the Docker client will permit the use of insecure (non-HTTPS) registries.

api_response [False] If `True`, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

> **Note:** This may result in a **lot** of additional return data, especially for larger images.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **`Layers` - A dictionary containing one or more of the following keys**:
  - `Already_Pulled` - Layers that that were already present on the Minion
  - `Pulled` - Layers that that were pulled
- `Status` - A string containing a summary of the pull action (usually a message saying that an image was downloaded, or that it was up to date).
- `Time_Elapsed` - Time in seconds taken to perform the pull

CLI Example:

```
salt myminion docker.pull centos
salt myminion docker.pull centos:6
```

`salt.modules.dockermod.`**`push`**(*image*, *insecure_registry=False*, *api_response=False*, *client_timeout=60*)

Changed in version 2015.8.4: The `Id` and `Image` keys are no longer present in the return data. This is due to changes in the Docker Remote API.

Pushes an image to a Docker registry. See the documentation at top of this page to configure authentication credentials.

image Image to be pushed, in `repo:tag` notation.

> Changed in version 2015.8.4: If just the repository name is passed, then all tagged images for the specified repo will be pushed. In prior releases, a tag of `latest` was assumed if the tag was omitted.

insecure_registry [False] If `True`, the Docker client will permit the use of insecure (non-HTTPS) registries.

api_response [False] If `True`, an `API_Response` key will be present in the return data, containing the raw output from the Docker API.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

RETURN DATA

A dictionary will be returned, containing the following keys:

- **`Layers` - A dictionary containing one or more of the following keys**:
  - `Already_Pushed` - Layers that that were already present on the Minion
  - `Pushed` - Layers that that were pushed
- `Time_Elapsed` - Time in seconds taken to perform the push

CLI Example:

```
salt myminion docker.push myuser/mycontainer
salt myminion docker.push myuser/mycontainer:mytag
```

`salt.modules.dockermod.`**`remove_network`**(*network_id*)

Remove a network

network_id ID of network

CLI Example:

```
salt myminion docker.remove_network
 ↪1f9d2454d0872b68dd9e8744c6e7a4c66b86f10abaccc21e14f7f014f729b2bc
```

salt.modules.dockermod.**remove_volume**(*name*)

Remove a volume

New in version 2015.8.4.

name Name of volume

CLI Example:

```
salt myminion docker.remove_volume my_volume
```

salt.modules.dockermod.**rename**(*name*, *new_name*)

New in version 2017.7.0.

Renames a container. Returns `True` if successful, and raises an error if the API returns one. If unsuccessful and the API returns no error (should not happen), then `False` will be returned.

name Name or ID of existing container

new_name New name to assign to container

CLI Example:

```
salt myminion docker.rename foo bar
```

salt.modules.dockermod.**resolve_tag**(*name*, *tags=None*)

New in version 2017.7.2,Oxygen.

Given an image tag, check the locally-pulled tags (using *docker.list_tags*) and return the matching tag. This helps disambiguate differences on some platforms where images from the Docker Hub are prefixed with `docker.io/`. If an image name with no tag is passed, a tag of `latest` is assumed.

If the specified image is not pulled locally, this function will return `False`.

tags An optional Python list of tags to check against. If passed, then *docker.list_tags* will not be run to get a list of tags. This is useful when resolving a number of tags at the same time.

CLI Examples:

```
salt myminion docker.resolve_tag busybox
salt myminion docker.resolve_tag busybox:latest
```

salt.modules.dockermod.**restart**(*name*, **args*, ***kwargs*)

Restarts a container

name Container name or ID

timeout [10] Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `restarted` - If restart was successful, this key will be present and will be set to `True`.

CLI Examples:

```
salt myminion docker.restart mycontainer
salt myminion docker.restart mycontainer timeout=20
```

salt.modules.dockermod.**retcode**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.retcode* within a container

name Container name or ID in which to run the command
cmd Command to run
exec_driver [None] If not passed, the execution driver will be detected as described *above*.
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.
CLI Example:

```
salt myminion docker.retcode mycontainer 'ls -l /etc'
```

`salt.modules.dockermod.`**`rm`**(**args*, ***kwargs*)
Removes a container
name Container name or ID
force [False] If `True`, the container will be killed first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.
stop [False] If `True`, the container will be stopped first before removal, as the Docker API will not permit a running container to be removed. This option is set to `False` by default to prevent accidental removal of a running container.

New in version 2017.7.0.

volumes [False] Also remove volumes associated with container
RETURN DATA

A list of the IDs of containers which were removed

CLI Example:

```
salt myminion docker.rm mycontainer
salt myminion docker.rm mycontainer force=True
```

`salt.modules.dockermod.`**`rmi`**(**names*, ***kwargs*)
Removes an image
name Name (in `repo:tag` notation) or ID of image.
force [False] If `True`, the image will be removed even if the Minion has containers created from that image
prune [True] If `True`, untagged parent image layers will be removed as well, set this to `False` to keep them.
RETURN DATA

A dictionary will be returned, containing the following two keys:
- `Layers` - A list of the IDs of image layers that were removed
- `Tags` - A list of the tags that were removed
- `Errors` - A list of any errors that were encountered

CLI Examples:

```
salt myminion docker.rmi busybox
salt myminion docker.rmi busybox force=True
salt myminion docker.rmi foo bar baz
```

`salt.modules.dockermod.`**`run`**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)
Run *`cmd.run`* within a container
name Container name or ID in which to run the command

cmd Command to run
exec_driver [None] If not passed, the execution driver will be detected as described *above*.
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.
CLI Example:

```
salt myminion docker.run mycontainer 'ls -l /etc'
```

salt.modules.dockermod.**run_all**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_all* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

name Container name or ID in which to run the command
cmd Command to run
exec_driver [None] If not passed, the execution driver will be detected as described *above*.
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_all mycontainer 'ls -l /etc'
```

salt.modules.dockermod.**run_stderr**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_stderr* within a container
name Container name or ID in which to run the command
cmd Command to run
exec_driver [None] If not passed, the execution driver will be detected as described *above*.
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console.
keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.
CLI Example:

```
salt myminion docker.run_stderr mycontainer 'ls -l /etc'
```

salt.modules.dockermod.**run_stdout**(*name*, *cmd*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_stdout* within a container

name Container name or ID in which to run the command

cmd Command to run

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.run_stdout mycontainer 'ls -l /etc'
```

salt.modules.dockermod.**save**(*name*, *path*, *overwrite=False*, *makedirs=False*, *compression=None*, ***kwargs*)

Saves an image and to a file on the minion. Equivalent to running the `docker save` Docker CLI command, but unlike `docker save` this will also work on named images instead of just images IDs.

name Name or ID of image. Specify a specific tag by using the `repo:tag` notation.

path Absolute path on the Minion where the image will be exported

overwrite [False] Unless this option is set to `True`, then if the destination file exists an error will be raised.

makedirs [False] If `True`, then if the parent directory of the file specified by the `path` argument does not exist, Salt will attempt to create it.

compression [None] Can be set to any of the following:

- `gzip` or `gz` for gzip compression
- `bzip2` or `bz2` for bzip2 compression
- `xz` or `lzma` for XZ compression (requires xz-utils, as well as the `lzma` module from Python 3.3, available in Python 2 and Python 3.0-3.2 as backports.lzma)

This parameter can be omitted and Salt will attempt to determine the compression type by examining the filename passed in the `path` parameter.

Note: Since the Docker API does not support `docker save`, compression will be a bit slower with this function than with *docker.export* since the image(s) will first be saved and then the compression done afterwards.

---

push [False] If `True`, the container will be pushed to the master using *cp.push*.

Note: This requires *file_recv* to be set to `True` on the Master.

RETURN DATA

A dictionary will be returned, containing the following keys:

- `Path` - Path of the file that was saved
- `Push` - Reports whether or not the file was successfully pushed to the Master

(Only present if push=True)

- `Size` - Size of the file, in bytes
- `Size_Human` - Size of the file, in human-readable units

- `Time_Elapsed` - Time in seconds taken to perform the save

CLI Examples:

```
salt myminion docker.save centos:7 /tmp/cent7.tar
salt myminion docker.save 0123456789ab cdef01234567 /tmp/saved.tar
```

salt.modules.dockermod.**script**(*name*, *source*, *saltenv='base'*, *args=None*, *template=None*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *ignore_retcode=False*, *use_vt=False*, *keep_env=None*)

Run *cmd.script* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

name Container name or ID

source Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

args A string containing additional command-line options to pass to the script.

template [None] Templating engine to use on the script before running.

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the script

output_loglevel [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script mycontainer salt://docker_script.py
salt myminion docker.script mycontainer salt://scripts/runme.sh 'arg1 arg2 "arg 3"'
salt myminion docker.script mycontainer salt://scripts/runme.sh stdin=
↪'one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

salt.modules.dockermod.**script_retcode**(*name*, *source*, *saltenv='base'*, *args=None*, *template=None*, *exec_driver=None*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *ignore_retcode=False*, *use_vt=False*, *keep_env=None*)

Run *cmd.script_retcode* within a container

name Container name or ID

source Path to the script. Can be a local path on the Minion or a remote file from the Salt fileserver.

args A string containing additional command-line options to pass to the script.

template [None] Templating engine to use on the script before running.

exec_driver [None] If not passed, the execution driver will be detected as described *above*.

stdin [None] Standard input to be used for the script

output_loglevel [debug] Level at which to log the output from the script. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion docker.script_retcode mycontainer salt://docker_script.py
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh 'arg1
↪arg2 "arg 3"'
```

```
salt myminion docker.script_retcode mycontainer salt://scripts/runme.sh stdin=
↪'one\ntwo\nthree\nfour\nfive\n' output_loglevel=quiet
```

salt.modules.dockermod.**search**(*name*, *official=False*, *trusted=False*)

Searches the registry for an image

name Search keyword

official [False] Limit results to official builds

trusted [False] Limit results to trusted builds

RETURN DATA

A dictionary with each key being the name of an image, and the following information for each image:

- `Description` - Image description
- `Official` - A boolean (`True` if an official build, `False` if not)
- `Stars` - Number of stars the image has on the registry
- `Trusted` - A boolean (`True` if a trusted build, `False` if not)

CLI Example:

```
salt myminion docker.search centos
salt myminion docker.search centos official=True
```

salt.modules.dockermod.**signal**(**args*, ***kwargs*)

Send a signal to a container. Signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage.

name Container name or ID

signal Signal to send to container

RETURN DATA

If the signal was successfully sent, `True` will be returned. Otherwise, an error will be raised.

CLI Example:

```
salt myminion docker.signal mycontainer SIGHUP
```

salt.modules.dockermod.**sls**(*name*, *mods=None*, *saltenv='base'*, ***kwargs*)

Apply the states defined by the specified SLS modules to the running container

New in version 2016.11.0.

The container does not need to have Salt installed, but Python is required.

name Container name or ID

mods [None] A string containing comma-separated list of SLS with defined states to apply to the container.

saltenv [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

CLI Example:

```
salt myminion docker.sls compassionate_mirzakhani mods=rails,web
```

salt.modules.dockermod.**sls_build**(*name*, *base='opensuse/python'*, *mods=None*, *saltenv='base'*, *dryrun=False*, ***kwargs*)

Build a Docker image using the specified SLS modules on top of base image

New in version 2016.11.0.

The base image does not need to have Salt installed, but Python is required.

name Image name to be built and committed

base [opensuse/python] Name or ID of the base image

mods [None] A string containing comma-separated list of SLS with defined states to apply to the base image.

saltenv [base] Specify the environment from which to retrieve the SLS indicated by the *mods* parameter.

base the base image

mods the state modules to execute during build
saltenv the salt environment to use
dryrun: **False** when set to True the container will not be committed at the end of the build. The dryrun succeed also when the state contains errors.
RETURN DATA

A dictionary with the ID of the new container. In case of a dryrun, the state result is returned and the container gets removed.

CLI Example:

```
salt myminion docker.sls_build imgname base=mybase mods=rails,web
```

salt.modules.dockermod.**start**(**args*, ***kwargs*)
Start a container
name Container name or ID
RETURN DATA

A dictionary will be returned, containing the following keys:
- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container cannot be started

CLI Example:

```
salt myminion docker.start mycontainer
```

salt.modules.dockermod.**state**(*name*, **args*, ***kwargs*)
Returns the state of the container
name Container name or ID
RETURN DATA

A string representing the current state of the container (either `running`, `paused`, or `stopped`)

CLI Example:

```
salt myminion docker.state mycontainer
```

salt.modules.dockermod.**stop**(**args*, ***kwargs*)
Stops a running container
name Container name or ID
unpause [False] If `True` and the container is paused, it will be unpaused before attempting to stop the container.
timeout Timeout in seconds after which the container will be killed (if it has not yet gracefully shut down)

Changed in version 2017.7.0: If this argument is not passed, then the container's configuration will be checked. If the container was created using the `stop_timeout` argument, then the configured timeout will be used, otherwise the timeout will be 10 seconds.

RETURN DATA

A dictionary will be returned, containing the following keys:
- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be stopped

CLI Examples:

```
salt myminion docker.stop mycontainer
salt myminion docker.stop mycontainer unpause=True
salt myminion docker.stop mycontainer timeout=20
```

salt.modules.dockermod.**tag**(*name*, *image*, *force=False*)

Tag an image into a repository and return `True`. If the tag was unsuccessful, an error will be raised.

name ID of image

image Tag to apply to the image, in `repo:tag` notation. If just the repository name is passed, a tag name of `latest` will be assumed.

force [False] Force apply tag

CLI Example:

```
salt myminion docker.tag 0123456789ab myrepo/mycontainer
salt myminion docker.tag 0123456789ab myrepo/mycontainer:mytag
```

salt.modules.dockermod.**top**(*name*, **args*, ***kwargs*)

Runs the *docker top* command on a specific container

name Container name or ID

CLI Example:

RETURN DATA

A list of dictionaries containing information about each process

```
salt myminion docker.top mycontainer
salt myminion docker.top 0123456789ab
```

salt.modules.dockermod.**unpause**(**args*, ***kwargs*)

Unpauses a container

name Container name or ID

RETURN DATA

A dictionary will be returned, containing the following keys:

- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `comment` - Only present if the container can not be unpaused

CLI Example:

```
salt myminion docker.pause mycontainer
```

salt.modules.dockermod.**version**()

Returns a dictionary of Docker version information. Equivalent to running the `docker version` Docker CLI command.

CLI Example:

```
salt myminion docker.version
```

salt.modules.dockermod.**volumes**(*filters=None*)

List existing volumes

New in version 2015.8.4.

filters There is one available filter: dangling=true

CLI Example:

```
salt myminion docker.volumes filters="{'dangling': True}"
```

salt.modules.dockermod.**wait**(*name*, *ignore_already_stopped=False*, *fail_on_exit_status=False*)

Wait for the container to exit gracefully, and return its exit code

Note: This function will block until the container is stopped.

name Container name or ID
ignore_already_stopped Boolean flag that prevent execution to fail, if a container is already stopped.
fail_on_exit_status Boolean flag to report execution as failure if `exit_status` is different than 0.

RETURN DATA

A dictionary will be returned, containing the following keys:
- `status` - A dictionary showing the prior state of the container as well as the new state
- `result` - A boolean noting whether or not the action was successful
- `exit_status` - Exit status for the container
- `comment` - Only present if the container is already stopped

CLI Example:

```
salt myminion docker.wait mycontainer
```

19.9.100 salt.modules.dpkg

Support for DEB packages

`salt.modules.dpkg.`**`bin_pkg_info`**(*path*, *saltenv='base'*)

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver envrionment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/foo-1.2.3-1ubuntu1_all.deb
salt '*' lowpkg.bin_pkg_info salt://foo-1.2.3-1ubuntu1_all.deb
```

`salt.modules.dpkg.`**`file_dict`**(**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg.`**`file_list`**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.dpkg.`**`info`**(**packages*, ***kwargs*)

Returns a detailed summary of package information for provided package names. If no packages are specified, all packages will be returned.

New in version 2015.8.1.

packages The names of the packages for which to return information.
failhard Whether to throw an exception if none of the packages are installed. Defaults to True.

New in version 2016.11.3.

CLI example:

```
salt '*' lowpkg.info
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info 'php5*' failhard=false
```

salt.modules.dpkg.**list_pkgs**(**packages*)
List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

External dependencies:

```
Virtual package resolution requires aptitude. Because this function
uses dpkg, virtual packages will be reported as not installed.
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
salt '*' lowpkg.list_pkgs httpd
```

salt.modules.dpkg.**unpurge**(**packages*)
Change package selection for each package specified to `install'

CLI Example:

```
salt '*' lowpkg.unpurge curl
```

19.9.101 salt.modules.drac

Manage Dell DRAC

salt.modules.drac.**change_password**(*username*, *password*, *uid=None*)
Change users password

CLI Example:

```
salt dell drac.change_password [USERNAME] [PASSWORD] [UID - optional]
salt dell drac.change_password diana secret
```

salt.modules.drac.**create_user**(*username*, *password*, *permissions*, *users=None*)
Create user accounts

CLI Example:

```
salt dell drac.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell drac.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users

- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.drac.**delete_user**(*username*, *uid=None*)
Delete a user

CLI Example:

```
salt dell drac.delete_user [USERNAME] [UID - optional]
salt dell drac.delete_user diana 4
```

salt.modules.drac.**email_alerts**(*action*)
Enable/Disable email alerts

CLI Example:

```
salt dell drac.email_alerts True
salt dell drac.email_alerts False
```

salt.modules.drac.**list_users**()
List all DRAC users

CLI Example:

```
salt dell drac.list_users
```

salt.modules.drac.**nameservers**(**ns*)
Configure the nameservers on the DRAC

CLI Example:

```
salt dell drac.nameservers [NAMESERVERS]
salt dell drac.nameservers ns1.example.com ns2.example.com
```

salt.modules.drac.**network_info**()
Return Network Configuration

CLI Example:

```
salt dell drac.network_info
```

salt.modules.drac.**server_hardreset**()
Performs a reset (reboot) operation on the managed server.

CLI Example:

```
salt dell drac.server_hardreset
```

salt.modules.drac.**server_poweroff**()
Powers down the managed server.

CLI Example:

```
salt dell drac.server_poweroff
```

salt.modules.drac.**server_poweron**()
Powers up the managed server.

CLI Example:

```
salt dell drac.server_poweron
```

salt.modules.drac.**server_pxe**()
Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell drac.server_pxe
```

salt.modules.drac.**server_reboot**()
Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.

CLI Example:

```
salt dell drac.server_reboot
```

salt.modules.drac.**set_network**(*ip*, *netmask*, *gateway*)
Configure Network

CLI Example:

```
salt dell drac.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell drac.set_network 192.168.0.2 255.255.255.0 192.168.0.1
```

salt.modules.drac.**set_permissions**(*username*, *permissions*, *uid=None*)
Configure users permissions

CLI Example:

```
salt dell drac.set_permissions [USERNAME] [PRIVILEGES] [USER INDEX - optional]
salt dell drac.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.drac.**set_snmp**(*community*)
Configure SNMP community string

CLI Example:

```
salt dell drac.set_snmp [COMMUNITY]
salt dell drac.set_snmp public
```

salt.modules.drac.**syslog**(*server*, *enable=True*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell drac.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell drac.syslog 0.0.0.0 False
```

salt.modules.drac.**system_info**()

Return System information

CLI Example:

```
salt dell drac.system_info
```

19.9.102 salt.modules.dracr

Manage Dell DRAC.

New in version 2015.8.2.

salt.modules.dracr.**change_password**(*username*, *password*, *uid=None*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Change user's password

CLI Example:

```
salt dell dracr.change_password [USERNAME] [PASSWORD] uid=[OPTIONAL]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have `root' as UID 1, so if you can depend on that then setting the password is much quicker. Raises an error if the supplied password is greater than 20 chars.

salt.modules.dracr.**create_user**(*username*, *password*, *permissions*, *users=None*, *host=None*, *admin_username=None*, *admin_password=None*)

Create user accounts

CLI Example:

```
salt dell dracr.create_user [USERNAME] [PASSWORD] [PRIVILEGES]
salt dell dracr.create_user diana secret login,test_alerts,clear_logs
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users

- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.dracr.**delete_user**(*username*, *uid=None*, *host=None*, *admin_username=None*, *admin_password=None*)

Delete a user

CLI Example:

```
salt dell dracr.delete_user [USERNAME] [UID - optional]
salt dell dracr.delete_user diana 4
```

salt.modules.dracr.**deploy_password**(*username*, *password*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Change the QuickDeploy password, used for switches as well

CLI Example:

```
salt dell dracr.deploy_password [USERNAME] [PASSWORD]
    host=<remote DRAC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.change_password diana secret
```

Note that if only a username is specified then this module will look up details for all 16 possible DRAC users. This is time consuming, but might be necessary if one is not sure which user slot contains the one you want. Many late-model Dell chassis have `root' as UID 1, so if you can depend on that then setting the password is much quicker.

salt.modules.dracr.**deploy_snmp**(*snmp*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Change the QuickDeploy SNMP community string, used for switches as well

CLI Example:

```
salt dell dracr.deploy_snmp SNMP_STRING
    host=<remote DRAC or CMC> admin_username=<DRAC user>
    admin_password=<DRAC PW>
salt dell dracr.deploy_password diana secret
```

salt.modules.dracr.**email_alerts**(*action*, *host=None*, *admin_username=None*, *admin_password=None*)

Enable/Disable email alerts

CLI Example:

```
salt dell dracr.email_alerts True
salt dell dracr.email_alerts False
```

salt.modules.dracr.**get_chassis_datacenter**(*host=None*, *admin_username=None*, *admin_password=None*)

Get the datacenter of the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.
CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
   admin_username=root admin_password=secret
```

salt.modules.dracr.**get_chassis_location**(*host=None*, *admin_username=None*, *admin_password=None*)

Get the location of the chassis.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
CLI Example:

```
salt '*' dracr.set_chassis_location host=111.222.333.444
   admin_username=root admin_password=secret
```

salt.modules.dracr.**get_chassis_name**(*host=None*, *admin_username=None*, *admin_password=None*)

Get the name of a chassis.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
CLI Example:

```
salt '*' dracr.get_chassis_name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**get_slotname**(*slot*, *host=None*, *admin_username=None*, *admin_password=None*)

Get the name of a slot number in the chassis.
slot The number of the slot for which to obtain the name.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
CLI Example:

```
salt-call --local dracr.get_slotname 0 host=111.222.333.444
   admin_username=root admin_password=secret
```

salt.modules.dracr.**idrac_general**(*blade_name*, *command*, *idrac_password=None*, *host=None*, *admin_username=None*, *admin_password=None*)

Run a generic racadm command against a particular blade in a chassis. Blades are usually named things like `server-1', `server-2', etc. If the iDRAC has a different password than the CMC, then you can pass it with the idrac_password kwarg.

Parameters

- **blade_name** -- Name of the blade to run the command on
- **command** -- Command like to pass to racadm
- **idrac_password** -- Password for the iDRAC if different from the CMC
- **host** -- Chassis hostname
- **admin_username** -- CMC username
- **admin_password** -- CMC password

Returns stdout if the retcode is 0, otherwise a standard cmd.run_all dictionary

CLI Example:

```
salt fx2 chassis.cmd idrac_general server-1 'get BIOS.SysProfileSettings'
```

salt.modules.dracr.**list_slotnames**(*host=None*, *admin_username=None*, *admin_password=None*)

List the names of all slots in the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt-call --local dracr.list_slotnames host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**list_users**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

List all DRAC users

CLI Example:

```
salt dell dracr.list_users
```

salt.modules.dracr.**nameservers**(*ns*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Configure the nameservers on the DRAC

CLI Example:

```
salt dell dracr.nameservers [NAMESERVERS]
salt dell dracr.nameservers ns1.example.com ns2.example.com
    admin_username=root admin_password=calvin module=server-1
    host=192.168.1.1
```

salt.modules.dracr.**network_info**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Return Network Configuration

CLI Example:

```
salt dell dracr.network_info
```

salt.modules.dracr.**server_hardreset**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Performs a reset (reboot) operation on the managed server.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

module The element to hard reset on the chassis such as a blade. If not provided, the chassis will be reset.

CLI Example:

```
salt dell dracr.server_hardreset
salt dell dracr.server_hardreset module=server-1
```

salt.modules.dracr.**server_power**(*status*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

status One of `powerup', `powerdown', `powercycle', `hardreset', `graceshutdown'

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.
module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.
CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

salt.modules.dracr.**server_poweroff**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)
Powers down the managed server.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to power off on the chassis such as a blade. If not provided, the chassis will be powered off.
CLI Example:

```
salt dell dracr.server_poweroff
salt dell dracr.server_poweroff module=server-1
```

salt.modules.dracr.**server_poweron**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)
Powers up the managed server.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to power on located on the chassis such as a blade. If not provided, the chassis will be powered on.
CLI Example:

```
salt dell dracr.server_poweron
salt dell dracr.server_poweron module=server-1
```

salt.modules.dracr.**server_powerstatus**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)
return the power status for the passed module

CLI Example:

```
salt dell drac.server_powerstatus
```

salt.modules.dracr.**server_pxe**(*host=None*, *admin_username=None*, *admin_password=None*)
Configure server to PXE perform a one off PXE boot

CLI Example:

```
salt dell dracr.server_pxe
```

salt.modules.dracr.**server_reboot**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)
Issues a power-cycle operation on the managed server. This action is similar to pressing the power button on the system's front panel to power down and then power up the system.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
module The element to reboot on the chassis such as a blade. If not provided, the chassis will be rebooted.
CLI Example:

```
salt dell dracr.server_reboot
salt dell dracr.server_reboot module=server-1
```

salt.modules.dracr.**set_chassis_datacenter**(*location*, *host=None*, *admin_username=None*, *admin_password=None*)

Set the location of the chassis.

location The name of the datacenter to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_datacenter datacenter-name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**set_chassis_location**(*location*, *host=None*, *admin_username=None*, *admin_password=None*)

Set the location of the chassis.

location The name of the location to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_location location-name host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**set_chassis_name**(*name*, *host=None*, *admin_username=None*, *admin_password=None*)

Set the name of the chassis.

name The name to be set on the chassis.

host The chassis host.

admin_username The username used to access the chassis.

admin_password The password used to access the chassis.

CLI Example:

```
salt '*' dracr.set_chassis_name my-chassis host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**set_network**(*ip*, *netmask*, *gateway*, *host=None*, *admin_username=None*, *admin_password=None*)

Configure Network on the CMC or individual iDRAC. Use `set_niccfg` for blade and switch addresses.

CLI Example:

```
salt dell dracr.set_network [DRAC IP] [NETMASK] [GATEWAY]
salt dell dracr.set_network 192.168.0.2 255.255.255.0 192.168.0.1
    admin_username=root admin_password=calvin host=192.168.1.1
```

salt.modules.dracr.**set_permissions**(*username*, *permissions*, *uid=None*, *host=None*, *admin_username=None*, *admin_password=None*)

Configure users permissions

CLI Example:

```
salt dell dracr.set_permissions [USERNAME] [PRIVILEGES]
     [USER INDEX - optional]
salt dell dracr.set_permissions diana login,test_alerts,clear_logs 4
```

DRAC Privileges

- login : Login to iDRAC
- drac : Configure iDRAC
- user_management : Configure Users
- clear_logs : Clear Logs
- server_control_commands : Execute Server Control Commands
- console_redirection : Access Console Redirection
- virtual_media : Access Virtual Media
- test_alerts : Test Alerts
- debug_commands : Execute Debug Commands

salt.modules.dracr.**set_slotname**(*slot*, *name*, *host=None*, *admin_username=None*, *admin_password=None*)

Set the name of a slot in a chassis.
slot The slot number to change.
name The name to set. Can only be 15 characters long.
host The chassis host.
admin_username The username used to access the chassis.
admin_password The password used to access the chassis.
CLI Example:

```
salt '*' dracr.set_slotname 2 my-slotname host=111.222.333.444
    admin_username=root admin_password=secret
```

salt.modules.dracr.**set_snmp**(*community*, *host=None*, *admin_username=None*, *admin_password=None*)

Configure CMC or individual iDRAC SNMP community string. Use `deploy_snmp` for configuring chassis switch SNMP.

CLI Example:

```
salt dell dracr.set_snmp [COMMUNITY]
salt dell dracr.set_snmp public
```

salt.modules.dracr.**syslog**(*server*, *enable=True*, *host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Configure syslog remote logging, by default syslog will automatically be enabled if a server is specified. However, if you want to disable syslog you will need to specify a server followed by False

CLI Example:

```
salt dell dracr.syslog [SYSLOG IP] [ENABLE/DISABLE]
salt dell dracr.syslog 0.0.0.0 False
```

salt.modules.dracr.**system_info**(*host=None*, *admin_username=None*, *admin_password=None*, *module=None*)

Return System information

CLI Example:

```
salt dell dracr.system_info
```

salt.modules.dracr.**update_firmware**(*filename*, *host=None*, *admin_username=None*, *admin_password=None*)

Updates firmware using local firmware file

```
salt dell dracr.update_firmware firmware.exe
```

This executes the following command on your FX2 (using username and password stored in the pillar data)

```
racadm update -f firmware.exe -u user -p pass
```

salt.modules.dracr.**update_firmware_nfs_or_cifs**(*filename*, *share*, *host=None*, *admin_username=None*, *admin_password=None*)

Executes the following for CIFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l //IP-Address/share
```

Or for NFS (using username and password stored in the pillar data)

```
racadm update -f <updatefile> -u user -p pass -l IP-address:/share
```

Salt command for CIFS:

```
salt dell dracr.update_firmware_nfs_or_cifs          firmware.exe //IP-Address/
↪share
```

Salt command for NFS:

```
salt dell dracr.update_firmware_nfs_or_cifs          firmware.exe IP-address:/share
```

19.9.103 salt.modules.drbd

DRBD administration module

salt.modules.drbd.**overview**()

Show status of the DRBD devices

CLI Example:

```
salt '*' drbd.overview
```

19.9.104 salt.modules.dummyproxy_package module

Package support for the dummy proxy used by the test suite

salt.modules.dummyproxy_package.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*)

salt.modules.dummyproxy_package.**installed**(*name*, *version=None*, *refresh=False*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *sources=None*, ***kwargs*)

salt.modules.dummyproxy_package.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

salt.modules.dummyproxy_package.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

salt.modules.dummyproxy_package.**upgrade**(*name=None*, *pkgs=None*, *refresh=True*, *skip_verify=True*, *normalize=True*, ***kwargs*)

salt.modules.dummyproxy_package.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.105 salt.modules.dummyproxy_service module

Provide the service module for the dummy proxy used in integration tests

salt.modules.dummyproxy_service.**enabled**(*name*, *sig=None*)

Only the `redbull' service is `enabled' in the test

New in version 2016.11.3.

salt.modules.dummyproxy_service.**get_all**()

Return a list of all available services

New in version 2016.11.3.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.dummyproxy_service.**list**()

Return a list of all available services.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.list
```

salt.modules.dummyproxy_service.**restart**(*name*, *sig=None*)

Restart the specified service with dummy.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.dummyproxy_service.**running**(*name*, *sig=None*)

Return whether this service is running.

New in version 2016.11.3.

salt.modules.dummyproxy_service.**start**(*name*, *sig=None*)

Start the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.dummyproxy_service.**status**(*name*, *sig=None*)

Return the status for a service via dummy, returns a bool whether the service is running.

New in version 2016.11.3.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.dummyproxy_service.**stop**(*name*, *sig=None*)

Stop the specified service on the dummy

New in version 2016.11.3.

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.106 salt.modules.ebuild

Support for Portage

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

---

optdepends

- portage Python adapter

For now all package names *MUST* include the package category, i.e. `'vim'` will not work, `'app-editors/vim'` will.

salt.modules.ebuild.**check_db**(**names*, ***kwargs*)

New in version 0.17.0.

Returns a dict containing the following information for each specified package:

1. A key `found`, which will be a boolean value denoting if a match was found in the package database.
2. If `found` is `False`, then a second key called `suggestions` will be present, which will contain a list of possible matches. This list will be empty if the package name was specified in `category/pkgname` format, since the suggestions are only intended to disambiguate ambiguous package names (ones submitted without a category).

CLI Examples:

```
salt '*' pkg.check_db <package1> <package2> <package3>
```

salt.modules.ebuild.**check_extra_requirements**(*pkgname*, *pkgver*)

Check if the installed package already has the given requirements.

CLI Example:

```
salt '*' pkg.check_extra_requirements 'sys-devel/gcc' '~>4.1.2:4.1::
↪gentoo[nls,fortran]'
```

salt.modules.ebuild.**depclean**(*name=None*, *slot=None*, *fromrepo=None*, *pkgs=None*)

Portage has a function to remove unused dependencies. If a package is provided, it will only removed the package if no other package depends on it.

name The name of the package to be cleaned.

slot Restrict the remove to a specific slot. Ignored if `name` is None.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is None.

pkgs Clean multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

Return a list containing the removed packages:

CLI Example:

```
salt '*' pkg.depclean <package name>
```

salt.modules.ebuild.**ex_mod_init**(*low*)

If the config option `ebuild.enforce_nice_config` is set to True, this module will enforce a nice tree structure for /etc/portage/package.* configuration files.

New in version 0.17.0: Initial automatic enforcement added when pkg is used on a Gentoo system.

Changed in version 2014.1.0-Hydrogen: Configure option added to make this behaviour optional, defaulting to off.

See also:

`ebuild.ex_mod_init` is called automatically when a state invokes a pkg state on a Gentoo system. *salt.states.pkg.mod_init()*

`ebuild.ex_mod_init` uses `portage_config.enforce_nice_config` to do the lifting. *salt.modules.portage_config.enforce_nice_config()*

CLI Example:

```
salt '*' pkg.ex_mod_init
```

salt.modules.ebuild.**install**(*name=None*, *refresh=False*, *pkgs=None*, *sources=None*, *slot=None*, *fromrepo=None*, *uses=None*, *binhost=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add refresh=True to sync the portage tree before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either ``pkgs'' or ``sources'' is passed. Additionally, please note that this option can only be used to emerge a package from the portage tree. To install a tbz2 package manually, use the ``sources'' option described below.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to sync the portage tree before installing.

version Install a specific version of the package, e.g. 1.0.9-r1. Ignored if ``pkgs'' or ``sources'' is passed.

slot Similar to version, but specifies a valid slot to be installed. It will install the latest available version in the specified slot. Ignored if ``pkgs'' or ``sources'' or ``version'' is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc slot='4.4'
```

fromrepo Similar to slot, but specifies the repository from the package will be installed. It will install the latest available version in the specified repository. Ignored if ``pkgs'' or ``sources'' or ``version'' is passed.

CLI Example:

```
salt '*' pkg.install salt fromrepo='gentoo'
```

uses Similar to slot, but specifies a list of use flag. Ignored if ``pkgs'' or ``sources'' or ``version'' is passed.

CLI Example:

```
salt '*' pkg.install sys-devel/gcc uses='["nptl","-nossp"]'
```

Multiple Package Installation Options:

pkgs A list of packages to install from the portage tree. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar","~category/package:slot::
↪repository[use]"]'
```

sources A list of tbz2 packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.tbz2"},{"bar": "salt://bar.
↪tbz2"}]'
```

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

salt.modules.ebuild.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.ebuild.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.ebuild.**list_upgrades**(*refresh=True*, *backtrack=3*, ***kwargs*)

List all available package upgrades.

refresh Whether or not to sync the portage tree before checking for upgrades.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: ´3´).

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.ebuild.**porttree_matches**(*name*)

Returns a list containing the matches for a given package name from the portage tree. Note that the specific version of the package will not be provided for packages that have several versions in the portage tree, but rather the name of the package (i.e. ``dev-python/paramiko'').

salt.modules.ebuild.**purge**(*name=None*, *slot=None*, *fromrepo=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Portage does not have a purge, this function calls remove followed by depclean to emulate a purge process

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if name is None.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is None.

Multiple Package Options:

pkgs Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package name> slot=4.4
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.ebuild.**refresh_db**()

Updates the portage tree (emerge --sync). Uses eix-sync if available.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.ebuild.**remove**(*name=None*, *slot=None*, *fromrepo=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages via emerge --unmerge.

name The name of the package to be deleted.

slot Restrict the remove to a specific slot. Ignored if `name` is None.

fromrepo Restrict the remove to a specific slot. Ignored if `name` is None.

Multiple Package Options:

pkgs Uninstall multiple packages. `slot` and `fromrepo` arguments are ignored if this argument is present. Must be passed as a python list.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package name> slot=4.4 fromrepo=gentoo
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.ebuild.`**`update`**(*pkg*, *slot=None*, *fromrepo=None*, *refresh=False*, *binhost=None*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Updates the passed package (emerge --update package)

slot Restrict the update to a particular slot. It will update to the latest version within the slot.

fromrepo Restrict the update to a particular repository. It will update to the latest version within the repository.

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.update <package name>
```

`salt.modules.ebuild.`**`upgrade`**(*refresh=True*, *binhost=None*, *backtrack=3*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any emerge commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade (emerge -uDN @world)

binhost has two options try and force. try - tells emerge to try and install the package from a configured binhost. force - forces emerge to install the package from a binhost otherwise it fails out.

backtrack Specifies an integer number of times to backtrack if dependency calculation fails due to a conflict or an unsatisfied dependency (default: ´3´).

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.ebuild.**upgrade_available**(*name*)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.ebuild.**version**(**names*, ***kwargs*)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.ebuild.**version_clean**(*version*)
Clean the version string removing extra data.

CLI Example:

```
salt '*' pkg.version_clean <version_string>
```

salt.modules.ebuild.**version_cmp**(*pkg1*, *pkg2*, ***kwargs*)
Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

19.9.107 salt.modules.eix

Support for Eix

salt.modules.eix.**sync**()
Sync portage/overlay trees and update the eix database

CLI Example:

```
salt '*' eix.sync
```

salt.modules.eix.**update**()
Update the eix database

CLI Example:

```
salt '*' eix.update
```

19.9.108 salt.modules.elasticsearch

Elasticsearch - A distributed RESTful search and analytics server

Module to provide Elasticsearch compatibility to Salt (compatible with Elasticsearch version 1.5.2+)

New in version 2015.8.0.

depends elasticsearch-py

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
elasticsearch:
  host: '10.10.10.100:9200'

elasticsearch-cluster:
  hosts:
    - '10.10.10.100:9200'
    - '10.10.10.101:9200'
    - '10.10.10.102:9200'

elasticsearch-extra:
  hosts:
    - '10.10.10.100:9200'
  use_ssl: True
  verify_certs: True
  ca_certs: /path/to/custom_ca_bundle.pem
  number_of_shards: 1
  number_of_replicas: 0
  functions_blacklist:
    - 'saltutil.find_job'
    - 'pillar.items'
    - 'grains.items'
  proxies:
    - http: http://proxy:3128
    - https: http://proxy:1080
```

When specifying proxies the requests backend will be used and the `proxies' data structure is passed as-is to that module.

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Some functionality might be limited by elasticsearch-py and Elasticsearch server versions.

`salt.modules.elasticsearch.`**`alias_create`**(*indices*, *alias*, *hosts=None*, *body=None*, *profile=None*)

Create an alias for a specific index/indices

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

alias Alias name

body Optional definition such as routing or filter as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

CLI example:

```
salt myminion elasticsearch.alias_create testindex_v1 testindex
```

`salt.modules.elasticsearch.`**`alias_delete`**(*indices*, *aliases*, *hosts=None*, *body=None*, *profile=None*)

Delete an alias of an index

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma

CLI example:

```
salt myminion elasticsearch.alias_delete testindex_v1 testindex
```

`salt.modules.elasticsearch.`**`alias_exists`**(*aliases*, *indices=None*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given alias exists

indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.

aliases Alias names separated by comma
CLI example:

```
salt myminion elasticsearch.alias_exists None testindex
```

salt.modules.elasticsearch.**alias_get**(*indices=None*, *aliases=None*, *hosts=None*, *profile=None*)
Check for the existence of an alias and if it exists, return it
indices Single or multiple indices separated by comma, use _all to perform the operation on all indices.
aliases Alias names separated by comma
CLI example:

```
salt myminion elasticsearch.alias_get testindex
```

salt.modules.elasticsearch.**cluster_health**(*index=None*, *level='cluster'*, *local=False*, *hosts=None*, *profile=None*)
New in version 2017.7.0.

Return Elasticsearch cluster health.
index Limit the information returned to a specific index
level Specify the level of detail for returned information, default `cluster', valid choices are: `cluster', `indices', `shards'
local Return local information, do not retrieve the state from master node
CLI example:

```
salt myminion elasticsearch.health
```

salt.modules.elasticsearch.**cluster_stats**(*nodes=None*, *hosts=None*, *profile=None*)
New in version 2017.7.0.

Return Elasticsearch cluster stats.
nodes List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all
CLI example:

```
salt myminion elasticsearch.stats
```

salt.modules.elasticsearch.**document_create**(*index*, *doc_type*, *body=None*, *id=None*, *hosts=None*, *profile=None*)
Create a document in a specified index
index Index name where the document should reside
doc_type Type of the document
body Document to store
id Optional unique document identifier for specified doc_type (empty for random)
CLI example:

```
salt myminion elasticsearch.document_create testindex doctype1 '{}'
```

salt.modules.elasticsearch.**document_delete**(*index*, *doc_type*, *id*, *hosts=None*, *profile=None*)
Delete a document from an index
index Index name where the document resides
doc_type Type of the document
id Document identifier
CLI example:

```
salt myminion elasticsearch.document_delete testindex doctype1 AUx-384m0Bug_
↪8U80wQZ
```

salt.modules.elasticsearch.**document_exists**(*index*, *id*, *doc_type='_all'*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given document exists

index Index name where the document resides

id Document identifier

doc_type Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_exists testindex AUx-384m0Bug_8U80wQZ
```

salt.modules.elasticsearch.**document_get**(*index*, *id*, *doc_type='_all'*, *hosts=None*, *profile=None*)

Check for the existence of a document and if it exists, return it

index Index name where the document resides

id Document identifier

doc_type Type of the document, use _all to fetch the first document matching the ID across all types

CLI example:

```
salt myminion elasticsearch.document_get testindex AUx-384m0Bug_8U80wQZ
```

salt.modules.elasticsearch.**index_close**(*index*, *allow_no_indices=True*, *expand_wildcards='open'*, *ignore_unavailable=True*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Close specified index.

index Index to be closed

allow_no_indices Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)

expand_wildcards Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'open', valid choices are: 'open', 'closed', 'none', 'all'

ignore_unavailable Whether specified concrete indices should be ignored when unavailable (missing or closed)

CLI example:

```
salt myminion elasticsearch.index_close testindex
```

salt.modules.elasticsearch.**index_create**(*index*, *body=None*, *hosts=None*, *profile=None*)

Create an index

index Index name

body Index definition, such as settings and mappings as defined in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

CLI example:

```
salt myminion elasticsearch.index_create testindex
salt myminion elasticsearch.index_create testindex2 '{"settings" : {"index" : {
↪"number_of_shards" : 3, "number_of_replicas" : 2}}}'
```

salt.modules.elasticsearch.**index_delete**(*index*, *hosts=None*, *profile=None*)

Delete an index

index Index name

CLI example:

```
salt myminion elasticsearch.index_delete testindex
```

salt.modules.elasticsearch.**index_exists**(*index*, *hosts=None*, *profile=None*)

Return a boolean indicating whether given index exists

index Index name
CLI example:

```
salt myminion elasticsearch.index_exists testindex
```

salt.modules.elasticsearch.**index_get**(*index*, *hosts=None*, *profile=None*)
Check for the existence of an index and if it exists, return it
index Index name
CLI example:

```
salt myminion elasticsearch.index_get testindex
```

salt.modules.elasticsearch.**index_open**(*index*, *allow_no_indices=True*, *expand_wildcards='closed'*, *ignore_unavailable=True*, *hosts=None*, *profile=None*)
New in version 2017.7.0.

Open specified index.
index Index to be opened
allow_no_indices Whether to ignore if a wildcard indices expression resolves into no concrete indices. (This includes _all string or when no indices have been specified)
expand_wildcards Whether to expand wildcard expression to concrete indices that are open, closed or both., default 'closed', valid choices are: 'open', 'closed', 'none', 'all'
ignore_unavailable Whether specified concrete indices should be ignored when unavailable (missing or closed)
CLI example:

```
salt myminion elasticsearch.index_open testindex
```

salt.modules.elasticsearch.**index_template_create**(*name*, *body*, *hosts=None*, *profile=None*)
Create an index template
name Index template name
body Template definition as specified in http://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html
CLI example:

```
salt myminion elasticsearch.index_template_create testindex_templ '{ "template":
↪"logstash-*", "order": 1, "settings": { "number_of_shards": 1 } }'
```

salt.modules.elasticsearch.**index_template_delete**(*name*, *hosts=None*, *profile=None*)
Delete an index template (type) along with its data
name Index template name
CLI example:

```
salt myminion elasticsearch.index_template_delete testindex_templ user
```

salt.modules.elasticsearch.**index_template_exists**(*name*, *hosts=None*, *profile=None*)
Return a boolean indicating whether given index template exists
name Index template name
CLI example:

```
salt myminion elasticsearch.index_template_exists testindex_templ
```

salt.modules.elasticsearch.**index_template_get**(*name*, *hosts=None*, *profile=None*)
Retrieve template definition of index or index/type
name Index template name

CLI example:

```
salt myminion elasticsearch.index_template_get testindex_templ
```

salt.modules.elasticsearch.**info**(*hosts=None*, *profile=None*)

New in version 2017.7.0.

Return Elasticsearch information.

CLI example:

```
salt myminion elasticsearch.info
salt myminion elasticsearch.info profile=elasticsearch-extra
```

salt.modules.elasticsearch.**mapping_create**(*index*, *doc_type*, *body*, *hosts=None*, *profile=None*)

Create a mapping in a given index

index Index for the mapping

doc_type Name of the document type

body Mapping definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-put-mapping.html

CLI example:

```
salt myminion elasticsearch.mapping_create testindex user '{ "user" : {
↪"properties" : { "message" : {"type" : "string", "store" : true } } } }'
```

salt.modules.elasticsearch.**mapping_delete**(*index*, *doc_type*, *hosts=None*, *profile=None*)

Delete a mapping (type) along with its data. As of Elasticsearch 5.0 this is no longer available.

index Index for the mapping

doc_type Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_delete testindex user
```

salt.modules.elasticsearch.**mapping_get**(*index*, *doc_type*, *hosts=None*, *profile=None*)

Retrieve mapping definition of index or index/type

index Index for the mapping

doc_type Name of the document type

CLI example:

```
salt myminion elasticsearch.mapping_get testindex user
```

salt.modules.elasticsearch.**node_info**(*nodes=None*, *flat_settings=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Return Elasticsearch node information.

nodes List of cluster nodes (id or name) to display stats for. Use _local for connected node, empty for all

flat_settings Flatten settings keys

CLI example:

```
salt myminion elasticsearch.node_info flat_settings=True
```

salt.modules.elasticsearch.**ping**(*allow_failure=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Test connection to Elasticsearch instance. This method does not fail if not explicitly specified.

allow_failure Throw exception if ping fails

CLI example:

```
salt myminion elasticsearch.ping allow_failure=True
salt myminion elasticsearch.ping profile=elasticsearch-extra
```

salt.modules.elasticsearch.**pipeline_create**(*id*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create Ingest pipeline by supplied definition. Available since Elasticsearch 5.0.

id Pipeline id

body Pipeline definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

CLI example:

```
salt myminion elasticsearch.pipeline_create mypipeline '{"description": "my
↪custom pipeline", "processors": [{"set" : {"field": "collector_timestamp_millis
↪", "value": "{{_ingest.timestamp}}"}}]}'
```

salt.modules.elasticsearch.**pipeline_delete**(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete Ingest pipeline. Available since Elasticsearch 5.0.

id Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_delete mypipeline
```

salt.modules.elasticsearch.**pipeline_get**(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Retrieve Ingest pipeline definition. Available since Elasticsearch 5.0.

id Pipeline id

CLI example:

```
salt myminion elasticsearch.pipeline_get mypipeline
```

salt.modules.elasticsearch.**pipeline_simulate**(*id*, *body*, *verbose=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Simulate existing Ingest pipeline on provided data. Available since Elasticsearch 5.0.

id Pipeline id

body Pipeline definition as specified in https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

verbose Specify if the output should be more verbose

CLI example:

```
salt myminion elasticsearch.pipeline_simulate mypipeline '{"docs":[{"_index":
↪"index","_type":"type","_id":"id","_source":{"foo":"bar"}},{"_index":"index","_
↪type":"type","_id":"id","_source":{"foo":"rab"}}]}' verbose=True
```

salt.modules.elasticsearch.**repository_create**(*name*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create repository for storing snapshots. Note that shared repository paths have to be specified in path.repo Elasticsearch configuration option.

name Repository name

body Repository definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html

CLI example:

```
salt myminion elasticsearch.repository_create testrepo '{"type":"fs","settings":{
↪"location":"/tmp/test","compress":true}}'
```

salt.modules.elasticsearch.**repository_delete**(*name*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete existing repository.
name Repository name
CLI example:

```
salt myminion elasticsearch.repository_delete testrepo
```

salt.modules.elasticsearch.**repository_get**(*name*, *local=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Get existing repository details.
name Repository name
local Retrieve only local information, default is false
CLI example:

```
salt myminion elasticsearch.repository_get testrepo
```

salt.modules.elasticsearch.**repository_verify**(*name*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain list of cluster nodes which successfully verified this repository.
name Repository name
CLI example:

```
salt myminion elasticsearch.repository_verify testrepo
```

salt.modules.elasticsearch.**search_template_create**(*id*, *body*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create search template by supplied definition
id Template ID
body Search template definition
CLI example:

```
salt myminion elasticsearch.search_template_create mytemplate '{"template":{"query
↪":{"match":{"title":"{{query_string}}"}}}}'
```

salt.modules.elasticsearch.**search_template_delete**(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete existing search template definition.
id Template ID
CLI example:

```
salt myminion elasticsearch.search_template_delete mytemplate
```

salt.modules.elasticsearch.**search_template_get**(*id*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain existing search template definition.
id Template ID

CLI example:

```
salt myminion elasticsearch.search_template_get mytemplate
```

salt.modules.elasticsearch.**snapshot_create**(*repository*, *snapshot*, *body=None*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Create snapshot in specified repository by supplied definition.
repository Repository name
snapshot Snapshot name
body Snapshot definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html
CLI example:

```
salt myminion elasticsearch.snapshot_create testrepo testsnapshot '{"indices":
↪"index_1,index_2","ignore_unavailable":true,"include_global_state":false}'
```

salt.modules.elasticsearch.**snapshot_delete**(*repository*, *snapshot*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Delete snapshot from specified repository.
repository Repository name
snapshot Snapshot name
CLI example:

```
salt myminion elasticsearch.snapshot_delete testrepo testsnapshot
```

salt.modules.elasticsearch.**snapshot_get**(*repository*, *snapshot*, *ignore_unavailable=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain snapshot residing in specified repository.
repository Repository name
snapshot Snapshot name, use _all to obtain all snapshots in specified repository
ignore_unavailable Ignore unavailable snapshots
CLI example:

```
salt myminion elasticsearch.snapshot_get testrepo testsnapshot
```

salt.modules.elasticsearch.**snapshot_restore**(*repository*, *snapshot*, *body=None*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Restore existing snapshot in specified repository by supplied definition.
repository Repository name
snapshot Snapshot name
body Restore definition as in https://www.elastic.co/guide/en/elasticsearch/reference/current/modules-snapshots.html
CLI example:

```
salt myminion elasticsearch.snapshot_restore testrepo testsnapshot '{"indices":
↪"index_1,index_2","ignore_unavailable":true,"include_global_state":true}'
```

salt.modules.elasticsearch.**snapshot_status**(*repository=None*, *snapshot=None*, *ignore_unavailable=False*, *hosts=None*, *profile=None*)

New in version 2017.7.0.

Obtain status of all currently running snapshots.
repository Particular repository to look for snapshots
snapshot Snapshot name
ignore_unavailable Ignore unavailable snapshots
CLI example:

```
salt myminion elasticsearch.snapshot_status ignore_unavailable=True
```

19.9.109 salt.modules.environ

Support for getting and setting the environment variables of the current salt process.

salt.modules.environ.**get**(*key*, *default=''*)
Get a single salt process environment variable.
key String used as the key for environment lookup.
default If the key is not found in the environment, return this value. Default: ``'
CLI Example:

```
salt '*' environ.get foo
salt '*' environ.get baz default=False
```

salt.modules.environ.**has_value**(*key*, *value=None*)
Determine whether the key exists in the current salt process environment dictionary. Optionally compare the current value of the environment against the supplied value string.
key Must be a string. Used as key for environment lookup.
value: Optional. If key exists in the environment, compare the current value with this value. Return True if they are equal.
CLI Example:

```
salt '*' environ.has_value foo
```

salt.modules.environ.**item**(*keys*, *default=''*)
Get one or more salt process environment variables. Returns a dict.
keys Either a string or a list of strings that will be used as the keys for environment lookup.
default If the key is not found in the environment, return this value. Default: ``'
CLI Example:

```
salt '*' environ.item foo
salt '*' environ.item '[foo, baz]' default=None
```

salt.modules.environ.**items**()
Return a dict of the entire environment set for the salt process

CLI Example:

```
salt '*' environ.items
```

salt.modules.environ.**setenv**(*environ*, *false_unsets=False*, *clear_all=False*, *update_minion=False*, *permanent=False*)
Set multiple salt process environment variables from a dict. Returns a dict.
environ Must be a dict. The top-level keys of the dict are the names of the environment variables to set. Each key's value must be a string or False. Refer to the `false_unsets' parameter for behavior when a value set to False.
false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM'' for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setenv '{"foo": "bar", "baz": "quux"}'
salt '*' environ.setenv '{"a": "b", "c": False}' false_unsets=True
```

salt.modules.environ.**setval**(*key*, *val*, *false_unsets=False*, *permanent=False*)

Set a single salt process environment variable. Returns True on success.

key The environment key to set. Must be a string.

val The value to set. Must be a string or False. Refer to the `false_unsets' parameter for behavior when set to False.

false_unsets If val is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If val is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False.

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM'' for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

CLI Example:

```
salt '*' environ.setval foo bar
salt '*' environ.setval baz val=False false_unsets=True
salt '*' environ.setval baz bar permanent=True
salt '*' environ.setval baz bar permanent=HKLM
```

19.9.110 salt.modules.eselect

Support for eselect, Gentoo's configuration and management tool.

salt.modules.eselect.**exec_action**(*module*, *action*, *module_parameter=None*, *action_parameter=None*, *state_only=False*)

Execute an arbitrary action on a module.

module name of the module to be executed

action name of the module's action to be run

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

state_only don't return any output but only the success/failure of the operation

CLI Example (updating the php implementation used for apache2):

```
salt '*' eselect.exec_action php update action_parameter='apache2'
```

salt.modules.eselect.**get_current_target**(*module*, *module_parameter=None*, *action_parameter=None*)

Get the currently selected target for the given module.

module name of the module to be queried for its current target

module_parameter additional params passed to the defined module

action_parameter additional params passed to the `show' action

CLI Example (current target of system-wide `java-vm`):

```
salt '*' eselect.get_current_target java-vm action_parameter='system'
```

CLI Example (current target of `kernel` symlink):

```
salt '*' eselect.get_current_target kernel
```

`salt.modules.eselect.`**`get_modules`**`()`

List available `eselect` modules.

CLI Example:

```
salt '*' eselect.get_modules
```

`salt.modules.eselect.`**`get_target_list`**`(`*module*, *action_parameter=None*`)`

List available targets for the given module.

module name of the module to be queried for its targets

action_parameter additional params passed to the defined action

New in version 2016.11.0.

CLI Example:

```
salt '*' eselect.get_target_list kernel
```

`salt.modules.eselect.`**`set_target`**`(`*module*, *target*, *module_parameter=None*, *action_parameter=None*`)`

Set the target for the given module. Target can be specified by index or name.

module name of the module for which a target should be set

target name of the target to be set for this module

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

CLI Example (setting target of system-wide `java-vm`):

```
salt '*' eselect.set_target java-vm icedtea-bin-7 action_parameter='system'
```

CLI Example (setting target of `kernel` symlink):

```
salt '*' eselect.set_target kernel linux-3.17.5-gentoo
```

19.9.111 salt.modules.esxi

Glues the VMware vSphere Execution Module to the VMware ESXi Proxy Minions to the *esxi proxymodule*.

New in version 2015.8.4.

Depends: *vSphere Remote Execution Module (salt.modules.vsphere)*

For documentation on commands that you can direct to an ESXi host via proxy, look in the documentation for *salt.modules.vsphere*.

This execution module calls through to a function in the ESXi proxy module called `ch_config`, which looks up the function passed in the `command` parameter in *salt.modules.vsphere* and calls it.

To execute commands with an ESXi Proxy Minion using the vSphere Execution Module, use the `esxi.cmd <vsphere-function-name>` syntax. Both args and kwargs needed for various vsphere execution module functions must be passed through in a kwarg- type manor.

```
salt 'esxi-proxy' esxi.cmd system_info
salt 'exsi-proxy' esxi.cmd get_service_policy service_name='ssh'
```

19.9.112 salt.modules.etcd_mod

Execution module to work with etcd

depends

- python-etcd

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar_opts* must be set to True.

Be aware that setting pillar_opts to True has security implications as this makes all master configuration settings available in all minion's pillars.

---

salt.modules.etcd_mod.**get**(*key*, *recurse=False*, *profile=None*)

New in version 2014.7.0.

Get a value from etcd, by direct path. Returns None on failure.

CLI Examples:

```
salt myminion etcd.get /path/to/key
salt myminion etcd.get /path/to/key profile=my_etcd_config
salt myminion etcd.get /path/to/key recurse=True profile=my_etcd_config
```

salt.modules.etcd_mod.**ls**(*path='/'*, *profile=None*)

New in version 2014.7.0.

Return all keys and dirs inside a specific path. Returns an empty dict on failure.

CLI Example:

```
salt myminion etcd.ls /path/to/dir/
salt myminion etcd.ls /path/to/dir/ profile=my_etcd_config
```

salt.modules.etcd_mod.**rm**(*key*, *recurse=False*, *profile=None*)

New in version 2014.7.0.

Delete a key from etcd. Returns True if the key was deleted, False if it was not and None if there was a failure.

CLI Example:

```
salt myminion etcd.rm /path/to/key
salt myminion etcd.rm /path/to/key profile=my_etcd_config
salt myminion etcd.rm /path/to/dir recurse=True profile=my_etcd_config
```

salt.modules.etcd_mod.**set**(*key*, *value*, *profile=None*, *ttl=None*, *directory=False*)

New in version 2014.7.0.

Set a key in etcd by direct path. Optionally, create a directory or set a TTL on the key. Returns None on failure.

CLI Example:

```
salt myminion etcd.set /path/to/key value
salt myminion etcd.set /path/to/key value profile=my_etcd_config
salt myminion etcd.set /path/to/dir '' directory=True
salt myminion etcd.set /path/to/key value ttl=5
```

salt.modules.etcd_mod.**tree**(*path='/'*, *profile=None*)

New in version 2014.7.0.

Recurse through etcd and return all values. Returns None on failure.

CLI Example:

```
salt myminion etcd.tree
salt myminion etcd.tree profile=my_etcd_config
salt myminion etcd.tree /path/to/keys profile=my_etcd_config
```

salt.modules.etcd_mod.**update**(*fields*, *path=''*, *profile=None*)

New in version 2016.3.0.

Sets a dictionary of values in one call. Useful for large updates in syndic environments. The dictionary can contain a mix of formats such as:

```
{
  '/some/example/key': 'bar',
  '/another/example/key': 'baz'
}
```

Or it may be a straight dictionary, which will be flattened to look like the above format:

```
{
    'some': {
        'example': {
            'key': 'bar'
        }
    },
    'another': {
        'example': {
            'key': 'baz'
        }
    }
}
```

You can even mix the two formats and it will be flattened to the first format. Leading and trailing `/' will be removed.

Empty directories can be created by setting the value of the key to an empty dictionary.

The `path' parameter will optionally set the root of the path to use.

CLI Example:

```
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}"
 ↪profile=my_etcd_config
salt myminion etcd.update "{'/path/to/key': 'baz', '/another/key': 'bar'}" path='/
 ↪some/root'
```

salt.modules.etcd_mod.**watch**(*key*, *recurse=False*, *profile=None*, *timeout=0*, *index=None*)

New in version 2016.3.0.

Makes a best effort to watch for a key or tree change in etcd. Returns a dict containing the new key value (or None if the key was deleted), the modifiedIndex of the key, whether the key changed or not, the path to the key that changed and whether it is a directory or not.

If something catastrophic happens, returns {}

CLI Example:

```
salt myminion etcd.watch /path/to/key
salt myminion etcd.watch /path/to/key timeout=10
salt myminion etcd.watch /patch/to/key profile=my_etcd_config index=10
```

19.9.113 salt.modules.ethtool module

Module for running ethtool command

New in version 2016.3.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity new

depends python-ethtool

platform linux

salt.modules.ethtool.**set_coalesce**(*devname*, ***kwargs*)

Changes the coalescing settings of the specified network device

CLI Example:

```
salt '*' ethtool.set_coalesce <devname> [adaptive_rx=on|off] [adaptive_tx=on|off]
 ↪[rx_usecs=N] [rx_frames=N]
    [rx_usecs_irq=N] [rx_frames_irq=N] [tx_usecs=N] [tx_frames=N] [tx_usecs_
 ↪irq=N] [tx_frames_irq=N]
    [stats_block_usecs=N] [pkt_rate_low=N] [rx_usecs_low=N] [rx_frames_low=N] [tx_
 ↪usecs_low=N] [tx_frames_low=N]
    [pkt_rate_high=N] [rx_usecs_high=N] [rx_frames_high=N] [tx_usecs_high=N] [tx_
 ↪frames_high=N]
    [sample_interval=N]
```

salt.modules.ethtool.**set_offload**(*devname*, ***kwargs*)

Changes the offload parameters and other features of the specified network device

CLI Example:

```
salt '*' ethtool.set_offload <devname> tcp_segmentation_offload=on
```

salt.modules.ethtool.**set_ring**(*devname*, ***kwargs*)
Changes the rx/tx ring parameters of the specified network device

CLI Example:

```
salt '*' ethtool.set_ring <devname> [rx=N] [rx_mini=N] [rx_jumbo=N] [tx=N]
```

salt.modules.ethtool.**show_coalesce**(*devname*)
Queries the specified network device for coalescing information

CLI Example:

```
salt '*' ethtool.show_coalesce <devname>
```

salt.modules.ethtool.**show_driver**(*devname*)
Queries the specified network device for associated driver information

CLI Example:

```
salt '*' ethtool.show_driver <devname>
```

salt.modules.ethtool.**show_offload**(*devname*)
Queries the specified network device for the state of protocol offload and other features

CLI Example:

```
salt '*' ethtool.show_offload <devname>
```

salt.modules.ethtool.**show_ring**(*devname*)
Queries the specified network device for rx/tx ring parameter information

CLI Example:

```
salt '*' ethtool.show_ring <devname>
```

19.9.114 salt.modules.event

Use the *Salt Event System* to fire events from the master to the minion and vice-versa.

salt.modules.event.**fire**(*data*, *tag*)
Fire an event on the local minion event bus. Data must be formed as a dict.

CLI Example:

```
salt '*' event.fire '{"data":"my event data"}' 'tag'
```

salt.modules.event.**fire_master**(*data*, *tag*, *preload=None*)
Fire an event off up to the master server

CLI Example:

```
salt '*' event.fire_master '{"data":"my event data"}' 'tag'
```

salt.modules.event.**send**(*tag*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, *with_env_opts=False*, ***kwargs*)
Send an event to the Salt Master

New in version 2014.7.0.

Parameters

- **tag** -- A tag to give the event. Use slashes to create a namespace for related events. E.g., `myco/build/buildserver1/start`, `myco/build/buildserver1/success`, `myco/build/buildserver1/failure`.
- **data** -- A dictionary of data to send in the event. This is free-form. Send any data points that are needed for whoever is consuming the event. Arguments on the CLI are interpreted as YAML so complex data structures are possible.
- **with_env** (Specify `True` to include all environment variables, or specify a list of strings of variable names to include.) -- Include environment variables from the current shell environment in the event data as `environ`.. This is a short-hand for working with systems that seed the environment with relevant data such as Jenkins.
- **with_grains** (Specify `True` to include all grains, or specify a list of strings of grain names to include.) -- Include grains from the current minion in the event data as `grains`.
- **with_pillar** (Specify `True` to include all Pillar values, or specify a list of strings of Pillar keys to include. It is a best-practice to only specify a relevant subset of Pillar data.) -- Include Pillar values from the current minion in the event data as `pillar`. Remember Pillar data is often sensitive data so be careful. This is useful for passing ephemeral Pillar values through an event. Such as passing the `pillar={}` kwarg in *`state.sls`* from the Master, through an event on the Minion, then back to the Master.
- **with_env_opts** (Specify `True` to include `saltenv` and `pillarenv` values or `False` to omit them.) -- Include `saltenv` and `pillarenv` set on minion at the moment when event is send into event data.
- **kwargs** -- Any additional keyword arguments passed to this function will be interpreted as key-value pairs and included in the event data. This provides a convenient alternative to YAML for simple values.

CLI Example:

```
salt-call event.send myco/mytag foo=Foo bar=Bar
salt-call event.send 'myco/mytag' '{foo: Foo, bar: Bar}'
```

A convenient way to allow Jenkins to execute `salt-call` is via sudo. The following rule in sudoers will allow the `jenkins` user to run only the following command.

`/etc/sudoers` (allow preserving the environment):

```
jenkins ALL=(ALL) NOPASSWD:SETENV: /usr/bin/salt-call event.send*
```

Call Jenkins via sudo (preserve the environment):

```
sudo -E salt-call event.send myco/jenkins/build/success with_env=[BUILD_ID, BUILD_
↪URL, GIT_BRANCH, GIT_COMMIT]
```

19.9.115 salt.modules.extfs

Module for managing ext2/3/4 file systems

`salt.modules.extfs.`**`attributes`**(*device*, *args=None*)

Return attributes from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.attributes /dev/sda1
```

salt.modules.extfs.**blocks**(*device*, *args=None*)

Return block and inode info from dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.blocks /dev/sda1
```

salt.modules.extfs.**dump**(*device*, *args=None*)

Return all contents of dumpe2fs for a specified device

CLI Example:

```
salt '*' extfs.dump /dev/sda1
```

salt.modules.extfs.**mkfs**(*device*, *fs_type*, ***kwargs*)

Create a file system on the specified device

CLI Example:

```
salt '*' extfs.mkfs /dev/sda1 fs_type=ext4 opts='acl,noexec'
```

Valid options are:

- **block_size**: 1024, 2048 or 4096
- **check**: check for bad blocks
- **direct**: use direct IO
- **ext_opts**: extended file system options (comma-separated)
- **fragment_size**: size of fragments
- **force**: setting force to True will cause mke2fs to specify the -F option twice (it is already set once); this is truly dangerous
- **blocks_per_group**: number of blocks in a block group
- **number_of_groups**: ext4 option for a virtual block group
- **bytes_per_inode**: set the bytes/inode ratio
- **inode_size**: size of the inode
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **blocks_file**: read bad blocks from file
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **test**: set to True to not actually create the file system (mke2fs -n)
- **number_of_inodes**: override default number of inodes
- **creator_os**: override ``creator operating system'' field
- **opts**: mount options (comma separated)
- **revision**: set the filesystem revision (default 1)
- **super**: write superblock and group descriptors only
- **fs_type**: set the filesystem type (REQUIRED)
- **usage_type**: how the filesystem is going to be used
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

salt.modules.extfs.**tune**(*device*, ***kwargs*)

Set attributes for the specified device (using tune2fs)

CLI Example:

```
salt '*' extfs.tune /dev/sda1 force=True label=wildstallyns opts='acl,noexec'
```

Valid options are:

- **max**: max mount count
- **count**: mount count
- **error**: error behavior
- **extended_opts**: extended options (comma separated)
- **force**: force, even if there are errors (set to True)
- **group**: group name or gid that can use the reserved blocks
- **interval**: interval between checks
- **journal**: set to True to create a journal (default on ext3/4)
- **journal_opts**: options for the fs journal (comma separated)
- **label**: label to apply to the file system
- **reserved**: percentage of blocks reserved for super-user
- **last_dir**: last mounted directory
- **opts**: mount options (comma separated)
- **feature**: set or clear a feature (comma separated)
- **mmp_check**: mmp check interval
- **reserved**: reserved blocks count
- **quota_opts**: quota options (comma separated)
- **time**: time last checked
- **user**: user or uid who can use the reserved blocks
- **uuid**: set the UUID for the file system

See the `mke2fs(8)` manpage for a more complete description of these options.

19.9.116 salt.modules.file

Manage information about regular files, directories, and special files on the minion, set/read user, group, mode, and data

`salt.modules.file.`**`access`**(*path*, *mode*)

New in version 2014.1.0.

Test whether the Salt process has the specified access to the file. One of the following modes must be specified:

CLI Example:

```
salt '*' file.access /path/to/file f
salt '*' file.access /path/to/file x
```

`salt.modules.file.`**`append`**(*path*, **args*, ***kwargs*)

New in version 0.9.5.

Append text to the end of a file
path path to file
***args** strings to append to file
CLI Example:

```
salt '*' file.append /etc/motd \
        "With all thine offerings thou shalt offer salt." \
        "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.append /etc/motd args='cheese=spam'

salt '*' file.append /etc/motd args="['cheese=spam','spam=cheese']"
```

---

salt.modules.file.**apply_template_on_contents**(*contents*, *template*, *context*, *defaults*, *saltenv*)

Return the contents after applying the templating engine
contents template string
template template format
context Overrides default context variables passed to the template.
defaults Default context passed to the template.
CLI Example:

```
salt '*' file.apply_template_on_contents \
    contents='This is a {{ template }} string.' \
    template=jinja \
    "context={}" "defaults={'template': 'cool'}" \
    saltenv=base
```

salt.modules.file.**basename**(*path*)

Returns the final component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- set filename = salt['file.basename'](source_file) %}
```

CLI Example:

```
salt '*' file.basename 'test/test.config'
```

salt.modules.file.**blockreplace**(*path*, *marker_start='#-- start managed zone --`*, *marker_end='#-- end managed zone --`*, *content='`*, *append_if_not_found=False*, *prepend_if_not_found=False*, *backup='.bak'*, *dry_run=False*, *show_changes=True*, *append_newline=False*)

New in version 2014.1.0.

Replace content of a text block in a file, delimited by line markers

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal.

Note: This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

---

path Filesystem path to the file to be edited
marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output
marker_end The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

content The content to be used between the two lines identified by marker_start and marker_stop.
append_if_not_found [False] If markers are not found and set to `True` then, the markers and content will be appended to the file.
prepend_if_not_found [False] If markers are not found and set to `True` then, the markers and content will be prepended to the file.
backup The file extension to use for a backup of the file if any edit is made. Set to `False` to skip making a backup.
dry_run [False] If `True`, do not make any edits to the file and simply return the changes that *would* be made.
show_changes [True] Controls how changes are presented. If `True`, this function will return a unified diff of the changes made. If False, then it will return a boolean (`True` if any changes were made, otherwise `False`).
append_newline [False] Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is `None` then a newline will only be added to the content block if it does not already end in a newline.

New in version 2016.3.4.

Changed in version 2017.7.5,2018.3.1: New behavior added when value is `None`.

Changed in version Fluorine: The default value of this argument will change to `None` to match the behavior of the *file.blockreplace state*

CLI Example:

```
salt '*' file.blockreplace /etc/hosts '#-- start managed zone foobar : DO NOT
 ↪EDIT --' \
'#-- end managed zone foobar --' $'10.0.1.1 foo.foobar\n10.0.1.2 bar.foobar' True
```

salt.modules.file.**check_file_meta**(*name*, *sfn*, *source*, *source_sum*, *user*, *group*, *mode*, *saltenv*, *contents=None*)

Check for the changes in the file metadata.

CLI Example:

```
salt '*' file.check_file_meta /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf
 ↪'{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' base
```

Note: Supported hash types include sha512, sha384, sha256, sha224, sha1, and md5.

---

name Path to file destination
sfn Template-processed source file contents
source URL to file source
source_sum File checksum information as a dictionary

```
{hash_type: md5, hsum: <md5sum>}
```

user Destination file user owner
group Destination file group owner
mode Destination file permissions mode
saltenv Salt environment used to resolve source files
contents File contents

salt.modules.file.**check_hash**(*path*, *file_hash*)

Check if a file matches the given hash string

Returns `True` if the hash matches, otherwise `False`.

path Path to a file local to the minion.
hash The hash to check against the file specified in the `path` argument.

Changed in version 2016.11.4.

For this and newer versions the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>=<hash_value>` (e.g. `md5=e138491e9d5b97023cea823fe17bac22`).

CLI Example:

```
salt '*' file.check_hash /etc/fstab e138491e9d5b97023cea823fe17bac22
salt '*' file.check_hash /etc/fstab md5=e138491e9d5b97023cea823fe17bac22
```

salt.modules.file.**check_managed**(*name*, *source*, *source_hash*, *source_hash_name*, *user*, *group*, *mode*, *template*, *context*, *defaults*, *saltenv*, *contents=None*, *skip_verify=False*, ***kwargs*)

Check to see what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed /etc/httpd/conf.d/httpd.conf salt://http/httpd.conf '
↪{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True None None base
```

salt.modules.file.**check_managed_changes**(*name*, *source*, *source_hash*, *source_hash_name*, *user*, *group*, *mode*, *template*, *context*, *defaults*, *saltenv*, *contents=None*, *skip_verify=False*, *keep_mode=False*, ***kwargs*)

Return a dictionary of what changes need to be made for a file

CLI Example:

```
salt '*' file.check_managed_changes /etc/httpd/conf.d/httpd.conf salt://http/
↪httpd.conf '{hash_type: 'md5', 'hsum': <md5sum>}' root, root, '755' jinja True
↪None None base
```

salt.modules.file.**check_perms**(*name*, *ret*, *user*, *group*, *mode*, *follow_symlinks=False*)

Check the permissions on files and chown if needed

CLI Example:

```
salt '*' file.check_perms /etc/sudoers '{}' root root 400
```

Changed in version 2014.1.3: `follow_symlinks` option added

salt.modules.file.**chgrp**(*path*, *group*)

Change the group of a file
path path to the file or directory
group group owner
CLI Example:

```
salt '*' file.chgrp /etc/passwd root
```

salt.modules.file.**chown**(*path*, *user*, *group*)

Chown a file, pass the file the desired user and group
path path to the file or directory
user user owner
group group owner
CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

salt.modules.file.**comment**(*path*, *regex*, *char='#'*, *backup='.bak'*)

Deprecated since version 0.17.0: Use *replace()* instead.

Comment out specified lines in a file

path The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^(foo)$)

char [#] The character to be inserted at the beginning of a line in order to comment it out

backup [.bak] The file will be backed up before edit with this file extension

> **Warning:** This backup will be overwritten each time sed / comment / uncomment is called. Meaning the backup will only be useful after the first invocation.

CLI Example:

```
salt '*' file.comment /etc/modules pcspkr
```

salt.modules.file.**comment_line**(*path*, *regex*, *char='#'*, *cmnt=True*, *backup='.bak'*)

Comment or Uncomment a line in a text file.

Parameters

- **path** -- string The full path to the text file.
- **regex** -- string A regex expression that begins with ^ that will find the line you wish to comment. Can be as simple as ^color =
- **char** -- string The character used to comment a line in the type of file you're referencing. Default is #
- **cmnt** -- boolean True to comment the line. False to uncomment the line. Default is True.
- **backup** -- string The file extension to give the backup file. Default is .bak Set to False/None to not keep a backup.

Returns boolean Returns True if successful, False if not

CLI Example:

The following example will comment out the pcspkr line in the /etc/modules file using the default # character and create a backup file named modules.bak

```
salt '*' file.comment_line '/etc/modules' '^pcspkr'
```

CLI Example:

The following example will uncomment the log_level setting in minion config file if it is set to either warning, info, or debug using the # character and create a backup file named minion.bk

```
salt '*' file.comment_line 'C:\salt\conf\minion' '^log_level: (warning|info|debug)
↪' '#' False '.bk'
```

salt.modules.file.**contains**(*path*, *text*)

Deprecated since version 0.17.0: Use *search()* instead.

Return True if the file at path contains text

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.**contains_glob**(*path*, *glob_expr*)

Deprecated since version 0.17.0: Use *search()* instead.

Return True if the given glob matches a string in the named file

CLI Example:

```
salt '*' file.contains_glob /etc/foobar '*cheese*'
```

salt.modules.file.**contains_regex**(*path*, *regex*, *lchar=''*)

Deprecated since version 0.17.0: Use *search()* instead.

Return True if the given regular expression matches on any line in the text of a given file.

If the lchar argument (leading char) is specified, it will strip *lchar* from the left side of each line before trying to match

CLI Example:

```
salt '*' file.contains_regex /etc/crontab
```

salt.modules.file.**copy**(*src*, *dst*, *recurse=False*, *remove_existing=False*)

Copy a file or directory from source to dst

In order to copy a directory, the recurse flag is required, and will by default overwrite files in the destination with the same path, and retain all other existing files. (similar to cp -r on unix)

remove_existing will remove all files in the target directory, and then copy files from the source.

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by *states.file.managed* and *states.file.recurse*.

CLI Example:

```
salt '*' file.copy /path/to/src /path/to/dst
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True
salt '*' file.copy /path/to/src_dir /path/to/dst_dir recurse=True remove_
↪existing=True
```

salt.modules.file.**delete_backup**(*path*, *backup_id*)

New in version 0.17.0.

Delete a previous version of a file that was backed up using Salt's *file state backup* system.

path The path on the minion to check for backups

backup_id The numeric id for the backup you wish to delete, as found using *file.list_backups*

CLI Example:

```
salt '*' file.delete_backup /var/cache/salt/minion/file_backup/home/foo/bar/baz.
↪txt 0
```

salt.modules.file.**directory_exists**(*path*)

Tests to see if path is a valid directory. Returns True/False.

CLI Example:

```
salt '*' file.directory_exists /etc
```

salt.modules.file.**dirname**(*path*)

Returns the directory component of a pathname

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.dirname'](tpldir) + '/vars.jinja' import parent_vars %}
```

CLI Example:

```
salt '*' file.dirname 'test/path/filename.config'
```

salt.modules.file.**diskusage**(*path*)

Recursively calculate disk usage of path and return it in bytes

CLI Example:

```
salt '*' file.diskusage /path/to/check
```

salt.modules.file.**extract_hash**(*hash_fn*, *hash_type='sha256'*, *file_name=''*, *source=''*, *source_hash_name=None*)

Changed in version 2016.3.5: Prior to this version, only the `file_name` argument was considered for filename matches in the hash file. This would be problematic for cases in which the user was relying on a remote checksum file that they do not control, and they wished to use a different name for that file on the minion from the filename on the remote server (and in the checksum file). For example, managing `/tmp/myfile.tar.gz` when the remote file was at `https://mydomain.tld/different_name.tar.gz`. The *file.managed* state now also passes this function the source URI as well as the `source_hash_name` (if specified). In cases where `source_hash_name` is specified, it takes precedence over both the `file_name` and `source`. When it is not specified, `file_name` takes precedence over `source`. This allows for better capability for matching hashes.

Changed in version 2016.11.0: File name and source URI matches are no longer disregarded when `source_hash_name` is specified. They will be used as fallback matches if there is no match to the `source_hash_name` value.

This routine is called from the *file.managed* state to pull a hash from a remote file. Regular expressions are used line by line on the `source_hash` file, to find a potential candidate of the indicated hash type. This avoids many problems of arbitrary file layout rules. It specifically permits pulling hash codes from debian `*.dsc` files.

If no exact match of a hash and filename are found, then the first hash found (if any) will be returned. If no hashes at all are found, then None will be returned.

For example:

```
openerp_7.0-latest-1.tar.gz:
  file.managed:
    - name: /tmp/openerp_7.0-20121227-075624-1_all.deb
    - source: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-20121227-
↪075624-1.tar.gz
    - source_hash: http://nightly.openerp.com/7.0/nightly/deb/openerp_7.0-
↪20121227-075624-1.dsc
```

CLI Example:

```
salt '*' file.extract_hash /path/to/hash/file sha512 /etc/foo
```

salt.modules.file.**file_exists**(*path*)

Tests to see if path is a valid file. Returns True/False.

CLI Example:

```
salt '*' file.file_exists /etc/passwd
```

salt.modules.file.**find**(*path*, **args*, ***kwargs*)

Approximate the Unix `find(1)` command and return a list of paths that meet the specified criteria.

The options include match criteria:

```
name    = path-glob                 # case sensitive
iname   = path-glob                 # case insensitive
regex   = path-regex                # case sensitive
iregex  = path-regex                # case insensitive
type    = file-types                # match any listed type
user    = users                     # match any listed user
group   = groups                    # match any listed group
size    = [+-]number[size-unit]     # default unit = byte
mtime   = interval                  # modified since date
grep    = regex                     # search file contents
```

and/or actions:

```
delete [= file-types]               # default type = 'f'
exec    = command [arg ...]         # where {} is replaced by pathname
print  [= print-opts]
```

and/or depth criteria:

```
maxdepth = maximum depth to transverse in path
mindepth = minimum depth to transverse before checking files or directories
```

The default action is `print=path`

`path-glob`:

```
*                = match zero or more chars
?                = match any char
[abc]            = match a, b, or c
[!abc] or [^abc] = match anything except a, b, and c
[x-y]            = match chars x through y
[!x-y] or [^x-y] = match anything except chars x through y
{a,b,c}          = match a or b or c
```

`path-regex`: a Python Regex (regular expression) pattern to match pathnames

`file-types`: a string of one or more of the following:

```
a: all file types
b: block device
c: character device
d: directory
p: FIFO (named pipe)
f: plain file
```

```
l: symlink
s: socket
```

users: a space and/or comma separated list of user names and/or uids

groups: a space and/or comma separated list of group names and/or gids

size-unit:

```
b: bytes
k: kilobytes
m: megabytes
g: gigabytes
t: terabytes
```

interval:

```
[<num>w] [<num>d] [<num>h] [<num>m] [<num>s]

where:
    w: week
    d: day
    h: hour
    m: minute
    s: second
```

print-opts: a comma and/or space separated list of one or more of the following:

```
group: group name
md5:   MD5 digest of file contents
mode:  file permissions (as integer)
mtime: last modification time (as time_t)
name:  file basename
path:  file absolute path
size:  file size in bytes
type:  file type
user:  user name
```

CLI Examples:

```
salt '*' file.find / type=f name=\*.bak size=+10m
salt '*' file.find /var mtime=+30d size=+10m print=path,size,mtime
salt '*' file.find /var/log name=\*.[0-9] mtime=+30d size=+10m delete
```

salt.modules.file.**get_devmm**(*name*)

Get major/minor info from a device

CLI Example:

```
salt '*' file.get_devmm /dev/chr
```

salt.modules.file.**get_diff**(*minionfile*, *masterfile*, *saltenv='base'*)

Return unified diff of file compared to file on master

CLI Example:

```
salt '*' file.get_diff /home/fred/.vimrc salt://users/fred/.vimrc
```

salt.modules.file.**get_gid**(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

path file or directory of which to get the gid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_gid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

salt.modules.file.**get_group**(*path*, *follow_symlinks=True*)

Return the group that owns a given file

path file or directory of which to get the group

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_group /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

salt.modules.file.**get_hash**(*path*, *form='sha256'*, *chunk_size=65536*)

Get the hash sum of a file

This is better than `get_sum` for the following reasons:

- It does not read the entire file into memory.
- **It does not return a string on error**. **The returned value of** `get_sum` cannot really be trusted since it is vulnerable to collisions: `get_sum(...,'xyz') == 'Hash xyz not supported'`

path path to the file or directory

form desired sum format

chunk_size amount to sum at once

CLI Example:

```
salt '*' file.get_hash /etc/shadow
```

salt.modules.file.**get_managed**(*name*, *template*, *source*, *source_hash*, *source_hash_name*, *user*, *group*, *mode*, *saltenv*, *context*, *defaults*, *skip_verify=False*, ***kwargs*)

Return the managed file data for file.managed

name location where the file lives on the server

template template format

source managed source file

source_hash hash of the source file

source_hash_name When `source_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.3.5.

user Owner of file

group Group owner of file

mode Permissions of file

context Variables to add to the template context

defaults Default values of for context_dict

skip_verify If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

CLI Example:

```
salt '*' file.get_managed /etc/httpd/conf.d/httpd.conf jinja salt://http/httpd.
 ↪conf '{hash_type: 'md5', 'hsum': <md5sum>}' None root root '755' base None None
```

salt.modules.file.**get_mode**(*path*, *follow_symlinks=True*)

Return the mode of a file

path file or directory of which to get the mode

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

Changed in version 2014.1.0: `follow_symlinks` option added

salt.modules.file.**get_selinux_context**(*path*)

Get an SELinux context from a given path

CLI Example:

```
salt '*' file.get_selinux_context /etc/hosts
```

salt.modules.file.**get_source_sum**(*file_name=''*, *source=''*, *source_hash=None*, *source_hash_name=None*, *saltenv='base'*)

New in version 2016.11.0.

Used by *`file.get_managed`* to obtain the hash and hash type from the parameters specified below.

file_name Optional file name being managed, for matching with *`file.extract_hash`*.

source Source file, as used in *`file`* and other states. If `source_hash` refers to a file containing hashes, then this filename will be used to match a filename in that file. If the `source_hash` is a hash expression, then this argument will be ignored.

source_hash Hash file/expression, as used in *`file`* and other states. If this value refers to a remote URL or absolute path to a local file, it will be cached and *`file.extract_hash`* will be used to obtain a hash from it.

source_hash_name Specific file name to look for when `source_hash` refers to a remote file, used to disambiguate ambiguous matches.

saltenv [base] Salt fileserver environment from which to retrieve the source_hash. This value will only be used when `source_hash` refers to a file on the Salt fileserver (i.e. one beginning with `salt://`).

CLI Example:

```
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
 ↪gz source_hash=499ae16dcae71eeb7c3a30c75ea7a1a6
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
 ↪gz source_hash=https://mydomain.tld/hashes.md5
salt '*' file.get_source_sum /tmp/foo.tar.gz source=http://mydomain.tld/foo.tar.
 ↪gz source_hash=https://mydomain.tld/hashes.md5 source_hash_name=./dir2/foo.tar.
 ↪gz
```

salt.modules.file.**get_sum**(*path*, *form='sha256'*)

Return the checksum for the given file. The following checksum algorithms are supported:

- md5
- sha1
- sha224
- sha256 **(default)**
- sha384
- sha512

path path to the file or directory

form desired sum format

CLI Example:

```
salt '*' file.get_sum /etc/passwd sha512
```

salt.modules.file.**get_uid**(*path*, *follow_symlinks=True*)

Return the id of the user that owns a given file

path file or directory of which to get the uid

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_uid /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

salt.modules.file.**get_user**(*path*, *follow_symlinks=True*)

Return the user that owns a given file

path file or directory of which to get the user

follow_symlinks indicated if symlinks should be followed

CLI Example:

```
salt '*' file.get_user /etc/passwd
```

Changed in version 0.16.4: `follow_symlinks` option added

salt.modules.file.**gid_to_group**(*gid*)

Convert the group id to the group name on this system

gid gid to convert to a group name

CLI Example:

```
salt '*' file.gid_to_group 0
```

salt.modules.file.**grep**(*path*, *pattern*, **opts*)

Grep for a string in the specified file

Note: This function's return value is slated for refinement in future versions of Salt

path Path to the file to be searched

Note: Globbing is supported (i.e. `/var/log/foo/*.log`, but if globbing is being used then the path should be quoted to keep the shell from attempting to expand the glob expression.

pattern Pattern to match. For example: `test`, or `a[0-5]`

opts Additional command-line flags to pass to the grep command. For example: `-v`, or `-i -B2`

Note: The options should come after a double-dash (as shown in the examples below) to keep Salt's own argument parser from interpreting them.

CLI Example:

```
salt '*' file.grep /etc/passwd nobody
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i
salt '*' file.grep /etc/sysconfig/network-scripts/ifcfg-eth0 ipaddr -- -i -B2
salt '*' file.grep "/etc/sysconfig/network-scripts/*" ipaddr -- -i -l
```

salt.modules.file.**group_to_gid**(*group*)
Convert the group to the gid on this system
group group to convert to its gid
CLI Example:

```
salt '*' file.group_to_gid root
```

salt.modules.file.**is_blkdev**(*name*)
Check if a file exists and is a block device.

CLI Example:

```
salt '*' file.is_blkdev /dev/blk
```

salt.modules.file.**is_chrdev**(*name*)
Check if a file exists and is a character device.

CLI Example:

```
salt '*' file.is_chrdev /dev/chr
```

salt.modules.file.**is_fifo**(*name*)
Check if a file exists and is a FIFO.

CLI Example:

```
salt '*' file.is_fifo /dev/fifo
```

salt.modules.file.**is_link**(*path*)
Check if the path is a symbolic link

CLI Example:

```
salt '*' file.is_link /path/to/link
```

salt.modules.file.**join**(**args*)
Return a normalized file system path for the underlying OS

New in version 2014.7.0.

This can be useful at the CLI but is frequently useful when scripting combining path variables:

```
{% set www_root = '/var' %}
{% set app_dir = 'myapp' %}

myapp_config:
  file:
    - managed
    - name: {{ salt['file.join'](www_root, app_dir, 'config.yaml') }}
```

CLI Example:

```
salt '*' file.join '/' 'usr' 'local' 'bin'
```

salt.modules.file.**lchown**(*path*, *user*, *group*)
Chown a file, pass the file the desired user and group without following symlinks.
path path to the file or directory
user user owner
group group owner

CLI Example:

```
salt '*' file.chown /etc/passwd root root
```

salt.modules.file.**line**(*path*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show_changes=True*, *backup=False*, *quiet=False*, *indent=True*)

New in version 2015.8.0.

Edit a line in the configuration file. The `path` and `content` arguments are required, as well as passing in one of the `mode` options.

path Filesystem path to the file to be edited.

content Content of the line. Allowed to be empty if mode=delete.

match Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, match becomes the `content` value.

mode Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added. This is based on the `content` argument.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

location Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

before Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

after Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

backup Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds''.

quiet Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

indent Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

CLI Example:

```
salt '*' file.line /etc/nsswitch.conf "networks:       files dns" after="hosts:.*?
 ↪" mode='ensure'
```

Note: If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument

in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.line /path/to/file content="CREATEMAIL_SPOOL=no" match="CREATE_MAIL_
↪SPOOL=yes" mode="replace"
```

`salt.modules.file.`**`link`**(*src*, *path*)

New in version 2014.1.0.

Create a hard link to a file

CLI Example:

```
salt '*' file.link /path/to/file /path/to/link
```

`salt.modules.file.`**`list_backups`**(*path*, *limit=None*)

New in version 0.17.0.

Lists the previous versions of a file backed up using Salt's *file state backup* system.
path The path on the minion to check for backups
limit Limit the number of results to the most recent N backups
CLI Example:

```
salt '*' file.list_backups /foo/bar/baz.txt
```

`salt.modules.file.`**`list_backups_dir`**(*path*, *limit=None*)

Lists the previous versions of a directory backed up using Salt's *file state backup* system.
path The directory on the minion to check for backups
limit Limit the number of results to the most recent N backups
CLI Example:

```
salt '*' file.list_backups_dir /foo/bar/baz/
```

`salt.modules.file.`**`lstat`**(*path*)

New in version 2014.1.0.

Returns the lstat attributes for the given file or dir. Does not support symbolic links.

CLI Example:

```
salt '*' file.lstat /path/to/file
```

`salt.modules.file.`**`makedirs`**(*path*, *user=None*, *group=None*, *mode=None*)

Ensure that the directory containing this path is available.

Note: The path must end with a trailing slash otherwise the directory/directories will be created up to the parent directory. For example if path is `/opt/code`, then it would be treated as `/opt/` but if the path ends with a trailing slash like `/opt/code/`, then it would be treated as `/opt/code/`.

CLI Example:

```
salt '*' file.makedirs /opt/code/
```

`salt.modules.file.`**`makedirs_perms`**(*name*, *user=None*, *group=None*, *mode=`0755'*)

Taken and modified from os.makedirs to set user, group and mode for each directory created.

CLI Example:

```
salt '*' file.makedirs_perms /opt/code
```

salt.modules.file.**manage_file**(*name*, *sfn*, *ret*, *source*, *source_sum*, *user*, *group*, *mode*, *saltenv*, *backup*, *makedirs=False*, *template=None*, *show_changes=True*, *contents=None*, *dir_mode=None*, *follow_symlinks=True*, *skip_verify=False*, *keep_mode=False*, *encoding=None*, *encoding_errors='strict'*, ***kwargs*)

Checks the destination against what was retrieved with get_managed and makes the appropriate modifications (if necessary).

name location to place the file

sfn location of cached file on the minion

This is the path to the file stored on the minion. This file is placed on the minion using cp.cache_file. If the hash sum of that file matches the source_sum, we do not transfer the file to the minion again.

This file is then grabbed and if it has template set, it renders the file to be placed into the correct place on the system using salt.files.utils.copyfile()

ret The initial state return data structure. Pass in `None` to use the default structure.

source file reference on the master

source_hash sum hash for source

user user owner

group group owner

backup backup_mode

makedirs make directories if they do not exist

template format of templating

show_changes Include diff in state return

contents: contents to be placed in the file

dir_mode mode for directories created with makedirs

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

keep_mode [False] If `True`, and the `source` is a file from the Salt fileserver (or a local file on the minion), the mode of the destination file will be set to the mode of the source file.

Note: keep_mode does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

encoding [None] If None, str() will be applied to contents. If not None, specified encoding will be used. See https://docs.python.org/3/library/codecs.html#standard-encodings for the list of available encodings.

New in version 2017.7.0.

encoding_errors [`strict'] Default is ``'strict'``. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the error handling schemes.

New in version 2017.7.0.

CLI Example:

```
salt '*' file.manage_file /etc/httpd/conf.d/httpd.conf '' '{}' salt://http/httpd.
↪conf '{hash_type: 'md5', 'hsum': <md5sum>}' root root '755' base ''
```

Changed in version 2014.7.0: `follow_symlinks` option added

salt.modules.file.**mkdir**(*dir_path*, *user=None*, *group=None*, *mode=None*)
Ensure that a directory is available.

CLI Example:

```
salt '*' file.mkdir /opt/jetty/context
```

salt.modules.file.**mknod**(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode=`0600'*)
New in version 0.17.0.

Create a block device, character device, or fifo pipe. Identical to the gnu mknod.

CLI Examples:

```
salt '*' file.mknod /dev/chr c 180 31
salt '*' file.mknod /dev/blk b 8 999
salt '*' file.nknod /dev/fifo p
```

salt.modules.file.**mknod_blkdev**(*name*, *major*, *minor*, *user=None*, *group=None*, *mode=`0660'*)
New in version 0.17.0.

Create a block device.

CLI Example:

```
salt '*' file.mknod_blkdev /dev/blk 8 999
```

salt.modules.file.**mknod_chrdev**(*name*, *major*, *minor*, *user=None*, *group=None*, *mode=`0660'*)
New in version 0.17.0.

Create a character device.

CLI Example:

```
salt '*' file.mknod_chrdev /dev/chr 180 31
```

salt.modules.file.**mknod_fifo**(*name*, *user=None*, *group=None*, *mode=`0660'*)
New in version 0.17.0.

Create a FIFO pipe.

CLI Example:

```
salt '*' file.mknod_fifo /dev/fifo
```

salt.modules.file.**move**(*src*, *dst*)
Move a file or directory

CLI Example:

```
salt '*' file.move /path/to/src /path/to/dst
```

salt.modules.file.**normpath**(*path*)
Returns Normalize path, eliminating double slashes, etc.

New in version 2015.5.0.

This can be useful at the CLI but is frequently useful when scripting.

```
{%- from salt['file.normpath'](tpldir + '/../vars.jinja') import parent_vars %}
```

CLI Example:

```
salt '*' file.normpath 'a/b/c/..'
```

salt.modules.file.**open_files**(*by_pid=False*)

Return a list of all physical open files on the system.

CLI Examples:

```
salt '*' file.open_files
salt '*' file.open_files by_pid=True
```

salt.modules.file.**pardir**()

Return the relative parent directory path symbol for underlying OS

New in version 2014.7.0.

This can be useful when constructing Salt Formulas.

```
{% set pardir = salt['file.pardir']() %}
{% set final_path = salt['file.join']('subdir', pardir, 'confdir') %}
```

CLI Example:

```
salt '*' file.pardir
```

salt.modules.file.**patch**(*originalfile*, *patchfile*, *options=''*, *dry_run=False*)

New in version 0.10.4.

Apply a patch to a file or directory.

Equivalent to:

```
patch <options> -i <patchfile> <originalfile>
```

Or, when a directory is patched:

```
patch <options> -i <patchfile> -d <originalfile> -p0
```

originalfile The full path to the file or directory to be patched
patchfile A patch file to apply to `originalfile`
options Options to pass to patch.

CLI Example:

```
salt '*' file.patch /opt/file.txt /tmp/file.txt.patch
```

salt.modules.file.**path_exists_glob**(*path*)

Tests to see if path after expansion is a valid path (file or directory). Expansion allows usage of ? * and character ranges []. Tilde expansion is not supported. Returns True/False.

New in version 2014.7.0.

CLI Example:

```
salt '*' file.path_exists_glob /etc/pam*/pass*
```

salt.modules.file.**prepend**(*path*, **args*, ***kwargs*)

New in version 2014.7.0.

Prepend text to the beginning of a file
path path to file

***args** strings to prepend to the file
CLI Example:

```
salt '*' file.prepend /etc/motd \
        "With all thine offerings thou shalt offer salt." \
        "Salt is what makes things taste bad when it isn't in them."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.prepend /etc/motd args='cheese=spam'

salt '*' file.prepend /etc/motd args="['cheese=spam','spam=cheese']"
```

---

salt.modules.file.**psed**(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *flags='gMS'*, *escape_all=False*, *multi=False*)

Deprecated since version 0.17.0: Use *replace()* instead.

Make a simple edit to a file (pure Python version)

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited
before A pattern to find in order to replace with `after`
after Text that will replace `before`
limit [`''`] An initial pattern to search for before searching for `before`
backup [`.bak`] The file will be backed up before edit with this file extension; **WARNING:** each time `sed`/`comment`/`uncomment` is called will overwrite this backup
flags [`gMS`]

Flags to modify the search. Valid values are:

- `g`: Replace all occurrences of the pattern, not just the first.
- `I`: Ignore case.
- `L`: Make `\w`, `\W`, `\b`, `\B`, `\s` and `\S` dependent on the locale.
- `M`: Treat multiple lines as a single line.
- `S`: Make `.` match all characters, including newlines.
- `U`: Make `\w`, `\W`, `\b`, `\B`, `\d`, `\D`, `\s` and `\S` dependent on Unicode.
- `X`: Verbose (whitespace is ignored).

multi: **`False`** If True, treat the entire file as a single line

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.**read**(*path*, *binary=False*)

New in version 2017.7.0.

Return the content of the file.

CLI Example:

```
salt '*' file.read /path/to/file
```

salt.modules.file.**readdir**(*path*)

New in version 2014.1.0.

Return a list containing the contents of a directory

CLI Example:

```
salt '*' file.readdir /path/to/dir/
```

salt.modules.file.**readlink**(*path*, *canonicalize=False*)

New in version 2014.1.0.

Return the path that a symlink points to If canonicalize is set to True, then it return the final target

CLI Example:

```
salt '*' file.readlink /path/to/link
```

salt.modules.file.**remove**(*path*)

Remove the named file. If a directory is supplied, it will be recursively deleted.

CLI Example:

```
salt '*' file.remove /tmp/foo
```

salt.modules.file.**rename**(*src*, *dst*)

Rename a file or directory

CLI Example:

```
salt '*' file.rename /path/to/src /path/to/dst
```

salt.modules.file.**replace**(*path*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *backup='.bak'*, *dry_run=False*, *search_only=False*, *show_changes=True*, *ignore_if_missing=False*, *preserve_inode=True*, *backslash_literal=False*)

New in version 0.17.0.

Replace occurrences of a pattern in a file. If `show_changes` is `True`, then a diff of what changed will be returned, otherwise a `True` will be returned when changes are made, and `False` when no changes are made.

This is a pure Python implementation that wraps Python's `sub()`.

path Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python's `search()`.

repl The replacement text

count [0] Maximum number of pattern occurrences to be replaced. If count is a positive integer `n`, only `n` occurrences will be replaced, otherwise all occurrences will be replaced.

flags (list or int) A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE','MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which supports `MULTILINE').

bufsize (int or str) How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found [False] New in version 2014.7.0.

If set to `True`, and pattern is not found, then the content will be appended to the file.

prepend_if_not_found [False] New in version 2014.7.0.

If set to `True` and pattern is not found, then the content will be prepended to the file.

not_found_content New in version 2014.7.0.

Content to use for append/prepend if not found. If None (default), uses `repl`. Useful when `repl` uses references to group in pattern.

backup [.bak] The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

dry_run [False] If set to `True`, no changes will be made to the file, the function will just return the changes that would have been made (or a `True`/`False` value if `show_changes` is set to `False`).

search_only [False] If set to true, this no changes will be performed on the file, and this function will simply return `True` if the pattern was matched, and `False` if not.

show_changes [True] If `True`, return a diff of changes made. Otherwise, return `True` if changes were made, and `False` if not.

Note: Using this option will store two copies of the file in memory (the original version and the edited version) in order to generate the diff. This may not normally be a concern, but could impact performance if used with large files.

---

ignore_if_missing [False] New in version 2015.8.0.

If set to `True`, this function will simply return `False` if the file doesn't exist. Otherwise, an error will be thrown.

preserve_inode [True] New in version 2015.8.0.

Preserve the inode of the file, so that any hard links continue to share the inode with the original filename. This works by *copying* the file, reading from the copy, and writing to the file at the original inode. If `False`, the file will be *moved* rather than copied, and a new file will be written to a new inode, but using the original filename. Hard links will then share an inode with the backup, instead (if using `backup` to create a backup copy).

backslash_literal [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

If an equal sign (=) appears in an argument to a Salt command it is interpreted as a keyword argument in the format `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
salt '*' file.replace /path/to/file pattern='=' repl=':'
salt '*' file.replace /path/to/file pattern="bind-address\s*=" repl='bind-address:
 ↪'
```

CLI Examples:

```
salt '*' file.replace /etc/httpd/httpd.conf pattern='LogLevel warn' repl=
 ↪'LogLevel info'
salt '*' file.replace /some/file pattern='before' repl='after' flags='[MULTILINE,
 ↪IGNORECASE]'
```

`salt.modules.file.`**`restore_backup`**(*path*, *backup_id*)

New in version 0.17.0.

Restore a previous version of a file that was backed up using Salt's *file state backup* system.

path The path on the minion to check for backups
backup_id The numeric id for the backup you wish to restore, as found using *file.list_backups*
CLI Example:

```
salt '*' file.restore_backup /foo/bar/baz.txt 0
```

salt.modules.file.**restorecon**(*path*, *recursive=False*)
Reset the SELinux context on a given path

CLI Example:

```
salt '*' file.restorecon /home/user/.ssh/authorized_keys
```

salt.modules.file.**rmdir**(*path*)
New in version 2014.1.0.

Remove the specified directory. Fails if a directory is not empty.

CLI Example:

```
salt '*' file.rmdir /tmp/foo/
```

salt.modules.file.**search**(*path*, *pattern*, *flags=8*, *bufsize=1*, *ignore_if_missing=False*, *multiline=False*)
New in version 0.17.0.

Search for occurrences of a pattern in a file

Except for multiline, params are identical to *replace()*.
multiline If true, inserts `MULTILINE' into `flags` and sets `bufsize` to `file'.

New in version 2015.8.0.

CLI Example:

```
salt '*' file.search /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.**sed**(*path*, *before*, *after*, *limit=''*, *backup='.bak'*, *options='-r -e'*, *flags='g'*, *escape_all=False*, *negate_match=False*)
Deprecated since version 0.17.0: Use *replace()* instead.

Make a simple edit to a file

Equivalent to:

```
sed <backup> <options> "/<limit>/ s/<before>/<after>/<flags> <file>"
```

path The full path to the file to be edited
before A pattern to find in order to replace with `after`
after Text that will replace `before`
limit [`''`] An initial pattern to search for before searching for `before`
backup [`.bak`] The file will be backed up before edit with this file extension; **WARNING:** each time `sed`/`comment`/`uncomment` is called will overwrite this backup
options [`-r -e`] Options to pass to sed
flags [`g`] Flags to modify the sed search; e.g., `i` for case-insensitive pattern matching
negate_match [False] Negate the search command (`!`)

New in version 0.17.0.

Forward slashes and single quotes will be escaped automatically in the `before` and `after` patterns.

CLI Example:

```
salt '*' file.sed /etc/httpd/httpd.conf 'LogLevel warn' 'LogLevel info'
```

salt.modules.file.**sed_contains**(*path*, *text*, *limit=''*, *flags='g'*)

Deprecated since version 0.17.0: Use *search()* instead.

Return True if the file at path contains text. Utilizes sed to perform the search (line-wise search).

Note: the p flag will be added to any flags you pass in.

CLI Example:

```
salt '*' file.contains /etc/crontab 'mymaintenance.sh'
```

salt.modules.file.**seek_read**(*path*, *size*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and read it
path path to file
seek amount to read at once
offset offset to start into the file
CLI Example:

```
salt '*' file.seek_read /path/to/file 4096 0
```

salt.modules.file.**seek_write**(*path*, *data*, *offset*)

New in version 2014.1.0.

Seek to a position on a file and write to it
path path to file
data data to write to file
offset position in file to start writing
CLI Example:

```
salt '*' file.seek_write /path/to/file 'some data' 4096
```

salt.modules.file.**set_mode**(*path*, *mode*)

Set the mode of a file
path file or directory of which to set the mode
mode mode to set the path to
CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

salt.modules.file.**set_selinux_context**(*path*, *user=None*, *role=None*, *type=None*, *range=None*)

Set a specific SELinux label on a given path

CLI Example:

```
salt '*' file.set_selinux_context path <role> <type> <range>
```

salt.modules.file.**source_list**(*source*, *source_hash*, *saltenv*)

Check the source list and return the source to use

CLI Example:

```
salt '*' file.source_list salt://http/httpd.conf '{hash_type: 'md5', 'hsum':
↪<md5sum>}' base
```

salt.modules.file.**stats**(*path*, *hash_type=None*, *follow_symlinks=True*)
Return a dict containing the stats for a given file

CLI Example:

```
salt '*' file.stats /etc/passwd
```

salt.modules.file.**statvfs**(*path*)
New in version 2014.1.0.

Perform a statvfs call against the filesystem that the file resides on

CLI Example:

```
salt '*' file.statvfs /path/to/file
```

salt.modules.file.**symlink**(*src*, *path*)
Create a symbolic link (symlink, soft link) to a file

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.file.**touch**(*name*, *atime=None*, *mtime=None*)
New in version 0.9.5.

Just like the `touch` command, create a file if it doesn't exist or simply update the atime and mtime if it already does.
atime: Access time in Unix epoch time
mtime: Last modification in Unix epoch time
CLI Example:

```
salt '*' file.touch /var/log/emptyfile
```

salt.modules.file.**truncate**(*path*, *length*)
New in version 2014.1.0.

Seek to a position on a file and delete everything after that point
path path to file
length offset into file to truncate
CLI Example:

```
salt '*' file.truncate /path/to/file 512
```

salt.modules.file.**uid_to_user**(*uid*)
Convert a uid to a user name
uid uid to convert to a username
CLI Example:

```
salt '*' file.uid_to_user 0
```

salt.modules.file.**uncomment**(*path*, *regex*, *char='#'*, *backup='.bak'*)
Deprecated since version 0.17.0: Use *replace()* instead.

Uncomment specified commented lines in a file
path The full path to the file to be edited
regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading ^ character will be stripped for convenience (for easily switching between comment() and uncomment()).

char [#] The character to remove in order to uncomment a line
backup [.bak] The file will be backed up before edit with this file extension; **WARNING:** each time `sed/comment/uncomment` is called will overwrite this backup
CLI Example:

```
salt '*' file.uncomment /etc/hosts.deny 'ALL: PARANOID'
```

`salt.modules.file.`**`user_to_uid`**(*user*)
Convert user name to a uid
user user name to convert to its uid
CLI Example:

```
salt '*' file.user_to_uid root
```

`salt.modules.file.`**`write`**(*path*, **args*, ***kwargs*)
New in version 2014.7.0.

Write text to a file, overwriting any existing contents.
path path to file
***args** strings to write to the file
CLI Example:

```
salt '*' file.write /etc/motd \
        "With all thine offerings thou shalt offer salt."
```

Attention

If you need to pass a string to append and that string contains an equal sign, you **must** include the argument name, args. For example:

```
salt '*' file.write /etc/motd args='cheese=spam'

salt '*' file.write /etc/motd args="['cheese=spam','spam=cheese']"
```

19.9.117 salt.modules.firewalld

Support for firewalld.

New in version 2015.2.0.

`salt.modules.firewalld.`**`add_interface`**(*zone*, *interface*, *permanent=True*)
Bind an interface to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_interface zone eth0
```

`salt.modules.firewalld.`**`add_masquerade`**(*zone=None*, *permanent=True*)
Enable masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_masquerade
```

To enable masquerade on a specific zone

```
salt '*' firewalld.add_masquerade dmz
```

salt.modules.firewalld.**add_port**(*zone*, *port*, *permanent=True*)

Allow specific ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port internal 443/tcp
```

salt.modules.firewalld.**add_port_fwd**(*zone*, *src*, *dest*, *proto='tcp'*, *dstaddr=''*, *permanent=True*)

Add port forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.add_port_fwd public 80 443 tcp
```

salt.modules.firewalld.**add_rich_rule**(*zone*, *rule*, *permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_rich_rule zone 'rule'
```

salt.modules.firewalld.**add_service**(*service*, *zone=None*, *permanent=True*)

Add a service for zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.add_service ssh
```

To assign a service to a specific zone:

```
salt '*' firewalld.add_service ssh my_zone
```

salt.modules.firewalld.**add_service_port**(*service*, *port*)

Add a new port to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_port zone 80
```

salt.modules.firewalld.**add_service_protocol**(*service*, *protocol*)

Add a new protocol to the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.add_service_protocol zone ssh
```

salt.modules.firewalld.**add_source**(*zone*, *source*, *permanent=True*)
Bind a source to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.add_source zone 192.168.1.0/24
```

salt.modules.firewalld.**allow_icmp**(*zone*, *icmp*, *permanent=True*)
Allow a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.allow_icmp zone echo-reply
```

salt.modules.firewalld.**block_icmp**(*zone*, *icmp*, *permanent=True*)
Block a specific ICMP type on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.block_icmp zone echo-reply
```

salt.modules.firewalld.**default_zone**()
Print default zone for connections and interfaces

CLI Example:

```
salt '*' firewalld.default_zone
```

salt.modules.firewalld.**delete_service**(*name*, *restart=True*)
Delete an existing service

CLI Example:

```
salt '*' firewalld.delete_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_service my_service False
```

salt.modules.firewalld.**delete_zone**(*zone*, *restart=True*)
Delete an existing zone

CLI Example:

```
salt '*' firewalld.delete_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.delete_zone my_zone False
```

salt.modules.firewalld.**get_icmp_types**(*permanent=True*)
Print predefined icmptypes

CLI Example:

```
salt '*' firewalld.get_icmp_types
```

salt.modules.firewalld.**get_interfaces**(*zone*, *permanent=True*)
List interfaces bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_interfaces zone
```

salt.modules.firewalld.**get_masquerade**(*zone=None*, *permanent=True*)
Show if masquerading is enabled on a zone. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.get_masquerade zone
```

salt.modules.firewalld.**get_rich_rules**(*zone*, *permanent=True*)
List rich rules bound to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_rich_rules zone
```

salt.modules.firewalld.**get_service_ports**(*service*)
List ports of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_ports zone
```

salt.modules.firewalld.**get_service_protocols**(*service*)
List protocols of a service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.get_service_protocols zone
```

salt.modules.firewalld.**get_services**(*permanent=True*)
Print predefined services

CLI Example:

```
salt '*' firewalld.get_services
```

salt.modules.firewalld.**get_sources**(*zone*, *permanent=True*)
List sources bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.get_sources zone
```

salt.modules.firewalld.**get_zones**(*permanent=True*)
Print predefined zones

CLI Example:

```
salt '*' firewalld.get_zones
```

salt.modules.firewalld.**list_all**(*zone=None*, *permanent=True*)
List everything added for or enabled in a zone

CLI Example:

```
salt '*' firewalld.list_all
```

List a specific zone

```
salt '*' firewalld.list_all my_zone
```

salt.modules.firewalld.**list_icmp_block**(*zone*, *permanent=True*)
List ICMP blocks on a zone

New in version 2015.8.0.

CLI Example:

```
salt '*' firewlld.list_icmp_block zone
```

salt.modules.firewalld.**list_port_fwd**(*zone*, *permanent=True*)
List port forwarding

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_port_fwd public
```

salt.modules.firewalld.**list_ports**(*zone*, *permanent=True*)
List all ports in a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.list_ports
```

salt.modules.firewalld.**list_services**(*zone=None*, *permanent=True*)
List services added for zone as a space separated list. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.list_services
```

List a specific zone

```
salt '*' firewalld.list_services my_zone
```

salt.modules.firewalld.**list_zones**(*permanent=True*)
List everything added for or enabled in all zones

CLI Example:

```
salt '*' firewalld.list_zones
```

salt.modules.firewalld.**make_permanent**()
Make current runtime configuration permanent.

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.make_permanent
```

salt.modules.firewalld.**new_service**(*name*, *restart=True*)
Add a new service

CLI Example:

```
salt '*' firewalld.new_service my_service
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_service my_service False
```

salt.modules.firewalld.**new_zone**(*zone*, *restart=True*)
Add a new zone

CLI Example:

```
salt '*' firewalld.new_zone my_zone
```

By default firewalld will be reloaded. However, to avoid reloading you need to specify the restart as False

```
salt '*' firewalld.new_zone my_zone False
```

salt.modules.firewalld.**reload_rules**()
Reload the firewall rules, which makes the permanent configuration the new runtime configuration without losing state information.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.reload
```

salt.modules.firewalld.**remove_interface**(*zone*, *interface*, *permanent=True*)
Remove an interface bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_interface zone eth0
```

salt.modules.firewalld.**remove_masquerade**(*zone=None*, *permanent=True*)
Remove masquerade on a zone. If zone is omitted, default zone will be used.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_masquerade
```

To remove masquerade on a specific zone

```
salt '*' firewalld.remove_masquerade dmz
```

salt.modules.firewalld.**remove_port**(*zone*, *port*, *permanent=True*)

Remove a specific port from a zone.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port internal 443/tcp
```

salt.modules.firewalld.**remove_port_fwd**(*zone*, *src*, *dest*, *proto='tcp'*, *dstaddr=''*, *permanent=True*)

Remove Port Forwarding.

New in version 2015.8.0.

CLI Example:

```
salt '*' firewalld.remove_port_fwd public 80 443 tcp
```

salt.modules.firewalld.**remove_rich_rule**(*zone*, *rule*, *permanent=True*)

Add a rich rule to a zone

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_rich_rule zone 'rule'
```

salt.modules.firewalld.**remove_service**(*service*, *zone=None*, *permanent=True*)

Remove a service from zone. This option can be specified multiple times. If zone is omitted, default zone will be used.

CLI Example:

```
salt '*' firewalld.remove_service ssh
```

To remove a service from a specific zone

```
salt '*' firewalld.remove_service ssh dmz
```

salt.modules.firewalld.**remove_service_port**(*service*, *port*)

Remove a port from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_port zone 80
```

salt.modules.firewalld.**remove_service_protocol**(*service*, *protocol*)

Remove a protocol from the specified service.

New in version 2016.11.0.

CLI Example:

```
salt '*' firewalld.remove_service_protocol zone ssh
```

salt.modules.firewalld.**remove_source**(*zone*, *source*, *permanent=True*)
Remove a source bound to a zone

New in version 2016.3.0.

CLI Example:

```
salt '*' firewalld.remove_source zone 192.168.1.0/24
```

salt.modules.firewalld.**set_default_zone**(*zone*)
Set default zone

CLI Example:

```
salt '*' firewalld.set_default_zone damian
```

salt.modules.firewalld.**version**()
Return version from firewall-cmd

CLI Example:

```
salt '*' firewalld.version
```

19.9.118 salt.modules.freebsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.freebsd_sysctl.**assign**(*name*, *value*)
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

salt.modules.freebsd_sysctl.**get**(*name*)
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.freebsd_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*)
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/boot/loader.conf
```

salt.modules.freebsd_sysctl.**show**(*config_file=False*)
Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

19.9.119 salt.modules.freebsd_update module

Support for freebsd-update utility on FreeBSD.

New in version 2017.7.0.

maintainer George Mamalakis <mamalos@gmail.com>

maturity new

platform FreeBSD

salt.modules.freebsd_update.**fetch**(***kwargs*)
New in version 2016.3.4.

freebsd-update fetch wrapper. Based on the currently installed world and the configuration options set, fetch all available binary updates.
kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.**ids**(***kwargs*)
New in version 2016.3.4.

freebsd-update IDS wrapper function. Compares the system against a ``known good'' index of the installed release.
kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.**install**(***kwargs*)
New in version 2016.3.4.

freebsd-update install wrapper. Install the most recently fetched updates or upgrade.
kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.**rollback**(***kwargs*)
New in version 2016.3.4.

freebsd-update rollback wrapper. Uninstalls the most recently installed updates.
kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.**update**(***kwargs*)
New in version 2016.3.4.

Command that simplifies freebsd-update by running freebsd-update fetch first and then freebsd-update install.
kwargs: Parameters of freebsd-update command.

salt.modules.freebsd_update.**upgrade**(***kwargs*)
New in version 2016.3.4.

Dummy function used only to print a message that upgrade is not available. The reason is that upgrade needs manual intervention and reboot, so even if used with:

```
yes | freebsd-upgrade -r VERSION
```

the additional freebsd-update install that needs to run after the reboot cannot be implemented easily.
kwargs: Parameters of freebsd-update command.

19.9.120 salt.modules.freebsdjail

The jail module for FreeBSD

salt.modules.freebsdjail.**fstab**(*jail*)
Display contents of a fstab(5) file defined in specified jail's configuration. If no file is defined, return False.

CLI Example:

```
salt '*' jail.fstab <jail name>
```

salt.modules.freebsdjail.**get_enabled**()
Return which jails are set to be run

CLI Example:

```
salt '*' jail.get_enabled
```

salt.modules.freebsdjail.**is_enabled**()
See if jail service is actually enabled on boot

CLI Example:

```
salt '*' jail.is_enabled <jail name>
```

salt.modules.freebsdjail.**restart**(*jail=''*)
Restart the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.restart [<jail name>]
```

salt.modules.freebsdjail.**show_config**(*jail*)
Display specified jail's configuration

CLI Example:

```
salt '*' jail.show_config <jail name>
```

salt.modules.freebsdjail.**start**(*jail=''*)
Start the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.start [<jail name>]
```

salt.modules.freebsdjail.**status**(*jail*)
See if specified jail is currently running

CLI Example:

```
salt '*' jail.status <jail name>
```

salt.modules.freebsdjail.**stop**(*jail=''*)
Stop the specified jail or all, if none specified

CLI Example:

```
salt '*' jail.stop [<jail name>]
```

salt.modules.freebsdjail.**sysctl**()
Dump all jail related kernel states (sysctl)

CLI Example:

```
salt '*' jail.sysctl
```

19.9.121 salt.modules.freebsdkmod

Module to manage FreeBSD kernel modules

salt.modules.freebsdkmod.**available**()
Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

salt.modules.freebsdkmod.**check_available**(*mod*)
Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available vmm
```

salt.modules.freebsdkmod.**is_loaded**(*mod*)
Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded vmm
```

salt.modules.freebsdkmod.**load**(*mod*, *persist=False*)
Load the specified kernel module
mod Name of the module to add
persist Write the module to sysrc kld_modules to make it load on system reboot
CLI Example:

```
salt '*' kmod.load bhyve
```

salt.modules.freebsdkmod.**lsmod**()
Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

salt.modules.freebsdkmod.**mod_list**(*only_persist=False*)
Return a list of the loaded module names

CLI Example:

```
salt '*' kmod.mod_list
```

salt.modules.freebsdkmod.**remove**(*mod*, *persist=False*)
Remove the specified kernel module

CLI Example:

```
salt '*' kmod.remove vmm
```

19.9.122 salt.modules.freebsdpkg

Remote package support using `pkg_add(1)`

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

Warning: This module has been completely rewritten. Up to and including version 0.17.0, it supported `pkg_add(1)`, but checked for the existence of a pkgng local database and, if found, would provide some of pkgng's functionality. The rewrite of this module has removed all pkgng support, and moved it to the *pkgng* execution module. For versions <= 0.17.0, the documentation here should not be considered accurate. If your Minion is running one of these versions, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkg
```

This module acts as the default package provider for FreeBSD 9 and older. If you need to use pkgng on a FreeBSD 9 system, you will need to override the `pkg` provider by setting the *`providers`* parameter in your Minion config file, in order to use pkgng.

```
providers:
  pkg: pkgng
```

More information on pkgng support can be found in the documentation for the *pkgng* module.

This module will respect the `PACKAGEROOT` and `PACKAGESITE` environment variables, if set, but these values can also be overridden in several ways:

1. **Salt configuration parameters.** The configuration parameters `freebsdpkg.PACKAGEROOT` and `freebsdpkg.PACKAGESITE` are recognized. These config parameters are looked up using *`config.get`* and can thus be specified in the Master config file, Grains, Pillar, or in the Minion config file. Example:

   ```
   freebsdpkg.PACKAGEROOT: ftp://ftp.freebsd.org/
   freebsdpkg.PACKAGESITE: ftp://ftp.freebsd.org/pub/FreeBSD/ports/ia64/packages-9-
    ↪stable/Latest/
   ```

2. **CLI arguments.** Both the `packageroot` (used interchangeably with `fromrepo` for API compatibility) and `packagesite` CLI arguments are recognized, and override their config counterparts from section 1 above.

   ```
       salt -G 'os:FreeBSD' pkg.install zsh fromrepo=ftp://ftp2.freebsd.org/
       salt -G 'os:FreeBSD' pkg.install zsh packageroot=ftp://ftp2.freebsd.org/
       salt -G 'os:FreeBSD' pkg.install zsh packagesite=ftp://ftp2.freebsd.org/pub/
    ↪FreeBSD/ports/ia64/packages-9-stable/Latest/

   .. note::

       These arguments can also be passed through in states:

       .. code-block:: yaml

           zsh:
             pkg.installed:
               - fromrepo: ftp://ftp2.freebsd.org/
   ```

`salt.modules.freebsdpkg.`**`file_dict`**`(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.freebsdpkg.**file_list**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.freebsdpkg.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Install package(s) using pkg_add(1)

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo or packageroot Specify a package repository from which to install. Overrides the system default, as well as the PACKAGEROOT environment variable.

packagesite Specify the exact directory from which to install the remote package. Overrides the PACKAGESITE environment variable, if present.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↪deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

salt.modules.freebsdpkg.**latest_version**(**names*, ***kwargs*)

pkg_add(1) is not capable of querying for remote packages, so this function will always return results as if there is no package available for install or upgrade.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.freebsdpkg.**list_pkgs**(*versions_as_list=False*, *with_origin=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.freebsdpkg.**refresh_db**()

`pkg_add(1)` does not use a local database of available packages, so this function simply returns `True`. it exists merely for API compatibility.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.freebsdpkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove packages using `pkg_delete(1)`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.freebsdpkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.123 salt.modules.freebsdports

Install software from the FreeBSD `ports(7)` system

New in version 2014.1.0.

This module allows you to install ports using `BATCH=yes` to bypass configuration prompts. It is recommended to use the `ports state` to install ports, but it it also possible to use this module exclusively from the command line.

```
salt minion-id ports.config security/nmap IPV6=off
salt minion-id ports.install security/nmap
```

salt.modules.freebsdports.**config**(*name*, *reset=False*, ***kwargs*)

Modify configuration options for a given port. Multiple options can be specified. To see the available options for a port, use *ports.showconfig*.

name The port name, in `category/name` format

reset [False] If `True`, runs a `make rmconfig` for the port, clearing its configuration before setting the desired options

CLI Examples:

```
salt '*' ports.config security/nmap IPV6=off
```

salt.modules.freebsdports.**deinstall**(*name*)

De-install a port.

CLI Example:

```
salt '*' ports.deinstall security/nmap
```

salt.modules.freebsdports.**install**(*name*, *clean=True*)

Install a port from the ports tree. Installs using `BATCH=yes` for non-interactive building. To set config options for a given port, use *ports.config*.

clean [True] If `True`, cleans after installation. Equivalent to running `make install clean BATCH=yes`.

Note: It may be helpful to run this function using the `-t` option to set a higher timeout, since compiling a port may cause the Salt command to exceed the default timeout.

CLI Example:

```
salt -t 1200 '*' ports.install security/nmap
```

salt.modules.freebsdports.**list_all**()

Lists all ports available.

CLI Example:

```
salt '*' ports.list_all
```

Warning: Takes a while to run, and returns a **LOT** of output

salt.modules.freebsdports.**rmconfig**(*name*)

Clear the cached options for the specified port; run a `make rmconfig`

name The name of the port to clear

CLI Example:

```
salt '*' ports.rmconfig security/nmap
```

salt.modules.freebsdports.**search**(*name*)

Search for matches in the ports tree. Globs are supported, and the category is optional

CLI Examples:

```
salt '*' ports.search 'security/*'
salt '*' ports.search 'security/n*'
salt '*' ports.search nmap
```

Warning: Takes a while to run

salt.modules.freebsdports.**showconfig**(*name*, *default=False*, *dict_return=False*)

Show the configuration options for a given port.

default [False] Show the default options for a port (not necessarily the same as the current configuration)

dict_return [False] Instead of returning the output of `make showconfig`, return the data in an dictionary

CLI Example:

```
salt '*' ports.showconfig security/nmap
salt '*' ports.showconfig security/nmap default=True
```

salt.modules.freebsdports.**update**(*extract=False*)

Update the ports tree

extract [False] If `True`, runs a `portsnap extract` after fetching, should be used for first-time installation of the ports tree.

CLI Example:

```
salt '*' ports.update
```

19.9.124 salt.modules.freebsdservice

The service module for FreeBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

salt.modules.freebsdservice.**available**(*name*, *jail=None*)

Check that the given service is available.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.freebsdservice.**disable**(*name*, ***kwargs*)

Disable the named service to start at boot

Arguments the same as for enable()

Changed in version 2016.3.4.

jail (optional keyword argument) the jail's id or name

chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.freebsdservice.**disabled**(*name*, ***kwargs*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.freebsdservice.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot

name service name

config [/etc/rc.conf] Config file for managing service. If config value is empty string, then /etc/rc.conf.d/<service> used. See man rc.conf(5) for details.

Also service.config variable can be used to change default.

Changed in version 2016.3.4.

jail (optional keyword argument) the jail's id or name

chroot (optional keyword argument) the jail's chroot, if the jail's /etc is not mounted read-write

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.freebsdservice.**enabled**(*name*, ***kwargs*)

Return True if the named service is enabled, false otherwise

name Service name

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.freebsdservice.**get_all**(*jail=None*)

Return a list of all available services

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.get_all
```

salt.modules.freebsdservice.**get_disabled**(*jail=None*)

Return what services are available but not enabled to start at boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.freebsdservice.**get_enabled**(*jail=None*)

Return what services are set to run on boot

Changed in version 2016.3.4.

Support for jail (representing jid or jail name) keyword argument in kwargs

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.freebsdservice.**missing**(*name*, *jail=None*)

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.freebsdservice.**reload**(*name*, *jail=None*)

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.freebsdservice.**restart**(*name*, *jail=None*)

Restart the named service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.freebsdservice.**start**(*name*, *jail=None*)

Start the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.freebsdservice.**status**(*name*, *sig=None*, *jail=None*)

Return the status for a service (True or False).

name Name of service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.freebsdservice.**stop**(*name*, *jail=None*)

Stop the specified service

Changed in version 2016.3.4.

jail: optional jid or jail name

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.125 salt.modules.gem

Manage ruby gems.

salt.modules.gem.**install**(*gems*, *ruby=None*, *gem_bin=None*, *runas=None*, *version=None*, *rdoc=False*, *ri=False*, *pre_releases=False*, *proxy=None*, *source=None*)

Installs one or several gems.

Parameters

- **gems** -- string The gems to install
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.
- **version** -- string : None Specify the version to install for the gem. Doesn't play nice with multiple gems at once
- **rdoc** -- boolean : False Generate RDoc documentation for the gem(s).
- **ri** -- boolean : False Generate RI documentation for the gem(s).
- **pre_releases** -- boolean : False Include pre-releases in the available versions
- **proxy** -- string : None Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname{[}:port]

source [None] Use the specified HTTP gem source server to download gem. Format: http://hostname{[}:port]

CLI Example:

```
salt '*' gem.install vagrant

salt '*' gem.install redphone gem_bin=/opt/sensu/embedded/bin/gem
```

salt.modules.gem.**list**(*prefix=''*, *ruby=None*, *runas=None*, *gem_bin=None*)

List locally installed gems.

Parameters

- **prefix** -- string : Only list gems when the name matches this prefix.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.list
```

salt.modules.gem.**list_upgrades**(*ruby=None*, *runas=None*, *gem_bin=None*)

New in version 2015.8.0.

Check if an upgrade is available for installed gems

gem_bin [None] Full path to `gem` binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

runas [None] The user to run gem as.

CLI Example:

```
salt '*' gem.list_upgrades
```

`salt.modules.gem.`**`sources_add`**(*source_uri*, *ruby=None*, *runas=None*, *gem_bin=None*)

Add a gem source.

Parameters

- **`source_uri`** -- string The source URI to add.
- **`gem_bin`** -- string : None Full path to `gem` binary to use.
- **`ruby`** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_add http://rubygems.org/
```

`salt.modules.gem.`**`sources_list`**(*ruby=None*, *runas=None*, *gem_bin=None*)

List the configured gem sources.

Parameters

- **`gem_bin`** -- string : None Full path to `gem` binary to use.
- **`ruby`** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_list
```

`salt.modules.gem.`**`sources_remove`**(*source_uri*, *ruby=None*, *runas=None*, *gem_bin=None*)

Remove a gem source.

Parameters

- **`source_uri`** -- string The source URI to remove.
- **`gem_bin`** -- string : None Full path to `gem` binary to use.
- **`ruby`** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **`runas`** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.sources_remove http://rubygems.org/
```

`salt.modules.gem.`**`uninstall`**(*gems*, *ruby=None*, *runas=None*, *gem_bin=None*)

Uninstall one or several gems.

Parameters

- **`gems`** -- string The gems to uninstall.
- **`gem_bin`** -- string : None Full path to `gem` binary to use.

- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.uninstall vagrant
```

`salt.modules.gem.`**`update`**(*gems*, *ruby=None*, *runas=None*, *gem_bin=None*)

Update one or several gems.

Parameters

- **gems** -- string The gems to update.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update vagrant
```

`salt.modules.gem.`**`update_system`**(*version=''*, *ruby=None*, *runas=None*, *gem_bin=None*)

Update rubygems.

Parameters

- **version** -- string : (newest) The version of rubygems to install.
- **gem_bin** -- string : None Full path to `gem` binary to use.
- **ruby** -- string : None If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.
- **runas** -- string : None The user to run gem as.

CLI Example:

```
salt '*' gem.update_system
```

19.9.126 salt.modules.genesis

Module for managing container and VM images

New in version 2014.7.0.

`salt.modules.genesis.`**`avail_platforms`**()

Return which platforms are available

CLI Example:

```
salt myminion genesis.avail_platforms
```

`salt.modules.genesis.`**`bootstrap`**(*platform*, *root*, *img_format='dir'*, *fs_format='ext2'*, *fs_opts=None*, *arch=None*, *flavor=None*, *repo_url=None*, *static_qemu=None*, *img_size=None*, *mount_dir=None*, *pkg_cache=None*, *pkgs=None*, *exclude_pkgs=None*, *epel_url='http://download.fedoraproject.org/pub/epel/6/i386/epel-release-6-8.noarch.rpm'*)

Create an image for a specific platform.

Please note that this function *MUST* be run as root, as images that are created make files belonging to root.

platform Which platform to use to create the image. Currently supported platforms are rpm, deb and pacman.

root Local path to create the root of the image filesystem.

img_format Which format to create the image in. By default, just copies files into a directory on the local filesystem (`dir`). Future support will exist for `sparse`.

fs_format When using a non-`dir` `img_format`, which filesystem to format the image to. By default, `ext2`.

fs_opts When using a non-`dir` `img_format`, a dict of opts may be specified.

arch Architecture to install packages for, if supported by the underlying bootstrap tool. Currently only used for deb.

flavor Which flavor of operating system to install. This correlates to a specific directory on the distribution repositories. For instance, `wheezy` on Debian.

repo_url Mainly important for Debian-based repos. Base URL for the mirror to install from. (e.x.: http://ftp.debian.org/debian/)

static_qemu Local path to the static qemu binary required for this arch. (e.x.: /usr/bin/qemu-amd64-static)

pkg_confs The location of the conf files to copy into the image, to point the installer to the right repos and configuration.

img_size If img_format is not `dir`, then the size of the image must be specified.

mount_dir If img_format is not `dir`, then the image must be mounted somewhere. If the `mount_dir` is not specified, then it will be created at `/opt/salt-genesis.<random_uuid>`. This directory will be unmounted and removed when the process is finished.

pkg_cache This points to a directory containing a cache of package files to be copied to the image. It does not need to be specified.

pkgs A list of packages to be installed on this image. For RedHat, this will include `yum`, `centos-release` and `iputils` by default.

exclude_pkgs A list of packages to be excluded. If you do not want to install the defaults, you need to include them in this list.

epel_url The URL to download the EPEL release package from.

CLI Examples:

```
salt myminion genesis.bootstrap pacman /root/arch
salt myminion genesis.bootstrap rpm /root/redhat
salt myminion genesis.bootstrap deb /root/wheezy arch=amd64
 ↪flavor=wheezy static_qemu=/usr/bin/qemu-x86_64-static
```

`salt.modules.genesis.`**`ldd_deps`**(*filename*, *ret=None*)

Recurse through a set of dependencies reported by `ldd`, to find associated dependencies.

Please note that this does not necessarily resolve all (non-package) dependencies for a file; but it does help.

CLI Example:

salt myminion genesis.ldd_deps bash salt myminion genesis.ldd_deps /bin/bash

`salt.modules.genesis.`**`mksls`**(*fmt*, *src*, *dst=None*)

Convert an installation file/script to an SLS file. Currently supports `kickstart`, `preseed`, and `autoyast`.

CLI Examples:

salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg salt <minion> genesis.mksls kickstart /path/to/kickstart.cfg /path/to/dest.sls

New in version Beryllium.

`salt.modules.genesis.`**`pack`**(*name*, *root*, *path=None*, *pack_format='tar'*, *compress='bzip2'*)

Pack up a directory structure, into a specific format

CLI Examples:

```
salt myminion genesis.pack centos /root/centos
salt myminion genesis.pack centos /root/centos pack_format='tar'
```

```
```

salt.modules.genesis.**unpack**(*name*, *dest=None*, *path=None*, *pack_format='tar'*, *compress='bz2'*)
Unpack an image into a directory structure

CLI Example:

```
salt myminion genesis.unpack centos /root/centos
```

19.9.127 salt.modules.gentoo_service

Top level package command wrapper, used to translate the os detected by grains to the correct service manager

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

salt.modules.gentoo_service.**available**(*name*)
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.gentoo_service.**disable**(*name*, ***kwargs*)
Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name> <runlevels=single-runlevel>
salt '*' service.disable <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.**disabled**(*name*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name> <runlevels=[runlevel]>
```

salt.modules.gentoo_service.**enable**(*name*, ***kwargs*)
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name> <runlevels=single-runlevel>
salt '*' service.enable <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.**enabled**(*name*, ***kwargs*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name> <runlevels=single-runlevel>
salt '*' service.enabled <service name> <runlevels=[runlevel1,runlevel2]>
```

salt.modules.gentoo_service.**get_all**()
Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.gentoo_service.**get_disabled**()
Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.gentoo_service.**get_enabled**()
Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.gentoo_service.**missing**(*name*)
The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.gentoo_service.**reload_**(*name*)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.gentoo_service.**restart**(*name*)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.gentoo_service.**start**(*name*)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.gentoo_service.**status**(*name*, *sig=None*)
Return the status for a service, returns the PID or an empty string if the service is running or not, pass a signature to use to find the service via ps

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.gentoo_service.**stop**(*name*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

salt.modules.gentoo_service.**zap**(*name*)

Resets service state

CLI Example:

```
salt '*' service.zap <service name>
```

19.9.128 salt.modules.gentoolkitmod

Support for Gentoolkit

salt.modules.gentoolkitmod.**eclean_dist**(*destructive=False*, *package_names=False*, *size_limit=0*, *time_limit=0*, *fetch_restricted=False*, *exclude_file='/etc/eclean/distfiles.exclude'*)

Clean obsolete portage sources

destructive Only keep minimum for reinstallation

package_names Protect all versions of installed packages. Only meaningful if used with destructive=True

size_limit <size> Don't delete distfiles bigger than <size>. <size> is a size specification: ``10M'' is ``ten megabytes'', ``200K'' is ``two hundreds kilobytes'', etc. Units are: G, M, K and B.

time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y'' is ``one year'', ``2w'' is ``two weeks'', etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

fetch_restricted Protect fetch-restricted files. Only meaningful if used with destructive=True

exclude_file Path to exclusion file. Default is /etc/eclean/distfiles.exclude This is the same default eclean-dist uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned, saved, and deprecated dists:

```
{'cleaned': {<dist file>: <size>},
 'deprecated': {<package>: <dist file>},
 'saved': {<package>: <dist file>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_dist destructive=True
```

salt.modules.gentoolkitmod.**eclean_pkg**(*destructive=False*, *package_names=False*, *time_limit=0*, *exclude_file='/etc/eclean/packages.exclude'*)

Clean obsolete binary packages

destructive Only keep minimum for reinstallation

package_names Protect all versions of installed packages. Only meaningful if used with destructive=True

time_limit <time> Don't delete distfiles files modified since <time> <time> is an amount of time: ``1y'' is ``one year'', ``2w'' is ``two weeks'', etc. Units are: y (years), m (months), w (weeks), d (days) and h (hours).

exclude_file Path to exclusion file. Default is /etc/eclean/packages.exclude This is the same default eclean-pkg uses. Use None if this file exists and you want to ignore.

Returns a dict containing the cleaned binary packages:

```
{'cleaned': {<dist file>: <size>},
 'total_cleaned': <size>}
```

CLI Example:

```
salt '*' gentoolkit.eclean_pkg destructive=True
```

salt.modules.gentoolkitmod.**glsa_check_list**(*glsa_list*)

List the status of Gentoo Linux Security Advisories

glsa_list can contain an arbitrary number of GLSA ids, filenames containing GLSAs or the special identifiers `all' and `affected'

Returns a dict containing glsa ids with a description, status, and CVEs:

```
{<glsa_id>: {'description': <glsa_description>,
 'status': <glsa status>,
 'CVEs': [<list of CVEs>]}}
```

CLI Example:

```
salt '*' gentoolkit.glsa_check_list 'affected'
```

salt.modules.gentoolkitmod.**revdep_rebuild**(*lib=None*)

Fix up broken reverse dependencies

lib Search for reverse dependencies for a particular library rather than every library on the system. It can be a full path to a library or basic regular expression.

CLI Example:

```
salt '*' gentoolkit.revdep_rebuild
```

19.9.129 salt.modules.git

Support for the Git SCM

salt.modules.git.**add**(*cwd*, *filename*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Changed in version 2015.8.0: The `--verbose` command line argument is now implied

Interface to git-add(1)

cwd The path to the git checkout

filename The location of the file/directory to add, relative to `cwd`

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `add` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.add /path/to/repo foo/bar.py
salt myminion git.add /path/to/repo foo/bar.py opts='--dry-run'
```

`salt.modules.git.`**`archive`**(*cwd*, *output*, *rev='HEAD'*, *prefix=None*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

Changed in version 2015.8.0: Returns `True` if successful, raises an error if not.

Interface to git-archive(1), exports a tarball/zip file of the repository

cwd The path to be archived

> **Note:** `git archive` permits a partial archive to be created. Thus, this path does not need to be the root of the git repository. Only the files within the directory specified by `cwd` (and its subdirectories) will be in the resulting archive. For example, if there is a git checkout at `/tmp/foo`, then passing `/tmp/foo/bar` as the `cwd` will result in just the files underneath `/tmp/foo/bar` to be exported as an archive.

output The path of the archive to be created

overwrite [False] Unless set to `True`, Salt will over overwrite an existing archive at the path specified by the `output` argument.

New in version 2015.8.0.

rev [HEAD] The revision from which to create the archive

format Manually specify the file format of the resulting archive. This argument can be omitted, and `git archive` will attempt to guess the archive type (and compression) from the filename. `zip`, `tar`, `tar.gz`, and `tgz` are extensions that are recognized automatically, and git can be configured to support other archive types with the addition of git configuration keys.

See the git-archive(1) manpage explanation of the `--format` argument (as well as the `CONFIGURATION` section of the manpage) for further information.

New in version 2015.8.0.

prefix Prepend `<prefix>` to every filename in the archive. If unspecified, the name of the directory at the top level of the repository will be used as the prefix (e.g. if `cwd` is set to `/foo/bar/baz`, the prefix will be `baz`, and the resulting archive will contain a top-level directory by that name).

> **Note:** The default behavior if the `--prefix` option for `git archive` is not specified is to not prepend a prefix, so Salt's behavior differs slightly from `git archive` in this respect. Use `prefix=''` to create an archive with no prefix.

Changed in version 2015.8.0: The behavior of this argument has been changed slightly. As of this version, it is necessary to include the trailing slash when specifying a prefix, if the prefix is intended to create a top-level directory.

git_opts Any additional options to add to git command itself (not the `archive` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.archive /path/to/repo /path/to/archive.tar
```

`salt.modules.git.`**`branch`**(*cwd*, *name=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-branch(1)

cwd The path to the git checkout

name Name of the branch on which to operate. If not specified, the current branch will be assumed.

opts Any additional options to add to the command line, in a single string

---

Note: To create a branch based on something other than HEAD, pass the name of the revision as `opts`. If the revision is in the format `remotename/branch`, then this will also set the remote tracking branch.

Additionally, on the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `branch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Set remote tracking branch
salt myminion git.branch /path/to/repo mybranch opts='--set-upstream-to origin/
↪mybranch'
# Create new branch
salt myminion git.branch /path/to/repo mybranch upstream/somebranch
# Delete branch
salt myminion git.branch /path/to/repo mybranch opts='-d'
```

```
# Rename branch (2015.8.0 and later)
salt myminion git.branch /path/to/repo newbranch opts='-m oldbranch'
```

salt.modules.git.**checkout**(*cwd*, *rev=None*, *force=False*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-checkout(1)

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `checkout` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

rev The remote branch or revision to checkout.

Changed in version 2015.8.0: Optional when using `-b` or `-B` in `opts`.

force [False] Force a checkout even if there might be overwritten changes

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Checking out local local revisions
salt myminion git.checkout /path/to/repo somebranch user=jeff
salt myminion git.checkout /path/to/repo opts='testbranch -- conf/file1 file2'
salt myminion git.checkout /path/to/repo rev=origin/mybranch opts='--track'
# Checking out remote revision into new branch
salt myminion git.checkout /path/to/repo upstream/master opts='-b newbranch'
# Checking out current revision into new branch (2015.8.0 and later)
salt myminion git.checkout /path/to/repo opts='-b newbranch'
```

salt.modules.git.**clone**(*cwd*, *url=None*, *name=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *saltenv='base'*)

Interface to git-clone(1)

cwd Location of git clone

Changed in version 2015.8.0: If `name` is passed, then the clone will be made *within* this directory.

url The URL of the repository to be cloned

Changed in version 2015.8.0: Argument renamed from `repository` to `url`

name Optional alternate name for the top-level directory to be created by the clone

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the `clone` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 20515.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.clone /path/to/repo_parent_dir git://github.com/saltstack/salt.
↪git
```

`salt.modules.git.`**`commit`**(*cwd*, *message*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *filename=None*, *ignore_retcode=False*)

Interface to git-commit(1)

cwd The path to the git checkout

message Commit message

opts Any additional options to add to the command line, in a single string. These opts will be added to the end of the git command being run.

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

The `-m` option should not be passed here, as the commit message will be defined by the `message` argument.

git_opts Any additional options to add to git command itself (not the `commit` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

filename The location of the file/directory to commit, relative to `cwd`. This argument is optional, and can be used to commit a file without first staging it.

Note: This argument only works on files which are already tracked by the git repository.

New in version 2015.8.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.commit /path/to/repo 'The commit message'
salt myminion git.commit /path/to/repo 'The commit message' filename=foo/bar.py
```

salt.modules.git.**config_get**(*key*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

Get the value of a key in the git configuration file

key The name of the configuration key to get

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

cwd The path to the git checkout

Changed in version 2015.8.0: Now optional if `global` is set to `True`

global [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

New in version 2015.8.0.

all [False] If `True`, return a list of all values set for `key`. If the key does not exist, `None` will be returned.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.config_get user.name cwd=/path/to/repo
salt myminion git.config_get user.email global=True
salt myminion git.config_get core.gitproxy cwd=/path/to/repo all=True
```

`salt.modules.git.`**`config_get_regexp`**(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

New in version 2015.8.0.

Get the value of a key or keys in the git configuration file using regexes for more flexible matching. The return data is a dictionary mapping keys to lists of values matching the `value_regex`. If no values match, an empty dictionary will be returned.

key Regex on which key names will be matched

value_regex If specified, return all values matching this regex. The return data will be a dictionary mapping keys to lists of values matching the regex.

Important: Only values matching the `value_regex` will be part of the return data. So, if `key` matches a multivar, then it is possible that not all of the values will be returned. To get all values set for a multivar, simply omit the `value_regex` argument.

---

cwd The path to the git checkout

global [False] If `True`, query the global git configuration. Otherwise, only the local git configuration will be queried.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Matches any values for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar
# Matches any value starting with 'baz' set for key 'foo.bar'
salt myminion git.config_get_regexp /path/to/repo foo.bar 'baz.*'
# Matches any key starting with 'user.'
salt myminion git.config_get_regexp '^user\.' global=True
```

`salt.modules.git.`**`config_set`**(*key*, *value=None*, *multivar=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

Changed in version 2015.8.0: Return the value(s) of the key being set

Set a key in the git configuration file

cwd The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be set.

Changed in version 2014.7.0: Made `cwd` argument optional if `is_global=True`

key The name of the configuration key to set

Changed in version 2015.8.0: Argument renamed from `setting_name` to `key`

value The value to set for the specified key. Incompatible with the `multivar` argument.

Changed in version 2015.8.0: Argument renamed from `setting_value` to `value`

add [False] Add a value to a key, creating/updating a multivar

New in version 2015.8.0.

multivar Set a multivar all at once. Values can be comma-separated or passed as a Python list. Incompatible with the `value` argument.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

global [False] If `True`, set a global variable

CLI Example:

```
salt myminion git.config_set user.email me@example.com cwd=/path/to/repo
salt myminion git.config_set user.email foo@bar.com global=True
```

`salt.modules.git.`**`config_unset`**(*key*, *value_regex=None*, *cwd=None*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

New in version 2015.8.0.

Unset a key in the git configuration file

cwd The path to the git checkout. Must be an absolute path, or the word `global` to indicate that a global key should be unset.

key The name of the configuration key to unset

value_regex Regular expression that matches exactly one key, used to delete a single value from a multivar. Ignored if `all` is set to `True`.

all [False] If `True` unset all values for a multivar. If `False`, and `key` is a multivar, an error will be raised.

global [False] If `True`, unset set a global variable. Otherwise, a local variable will be unset.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Example:

```
salt myminion git.config_unset /path/to/repo foo.bar
salt myminion git.config_unset /path/to/repo foo.bar all=True
```

`salt.modules.git.`**`current_branch`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*)

Returns the current branch name of a local checkout. If HEAD is detached, return the SHA1 of the revision which is currently checked out.

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.current_branch /path/to/repo
```

`salt.modules.git.`**`describe`**(*cwd*, *rev='HEAD'*, *user=None*, *password=None*, *ignore_retcode=False*)

Returns the git-describe(1) string (or the SHA1 hash if there are no tags) for the given revision.

cwd The path to the git checkout

rev [HEAD] The revision to describe

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.describe /path/to/repo
salt myminion git.describe /path/to/repo develop
```

`salt.modules.git.`**`diff`**(*cwd*, *item1=None*, *item2=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *no_index=False*, *cached=False*, *paths=None*)

New in version 2015.8.12,2016.3.3,2016.11.0.

Interface to git-diff(1)

cwd The path to the git checkout

item1 and item2 Revision(s) to pass to the `git diff` command. One or both of these arguments may be ignored if some of the options below are set to `True`. When `cached` is `False`, and no revisions are passed to this function, then the current working tree will be compared against the index (i.e. unstaged changes). When two revisions are passed, they will be compared to each other.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `diff` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

no_index [False] When it is necessary to diff two files in the same repo against each other, and not diff two different revisions, set this option to `True`. If this is left `False` in these instances, then a normal `git diff` will be performed against the index (i.e. unstaged changes), and files in the `paths` option will be used to narrow down the diff output.

Note: Requires Git 1.5.1 or newer. Additionally, when set to `True`, `item1` and `item2` will be ignored.

cached [False] If `True`, compare staged changes to `item1` (if specified), otherwise compare them to the most recent commit.

Note: `item2` is ignored if this option is is set to `True`.

paths File paths to pass to the `git diff` command. Can be passed as a comma-separated list or a Python list.

CLI Example:

```
# Perform diff against the index (staging area for next commit)
salt myminion git.diff /path/to/repo
# Compare staged changes to the most recent commit
salt myminion git.diff /path/to/repo cached=True
# Compare staged changes to a specific revision
salt myminion git.diff /path/to/repo mybranch cached=True
# Perform diff against the most recent commit (includes staged changes)
salt myminion git.diff /path/to/repo HEAD
# Diff two commits
salt myminion git.diff /path/to/repo abcdef1 aabbccd
# Diff two commits, only showing differences in the specified paths
salt myminion git.diff /path/to/repo abcdef1 aabbccd paths=path/to/file1,path/to/
↪file2
# Diff two files with one being outside the working tree
salt myminion git.diff /path/to/repo no_index=True paths=path/to/file1,/absolute/
↪path/to/file2
```

`salt.modules.git.`**`fetch`**(*cwd*, *remote=None*, *force=False*, *refspecs=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*)

Changed in version 2015.8.2: Return data is now a dictionary containing information on branches and tags that were added/updated

Interface to git-fetch(1)

cwd The path to the git checkout

remote Optional remote name to fetch. If not passed, then git will use its default behavior (as detailed in git-fetch(1)).

New in version 2015.8.0.

force Force the fetch even when it is not a fast-forward.

New in version 2015.8.0.

refspecs Override the refspec(s) configured for the remote with this argument. Multiple refspecs can be passed, comma-separated.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `fetch` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.fetch /path/to/repo upstream
salt myminion git.fetch /path/to/repo identity=/root/.ssh/id_rsa
```

`salt.modules.git.`**`init`**(*cwd*, *bare=False*, *template=None*, *separate_git_dir=None*, *shared=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-init(1)

cwd The path to the directory to be initialized

bare [False] If `True`, init a bare repository

New in version 2015.8.0.

template Set this argument to specify an alternate template directory

New in version 2015.8.0.

separate_git_dir Set this argument to specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared Set sharing permissions on git repo. See git-init(1) for more details.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `init` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.init /path/to/repo
# Init a bare repo (before 2015.8.0)
salt myminion git.init /path/to/bare/repo.git opts='--bare'
# Init a bare repo (2015.8.0 and later)
salt myminion git.init /path/to/bare/repo.git bare=True
```

`salt.modules.git.`**`is_worktree`**(*cwd*, *user=None*, *password=None*)

New in version 2015.8.0.

This function will attempt to determine if `cwd` is part of a worktree by checking its `.git` to see if it is a file containing a reference to another gitdir.

cwd path to the worktree to be removed

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

CLI Example:

```
salt myminion git.is_worktree /path/to/repo
```

salt.modules.git.**list_branches**(*cwd*, *remote=False*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Return a list of branches

cwd The path to the git checkout

remote [False] If `True`, list remote branches. Otherwise, local branches will be listed.

> **Warning:** This option will only return remote branches of which the local checkout is aware, use *git.fetch* to update remotes.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.list_branches /path/to/repo
salt myminion git.list_branches /path/to/repo remote=True
```

salt.modules.git.**list_tags**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Return a list of tags

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.list_tags /path/to/repo
```

salt.modules.git.**list_worktrees**(*cwd*, *stale=False*, *user=None*, *password=None*, ***kwargs*)

New in version 2015.8.0.

Returns information on worktrees

Changed in version 2015.8.4: Version 2.7.0 added the `list` subcommand to git-worktree(1) which provides a lot of additional information. The return data has been changed to include this information, even for pre-2.7.0 versions of git. In addition, if a worktree has a detached head, then any tags which point to the worktree's HEAD will be included in the return data.

Note: By default, only worktrees for which the worktree directory is still present are returned, but this can be changed using the `all` and `stale` arguments (described below).

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

all [False] If `True`, then return all worktrees tracked under $GIT_DIR/worktrees, including ones for which the gitdir is no longer present.

stale [False] If `True`, return *only* worktrees whose gitdir is no longer present.

Note: Only one of `all` and `stale` can be set to `True`.

CLI Examples:

```
salt myminion git.list_worktrees /path/to/repo
salt myminion git.list_worktrees /path/to/repo all=True
salt myminion git.list_worktrees /path/to/repo stale=True
```

`salt.modules.git.`**`ls_remote`**(*cwd=None*, *remote='origin'*, *ref=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *saltenv='base'*)

Interface to git-ls-remote(1). Returns the upstream hash for a remote reference.

cwd The path to the git checkout. Optional (and ignored if present) when `remote` is set to a URL instead of a remote name.

remote [origin] The name of the remote to query. Can be the name of a git remote (which exists in the git checkout defined by the `cwd` parameter), or the URL of a remote repository.

Changed in version 2015.8.0: Argument renamed from `repository` to `remote`

ref The name of the ref to query. Optional, if not specified, all refs are returned. Can be a branch or tag name, or the full name of the reference (for example, to get the hash for a Github pull request number 1234, `ref` can be set to `refs/pull/1234/head`

Changed in version 2015.8.0: Argument renamed from `branch` to `ref`

Changed in version 2015.8.4: Defaults to returning all refs instead of master.

opts Any additional options to add to the command line, in a single string

New in version 2015.8.0.

git_opts Any additional options to add to git command itself (not the `ls-remote` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.ls_remote /path/to/repo origin master
salt myminion git.ls_remote remote=https://mydomain.tld/repo.git ref=mytag opts='--tags'
```

`salt.modules.git.`**`merge`**(*cwd*, *rev=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

Interface to git-merge(1)

cwd The path to the git checkout

rev Revision to merge into the current branch. If not specified, the remote tracking branch will be merged.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `merge` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
# Fetch first...
salt myminion git.fetch /path/to/repo
# ... then merge the remote tracking branch
salt myminion git.merge /path/to/repo
# .. or merge another rev
salt myminion git.merge /path/to/repo rev=upstream/foo
```

`salt.modules.git.`**`merge_base`**(*cwd*, *refs=None*, *octopus=False*, *is_ancestor=False*, *independent=False*, *fork_point=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

New in version 2015.8.0.

Interface to git-merge-base(1).

cwd The path to the git checkout

refs Any refs/commits to check for a merge base. Can be passed as a comma-separated list or a Python list.

all [False] Return a list of all matching merge bases. Not compatible with any of the below options except for `octopus`.

octopus [False] If `True`, then this function will determine the best common ancestors of all specified commits, in preparation for an n-way merge. See here for a description of how these bases are determined.

Set `all` to `True` with this option to return all computed merge bases, otherwise only the ``best'' will be returned.

is_ancestor [False] If `True`, then instead of returning the merge base, return a boolean telling whether or not the first commit is an ancestor of the second commit.

Note: This option requires two commits to be passed.

Changed in version 2015.8.2: Works properly in git versions older than 1.8.0, where the `--is-ancestor` CLI option is not present.

independent [False] If `True`, this function will return the IDs of the refs/commits passed which cannot be reached by another commit.

fork_point If passed, then this function will return the commit where the commit diverged from the ref specified by `fork_point`. If no fork point is found, `None` is returned.

Note: At most one commit is permitted to be passed if a `fork_point` is specified. If no commits are passed, then HEAD is assumed.

---

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

This option should not be necessary unless new CLI arguments are added to git-merge-base(1) and are not yet supported in Salt.

---

git_opts Any additional options to add to git command itself (not the `merge-base` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
salt myminion git.merge_base /path/to/repo HEAD upstream/mybranch
salt myminion git.merge_base /path/to/repo 8f2e542,4ad8cab,cdc9886 octopus=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab,cdc9886
 ↪independent=True
salt myminion git.merge_base /path/to/repo refs=8f2e542,4ad8cab is_ancestor=True
salt myminion git.merge_base /path/to/repo fork_point=upstream/master
salt myminion git.merge_base /path/to/repo refs=mybranch fork_point=upstream/
 ↪master
```

`salt.modules.git.`**`merge_tree`**(*cwd*, *ref1*, *ref2*, *base=None*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Interface to git-merge-tree(1), shows the merge results and conflicts from a 3-way merge without touching the index.

cwd The path to the git checkout

ref1 First ref/commit to compare

ref2 Second ref/commit to compare

base The base tree to use for the 3-way-merge. If not provided, then *`git.merge_base`* will be invoked on `ref1` and `ref2` to determine the merge base to use.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] if `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev
salt myminion git.merge_tree /path/to/repo HEAD upstream/dev base=aaf3c3d
```

`salt.modules.git.`**`pull`**(*cwd*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*)

Interface to git-pull(1)

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `pull` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.pull /path/to/repo opts='--rebase origin master'
```

`salt.modules.git.`**`push`**(*cwd*, *remote=None*, *ref=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, ***kwargs*)

Interface to git-push(1)

cwd The path to the git checkout

remote Name of the remote to which the ref should being pushed

New in version 2015.8.0.

ref [master] Name of the ref to push

> **Note:** Being a refspec, this argument can include a colon to define local and remote ref names.

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `push` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
# Push master as origin/master
salt myminion git.push /path/to/repo origin master
# Push issue21 as upstream/develop
salt myminion git.push /path/to/repo upstream issue21:develop
# Delete remote branch 'upstream/temp'
salt myminion git.push /path/to/repo upstream :temp
```

`salt.modules.git.`**`rebase`**(*cwd*, *rev='master'*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-rebase(1)

cwd The path to the git checkout

rev [master] The revision to rebase onto the current branch

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `rebase` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.rebase /path/to/repo master
salt myminion git.rebase /path/to/repo 'origin master'
salt myminion git.rebase /path/to/repo origin/master opts='--onto newbranch'
```

salt.modules.git.**remote_get**(*cwd*, *remote='origin'*, *user=None*, *password=None*, *redact_auth=True*, *ignore_retcode=False*)

Get the fetch and push URL for a specific remote

cwd The path to the git checkout

remote [origin] Name of the remote to query

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to `False` to include the username/password if the remote uses HTTPS Basic Auth. Otherwise, this information will be redacted.

Warning: Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.remote_get /path/to/repo
salt myminion git.remote_get /path/to/repo upstream
```

salt.modules.git.**remote_refs**(*url*, *heads=False*, *tags=False*, *user=None*, *password=None*, *identity=None*, *https_user=None*, *https_pass=None*, *ignore_retcode=False*, *saltenv='base'*)

New in version 2015.8.0.

Return the remote refs for the specified URL

url URL of the remote repository

heads [False] Restrict output to heads. Can be combined with `tags`.

tags [False] Restrict output to tags. Can be combined with `heads`.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

Warning: Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
salt myminion git.remote_refs https://github.com/saltstack/salt.git
```

salt.modules.git.**remote_set**(*cwd*, *url*, *remote='origin'*, *user=None*, *password=None*, *https_user=None*, *https_pass=None*, *push_url=None*, *push_https_user=None*, *push_https_pass=None*, *ignore_retcode=False*)

cwd The path to the git checkout

url Remote URL to set

remote [origin] Name of the remote to set

push_url If unset, the push URL will be identical to the fetch URL.

New in version 2015.8.0.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

https_user Set HTTP Basic Auth username. Only accepted for HTTPS URLs.

New in version 2015.5.0.

https_pass Set HTTP Basic Auth password. Only accepted for HTTPS URLs.

New in version 2015.5.0.

push_https_user Set HTTP Basic Auth user for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

push_https_pass Set HTTP Basic Auth password for `push_url`. Ignored if `push_url` is unset. Only accepted for HTTPS URLs.

New in version 2015.8.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
salt myminion git.remote_set /path/to/repo git@github.com:user/repo.git
 ↪remote=upstream
salt myminion git.remote_set /path/to/repo https://github.com/user/repo.git
 ↪remote=upstream push_url=git@github.com:user/repo.git
```

`salt.modules.git.`**`remotes`**(*cwd*, *user=None*, *password=None*, *redact_auth=True*, *ignore_retcode=False*)

Get fetch and push URLs for each remote in a git checkout

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

redact_auth [True] Set to `False` to include the username/password for authenticated remotes in the return data. Otherwise, this information will be redacted.

> **Warning:** Setting this to `False` will not only reveal any HTTPS Basic Auth that is configured, but the return data will also be written to the job cache. When possible, it is recommended to use SSH for authentication.

New in version 2015.5.6.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.remotes /path/to/repo
```

salt.modules.git.**reset**(*cwd*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-reset(1), returns the stdout from the git command

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string

> **Note:** On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `reset` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Soft reset to a specific commit ID
salt myminion git.reset /path/to/repo ac3ee5c
# Hard reset
salt myminion git.reset /path/to/repo opts='--hard origin/master'
```

salt.modules.git.**rev_parse**(*cwd*, *rev=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Interface to git-rev-parse(1)

cwd The path to the git checkout

rev Revision to parse. See the SPECIFYING REVISIONS section of the git-rev-parse(1) manpage for details on how to format this argument.

This argument is optional when using the options in the *Options for Files* section of the git-rev-parse(1) manpage.

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the `rev-parse` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

CLI Examples:

```
# Get the full SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD
# Get the short SHA1 for HEAD
salt myminion git.rev_parse /path/to/repo HEAD opts='--short'
# Get the develop branch's upstream tracking branch
salt myminion git.rev_parse /path/to/repo 'develop@{upstream}' opts='--abbrev-ref'
# Get the SHA1 for the commit corresponding to tag v1.2.3
salt myminion git.rev_parse /path/to/repo 'v1.2.3^{commit}'
# Find out whether or not the repo at /path/to/repo is a bare repository
salt myminion git.rev_parse /path/to/repo opts='--is-bare-repository'
```

`salt.modules.git.`**`revision`**(*cwd*, *rev='HEAD'*, *short=False*, *user=None*, *password=None*, *ignore_retcode=False*)

Returns the SHA1 hash of a given identifier (hash, branch, tag, HEAD, etc.)

cwd The path to the git checkout

rev [HEAD] The revision

short [False] If `True`, return an abbreviated SHA1 git hash

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.revision /path/to/repo mybranch
```

`salt.modules.git.`**`rm`**(*cwd*, *filename*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-rm(1)

cwd The path to the git checkout

filename The location of the file/directory to remove, relative to `cwd`

Note: To remove a directory, `-r` must be part of the `opts` parameter.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

git_opts Any additional options to add to git command itself (not the `rm` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.rm /path/to/repo foo/bar.py
salt myminion git.rm /path/to/repo foo/bar.py opts='--dry-run'
salt myminion git.rm /path/to/repo foo/baz opts='-r'
```

`salt.modules.git.`**`stash`**(*cwd*, *action='save'*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

Interface to git-stash(1), returns the stdout from the git command

cwd The path to the git checkout

opts Any additional options to add to the command line, in a single string. Use this to complete the `git stash` command by adding the remaining arguments (i.e. `'save <stash comment>'`, `'apply stash@{2}'`, `'show'`, etc.). Omitting this argument will simply run `git stash`.

git_opts Any additional options to add to git command itself (not the `stash` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.stash /path/to/repo save opts='work in progress'
salt myminion git.stash /path/to/repo apply opts='stash@{1}'
salt myminion git.stash /path/to/repo drop opts='stash@{1}'
salt myminion git.stash /path/to/repo list
```

`salt.modules.git.`**`status`**(*cwd*, *user=None*, *password=None*, *ignore_retcode=False*)

Changed in version 2015.8.0: Return data has changed from a list of lists to a dictionary

Returns the changes to the repository

cwd The path to the git checkout

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Example:

```
salt myminion git.status /path/to/repo
```

`salt.modules.git.`**`submodule`**(*cwd*, *command*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *identity=None*, *ignore_retcode=False*, *saltenv='base'*, ***kwargs*)

Changed in version 2015.8.0: Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`

Interface to git-submodule(1)

cwd The path to the submodule

command Submodule command to run, see *git-submodule(1) <git submodule>* for more information. Any additional arguments after the command (such as the URL when adding a submodule) must be passed in the `opts` parameter.

New in version 2015.8.0.

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` (as in the CLI examples below) to avoid causing errors with Salt's own argument parsing.

---

git_opts Any additional options to add to git command itself (not the `submodule` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

---

init [False] If `True`, ensures that new submodules are initialized

Deprecated since version 2015.8.0: Pass `init` as the `command` parameter, or include `--init` in the `opts` param with `command` set to update.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

identity Path to a private key to use for ssh URLs

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Key can also be specified as a SaltStack file server URL, eg. salt://location/identity_file

Changed in version 2016.3.0.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

saltenv The default salt environment to pull sls files from

New in version 2016.3.1.

CLI Example:

```
# Update submodule and ensure it is initialized (before 2015.8.0)
salt myminion git.submodule /path/to/repo/sub/repo init=True
# Update submodule and ensure it is initialized (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--init'

# Rebase submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo update opts='--rebase'

# Add submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo add opts='https://mydomain.tld/
↪repo.git'

# Unregister submodule (2015.8.0 and later)
salt myminion git.submodule /path/to/repo/sub/repo deinit
```

`salt.modules.git.`**`symbolic_ref`**(*cwd*, *ref*, *value=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Interface to git-symbolic-ref(1)

cwd The path to the git checkout

ref Symbolic ref to read/modify

value If passed, then the symbolic ref will be set to this value and an empty string will be returned.

If not passed, then the ref to which `ref` points will be returned, unless `--delete` is included in `opts` (in which case the symbolic ref will be deleted).

opts Any additional options to add to the command line, in a single string

git_opts Any additional options to add to git command itself (not the `symbolic-refs` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

> **Note:** This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
# Get ref to which HEAD is pointing
salt myminion git.symbolic_ref /path/to/repo HEAD
# Set/overwrite symbolic ref 'FOO' to local branch 'foo'
salt myminion git.symbolic_ref /path/to/repo FOO refs/heads/foo
# Delete symbolic ref 'FOO'
salt myminion git.symbolic_ref /path/to/repo FOO opts='--delete'
```

`salt.modules.git.`**`version`**(*versioninfo=False*)

New in version 2015.8.0.

Returns the version of Git installed on the minion

versioninfo [False] If `True`, return the version in a versioninfo list (e.g. `[2,5,0]`)

CLI Example:

```
salt myminion git.version
```

`salt.modules.git.`**`worktree_add`**(*cwd*, *worktree_path*, *ref=None*, *reset_branch=None*, *force=None*, *detach=False*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*, ***kwargs*)

New in version 2015.8.0.

Interface to git-worktree(1), adds a worktree

cwd The path to the git checkout

worktree_path Path to the new worktree. Can be either absolute, or relative to `cwd`.

branch Name of new branch to create. If omitted, will be set to the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz`, then `branch` will be `baz`.

ref Name of the ref on which to base the new worktree. If omitted, then `HEAD` is use, and a new branch will be created, named for the basename of the `worktree_path`. For example, if the `worktree_path` is `/foo/bar/baz` then a new branch `baz` will be created, and pointed at `HEAD`.

reset_branch [False] If `False`, then git-worktree(1) will fail to create the worktree if the targeted branch already exists. Set this argument to `True` to reset the targeted branch to point at `ref`, and checkout the newly-reset branch into the new worktree.

force [False] By default, git-worktree(1) will not permit the same branch to be checked out in more than one worktree. Set this argument to `True` to override this.

opts Any additional options to add to the command line, in a single string

---

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for adding worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

---

git_opts Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_add /path/to/repo/main ../hotfix ref=origin/master
salt myminion git.worktree_add /path/to/repo/main ../hotfix branch=hotfix21
 ↪ref=v2.1.9.3
```

`salt.modules.git.`**`worktree_prune`**(*cwd*, *dry_run=False*, *verbose=True*, *expire=None*, *opts=''*, *git_opts=''*, *user=None*, *password=None*, *ignore_retcode=False*)

New in version 2015.8.0.

Interface to git-worktree(1), prunes stale worktree administrative data from the gitdir

cwd The path to the main git checkout or a linked worktree

dry_run [False] If `True`, then this function will report what would have been pruned, but no changes will be made.

verbose [True] Report all changes made. Set to `False` to suppress this output.

expire Only prune unused worktree data older than a specific period of time. The date format for this parameter is described in the documentation for the `gc.pruneWorktreesExpire` config param in the git-config(1) manpage.

opts Any additional options to add to the command line, in a single string

Note: On the Salt CLI, if the opts are preceded with a dash, it is necessary to precede them with `opts=` to avoid causing errors with Salt's own argument parsing.

All CLI options for pruning worktrees as of Git 2.5.0 are already supported by this function as of Salt 2015.8.0, so using this argument is unnecessary unless new CLI arguments are added to git-worktree(1) and are not yet supported in Salt.

git_opts Any additional options to add to git command itself (not the `worktree` subcommand), in a single string. This is useful for passing `-c` to run git with temporary changes to the git configuration.

New in version 2017.7.0.

Note: This is only supported in git 1.7.2 and newer.

user User under which to run the git command. By default, the command is run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

ignore_retcode [False] If `True`, do not log an error to the minion log if the git command returns a nonzero exit status.

New in version 2015.8.0.

CLI Examples:

```
salt myminion git.worktree_prune /path/to/repo
salt myminion git.worktree_prune /path/to/repo dry_run=True
salt myminion git.worktree_prune /path/to/repo expire=1.day.ago
```

`salt.modules.git.`**`worktree_rm`**(*cwd*, *user=None*)

New in version 2015.8.0.

Recursively removes the worktree located at `cwd`, returning `True` if successful. This function will attempt to determine if `cwd` is actually a worktree by invoking *`git.is_worktree`*. If the path does not correspond to a worktree, then an error will be raised and no action will be taken.

> **Warning:** There is no undoing this action. Be **VERY** careful before running this function.

cwd Path to the worktree to be removed

user Used for path expansion when `cwd` is not an absolute path. By default, when `cwd` is not absolute, the path will be assumed to be relative to the home directory of the user under which the minion is running. Setting this option will change the home directory from which path expansion is performed.

CLI Examples:

```
salt myminion git.worktree_rm /path/to/worktree
```

19.9.130 salt.modules.github module

Module for interacting with the GitHub v3 API.

New in version 2016.3.0.

depends PyGithub python module

Configuration

Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `github' key by default, if defined.

For example:

```
github:
  token: abc1234
  org_name: my_organization

  # optional: some functions require a repo_name, which
  # can be set in the config file, or passed in at the CLI.
  repo_name: my_repo

  # optional: it can be dangerous to change the privacy of a repository
  # in an automated way. set this to True to allow privacy modifications
  allow_repo_privacy_changes: False
```

salt.modules.github.**add_repo**(*name*, *description=None*, *homepage=None*, *private=None*, *has_issues=None*, *has_wiki=None*, *has_downloads=None*, *auto_init=None*, *gitignore_template=None*, *license_template=None*, *profile='github'*)

Create a new github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visiblity of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

auto_init Whether to create an initial commit with an empty README.

gitignore_template The desired language or platform for a .gitignore, e.g ``Haskell''.

license_template The desired LICENSE template to apply, e.g ``mit'' or ``mozilla''.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

salt.modules.github.**add_team**(*name*, *description=None*, *repo_names=None*, *privacy=None*, *permission=None*, *profile='github'*)

Create a new Github team within an organization.

name The name of the team to be created.

description The description of the team.

repo_names The names of repositories to add the team to.

privacy The level of privacy for the team, can be `secret' or `closed'.

permission The default permission for new repositories added to the team, can be `pull', `push' or `admin'.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**add_team_member**(*name*, *team_name*, *profile='github'*)

Adds a team member to a team with team_name.

name The name of the team member to add.

team_name The name of the team of which to add the user.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**add_team_repo**(*repo_name*, *team_name*, *profile='github'*, *permission=None*)

Adds a repository to a team with team_name.

repo_name The name of the repository to add.

team_name The name of the team of which to add the repository.

profile The name of the profile configuration to use. Defaults to `github`.

permission The permission for team members within the repository, can be `pull', `push' or `admin'. If not specified, the default permission specified on the team will be used.

New in version 2017.7.0.

CLI Example:

```
salt myminion github.add_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**add_user**(*name*, *profile='github'*)

Add a GitHub user.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_user github-handle
```

salt.modules.github.**edit_repo**(*name*, *description=None*, *homepage=None*, *private=None*, *has_issues=None*, *has_wiki=None*, *has_downloads=None*, *profile='github'*)

Updates an existing Github repository.

name The name of the team to be created.

description The description of the repository.

homepage The URL with more information about the repository.

private The visiblity of the repository. Note that private repositories require a paid GitHub account.

has_issues Whether to enable issues for this repository.

has_wiki Whether to enable the wiki for this repository.

has_downloads Whether to enable downloads for this repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.add_repo 'repo_name'
```

New in version 2016.11.0.

salt.modules.github.**edit_team**(*name*, *description=None*, *privacy=None*, *permission=None*, *profile='github'*)

Updates an existing Github team.

name The name of the team to be edited.

description The description of the team.

privacy The level of privacy for the team, can be `secret' or `closed'.

permission The default permission for new repositories added to the team, can be `pull', `push' or `admin'.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.edit_team 'team_name' description='Team description'
```

New in version 2016.11.0.

salt.modules.github.**get_issue**(*issue_number*, *repo_name=None*, *profile='github'*, *output='min'*)

Return information about a single issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue to retrieve.

repo_name The name of the repository from which to get the issue. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.**get_issue_comments**(*issue_number*, *repo_name=None*, *profile='github'*, *since=None*, *output='min'*)

Return information about the comments for a given issue in a named repository.

New in version 2016.11.0.

issue_number The number of the issue for which to retrieve comments.

repo_name The name of the repository to which the issue belongs. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

since Only comments updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_issue_comments 514
salt myminion github.get_issue 514 repo_name=salt
```

salt.modules.github.**get_issues**(*repo_name=None*, *profile='github'*, *milestone=None*, *state='open'*, *assignee=None*, *creator=None*, *mentioned=None*, *labels=None*, *sort='created'*, *direction='desc'*, *since=None*, *output='min'*, *per_page=None*)

Returns information for all issues in a given repository, based on the search options.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

milestone The number of a GitHub milestone, or a string of either `*` or `none`.

If a number is passed, it should refer to a milestone by its number field. Use the `github.get_milestone` function to obtain a milestone's number.

If the string `*` is passed, issues with any milestone are accepted. If the string `none` is passed, issues without milestones are returned.

state Indicates the state of the issues to return. Can be either `open`, `closed`, or `all`. Default is `open`.

assignee Can be the name of a user. Pass in `none` (as a string) for issues with no assigned user or `*` for issues assigned to any user.

creator The user that created the issue.

mentioned A user that's mentioned in the issue.

labels A string of comma separated label names. For example, `bug,ui,@high`.

sort What to sort results by. Can be either `created`, `updated`, or `comments`. Default is `created`.

direction The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

since Only issues updated at or after this time are returned. This is a timestamp in ISO 8601 format: `YYYY-MM-DDTHH:MM:SSZ`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.

CLI Example:

```
salt myminion github.get_issues my-github-repo
```

salt.modules.github.**get_milestone**(*number=None*, *name=None*, *repo_name=None*, *profile='github'*, *output='min'*)

Return information about a single milestone in a named repository.

New in version 2016.11.0.

number The number of the milestone to retrieve. If provided, this option will be favored over `name`.

name The name of the milestone to retrieve.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

CLI Example:

```
salt myminion github.get_milestone 72
salt myminion github.get_milestone name=my_milestone
```

salt.modules.github.**get_milestones**(*repo_name=None*, *profile='github'*, *state='open'*, *sort='due_on'*, *direction='asc'*, *output='min'*, *per_page=None*)

Return information about milestones for a given repository.

New in version 2016.11.0.

repo_name The name of the repository for which to list issues. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the repo_name defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

state The state of the milestone. Either `open`, `closed`, or `all`. Default is `open`.

sort What to sort results by. Either `due_on` or `completeness`. Default is `due_on`.

direction The direction of the sort. Either `asc` or `desc`. Default is `asc`.

output The amount of data returned by each issue. Defaults to `min`. Change to `full` to see all issue output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of issues gathered from GitHub, per page. If not set, GitHub defaults are used.

CLI Example:

```
salt myminion github.get_milestones
```

salt.modules.github.**get_prs**(*repo_name=None*, *profile='github'*, *state='open'*, *head=None*, *base=None*, *sort='created'*, *direction='desc'*, *output='min'*, *per_page=None*)

Returns information for all pull requests in a given repository, based on the search options provided.

New in version 2017.7.0.

repo_name The name of the repository for which to list pull requests. This argument is required, either passed via the CLI, or defined in the configured profile. A `repo_name` passed as a CLI argument will override the `repo_name` defined in the configured profile, if provided.

profile The name of the profile configuration to use. Defaults to `github`.

state Indicates the state of the pull requests to return. Can be either `open`, `closed`, or `all`. Default is `open`.

head Filter pull requests by head user and branch name in the format of `user:ref-name`. Example: `'github:new-script-format'`. Default is None.

base Filter pulls by base branch name. Example: `gh-pages`. Default is None.

sort What to sort results by. Can be either `created`, `updated`, `popularity` (comment count), or `long-running` (age, filtering by pull requests updated within the last month). Default is `created`.

direction The direction of the sort. Can be either `asc` or `desc`. Default is `desc`.

output The amount of data returned by each pull request. Defaults to `min`. Change to `full` to see all pull request output.

per_page GitHub paginates data in their API calls. Use this value to increase or decrease the number of pull requests gathered from GitHub, per page. If not set, GitHub defaults are used. Maximum is 100.
CLI Example:

```
salt myminion github.get_prs
salt myminion github.get_prs base=2016.11
```

salt.modules.github.**get_repo_info**(*repo_name*, *profile='github'*, *ignore_cache=False*)
Return information for a given repo.

New in version 2016.11.0.
repo_name The name of the repository.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.get_repo_info salt
salt myminion github.get_repo_info salt profile='my-github-profile'
```

salt.modules.github.**get_repo_teams**(*repo_name*, *profile='github'*)
Return teams belonging to a repository.

New in version 2017.7.0.
repo_name The name of the repository from which to retrieve teams.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.get_repo_teams salt
salt myminion github.get_repo_teams salt profile='my-github-profile'
```

salt.modules.github.**get_team**(*name*, *profile='github'*)
Returns the team details if a team with the given name exists, or None otherwise.
name The team name for which to obtain information.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.get_team 'team_name'
```

salt.modules.github.**get_user**(*name*, *profile='github'*, *user_details=False*)
Get a GitHub user by name.
name The user for which to obtain information.
profile The name of the profile configuration to use. Defaults to `github`.
user_details Prints user information details. Defaults to `False`. If the user is already in the organization and user_details is set to False, the get_user function returns `True`. If the user is not already present in the organization, user details will be printed by default.
CLI Example:

```
salt myminion github.get_user github-handle
salt myminion github.get_user github-handle user_details=true
```

salt.modules.github.**is_team_member**(*name*, *team_name*, *profile='github'*)
Returns True if the github user is in the team with team_name, or False otherwise.
name The name of the user whose membership to check.
team_name The name of the team to check membership in.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.is_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**list_members_without_mfa**(*profile='github'*, *ignore_cache=False*)

List all members (in lower case) without MFA turned on.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team repos.

CLI Example:

```
salt myminion github.list_members_without_mfa
```

New in version 2016.11.0.

salt.modules.github.**list_private_repos**(*profile='github'*)

List private repositories within the organization. Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_private_repos
salt myminion github.list_private_repos profile='my-github-profile'
```

salt.modules.github.**list_public_repos**(*profile='github'*)

List public repositories within the organization.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_public_repos
salt myminion github.list_public_repos profile='my-github-profile'
```

salt.modules.github.**list_repos**(*profile='github'*)

List all repositories within the organization. Includes public and private repositories within the organization Dependent upon the access rights of the profile token.

New in version 2016.11.0.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.list_repos
salt myminion github.list_repos profile='my-github-profile'
```

salt.modules.github.**list_team_members**(*team_name*, *profile='github'*, *ignore_cache=False*)

Gets the names of team members in lower case.

team_name The name of the team from which to list members.

profile The name of the profile configuration to use. Defaults to `github`.

ignore_cache Bypasses the use of cached team members.

CLI Example:

```
salt myminion github.list_team_members 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**list_team_repos**(*team_name*, *profile='github'*, *ignore_cache=False*)

Gets the repo details for a given team as a dict from repo_name to repo details. Note that repo names are

always in lower case.
team_name The name of the team from which to list repos.
profile The name of the profile configuration to use. Defaults to `github`.
ignore_cache Bypasses the use of cached team repos.
CLI Example:

```
salt myminion github.list_team_repos 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`list_teams`**(*profile='github'*, *ignore_cache=False*)
Lists all teams with the organization.
profile The name of the profile configuration to use. Defaults to `github`.
ignore_cache Bypasses the use of cached teams.
CLI Example:

```
salt myminion github.list_teams
```

New in version 2016.11.0.

`salt.modules.github.`**`list_users`**(*profile='github'*, *ignore_cache=False*)
List all users within the organization.
profile The name of the profile configuration to use. Defaults to `github`.
ignore_cache Bypasses the use of cached users.

New in version 2016.11.0.

CLI Example:

```
salt myminion github.list_users
salt myminion github.list_users profile='my-github-profile'
```

`salt.modules.github.`**`remove_repo`**(*name*, *profile='github'*)
Remove a Github repository.
name The name of the repository to be removed.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.remove_repo 'my-repo'
```

New in version 2016.11.0.

`salt.modules.github.`**`remove_team`**(*name*, *profile='github'*)
Remove a github team.
name The name of the team to be removed.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.remove_team 'team_name'
```

New in version 2016.11.0.

`salt.modules.github.`**`remove_team_member`**(*name*, *team_name*, *profile='github'*)
Removes a team member from a team with team_name.
name The name of the team member to remove.
team_name The name of the team from which to remove the user.
profile The name of the profile configuration to use. Defaults to `github`.
CLI Example:

```
salt myminion github.remove_team_member 'user_name' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**remove_team_repo**(*repo_name*, *team_name*, *profile='github'*)

Removes a repository from a team with team_name.

repo_name The name of the repository to remove.

team_name The name of the team of which to remove the repository.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_team_repo 'my_repo' 'team_name'
```

New in version 2016.11.0.

salt.modules.github.**remove_user**(*name*, *profile='github'*)

Remove a Github user by name.

name The user for which to obtain information.

profile The name of the profile configuration to use. Defaults to `github`.

CLI Example:

```
salt myminion github.remove_user github-handle
```

19.9.131 salt.modules.glance

Module for handling openstack glance calls.

optdepends

- glanceclient Python adapter

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False   #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the glance functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' glance.image_list profile=openstack1
```

salt.modules.glance.**image_create**(*name*, *location=None*, *profile=None*, *visibility=None*, *container_format='bare'*, *disk_format='raw'*, *protected=None*)

Create an image (glance image-create)

CLI Example, old format:

```
salt '*' glance.image_create name=f16-jeos \
        disk_format=qcow2 container_format=ovf
```

CLI Example, new format resembling Glance API v2:

```
salt '*' glance.image_create name=f16-jeos visibility=public \
        disk_format=qcow2 container_format=ovf
```

The parameter `visibility' defaults to `public' if not specified.

salt.modules.glance.**image_delete**(*id=None*, *name=None*, *profile=None*)

Delete an image (glance image-delete)

CLI Examples:

```
salt '*' glance.image_delete c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_delete name=f16-jeos
```

salt.modules.glance.**image_list**(*id=None*, *profile=None*, *name=None*)

Return a list of available images (glance image-list)

CLI Example:

```
salt '*' glance.image_list
```

salt.modules.glance.**image_schema**(*profile=None*)

Returns names and descriptions of the schema ``image```s properties for this profile's instance of glance

CLI Example:

```
salt '*' glance.image_schema
```

salt.modules.glance.**image_show**(*id=None*, *name=None*, *profile=None*)

Return details about a specific image (glance image-show)

CLI Example:

```
salt '*' glance.image_show
```

salt.modules.glance.**image_update**(*id=None*, *name=None*, *profile=None*, ***kwargs*)

Update properties of given image. Known to work for: - min_ram (in MB) - protected (bool) - visibility (`public' or `private')

CLI Example:

```
salt '*' glance.image_update id=c2eb2eb0-53e1-4a80-b990-8ec887eae7df
salt '*' glance.image_update name=f16-jeos
```

salt.modules.glance.**schema_get**(*name*, *profile=None*)

Known valid names of schemas are:

- image
- images
- member
- members

CLI Example:

```
salt '*' glance.schema_get name=f16-jeos
```

19.9.132 salt.modules.glusterfs

Manage a glusterfs pool

salt.modules.glusterfs.**add_volume_bricks**(*name*, *bricks*)

Add brick(s) to an existing volume

name Volume name

bricks List of bricks to add to the volume

CLI Example:

```
salt '*' glusterfs.add_volume_bricks <volume> <bricks>
```

salt.modules.glusterfs.**create_volume**(*name*, *bricks*, *stripe=False*, *replica=False*, *device_vg=False*, *transport='tcp'*, *start=False*, *force=False*)

Create a glusterfs volume

name Name of the gluster volume

bricks Bricks to create volume from, in <peer>:<brick path> format. For multiple bricks use list format: `["<peer1>:<brick1>", ``<peer2>:<brick2>"]'

stripe Stripe count, the number of bricks should be a multiple of the stripe count for a distributed striped volume

replica Replica count, the number of bricks should be a multiple of the replica count for a distributed replicated volume

device_vg If true, specifies volume should use block backend instead of regular posix backend. Block device backend volume does not support multiple bricks

transport Transport protocol to use, can be `tcp', `rdma' or `tcp,rdma'

start Start the volume after creation

force Force volume creation, this works even if creating in root FS

CLI Examples:

```
salt host1 glusterfs.create newvolume host1:/brick

salt gluster1 glusterfs.create vol2 '["gluster1:/export/vol2/brick",
↪"gluster2:/export/vol2/brick"]' replica=2 start=True
```

salt.modules.glusterfs.**delete_volume**(*target*, *stop=True*)

Deletes a gluster volume

target Volume to delete

stop [True] If `True`, stop volume before delete

CLI Example:

```
salt '*' glusterfs.delete_volume <volume>
```

salt.modules.glusterfs.**disable_quota_volume**(*name*)

Disable quota on a glusterfs volume.

name Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.disable_quota_volume <volume>
```

salt.modules.glusterfs.**enable_quota_volume**(*name*)

Enable quota on a glusterfs volume.

name Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.enable_quota_volume <volume>
```

salt.modules.glusterfs.**info**(*name=None*)

New in version 2015.8.4.

Return gluster volume info.

name Optional name to retrieve only information of one volume

CLI Example:

```
salt '*' glusterfs.info
```

salt.modules.glusterfs.**list_quota_volume**(*name*)

List quotas of glusterfs volume

name Name of the gluster volume

CLI Example:

```
salt '*' glusterfs.list_quota_volume <volume>
```

salt.modules.glusterfs.**list_volumes**()

List configured volumes

CLI Example:

```
salt '*' glusterfs.list_volumes
```

salt.modules.glusterfs.**peer**(*name*)

Add another node into the peer list.

name The remote host to probe.

CLI Example:

```
salt 'one.gluster.*' glusterfs.peer two
```

GLUSTER direct CLI example (to show what salt is sending to gluster):
$ gluster peer probe ftp2

GLUSTER CLI 3.4.4 return example (so we know what we are parsing): #if the ``peer'' is the local host: peer probe: success: on localhost not needed

#if the peer was just added: peer probe: success

#if the peer was already part of the cluster: peer probe: success: host ftp2 port 24007 already in peer list

salt.modules.glusterfs.**peer_status**()

Return peer status information

The return value is a dictionary with peer UUIDs as keys and dicts of peer information as values. Hostnames are listed in one list. GlusterFS separates one of the hostnames but the only reason for this seems to be which hostname happens to be used first in peering.

CLI Example:

```
salt '*' glusterfs.peer_status
```

GLUSTER direct CLI example (to show what salt is sending to gluster):
$ gluster peer status
GLUSTER CLI 3.4.4 return example (so we know what we are parsing):
Number of Peers: 2

Hostname: ftp2 Port: 24007 Uuid: cbcb256b-e66e-4ec7-a718-21082d396c24 State: Peer in Cluster (Connected)

Hostname: ftp3 Uuid: 5ea10457-6cb2-427b-a770-7897509625e9 State: Peer in Cluster (Connected)

salt.modules.glusterfs.**set_quota_volume**(*name*, *path*, *size*, *enable_quota=False*)
Set quota to glusterfs volume.
name Name of the gluster volume
path Folder path for restriction in volume (``/'')
size Hard-limit size of the volume (MB/GB)
enable_quota Enable quota before set up restriction
CLI Example:

```
salt '*' glusterfs.set_quota_volume <volume> <path> <size> enable_quota=True
```

salt.modules.glusterfs.**start_volume**(*name*, *force=False*)
Start a gluster volume
name Volume name
force Force the volume start even if the volume is started .. versionadded:: 2015.8.4
CLI Example:

```
salt '*' glusterfs.start mycluster
```

salt.modules.glusterfs.**status**(*name*)
Check the status of a gluster volume.
name Volume name
CLI Example:

```
salt '*' glusterfs.status myvolume
```

salt.modules.glusterfs.**stop_volume**(*name*, *force=False*)
Stop a gluster volume
name Volume name
force Force stop the volume

New in version 2015.8.4.
CLI Example:

```
salt '*' glusterfs.stop_volume mycluster
```

salt.modules.glusterfs.**unset_quota_volume**(*name*, *path*)
Unset quota on glusterfs volume
name Name of the gluster volume
path Folder path for restriction in volume
CLI Example:

```
salt '*' glusterfs.unset_quota_volume <volume> <path>
```

19.9.133 salt.modules.gnomedesktop

GNOME implementations

salt.modules.gnomedesktop.**get**(*schema=None*, *key=None*, *user=None*, ***kwargs*)
Get key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.get user=<username> schema=org.gnome.desktop.screensaver key=idle-
↪activation-enabled
```

salt.modules.gnomedesktop.**getClockFormat**(***kwargs*)
Return the current clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.getClockFormat user=<username>
```

salt.modules.gnomedesktop.**getClockShowDate**(***kwargs*)
Return the current setting, if the date is shown in the clock

CLI Example:

```
salt '*' gnome.getClockShowDate user=<username>
```

salt.modules.gnomedesktop.**getIdleActivation**(***kwargs*)
Get whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.getIdleActivation user=<username>
```

salt.modules.gnomedesktop.**getIdleDelay**(***kwargs*)
Return the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.getIdleDelay user=<username>
```

salt.modules.gnomedesktop.**ping**(***kwargs*)
A test to ensure the GNOME module is loaded

CLI Example:

```
salt '*' gnome.ping user=<username>
```

salt.modules.gnomedesktop.**setClockFormat**(*clockFormat*, ***kwargs*)
Set the clock format, either 12h or 24h format.

CLI Example:

```
salt '*' gnome.setClockFormat <12h|24h> user=<username>
```

salt.modules.gnomedesktop.**setClockShowDate**(*kvalue*, ***kwargs*)
Set whether the date is visible in the clock

CLI Example:

```
salt '*' gnome.setClockShowDate <True|False> user=<username>
```

salt.modules.gnomedesktop.**setIdleActivation**(*kvalue*, ***kwargs*)
Set whether the idle activation is enabled

CLI Example:

```
salt '*' gnome.setIdleActivation <True|False> user=<username>
```

salt.modules.gnomedesktop.**setIdleDelay**(*delaySeconds*, ***kwargs*)
Set the current idle delay setting in seconds

CLI Example:

```
salt '*' gnome.setIdleDelay <seconds> user=<username>
```

salt.modules.gnomedesktop.**set**(*schema=None*, *key=None*, *user=None*, *value=None*, ***kwargs*)
Set key in a particular GNOME schema

CLI Example:

```
salt '*' gnome.set user=<username> schema=org.gnome.desktop.screensaver key=idle-
↪activation-enabled value=False
```

19.9.134 salt.modules.gpg

Manage a GPG keychains, add keys, create keys, retrieve keys from keyservers. Sign, encrypt and sign plus encrypt text and files.

New in version 2015.5.0.

Note: The `python-gnupg` library and `gpg` binary are required to be installed.

---

salt.modules.gpg.**create_key**(**args*, ***kwargs*)
Create a key in the GPG keychain

Note: GPG key generation requires *a lot* of entropy and randomness. Difficult to do over a remote connection, consider having another process available which is generating randomness for the machine. Also especially difficult on virtual machines, consider the rng-tools package.

The create_key process takes awhile so increasing the timeout may be necessary, e.g. -t 15.

---

key_type The type of the primary key to generate. It must be capable of signing. `RSA' or `DSA'.
key_length The length of the primary key in bits.
name_real The real name of the user identity which is represented by the key.
name_comment A comment to attach to the user id.
name_email An email address for the user.
subkey_type The type of the secondary key to generate.
subkey_length The length of the secondary key in bits.
expire_date The expiration date for the primary and any secondary key. You can specify an ISO date, A number of days/weeks/months/years, an epoch value, or 0 for a non-expiring key.
use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt -t 15 '*' gpg.create_key
```

salt.modules.gpg.**decrypt**(*user=None*, *text=None*, *filename=None*, *output=None*, *use_passphrase=False*, *gnupghome=None*, *bare=False*)

Decrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

text The encrypted text to decrypt.

filename The encrypted filename to decrypt.

output The filename where the decrypted data will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If `True`, return the (armored) decrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '*' gpg.decrypt filename='/path/to/important.file.gpg'

salt '*' gpg.decrypt filename='/path/to/important.file.gpg' use_passphrase=True
```

salt.modules.gpg.**delete_key**(*keyid=None*, *fingerprint=None*, *delete_secret=False*, *user=None*, *gnupghome=None*)

Get a key from the GPG keychain

keyid The keyid of the key to be deleted.

fingerprint The fingerprint of the key to be deleted.

delete_secret Whether to delete a corresponding secret key prior to deleting the public key. Secret keys must be deleted before deleting any corresponding public keys.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.delete_key keyid=3FAD9F1E

salt '*' gpg.delete_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.delete_key keyid=3FAD9F1E user=username

salt '*' gpg.delete_key keyid=3FAD9F1E user=username delete_secret=True
```

salt.modules.gpg.**encrypt**(*user=None*, *recipients=None*, *text=None*, *filename=None*, *output=None*, *sign=None*, *use_passphrase=False*, *gnupghome=None*, *bare=False*)

Encrypt a message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

recipients The fingerprints for those recipient whom the data is being encrypted for.

text The text to encrypt.

filename The filename to encrypt.

output The filename where the signed file will be written, default is standard out.

sign Whether to sign, in addition to encrypt, the data. `True` to use default key or fingerprint to specify a different key to sign with.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

bare If `True`, return the (armored) encrypted block as a string without the standard comment/res dict.

CLI Example:

```
salt '*' gpg.encrypt text='Hello there.  How are you?'

salt '*' gpg.encrypt filename='/path/to/important.file'

salt '*' gpg.encrypt filename='/path/to/important.file' use_passphrase=True
```

salt.modules.gpg.**export_key**(*keyids=None*, *secret=False*, *user=None*, *gnupghome=None*)

Export a key from the GPG keychain

keyids The key ID(s) of the key(s) to be exported. Can be specified as a comma separated string or a list. Anything which GnuPG itself accepts to identify a key - for example, the key ID or the fingerprint could be used.

secret Export the secret key identified by the `keyids` information passed.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.export_key keyids=3FAD9F1E

salt '*' gpg.export_key keyids=3FAD9F1E secret=True

salt '*' gpg.export_key keyids="['3FAD9F1E','3FBD8F1E']" user=username
```

salt.modules.gpg.**get_key**(*keyid=None*, *fingerprint=None*, *user=None*, *gnupghome=None*)

Get a key from the GPG keychain

keyid The key ID (short or long) of the key to be retrieved.

fingerprint The fingerprint of the key to be retrieved.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.get_key keyid=3FAD9F1E

salt '*' gpg.get_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_key keyid=3FAD9F1E user=username
```

salt.modules.gpg.**get_secret_key**(*keyid=None*, *fingerprint=None*, *user=None*, *gnupghome=None*)

Get a key from the GPG keychain

keyid The key ID (short or long) of the key to be retrieved.

fingerprint The fingerprint of the key to be retrieved.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.get_secret_key keyid=3FAD9F1E

salt '*' gpg.get_secret_key fingerprint=53C96788253E58416D20BCD352952C84C3252192

salt '*' gpg.get_secret_key keyid=3FAD9F1E user=username
```

salt.modules.gpg.**import_key**(**args*, ***kwargs*)

Import a key from text or file

text The text containing to import.

filename The filename containing the key to import.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
gnupghome Specify the location where GPG keyring and related files are stored.
CLI Example:

```
salt '*' gpg.import_key text='-----BEGIN PGP PUBLIC KEY BLOCK-----\n ... -----END
↪PGP PUBLIC KEY BLOCK-----'
salt '*' gpg.import_key filename='/path/to/public-key-file'
```

`salt.modules.gpg.`**`list_keys`**(*user=None*, *gnupghome=None*)
List keys in GPG keychain
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
gnupghome Specify the location where GPG keyring and related files are stored.
CLI Example:

```
salt '*' gpg.list_keys
```

`salt.modules.gpg.`**`list_secret_keys`**(*user=None*, *gnupghome=None*)
List secret keys in GPG keychain
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
gnupghome Specify the location where GPG keyring and related files are stored.
CLI Example:

```
salt '*' gpg.list_secret_keys
```

`salt.modules.gpg.`**`receive_keys`**(**args*, ***kwargs*)
Receive key(s) from keyserver and add them to keychain
keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu
keys The keyID(s) to retrieve from the keyserver. Can be specified as a comma separated string or a list.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
gnupghome Specify the location where GPG keyring and related files are stored.
CLI Example:

```
salt '*' gpg.receive_keys keys='3FAD9F1E'

salt '*' gpg.receive_keys keys="['3FAD9F1E','3FBD9F2E']"

salt '*' gpg.receive_keys keys=3FAD9F1E user=username
```

`salt.modules.gpg.`**`search_keys`**(*text*, *keyserver=None*, *user=None*)
Search keys from keyserver
text Text to search the keyserver for, e.g. email address, keyID or fingerprint.
keyserver Keyserver to use for searching for GPG keys, defaults to pgp.mit.edu.
user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.
CLI Example:

```
salt '*' gpg.search_keys user@example.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com

salt '*' gpg.search_keys user@example.com keyserver=keyserver.ubuntu.com
↪user=username
```

salt.modules.gpg.**sign**(*user=None*, *keyid=None*, *text=None*, *filename=None*, *output=None*, *use_passphrase=False*, *gnupghome=None*)

Sign message or file

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

keyid The keyid of the key to set the trust level for, defaults to first key in the secret keyring.

text The text to sign.

filename The filename to sign.

output The filename where the signed file will be written, default is standard out.

use_passphrase Whether to use a passphrase with the signing key. Passphrase is received from Pillar.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.sign text='Hello there.  How are you?'

salt '*' gpg.sign filename='/path/to/important.file'

salt '*' gpg.sign filename='/path/to/important.file' use_passphrase=True
```

salt.modules.gpg.**trust_key**(*keyid=None*, *fingerprint=None*, *trust_level=None*, *user=None*)

Set the trust level for a key in GPG keychain

keyid The keyid of the key to set the trust level for.

fingerprint The fingerprint of the key to set the trust level for.

trust_level The trust level to set for the specified key, must be one of the following: expired, unknown, not_trusted, marginally, fully, ultimately

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

CLI Example:

```
salt '*' gpg.trust_key keyid='3FAD9F1E' trust_level='marginally'
salt '*' gpg.trust_key fingerprint='53C96788253E58416D20BCD352952C84C3252192'
↪trust_level='not_trusted'
salt '*' gpg.trust_key keys=3FAD9F1E trust_level='ultimately' user='username'
```

salt.modules.gpg.**verify**(*text=None*, *user=None*, *filename=None*, *gnupghome=None*)

Verify a message or file

text The text to verify.

filename The filename to verify.

user Which user's keychain to access, defaults to user Salt is running as. Passing the user as `salt` will set the GnuPG home directory to the `/etc/salt/gpgkeys`.

gnupghome Specify the location where GPG keyring and related files are stored.

CLI Example:

```
salt '*' gpg.verify text='Hello there.  How are you?'

salt '*' gpg.verify filename='/path/to/important.file'

salt '*' gpg.verify filename='/path/to/important.file' use_passphrase=True
```

19.9.135 salt.modules.grafana4 module

Module for working with the Grafana v4 API

New in version 2017.7.0.

depends requests

configuration This module requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the `grafana' key by default, if defined.

For example:

```
grafana:
    grafana_url: http://grafana.localhost
    grafana_user: admin
    grafana_password: admin
    grafana_timeout: 3
```

salt.modules.grafana4.**create_datasource**(*orgname=None*, *profile='grafana'*, ***kwargs*)

Create a new datasource in an organisation.

name Name of the data source.

type Type of the datasource (`graphite', `influxdb' etc.).

access Use proxy or direct.

url The URL to the data source API.

user Optional - user to authenticate with the data source.

password Optional - password to authenticate with the data source.

database Optional - database to use with the data source.

basicAuth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basicAuthUser Optional - HTTP basic auth username.

basicAuthPassword Optional - HTTP basic auth password.

jsonData Optional - additional json data to post (eg. ``timeInterval'').

isDefault Optional - set data source as default.

withCredentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

typeLogoUrl Optional - Logo to use for this datasource.

orgname Name of the organization in which the data source should be created.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_datasource
```

salt.modules.grafana4.**create_org**(*profile='grafana'*, ***kwargs*)

Create a new organization.

name Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.create_org <name>
```

salt.modules.grafana4.**create_org_user**(*orgname=None*, *profile='grafana'*, ***kwargs*)

Add user to the organization.

loginOrEmail Login or email of the user.

role

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname Name of the organization in which users are added.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.create_org_user <orgname> loginOrEmail=<loginOrEmail> role=
↪<role>
```

salt.modules.grafana4.**create_update_dashboard**(*orgname=None*, *profile='grafana'*, ***kwargs*)

Create or update a dashboard.
dashboard A dict that defines the dashboard to create/update.
overwrite Whether the dashboard should be overwritten if already existing.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.create_update_dashboard dashboard=<dashboard> overwrite=True
↪orgname=<orgname>
```

salt.modules.grafana4.**create_user**(*profile='grafana'*, ***kwargs*)

Create a new user.
login Login of the new user.
password Password of the new user.
email Email of the new user.
name Optional - Full name of the new user.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.create_user login=<login> password=<password> email=<email>
```

salt.modules.grafana4.**delete_dashboard**(*slug*, *orgname=None*, *profile='grafana'*)

Delete a dashboard.
slug Slug (name) of the dashboard.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.delete_dashboard <slug>
```

salt.modules.grafana4.**delete_datasource**(*datasourceid*, *orgname=None*, *profile='grafana'*)

Delete a datasource.
datasourceid Id of the datasource.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.delete_datasource <datasource_id>
```

salt.modules.grafana4.**delete_org**(*orgid*, *profile='grafana'*)

Delete an organization.
orgid Id of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.delete_org <org_id>
```

salt.modules.grafana4.**delete_org_user**(*userid*, *orgname=None*, *profile='grafana'*)

Remove user from the organization.

userid Id of the user.
orgname Name of the organization in which users are updated.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.delete_org_user <user_id> <orgname>
```

salt.modules.grafana4.**delete_user**(*userid*, *profile='grafana'*)
Delete a user.
userid Id of the user.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.delete_user <user_id>
```

salt.modules.grafana4.**delete_user_org**(*userid*, *orgid*, *profile='grafana'*)
Remove a user from an organization.
userid Id of the user.
orgid Id of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.delete_user_org <user_id> <org_id>
```

salt.modules.grafana4.**get_dashboard**(*slug*, *orgname=None*, *profile='grafana'*)
Get a dashboard.
slug Slug (name) of the dashboard.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.get_dashboard <slug>
```

salt.modules.grafana4.**get_datasource**(*name*, *orgname=None*, *profile='grafana'*)
Show a single datasource in an organisation.
name Name of the datasource.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.get_datasource <name> <orgname>
```

salt.modules.grafana4.**get_datasources**(*orgname=None*, *profile='grafana'*)
List all datasources in an organisation.
orgname Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.get_datasources <orgname>
```

salt.modules.grafana4.**get_org**(*name*, *profile='grafana'*)
Show a single organization.
name Name of the organization.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.get_org <name>
```

salt.modules.grafana4.**get_org_address**(*orgname=None*, *profile='grafana'*)

Get the organization address.

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_org_address <orgname>
```

salt.modules.grafana4.**get_org_prefs**(*orgname=None*, *profile='grafana'*)

Get the organization preferences.

orgname Name of the organization in which users are updated.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_org_prefs <orgname>
```

salt.modules.grafana4.**get_org_users**(*orgname=None*, *profile='grafana'*)

Get the list of users that belong to the organization.

orgname Name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_org_users <orgname>
```

salt.modules.grafana4.**get_orgs**(*profile='grafana'*)

List all organizations.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_orgs
```

salt.modules.grafana4.**get_user**(*login*, *profile='grafana'*)

Show a single user.

login Login of the user.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_user <login>
```

salt.modules.grafana4.**get_user_data**(*userid*, *profile='grafana'*)

Get user data.

userid Id of the user.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_user_data <user_id>
```

salt.modules.grafana4.**get_user_orgs**(*userid*, *profile='grafana'*)

Get the list of organisations a user belong to.

userid Id of the user.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_user_orgs <user_id>
```

salt.modules.grafana4.**get_users**(*profile='grafana'*)

List all users.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.get_users
```

salt.modules.grafana4.**switch_org**(*orgname*, *profile='grafana'*)

Switch the current organization.

name Name of the organization to switch to.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.switch_org <name>
```

salt.modules.grafana4.**update_datasource**(*datasourceid*, *orgname=None*, *profile='grafana'*, ***kwargs*)

Update a datasource.

datasourceid Id of the datasource.

name Name of the data source.

type Type of the datasource (`graphite', `influxdb' etc.).

access Use proxy or direct.

url The URL to the data source API.

user Optional - user to authenticate with the data source.

password Optional - password to authenticate with the data source.

database Optional - database to use with the data source.

basicAuth Optional - set to True to use HTTP basic auth to authenticate with the data source.

basicAuthUser Optional - HTTP basic auth username.

basicAuthPassword Optional - HTTP basic auth password.

jsonData Optional - additional json data to post (eg. ``timeInterval'').

isDefault Optional - set data source as default.

withCredentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.

typeLogoUrl Optional - Logo to use for this datasource.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.update_datasource <datasourceid>
```

salt.modules.grafana4.**update_org**(*orgid*, *profile='grafana'*, ***kwargs*)

Update an existing organization.

orgid Id of the organization.

name New name of the organization.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.update_org <org_id> name=<name>
```

salt.modules.grafana4.**update_org_address**(*orgname=None*, *profile='grafana'*, ***kwargs*)

Update the organization address.

orgname Name of the organization in which users are updated.

address1 Optional - address1 of the org.

address2 Optional - address2 of the org.

city Optional - city of the org.
zip_code Optional - zip_code of the org.
state Optional - state of the org.
country Optional - country of the org.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.update_org_address <orgname> country=<country>
```

salt.modules.grafana4.**update_org_prefs**(*orgname=None*, *profile='grafana'*, ***kwargs*)
Update the organization preferences.
orgname Name of the organization in which users are updated.
theme Selected theme for the org.
homeDashboardId Home dashboard for the org.
timezone Timezone for the org (one of: ``browser'', ``utc'', or ``'').
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.update_org_prefs <orgname> theme=<theme> timezone=<timezone>
```

salt.modules.grafana4.**update_org_user**(*userid*, *orgname=None*, *profile='grafana'*, ***kwargs*)
Update user role in the organization.
userid Id of the user.
loginOrEmail Login or email of the user.
role

Role of the user for this organization. Should be one of:

- Admin
- Editor
- Read Only Editor
- Viewer

orgname Name of the organization in which users are updated.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.update_org_user <user_id> <orgname> loginOrEmail=<loginOrEmail>
↪role=<role>
```

salt.modules.grafana4.**update_user**(*userid*, *profile='grafana'*, ***kwargs*)
Update an existing user.
userid Id of the user.
login Optional - Login of the user.
email Optional - Email of the user.
name Optional - Full name of the user.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.
CLI Example:

```
salt '*' grafana4.update_user <user_id> login=<login> email=<email>
```

salt.modules.grafana4.**update_user_password**(*userid*, *profile='grafana'*, ***kwargs*)
Update a user password.
userid Id of the user.
password New password of the user.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.update_user_password <user_id> password=<password>
```

salt.modules.grafana4.**update_user_permissions**(*userid*, *profile='grafana'*, ***kwargs*)

Update a user password.

userid Id of the user.

isGrafanaAdmin Whether user is a Grafana admin.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

CLI Example:

```
salt '*' grafana4.update_user_permissions <user_id> isGrafanaAdmin=<true|false>
```

19.9.136 salt.modules.grains

Return/control aspects of the grains data

Grains set or altered with this module are stored in the `grains' file on the minions. By default, this file is located at: `/etc/salt/grains`

Note: This does **NOT** override any grains set in the minion config file.

salt.modules.grains.**append**(*key*, *val*, *convert=False*, *delimiter=':'*)

New in version 0.17.0.

Append a value to a list in the grains config file. If the grain doesn't exist, the grain key is added and the value is appended to the new grain as a list item.

key The grain key to be appended to

val The value to append to the grain key

convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2014.7.6.

CLI Example:

```
salt '*' grains.append key val
```

salt.modules.grains.**delkey**(*key*)

New in version 2017.7.0.

Remove a grain completely from the grain system, this will remove the grain key and value

key The grain key from which to delete the value.

CLI Example:

```
salt '*' grains.delkey key
```

salt.modules.grains.**delval**(*key*, *destructive=False*)

New in version 0.17.0.

Delete a grain value from the grains config file. This will just set the grain value to `None`. To completely remove the grain, run `grains.delkey` or pass `destructive=True` to `grains.delval`.

key The grain key from which to delete the value.

destructive Delete the key, too. Defaults to False.
CLI Example:

```
salt '*' grains.delval key
```

salt.modules.grains.**equals**(*key*, *value*)
Used to make sure the minion's grain key/value matches.

Returns `True` if matches otherwise `False`.

New in version 2017.7.0.

CLI Example:

```
salt '*' grains.equals fqdn <expected_fqdn>
salt '*' grains.equals systemd:version 219
```

salt.modules.grains.**fetch**(*key*, *default=''*, *delimiter=':'*, *ordered=True*)
Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

salt.modules.grains.**filter_by**(*lookup_dict*, *grain='os_family'*, *merge=None*, *default='default'*, *base=None*)
New in version 0.17.0.

Look up the given grain in a given dictionary for the current OS and return the result

Although this may occasionally be useful at the CLI, the primary intent of this function is for use in Jinja to make short work of creating lookup tables for OS-specific data. For example:

```
{% set apache = salt['grains.filter_by']({
    'Debian': {'pkg': 'apache2', 'srv': 'apache2'},
    'RedHat': {'pkg': 'httpd', 'srv': 'httpd'},
}, default='Debian') %}

myapache:
```

```
  pkg.installed:
    - name: {{ apache.pkg }}
  service.running:
    - name: {{ apache.srv }}
```

Values in the lookup table may be overridden by values in Pillar. An example Pillar to override values in the example above could be as follows:

```
apache:
  lookup:
    pkg: apache_13
    srv: apache
```

The call to `filter_by()` would be modified as follows to reference those Pillar values:

```
{% set apache = salt['grains.filter_by']({
    ...
}, merge=salt['pillar.get']('apache:lookup')) %}
```

Parameters

- **`lookup_dict`** -- A dictionary, keyed by a grain, containing a value or values relevant to systems matching that grain. For example, a key could be the grain for an OS and the value could the name of a package on that particular OS.

  Changed in version 2016.11.0: The dictionary key could be a globbing pattern. The function will return the corresponding `lookup_dict` value where grain value matches the pattern. For example:

  ```
  # this will render 'got some salt' if Minion ID begins from 'salt
   ↪'
  salt '*' grains.filter_by '{salt*: got some salt, default: salt
   ↪is not here}' id
  ```

- **`grain`** -- The name of a grain to match with the current system's grains. For example, the value of the ``os_family'' grain for the current system could be used to pull values from the `lookup_dict` dictionary.

  Changed in version 2016.11.0: The grain value could be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **`merge`** -- A dictionary to merge with the results of the grain selection from `lookup_dict`. This allows Pillar to override the values in the `lookup_dict`. This could be useful, for example, to override the values for non-standard package names such as when using a different Python version from the default Python version provided by the OS (e.g., `python26-mysql` instead of `python-mysql`).

- **`default`** -- default lookup_dict's key used if the grain does not exists or if the grain value has no match on lookup_dict. If unspecified the value is ``default''.

  New in version 2014.1.0.

- **`base`** -- A lookup_dict key to use for a base dictionary. The grain-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the grain selection dictionary and the merge dictionary. Default is unset.

  New in version 2015.5.0.

CLI Example:

```
salt '*' grains.filter_by '{Debian: Debheads rule, RedHat: I love my hat}'
# this one will render {D: {E: I, G: H}, J: K}
salt '*' grains.filter_by '{A: B, C: {D: {E: F, G: H}}}' 'xxx' '{D: {E: I}, J: K}'
 ↪'C'
# next one renders {A: {B: G}, D: J}
salt '*' grains.filter_by '{default: {A: {B: C}, D: E}, F: {A: {B: G}}, H: {D: I}}
 ↪' 'xxx' '{D: J}' 'F' 'default'
# next same as above when default='H' instead of 'F' renders {A: {B: C}, D: J}
```

salt.modules.grains.**get**(*key*, *default=''*, *delimiter=':'*, *ordered=True*)

Attempt to retrieve the named value from grains, if the named value is not available return the passed default. The default return is an empty string.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in grains looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed:

```
pkg:apache
```

Parameters

- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

  New in version 2014.7.0.

- **ordered** -- Outputs an ordered dict if applicable (default: True)

  New in version 2016.11.0.

CLI Example:

```
salt '*' grains.get pkg:apache
salt '*' grains.get abc::def|ghi delimiter='|'
```

salt.modules.grains.**get_or_set_hash**(*name*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'*)

Perform a one-time generation of a hash and write it to the local grains. If that grain has already been set return the value instead.

This is useful for generating passwords or keys that are specific to a single minion that don't need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: {{ salt['grains.get_or_set_hash']('mysql:some_mysql_user') }}
```

CLI Example:

```
salt '*' grains.get_or_set_hash 'django:SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.modules.grains.**has_value**(*key*)

Determine whether a key exists in the grains dictionary.

Given a grains dictionary that contains the following structure:

```
{'pkg': {'apache': 'httpd'}}
```

One would determine if the apache key in the pkg dict exists by:

```
pkg:apache
```

CLI Example:

```
salt '*' grains.has_value pkg:apache
```

salt.modules.grains.**item**(**args*, ***kwargs*)

Return one or more grains

CLI Example:

```
salt '*' grains.item os
salt '*' grains.item os osrelease oscodename
```

Sanitized CLI Example:

```
salt '*' grains.item host sanitize=True
```

salt.modules.grains.**items**(*sanitize=False*)

Return all of the minion's grains

CLI Example:

```
salt '*' grains.items
```

Sanitized CLI Example:

```
salt '*' grains.items sanitize=True
```

salt.modules.grains.**ls**()

Return a list of all available grains

CLI Example:

```
salt '*' grains.ls
```

salt.modules.grains.**remove**(*key*, *val*, *delimiter=':'*)

New in version 0.17.0.

Remove a value from a list in the grains config file

key The grain key to remove.

val The value to remove.

delimiter The key can be a nested dict key. Use this parameter to specify the delimiter you use, instead of the default `:`. You can now append values to a list in nested dictionary grains. If the list doesn't exist at this level, it will be created.

New in version 2015.8.2.

CLI Example:

```
salt '*' grains.remove key val
```

salt.modules.grains.**set**(*key*, *val=''*, *force=False*, *destructive=False*, *delimiter=':'*)

Set a key to an arbitrary value. It is used like setval but works with nested keys.

This function is conservative. It will only overwrite an entry if its value and the given one are not a list or a dict. The `force` parameter is used to allow overwriting in all cases.

New in version 2015.8.0.

Parameters

- **force** -- Force writing over existing entry if given or existing values are list or dict. Defaults to False.
- **destructive** -- If an operation results in a key being removed, delete the key, too. Defaults to False.
- **delimiter** -- Specify an alternate delimiter to use when traversing a nested dict, the default being **:**

CLI Example:

```
salt '*' grains.set 'apps:myApp:port' 2209
salt '*' grains.set 'apps:myApp' '{port: 2209}'
```

salt.modules.grains.**setval**(*key*, *val*, *destructive=False*)

Set a grains value in the grains config file

key The grain key to be set.

val The value to set the grain key to.

destructive If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setval key val
salt '*' grains.setval key "{'sub-key': 'val', 'sub-key2': 'val2'}"
```

salt.modules.grains.**setvals**(*grains*, *destructive=False*)

Set new grains values in the grains config file

destructive If an operation results in a key being removed, delete the key, too. Defaults to False.

CLI Example:

```
salt '*' grains.setvals "{'key1': 'val1', 'key2': 'val2'}"
```

19.9.137 salt.modules.groupadd

Manage groups on Linux, OpenBSD and NetBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *`group.info' is not available*), see *here*.

---

salt.modules.groupadd.**add**(*name*, *gid=None*, *system=False*, *root=None*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.groupadd.**adduser**(*name*, *username*, *root=None*)
Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar' as a member of an existing group `foo', if not then adds it.

salt.modules.groupadd.**chgid**(*name*, *gid*, *root=None*)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.groupadd.**delete**(*name*, *root=None*)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.groupadd.**deluser**(*name*, *username*, *root=None*)
Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar' from a group `foo'. If group is not present then returns True.

salt.modules.groupadd.**getent**(*refresh=False*)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.groupadd.**info**(*name*)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.groupadd.**members**(*name*, *members_list*, *root=None*)
Replaces members of the group with a provided list.

CLI Example:
salt `*' group.members foo `user1,user2,user3,...'

Replaces a membership list for a local group `foo'. foo:x:1234:user1,user2,user3,...

19.9.138 salt.modules.grub_legacy

Support for GRUB Legacy

salt.modules.grub_legacy.**conf**()
Parse GRUB conf file

CLI Example:

```
salt '*' grub.conf
```

salt.modules.grub_legacy.**version**()
Return server version from grub --version

CLI Example:

```
salt '*' grub.version
```

19.9.139 salt.modules.guestfs

Interact with virtual machine images via libguestfs

depends

- libguestfs

salt.modules.guestfs.**mount**(*location*, *access='rw'*, *root=None*)
Mount an image

CLI Example:

```
salt '*' guest.mount /srv/images/fedora.qcow
```

19.9.140 salt.modules.hadoop

Support for hadoop

maintainer Yann Jouanin <yann.jouanin@intelunix.fr>

maturity new

depends

platform linux

salt.modules.hadoop.**dfs**(*command=None*, **args*)
Execute a command on DFS

CLI Example:

```
salt '*' hadoop.dfs ls /
```

salt.modules.hadoop.**dfs_absent**(*path*)
Check if a file or directory is absent on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_absent /some_random_file
```

Returns True if the file is absent

salt.modules.hadoop.**dfs_present**(*path*)
Check if a file or directory is present on the distributed FS.

CLI Example:

```
salt '*' hadoop.dfs_present /some_random_file
```

Returns True if the file is present

salt.modules.hadoop.**namenode_format**(*force=None*)
Format a name node

```
salt '*' hadoop.namenode_format force=True
```

salt.modules.hadoop.**version**()
Return version from hadoop version

CLI Example:

```
salt '*' hadoop.version
```

19.9.141 salt.modules.haproxyconn

Support for haproxy

New in version 2014.7.0.

salt.modules.haproxyconn.**disable_server**(*name*, *backend*, *socket='/var/run/haproxy.sock'*)
Disable server in haproxy.
name Server to disable
backend haproxy backend, or all backends if ``*'' is supplied
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.disable_server db1.example.com mysql
```

salt.modules.haproxyconn.**enable_server**(*name*, *backend*, *socket='/var/run/haproxy.sock'*)
Enable Server in haproxy
name Server to enable
backend haproxy backend, or all backends if ``*'' is supplied
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.enable_server web1.example.com www
```

salt.modules.haproxyconn.**get_sessions**(*name*, *backend*, *socket='/var/run/haproxy.sock'*)
New in version 2016.11.0.

Get number of current sessions on server in backend (scur)
name Server name
backend haproxy backend
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.get_sessions web1.example.com www
```

salt.modules.haproxyconn.**get_weight**(*name*, *backend*, *socket='/var/run/haproxy.sock'*)
Get server weight

name Server name
backend haproxy backend
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.get_weight web1.example.com www
```

salt.modules.haproxyconn.**list_servers**(*backend*, *socket='/var/run/haproxy.sock'*, *objectify=False*)

List servers in haproxy backend.
backend haproxy backend
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.list_servers mysql
```

salt.modules.haproxyconn.**set_state**(*name*, *backend*, *state*, *socket='/var/run/haproxy.sock'*)

Force a server's administrative state to a new state. This can be useful to disable load balancing and/or any traffic to a server. Setting the state to ``ready'' puts the server in normal mode, and the command is the equivalent of the ``enable server'' command. Setting the state to ``maint'' disables any traffic to the server as well as any health checks. This is the equivalent of the ``disable server'' command. Setting the mode to ``drain'' only removes the server from load balancing but still allows it to be checked and to accept new persistent connections. Changes are propagated to tracking servers if any.
name Server name
backend haproxy backend
state A string of the state to set. Must be `ready', `drain', or `maint'
CLI Example:

```
salt '*' haproxy.set_state my_proxy_server my_backend ready
```

salt.modules.haproxyconn.**set_weight**(*name*, *backend*, *weight=0*, *socket='/var/run/haproxy.sock'*)

Set server weight
name Server name
backend haproxy backend
weight Server Weight
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.set_weight web1.example.com www 13
```

salt.modules.haproxyconn.**show_backends**(*socket='/var/run/haproxy.sock'*)

Show HaProxy Backends
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.show_backends
```

salt.modules.haproxyconn.**show_frontends**(*socket='/var/run/haproxy.sock'*)

Show HaProxy frontends
socket haproxy stats socket
CLI Example:

```
salt '*' haproxy.show_frontends
```

19.9.142 salt.modules.hashutil

A collection of hashing and encoding functions

salt.modules.hashutil.**base64_b64decode**(*instr*)
Decode a base64-encoded string using the ``modern'' Python interface

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64decode 'Z2V0IHNhbHRlZA=='
```

salt.modules.hashutil.**base64_b64encode**(*instr*)
Encode a string as base64 using the ``modern'' Python interface.

Among other possible differences, the ``modern'' encoder does not include newline (`n') characters in the encoded output.

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_b64encode 'get salted'
```

salt.modules.hashutil.**base64_decodefile**(*instr*, *outfile*)
Decode a base64-encoded string and write the result to a file

New in version 2016.3.0.

CLI Example:

```
salt '*' hashutil.base64_decodefile instr='Z2V0IHNhbHRlZAo=' outfile='/path/to/
↪binary_file'
```

salt.modules.hashutil.**base64_decodestring**(*instr*)
Decode a base64-encoded string using the ``legacy'' Python interface

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_decodestring instr='Z2V0IHNhbHRlZAo='
```

salt.modules.hashutil.**base64_encodefile**(*fname*)
Read a file from the file system and return as a base64 encoded string

New in version 2016.3.0.

Pillar example:

```
path:
  to:
    data: |
      {{ salt.hashutil.base64_encodefile('/path/to/binary_file') | indent(6) }}
```

The *file.decode* state function can be used to decode this data and write it to disk.

CLI Example:

```
salt '*' hashutil.base64_encodefile /path/to/binary_file
```

salt.modules.hashutil.**base64_encodestring**(*instr*)
Encode a string as base64 using the ``legacy'' Python interface.

Among other possible differences, the ``legacy'' encoder includes a newline (`n') character after every 76 characters and always at the end of the encoded string.

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.base64_encodestring 'get salted'
```

salt.modules.hashutil.**digest**(*instr*, *checksum='md5'*)
Return a checksum digest for a string
instr A string
checksum [md5] The hashing algorithm to use to generate checksums. Valid options: md5, sha256, sha512.
CLI Example:

```
salt '*' hashutil.digest 'get salted'
```

salt.modules.hashutil.**digest_file**(*infile*, *checksum='md5'*)
Return a checksum digest for a file
infile A file path
checksum [md5] The hashing algorithm to use to generate checksums. Wraps the *hashutil.digest* execution function.
CLI Example:

```
salt '*' hashutil.digest_file /path/to/file
```

salt.modules.hashutil.**github_signature**(*string*, *shared_secret*, *challenge_hmac*)
Verify a challenging hmac signature against a string / shared-secret for github webhooks.

New in version 2017.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.github_signature '{"ref":....} ' 'shared secret'
↪'sha1=bc6550fc290acf5b42283fa8deaf55cea0f8c206'
```

salt.modules.hashutil.**hmac_signature**(*string*, *shared_secret*, *challenge_hmac*)
Verify a challenging hmac signature against a string / shared-secret

New in version 2014.7.0.

Returns a boolean if the verification succeeded or failed.

CLI Example:

```
salt '*' hashutil.hmac_signature 'get salted' 'shared secret'
↪'eBWf9bstXg+NiP5AOwppB5HMvZiYMPzEM9W5YMm/AmQ='
```

salt.modules.hashutil.**md5_digest**(*instr*)
Generate an md5 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.md5_digest 'get salted'
```

salt.modules.hashutil.**sha256_digest**(*instr*)

Generate an sha256 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha256_digest 'get salted'
```

salt.modules.hashutil.**sha512_digest**(*instr*)

Generate an sha512 hash of a given string

New in version 2014.7.0.

CLI Example:

```
salt '*' hashutil.sha512_digest 'get salted'
```

19.9.143 salt.modules.heat module

Module for handling OpenStack Heat calls

New in version 2017.7.0.

depends

- heatclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.insecure: False   #(optional)
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the heat functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' heat.flavor_list profile=openstack1
```

salt.modules.heat.**create_stack**(*name=None*, *template_file=None*, *environment=None*, *parameters=None*, *poll=0*, *rollback=False*, *timeout=60*, *profile=None*, *enviroment=None*)

Create a stack (heat stack-create)

name Name of the new stack

template_file File of template

environment File of environment

parameters Parameter dict used to create the stack

poll Poll and report events until stack complete

rollback Enable rollback on create failure

timeout Stack creation timeout in minutes

profile Profile to build on

CLI Example:

```
salt '*' heat.create_stack name=mystack \
        template_file=salt://template.yaml \
        environment=salt://environment.yaml \
        parameters="{"image": "Debian 8", "flavor": "m1.small"}" \
        poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

salt.modules.heat.**delete_stack**(*name=None*, *poll=0*, *timeout=60*, *profile=None*)

Delete a stack (heat stack-delete)

name Name of the stack

poll Poll and report events until stack complete

timeout Stack creation timeout in minute

profile Profile to use

CLI Examples:

```
salt '*' heat.delete_stack name=mystack poll=5 \
        profile=openstack1
```

salt.modules.heat.**list_stack**(*profile=None*)

Return a list of available stack (heat stack-list)

profile Profile to use

CLI Example:

```
salt '*' heat.list_stack profile=openstack1
```

salt.modules.heat.**show_stack**(*name=None*, *profile=None*)

Return details about a specific stack (heat stack-show)

name Name of the stack

profile Profile to use

CLI Example:

```
salt '*' heat.show_stack name=mystack profile=openstack1
```

salt.modules.heat.**template_stack**(*name=None*, *profile=None*)

Return template a specific stack (heat stack-template)

name Name of the stack

profile Profile to use

CLI Example:

```
salt '*' heat.template_stack name=mystack profile=openstack1
```

salt.modules.heat.**update_stack**(*name=None*, *template_file=None*, *environment=None*, *parameters=None*, *poll=0*, *rollback=False*, *timeout=60*, *profile=None*, *enviroment=None*)

Update a stack (heat stack-template)

name Name of the stack

template_file File of template

environment File of environment

parameters Parameter dict used to update the stack

poll Poll and report events until stack complete

rollback Enable rollback on update failure

timeout Stack creation timeout in minutes

profile Profile to build on

CLI Example:

```
salt '*' heat.update_stack name=mystack \
         template_file=salt://template.yaml \
         environment=salt://environment.yaml \
         parameters="{"image": "Debian 8", "flavor": "m1.small"}" \
         poll=5 rollback=False timeout=60 profile=openstack1
```

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

19.9.144 salt.modules.hg

Support for the Mercurial SCM

salt.modules.hg.**archive**(*cwd*, *output*, *rev='tip'*, *fmt=None*, *prefix=None*, *user=None*)

Export a tarball from the repository

cwd The path to the Mercurial repository

output The path to the archive tarball

rev: **tip** The revision to create an archive from

fmt: **None** Format of the resulting archive. Mercurial supports: tar, tbz2, tgz, zip, uzip, and files formats.

prefix [None] Prepend <prefix>/ to every filename in the archive

user [None] Run hg as a user other than what the minion runs as

If `prefix` is not specified it defaults to the basename of the repo directory.

CLI Example:

```
salt '*' hg.archive /path/to/repo output=/tmp/archive.tgz fmt=tgz
```

salt.modules.hg.**clone**(*cwd*, *repository*, *opts=None*, *user=None*, *identity=None*)

Clone a new repository

cwd The path to the Mercurial repository

repository The hg URI of the repository

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

identity [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.clone /path/to/repo https://bitbucket.org/birkenfeld/sphinx
```

salt.modules.hg.**describe**(*cwd*, *rev='tip'*, *user=None*)

Mimic git describe and return an identifier for the given revision

cwd The path to the Mercurial repository

rev: **tip** The path to the archive tarball

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.describe /path/to/repo
```

salt.modules.hg.**pull**(*cwd*, *opts=None*, *user=None*, *identity=None*, *repository=None*)

Perform a pull on the given repository

cwd The path to the Mercurial repository

repository [None] Perform pull from the repository different from .hg/hgrc:[paths]:default

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

identity [None] Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

CLI Example:

```
salt '*' hg.pull /path/to/repo opts=-u
```

salt.modules.hg.**revision**(*cwd*, *rev='tip'*, *short=False*, *user=None*)

Returns the long hash of a given identifier (hash, branch, tag, HEAD, etc)

cwd The path to the Mercurial repository

rev: **tip** The revision

short: **False** Return an abbreviated commit hash

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.revision /path/to/repo mybranch
```

salt.modules.hg.**status**(*cwd*, *opts=None*, *user=None*)

Show changed files of the given repository

cwd The path to the Mercurial repository

opts [None] Any additional options to add to the command line

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt '*' hg.status /path/to/repo
```

salt.modules.hg.**update**(*cwd*, *rev*, *force=False*, *user=None*)

Update to a given revision

cwd The path to the Mercurial repository

rev The revision to update to

force [False] Force an update

user [None] Run hg as a user other than what the minion runs as

CLI Example:

```
salt devserver1 hg.update /path/to/repo somebranch
```

19.9.145 salt.modules.hipchat

Module for sending messages to hipchat.

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

It is possible to use a different API than http://api.hipchat.com, by specifying the API URL in config as api_url, or by passing the value directly.

For example:

```
hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1
```

Custom API Example:

```
hipchat:
  api_url: http://api.hipchat.myteam.com
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v2
```

salt.modules.hipchat.**find_room**(*name*, *api_url=None*, *api_key=None*, *api_version=None*)

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The room object.

CLI Example:

```
salt '*' hipchat.find_room name="Development Room"

salt '*' hipchat.find_room name="Development Room" api_
 ↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

salt.modules.hipchat.**find_user**(*name*, *api_url=None*, *api_key=None*, *api_version=None*)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The user object.

CLI Example:

```
salt '*' hipchat.find_user name="Thomas Hatch"

salt '*' hipchat.find_user name="Thomas Hatch" api_
 ↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_version=v1
```

salt.modules.hipchat.**list_rooms**(*api_url=None*, *api_key=None*, *api_version=None*)

List all HipChat rooms.

Parameters

- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The room list.

CLI Example:

```
salt '*' hipchat.list_rooms

salt '*' hipchat.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=v1
```

salt.modules.hipchat.**list_users**(*api_url=None*, *api_key=None*, *api_version=None*)

List all HipChat users.

Parameters

- **api_url** -- The HipChat API URL, if not specified in the configuration.
- **api_key** -- The HipChat admin api key.
- **api_version** -- The HipChat api version, if not specified in the configuration.

Returns The user list.

CLI Example:

```
salt '*' hipchat.list_users

salt '*' hipchat.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=v1
```

salt.modules.hipchat.**send_message**(*room_id*, *message*, *from_name*, *api_url=None*, *api_key=None*, *api_version=None*, *color='yellow'*, *notify=False*)

Send a message to a HipChat room.

Parameters

- **room_id** -- The room id or room name, either will work.
- **message** -- The message to send to the HipChat room.
- **from_name** -- Specify who the message is from.
- **api_url** -- The HipChat api URL, if not specified in the configuration.
- **api_key** -- The HipChat api key, if not specified in the configuration.
- **api_version** -- The HipChat api version, if not specified in the configuration.
- **color** -- The color for the message, default: yellow.
- **notify** -- Whether to notify the room, default: False.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' hipchat.send_message room_id="Development Room" message="Build is done"
↪from_name="Build Server"

salt '*' hipchat.send_message room_id="Development Room" message="Build failed"
↪from_name="Build Server" color="red" notify=True
```

19.9.146 salt.modules.hosts

Manage the information in the hosts file

salt.modules.hosts.**add_host**(*ip*, *alias*)

Add a host to an existing entry, if the entry is not in place then create it with the given host

CLI Example:

```
salt '*' hosts.add_host <ip> <alias>
```

salt.modules.hosts.**get_alias**(*ip*)

Return the list of aliases associated with an ip

Aliases (host names) are returned in the order in which they appear in the hosts file. If there are no aliases associated with the IP, an empty list is returned.

CLI Example:

```
salt '*' hosts.get_alias <ip addr>
```

salt.modules.hosts.**get_ip**(*host*)

Return the ip associated with the named host

CLI Example:

```
salt '*' hosts.get_ip <hostname>
```

salt.modules.hosts.**has_pair**(*ip*, *alias*)

Return true if the alias is set

CLI Example:

```
salt '*' hosts.has_pair <ip> <alias>
```

salt.modules.hosts.**list_hosts**()

Return the hosts found in the hosts file in this format:

```
{'<ip addr>': ['alias1', 'alias2', ...]}
```

CLI Example:

```
salt '*' hosts.list_hosts
```

salt.modules.hosts.**rm_host**(*ip*, *alias*)

Remove a host entry from the hosts file

CLI Example:

```
salt '*' hosts.rm_host <ip> <alias>
```

salt.modules.hosts.**set_host**(*ip*, *alias*)

Set the host entry in the hosts file for the given ip, this will overwrite any previous entry for the given ip

Changed in version 2016.3.0: If `alias` does not include any host names (it is the empty string or contains only whitespace), all entries for the given IP address are removed.

CLI Example:

```
salt '*' hosts.set_host <ip> <alias>
```

19.9.147 salt.modules.htpasswd

Support for htpasswd command. Requires the apache2-utils package for Debian-based distros.

New in version 2014.1.0.

The functions here will load inside the webutil module. This allows other functions that don't use htpasswd to use the webutil module name.

salt.modules.htpasswd.**useradd**(*pwfile*, *user*, *password*, *opts='`*, *runas=None*)

Add a user to htpasswd file using the htpasswd command. If the htpasswd file does not exist, it will be created.
pwfile Path to htpasswd file
user User name
password User password
opts Valid options that can be passed are:

- *n* Don't update file; display results on stdout.
- *m* Force MD5 encryption of the password (default).
- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas The system user to run htpasswd command with
CLI Examples:

```
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpassword
salt '*' webutil.useradd /etc/httpd/htpasswd larry badpass opts=ns
```

salt.modules.htpasswd.**userdel**(*pwfile*, *user*, *runas=None*, *all_results=False*)

Delete a user from the specified htpasswd file.
pwfile Path to htpasswd file
user User name
runas The system user to run htpasswd command with
all_results Return stdout, stderr, and retcode, not just stdout
CLI Examples:

```
salt '*' webutil.userdel /etc/httpd/htpasswd larry
```

salt.modules.htpasswd.**verify**(*pwfile*, *user*, *password*, *opts='`*, *runas=None*)

Return True if the htpasswd file exists, the user has an entry, and their password matches.
pwfile Fully qualified path to htpasswd file
user User name
password User password
opts Valid options that can be passed are:

- *m* Force MD5 encryption of the password (default).

- *d* Force CRYPT encryption of the password.
- *p* Do not encrypt the password (plaintext).
- *s* Force SHA encryption of the password.

runas The system user to run htpasswd command with

CLI Examples:

```
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword
salt '*' webutil.verify /etc/httpd/htpasswd larry maybepassword opts=ns
```

19.9.148 salt.modules.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.modules.http.`**`query`**(*url*, ***kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```
salt '*' http.query http://somelink.com/
salt '*' http.query http://somelink.com/ method=POST             params='key1=val1&
↪key2=val2'
salt '*' http.query http://somelink.com/ method=POST              data='<xml>
↪somecontent</xml>'
```

`salt.modules.http.`**`update_ca_bundle`**(*target=None*, *source=None*, *merge_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt '*' http.update_ca_bundle
salt '*' http.update_ca_bundle target=/path/to/cacerts.pem
salt '*' http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the minion. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the minion. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt '*' http.update_ca_bundle merge_files=/path/to/mycert.pem
```

`salt.modules.http.`**`wait_for_successful_query`**(*url*, *wait_for=300*, ***kwargs*)

Query a resource until a successful response, and decode the return data

CLI Example:

```
salt '*' http.wait_for_successful_query http://somelink.com/ wait_for=160
```

19.9.149 salt.modules.ifttt

Support for IFTTT

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

`salt.modules.ifttt.`**`trigger_event`**(*event=None*, ***kwargs*)

Trigger a configured event in IFTTT.

Parameters **`event`** -- The name of the event to trigger.

Returns A dictionary with status, text, and error if result was failure.

19.9.150 salt.modules.ilo

Manage HP ILO

depends hponcfg (SmartStart Scripting Toolkit Linux Edition)

`salt.modules.ilo.`**`change_password`**(*username*, *password*)

Reset a users password

CLI Example:

```
salt '*' ilo.change_password damianMyerscough
```

`salt.modules.ilo.`**`change_username`**(*old_username*, *new_username*)

Change a username

CLI Example:

```
salt '*' ilo.change_username damian diana
```

`salt.modules.ilo.`**`configure_network`**(*ip*, *netmask*, *gateway*)

Configure Network Interface

CLI Example:

```
salt '*' ilo.configure_network [IP ADDRESS] [NETMASK] [GATEWAY]
```

`salt.modules.ilo.`**`configure_snmp`**(*community*, *snmp_port=161*, *snmp_trapport=161*)

Configure SNMP

CLI Example:

```
salt '*' ilo.configure_snmp [COMMUNITY STRING] [SNMP PORT] [SNMP TRAP PORT]
```

`salt.modules.ilo.`**`create_user`**(*name*, *password*, **privileges*)

Create user

CLI Example:

```
salt '*' ilo.create_user damian secretagent VIRTUAL_MEDIA_PRIV
```

If no permissions are specify the user will only have a read-only account.

Supported privelges:

- •ADMIN_PRIV Enables the user to administer user accounts.
- •REMOTE_CONS_PRIV Enables the user to access the Remote Console functionality.
- •RESET_SERVER_PRIV Enables the user to remotely manipulate the server power setting.
- •VIRTUAL_MEDIA_PRIV Enables the user permission to access the virtual media functionality.
- •CONFIG_ILO_PRIV Enables the user to configure iLO settings.

salt.modules.ilo.**delete_ssh_key**(*username*)

Delete a users SSH key from the ILO

CLI Example:

```
salt '*' ilo.delete_user_sshkey damian
```

salt.modules.ilo.**delete_user**(*username*)

Delete a user

CLI Example:

```
salt '*' ilo.delete_user damian
```

salt.modules.ilo.**disable_dhcp**()

Disable DHCP

CLI Example:

```
salt '*' ilo.disable_dhcp
```

salt.modules.ilo.**disable_ssh**()

Disable the SSH daemon

CLI Example:

```
salt '*' ilo.disable_ssh
```

salt.modules.ilo.**enable_dhcp**()

Enable DHCP

CLI Example:

```
salt '*' ilo.enable_dhcp
```

salt.modules.ilo.**enable_ssh**()

Enable the SSH daemon

CLI Example:

```
salt '*' ilo.enable_ssh
```

salt.modules.ilo.**get_user**(*username*)

Returns local user information, excluding the password

CLI Example:

```
salt '*' ilo.get_user damian
```

salt.modules.ilo.**global_settings**()

Show global settings

CLI Example:

```
salt '*' ilo.global_settings
```

salt.modules.ilo.**list_users**()
List all users

CLI Example:

```
salt '*' ilo.list_users
```

salt.modules.ilo.**list_users_info**()
List all users in detail

CLI Example:

```
salt '*' ilo.list_users_info
```

salt.modules.ilo.**network**()
Grab the current network settings

CLI Example:

```
salt '*' ilo.network
```

salt.modules.ilo.**set_http_port**(*port=80*)
Configure the port HTTP should listen on

CLI Example:

```
salt '*' ilo.set_http_port 8080
```

salt.modules.ilo.**set_https_port**(*port=443*)
Configure the port HTTPS should listen on

CLI Example:

```
salt '*' ilo.set_https_port 4334
```

salt.modules.ilo.**set_ssh_key**(*public_key*)
Configure SSH public keys for specific users

CLI Example:

```
salt '*' ilo.set_ssh_key "ssh-dss AAAAB3NzaC1kc3MAAACBA... damian"
```

The SSH public key needs to be DSA and the last argument in the key needs to be the username (case-senstive) of the ILO username.

salt.modules.ilo.**set_ssh_port**(*port=22*)
Enable SSH on a user defined port

CLI Example:

```
salt '*' ilo.set_ssh_port 2222
```

19.9.151 salt.modules.icinga2 module

Module to provide icinga2 compatibility to salt.

New in version 2017.7.0.

depends

- icinga2 server

salt.modules.icinga2.**generate_cert**(*domain*)

Generate an icinga2 client certificate and key.

Returns:: icinga2 pki new-cert --cn domain.tld --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt

CLI Example:

```
salt '*' icinga2.generate_cert domain.tld
```

salt.modules.icinga2.**generate_ticket**(*domain*)

Generate and save an icinga2 ticket.

Returns:: icinga2 pki ticket --cn domain.tld

CLI Example:

```
salt '*' icinga2.generate_ticket domain.tld
```

salt.modules.icinga2.**node_setup**(*domain*, *master*, *ticket*)

Setup the icinga2 node.

Returns:: icinga2 node setup --ticket TICKET_ID --endpoint master.domain.tld --zone domain.tld --master_host master.domain.tld --trustedcert /etc/icinga2/pki/trusted-master.crt

CLI Example:

```
salt '*' icinga2.node_setup domain.tld master.domain.tld TICKET_ID
```

salt.modules.icinga2.**request_cert**(*domain*, *master*, *ticket*, *port*)

Request CA cert from master icinga2 node.

Returns:: icinga2 pki request --host master.domain.tld --port 5665 --ticket TICKET_ID --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --ca /etc/icinga2/pki/ca.crt

CLI Example:

```
salt '*' icinga2.request_cert domain.tld master.domain.tld TICKET_ID
```

salt.modules.icinga2.**save_cert**(*domain*, *master*)

Save the certificate for master icinga2 node.

Returns:: icinga2 pki save-cert --key /etc/icinga2/pki/domain.tld.key --cert /etc/icinga2/pki/domain.tld.crt --trustedcert /etc/icinga2/pki/trusted-master.crt --host master.domain.tld

CLI Example:

```
salt '*' icinga2.save_cert domain.tld master.domain.tld
```

19.9.152 salt.modules.incron

Work with incron

salt.modules.incron.**list_tab**(*user*)

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

salt.modules.incron.**ls**(*user*)

This function is an alias of `list_tab`.

Return the contents of the specified user's incrontab

CLI Example:

```
salt '*' incron.list_tab root
```

salt.modules.incron.**raw_incron**(*user*)

Return the contents of the user's incrontab

CLI Example:

```
salt '*' incron.raw_incron root
```

salt.modules.incron.**raw_system_incron**()

Return the contents of the system wide incrontab

CLI Example:

```
salt '*' incron.raw_system_incron
```

salt.modules.incron.**rm**(*user*, *path*, *mask*, *cmd*)

This function is an alias of `rm_job`.

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

salt.modules.incron.**rm_job**(*user*, *path*, *mask*, *cmd*)

Remove a incron job for a specified user. If any of the day/time params are specified, the job will only be removed if the specified params match.

CLI Example:

```
salt '*' incron.rm_job root /path
```

salt.modules.incron.**set_job**(*user*, *path*, *mask*, *cmd*)

Sets an incron job up for a specified user.

CLI Example:

```
salt '*' incron.set_job root '/root' 'IN_MODIFY' 'echo "$$ $@ $# $% $&"'
```

salt.modules.incron.**write_incron_file**(*user*, *path*)

Writes the contents of a file to a user's incrontab

CLI Example:

```
salt '*' incron.write_incron_file root /tmp/new_incron
```

salt.modules.incron.**write_incron_file_verbose**(*user*, *path*)

Writes the contents of a file to a user's incrontab and return error message on error

CLI Example:

```
salt '*' incron.write_incron_file_verbose root /tmp/new_incron
```

19.9.153 salt.modules.influx

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.9+)

depends

- influxdb Python module (>= 3.0.0)

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb.host: 'localhost'
influxdb.port: 8086
influxdb.user: 'root'
influxdb.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

Most functions in this module allow you to override or provide some or all of these settings via keyword arguments:

```
salt '*' influxdb.foo_function user='influxadmin' password='s3cr1t'
```

would override `user` and `password` while still using the defaults for `host` and `port`.

`salt.modules.influx.`**`alter_retention_policy`**(*database*, *name*, *duration*, *replication*, *default=False*, ***client_args*)

Modify an existing retention policy.

name Name of the retention policy to modify.

database Name of the database for which the retention policy was defined.

duration New duration of given retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use `INF' for duration. The minimum retention period is 1 hour.

replication New replication of given retention policy.

This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not to set the modified policy as default.

CLI Example:

```
salt '*' influxdb.alter_retention_policy metrics default 1d 1
```

`salt.modules.influx.`**`continuous_query_exists`**(*database*, *name*, ***client_args*)

Check if continuous query with given name exists on the database.

database Name of the database for which the continuous query was defined.

name Name of the continuous query to check.

CLI Example:

```
salt '*' influxdb.continuous_query_exists metrics default
```

`salt.modules.influx.`**`create_continuous_query`**(*database*, *name*, *query*, *resample_time=None*, *coverage_period=None*, ***client_args*)

Create a continuous query.

database Name of the database for which the continuous query will be created on.

name Name of the continuous query to create.

query The continuous query string.

resample_time [None] Duration between continuous query resampling.
coverage_period [None] Duration specifying time period per sample.
CLI Example:

```
salt '*' influxdb.create_continuous_query mydb cq_month 'SELECT mean(*) INTO mydb.
↪a_month.:MEASUREMENT FROM mydb.a_week./.*/ GROUP BY time(5m), *'
```

salt.modules.influx.**create_db**(*name*, ***client_args*)
Create a database.
name Name of the database to create.
CLI Example:

```
salt '*' influxdb.create_db <name>
```

salt.modules.influx.**create_retention_policy**(*database*, *name*, *duration*, *replication*, *default=False*, ***client_args*)
Create a retention policy.
database Name of the database for which the retention policy will be created.
name Name of the new retention policy.
duration Duration of the new retention policy.

Durations such as 1h, 90m, 12h, 7d, and 4w, are all supported and mean 1 hour, 90 minutes, 12 hours, 7 day, and 4 weeks, respectively. For infinite retention – meaning the data will never be deleted – use `INF' for duration. The minimum retention period is 1 hour.

replication Replication factor of the retention policy.

This determines how many independent copies of each data point are stored in a cluster.

default [False] Whether or not the policy as default will be set as default.
CLI Example:

```
salt '*' influxdb.create_retention_policy metrics default 1d 1
```

salt.modules.influx.**create_user**(*name*, *password*, *admin=False*, ***client_args*)
Create a user.
name Name of the user to create.
password Password of the new user.
admin [False] Whether the user should have cluster administration privileges or not.
CLI Example:

```
salt '*' influxdb.create_user <name> <password>
salt '*' influxdb.create_user <name> <password> admin=True
```

salt.modules.influx.**db_exists**(*name*, ***client_args*)
Checks if a database exists in InfluxDB.
name Name of the database to check.
CLI Example:

```
salt '*' influxdb.db_exists <name>
```

salt.modules.influx.**drop_continuous_query**(*database*, *name*, ***client_args*)
Drop a continuous query.
database Name of the database for which the continuous query will be drop from.
name Name of the continuous query to drop.
CLI Example:

```
salt '*' influxdb.drop_continuous_query mydb my_cq
```

salt.modules.influx.**drop_db**(*name*, ***client_args*)

Drop a database.

name Name of the database to drop.

CLI Example:

```
salt '*' influxdb.drop_db <name>
```

salt.modules.influx.**drop_retention_policy**(*database*, *name*, ***client_args*)

Drop a retention policy.

database Name of the database for which the retention policy will be dropped.

name Name of the retention policy to drop.

CLI Example:

```
salt '*' influxdb.drop_retention_policy mydb mypr
```

salt.modules.influx.**get_continuous_query**(*database*, *name*, ***client_args*)

Get an existing continuous query.

database Name of the database for which the continuous query was defined.

name Name of the continuous query to get.

CLI Example:

```
salt '*' influxdb.get_continuous_query mydb cq_month
```

salt.modules.influx.**get_retention_policy**(*database*, *name*, ***client_args*)

Get an existing retention policy.

database Name of the database for which the retention policy was defined.

name Name of the retention policy.

CLI Example:

```
salt '*' influxdb.get_retention_policy metrics default
```

salt.modules.influx.**grant_admin_privileges**(*name*, ***client_args*)

Grant cluster administration privileges to a user.

name Name of the user to whom admin privileges will be granted.

CLI Example:

```
salt '*' influxdb.grant_admin_privileges <name>
```

salt.modules.influx.**grant_privilege**(*database*, *privilege*, *username*, ***client_args*)

Grant a privilege on a database to a user.

database Name of the database to grant the privilege on.

privilege Privilege to grant. Can be one of `read', `write' or `all'.

username Name of the user to grant the privilege to.

salt.modules.influx.**list_dbs**(***client_args*)

List all InfluxDB databases.

CLI Example:

```
salt '*' influxdb.list_dbs
```

salt.modules.influx.**list_privileges**(*name*, ***client_args*)

List privileges from a user.

name Name of the user from whom privileges will be listed.

CLI Example:

```
salt '*' influxdb.list_privileges <name>
```

salt.modules.influx.**list_users**(***client_args*)

List all users.

CLI Example:

```
salt '*' influxdb.list_users
```

salt.modules.influx.**query**(*database*, *query*, ***client_args*)

Execute a query.

database Name of the database to query on.

query InfluxQL query string.

salt.modules.influx.**remove_user**(*name*, ***client_args*)

Remove a user.

name Name of the user to remove

CLI Example:

```
salt '*' influxdb.remove_user <name>
```

salt.modules.influx.**retention_policy_exists**(*database*, *name*, ***client_args*)

Check if retention policy with given name exists.

database Name of the database for which the retention policy was defined.

name Name of the retention policy to check.

CLI Example:

```
salt '*' influxdb.retention_policy_exists metrics default
```

salt.modules.influx.**revoke_admin_privileges**(*name*, ***client_args*)

Revoke cluster administration privileges from a user.

name Name of the user from whom admin privileges will be revoked.

CLI Example:

```
salt '*' influxdb.revoke_admin_privileges <name>
```

salt.modules.influx.**revoke_privilege**(*database*, *privilege*, *username*, ***client_args*)

Revoke a privilege on a database from a user.

database Name of the database to grant the privilege on.

privilege Privilege to grant. Can be one of `read', `write' or `all'.

username Name of the user to grant the privilege to.

salt.modules.influx.**set_user_password**(*name*, *password*, ***client_args*)

Change password of a user.

name Name of the user for whom to set the password.

password New password of the user.

CLI Example:

```
salt '*' influxdb.set_user_password <name> <password>
```

salt.modules.influx.**user_exists**(*name*, ***client_args*)

Check if a user exists.

name Name of the user to check.

CLI Example:

```
salt '*' influxdb.user_exists <name>
```

salt.modules.influx.**user_info**(*name*, ***client_args*)

Get information about given user.

name Name of the user for which to get information.

CLI Example:

```
salt '*' influxdb.user_info <name>
```

19.9.154 salt.modules.influx08 module

InfluxDB - A distributed time series database

Module to provide InfluxDB compatibility to Salt (compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

depends

- influxdb Python module (>= 1.0.0)

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
influxdb08.host: 'localhost'
influxdb08.port: 8086
influxdb08.user: 'root'
influxdb08.password: 'root'
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.influx08.**db_create**(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Create a database

name Database name to create

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_create <name>
salt '*' influxdb08.db_create <name> <user> <password> <host> <port>
```

salt.modules.influx08.**db_exists**(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Checks if a database exists in Influxdb

name Database name to create

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_exists <name>
salt '*' influxdb08.db_exists <name> <user> <password> <host> <port>
```

salt.modules.influx08.**db_list**(*user=None*, *password=None*, *host=None*, *port=None*)

List all InfluxDB databases

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_list
salt '*' influxdb08.db_list <user> <password> <host> <port>
```

salt.modules.influx08.**db_remove**(*name*, *user=None*, *password=None*, *host=None*, *port=None*)

Remove a database

name Database name to remove

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.db_remove <name>
salt '*' influxdb08.db_remove <name> <user> <password> <host> <port>
```

salt.modules.influx08.**login_test**(*name*, *password*, *database=None*, *host=None*, *port=None*)

Checks if a credential pair can log in at all.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.

name The user to connect as

password The password of the user

database The database to try to log in to

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.login_test <name>
salt '*' influxdb08.login_test <name> <database>
salt '*' influxdb08.login_test <name> <database> <user> <password> <host> <port>
```

salt.modules.influx08.**query**(*database*, *query*, *time_precision='s'*, *chunked=False*, *user=None*, *password=None*, *host=None*, *port=None*)

Querying data

database The database to query

query Query to be executed

time_precision Time precision to use (`s', `m', or `u')

chunked Whether is chunked or not

user The user to connect as

password The password of the user

host The host to connect to

port The port to connect to

CLI Example:

```
salt '*' influxdb08.query <database> <query>
salt '*' influxdb08.query <database> <query> <time_precision> <chunked> <user>
↪<password> <host> <port>
```

salt.modules.influx08.**retention_policy_add**(*database*, *name*, *duration*, *replication*, *default=False*, *user=None*, *password=None*, *host=None*, *port=None*)

Add a retention policy.
database The database to operate on.
name Name of the policy to modify.
duration How long InfluxDB keeps the data.
replication How many copies of the data are stored in the cluster.
default Whether this policy should be the default or not. Default is False.
CLI Example:

```
salt '*' influxdb.retention_policy_add metrics default 1d 1
```

salt.modules.influx08.**retention_policy_alter**(*database*, *name*, *duration*, *replication*, *default=False*, *user=None*, *password=None*, *host=None*, *port=None*)

Modify an existing retention policy.
database The database to operate on.
name Name of the policy to modify.
duration How long InfluxDB keeps the data.
replication How many copies of the data are stored in the cluster.
default Whether this policy should be the default or not. Default is False.
CLI Example:

```
salt '*' influxdb08.retention_policy_modify metrics default 1d 1
```

salt.modules.influx08.**retention_policy_exists**(*database*, *name*, *user=None*, *password=None*, *host=None*, *port=None*)

Check if a retention policy exists.
database The database to operate on.
name Name of the policy to modify.
CLI Example:

```
salt '*' influxdb08.retention_policy_exists metrics default
```

salt.modules.influx08.**retention_policy_get**(*database*, *name*, *user=None*, *password=None*, *host=None*, *port=None*)

Get an existing retention policy.
database The database to operate on.
name Name of the policy to modify.
CLI Example:

```
salt '*' influxdb08.retention_policy_get metrics default
```

salt.modules.influx08.**user_chpass**(*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Change password for a cluster admin or a database user.

If a database is specified: it will update database user password. If a database is not specified: it will update cluster admin password.
name User name for whom to change the password
passwd New password
database The database on which to operate
user The user to connect as
password The password of the user
host The host to connect to

port The port to connect to
CLI Example:

```
salt '*' influxdb08.user_chpass <name> <passwd>
salt '*' influxdb08.user_chpass <name> <passwd> <database>
salt '*' influxdb08.user_chpass <name> <passwd> <database> <user> <password>
 ↪<host> <port>
```

salt.modules.influx08.**user_create**(*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Create a cluster admin or a database user.

If a database is specified: it will create database user. If a database is not specified: it will create a cluster admin.
name User name for the new user to create
passwd Password for the new user to create
database The database to create the user in
user The user to connect as
password The password of the user
host The host to connect to
port The port to connect to
CLI Example:

```
salt '*' influxdb08.user_create <name> <passwd>
salt '*' influxdb08.user_create <name> <passwd> <database>
salt '*' influxdb08.user_create <name> <passwd> <database> <user> <password>
 ↪<host> <port>
```

salt.modules.influx08.**user_exists**(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Checks if a cluster admin or database user exists.

If a database is specified: it will check for database user existence. If a database is not specified: it will check for cluster admin existence.
name User name
database The database to check for the user to exist
user The user to connect as
password The password of the user
host The host to connect to
port The port to connect to
CLI Example:

```
salt '*' influxdb08.user_exists <name>
salt '*' influxdb08.user_exists <name> <database>
salt '*' influxdb08.user_exists <name> <database> <user> <password> <host> <port>
```

salt.modules.influx08.**user_list**(*database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

List cluster admins or database users.

If a database is specified: it will return database users list. If a database is not specified: it will return cluster admins list.
database The database to list the users from
user The user to connect as
password The password of the user
host The host to connect to
port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_list
salt '*' influxdb08.user_list <database>
salt '*' influxdb08.user_list <database> <user> <password> <host> <port>
```

salt.modules.influx08.**user_remove**(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)

Remove a cluster admin or a database user.

If a database is specified: it will remove the database user. If a database is not specified: it will remove the cluster admin.

name User name to remove
database The database to remove the user from
user User name for the new user to delete
user The user to connect as
password The password of the user
host The host to connect to
port The port to connect to

CLI Example:

```
salt '*' influxdb08.user_remove <name>
salt '*' influxdb08.user_remove <name> <database>
salt '*' influxdb08.user_remove <name> <database> <user> <password> <host> <port>
```

19.9.155 salt.modules.infoblox

Module for managing Infoblox

Will look for pillar data infoblox:server, infoblox:user, infoblox:password if not passed to functions

New in version 2016.3.0.

depends

- requests

salt.modules.infoblox.**add_record**(*name*, *value*, *record_type*, *dns_view*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

add a record to an infoblox dns view

name the record name
value

the value for the entry can make use of infoblox functions for next available IP, like `func:nextavailableip:10.1.0.0/24'

record_type the record type (cname, a, host, etc)
dns_view the DNS view to add the record to
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infolblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API

CLI Example:

```
salt 'myminion' infoblox.add_record alias.network.name canonical.network.name
 ↪MyView
```

salt.modules.infoblox.**delete_record**(*name*, *dns_view*, *record_type*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

delete a record
name name of the record
dns_view the DNS view to remove the record from
record_type the record type (a, cname, host, etc)
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infolblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
CLI Example:

```
salt my-minion infoblox.delete_record some.dns.record MyInfobloxView A
↪sslVerify=False
```

salt.modules.infoblox.**get_network**(*network_name*, *network_view=None*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

get a network from infoblox
network_name The name of the network in IPAM
network_view The name of the network view the network belongs to
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infolblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
CLI Example:

```
salt myminion infoblox.get_network '10.0.0.0/8'
```

salt.modules.infoblox.**get_record**(*record_name*, *record_type='host'*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *dns_view=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

get a record from infoblox
record_name name of the record to search for
record_type type of reacord to search for (host, cname, a, etc...defaults to host)
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infolblox:password pillar)
dns_view the infoblox DNS view to search, if not specified all views are searched
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
CLI Example:

```
salt myminion infoblox.get_record some.host.com A sslVerify=False
```

salt.modules.infoblox.**update_record**(*name*, *value*, *dns_view*, *record_type*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

update an entry to an infoblox dns view
name the dns name
value the value for the record
record_type the record type (a, cname, etc)

dns_view the DNS view to add the record to
infoblox_server the infoblox server hostname (can also use the infoblox:server pillar)
infoblox_user the infoblox user to connect with (can also use the infoblox:user pillar)
infoblox_password the infoblox user's password (can also use the infolblox:password pillar)
infoblox_api_version the infoblox api version to use
sslVerify should ssl verification be done on the connection to the Infoblox REST API
CLI Example:

```
salt '*' infoblox.update_record alias.network.name canonical.network.name
 ↪MyInfobloxView cname sslVerify=False
```

19.9.156 salt.modules.ini_manage

Edit ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

(for example /etc/sysctl.conf)

salt.modules.ini_manage.**get_option**(*file_name*, *section*, *option*, *separator='='*)
Get value of a key from a section in an ini file. Returns None if no matching key was found.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_option',
       [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.get_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.**get_section**(*file_name*, *section*, *separator='='*)
Retrieve a section from an ini file. Returns the section as dictionary. If the section is not found, an empty dictionary is returned.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.get_section',
       [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.get_section /path/to/ini section_name
```

salt.modules.ini_manage.**remove_option**(*file_name*, *section*, *option*, *separator='='*)
Remove a key/value pair from a section in an ini file. Returns the value of the removed key, or None if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_option',
       [path_to_ini_file, section_name, option])
```

CLI Example:

```
salt '*' ini.remove_option /path/to/ini section_name option_name
```

salt.modules.ini_manage.**remove_section**(*file_name*, *section*, *separator='='*)

Remove a section in an ini file. Returns the removed section as dictionary, or None if nothing was removed.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.remove_section',
       [path_to_ini_file, section_name])
```

CLI Example:

```
salt '*' ini.remove_section /path/to/ini section_name
```

salt.modules.ini_manage.**set_option**(*file_name*, *sections=None*, *separator='='*)

Edit an ini file, replacing one or more sections. Returns a dictionary containing the changes made.

file_name path of ini_file

sections [None] A dictionary representing the sections to be edited ini file The keys are the section names and the values are the dictionary containing the options If the ini file does not contain sections the keys and values represent the options

separator [=] A character used to separate keys and values. Standard ini files use the ``=" character.

New in version 2016.11.0.

API Example:

```
import salt
sc = salt.client.get_local_client()
sc.cmd('target', 'ini.set_option',
       ['path_to_ini_file', '{"section_to_change": {"key": "value"}}'])
```

CLI Example:

```
salt '*' ini.set_option /path/to/ini '{section_foo: {key: value}}'
```

19.9.157 salt.modules.inspectlib package

Submodules

salt.modules.inspectlib.collector module

salt.modules.inspectlib.collector.**is_alive**(*pidfile*)

Check if PID is still alive.

salt.modules.inspectlib.collector.**main**(*dbfile*, *pidfile*, *mode*)

Main analyzer routine.

salt.modules.inspectlib.dbhandle module

class salt.modules.inspectlib.dbhandle.**DBHandleBase**(*path*)
Handle for the *volatile* database, which serves the purpose of caching the inspected data. This database can be destroyed or corrupted, so it should be simply re-created from scratch.

close()
Close the database connection.

flush(*table*)
Flush the table.

open(*new=False*)
Init the database, if required.

purge()
Purge whole database.

salt.modules.inspectlib.exceptions module

exception salt.modules.inspectlib.exceptions.**InspectorKiwiProcessorException**
Kiwi builder/exporter exception.

exception salt.modules.inspectlib.exceptions.**InspectorQueryException**
Exception that is only for the inspector query.

exception salt.modules.inspectlib.exceptions.**InspectorSnapshotException**
Snapshot exception.

exception salt.modules.inspectlib.exceptions.**SIException**
System information exception.

salt.modules.inspectlib.query module

class salt.modules.inspectlib.query.**Query**(*scope*, *cachedir=None*)
Query the system. This class is actually puts all Salt features together, so there would be no need to pick it from various places.

class salt.modules.inspectlib.query.**SysInfo**(*systype*)
System information.

Module contents

class salt.modules.inspectlib.**EnvLoader**(*cachedir=None*, *piddir=None*, *pidfilename=None*)
Load environment.

19.9.158 salt.modules.inspectlib.entities module

class salt.modules.inspectlib.entities.**AllowedDir**
Allowed directories

class salt.modules.inspectlib.entities.**IgnoredDir**
Ignored directories

class salt.modules.inspectlib.entities.**Package**
Package.

class salt.modules.inspectlib.entities.**PackageCfgFile**
Config file, belongs to the package

class salt.modules.inspectlib.entities.**PayloadFile**
Payload file.

19.9.159 salt.modules.inspectlib.fsdb module

codeauthor Bo Maryniuk <bo@suse.de>

class salt.modules.inspectlib.fsdb.**CsvDB**(*path*)
File-based CSV database. This database is in-memory operating relatively small plain text csv files.

close()
Close the database.

Returns

create_table_from_object(*obj*)
Create a table from the object. NOTE: This method doesn't stores anything.

Parameters **obj** --

Returns

delete(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Delete object from the database.

Parameters

- **obj** --
- **matches** --
- **mt** --
- **lt** --
- **eq** --

Returns

flush(*table*)
Flush table.

Parameters **table** --

Returns

get(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Get objects from the table.

Parameters

- **table_name** --
- **matches** -- Regexp.
- **mt** -- More than.
- **lt** -- Less than.
- **eq** -- Equals.

Returns

is_closed()
Return if the database is closed.

Returns

list()
List all the databases on the given path.

Returns

list_tables()
Load existing tables and their descriptions.

Returns

new()
Create a new database and opens it.

Returns

open(*dbname=None*)
Open database from the path with the name or latest. If there are no yet databases, create a new implicitly.

Returns

purge(*dbid*)
Purge the database.

Parameters **dbid** --

Returns

store(*obj*, *distinct=False*)
Store an object in the table.

Parameters

- **obj** -- An object to store
- **distinct** -- Store object only if there is none identical of such. If at least one field is different, store it.

Returns

update(*obj*, *matches=None*, *mt=None*, *lt=None*, *eq=None*)
Update object(s) in the database.

Parameters

- **obj** --
- **matches** --
- **mt** --
- **lt** --
- **eq** --

Returns

class salt.modules.inspectlib.fsdb.**CsvDBEntity**
Serializable object for the table.

19.9.160 salt.modules.inspectlib.kiwiproc module

class salt.modules.inspectlib.kiwiproc.**KiwiExporter**(*grains*, *format*)
Exports system description as Kiwi configuration.

export(*name*)
Export to the Kiwi config.xml as text.

Returns

load(***descr*)
Load data by keys.

Parameters **data** --

Returns

19.9.161 salt.modules.inspector module

Module for full system inspection.

salt.modules.inspector.**build**(*format='qcow2'*, *path='/tmp/'*)
Build an image from a current system description. The image is a system image can be output in bootable ISO or QCOW2 formats.

Node uses the image building library Kiwi to perform the actual build.

Parameters:
- **format**: Specifies output format: ``qcow2'' or ``iso. Default: *qcow2*.
- **path**: Specifies output path where to store built image. Default: */tmp*.

CLI Example:

```
salt myminion inspector.build
salt myminion inspector.build format=iso path=/opt/builds/
```

salt.modules.inspector.**delete**(*all=False*, **databases*)
Remove description snapshots from the system.

::parameter: all. Default: False. Remove all snapshots, if set to True.

CLI example:

```
salt myminion inspector.delete <ID> <ID1> <ID2>..
salt myminion inspector.delete all=True
```

salt.modules.inspector.**export**(*local=False*, *path='/tmp'*, *format='qcow2'*)
Export an image description for Kiwi.

Parameters:
- **local**: Specifies True or False if the export has to be in the local file. Default: False.
- **path**: **If *local=True*, then specifies the path where file with the Kiwi description is written.** Default: */tmp*.

CLI Example:

```
salt myminion inspector.export
salt myminion inspector.export format=iso path=/opt/builds/
```

salt.modules.inspector.**inspect**(*mode='all'*, *priority=19*, ***kwargs*)
Start node inspection and save the data to the database for further query.

Parameters:

- **mode**: Clarify inspection mode: configuration, payload, all (default)

  payload

  - **filter**: Comma-separated directories to track payload.
- **priority**: (advanced) Set priority of the inspection. Default is low priority.

CLI Example:

```
salt '*' inspector.inspect
salt '*' inspector.inspect configuration
salt '*' inspector.inspect payload filter=/opt,/ext/oracle
```

salt.modules.inspector.**query**(**args*, ***kwargs*)

Query the node for specific information.

Parameters:

- **scope**: Specify scope of the query.
  - **System**: Return system data.
  - **Software**: Return software information.
  - **Services**: Return known services.
  - **Identity**: **Return user accounts information for this system.**

    accounts Can be either `local', `remote' or `all' (equal to ``local,remote''). Remote accounts cannot be resolved on all systems, but only those, which supports `passwd -S -a'.

    disabled True (or False, default) to return only disabled accounts.
  - **payload**: **Payload scope parameters:**

    filter Include only results which path starts from the filter string.

    time Display time in Unix ticks or format according to the configured TZ (default) Values: ticks, tz (default)

    size Format size. Values: B, KB, MB, GB

    type Include payload type. Values (comma-separated): directory (or dir), link, file (default) Example (returns everything): type=directory,link,file

    owners Resolve UID/GID to an actual names or leave them numeric (default). Values: name (default), id

    brief Return just a list of payload elements, if True. Default: False.
  - **all**: Return all information (default).

CLI Example:

```
salt '*' inspector.query scope=system
salt '*' inspector.query scope=payload type=file,link filter=/etc size=Kb
 ↪brief=False
```

salt.modules.inspector.**snapshots**()

List current description snapshots.

CLI Example:

```
salt myminion inspector.snapshots
```

19.9.162 salt.modules.introspect

Functions to perform introspection on a minion, and return data in a format usable by Salt States

salt.modules.introspect.**enabled_service_owners**()
Return which packages own each of the services that are currently enabled.

CLI Example:
salt myminion introspect.enabled_service_owners

salt.modules.introspect.**running_service_owners**(*exclude=(`/dev', `/home', `/media', `/proc', `/run', `/sys/', `/tmp', `/var')*)
Determine which packages own the currently running services. By default, excludes files whose full path starts with /dev, /home, /media, /proc, /run, /sys, /tmp and /var. This can be overridden by passing in a new list to exclude.

CLI Example:
salt myminion introspect.running_service_owners

salt.modules.introspect.**service_highstate**(*requires=True*)
Return running and enabled services in a highstate structure. By default also returns package dependencies for those services, which means that package definitions must be created outside this function. To drop the package dependencies, set requires to False.

CLI Example:
salt myminion introspect.service_highstate salt myminion introspect.service_highstate requires=False

19.9.163 salt.modules.ipmi

Support IPMI commands over LAN. This module does not talk to the local systems hardware through IPMI drivers. It uses a python module *pyghmi*.

depends Python module pyghmi. You can install pyghmi using pip:

```
pip install pyghmi
```

configuration The following configuration defaults can be define (pillar or config files):

```
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
    api_pass: apassword
    api_port: 623
    api_kg: None
```

Usage can override the config defaults:

```
salt-call ipmi.get_user api_host=myipmienabled.system
                        api_user=admin api_pass=pass
                        uid=1
```

salt.modules.ipmi.**create_user**(*uid*, *name*, *password*, *channel=14*, *callback=False*, *link_auth=True*, *ipmi_msg=True*, *privilege_level='administrator'*, ***kwargs*)
create/ensure a user is created with provided settings.
Parameters

- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.) * callback * user * operator * administrator * proprietary * no_access
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.create_user uid=2 name=steverweber api_host=172.168.0.7 api_
↪pass=nevertell
```

salt.modules.ipmi.**fast_connect_test**(***kwargs*)

Returns True if connection success. This uses an aggressive timeout value!

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:

```
salt-call ipmi.fast_connect_test api_host=172.168.0.9
```

salt.modules.ipmi.**get_bootdev**(***kwargs*)

Get current boot device override information.

Provides the current requested boot device. Be aware that not all IPMI devices support this. Even in BMCs that claim to, occasionally the BIOS or UEFI fail to honor it. This is usually only applicable to the next reboot.

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_bootdev api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_channel_access**(*channel=14*, *read_mode='non_volatile'*, ***kwargs*)

:param kwargs:api_host=`127.0.0.1' api_user='admin' api_pass='example' api_port=623

Parameters

- **channel** -- number [1:7]
- **read_mode** --

- non_volatile = get non-volatile Channel Access
- volatile = get present volatile (active) setting of Channel Access

- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

A Python dict with the following keys/values:

```
{
    alerting:
    per_msg_auth:
    user_level_auth:
    access_mode:{ (ONE OF)
        0: 'disabled',
        1: 'pre_boot',
        2: 'always',
        3: 'shared'
    }
    privilege_level: { (ONE OF)
        1: 'callback',
        2: 'user',
        3: 'operator',
        4: 'administrator',
        5: 'proprietary',
    }
}
```

CLI Examples:

```
salt-call ipmi.get_channel_access channel=1
```

salt.modules.ipmi.**get_channel_info**(*channel=14*, ***kwargs*)

Get channel info

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data channel session supports

```
- no_session: channel is session-less
- single: channel is single-session
- multi: channel is multi-session
```

```
- auto: channel is session-based (channel could alternate between
    single- and multi-session operation, as can occur with a
    serial/modem channel that supports connection mode auto-detect)
```

CLI Examples:

```
salt-call ipmi.get_channel_info
```

salt.modules.ipmi.**get_channel_max_user_count**(*channel=14*, ***kwargs*)

Get max users in channel

Parameters

- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns int -- often 16

CLI Examples:

```
salt-call ipmi.get_channel_max_user_count
```

salt.modules.ipmi.**get_health**(***kwargs*)

Get Summarize health

This provides a summary of the health of the managed system. It additionally provides an iterable list of reasons for warning, critical, or failed assessments.

good health: {`badreadings': [], `health': 0}

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_health api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_power**(***kwargs*)

Get current power state

The response, if successful, should contain `powerstate' key and either `on' or `off' to indicate current state.

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example

- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_power api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_sensor_data**(***kwargs*)

Get sensor readings

Iterates sensor reading objects

Parameters **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

CLI Example:

```
salt-call ipmi.get_sensor_data api_host=127.0.0.1 api_user=admin api_pass=pass
```

salt.modules.ipmi.**get_user**(*uid*, *channel=14*, ***kwargs*)

Get user from uid and access on channel

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

```
name: (str)
uid: (int)
channel: (int)
access:
    - callback (bool)
    - link_auth (bool)
    - ipmi_msg (bool)
    - privilege_level: (str)[callback, user, operatorm administrator,
                             proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user uid=2
```

salt.modules.ipmi.**get_user_access**(*uid*, *channel=14*, ***kwargs*)

Get user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Return Data

```
channel_info:
    - max_user_count = maximum number of user IDs on this channel
    - enabled_users = count of User ID slots presently in use
    - users_with_fixed_names = count of user IDs with fixed names
access:
    - callback
    - link_auth
    - ipmi_msg
    - privilege_level: [reserved, callback, user, operator
                        administrator, proprietary, no_access]
```

CLI Examples:

```
salt-call ipmi.get_user_access uid=2
```

salt.modules.ipmi.**get_user_name**(*uid*, *return_none_on_error=True*, ***kwargs*)

Get user name

Parameters

- **uid** -- user number [1:16]
- **return_none_on_error** -- return None on error
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.get_user_name uid=2
```

salt.modules.ipmi.**get_users**(*channel=14*, ***kwargs*)

get list of users and access information

Parameters

- **channel** -- number [1:7]
- **kwargs** --

- api_host=127.0.0.1
- api_user=admin
- api_pass=example
- api_port=623
- api_kg=None

Returns

- name: (str)
- uid: (int)
- channel: (int)
- **access**:
  - callback (bool)
  - link_auth (bool)
  - ipmi_msg (bool)
  - privilege_level: (str)[callback, user, operatorm administrator, proprietary, no_access]

CLI Examples:

```
salt-call ipmi.get_users api_host=172.168.0.7
```

salt.modules.ipmi.**raw_command**(*netfn*, *command*, *bridge_request=None*, *data=()*, *retry=True*, *delay_xmit=None*, ***kwargs*)

Send raw ipmi command

This allows arbitrary IPMI bytes to be issued. This is commonly used for certain vendor specific commands.

Parameters

- **netfn** -- Net function number
- **command** -- Command value
- **bridge_request** -- The target slave address and channel number for the bridge request.
- **data** -- Command data as a tuple or list
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- The response from IPMI device

CLI Examples:

```
salt-call ipmi.raw_command netfn=0x06 command=0x46 data=[0x02]
# this will return the name of the user with id 2 in bytes
```

salt.modules.ipmi.**set_bootdev**(*bootdev='default'*, *persist=False*, *uefiboot=False*, ***kwargs*)

Set boot device to use on next reboot

Parameters

- **bootdev** --
  - network: Request network boot
  - hd: Boot from hard drive
  - safe: Boot from hard drive, requesting `safe mode'
  - optical: boot from CD/DVD/BD drive
  - setup: Boot into setup utility
  - default: remove any IPMI directed boot device request
- **persist** -- If true, ask that system firmware use this device beyond next boot. Be aware many systems do not honor this
- **uefiboot** -- If true, request UEFI boot explicitly. Strictly speaking, the spec suggests that if not set, the system should BIOS boot and offers no ``don't care'' option. In practice, this flag not being set does not preclude UEFI boot on any system I've encountered.
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict or True -- If callback is not provided, the response

CLI Examples:

```
salt-call ipmi.set_bootdev bootdev=network persist=True
```

salt.modules.ipmi.**set_channel_access**(*channel=14*, *access_update_mode='non_volatile'*, *alerting=False*, *per_msg_auth=False*, *user_level_auth=False*, *access_mode='always'*, *privilege_update_mode='non_volatile'*, *privilege_level='administrator'*, ***kwargs*)

Set channel access

Parameters

- **channel** -- number [1:7]
- **access_update_mode** --
  - `dont_change' = don't set or change Channel Access
  - `non_volatile' = set non-volatile Channel Access
  - `volatile' = set volatile (active) setting of Channel Access
- **alerting** -- PEF Alerting Enable/Disable
  - True = enable PEF Alerting

  - False = disable PEF Alerting on this channel (Alert Immediate command can still be used to generate alerts)

- **per_msg_auth** -- Per-message Authentication
  - True = enable
  - False = disable Per-message Authentication. [Authentication required to activate any session on this channel, but authentication not used on subsequent packets for the session.]
- **user_level_auth** -- User Level Authentication Enable/Disable
  - True = enable User Level Authentication. All User Level commands are to be authenticated per the Authentication Type that was negotiated when the session was activated.
  - False = disable User Level Authentication. Allow User Level commands to be executed without being authenticated. If the option to disable User Level Command authentication is accepted, the BMC will accept packets with Authentication Type set to None if they contain user level commands. For outgoing packets, the BMC returns responses with the same Authentication Type that was used for the request.
- **access_mode** -- Access Mode for IPMI messaging (PEF Alerting is enabled/disabled separately from IPMI messaging)
  - disabled = disabled for IPMI messaging
  - pre_boot = pre-boot only channel only available when system is in a powered down state or in BIOS prior to start of boot.
  - always = channel always available regardless of system mode. BIOS typically dedicates the serial connection to the BMC.
  - shared = same as always available, but BIOS typically leaves the serial port available for software use.
- **privilege_update_mode** -- Channel Privilege Level Limit. This value sets the maximum privilege level that can be accepted on the specified channel.
  - dont_change = don't set or change channel Privilege Level Limit
  - non_volatile = non-volatile Privilege Level Limit according
  - volatile = volatile setting of Privilege Level Limit
- **privilege_level** -- Channel Privilege Level Limit
  - reserved = unused
  - callback
  - user
  - operator
  - administrator
  - proprietary = used by OEM
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin

- api_pass=example
- api_port=623
- api_kg=None

CLI Examples:

```
salt-call ipmi.set_channel_access privilege_level='administrator'
```

salt.modules.ipmi.**set_identify**(*on=True*, *duration=600*, ***kwargs*)

Request identify light

Request the identify light to turn off, on for a duration, or on indefinitely. Other than error exceptions,

Parameters

- **on** -- Set to True to force on or False to force off
- **duration** -- Set if wanting to request turn on for a duration in seconds, None = indefinitely.
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_identify
```

salt.modules.ipmi.**set_power**(*state='power_on'*, *wait=True*, ***kwargs*)

Request power state change

Parameters

- **name** --
  - power_on -- system turn on
  - power_off -- system turn off (without waiting for OS)
  - shutdown -- request OS proper shutdown
  - reset -- reset (without waiting for OS)
  - boot -- If system is off, then `on', else `reset'
- **ensure** -- If (bool True), do not return until system actually completes requested state change for 300 seconds. If a non-zero (int), adjust the wait time to the requested number of seconds
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns dict -- A dict describing the response retrieved

CLI Examples:

```
salt-call ipmi.set_power state=shutdown wait=True
```

salt.modules.ipmi.**set_user_access**(*uid*, *channel=14*, *callback=True*, *link_auth=True*, *ipmi_msg=True*, *privilege_level='administrator'*, ***kwargs*)

Set user access

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **callback** -- User Restricted to Callback
  - False = User Privilege Limit is determined by the User Privilege Limit parameter, below, for both callback and non-callback connections.
  - True = User Privilege Limit is determined by the User Privilege Limit parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.
- **link_auth** -- User Link authentication enable/disable (used to enable whether this user's name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.
- **ipmi_msg** -- User IPMI Messaging: (used to enable/disable whether this user's name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.)
- **privilege_level** -- User Privilege Limit. (Determines the maximum privilege level that the user is allowed to switch to on the specified channel.)
  - callback
  - user
  - operator
  - administrator
  - proprietary
  - no_access
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623

- api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_access uid=2 privilege_level='operator'
```

salt.modules.ipmi.**set_user_name**(*uid*, *name*, ***kwargs*)

Set user name

Parameters

- **uid** -- user number [1:16]
- **name** -- username (limit of 16bytes)
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.set_user_name uid=2 name='steverweber'
```

salt.modules.ipmi.**set_user_password**(*uid*, *mode='set_password'*, *password=None*, ***kwargs*)

Set user password and (modes)

Parameters

- **uid** -- id number of user. see: get_names_uid()['name']
- **mode** --
  - disable = disable user connections
  - enable = enable user connections
  - set_password = set or ensure password
  - test_password = test password is correct
- **password** -- max 16 char string (optional when mode is [disable or enable])
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

Returns True on success when mode = test_password, return False on bad password

CLI Example:

```
salt-call ipmi.set_user_password api_host=127.0.0.1 api_user=admin api_pass=pass
                                 uid=1 password=newPass
salt-call ipmi.set_user_password uid=1 mode=enable
```

salt.modules.ipmi.**user_delete**(*uid*, *channel=14*, ***kwargs*)

Delete user (helper)

Parameters

- **uid** -- user number [1:16]
- **channel** -- number [1:7]
- **kwargs** --
  - api_host=127.0.0.1
  - api_user=admin
  - api_pass=example
  - api_port=623
  - api_kg=None

CLI Examples:

```
salt-call ipmi.user_delete uid=2
```

19.9.164 salt.modules.ipset

Support for ipset

salt.modules.ipset.**add**(*set=None*, *entry=None*, *family='ipv4'*, ***kwargs*)

Append an entry to the specified set.

CLI Example:

```
salt '*' ipset.add setname 192.168.1.26

salt '*' ipset.add setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

salt.modules.ipset.**check**(*set=None*, *entry=None*, *family='ipv4'*)

Check that an entry exists in the specified set.

set The ipset name

entry An entry in the ipset. This parameter can be a single IP address, a range of IP addresses, or a subnet block. Example:

```
192.168.0.1
192.168.0.2-192.168.0.19
192.168.0.0/25
```

family IP protocol version: ipv4 or ipv6

CLI Example:

```
salt '*' ipset.check setname '192.168.0.1 comment "Hello"'
```

salt.modules.ipset.**check_set**(*set=None*, *family='ipv4'*)

Check that given ipset set exists.

New in version 2014.7.0.

CLI Example:

```
salt '*' ipset.check_set setname
```

salt.modules.ipset.**delete**(*set=None*, *entry=None*, *family='ipv4'*, ***kwargs*)
Delete an entry from the specified set.

CLI Example:

```
salt '*' ipset.delete setname 192.168.0.3,AA:BB:CC:DD:EE:FF
```

salt.modules.ipset.**delete_set**(*set=None*, *family='ipv4'*)
New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.delete_set custom_set

IPv6:
salt '*' ipset.delete_set custom_set family=ipv6
```

salt.modules.ipset.**flush**(*set=None*, *family='ipv4'*)
Flush entries in the specified set, Flush all sets if set is not specified.

CLI Example:

```
salt '*' ipset.flush

salt '*' ipset.flush set

IPv6:
salt '*' ipset.flush

salt '*' ipset.flush set
```

salt.modules.ipset.**list_sets**(*family='ipv4'*)
New in version 2014.7.0.

List all ipset sets.

CLI Example:

```
salt '*' ipset.list_sets
```

salt.modules.ipset.**new_set**(*set=None*, *set_type=None*, *family='ipv4'*, *comment=False*, ***kwargs*)
New in version 2014.7.0.

Create new custom set

CLI Example:

```
salt '*' ipset.new_set custom_set list:set

salt '*' ipset.new_set custom_set list:set comment=True

IPv6:
salt '*' ipset.new_set custom_set list:set family=ipv6
```

salt.modules.ipset.**rename_set**(*set=None*, *new_set=None*, *family='ipv4'*)
New in version 2014.7.0.

Delete ipset set.

CLI Example:

```
salt '*' ipset.rename_set custom_set new_set=new_set_name

IPv6:
salt '*' ipset.rename_set custom_set new_set=new_set_name family=ipv6
```

salt.modules.ipset.**test**(*set=None*, *entry=None*, *family='ipv4'*, ***kwargs*)

Test if an entry is in the specified set.

CLI Example:

```
salt '*' ipset.test setname 192.168.0.2

IPv6:
salt '*' ipset.test setname fd81:fc56:9ac7::/48
```

salt.modules.ipset.**version**()

Return version from ipset --version

CLI Example:

```
salt '*' ipset.version
```

19.9.165 salt.modules.iptables

Support for iptables

Configuration Options

The following options can be set in the minion config, grains, pillar, or master config. The configuration is read using *config.get*.

- `iptables.save_filters`: List of REGEX strings to FILTER OUT matching lines

  This is useful for filtering out chains, rules, etc that you do not wish to persist, such as ephemeral Docker rules.

  The default is to not filter out anything.

```
iptables.save_filters:
  - "-j CATTLE_PREROUTING"
  - "-j DOCKER"
  - "-A POSTROUTING"
  - "-A CATTLE_POSTROUTING"
  - "-A FORWARD"
```

salt.modules.iptables.**append**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Append a rule to the specified table/chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
```

```
salt '*' iptables.append filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

salt.modules.iptables.**build_rule**(*table='filter'*, *chain=None*, *command=None*, *position=''*, *full=None*, *family='ipv4'*, ***kwargs*)

Build a well-formatted iptables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is *True*, then *table*, *chain* and *command* are required. *command* may be specified as either a short option (`I') or a long option (*--insert*). This will return the iptables command, exactly as it would be used from the command line.

If a position is required (as with *-I* or *-D*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

To pass in jump options that doesn't take arguments, pass in an empty string.

Note: Whereas iptables will accept `-p`, `--proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the iptables-extensions(8) man page).

CLI Examples:

```
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    source='127.0.0.1' jump=ACCEPT

.. Invert Rules
salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    source='! 127.0.0.1' jump=ACCEPT

salt '*' iptables.build_rule filter INPUT command=A \
    full=True match=state state=RELATED,ESTABLISHED \
    destination='not 127.0.0.1' jump=ACCEPT

IPv6:
salt '*' iptables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
salt '*' iptables.build_rule filter INPUT command=I position=3 \
    full=True match=state state=RELATED,ESTABLISHED jump=ACCEPT \
    family=ipv6
```

salt.modules.iptables.**check**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.check filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

salt.modules.iptables.**check_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.1.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' iptables.check_chain filter INPUT

IPv6:
salt '*' iptables.check_chain filter INPUT family=ipv6
```

salt.modules.iptables.**delete**(*table*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Delete a rule from the specified table/chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' iptables.delete filter INPUT position=3
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
salt '*' iptables.delete filter INPUT position=3 family=ipv6
salt '*' iptables.delete filter INPUT \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

salt.modules.iptables.**delete_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.1.0.

Delete custom chain to the specified table.

CLI Example:

```
salt '*' iptables.delete_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.delete_chain filter CUSTOM_CHAIN family=ipv6
```

salt.modules.iptables.**flush**(*table='filter'*, *chain=''*, *family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if not specified chain.

CLI Example:

```
salt '*' iptables.flush filter INPUT

IPv6:
salt '*' iptables.flush filter INPUT family=ipv6
```

salt.modules.iptables.**get_policy**(*table='filter'*, *chain=None*, *family='ipv4'*)

Return the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.get_policy filter INPUT

IPv6:
salt '*' iptables.get_policy filter INPUT family=ipv6
```

salt.modules.iptables.**get_rules**(*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' iptables.get_rules

IPv6:
salt '*' iptables.get_rules family=ipv6
```

salt.modules.iptables.**get_saved_policy**(*table='filter'*, *chain=None*, *conf_file=None*, *family='ipv4'*)

Return the current policy for the specified table/chain

CLI Examples:

```
salt '*' iptables.get_saved_policy filter INPUT
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved

IPv6:
salt '*' iptables.get_saved_policy filter INPUT family=ipv6
salt '*' iptables.get_saved_policy filter INPUT \
    conf_file=/etc/iptables.saved family=ipv6
```

salt.modules.iptables.**get_saved_rules**(*conf_file=None*, *family='ipv4'*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' iptables.get_saved_rules

IPv6:
salt '*' iptables.get_saved_rules family=ipv6
```

salt.modules.iptables.**insert**(*table='filter'*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Insert a rule into the specified table/chain, at the specified position.

This function accepts a rule in a standard iptables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

If the position specified is a negative number, then the insert will be performed counting from the end of the list. For instance, a position of -1 will insert the rule as the second to last rule. To insert a rule in the last position, use the append function instead.

CLI Examples:

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT'

IPv6:
```

```
salt '*' iptables.insert filter INPUT position=3 \
    rule='-m state --state RELATED,ESTABLISHED -j ACCEPT' \
    family=ipv6
```

salt.modules.iptables.**new_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)
New in version 2014.1.0.

Create new custom chain to the specified table.

CLI Example:

```
salt '*' iptables.new_chain filter CUSTOM_CHAIN

IPv6:
salt '*' iptables.new_chain filter CUSTOM_CHAIN family=ipv6
```

salt.modules.iptables.**save**(*filename=None*, *family='ipv4'*)
Save the current in-memory rules to disk

CLI Example:

```
salt '*' iptables.save /etc/sysconfig/iptables

IPv6:
salt '*' iptables.save /etc/sysconfig/iptables family=ipv6
```

salt.modules.iptables.**set_policy**(*table='filter'*, *chain=None*, *policy=None*, *family='ipv4'*)
Set the current policy for the specified table/chain

CLI Example:

```
salt '*' iptables.set_policy filter INPUT ACCEPT

IPv6:
salt '*' iptables.set_policy filter INPUT ACCEPT family=ipv6
```

salt.modules.iptables.**version**(*family='ipv4'*)
Return version from iptables --version

CLI Example:

```
salt '*' iptables.version

IPv6:
salt '*' iptables.version family=ipv6
```

19.9.166 salt.modules.iwtools module

Support for Wireless Tools for Linux

salt.modules.iwtools.**list_interfaces**(*style=None*)
List all of the wireless interfaces

CLI Example:
salt minion iwtools.list_interfaces

salt.modules.iwtools.**scan**(*iface*, *style=None*)
List networks on a wireless interface

CLI Examples:

salt minion iwtools.scan wlp3s0 salt minion iwtools.scan wlp3s0 list

salt.modules.iwtools.**set_mode**(*iface*, *mode*)

List networks on a wireless interface

CLI Example:

salt minion iwtools.set_mode wlp3s0 Managed

19.9.167 salt.modules.jboss7

Module for managing JBoss AS 7 through the CLI interface.

New in version 2015.5.0.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: `/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
   cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   controller: 10.11.12.13:9999
   cli_user: 'jbossadm'
   cli_password: 'jbossadm'
```

salt.modules.jboss7.**create_datasource**(*jboss_config*, *name*, *datasource_properties*, *profile=None*)

Create datasource in running jboss instance

jboss_config Configuration dictionary with properties specified above.

name Datasource name

datasource_properties

A dictionary of datasource properties to be created:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↪", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↪"java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↪"secret", "min-pool-size": 3, "use-java-context": True}'
```

salt.modules.jboss7.**create_simple_binding**(*jboss_config*, *binding_name*, *value*, *profile=None*)

Create a simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be created

value Binding value

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.create_simple_binding \
       '{"cli_path": "integration.modules.sysmod.SysModuleTest.test_valid_docs", \
        "controller": "10.11.12.13:9999", "cli_user": "jbossadm", "cli_password":
↪"jbossadm"}' \
       my_binding_name my_binding_value
```

salt.modules.jboss7.**deploy**(*jboss_config*, *source_file*)

Deploy the application on the jboss instance from the local file system where minion is running.

jboss_config Configuration dictionary with properties specified above.

source_file Source file to deploy from

CLI Example:

```
salt '*' jboss7.deploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}' /opt/deploy_files/my_deploy
```

salt.modules.jboss7.**list_deployments**(*jboss_config*)

List all deployments on the jboss instance

jboss_config

Configuration dictionary with properties specified above.

CLI Example:

```
salt '*' jboss7.list_deployments '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user
↪": "jbossadm", "cli_password": "jbossadm"}'
```

salt.modules.jboss7.**read_datasource**(*jboss_config*, *name*, *profile=None*)

Read datasource properties in the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile Profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.read_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}'
```

salt.modules.jboss7.**read_simple_binding**(*jboss_config*, *binding_name*, *profile=None*)

Read jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be created

profile The profile name (JBoss domain mode only)

CLI Example:

salt '*' jboss7.read_simple_binding '{``cli_path'': ``integration.modules.sysmod.SysModuleTest.test_valid_docs'', ``controller'': ``10.11.12.13:9999'', ``cli_user'': ``jbossadm'', ``cli_password'': ``jbossadm''}' my_binding_name

salt.modules.jboss7.**reload**(*jboss_config*, *host=None*)

Reload running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the ``name'' attribute of the ``host'' element in host.xml

CLI Example:

```
salt '*' jboss7.reload '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}'
```

salt.modules.jboss7.**remove_datasource**(*jboss_config*, *name*, *profile=None*)

Remove an existing datasource from the running jboss instance.

jboss_config Configuration dictionary with properties specified above.

name Datasource name

profile The profile (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.remove_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' my_datasource_name
```

salt.modules.jboss7.**status**(*jboss_config*, *host=None*, *server_config=None*)

Get status of running jboss instance.

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the ``name'' attribute of the ``host'' element in host.xml

server_config The name of the Server Configuration. JBoss Domain mode only - and required if running in domain mode.

CLI Example:

```
salt '*' jboss7.status '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}'
```

salt.modules.jboss7.**stop_server**(*jboss_config*, *host=None*)

Stop running jboss instance

jboss_config Configuration dictionary with properties specified above.

host The name of the host. JBoss domain mode only - and required if running in domain mode. The host name is the ``name'' attribute of the ``host'' element in host.xml

CLI Example:

```
salt '*' jboss7.stop_server '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}'
```

salt.modules.jboss7.**undeploy**(*jboss_config*, *deployment*)

Undeploy the application from jboss instance

jboss_config Configuration dictionary with properties specified above.

deployment Deployment name to undeploy

CLI Example:

```
salt '*' jboss7.undeploy '{"cli_path": "integration.modules.sysmod.SysModuleTest.
↪test_valid_docs", "controller": "10.11.12.13:9999", "cli_user": "jbossadm",
↪"cli_password": "jbossadm"}' my_deployment
```

salt.modules.jboss7.**update_datasource**(*jboss_config*, *name*, *new_properties*, *profile=None*)

Update an existing datasource in running jboss instance. If the property doesn't exist if will be created, if it does, it will be updated with the new value

jboss_config Configuration dictionary with properties specified above.

name Datasource name

new_properties

A dictionary of datasource properties to be updated. For example:

- driver-name: mysql
- connection-url: `jdbc:mysql://localhost:3306/sampleDatabase`
- jndi-name: `java:jboss/datasources/sampleDS'
- user-name: sampleuser
- password: secret
- min-pool-size: 3
- use-java-context: True

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_datasource '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' 'my_datasource' '{"driver-name": "mysql
↪", "connection-url": "jdbc:mysql://localhost:3306/sampleDatabase", "jndi-name":
↪"java:jboss/datasources/sampleDS", "user-name": "sampleuser", "password":
↪"secret", "min-pool-size": 3, "use-java-context": True}'
```

salt.modules.jboss7.**update_simple_binding**(*jboss_config*, *binding_name*, *value*, *profile=None*)

Update the simple jndi binding in the running jboss instance

jboss_config Configuration dictionary with properties specified above.

binding_name Binding name to be updated

value New binding value

profile The profile name (JBoss domain mode only)

CLI Example:

```
salt '*' jboss7.update_simple_binding '{"cli_path": "integration.modules.sysmod.
↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
↪"jbossadm", "cli_password": "jbossadm"}' my_binding_name my_binding_value
```

19.9.168 salt.modules.jboss7_cli

Module for low-level interaction with JbossAS7 through CLI.

This module exposes two ways of interaction with the CLI, either through commands or operations.

Note: Following JBoss documentation (https://developer.jboss.org/wiki/CommandLineInterface): ``Operations are considered a low level but comprehensive way to manage the AS controller, i.e. if it can't be done with operations

it can't be done in any other way. Commands, on the other hand, are more user-friendly in syntax, although most of them still translate into operation requests and some of them even into a few composite operation requests, i.e. commands also simplify some management operations from the user's point of view."

The difference between calling a command or operation is in handling the result. Commands return a zero return code if operation is successful or return non-zero return code and print an error to standard output in plain text, in case of an error.

Operations return a json-like structure, that contain more information about the result. In case of a failure, they also return a specific return code. This module parses the output from the operations and returns it as a dictionary so that an execution of an operation can then be verified against specific errors.

In order to run each function, jboss_config dictionary with the following properties must be passed:

- cli_path: the path to jboss-cli script, for example: `/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
- controller: the IP address and port of controller, for example: 10.11.12.13:9999
- cli_user: username to connect to jboss administration console if necessary
- cli_password: password to connect to jboss administration console if necessary

Example:

```
jboss_config:
   cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   controller: 10.11.12.13:9999
   cli_user: 'jbossadm'
   cli_password: 'jbossadm'
```

salt.modules.jboss7_cli.**run_command**(*jboss_config*, *command*, *fail_on_error=True*)

Execute a command against jboss instance through the CLI interface.

jboss_config Configuration dictionary with properties specified above.

command Command to execute against jboss instance

fail_on_error (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, `success' property of the returned dictionary is set to False

CLI Example:

```
salt '*' jboss7_cli.run_command '{"cli_path": "integration.modules.sysmod.
 ↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
 ↪"jbossadm", "cli_password": "jbossadm"}' my_command
```

salt.modules.jboss7_cli.**run_operation**(*jboss_config*, *operation*, *fail_on_error=True*, *retries=1*)

Execute an operation against jboss instance through the CLI interface.

jboss_config Configuration dictionary with properties specified above.

operation An operation to execute against jboss instance

fail_on_error (default=True) Is true, raise CommandExecutionError exception if execution fails. If false, `success' property of the returned dictionary is set to False

retries: Number of retries in case of ``JBAS012144: Could not connect to remote'' error.

CLI Example:

```
salt '*' jboss7_cli.run_operation '{"cli_path": "integration.modules.sysmod.
 ↪SysModuleTest.test_valid_docs", "controller": "10.11.12.13:9999", "cli_user":
 ↪"jbossadm", "cli_password": "jbossadm"}' my_operation
```

19.9.169 salt.modules.jenkinsmod module

Module for controlling Jenkins

depends python-jenkins

New in version 2016.3.0.

depends python-jenkins Python module (not to be confused with jenkins)

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
jenkins:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.jenkinsmod.**build_job**(*name=None*, *parameters=None*)

Initiate a build for the provided job.

Parameters

- **name** -- The name of the job is check if it exists.
- **parameters** -- Parameters to send to the job.

Returns True is successful, otherwise raise an exception.

CLI Example:

```
salt '*' jenkins.build_job jobname
```

salt.modules.jenkinsmod.**create_job**(*name=None*, *config_xml=None*, *saltenv='base'*)

Return the configuration file.

Parameters

- **name** -- The name of the job is check if it exists.
- **config_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.create_job jobname

salt '*' jenkins.create_job jobname config_xml='salt://jenkins/config.xml'
```

salt.modules.jenkinsmod.**delete_job**(*name=None*)

Return true is job is deleted successfully.

Parameters **name** -- The name of the job to delete.

Returns Return true if job is deleted successfully.

CLI Example:

```
salt '*' jenkins.delete_job jobname
```

salt.modules.jenkinsmod.**disable_job**(*name=None*)

Return true is job is disabled successfully.

Parameters **name** -- The name of the job to disable.

Returns Return true if job is disabled successfully.

CLI Example:

```
salt '*' jenkins.disable_job jobname
```

salt.modules.jenkinsmod.**enable_job**(*name=None*)

Return true is job is enabled successfully.

Parameters **name** -- The name of the job to enable.

Returns Return true if job is enabled successfully.

CLI Example:

```
salt '*' jenkins.enable_job jobname
```

salt.modules.jenkinsmod.**get_job_config**(*name=None*)

Return the current job configuration for the provided job.

Parameters **name** -- The name of the job to return the configuration for.

Returns The configuration for the job specified.

CLI Example:

```
salt '*' jenkins.get_job_config jobname
```

salt.modules.jenkinsmod.**get_job_info**(*name=None*)

Return information about the Jenkins job.

Parameters **name** -- The name of the job is check if it exists.

Returns Information about the Jenkins job.

CLI Example:

```
salt '*' jenkins.get_job_info jobname
```

salt.modules.jenkinsmod.**get_jobs**()

Return the currently configured jobs.

Returns The currently configured jobs.

CLI Example:

```
salt '*' jenkins.get_jobs
```

salt.modules.jenkinsmod.**get_version**()

Return version of Jenkins

Returns The version of Jenkins

CLI Example:

```
salt '*' jenkins.get_version
```

salt.modules.jenkinsmod.**job_exists**(*name=None*)

Check whether the job exists in configured Jenkins jobs.

Parameters **name** -- The name of the job is check if it exists.

Returns True if job exists, False if job does not exist.

CLI Example:

```
salt '*' jenkins.job_exists jobname
```

salt.modules.jenkinsmod.**job_status**(*name=None*)

Return the current status, enabled or disabled, of the job.

Parameters **name** -- The name of the job to return status for

Returns Return true if enabled or false if disabled.

CLI Example:

```
salt '*' jenkins.job_status jobname
```

salt.modules.jenkinsmod.**plugin_installed**(*name*)

New in version 2016.11.0.

Return if the plugin is installed for the provided plugin name.

Parameters **name** -- The name of the parameter to confirm installation.

Returns True if plugin exists, False if plugin does not exist.

CLI Example:

```
salt '*' jenkins.plugin_installed pluginName
```

salt.modules.jenkinsmod.**run**(*script*)

New in version 2017.7.0.

Execute a script on the jenkins master

Parameters **script** -- The script

CLI Example:

```
salt '*' jenkins.run 'Jenkins.instance.doSafeRestart()'
```

salt.modules.jenkinsmod.**update_job**(*name=None*, *config_xml=None*, *saltenv='base'*)

Return the updated configuration file.

Parameters

- **name** -- The name of the job is check if it exists.
- **config_xml** -- The configuration file to use to create the job.
- **saltenv** -- The environment to look for the file in.

Returns The configuration file used for the job.

CLI Example:

```
salt '*' jenkins.update_job jobname

salt '*' jenkins.update_job jobname config_xml='salt://jenkins/config.xml'
```

19.9.170 salt.modules.junos

Module to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to *junos* for information on connecting to junos proxy.

salt.modules.junos.**cli**(*command=None*, ***kwargs*)

Executes the CLI commands and returns the output in specified format. (default is text) The output can also be stored in a file.

command (required) The command to execute on the Junos CLI

format [text] Format in which to get the CLI output (either `text` or `xml`)
dev_timeout [30] The NETCONF RPC timeout (in seconds)
dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use *cp.push*.
CLI Examples:

```
salt 'device_name' junos.cli 'show system commit'
salt 'device_name' junos.cli 'show version' dev_timeout=40
salt 'device_name' junos.cli 'show system alarms' format=xml dest=/home/user/cli_
 ↪output.txt
```

salt.modules.junos.**commit**(***kwargs*)
To commit the changes loaded in the candidate configuration.
dev_timeout [30] The NETCONF RPC timeout (in seconds)
comment Provide a comment for the commit
confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.
sync [False] When `True`, on dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane, checked for correct syntax, and committed on both Routing Engines.
force_sync [False] When `True`, on dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
full When `True`, requires all the daemons to check and evaluate the new configuration.
detail When `True`, return commit detail
CLI Examples:

```
salt 'device_name' junos.commit comment='Commiting via saltstack' detail=True
salt 'device_name' junos.commit dev_timeout=60 confirm=10
salt 'device_name' junos.commit sync=True dev_timeout=90
```

salt.modules.junos.**commit_check**()
Perform a commit check on the configuration

CLI Example:

```
salt 'device_name' junos.commit_check
```

salt.modules.junos.**diff**(***kwargs*)
Returns the difference between the candidate and the current configuration
id [0] The rollback ID value (0-49)
CLI Example:

```
salt 'device_name' junos.diff 3
```

salt.modules.junos.**facts**()
Displays the facts gathered during the connection. These facts are also stored in Salt grains.

CLI Example:

```
salt 'device_name' junos.facts
```

salt.modules.junos.**facts_refresh**()
Reload the facts dictionary from the device. Usually only needed if, the device configuration is changed by some other actor. This function will also refresh the facts stored in the salt grains.

CLI Example:

```
salt 'device_name' junos.facts_refresh
```

salt.modules.junos.**file_copy**(*src=None*, *dest=None*)

Copies the file from the local device to the junos device

src The source path where the file is kept.

dest The destination path on the where the file will be copied

CLI Example:

```
salt 'device_name' junos.file_copy /home/m2/info.txt info_copy.txt
```

salt.modules.junos.**install_config**(*path=None*, ***kwargs*)

Installs the given configuration file into the candidate configuration. Commits the changes if the commit checks or throws an error.

path (required) Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

mode [exclusive] The mode in which the configuration is locked. Can be one of `private`, `dynamic`, `batch`, `exclusive`.

dev_timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

overwrite [False] Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

format Determines the format of the contents

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

comment Provide a comment for the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use *cp.push*.

template_vars Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.install_config 'salt://production/network/routers/config.
↪set'
salt 'device_name' junos.install_config 'salt://templates/replace_config.conf'
↪replace=True comment='Committed via SaltStack'
salt 'device_name' junos.install_config 'salt://my_new_configuration.conf' dev_
↪timeout=300 diffs_file='/salt/confs/old_config.conf' overwrite=True
salt 'device_name' junos.install_config 'salt://syslog_template.conf' template_
↪vars='{"syslog_host": "10.180.222.7"}'
```

salt.modules.junos.**install_os**(*path=None*, ***kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

path (required) Path where the image file is present on the proxy minion

dev_timeout [30] The NETCONF RPC timeout (in seconds)

reboot [False] Whether to reboot after installation

no_copy [False] If `True` the software package will not be SCP'd to the device
CLI Examples:

```
salt 'device_name' junos.install_os 'salt://images/junos_image.tgz' reboot=True
salt 'device_name' junos.install_os 'salt://junos_16_1.tgz' dev_timeout=300
```

`salt.modules.junos.`**`load`**(*path=None*, ***kwargs*)

Loads the configuration from the file provided onto the device.

path (required) Path where the configuration/template file is present. If the file has a `.conf` extension, the content is treated as text format. If the file has a `.xml` extension, the content is treated as XML format. If the file has a `.set` extension, the content is treated as Junos OS `set` commands.

overwrite [False] Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses `replace:` statements. If `True`, only those statements under the `replace` tag will be changed.

format Determines the format of the contents

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1.

template_vars Variables to be passed into the template processing engine in addition to those present in pillar, the minion configuration, grains, etc. You may reference these variables in your template like so:

```
{{ template_vars["var_name"] }}
```

CLI Examples:

```
salt 'device_name' junos.load 'salt://production/network/routers/config.set'

salt 'device_name' junos.load 'salt://templates/replace_config.conf' replace=True

salt 'device_name' junos.load 'salt://my_new_configuration.conf' overwrite=True

salt 'device_name' junos.load 'salt://syslog_template.conf' template_vars='{
 ↪"syslog_host": "10.180.222.7"}'
```

`salt.modules.junos.`**`lock`**()

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: When locking, it is important to remember to call *`junos.unlock`* once finished. If locking during orchestration, remember to include a step in the orchestration job to unlock.

CLI Example:

```
salt 'device_name' junos.lock
```

`salt.modules.junos.`**`ping`**(*dest_ip=None*, ***kwargs*)

Send a ping RPC to a device

dest_ip The IP of the device to ping

dev_timeout [30] The NETCONF RPC timeout (in seconds)

rapid [False] When `True`, executes ping at 100pps instead of 1pps

ttl Maximum number of IP routers (IP hops) allowed between source and destination

routing_instance Name of the routing instance to use to send the ping

interface Interface used to send traffic

count [5] Number of packets to send

CLI Examples:

```
salt 'device_name' junos.ping '8.8.8.8' count=5
salt 'device_name' junos.ping '8.8.8.8' ttl=1 rapid=True
```

salt.modules.junos.**rollback**(***kwargs*)

Roll back the last committed configuration changes and commit

id [0] The rollback ID value (0-49)

dev_timeout [30] The NETCONF RPC timeout (in seconds)

comment Provide a comment for the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored. Note that the file will be stored on the proxy minion. To push the files to the master use *cp.push*.

CLI Example:

```
salt 'device_name' junos.rollback 10
```

salt.modules.junos.**rpc**(*cmd=None*, *dest=None*, ***kwargs*)

This function executes the RPC provided as arguments on the junos device. The returned data can be stored in a file.

cmd The RPC to be executed

dest Destination file where the RPC output is stored. Note that the file will be stored on the proxy minion. To push the files to the master use *cp.push*.

format [xml] The format in which the RPC reply is received from the device

dev_timeout [30] The NETCONF RPC timeout (in seconds)

filter Used with the `get-config` RPC to get specific configuration

terse [False] Amount of information you want

interface_name Name of the interface to query

CLI Example:

```
salt 'device' junos.rpc get_config /var/log/config.txt format=text filter='
↪<configuration><system/></configuration>'
salt 'device' junos.rpc get-interface-information /home/user/interface.xml
↪interface_name='lo0' terse=True
salt 'device' junos.rpc get-chassis-inventory
```

salt.modules.junos.**set_hostname**(*hostname=None*, ***kwargs*)

Set the device's hostname

hostname The name to be set

dev_timeout [30] The NETCONF RPC timeout (in seconds)

comment Provide a comment to the commit

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the specified amount of time unless the commit is confirmed.

CLI Example:

```
salt 'device_name' junos.set_hostname salt-device
```

salt.modules.junos.**shutdown**(***kwargs*)

Shut down (power off) or reboot a device running Junos OS. This includes all Routing Engines in a Virtual Chassis or a dual Routing Engine system.

> **Note:** One of `shutdown` or `reboot` must be set to `True` or no action will be taken.

shutdown [False] Set this to `True` if you want to shutdown the machine. This is a safety mechanism so that the user does not accidentally shutdown the junos device.

reboot [False] If `True`, reboot instead of shutting down

at Used when rebooting, to specify the date and time the reboot should take place. The value of this option must match the JunOS CLI reboot syntax.

in_min Used when shutting down. Specify the delay (in minutes) before the device will be shut down.

CLI Examples:

```
salt 'device_name' junos.shutdown reboot=True
salt 'device_name' junos.shutdown shutdown=True in_min=10
salt 'device_name' junos.shutdown shutdown=True
```

salt.modules.junos.**unlock**()

Unlocks the candidate configuration.

CLI Example:

```
salt 'device_name' junos.unlock
```

salt.modules.junos.**zeroize**()

Resets the device to default factory settings

CLI Example:

```
salt 'device_name' junos.zeroize
```

19.9.171 salt.modules.k8s

Salt module to manage Kubernetes cluster

New in version 2016.3.0.

Roadmap:

- Add creation of K8S objects (pod, rc, service, ...)
- Add replace of K8S objects (pod, rc, service, ...)
- Add deletion of K8S objects (pod, rc, service, ...)
- Add rolling update
- Add (auto)scalling

salt.modules.k8s.**create_namespace**(*name*, *apiserver_url=None*)

New in version 2016.3.0.

Create kubernetes namespace from the name, similar to the functionality added to kubectl since v.1.2.0: .. code-block:: bash

kubectl create namespaces namespace-name

CLI Example:

```
salt '*' k8s.create_namespace namespace_name

salt '*' k8s.create_namespace namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.**create_secret**(*namespace*, *name*, *sources*, *apiserver_url=None*, *force=False*, *update=False*, *saltenv='base'*)

New in version 2016.3.0.

Create k8s secrets in the defined namespace from the list of files

CLI Example:

```
salt '*' k8s.create_secret namespace_name secret_name sources

salt '*' k8s.create_secret namespace_name secret_name sources
http://kube-master.cluster.local
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```

```

['/full/path/filename', ``file:///full/path/filename'', ``salt://secret/storage/file.txt'', ``http://user:password@securesite.com/secret-file.json'']

Example of dictionaries:

```

```

{``nameit'': `/full/path/fiename', name2: ``salt://secret/storage/file.txt''}

optional parameters accepted:

update=[false] default value is false if set to false, and secret is already present on the cluster - warning will be returned and no changes to the secret will be done. In case it is set to ``true'' and secret is present but data is differ - secret will be updated.

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case `salt://' path is used, this parameter can change the visibility of files

salt.modules.k8s.**delete_secret**(*namespace*, *name*, *apiserver_url=None*, *force=True*)

New in version 2016.3.0.

Delete kubernetes secret in the defined namespace. Namespace is the mandatory parameter as well as name.

CLI Example:

```
salt '*' k8s.delete_secret namespace_name secret_name

salt '*' k8s.delete_secret namespace_name secret_name http://kube-master.cluster.
↪local
```

salt.modules.k8s.**get_labels**(*node=None*, *apiserver_url=None*)

New in version 2016.3.0.

Get labels from the current node

CLI Example:

```
salt '*' k8s.get_labels
salt '*' k8s.get_labels kube-node.cluster.local http://kube-master.cluster.local
```

salt.modules.k8s.**get_namespaces**(*namespace=''*, *apiserver_url=None*)

New in version 2016.3.0.

Get one or all kubernetes namespaces.

If namespace parameter is omitted, all namespaces will be returned back to user, similar to following kubectl example:

```
kubectl get namespaces -o json
```

In case namespace is set by user, the output will be similar to the one from kubectl:

```
kubectl get namespaces namespace_name -o json
```

CLI Example:

```
salt '*' k8s.get_namespaces
salt '*' k8s.get_namespaces namespace_name http://kube-master.cluster.local
```

salt.modules.k8s.**get_secrets**(*namespace*, *name=''*, *apiserver_url=None*, *decode=False*, *brief=False*)

Get k8s namespaces

CLI Example:

```
salt '*' k8s.get_secrets namespace_name
salt '*' k8s.get_secrets namespace_name secret_name http://kube-master.cluster.
↪local
```

salt.modules.k8s.**label_absent**(*name*, *node=None*, *apiserver_url=None*)

New in version 2016.3.0.

Delete label to the current node

CLI Example:

```
salt '*' k8s.label_absent hw/disktype
salt '*' k8s.label_absent hw/disktype kube-node.cluster.local http://kube-master.
↪cluster.local
```

salt.modules.k8s.**label_folder_absent**(*name*, *node=None*, *apiserver_url=None*)

New in version 2016.3.0.

Delete label folder to the current node

CLI Example:

```
salt '*' k8s.label_folder_absent hw
salt '*' k8s.label_folder_absent hw/ kube-node.cluster.local http://kube-master.
↪cluster.local
```

salt.modules.k8s.**label_present**(*name*, *value*, *node=None*, *apiserver_url=None*)

New in version 2016.3.0.

Set label to the current node

CLI Example:

```
salt '*' k8s.label_present hw/disktype ssd

salt '*' k8s.label_present hw/disktype ssd kube-node.cluster.local http://kube-
↪master.cluster.local
```

salt.modules.k8s.**update_secret**(*namespace*, *name*, *sources*, *apiserver_url=None*, *force=True*, *saltenv='base'*)

New in version 2016.3.0.

alias to k8s.create_secret with update=true

CLI Example:

```
salt '*' k8s.update_secret namespace_name secret_name sources [apiserver_url]
↪[force=true] [update=false] [saltenv='base']
```

sources are either dictionary of {name: path, name1: path} pairs or array of strings defining paths.

Example of paths array:

```
```

['/full/path/filename', ``file:///full/path/filename'', ``salt://secret/storage/file.txt'', ``http://user:password@securesite.com/secret-file.json'']

Example of dictionaries:

```
```

{``nameit'': `/full/path/fiename', name2: ``salt://secret/storage/file.txt''}

optional parameters accepted:

force=[true] default value is true if the to False, secret will not be created in case one of the files is not valid kubernetes secret. e.g. capital letters in secret name or _ in case force is set to True, wrong files will be skipped but secret will be created any way.

saltenv=['base'] default value is base in case `salt://' path is used, this parameter can change the visibility of files

19.9.172 salt.modules.kapacitor module

Kapacitor execution module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

salt.modules.kapacitor.**define_task**(*name*, *tick_script*, *task_type='stream'*, *database=None*, *retention_policy='default'*)

Define a task. Serves as both create/update.

name Name of the task.

tick_script Path to the TICK script for the task. Can be a salt:// source.

task_type Task type. Defaults to `stream'

database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.

retention_policy Which retention policy to fetch data from. Defaults to `default'.

CLI Example:

```
salt '*' kapacitor.define_task cpu salt://kapacitor/cpu.tick database=telegraf
```

salt.modules.kapacitor.**delete_task**(*name*)

Delete a kapacitor task.

name Name of the task to delete.

CLI Example:

```
salt '*' kapacitor.delete_task cpu
```

salt.modules.kapacitor.**disable_task**(*name*)

Disable a kapacitor task.

name Name of the task to disable.

CLI Example:

```
salt '*' kapacitor.disable_task cpu
```

salt.modules.kapacitor.**enable_task**(*name*)

Enable a kapacitor task.

name Name of the task to enable.

CLI Example:

```
salt '*' kapacitor.enable_task cpu
```

salt.modules.kapacitor.**get_task**(*name*)

Get a dict of data on a task.

name Name of the task to get information about.

CLI Example:

```
salt '*' kapacitor.get_task cpu
```

salt.modules.kapacitor.**version**(**args*, ***kwargs*)

Get the kapacitor version.

19.9.173 salt.modules.kerberos

Manage Kerberos KDC

configuration In order to manage your KDC you will need to generate a keytab that can authenticate without requiring a password.

```
# ktadd -k /root/secure.keytab kadmin/admin kadmin/changepw
```

On the KDC minion you will need to add the following to the minion configuration file so Salt knows what keytab to use and what principal to authenticate as.

```
auth_keytab: /root/auth.keytab
auth_principal: kadmin/admin
```

salt.modules.kerberos.**create_keytab**(*name*, *keytab*, *enctypes=None*)

Create keytab

CLI Example:

```
salt 'kdc.example.com' kerberos.create_keytab host/host1.example.com host1.
↪example.com.keytab
```

salt.modules.kerberos.**create_principal**(*name*, *enctypes=None*)
Create Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.create_principal host/example.com
```

salt.modules.kerberos.**delete_principal**(*name*)
Delete Principal

CLI Example:

```
salt 'kdc.example.com' kerberos.delete_principal host/example.com@EXAMPLE.COM
```

salt.modules.kerberos.**get_policy**(*name*)
Get policy details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_policy my_policy
```

salt.modules.kerberos.**get_principal**(*name*)
Get princial details

CLI Example:

```
salt 'kdc.example.com' kerberos.get_principal root/admin
```

salt.modules.kerberos.**get_privs**()
Current privileges

CLI Example:

```
salt 'kdc.example.com' kerberos.get_privs
```

salt.modules.kerberos.**list_policies**()
List policies

CLI Example:

```
salt 'kdc.example.com' kerberos.list_policies
```

salt.modules.kerberos.**list_principals**()
Get all principals

CLI Example:

```
salt 'kde.example.com' kerberos.list_principals
```

19.9.174 salt.modules.key

Functions to view the minion's public key information

salt.modules.key.**finger**(*hash_type=None*)
Return the minion's public key fingerprint

hash_type The hash algorithm used to calculate the fingerprint
CLI Example:

```
salt '*' key.finger
```

salt.modules.key.**finger_master**(*hash_type=None*)
Return the fingerprint of the master's public key on the minion.
hash_type The hash algorithm used to calculate the fingerprint
CLI Example:

```
salt '*' key.finger_master
```

19.9.175 salt.modules.keyboard

Module for managing keyboards on supported POSIX-like systems using systemd, or such as Redhat, Debian and Gentoo.

salt.modules.keyboard.**get_sys**()
Get current system keyboard setting

CLI Example:

```
salt '*' keyboard.get_sys
```

salt.modules.keyboard.**get_x**()
Get current X keyboard setting

CLI Example:

```
salt '*' keyboard.get_x
```

salt.modules.keyboard.**set_sys**(*layout*)
Set current system keyboard setting

CLI Example:

```
salt '*' keyboard.set_sys dvorak
```

salt.modules.keyboard.**set_x**(*layout*)
Set current X keyboard setting

CLI Example:

```
salt '*' keyboard.set_x dvorak
```

19.9.176 salt.modules.keystone

Module for handling openstack keystone calls.

optdepends

- keystoneclient Python adapter

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.tenant_id: f80919baedab48ec8931f200c65a50df
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

OR (for token based authentication)

```
keystone.token: 'ADMIN'
keystone.endpoint: 'http://127.0.0.1:35357/v2.0'
```

If configuration for multiple openstack accounts is required, they can be set up as different configuration profiles. For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.tenant_id: f80919baedab48ec8931f200c65a50df
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the keystone functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' keystone.tenant_list profile=openstack1
```

salt.modules.keystone.**api_version**(*profile=None*, ***connection_args*)

Returns the API version derived from endpoint's response.

CLI Example:

```
salt '*' keystone.api_version
```

salt.modules.keystone.**auth**(*profile=None*, ***connection_args*)

Set up keystone credentials. Only intended to be used within Keystone-enabled modules.

CLI Example:

```
salt '*' keystone.auth
```

salt.modules.keystone.**ec2_credentials_create**(*user_id=None*, *name=None*, *tenant_id=None*, *tenant=None*, *profile=None*, ***connection_args*)

Create EC2-compatible credentials for user per tenant

CLI Examples:

```
salt '*' keystone.ec2_credentials_create name=admin tenant=admin

salt '*' keystone.ec2_credentials_create         user_
 ↪id=c965f79c4f864eaaa9c3b41904e67082         tenant_
 ↪id=722787eb540849158668370dc627ec5f
```

salt.modules.keystone.**ec2_credentials_delete**(*user_id=None*, *name=None*, *access_key=None*, *profile=None*, ***connection_args*)

Delete EC2-compatible credentials

CLI Examples:

```
salt '*' keystone.ec2_credentials_delete 860f8c2c38ca4fab989f9bc56a061a64
 ↪access_key=5f66d2f24f604b8bb9cd28886106f442

salt '*' keystone.ec2_credentials_delete name=admin access_
 ↪key=5f66d2f24f604b8bb9cd28886106f442
```

salt.modules.keystone.**ec2_credentials_get**(*user_id=None*, *name=None*, *access=None*, *profile=None*, ***connection_args*)

Return ec2_credentials for a user (keystone ec2-credentials-get)

CLI Examples:

```
salt '*' keystone.ec2_credentials_get c965f79c4f864eaaa9c3b41904e67082
 ↪access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get user_id=c965f79c4f864eaaa9c3b41904e67082
 ↪access=722787eb540849158668370
salt '*' keystone.ec2_credentials_get name=nova
 ↪access=722787eb540849158668370dc627ec5f
```

salt.modules.keystone.**ec2_credentials_list**(*user_id=None*, *name=None*, *profile=None*, ***connection_args*)

Return a list of ec2_credentials for a specific user (keystone ec2-credentials-list)

CLI Examples:

```
salt '*' keystone.ec2_credentials_list 298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list user_id=298ce377245c4ec9b70e1c639c89e654
salt '*' keystone.ec2_credentials_list name=jack
```

salt.modules.keystone.**endpoint_create**(*service*, *publicurl=None*, *internalurl=None*, *adminurl=None*, *region=None*, *profile=None*, *url=None*, *interface=None*, ***connection_args*)

Create an endpoint for an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_create nova 'http://public/url' 'http://internal/url'
 ↪'http://adminurl/url' region

salt 'v3' keystone.endpoint_create nova url='http://public/url' interface='public
 ↪' region='RegionOne'
```

salt.modules.keystone.**endpoint_delete**(*service*, *region=None*, *profile=None*, *interface=None*, ***connection_args*)

Delete endpoints of an Openstack service

CLI Examples:

```
salt 'v2' keystone.endpoint_delete nova [region=RegionOne]

salt 'v3' keystone.endpoint_delete nova interface=admin [region=RegionOne]
```

salt.modules.keystone.**endpoint_get**(*service*, *region=None*, *profile=None*, *interface=None*, ***connection_args*)

Return a specific endpoint (keystone endpoint-get)

CLI Example:

```
salt 'v2' keystone.endpoint_get nova [region=RegionOne]

salt 'v3' keystone.endpoint_get nova interface=admin [region=RegionOne]
```

salt.modules.keystone.**endpoint_list**(*profile=None*, ***connection_args*)

Return a list of available endpoints (keystone endpoints-list)

CLI Example:

```
salt '*' keystone.endpoint_list
```

salt.modules.keystone.**project_create**(*name*, *domain*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Create a keystone project. Overrides keystone tenant_create form api V2. For keystone api V3.

New in version 2016.11.0.

name The project name, which must be unique within the owning domain.
domain The domain name.
description The project description.
enabled Enables or disables the project.
profile Configuration profile - if configuration for multiple openstack accounts required.
CLI Examples:

```
salt '*' keystone.project_create nova default description='Nova Compute Project'
salt '*' keystone.project_create test default enabled=False
```

salt.modules.keystone.**project_delete**(*project_id=None*, *name=None*, *profile=None*, ***connection_args*)

Delete a project (keystone project-delete). Overrides keystone tenant-delete form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.
name The project name.
profile Configuration profile - if configuration for multiple openstack accounts required.
CLI Examples:

```
salt '*' keystone.project_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_delete name=demo
```

salt.modules.keystone.**project_get**(*project_id=None*, *name=None*, *profile=None*, ***connection_args*)

Return a specific projects (keystone project-get) Overrides keystone tenant-get form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.
name The project name.
profile Configuration profile - if configuration for multiple openstack accounts required.
CLI Examples:

```
salt '*' keystone.project_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get project_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.project_get name=nova
```

salt.modules.keystone.**project_list**(*profile=None*, ***connection_args*)

Return a list of available projects (keystone projects-list). Overrides keystone tenants-list form api V2. For keystone api V3 only.

New in version 2016.11.0.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Example:

```
salt '*' keystone.project_list
```

salt.modules.keystone.**project_update**(*project_id=None*, *name=None*, *description=None*, *enabled=None*, *profile=None*, ***connection_args*)

Update a tenant's information (keystone project-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

Overrides keystone tenant_update form api V2. For keystone api V3 only.

New in version 2016.11.0.

project_id The project id.

name The project name, which must be unique within the owning domain.

description The project description.

enabled Enables or disables the project.

profile Configuration profile - if configuration for multiple openstack accounts required.

CLI Examples:

```
salt '*' keystone.project_update name=admin enabled=True
salt '*' keystone.project_update c965f79c4f864eaaa9c3b41904e67082 name=admin
↪email=admin@domain.com
```

salt.modules.keystone.**role_create**(*name*, *profile=None*, ***connection_args*)

Create a named role.

CLI Example:

```
salt '*' keystone.role_create admin
```

salt.modules.keystone.**role_delete**(*role_id=None*, *name=None*, *profile=None*, ***connection_args*)

Delete a role (keystone role-delete)

CLI Examples:

```
salt '*' keystone.role_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_delete name=admin
```

salt.modules.keystone.**role_get**(*role_id=None*, *name=None*, *profile=None*, ***connection_args*)

Return a specific roles (keystone role-get)

CLI Examples:

```
salt '*' keystone.role_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get role_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.role_get name=nova
```

salt.modules.keystone.**role_list**(*profile=None*, ***connection_args*)
Return a list of available roles (keystone role-list)

CLI Example:

```
salt '*' keystone.role_list
```

salt.modules.keystone.**service_create**(*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*)
Add service to Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_create nova compute 'OpenStack Compute Service'
```

salt.modules.keystone.**service_delete**(*service_id=None*, *name=None*, *profile=None*, ***connection_args*)
Delete a service from Keystone service catalog

CLI Examples:

```
salt '*' keystone.service_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_delete name=nova
```

salt.modules.keystone.**service_get**(*service_id=None*, *name=None*, *profile=None*, ***connection_args*)
Return a specific services (keystone service-get)

CLI Examples:

```
salt '*' keystone.service_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get service_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.service_get name=nova
```

salt.modules.keystone.**service_list**(*profile=None*, ***connection_args*)
Return a list of available services (keystone services-list)

CLI Example:

```
salt '*' keystone.service_list
```

salt.modules.keystone.**tenant_create**(*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)
Create a keystone tenant

CLI Examples:

```
salt '*' keystone.tenant_create nova description='nova tenant'
salt '*' keystone.tenant_create test enabled=False
```

salt.modules.keystone.**tenant_delete**(*tenant_id=None*, *name=None*, *profile=None*, ***connection_args*)
Delete a tenant (keystone tenant-delete)

CLI Examples:

```
salt '*' keystone.tenant_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_delete name=demo
```

salt.modules.keystone.**tenant_get**(*tenant_id=None*, *name=None*, *profile=None*, ***connection_args*)

Return a specific tenants (keystone tenant-get)

CLI Examples:

```
salt '*' keystone.tenant_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get tenant_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.tenant_get name=nova
```

salt.modules.keystone.**tenant_list**(*profile=None*, ***connection_args*)

Return a list of available tenants (keystone tenants-list)

CLI Example:

```
salt '*' keystone.tenant_list
```

salt.modules.keystone.**tenant_update**(*tenant_id=None*, *name=None*, *description=None*, *enabled=None*, *profile=None*, ***connection_args*)

Update a tenant's information (keystone tenant-update) The following fields may be updated: name, description, enabled. Can only update name if targeting by ID

CLI Examples:

```
salt '*' keystone.tenant_update name=admin enabled=True
salt '*' keystone.tenant_update c965f79c4f864eaaa9c3b41904e67082 name=admin
 ↪email=admin@domain.com
```

salt.modules.keystone.**token_get**(*profile=None*, ***connection_args*)

Return the configured tokens (keystone token-get)

CLI Example:

```
salt '*' keystone.token_get c965f79c4f864eaaa9c3b41904e67082
```

salt.modules.keystone.**user_create**(*name*, *password*, *email*, *tenant_id=None*, *enabled=True*, *profile=None*, *project_id=None*, *description=None*, ***connection_args*)

Create a user (keystone user-create)

CLI Examples:

```
salt '*' keystone.user_create name=jack password=zero email=jack@halloweentown.
 ↪org          tenant_id=a28a7b5a999a455f84b1f5210264375e enabled=True
```

salt.modules.keystone.**user_delete**(*user_id=None*, *name=None*, *profile=None*, ***connection_args*)

Delete a user (keystone user-delete)

CLI Examples:

```
salt '*' keystone.user_delete c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_delete name=nova
```

salt.modules.keystone.**user_get**(*user_id=None*, *name=None*, *profile=None*, ***connection_args*)

Return a specific users (keystone user-get)

CLI Examples:

```
salt '*' keystone.user_get c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get user_id=c965f79c4f864eaaa9c3b41904e67082
salt '*' keystone.user_get name=nova
```

salt.modules.keystone.**user_list**(*profile=None*, ***connection_args*)

Return a list of available users (keystone user-list)

CLI Example:

```
salt '*' keystone.user_list
```

salt.modules.keystone.**user_password_update**(*user_id=None*, *name=None*, *password=None*, *profile=None*, ***connection_args*)

Update a user's password (keystone user-password-update)

CLI Examples:

```
salt '*' keystone.user_password_update c965f79c4f864eaaa9c3b41904e67082
 ↪password=12345
salt '*' keystone.user_password_update user_id=c965f79c4f864eaaa9c3b41904e67082
 ↪password=12345
salt '*' keystone.user_password_update name=nova password=12345
```

salt.modules.keystone.**user_role_add**(*user_id=None*, *user=None*, *tenant_id=None*, *tenant=None*, *role_id=None*, *role=None*, *profile=None*, *project_id=None*, *project_name=None*, ***connection_args*)

Add role for user in tenant (keystone user-role-add)

CLI Examples:

```
salt '*' keystone.user_role_add user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
 ↪id=7167a092ece84bae8cead4bf9d15bb3b role_id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_add user=admin tenant=admin role=admin
```

salt.modules.keystone.**user_role_list**(*user_id=None*, *tenant_id=None*, *user_name=None*, *tenant_name=None*, *profile=None*, *project_id=None*, *project_name=None*, ***connection_args*)

Return a list of available user_roles (keystone user-roles-list)

CLI Examples:

```
salt '*' keystone.user_role_list user_id=298ce377245c4ec9b70e1c639c89e654 tenant_
 ↪id=7167a092ece84bae8cead4bf9d15bb3b
salt '*' keystone.user_role_list user_name=admin tenant_name=admin
```

salt.modules.keystone.**user_role_remove**(*user_id=None*, *user=None*, *tenant_id=None*, *tenant=None*, *role_id=None*, *role=None*, *profile=None*, *project_id=None*, *project_name=None*, ***connection_args*)

Remove role for user in tenant (keystone user-role-remove)

CLI Examples:

```
salt '*' keystone.user_role_remove user_id=298ce377245c4ec9b70e1c639c89e654
 ↪tenant_id=7167a092ece84bae8cead4bf9d15bb3b role_
 ↪id=ce377245c4ec9b70e1c639c89e8cead4
salt '*' keystone.user_role_remove user=admin tenant=admin role=admin
```

salt.modules.keystone.**user_update**(*user_id=None*, *name=None*, *email=None*, *enabled=None*, *tenant=None*, *profile=None*, *project=None*, *description=None*, ***connection_args*)

Update a user's information (keystone user-update) The following fields may be updated: name, email, enabled, tenant. Because the name is one of the fields, a valid user id is required.

CLI Examples:

```
salt '*' keystone.user_update user_id=c965f79c4f864eaaa9c3b41904e67082
 ↪name=newname
salt '*' keystone.user_update c965f79c4f864eaaa9c3b41904e67082 name=newname
 ↪email=newemail@domain.com
```

salt.modules.keystone.**user_verify_password**(*user_id=None*, *name=None*, *password=None*, *profile=None*, ***connection_args*)

Verify a user's password

CLI Examples:

```
salt '*' keystone.user_verify_password name=test password=foobar
salt '*' keystone.user_verify_password user_id=c965f79c4f864eaaa9c3b41904e67082
 ↪password=foobar
```

19.9.177 salt.modules.kmod

Module to manage Linux kernel modules

salt.modules.kmod.**available**()

Return a list of all available kernel modules

CLI Example:

```
salt '*' kmod.available
```

salt.modules.kmod.**check_available**(*mod*)

Check to see if the specified kernel module is available

CLI Example:

```
salt '*' kmod.check_available kvm
```

salt.modules.kmod.**is_loaded**(*mod*)

Check to see if the specified kernel module is loaded

CLI Example:

```
salt '*' kmod.is_loaded kvm
```

salt.modules.kmod.**load**(*mod*, *persist=False*)

Load the specified kernel module

mod Name of module to add

persist Write module to /etc/modules to make it load on system reboot

CLI Example:

```
salt '*' kmod.load kvm
```

salt.modules.kmod.**lsmod**()

Return a dict containing information about currently loaded modules

CLI Example:

```
salt '*' kmod.lsmod
```

salt.modules.kmod.**mod_list**(*only_persist=False*)

Return a list of the loaded module names

only_persist Only return the list of loaded persistent modules

CLI Example:

```
salt '*' kmod.mod_list
```

salt.modules.kmod.**remove**(*mod*, *persist=False*, *comment=True*)

Remove the specified kernel module

mod Name of module to remove

persist Also remove module from /etc/modules

comment If persist is set don't remove line from /etc/modules but only comment it

CLI Example:

```
salt '*' kmod.remove kvm
```

19.9.178 salt.modules.kubernetes

Module for handling kubernetes calls.

optdepends

- kubernetes Python client

configuration The k8s API settings are provided either in a pillar, in the minion's config file, or in master's config file:

```
kubernetes.user: admin
kubernetes.password: verybadpass
kubernetes.api_url: 'http://127.0.0.1:8080'
kubernetes.certificate-authority-data: '...'
kubernetes.client-certificate-data: '....n
kubernetes.client-key-data: '...'
kubernetes.certificate-authority-file: '/path/to/ca.crt'
kubernetes.client-certificate-file: '/path/to/client.crt'
kubernetes.client-key-file: '/path/to/client.key'
```

These settings can be also overridden by adding *api_url*, *api_user*, *api_password*, *api_certificate_authority_file*, *api_client_certificate_file* or *api_client_key_file* parameters when calling a function:

The data format for *kubernetes.*-data* values is the same as provided in *kubeconfig*. It's base64 encoded certificates/keys in one line.

For an item only one field should be provided. Either a *data* or a *file* entry. In case both are provided the *file* entry is preferred.

```
salt '*' kubernetes.nodes api_url=http://k8s-api-server:port api_user=myuser api_
↪password=pass
```

Warning: Configuration options will change in Flourine. All options above will be replaced by:

- kubernetes.kubeconfig or kubernetes.kubeconfig-data

- kubernetes.context

salt.modules.kubernetes.**configmaps**(*namespace='default'*, ***kwargs*)
Return a list of kubernetes configmaps defined in the namespace

CLI Examples:

```
salt '*' kubernetes.configmaps
salt '*' kubernetes.configmaps namespace=default
```

salt.modules.kubernetes.**create_configmap**(*name*, *namespace*, *data*, *source*, *template*, *saltenv*, ***kwargs*)
Creates the kubernetes configmap as defined by the user.

salt.modules.kubernetes.**create_deployment**(*name*, *namespace*, *metadata*, *spec*, *source*, *template*, *saltenv*, ***kwargs*)
Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetes.**create_namespace**(*name*, ***kwargs*)
Creates a namespace with the specified name.
CLI Example: salt `*' kubernetes.create_namespace salt salt `*' kubernetes.create_namespace name=salt

salt.modules.kubernetes.**create_pod**(*name*, *namespace*, *metadata*, *spec*, *source*, *template*, *saltenv*, ***kwargs*)
Creates the kubernetes deployment as defined by the user.

salt.modules.kubernetes.**create_secret**(*name*, *namespace*, *data*, *source*, *template*, *saltenv*, ***kwargs*)
Creates the kubernetes secret as defined by the user.

salt.modules.kubernetes.**create_service**(*name*, *namespace*, *metadata*, *spec*, *source*, *template*, *saltenv*, ***kwargs*)
Creates the kubernetes service as defined by the user.

salt.modules.kubernetes.**delete_configmap**(*name*, *namespace='default'*, ***kwargs*)
Deletes the kubernetes configmap defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_configmap settings default
salt '*' kubernetes.delete_configmap name=settings namespace=default
```

salt.modules.kubernetes.**delete_deployment**(*name*, *namespace='default'*, ***kwargs*)
Deletes the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_deployment my-nginx
salt '*' kubernetes.delete_deployment name=my-nginx namespace=default
```

salt.modules.kubernetes.**delete_namespace**(*name*, ***kwargs*)
Deletes the kubernetes namespace defined by name

CLI Examples:

```
salt '*' kubernetes.delete_namespace salt
salt '*' kubernetes.delete_namespace name=salt
```

salt.modules.kubernetes.**delete_pod**(*name*, *namespace='default'*, ***kwargs*)
Deletes the kubernetes pod defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_pod guestbook-708336848-5nl8c default
salt '*' kubernetes.delete_pod name=guestbook-708336848-5nl8c namespace=default
```

salt.modules.kubernetes.**delete_secret**(*name*, *namespace='default'*, ***kwargs*)
Deletes the kubernetes secret defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_secret confidential default
salt '*' kubernetes.delete_secret name=confidential namespace=default
```

salt.modules.kubernetes.**delete_service**(*name*, *namespace='default'*, ***kwargs*)
Deletes the kubernetes service defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.delete_service my-nginx default
salt '*' kubernetes.delete_service name=my-nginx namespace=default
```

salt.modules.kubernetes.**deployments**(*namespace='default'*, ***kwargs*)
Return a list of kubernetes deployments defined in the namespace

CLI Examples:

```
salt '*' kubernetes.deployments
salt '*' kubernetes.deployments namespace=default
```

salt.modules.kubernetes.**namespaces**(***kwargs*)
Return the names of the available namespaces

CLI Examples:

```
salt '*' kubernetes.namespaces
salt '*' kubernetes.namespaces api_url=http://myhost:port api_user=my-user
```

salt.modules.kubernetes.**node**(*name*, ***kwargs*)
Return the details of the node identified by the specified name

CLI Examples:

```
salt '*' kubernetes.node name='minikube'
```

salt.modules.kubernetes.**node_add_label**(*node_name*, *label_name*, *label_value*, ***kwargs*)
Set the value of the label identified by *label_name* to *label_value* on the node identified by the name *node_name*. Creates the lable if not present.

CLI Examples:

```
salt '*' kubernetes.node_add_label node_name="minikube"              label_name="foo
↪" label_value="bar"
```

salt.modules.kubernetes.**node_labels**(*name*, ***kwargs*)
Return the labels of the node identified by the specified name

CLI Examples:

```
salt '*' kubernetes.node_labels name="minikube"
```

salt.modules.kubernetes.**node_remove_label**(*node_name*, *label_name*, ***kwargs*)

Removes the label identified by *label_name* from the node identified by the name *node_name*.

CLI Examples:

```
salt '*' kubernetes.node_remove_label node_name="minikube"              label_name=
↪"foo"
```

salt.modules.kubernetes.**nodes**(***kwargs*)

Return the names of the nodes composing the kubernetes cluster

CLI Examples:

```
salt '*' kubernetes.nodes
salt '*' kubernetes.nodes api_url=http://myhost:port api_user=my-user
```

salt.modules.kubernetes.**ping**(***kwargs*)

Checks connections with the kubernetes API server. Returns True if the connection can be established, False otherwise.

CLI Example: salt `*' kubernetes.ping

salt.modules.kubernetes.**pods**(*namespace='default'*, ***kwargs*)

Return a list of kubernetes pods defined in the namespace

CLI Examples:

```
salt '*' kubernetes.pods
salt '*' kubernetes.pods namespace=default
```

salt.modules.kubernetes.**replace_configmap**(*name*, *data*, *source*, *template*, *saltenv*, *namespace='default'*, ***kwargs*)

Replaces an existing configmap with a new one defined by name and namespace, having the specificed data.

salt.modules.kubernetes.**replace_deployment**(*name*, *metadata*, *spec*, *source*, *template*, *saltenv*, *namespace='default'*, ***kwargs*)

Replaces an existing deployment with a new one defined by name and namespace, having the specificed metadata and spec.

salt.modules.kubernetes.**replace_secret**(*name*, *data*, *source*, *template*, *saltenv*, *namespace='default'*, ***kwargs*)

Replaces an existing secret with a new one defined by name and namespace, having the specificed data.

salt.modules.kubernetes.**replace_service**(*name*, *metadata*, *spec*, *source*, *template*, *old_service*, *saltenv*, *namespace='default'*, ***kwargs*)

Replaces an existing service with a new one defined by name and namespace, having the specificed metadata and spec.

salt.modules.kubernetes.**secrets**(*namespace='default'*, ***kwargs*)

Return a list of kubernetes secrets defined in the namespace

CLI Examples:

```
salt '*' kubernetes.secrets
salt '*' kubernetes.secrets namespace=default
```

salt.modules.kubernetes.**services**(*namespace='default'*, ***kwargs*)

Return a list of kubernetes services defined in the namespace

CLI Examples:

```
salt '*' kubernetes.services
salt '*' kubernetes.services namespace=default
```

salt.modules.kubernetes.**show_configmap**(*name*, *namespace='default'*, ***kwargs*)
Return the kubernetes configmap defined by name and namespace.

CLI Examples:

```
salt '*' kubernetes.show_configmap game-config default
salt '*' kubernetes.show_configmap name=game-config namespace=default
```

salt.modules.kubernetes.**show_deployment**(*name*, *namespace='default'*, ***kwargs*)
Return the kubernetes deployment defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_deployment my-nginx default
salt '*' kubernetes.show_deployment name=my-nginx namespace=default
```

salt.modules.kubernetes.**show_namespace**(*name*, ***kwargs*)
Return information for a given namespace defined by the specified name

CLI Examples:

```
salt '*' kubernetes.show_namespace kube-system
```

salt.modules.kubernetes.**show_pod**(*name*, *namespace='default'*, ***kwargs*)
Return POD information for a given pod name defined in the namespace

CLI Examples:

```
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x
salt '*' kubernetes.show_pod guestbook-708336848-fqr2x namespace=default
```

salt.modules.kubernetes.**show_secret**(*name*, *namespace='default'*, *decode=False*, ***kwargs*)
Return the kubernetes secret defined by name and namespace. The secrets can be decoded if specified by the user. Warning: this has security implications.

CLI Examples:

```
salt '*' kubernetes.show_secret confidential default
salt '*' kubernetes.show_secret name=confidential namespace=default
salt '*' kubernetes.show_secret name=confidential decode=True
```

salt.modules.kubernetes.**show_service**(*name*, *namespace='default'*, ***kwargs*)
Return the kubernetes service defined by name and namespace

CLI Examples:

```
salt '*' kubernetes.show_service my-nginx default
salt '*' kubernetes.show_service name=my-nginx namespace=default
```

19.9.179 salt.modules.launchctl

Module for the management of MacOS systems that use launchd/launchctl

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

depends

- plistlib Python module

salt.modules.launchctl.**available**(*job_label*)

Check that the given service is available.

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

salt.modules.launchctl.**disabled**(*job_label*, *runas=None*)

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service label>
```

salt.modules.launchctl.**enabled**(*job_label*, *runas=None*)

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service label>
```

salt.modules.launchctl.**get_all**()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.launchctl.**missing**(*job_label*)

The inverse of service.available Check that the given service is not available.

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

salt.modules.launchctl.**restart**(*job_label*, *runas=None*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service label>
```

salt.modules.launchctl.**start**(*job_label*, *runas=None*)

Start the specified service

CLI Example:

```
salt '*' service.start <service label>
salt '*' service.start org.ntp.ntpd
salt '*' service.start /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

salt.modules.launchctl.**status**(*job_label*, *runas=None*)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service label>
```

salt.modules.launchctl.**stop**(*job_label*, *runas=None*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service label>
salt '*' service.stop org.ntp.ntpd
salt '*' service.stop /System/Library/LaunchDaemons/org.ntp.ntpd.plist
```

19.9.180 salt.modules.layman

Support for Layman

salt.modules.layman.**add**(*overlay*)
Add the given overlay from the cached remote list to your locally installed overlays. Specify `ALL' to add all overlays from the remote list.

Return a list of the new overlay(s) added:

CLI Example:

```
salt '*' layman.add <overlay name>
```

salt.modules.layman.**delete**(*overlay*)
Remove the given overlay from the your locally installed overlays. Specify `ALL' to remove all overlays.

Return a list of the overlays(s) that were removed:

CLI Example:

```
salt '*' layman.delete <overlay name>
```

salt.modules.layman.**list_all**()
List all overlays, including remote ones.

Return a list of available overlays:

CLI Example:

```
salt '*' layman.list_all
```

salt.modules.layman.**list_local**()
List the locally installed overlays.

Return a list of installed overlays:

CLI Example:

```
salt '*' layman.list_local
```

salt.modules.layman.**sync**(*overlay='ALL'*)
Update the specified overlay. Use `ALL' to synchronize all overlays. This is the default if no overlay is specified.
overlay Name of the overlay to sync. (Defaults to `ALL')

CLI Example:

```
salt '*' layman.sync
```

19.9.181 salt.modules.ldap3

Query and modify an LDAP database (alternative interface)

New in version 2016.3.0.

This is an alternative to the `ldap` interface provided by the *ldapmod* execution module.

depends

- `ldap` Python module

exception `salt.modules.ldap3.`**`LDAPError`**(*message*, *cause=None*)
Base class of all LDAP exceptions raised by backends.

This is only used for errors encountered while interacting with the LDAP server; usage errors (e.g., invalid backend name) will have a different type.

Variables **`cause`** -- backend exception object, if applicable

`salt.modules.ldap3.`**`add`**(*connect_spec*, *dn*, *attributes*)
Add an entry to an LDAP database.

Parameters

- **`connect_spec`** -- See the documentation for the `connect_spec` parameter for *connect()*.
- **`dn`** -- Distinguished name of the entry.
- **`attributes`** -- Non-empty dict mapping each of the new entry's attributes to a non-empty iterable of values.

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.add "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret',
    },
}" "dn='dc=example,dc=com'" "attributes={'example': 'values'}"
```

`salt.modules.ldap3.`**`change`**(*connect_spec*, *dn*, *before*, *after*)
Modify an entry in an LDAP database.

This does the same thing as *modify()*, but with a simpler interface. Instead of taking a list of directives, it takes a before and after view of an entry, determines the differences between the two, computes the directives, and executes them.

Any attribute value present in `before` but missing in `after` is deleted. Any attribute value present in `after` but missing in `before` is added. Any attribute value in the database that is not mentioned in either `before` or `after` is not altered. Any attribute value that is present in both `before` and `after` is ignored, regardless of whether that attribute value exists in the database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for *connect()*.
- **dn** -- Distinguished name of the entry.
- **before** -- The expected state of the entry before modification. This is a dict mapping each attribute name to an iterable of values.
- **after** -- The desired state of the entry after modification. This is a dict mapping each attribute name to an iterable of values.

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.change "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
before="{'example_value': 'before_val'}"
after="{'example_value': 'after_val'}"
```

`salt.modules.ldap3.`**connect**(*connect_spec=None*)

Connect and optionally bind to an LDAP server.

Parameters **connect_spec** -- This can be an LDAP connection object returned by a previous call to *connect()* (in which case the argument is simply returned), `None` (in which case an empty dict is used), or a dict with the following keys:

- **'backend'** Optional; default depends on which Python LDAP modules are installed. Name of the Python LDAP module to use. Only `'ldap'` is supported at the moment.
- **'url'** Optional; defaults to `'ldapi:///'`. URL to the LDAP server.
- **'bind'** Optional; defaults to `None`. Describes how to bind an identity to the LDAP connection. If `None`, an anonymous connection is made. Valid keys:
  - **'method'** Optional; defaults to `None`. The authentication method to use. Valid values include but are not necessarily limited to `'simple'`, `'sasl'`, and `None`. If `None`, an anonymous connection is made. Available methods depend on the chosen backend.
  - **'mechanism'** Optional; defaults to `'EXTERNAL'`. The SASL mechanism to use. Ignored unless the method is `'sasl'`. Available methods depend on the chosen backend and the server's capabilities.
  - **'credentials'** Optional; defaults to `None`. An object specific to the chosen SASL mechanism and backend that represents the authentication credentials. Ignored unless the method is `'sasl'`.

    For the `'ldap'` backend, this is a dictionary. If `None`, an empty dict is used. Keys:

    * **'args'** Optional; defaults to an empty list. A list of arguments to pass to the SASL mechanism constructor. See the SASL mechanism constructor documentation in the `ldap.sasl` Python module.
    * **'kwargs'** Optional; defaults to an empty dict. A dict of keyword arguments to pass to the SASL mechanism constructor. See the SASL

mechanism constructor documentation in the ldap.sasl Python module.

- **'dn'** Optional; defaults to an empty string. The distinguished name to bind.
- **'password'** Optional; defaults to an empty string. Password for binding. Ignored if the method is 'sasl'.

- **'tls'** Optional; defaults to None. A backend-specific object containing settings to override default TLS behavior.

  For the 'ldap' backend, this is a dictionary. Not all settings in this dictionary are supported by all versions of python-ldap or the underlying TLS library. If None, an empty dict is used. Possible keys:

  - **'starttls'** If present, initiate a TLS connection using StartTLS. (The value associated with this key is ignored.)
  - **'cacertdir'** Set the path of the directory containing CA certificates.
  - **'cacertfile'** Set the pathname of the CA certificate file.
  - **'certfile'** Set the pathname of the certificate file.
  - **'cipher_suite'** Set the allowed cipher suite.
  - **'crlcheck'** Set the CRL evaluation strategy. Valid values are 'none', 'peer', and 'all'.
  - **'crlfile'** Set the pathname of the CRL file.
  - **'dhfile'** Set the pathname of the file containing the parameters for Diffie-Hellman ephemeral key exchange.
  - **'keyfile'** Set the pathname of the certificate key file.
  - **'newctx'** If present, instruct the underlying TLS library to create a new TLS context. (The value associated with this key is ignored.)
  - **'protocol_min'** Set the minimum protocol version.
  - **'random_file'** Set the pathname of the random file when /dev/random and /dev/urandom are not available.
  - **'require_cert'** Set the certificate validation policy. Valid values are 'never', 'hard', 'demand', 'allow', and 'try'.

- **'opts'** Optional; defaults to None. A backend-specific object containing options for the backend.

  For the 'ldap' backend, this is a dictionary of OpenLDAP options to set. If None, an empty dict is used. Each key is a the name of an OpenLDAP option constant without the 'LDAP_OPT_' prefix, then converted to lower case.

Returns

an object representing an LDAP connection that can be used as the connect_spec argument to any of the functions in this module (to avoid the overhead of making and terminating multiple connections).

This object should be used as a context manager. It is safe to nest with statements.

CLI example:

```
salt '*' ldap3.connect "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret'}
}"
```

salt.modules.ldap3.**delete**(*connect_spec*, *dn*)

Delete an entry from an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for *connect()*.
- **dn** -- Distinguished name of the entry.

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.delete "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'}
}" dn='cn=admin,dc=example,dc=com'
```

salt.modules.ldap3.**modify**(*connect_spec*, *dn*, *directives*)

Modify an entry in an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for *connect()*.
- **dn** -- Distinguished name of the entry.
- **directives** -- Iterable of directives that indicate how to modify the entry. Each directive is a tuple of the form `(op,attr,vals)`, where:
  - `op` identifies the modification operation to perform. One of:
    - `'add'` to add one or more values to the attribute
    - `'delete'` to delete some or all of the values from the attribute. If no values are specified with this operation, all of the attribute's values are deleted. Otherwise, only the named values are deleted.
    - `'replace'` to replace all of the attribute's values with zero or more new values
  - `attr` names the attribute to modify
  - `vals` is an iterable of values to add or delete

Returns `True` if successful, raises an exception otherwise.

CLI example:

```
salt '*' ldap3.modify "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'password': 'secret'}
```

```
}" dn='cn=admin,dc=example,dc=com'
directives="('add', 'example', ['example_val'])"
```

salt.modules.ldap3.**search**(*connect_spec*, *base*, *scope='subtree'*, *filterstr='(objectClass=*)'*, *attrlist=None*, *attrsonly=0*)

Search an LDAP database.

Parameters

- **connect_spec** -- See the documentation for the `connect_spec` parameter for *connect()*.
- **base** -- Distinguished name of the entry at which to start the search.
- **scope** -- One of the following:
  - **'subtree'** Search the base and all of its descendants.
  - **'base'** Search only the base itself.
  - **'onelevel'** Search only the base's immediate children.
- **filterstr** -- String representation of the filter to apply in the search.
- **attrlist** -- Limit the returned attributes to those in the specified list. If `None`, all attributes of each entry are returned.
- **attrsonly** -- If non-zero, don't return any attribute values.

Returns a dict of results. The dict is empty if there are no results. The dict maps each returned entry's distinguished name to a dict that maps each of the matching attribute names to a list of its values.

CLI example:

```
salt '*' ldap3.search "{
    'url': 'ldaps://ldap.example.com/',
    'bind': {
        'method': 'simple',
        'dn': 'cn=admin,dc=example,dc=com',
        'password': 'secret',
    },
}" "base='dc=example,dc=com'"
```

19.9.182 salt.modules.ldapmod

Salt interface to LDAP commands

depends

- ldap Python module

configuration In order to connect to LDAP, certain configuration is required in the minion config on the LDAP server. The minimum configuration items that must be set are:

```
ldap.basedn: dc=acme,dc=com (example values, adjust to suit)
```

If your LDAP server requires authentication then you must also set:

```
ldap.anonymous: False
ldap.binddn: admin
ldap.bindpw: password
```

In addition, the following optional values may be set:

```
ldap.server: localhost (default=localhost, see warning below)
ldap.port: 389 (default=389, standard port)
ldap.tls: False (default=False, no TLS)
ldap.no_verify: False (default=False, verify TLS)
ldap.anonymous: True (default=True, bind anonymous)
ldap.scope: 2 (default=2, ldap.SCOPE_SUBTREE)
ldap.attrs: [saltAttr] (default=None, return all attributes)
```

Warning: At the moment this module only recommends connection to LDAP services listening on `localhost`. This is deliberate to avoid the potentially dangerous situation of multiple minions sending identical update commands to the same LDAP server. It's easy enough to override this behavior, but badness may ensue - you have been warned.

`salt.modules.ldapmod.`**`search`**(*filter*, *dn=None*, *scope=None*, *attrs=None*, ***kwargs*)

Run an arbitrary LDAP query and return the results.

CLI Example:

```
salt 'ldaphost' ldap.search "filter=cn=myhost"
```

Return data:

```
{'myhost': {'count': 1,
            'results': [['cn=myhost,ou=hosts,o=acme,c=gb',
                         {'saltKeyValue': ['ntpserver=ntp.acme.local',
                                           'foo=myfoo'],
                          'saltState': ['foo', 'bar']}]],
            'time': {'human': '1.2ms', 'raw': '0.00123'}}}
```

Search and connection options can be overridden by specifying the relevant option as key=value pairs, for example:

```
salt 'ldaphost' ldap.search filter=cn=myhost dn=ou=hosts,o=acme,c=gb
scope=1 attrs='' server='localhost' port='7393' tls=True bindpw='ssh'
```

19.9.183 salt.modules.libcloud_dns module

Connection module for Apache Libcloud DNS management

New in version 2016.11.0.

configuration This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
    profile_test1:
      driver: cloudflare
      key: 12345
      secret: mysecret
    profile_test2:
      driver: godaddy
      key: 12345
      secret: mysecret
      shopper_id: 12345
```

depends apache-libcloud

salt.modules.libcloud_dns.**create_record**(*name*, *zone_id*, *type*, *data*, *profile*)

Create a new record.

Parameters

- **name** (str) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (`') for this argument.
- **zone_id** (str) -- Zone where the requested record is created.
- **type** (str) -- DNS record type (A, AAAA, ...).
- **data** (str) -- Data for the record (depends on the record type).
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.create_record www google.com A 12.32.12.2 profile1
```

salt.modules.libcloud_dns.**create_zone**(*domain*, *profile*, *type='master'*, *ttl=None*)

Create a new zone.

Parameters

- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.create_zone google.com profile1
```

salt.modules.libcloud_dns.**delete_record**(*zone_id*, *record_id*, *profile*)

Delete a record.

Parameters

- **zone_id** (str) -- Zone to delete.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

Return type bool

CLI Example:

```
salt myminion libcloud_dns.delete_record google.com www profile1
```

salt.modules.libcloud_dns.**delete_zone**(*zone_id*, *profile*)

Delete a zone.

Parameters

- **zone_id** (str) -- Zone to delete.
- **profile** (str) -- The profile key

Return type bool

CLI Example:

```
salt myminion libcloud_dns.delete_zone google.com profile1
```

salt.modules.libcloud_dns.**get_bind_data**(*zone_id*, *profile*)

Export Zone to the BIND compatible format.

Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

Returns Zone data in BIND compatible format.

Return type str

CLI Example:

```
salt myminion libcloud_dns.get_bind_data google.com profile1
```

salt.modules.libcloud_dns.**get_record**(*zone_id*, *record_id*, *profile*)

Get record information for the given zone_id on the given profile

Parameters

- **zone_id** (str) -- Zone to export.
- **record_id** (str) -- Record to delete.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_record google.com www profile1
```

salt.modules.libcloud_dns.**get_zone**(*zone_id*, *profile*)

Get zone information for the given zone_id on the given profile

Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.get_zone google.com profile1
```

salt.modules.libcloud_dns.**list_record_types**(*profile*)

List available record types for the given profile, e.g. A, AAAA

Parameters **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_record_types profile1
```

salt.modules.libcloud_dns.**list_records**(*zone_id*, *profile*)

List records for the given zone_id on the given profile

Parameters

- **zone_id** (str) -- Zone to export.
- **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_records google.com profile1
```

salt.modules.libcloud_dns.**list_zones**(*profile*)

List zones for the given profile

Parameters **profile** (str) -- The profile key

CLI Example:

```
salt myminion libcloud_dns.list_zones profile1
```

salt.modules.libcloud_dns.**update_zone**(*zone_id*, *domain*, *profile*, *type='master'*, *ttl=None*)

Update an existing zone.

Parameters

- **zone_id** (str) -- Zone ID to update.
- **domain** (str) -- Zone domain name (e.g. example.com)
- **profile** (str) -- The profile key
- **type** (str) -- Zone type (master / slave).
- **ttl** (int) -- TTL for new records. (optional)

CLI Example:

```
salt myminion libcloud_dns.update_zone google.com google.com profile1 type=slave
```

19.9.184 salt.modules.linux_acl

Support for Linux File Access Control Lists

The Linux ACL module requires the *getfacl* and *setfacl* binaries.

salt.modules.linux_acl.**delfacl**(*acl_type*, *acl_name=''*, **args*, ***kwargs*)

Remove specific FACL from the specified file(s)

CLI Examples:

```
salt '*' acl.delfacl user myuser /tmp/house/kitchen
salt '*' acl.delfacl default:group mygroup /tmp/house/kitchen
salt '*' acl.delfacl d:u myuser /tmp/house/kitchen
salt '*' acl.delfacl g myuser /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.delfacl user myuser /tmp/house/kitchen recursive=True
```

salt.modules.linux_acl.**getfacl**(**args*, ***kwargs*)

Return (extremely verbose) map of FACLs on specified file(s)

CLI Examples:

```
salt '*' acl.getfacl /tmp/house/kitchen
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.getfacl /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

salt.modules.linux_acl.**modfacl**(*acl_type*, *acl_name=''*, *perms=''*, **args*, ***kwargs*)

Add or modify a FACL for the specified file(s)

CLI Examples:

```
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen
salt '*' acl.modfacl default:group mygroup rx /tmp/house/kitchen
salt '*' acl.modfacl d:u myuser 7 /tmp/house/kitchen
salt '*' acl.modfacl g mygroup 0 /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.modfacl user myuser rwx /tmp/house/kitchen recursive=True
```

salt.modules.linux_acl.**version**()

Return facl version from getfacl --version

CLI Example:

```
salt '*' acl.version
```

salt.modules.linux_acl.**wipefacls**(**args*, ***kwargs*)
Remove all FACLs from the specified file(s)

CLI Examples:

```
salt '*' acl.wipefacls /tmp/house/kitchen
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom
salt '*' acl.wipefacls /tmp/house/kitchen /tmp/house/livingroom recursive=True
```

19.9.185 salt.modules.linux_ip module

The networking module for Non-RH/Deb Linux distros

salt.modules.linux_ip.**down**(*iface*, *iface_type=None*)
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.linux_ip.**get_interface**(*iface*)
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.linux_ip.**get_routes**(*iface=None*)
Return the current routing table

CLI Examples:

```
salt '*' ip.get_routes
salt '*' ip.get_routes eth0
```

salt.modules.linux_ip.**up**(*iface*, *iface_type=None*)
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

19.9.186 salt.modules.linux_lvm

Support for Linux LVM2

salt.modules.linux_lvm.**fullversion**()
Return all version info from lvm version

CLI Example:

```
salt '*' lvm.fullversion
```

salt.modules.linux_lvm.**lvcreate**(*lvname*, *vgname*, *size=None*, *extents=None*, *snapshot=None*, *pv=None*, *thinvolume=False*, *thinpool=False*, ***kwargs*)

Create a new logical volume, with option for which physical volume to be used

CLI Examples:

```
salt '*' lvm.lvcreate new_volume_name     vg_name size=10G
salt '*' lvm.lvcreate new_volume_name     vg_name extents=100 pv=/dev/sdb
salt '*' lvm.lvcreate new_snapshot        vg_name snapshot=volume_name size=3G
```

New in version to_complete.

Support for thin pools and thin volumes

CLI Examples:

```
salt '*' lvm.lvcreate new_thinpool_name   vg_name               size=20G
 ↪thinpool=True
salt '*' lvm.lvcreate new_thinvolume_name vg_name/thinpool_name size=10G
 ↪thinvolume=True
```

salt.modules.linux_lvm.**lvdisplay**(*lvname=''*)

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvdisplay
salt '*' lvm.lvdisplay /dev/vg_myserver/root
```

salt.modules.linux_lvm.**lvremove**(*lvname*, *vgname*)

Remove a given existing logical volume from a named existing volume group

CLI Example:

```
salt '*' lvm.lvremove lvname vgname force=True
```

salt.modules.linux_lvm.**lvresize**(*size*, *lvpath*)

Return information about the logical volume(s)

CLI Examples:

```
salt '*' lvm.lvresize +12M /dev/mapper/vg1-test
```

salt.modules.linux_lvm.**pvcreate**(*devices*, *override=True*, ***kwargs*)

Set a physical device to be used as an LVM physical volume

override Skip devices, if they are already LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvcreate /dev/sdb1,/dev/sdb2
salt mymachine lvm.pvcreate /dev/sdb1 dataalignmentoffset=7s
```

salt.modules.linux_lvm.**pvdisplay**(*pvname=''*, *real=False*)

Return information about the physical volume(s)

pvname physical device name

real dereference any symlinks and report the real device

New in version 2015.8.7.

CLI Examples:

```
salt '*' lvm.pvdisplay
salt '*' lvm.pvdisplay /dev/md0
```

salt.modules.linux_lvm.**pvremove**(*devices*, *override=True*)

Remove a physical device being used as an LVM physical volume

override Skip devices, if they are already not used as LVM physical volumes

CLI Examples:

```
salt mymachine lvm.pvremove /dev/sdb1,/dev/sdb2
```

salt.modules.linux_lvm.**version**()

Return LVM version from lvm version

CLI Example:

```
salt '*' lvm.version
```

salt.modules.linux_lvm.**vgcreate**(*vgname*, *devices*, ***kwargs*)

Create an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgcreate my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgcreate my_vg /dev/sdb1 clustered=y
```

salt.modules.linux_lvm.**vgdisplay**(*vgname=''*)

Return information about the volume group(s)

CLI Examples:

```
salt '*' lvm.vgdisplay
salt '*' lvm.vgdisplay nova-volumes
```

salt.modules.linux_lvm.**vgextend**(*vgname*, *devices*)

Add physical volumes to an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgextend my_vg /dev/sdb1,/dev/sdb2
salt mymachine lvm.vgextend my_vg /dev/sdb1
```

salt.modules.linux_lvm.**vgremove**(*vgname*)

Remove an LVM volume group

CLI Examples:

```
salt mymachine lvm.vgremove vgname
salt mymachine lvm.vgremove vgname force=True
```

19.9.187 salt.modules.linux_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.linux_sysctl.**assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.ipv4.ip_forward 1
```

salt.modules.linux_sysctl.**default_config**()

Linux hosts using systemd 207 or later ignore `/etc/sysctl.conf` and only load from `/etc/sysctl.d/*.conf`. This function will do the proper checks and return a default config file which will be valid for the Minion. Hosts running systemd >= 207 will use `/etc/sysctl.d/99-salt.conf`.

CLI Example:

```
salt -G 'kernel:Linux' sysctl.default_config
```

salt.modules.linux_sysctl.**get**(*name*)

Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get net.ipv4.ip_forward
```

salt.modules.linux_sysctl.**persist**(*name*, *value*, *config=None*)

Assign and persist a simple sysctl parameter for this minion. If `config` is not specified, a sensible default will be chosen using *sysctl.default_config*.

CLI Example:

```
salt '*' sysctl.persist net.ipv4.ip_forward 1
```

salt.modules.linux_sysctl.**show**(*config_file=False*)

Return a list of sysctl parameters for this minion

config: **Pull the data from the system configuration file** instead of the live data.

CLI Example:

```
salt '*' sysctl.show
```

19.9.188 salt.modules.localemod

Module for managing locales on POSIX-like systems.

salt.modules.localemod.**avail**(*locale*)

Check if a locale is available.

New in version 2014.7.0.

CLI Example:

```
salt '*' locale.avail 'en_US.UTF-8'
```

salt.modules.localemod.**gen_locale**(*locale*, ***kwargs*)

Generate a locale. Options:

New in version 2014.7.0.

Parameters **locale** -- Any locale listed in /usr/share/i18n/locales or /usr/share/i18n/SUPPORTED for Debian and Gentoo based distributions, which require the charmap to be specified as part of the locale when generating it.

verbose Show extra warnings about errors that are normally ignored.

CLI Example:

```
salt '*' locale.gen_locale en_US.UTF-8
salt '*' locale.gen_locale 'en_IE.UTF-8 UTF-8'    # Debian/Gentoo only
```

salt.modules.localemod.**get_locale**()
Get the current system locale

CLI Example:

```
salt '*' locale.get_locale
```

salt.modules.localemod.**list_avail**()
Lists available (compiled) locales

CLI Example:

```
salt '*' locale.list_avail
```

salt.modules.localemod.**set_locale**(*locale*)
Sets the current system locale

CLI Example:

```
salt '*' locale.set_locale 'en_US.UTF-8'
```

19.9.189 salt.modules.locate

Module for using the locate utilities

salt.modules.locate.**locate**(*pattern*, *database=''*, *limit=0*, ***kwargs*)
Performs a file lookup. Valid options (and their defaults) are:

```
basename=False
count=False
existing=False
follow=True
ignore=False
nofollow=False
wholename=True
regex=False
database=<locate's default database>
limit=<integer, not set by default>
```

See the manpage for `locate(1)` for further explanation of these options.

CLI Example:

```
salt '*' locate.locate
```

salt.modules.locate.**stats**()
Returns statistics about the locate database

CLI Example:

```
salt '*' locate.stats
```

salt.modules.locate.**updatedb**()
Updates the locate database

CLI Example:

```
salt '*' locate.updatedb
```

salt.modules.locate.**version**()
Returns the version of locate

CLI Example:

```
salt '*' locate.version
```

19.9.190 salt.modules.logadm

Module for managing Solaris logadm based log rotations.

salt.modules.logadm.**remove**(*name*, *conf_file='/etc/logadm.conf'*)
Remove log pattern from logadm

CLI Example:

```
salt '*' logadm.remove myapplog
```

salt.modules.logadm.**rotate**(*name*, *pattern=False*, *count=False*, *age=False*, *size=False*, *copy=True*, *conf_file='/etc/logadm.conf'*)
Set up pattern for logging.

CLI Example:

```
salt '*' logadm.rotate myapplog pattern='/var/log/myapp/*.log' count=7
```

salt.modules.logadm.**show_conf**(*conf_file='/etc/logadm.conf'*)
Show parsed configuration

CLI Example:

```
salt '*' logadm.show_conf
```

19.9.191 salt.modules.logmod module

On-demand logging

New in version 2017.7.0.

The sole purpose of this module is logging messages in the (proxy) minion. It comes very handy when debugging complex Jinja templates, for example:

```
{%- for var in range(10) %}
  {%- do salt.log.info(var) -%}
{%- endfor %}
```

CLI Example:

```
salt '*' log.error "Please don't do that, this module is not for CLI use!"
```

salt.modules.logmod.**critical**(*message*)
Log message at level CRITICAL.

salt.modules.logmod.**debug**(*message*)
Log message at level DEBUG.

salt.modules.logmod.**error**(*message*)
Log message at level ERROR.

salt.modules.logmod.**exception**(*message*)
Log message at level EXCEPTION.

salt.modules.logmod.**info**(*message*)
Log message at level INFO.

salt.modules.logmod.**warning**(*message*)
Log message at level WARNING.

19.9.192 salt.modules.logrotate

Module for managing logrotate.

salt.modules.logrotate.**get**(*key*, *value=None*, *conf_file='/etc/logrotate.conf'*)
Get the value for a specific configuration line.

Parameters

- **key** (*str*) -- The command or stanza block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **conf_file** (*str*) -- The logrotate configuration file.

Returns The value for a specific configuration line.

Return type bool|int|str

CLI Example:

```
salt '*' logrotate.get rotate

salt '*' logrotate.get /var/log/wtmp rotate /etc/logrotate.conf
```

salt.modules.logrotate.**set**(*key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*)
Set a new value for a specific configuration line.

Parameters

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf_file** (*str*) -- The logrotate configuration file.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' logrotate.set rotate 2
```

Can also be used to set a single value inside a multiline configuration block. For instance, to change rotate in the following block:

```
/var/log/wtmp {
    monthly
    create 0664 root root
    rotate 1
}
```

Use the following command:

```
salt '*' logrotate.set /var/log/wtmp rotate 2
```

This module also has the ability to scan files inside an include directory, and make changes in the appropriate file.

salt.modules.logrotate.**show_conf**(*conf_file='/etc/logrotate.conf'*)

Show parsed configuration

Parameters **conf_file** (*str*) -- The logrotate configuration file.

Returns The parsed configuration.

Return type dict

CLI Example:

```
salt '*' logrotate.show_conf
```

19.9.193 salt.modules.lvs

Support for LVS (Linux Virtual Server)

salt.modules.lvs.**add_server**(*protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method='dr'*, *weight=1*, ***kwargs*)

Add a real server to a virtual service.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The real server address.

packet_forward_method The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

weight The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.add_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.**add_service**(*protocol=None*, *service_address=None*, *scheduler='wlc'*)

Add a virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.add_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.**check_server**(*protocol=None*, *service_address=None*, *server_address=None*, ***kwargs*)

Check the real server exists in the specified service.

CLI Example:

```
salt '*' lvs.check_server tcp 1.1.1.1:80 192.168.0.11:8080
```

salt.modules.lvs.**check_service**(*protocol=None*, *service_address=None*, ***kwargs*)

Check the virtual service exists.

CLI Example:

```
salt '*' lvs.check_service tcp 1.1.1.1:80
```

salt.modules.lvs.**clear**()

Clear the virtual server table

CLI Example:

```
salt '*' lvs.clear
```

salt.modules.lvs.**delete_server**(*protocol=None*, *service_address=None*, *server_address=None*)

Delete the realserver from the virtual service.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The real server address.

CLI Example:

```
salt '*' lvs.delete_server tcp 1.1.1.1:80 192.168.0.11:8080
```

salt.modules.lvs.**delete_service**(*protocol=None*, *service_address=None*)

Delete the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

CLI Example:

```
salt '*' lvs.delete_service tcp 1.1.1.1:80
```

salt.modules.lvs.**edit_server**(*protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method=None*, *weight=None*, ***kwargs*)

Edit a real server to a virtual service.

protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).

service_address The LVS service address.

server_address The real server address.

packet_forward_method The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).

weight The capacity of a server relative to the others in the pool.

CLI Example:

```
salt '*' lvs.edit_server tcp 1.1.1.1:80 192.168.0.11:8080 nat 1
```

salt.modules.lvs.**edit_service**(*protocol=None*, *service_address=None*, *scheduler=None*)

Edit the virtual service.

protocol The service protocol(only support tcp, udp and fwmark service).

service_address The LVS service address.

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

CLI Example:

```
salt '*' lvs.edit_service tcp 1.1.1.1:80 rr
```

salt.modules.lvs.**get_rules**()

Get the virtual server rules

CLI Example:

```
salt '*' lvs.get_rules
```

salt.modules.lvs.**list**(*protocol=None*, *service_address=None*)
List the virtual server table if service_address is not specified. If a service_address is selected, list this service only.

CLI Example:

```
salt '*' lvs.list
```

salt.modules.lvs.**zero**(*protocol=None*, *service_address=None*)
Zero the packet, byte and rate counters in a service or all services.

CLI Example:

```
salt '*' lvs.zero
```

19.9.194 salt.modules.lxc

Control Linux Containers via Salt

depends lxc package for distribution

lxc >= 1.0 (even beta alpha) is required

salt.modules.lxc.**add_veth**(*name*, *interface_name*, *bridge=None*, *path=None*)
Add a veth to a container. Note : this function doesn't update the container config, just add the interface at runtime
name Name of the container
interface_name Name of the interface in the container
bridge Name of the bridge to attach the interface to (facultative)
CLI Examples:

```
salt '*' lxc.add_veth container_name eth1 br1
salt '*' lxc.add_veth container_name eth1
```

salt.modules.lxc.**apply_network_profile**(*name*, *network_profile*, *nic_opts=None*, *path=None*)
New in version 2015.5.0.

Apply a network profile to a container
network_profile profile name or default values (dict)
nic_opts values to override in defaults (dict) indexed by nic card names
path path to the container parent

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.apply_network_profile web1 centos
salt 'minion' lxc.apply_network_profile web1 centos \
        nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
salt 'minion' lxc.apply_network_profile web1 \
        "{'eth0': {'mac': 'xx:xx:xx:xx:xx:yy'}}"
        nic_opts="{'eth0': {'mac': 'xx:xx:xx:xx:xx:xx'}}"
```

The special case to disable use of ethernet nics:

```
salt 'minion' lxc.apply_network_profile web1 centos \
        "{eth0: {disable: true}}"
```

salt.modules.lxc.**attachable**(*name*, *path=None*)

Return True if the named container can be attached to via the lxc-attach command

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt 'minion' lxc.attachable ubuntu
```

salt.modules.lxc.**bootstrap**(*name*, *config=None*, *approve_key=True*, *install=True*, *pub_key=None*, *priv_key=None*, *bootstrap_url=None*, *force_install=False*, *unconditional_install=False*, *path=None*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*)

Install and configure salt in a container.

config Minion configuration options. By default, the `master` option is set to the target host's master.

approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: `True`

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

pub_key Explicit public key to pressed the minion with (optional). This can be either a filepath or a string representing the key

priv_key Explicit private key to pressed the minion with (optional). This can be either a filepath or a string representing the key

bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url url, content or filepath to the salt bootstrap script

bootstrap_args salt bootstrap script arguments

bootstrap_shell shell to execute the script into

install Whether to attempt a full installation of salt-minion if needed.

force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container

unconditional_install Run the script even if the container seems seeded

CLI Examples:

```
salt 'minion' lxc.bootstrap container_name [config=config_data] \
        [approve_key=(True|False)] [install=(True|False)]
```

salt.modules.lxc.**clone**(*name*, *orig*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container as a clone of another container

name Name of the container

orig Name of the original container to be cloned

profile Profile to use in container cloning (see *`lxc.get_container_profile`*). Values in a profile will be overridden by the **Container Cloning Arguments** listed below.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

Container Cloning Arguments

snapshot Use Copy On Write snapshots (LVM)

size [1G] Size of the volume to create. Only applicable if `backing=lvm`.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

network_profile Network profile to use for container

New in version 2015.8.0.

nic_opts give extra opts overriding network profile values

New in version 2015.8.0.

CLI Examples:

```
salt '*' lxc.clone myclone orig=orig_container
salt '*' lxc.clone myclone orig=orig_container snapshot=True
```

salt.modules.lxc.**cloud_init**(*name*, *vm_=None*, ***kwargs*)

Thin wrapper to lxc.init to be used from the saltcloud lxc driver

name Name of the container may be None and then guessed from saltcloud mapping

vm_ saltcloud mapping defaults for the vm

CLI Example:

```
salt '*' lxc.cloud_init foo
```

salt.modules.lxc.**cloud_init_interface**(*name*, *vm_=None*, ***kwargs*)

Interface between salt.cloud.lxc driver and lxc.init `vm_` is a mapping of vm opts in the salt.cloud format as documented for the lxc driver.

This can be used either:

- from the salt cloud driver
- because you find the argument to give easier here than using directly lxc.init

Warning: BE REALLY CAREFUL CHANGING DEFAULTS !!! IT'S A RETRO COMPATIBLE INTERFACE WITH THE SALT CLOUD DRIVER (ask kiorky).

name name of the lxc container to create

pub_key public key to preseed the minion with. Can be the keycontent or a filepath

priv_key private key to preseed the minion with. Can be the keycontent or a filepath

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

profile *profile* selection

network_profile *network profile* selection

nic_opts per interface settings compatibles with network profile (ipv4/ipv6/link/gateway/mac/netmask)

eg:

```
- {'eth0': {'mac': '00:16:3e:01:29:40',
            'gateway': None, (default)
            'link': 'br0', (default)
            'gateway': None, (default)
            'netmask': '', (default)
            'ip': '22.1.4.25'}}
```

unconditional_install given to lxc.bootstrap (see relative doc)

force_install given to lxc.bootstrap (see relative doc)

config any extra argument for the salt minion config

dnsservers list of DNS servers to set inside the container (Defaults to 8.8.8.8 and 4.4.4.4 until Oxygen release)

dns_via_dhcp do not set the dns servers, let them be set by the dhcp. (Defaults to False until Oxygen release)

autostart autostart the container at boot time

password administrative password for the container

bootstrap_delay delay before launching bootstrap script at Container init

Warning: Legacy but still supported options:

from_container which container we use as a template when running lxc.clone

image which template do we use when we are using lxc.create. This is the default mode unless you specify something in from_container

backing which backing store to use. Values can be: overlayfs, dir(default), lvm, zfs, brtfs

fstype When using a blockdevice level backing store, which filesystem to use on

size When using a blockdevice level backing store, which size for the filesystem to use on

snapshot Use snapshot when cloning the container source

vgname if using LVM: vgname

lvname if using LVM: lvname

thinpool: if using LVM: thinpool

ip ip for the primary nic

mac mac address for the primary nic

netmask netmask for the primary nic (24) = `vm_.get('netmask','24')`

bridge bridge for the primary nic (lxcbr0)

gateway network gateway for the container

additional_ips additional ips which will be wired on the main bridge (br0) which is connected to internet. Be aware that you may use manual virtual mac addresses providen by you provider (online, ovh, etc). This is a list of mappings {ip: `', mac: `', netmask:'`} Set gateway to None and an interface with a gateway to escape from another interface that eth0. eg:

```
- {'mac': '00:16:3e:01:29:40',
   'gateway': None, (default)
   'link': 'br0', (default)
   'netmask': '', (default)
   'ip': '22.1.4.25'}
```

users administrative users for the container default: [root] and [root, ubuntu] on ubuntu

default_nic name of the first interface, you should really not override this

CLI Example:

```
salt '*' lxc.cloud_init_interface foo
```

`salt.modules.lxc.`**`copy_to`**(*name*, *source*, *dest*, *overwrite=False*, *makedirs=False*, *path=None*)

Changed in version 2015.8.0: Function renamed from `lxc.cp` to `lxc.copy_to` for consistency with other container types. `lxc.cp` will continue to work, however. For versions 2015.2.x and earlier, use `lxc.cp`.

Copy a file or directory from the host into a container

name Container name

source File to be copied to the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

dest Destination on the container. Must be an absolute path.

Changed in version 2015.5.0: If the destination is a directory, the file will be copied into that directory.

overwrite [False] Unless this option is set to `True`, then if a file exists at the location specified by the `dest` argument, an error will be raised.

New in version 2015.8.0.

makedirs : False
Create the parent directory on the container if it does not already exist.

New in version 2015.5.0.

CLI Example:

```
salt 'minion' lxc.copy_to /tmp/foo /root/foo
salt 'minion' lxc.cp /tmp/foo /root/foo
```

`salt.modules.lxc.`**`create`**(*name*, *config=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, ***kwargs*)

Create a new container.

name Name of the container

config The config file to use for the container. Defaults to system-wide config (usually in /etc/lxc/lxc.conf).

profile Profile to use in container creation (see *`lxc.get_container_profile`*). Values in a profile will be overridden by the **Container Creation Arguments** listed below.

network_profile Network profile to use for container

New in version 2015.5.0.

Container Creation Arguments

template The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the *`lxc.templates`* function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the *`lxc.images`* function.

---

options Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
options='{"dist": "centos", "release": "6", "arch": "amd64"}'
```

For available template options, refer to the lxc template scripts which are ususally located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.

fstype Filesystem type to use on LVM logical volume

size [1G] Size of the volume to create. Only applicable if `backing=lvm`.

vgname [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing=lvm`.

lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing=lvm`.

thinpool Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing=lvm`.

nic_opts give extra opts overriding network profile values

path parent path for the container creation (default: /var/lib/lxc)

zfsroot Name of the ZFS root in which to create the volume for this container. Only applicable if `backing=zfs`. (default: tank/lxc)

New in version 2015.8.0.

salt.modules.lxc.**destroy**(*name*, *stop=False*, *path=None*)

Destroy the named container.

> **Warning:** Destroys all data associated with the container.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

stop [False] If `True`, the container will be destroyed even if it is running/frozen.

Changed in version 2015.5.0: Default value changed to `False`. This more closely matches the behavior of `lxc-destroy(1)`, and also makes it less likely that an accidental command will destroy a running container that was being used for important things.

CLI Examples:

```
salt '*' lxc.destroy foo
salt '*' lxc.destroy foo stop=True
```

salt.modules.lxc.**edit_conf**(*conf_file*, *out_format='simple'*, *read_only=False*, *lxc_config=None*, ***kwargs*)

Edit an LXC configuration file. If a setting is already present inside the file, its value will be replaced. If it does not exist, it will be appended to the end of the file. Comments and blank lines will be kept in-tact if they already exist in the file.

out_format: Set to simple if you need backward compatibility (multiple items for a simple key is not supported)

read_only: return only the edited configuration without applying it to the underlying lxc configuration file

lxc_config: List of dict containning lxc configuration items For network configuration, you also need to add the device it belongs to, otherwise it will default to eth0. Also, any change to a network parameter will result in the whole network reconfiguration to avoid mismatchs, be aware of that !

After the file is edited, its contents will be returned. By default, it will be returned in `simple` format, meaning an unordered dict (which may not represent the actual file order). Passing in an `out_format` of `commented` will return a data structure which accurately represents the order and content of the file.

CLI Example:

```
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
    out_format=commented lxc.network.type=veth
salt 'minion' lxc.edit_conf /etc/lxc/mycontainer.conf \
    out_format=commented \
    lxc_config="[{'lxc.network.name': 'eth0', \
                  'lxc.network.ipv4': '1.2.3.4'},
                 {'lxc.network.name': 'eth2', \
                  'lxc.network.ipv4': '1.2.3.5',\
                  'lxc.network.gateway': '1.2.3.1'}]"
```

salt.modules.lxc.**exists**(*name*, *path=None*)

Returns whether the named container exists.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.exists name
```

salt.modules.lxc.**freeze**(*name*, ***kwargs*)

Freeze the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

start [False] If `True` and the container is stopped, the container will be started before attempting to freeze.

New in version 2015.5.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.freeze name
```

salt.modules.lxc.**get_container_profile**(*name=None*, ***kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of container configuration parameters. If no arguments are passed, an empty profile is returned.

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using *config.get*. The key under which LXC profiles must be configured is `lxc.container_profile.profile_name`. An example container profile would be as follows:

```
lxc.container_profile:
  ubuntu:
    template: ubuntu
    backing: lvm
    vgname: lxc
    size: 1G
```

Parameters set in a profile can be overridden by passing additional container creation arguments (such as the ones passed to *lxc.create*) to this function.

A profile can be defined either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use LXC profiles.

CLI Example:

```
salt-call lxc.get_container_profile centos
salt-call lxc.get_container_profile ubuntu template=ubuntu backing=overlayfs
```

salt.modules.lxc.**get_network_profile**(*name=None*, ***kwargs*)

New in version 2015.5.0.

Gather a pre-configured set of network configuration parameters. If no arguments are passed, the following default profile is returned:

```
{'eth0': {'link': 'br0', 'type': 'veth', 'flags': 'up'}}
```

Profiles can be defined in the minion or master config files, or in pillar or grains, and are loaded using *config.get*. The key under which LXC profiles must be configured is `lxc.network_profile`. An example network profile would be as follows:

```
lxc.network_profile.centos:
  eth0:
    link: br0
    type: veth
    flags: up
```

To disable networking entirely:

```
lxc.network_profile.centos:
  eth0:
    disable: true
```

Parameters set in a profile can be overridden by passing additional arguments to this function.

A profile can be passed either as the name of the profile, or a dictionary of variable names and values. See the *LXC Tutorial* for more information on how to use network profiles.

Warning: The `ipv4`, `ipv6`, `gateway`, and `link` (bridge) settings in network profiles will only work if the container doesn't redefine the network configuration (for example in `/etc/sysconfig/network-scripts/ifcfg-<interface_name>` on RHEL/CentOS, or `/etc/network/interfaces` on Debian/Ubuntu/etc.)

CLI Example:

```
salt-call lxc.get_network_profile default
```

`salt.modules.lxc.`**`get_parameter`**(*name*, *parameter*, *path=None*)

Returns the value of a cgroup parameter for a container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_parameter container_name memory.limit_in_bytes
```

`salt.modules.lxc.`**`get_pid`**(*name*, *path=None*)

Returns a container pid. Throw an exception if the container isn't running.

CLI Example:

```
salt '*' lxc.get_pid name
```

`salt.modules.lxc.`**`get_root_path`**(*path*)

Get the configured lxc root for containers

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.get_root_path
```

`salt.modules.lxc.`**`images`**(*dist=None*)

New in version 2015.5.0.

List the available images for LXC's `download` template.

dist [None] Filter results to a single Linux distribution

CLI Examples:

```
salt myminion lxc.images
salt myminion lxc.images dist=centos
```

`salt.modules.lxc.`**`info`**(*name*, *path=None*)

Returns information about a container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.info name
```

salt.modules.lxc.**init**(*name*, *config=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *cpu=None*, *autostart=True*, *password=None*, *password_encrypted=None*, *users=None*, *dnsservers=None*, *searchdomains=None*, *bridge=None*, *gateway=None*, *pub_key=None*, *priv_key=None*, *force_install=False*, *unconditional_install=False*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*, *bootstrap_url=None*, ***kwargs*)

Initialize a new container.

This is a partial idempotent function as if it is already provisioned, we will reset a bit the lxc configuration file but much of the hard work will be escaped as markers will prevent re-execution of harmful tasks.

name Name of the container

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.

cpus Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset Explicitly define the cpus this container will be bound to

cpushare cgroups cpu shares

autostart autostart container on reboot

memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

gateway the ipv4 gateway to use the default does nothing more than lxcutils does

bridge the bridge to use the default does nothing more than lxcutils does

network_profile Network profile to use for the container

New in version 2015.5.0.

nic_opts Extra options for network interfaces, will override

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1","ipv6":
"2001:db8::ff00:42:8329"}}
```

or

```
{"eth0": {"hwaddr": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1/24","ipv6":
"2001:db8::ff00:42:8329"}}
```

users Users for which the password defined in the `password` param should be set. Can be passed as a comma separated list or a python list. Defaults to just the `root` user.

password Set the initial password for the users defined in the `users` parameter

password_encrypted [False] Set to `True` to denote a password hash instead of a plaintext password

New in version 2015.5.0.

profile A LXC profile (defined in config or pillar). This can be either a real profile mapping or a string to retrieve it in configuration

start Start the newly-created container

dnsservers list of dns servers to set in the container, default [] (no setting)

seed Seed the container with the minion config. Default: `True`

install If salt-minion is not already installed, install it. Default: `True`

config Optional config parameters. By default, the id is set to the name of the container.

master salt master (default to minion's master)

master_port salt master port (default to minion's master port)
pub_key Explicit public key to preseed the minion with (optional). This can be either a filepath or a string representing the key
priv_key Explicit private key to preseed the minion with (optional). This can be either a filepath or a string representing the key
approve_key If explicit preseeding is not used; Attempt to request key approval from the master. Default: `True`
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

clone_from Original from which to use a clone operation to create the container. Default: `None`
bootstrap_delay Delay in seconds between end of container creation and bootstrapping. Useful when waiting for container to obtain a DHCP lease.

New in version 2015.5.0.

bootstrap_url See lxc.bootstrap
bootstrap_shell See lxc.bootstrap
bootstrap_args See lxc.bootstrap
force_install Force installation even if salt-minion is detected, this is the way to run vendor bootstrap scripts even if a salt minion is already present in the container
unconditional_install Run the script even if the container seems seeded
CLI Example:

```
salt 'minion' lxc.init name [cpuset=cgroups_cpuset] \
        [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
        [nic=nic_profile] [profile=lxc_profile] \
        [nic_opts=nic_opts] [start=(True|False)] \
        [seed=(True|False)] [install=(True|False)] \
        [config=minion_config] [approve_key=(True|False) \
        [clone_from=original] [autostart=True] \
        [priv_key=/path_or_content] [pub_key=/path_or_content] \
        [bridge=lxcbr0] [gateway=10.0.3.1] \
        [dnsservers[dns1,dns2]] \
        [users=[foo]] [password='secret'] \
        [password_encrypted=(True|False)]
```

`salt.modules.lxc.`**`list`**(*extra=False*, *limit=None*, *path=None*)
List containers classified by state
extra Also get per-container specific info. This will change the return data. Instead of returning a list of containers, a dictionary of containers and each container's output from *`lxc.info`*.
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

limit Return output matching a specific state (**frozen**, **running**, or **stopped**).

New in version 2015.5.0.

CLI Examples:

```
salt '*' lxc.list
salt '*' lxc.list extra=True
salt '*' lxc.list limit=running
```

`salt.modules.lxc.`**`ls`**(*active=None*, *cache=True*, *path=None*)
Return a list of the containers available on the minion
path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

active If `True`, return only active (i.e. running) containers

New in version 2015.5.0.

CLI Example:

```
salt '*' lxc.ls
salt '*' lxc.ls active=True
```

salt.modules.lxc.**read_conf**(*conf_file*, *out_format='simple'*)

Read in an LXC configuration file. By default returns a simple, unsorted dict, but can also return a more detailed structure including blank lines and comments.

out_format: set to `simple' if you need the old and unsupported behavior. This won't support the multiple lxc values (eg: multiple network nics)

CLI Examples:

```
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf
salt 'minion' lxc.read_conf /etc/lxc/mycontainer.conf out_format=commented
```

salt.modules.lxc.**reboot**(*name*, *path=None*)

Reboot a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Examples:

```
salt 'minion' lxc.reboot myvm
```

salt.modules.lxc.**reconfigure**(*name*, *cpu=None*, *cpuset=None*, *cpushare=None*, *memory=None*, *profile=None*, *network_profile=None*, *nic_opts=None*, *bridge=None*, *gateway=None*, *autostart=None*, *utsname=None*, *rootfs=None*, *path=None*, ***kwargs*)

Reconfigure a container.

This only applies to a few property

name Name of the container.

utsname utsname of the container.

New in version 2016.3.0.

rootfs rootfs of the container.

New in version 2016.3.0.

cpu Select a random number of cpu cores and assign it to the cpuset, if the cpuset option is set then this option will be ignored

cpuset Explicitly define the cpus this container will be bound to

cpushare cgroups cpu shares.

autostart autostart container on reboot

memory cgroups memory limit, in MB. (0 for nolimit, None for old default 1024MB)

gateway the ipv4 gateway to use the default does nothing more than lxcutils does

bridge the bridge to use the default does nothing more than lxcutils does

nic Network interfaces profile (defined in config or pillar).

nic_opts Extra options for network interfaces, will override

```
{"eth0":   {"mac":   "aa:bb:cc:dd:ee:ff","ipv4":   "10.1.1.1","ipv6":
"2001:db8::ff00:42:8329"}}
```

or

```
{"eth0":  {"mac":  "aa:bb:cc:dd:ee:ff","ipv4":  "10.1.1.1/24","ipv6":
"2001:db8::ff00:42:8329"}}
```

path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt-call -lall mc_lxc_fork.reconfigure foobar nic_opts="{'eth1': {'mac': '00:16:
↪3e:dd:ee:44'}}" memory=4
```

salt.modules.lxc.**restart**(*name*, *path=None*, *lxc_config=None*, *force=False*)

New in version 2015.5.0.

Restart the named container. If the container was not running, the container will merely be started.

name The name of the container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

force [False] If `True`, the container will be force-stopped instead of gracefully shut down

CLI Example:

```
salt myminion lxc.restart name
```

salt.modules.lxc.**retcode**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy*, *https_proxy*, *no_proxy'*)

New in version 2015.5.0.

Run *cmd.retcode* within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If the retcode is nonzero and not what was expected, try using *lxc.run_stderr* or *lxc.run_all*.

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.

keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.retcode mycontainer 'ip addr show'
```

salt.modules.lxc.**run**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy, https_proxy, no_proxy'*)

New in version 2015.8.0.

Run *cmd.run* within a container

> **Warning:** Many shell builtins do not work, failing with stderr similar to the following:
>
> ```
> lxc_container: No such file or directory - failed to exec 'command'
> ```
>
> The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using *lxc.run_stderr* or *lxc.run_all*.

name Name of the container in which to run the command
cmd Command to run
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.
chroot_fallback if the container is not running, try to run the command using chroot default: false
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.

CLI Example:

```
salt myminion lxc.run mycontainer 'ifconfig -a'
```

salt.modules.lxc.**run_all**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy, https_proxy, no_proxy'*)

New in version 2015.5.0.

Run *cmd.run_all* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

> **Warning:** Many shell builtins do not work, failing with stderr similar to the following:
>
> ```
> lxc_container: No such file or directory - failed to exec 'command'
> ```
>
> The same error will be displayed in stderr if the command being run does not exist.

name Name of the container in which to run the command
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

cmd Command to run

no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.
chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_all mycontainer 'ip addr show'
```

salt.modules.lxc.**run_stderr**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy*, *https_proxy*, *no_proxy'*)

New in version 2015.5.0.

Run *cmd.run_stderr* within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed if the command being run does not exist.

name Name of the container in which to run the command
cmd Command to run
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.
chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stderr mycontainer 'ip addr show'
```

salt.modules.lxc.**run_stdout**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *path=None*, *ignore_retcode=False*, *chroot_fallback=False*, *keep_env='http_proxy*, *https_proxy*, *no_proxy'*)

New in version 2015.5.0.

Run *cmd.run_stdout* within a container

Warning: Many shell builtins do not work, failing with stderr similar to the following:

```
lxc_container: No such file or directory - failed to exec 'command'
```

The same error will be displayed in stderr if the command being run does not exist. If no output is returned using this function, try using *lxc.run_stderr* or *lxc.run_all*.

name Name of the container in which to run the command
cmd Command to run
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

no_start [False] If the container is not running, don't start it
preserve_state [True] After running the command, return the container to its previous state
stdin [None] Standard input to be used for the command
output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.
use_vt [False] Use SaltStack's utils.vt to stream output to console `output=all`.
keep_env [http_proxy,https_proxy,no_proxy] A list of env vars to preserve. May be passed as commma-delimited list.
chroot_fallback if the container is not running, try to run the command using chroot default: false

CLI Example:

```
salt myminion lxc.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.lxc.`**`running_systemd`**(*name*, *cache=True*, *path=None*)
Determine if systemD is running
path path to the container parent

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.running_systemd ubuntu
```

`salt.modules.lxc.`**`search_lxc_bridge`**()
Search the first bridge which is potentially available as LXC bridge

CLI Example:

```
salt '*' lxc.search_lxc_bridge
```

`salt.modules.lxc.`**`search_lxc_bridges`**()
Search which bridges are potentially available as LXC bridges

CLI Example:

```
salt '*' lxc.search_lxc_bridges
```

`salt.modules.lxc.`**`set_dns`**(*name*, *dnsservers=None*, *searchdomains=None*, *path=None*)
Changed in version 2015.5.0: The `dnsservers` and `searchdomains` parameters can now be passed as a comma-separated list.

Update /etc/resolv.confo

path
path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.set_dns ubuntu "['8.8.8.8', '4.4.4.4']"
```

salt.modules.lxc.**set_parameter**(*name*, *parameter*, *value*, *path=None*)

Set the value of a cgroup parameter for a container.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_parameter name parameter value
```

salt.modules.lxc.**set_password**(*name*, *users*, *password*, *encrypted=True*, *path=None*)

Changed in version 2015.5.0: Function renamed from `set_pass` to `set_password`. Additionally, this function now supports (and defaults to using) a password hash instead of a plaintext password.

Set the password of one or more system users inside containers

users Comma-separated list (or python list) of users to change password

password Password to set for the specified user(s)

encrypted [True] If true, `password` must be a password hash. Set to `False` to set a plaintext password (not recommended).

New in version 2015.5.0.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.set_pass container-name root '$6$uJ2uAyLU$KoI67t8As/
↪0fXtJOPcHKGXmUpcoYUcVR2K6x93walnShTCQvjRwq25yIkiCBOqgbfdKQSFnAo28/ek6716vEV1'
salt '*' lxc.set_pass container-name root foo encrypted=False
```

salt.modules.lxc.**start**(*name*, ***kwargs*)

Start the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

lxc_config path to a lxc config file config file will be guessed from container name otherwise

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.start name
```

salt.modules.lxc.**state**(*name*, *path=None*)

Returns the state of a container.

path path to the container parent directory (default: /var/lib/lxc)

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.state name
```

salt.modules.lxc.**stop**(*name*, *kill=False*, *path=None*, *use_vt=None*)

Stop the named container

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

kill: **False** Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

Changed in version 2015.5.0: Default value changed to `False`

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.stop name
```

salt.modules.lxc.**systemd_running_state**(*name*, *path=None*)

Get the operational state of a systemd based container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.systemd_running_state ubuntu
```

salt.modules.lxc.**templates**()

New in version 2015.5.0.

List the available LXC template scripts installed on the minion

CLI Examples:

```
salt myminion lxc.templates
```

salt.modules.lxc.**test_bare_started_state**(*name*, *path=None*)

Test if a non systemd container is fully started For now, it consists only to test if the container is attachable

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_bare_started_state ubuntu
```

salt.modules.lxc.**test_sd_started_state**(*name*, *path=None*)

Test if a systemd container is fully started

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.test_sd_started_state ubuntu
```

salt.modules.lxc.**unfreeze**(*name*, *path=None*, *use_vt=None*)

Unfreeze the named container.

path path to the container parent directory default: /var/lib/lxc (system)

New in version 2015.8.0.

use_vt run the command through VT

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.unfreeze name
```

salt.modules.lxc.**update_lxc_conf**(*name*, *lxc_conf*, *lxc_conf_unset*, *path=None*)

Edit LXC configuration options

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.update_lxc_conf ubuntu \
        lxc_conf="[{'network.ipv4.ip':'10.0.3.5'}]" \
        lxc_conf_unset="['lxc.utsname']"
```

salt.modules.lxc.**version**()

Return the actual lxc client version

New in version 2015.8.0.

CLI Example:

```
salt '*' lxc.version
```

salt.modules.lxc.**wait_started**(*name*, *path=None*, *timeout=300*)

Check that the system has fully inited

This is actually very important for systemD based containers

see https://github.com/saltstack/salt/issues/23847

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

CLI Example:

```
salt myminion lxc.wait_started ubuntu
```

salt.modules.lxc.**write_conf**(*conf_file*, *conf*)

Write out an LXC configuration file

This is normally only used internally. The format of the data structure must match that which is returned from `lxc.read_conf()`, with `out_format` set to `commented`.

An example might look like:

```
[
    {'lxc.utsname': '$CONTAINER_NAME'},
    '# This is a commented line\n',
    '\n',
    {'lxc.mount': '$CONTAINER_FSTAB'},
    {'lxc.rootfs': {'comment': 'This is another test',
                    'value': 'This is another test'}},
    '\n',
    {'lxc.network.type': 'veth'},
    {'lxc.network.flags': 'up'},
    {'lxc.network.link': 'br0'},
    {'lxc.network.mac': '$CONTAINER_MACADDR'},
    {'lxc.network.ipv4': '$CONTAINER_IPADDR'},
    {'lxc.network.name': '$CONTAINER_DEVICENAME'},
]
```

CLI Example:

```
salt 'minion' lxc.write_conf /etc/lxc/mycontainer.conf \
    out_format=commented
```

19.9.195 salt.modules.mac_assistive module

This module allows you to manage assistive access on macOS minions with 10.9+

New in version 2016.3.0.

```
salt '*' assistive.install /usr/bin/osascript
```

salt.modules.mac_assistive.**enable**(*app_id*, *enabled=True*)

Enable or disable an existing assistive access application.

app_id The bundle ID or command to set assistive access status.

enabled Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.enable /usr/bin/osascript
salt '*' assistive.enable com.smileonmymac.textexpander enabled=False
```

salt.modules.mac_assistive.**enabled**(*app_id*)

Check if a bundle ID or command is listed in assistive access and enabled.

app_id The bundle ID or command to retrieve assistive access status.

CLI Example:

```
salt '*' assistive.enabled /usr/bin/osascript
salt '*' assistive.enabled com.smileonmymac.textexpander
```

salt.modules.mac_assistive.**install**(*app_id*, *enable=True*)

Install a bundle ID or command as being allowed to use assistive access.

app_id The bundle ID or command to install for assistive access.

enabled Sets enabled or disabled status. Default is True.

CLI Example:

```
salt '*' assistive.install /usr/bin/osascript
salt '*' assistive.install com.smileonmymac.textexpander
```

salt.modules.mac_assistive.**installed**(*app_id*)

Check if a bundle ID or command is listed in assistive access. This will not check to see if it's enabled.

app_id The bundle ID or command to check installed status.

CLI Example:

```
salt '*' assistive.installed /usr/bin/osascript
salt '*' assistive.installed com.smileonmymac.textexpander
```

salt.modules.mac_assistive.**remove**(*app_id*)

Remove a bundle ID or command as being allowed to use assistive access.

app_id The bundle ID or command to remove from assistive access list.

CLI Example:

```
salt '*' assistive.remove /usr/bin/osascript
salt '*' assistive.remove com.smileonmymac.textexpander
```

19.9.196 salt.modules.mac_brew module

Homebrew for macOS

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

salt.modules.mac_brew.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_brew.**info_installed**(**names*)

Return the information of the named package(s) installed on the system.

New in version 2016.3.1.

names The names of the packages for which to return information.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

salt.modules.mac_brew.**install**(*name=None*, *pkgs=None*, *taps=None*, *options=None*, ***kwargs*)

Install the passed package(s) with `brew install`

name The name of the formula to be installed. Note that this parameter is ignored if ``pkgs" is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

taps Unofficial GitHub repos to use when updating and installing formulas.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install zlib taps='homebrew/dupes'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
```

options Options to pass to brew. Only applies to initial install. Due to how brew works, modifying chosen options requires a full uninstall followed by a fresh install. Note that if ``pkgs" is used, all options will be passed to all packages. Unrecognized options for a package will be silently ignored by brew.

CLI Example:

```
salt '*' pkg.install <package name> tap='<tap>'
salt '*' pkg.install php54 taps='["josegonzalez/php", "homebrew/dupes"]'
 ↪options='["--with-fpm"]'
```

Multiple Package Installation Options:

pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

salt.modules.mac_brew.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation

Currently chooses stable versions, falling back to devel if that does not exist.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_brew.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.mac_brew.**list_upgrades**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.mac_brew.**refresh_db**()

Update the homebrew package repository.

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.mac_brew.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Removes packages with `brew uninstall`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.mac_brew.**upgrade**(*refresh=True*)

Upgrade outdated, unpinned brews.

refresh Fetch the newest version of Homebrew and all formulae from GitHub before installing.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.mac_brew.**upgrade_available**(*pkg*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_brew.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

19.9.197 salt.modules.mac_defaults module

Set defaults on Mac OS

salt.modules.mac_defaults.**delete**(*domain*, *key*, *user=None*)

Delete a default from the system

CLI Example:

```
salt '*' macdefaults.delete com.apple.CrashReporter DialogType

salt '*' macdefaults.delete NSGlobalDomain ApplePersistence
```

domain The name of the domain to delete from

key The key of the given domain to delete

user The user to delete the defaults with

salt.modules.mac_defaults.**read**(*domain*, *key*, *user=None*)

Write a default to the system

CLI Example:

```
salt '*' macdefaults.read com.apple.CrashReporter DialogType

salt '*' macdefaults.read NSGlobalDomain ApplePersistence
```

domain The name of the domain to read from

key The key of the given domain to read from

user The user to write the defaults to

salt.modules.mac_defaults.**write**(*domain*, *key*, *value*, *type='string'*, *user=None*)
Write a default to the system

CLI Example:

```
salt '*' macdefaults.write com.apple.CrashReporter DialogType Server

salt '*' macdefaults.write NSGlobalDomain ApplePersistence True type=bool
```

domain The name of the domain to write to
key The key of the given domain to write to
value The value to write to the given key
type The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add
user The user to write the defaults to

19.9.198 salt.modules.mac_desktop module

macOS implementations of various commands in the ``desktop'' interface

salt.modules.mac_desktop.**get_output_volume**()
Get the output volume (range 0 to 100)

CLI Example:

```
salt '*' desktop.get_output_volume
```

salt.modules.mac_desktop.**lock**()
Lock the desktop session

CLI Example:

```
salt '*' desktop.lock
```

salt.modules.mac_desktop.**say**(**words*)
Say some words.
words The words to execute the say command with.
CLI Example:

```
salt '*' desktop.say <word0> <word1> ... <wordN>
```

salt.modules.mac_desktop.**screensaver**()
Launch the screensaver.

CLI Example:

```
salt '*' desktop.screensaver
```

salt.modules.mac_desktop.**set_output_volume**(*volume*)
Set the volume of sound.
volume The level of volume. Can range from 0 to 100.
CLI Example:

```
salt '*' desktop.set_output_volume <volume>
```

19.9.199 salt.modules.mac_group

Manage groups on Mac OS 10.7+

salt.modules.mac_group.**add**(*name*, *gid=None*, ***kwargs*)
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.mac_group.**adduser**(*group*, *name*)
Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar' as a member of an existing group `foo', if not then adds it.

salt.modules.mac_group.**chgid**(*name*, *gid*)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.mac_group.**delete**(*name*)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.mac_group.**deluser**(*group*, *name*)
Remove a user from the group

New in version 2016.3.0.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar' from a group `foo'. If group is not present then returns True.

salt.modules.mac_group.**getent**(*refresh=False*)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.mac_group.**info**(*name*)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.mac_group.**members**(*name*, *members_list*)
Replaces members of the group with a provided list.

New in version 2016.3.0.

CLI Example:

salt `*' group.members foo `user1,user2,user3,...'

Replaces a membership list for a local group `foo'.

19.9.200 salt.modules.mac_keychain module

Install certificates into the keychain on Mac OS

New in version 2016.3.0.

salt.modules.mac_keychain.**get_default_keychain**(*user=None*, *domain='user'*)

Get the default keychain

user The user to check the default keychain of

domain The domain to use valid values are user|system|common|dynamic, the default is user

CLI Example:

```
salt '*' keychain.get_default_keychain
```

salt.modules.mac_keychain.**get_friendly_name**(*cert*, *password*)

Get the friendly name of the given certificate

cert The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.get_friendly_name /tmp/test.p12 test123
```

salt.modules.mac_keychain.**get_hash**(*name*, *password=None*)

Returns the hash of a certificate in the keychain.

name The name of the certificate (which you can get from keychain.get_friendly_name) or the location of a p12 file.

password The password that is used in the certificate. Only required if your passing a p12 file. Note: This will be outputted to logs

CLI Example:

```
salt '*' keychain.get_hash /tmp/test.p12 test123
```

salt.modules.mac_keychain.**install**(*cert*, *password*, *keychain='/Library/Keychains/System.keychain'*, *allow_any=False*, *keychain_password=None*)

Install a certificate

cert The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section.

Note: The password given here will show up as plaintext in the job returned info.

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.**list_certs**(*keychain='/Library/Keychains/System.keychain'*)

List all of the installed certificates

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

CLI Example:

```
salt '*' keychain.list_certs
```

salt.modules.mac_keychain.**set_default_keychain**(*keychain*, *domain='user'*, *user=None*)

Set the default keychain

keychain The location of the keychain to set as default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to set the default keychain as

CLI Example:

```
salt '*' keychain.set_keychain /Users/fred/Library/Keychains/login.keychain
```

salt.modules.mac_keychain.**uninstall**(*cert_name*, *keychain='/Library/Keychains/System.keychain'*, *keychain_password=None*)

Uninstall a certificate from a keychain

cert_name The name of the certificate to remove

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.install test.p12 test123
```

salt.modules.mac_keychain.**unlock_keychain**(*keychain*, *password*)

Unlock the given keychain with the password

keychain The keychain to unlock

password The password to use to unlock the keychain.

Note: The password given here will show up as plaintext in the returned job info.

CLI Example:

```
salt '*' keychain.unlock_keychain /tmp/test.p12 test123
```

19.9.201 salt.modules.mac_package module

Install pkg, dmg and .app applications on macOS minions.

salt.modules.mac_package.**get_mpkg_ids**(*mpkg*)

Attempt to get the package IDs from a mounted .mpkg file

Parameters **mpkg** (*str*) -- The location of the mounted mpkg file

Returns List of package IDs

Return type *list*

CLI Example:

```
salt '*' macpackage.get_mpkg_ids /dev/disk2
```

salt.modules.mac_package.**get_pkg_id**(*pkg*)

Attempt to get the package ID from a .pkg file

Parameters **pkg** (*str*) -- The location of the pkg file

Returns List of all of the package IDs

Return type *list*

CLI Example:

```
salt '*' macpackage.get_pkg_id /tmp/test.pkg
```

salt.modules.mac_package.**install**(*pkg*, *target='LocalSystem'*, *store=False*, *allow_untrusted=False*)

Install a pkg file

Parameters

- **pkg** (*str*) -- The package to install
- **target** (*str*) -- The target in which to install the package to
- **store** (*bool*) -- Should the package be installed as if it was from the store?
- **allow_untrusted** (*bool*) -- Allow the installation of untrusted packages?

Returns A dictionary containing the results of the installation

Return type dict

CLI Example:

```
salt '*' macpackage.install test.pkg
```

salt.modules.mac_package.**install_app**(*app*, *target='/Applications/'*)

Install an app file by moving it into the specified Applications directory

Parameters

- **app** (*str*) -- The location of the .app file
- **target** (*str*) -- The target in which to install the package to Default is `'/Applications/'`

Returns The results of the rsync command

Return type str

CLI Example:

```
salt '*' macpackage.install_app /tmp/tmp.app /Applications/
```

salt.modules.mac_package.**installed_pkgs**()

Return the list of installed packages on the machine

Returns List of installed packages

Return type *list*

CLI Example:

```
salt '*' macpackage.installed_pkgs
```

salt.modules.mac_package.**mount**(*dmg*)

Attempt to mount a dmg file to a temporary location and return the location of the pkg file inside

Parameters **dmg** (*str*) -- The location of the dmg file to mount

Returns

Tuple containing the results of the command along with the mount point

Return type tuple

CLI Example:

```
salt '*' macpackage.mount /tmp/software.dmg
```

salt.modules.mac_package.**uninstall_app**(*app*)

Uninstall an app file by removing it from the Applications directory

Parameters **app** (*str*) -- The location of the .app file

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' macpackage.uninstall_app /Applications/app.app
```

salt.modules.mac_package.**unmount**(*mountpoint*)

Attempt to unmount a dmg file from a temporary location

Parameters **mountpoint** (*str*) -- The location of the mount point

Returns The results of the hdutil detach command

Return type str

CLI Example:

```
salt '*' macpackage.unmount /dev/disk2
```

19.9.202 salt.modules.mac_pkgutil module

Installer support for macOS.

Installer is the native .pkg/.mpkg package manager for macOS.

salt.modules.mac_pkgutil.**forget**(*package_id*)

New in version 2016.3.0.

Remove the receipt data about the specified package. Does not remove files.

> **Warning:** DO NOT use this command to fix broken package design

Parameters **package_id** (*str*) -- The name of the package to forget

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' pkgutil.forget com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.**install**(*source*, *package_id*)

Install a .pkg from an URI or an absolute path.

Parameters

- **source** (*str*) -- The path to a package.
- **package_id** (*str*) -- The package ID

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' pkgutil.install source=/vagrant/build_essentials.pkg package_id=com.
↪apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.**is_installed**(*package_id*)

Returns whether a given package id is installed.

Returns True if installed, otherwise False

Return type bool

CLI Example:

```
salt '*' pkgutil.is_installed com.apple.pkg.gcc4.2Leo
```

salt.modules.mac_pkgutil.**list**()

List the installed packages.

Returns A list of installed packages

Return type *list*

CLI Example:

```
salt '*' pkgutil.list
```

19.9.203 salt.modules.mac_ports module

Support for MacPorts under macOS.

This module has some caveats.

1. Updating the database of available ports is quite resource-intensive. However, *refresh=True* is the default for all operations that need an up-to-date copy of available ports. Consider *refresh=False* when you are sure no db update is needed.

2. In some cases MacPorts doesn't always realize when another copy of itself is running and will gleefully tromp all over the available ports database. This makes MacPorts behave in undefined ways until a fresh complete copy is retrieved.

Because of 1 and 2 it is possible to get the salt-minion into a state where *salt mac-machine pkg./something/* won't want to return. Use

salt-run jobs.active

on the master to check for potentially long-running calls to *port*.

Finally, ports database updates are always handled with *port selfupdate* as opposed to *port sync*. This makes sense in the MacPorts user commmunity but may confuse experienced Linux admins as Linux package managers don't upgrade the packaging software when doing a package database update. In other words *salt mac-machine pkg.refresh_db* is more like *apt-get update; apt-get upgrade dpkg apt-get* than simply *apt-get update*.

salt.modules.mac_ports.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation

Options:

refresh Update ports with `port selfupdate`

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

salt.modules.mac_ports.**install**(*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*)

Install the passed package(s) with `port install`

name The name of the formula to be installed. Note that this parameter is ignored if ``pkgs'' is passed.

CLI Example:

```
salt '*' pkg.install <package name>
```

version Specify a version to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5'
```

variant Specify a variant to pkg to install. Ignored if pkgs is specified.

CLI Example:

```
salt '*' pkg.install <package name>
salt '*' pkg.install git-core version='1.8.5.5' variant='+credential_
 ↪osxkeychain+doc+pcre'
```

Multiple Package Installation Options:
pkgs A list of formulas to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
salt '*' pkg.install pkgs='["foo@1.2","bar"]'
salt '*' pkg.install pkgs='["foo@1.2+ssl","bar@2.3"]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install 'package package package'
```

`salt.modules.mac_ports.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation

Options:
refresh Update ports with `port selfupdate`
CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3>
```

`salt.modules.mac_ports.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.mac_ports.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

Options:
refresh Update ports with `port selfupdate`
CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.mac_ports.**refresh_db**()
Update ports with `port selfupdate`

CLI Example:

```
salt mac pkg.refresh_db
```

salt.modules.mac_ports.**remove**(*name=None*, *pkgs=None*, ***kwargs*)
Removes packages with `port uninstall`.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.mac_ports.**upgrade**(*refresh=True*)
Run a full upgrade using MacPorts `port upgrade outdated'

Options:
refresh Update ports with `port selfupdate`
Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.mac_ports.**upgrade_available**(*pkg*, *refresh=True*)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.mac_ports.**version**(**names*, ***kwargs*)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3>
```

19.9.204 salt.modules.mac_power module

Module for editing power settings on macOS

New in version 2016.3.0.

salt.modules.mac_power.**get_computer_sleep**()

Display the amount of idle time until the computer sleeps.

Returns A string representing the sleep settings for the computer

Return type str

CLI Example:

..code-block:: bash

salt `*' power.get_computer_sleep

salt.modules.mac_power.**get_display_sleep**()

Display the amount of idle time until the display sleeps.

Returns A string representing the sleep settings for the displey

Return type str

CLI Example:

..code-block:: bash

salt `*' power.get_display_sleep

salt.modules.mac_power.**get_harddisk_sleep**()

Display the amount of idle time until the hard disk sleeps.

Returns A string representing the sleep settings for the hard disk

Return type str

CLI Example:

..code-block:: bash

salt `*' power.get_harddisk_sleep

salt.modules.mac_power.**get_restart_freeze**()

Displays whether `restart on freeze' is on or off if supported

Returns A string value representing the ``restart on freeze'' settings

Return type *string*

CLI Example:

```
salt '*' power.get_restart_freeze
```

salt.modules.mac_power.**get_restart_power_failure**()

Displays whether `restart on power failure' is on or off if supported

Returns A string value representing the ``restart on power failure'' settings

Return type *string*

CLI Example:

```
salt '*' power.get_restart_power_failure
```

salt.modules.mac_power.**get_sleep**()

Displays the amount of idle time until the machine sleeps. Settings for Computer, Display, and Hard Disk are displayed.

Returns A dictionary containing the sleep status for Computer, Display, and Hard Disk

Return type dict

CLI Example:

```
salt '*' power.get_sleep
```

salt.modules.mac_power.**get_sleep_on_power_button**()

Displays whether `allow power button to sleep computer' is on or off if supported

Returns A string value representing the ``allow power button to sleep computer'' settings

Return type *string*

CLI Example:

```
salt '*' power.get_sleep_on_power_button
```

salt.modules.mac_power.**get_wake_on_modem**()

Displays whether `wake on modem' is on or off if supported

Returns A string value representing the ``wake on modem'' settings

Return type str

CLI Example:

```
salt '*' power.get_wake_on_modem
```

salt.modules.mac_power.**get_wake_on_network**()

Displays whether `wake on network' is on or off if supported

Returns A string value representing the ``wake on network'' settings

Return type *string*

CLI Example:

```
salt '*' power.get_wake_on_network
```

salt.modules.mac_power.**set_computer_sleep**(*minutes*)

Set the amount of idle time until the computer sleeps. Pass ``Never'' of ``Off'' to never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or ``Never'' or ``Off''

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_computer_sleep 120
salt '*' power.set_computer_sleep off
```

salt.modules.mac_power.**set_display_sleep**(*minutes*)

Set the amount of idle time until the display sleeps. Pass ``Never'' of ``Off'' to never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or ``Never'' or ``Off''

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_display_sleep 120
salt '*' power.set_display_sleep off
```

salt.modules.mac_power.**set_harddisk_sleep**(*minutes*)

Set the amount of idle time until the harddisk sleeps. Pass ``Never'' of ``Off'' to never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or ``Never'' or ``Off''

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_harddisk_sleep 120
salt '*' power.set_harddisk_sleep off
```

salt.modules.mac_power.**set_restart_freeze**(*enabled*)

Specifies whether the server restarts automatically after a system freeze. This setting doesn't seem to be

editable. The command completes successfully but the setting isn't actually updated. This is probably a macOS. The functions remains in case they ever fix the bug.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_restart_freeze True
```

salt.modules.mac_power.**set_restart_power_failure**(*enabled*)

Set whether or not the computer will automatically restart after a power failure.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_restart_power_failure True
```

salt.modules.mac_power.**set_sleep**(*minutes*)

Sets the amount of idle time until the machine sleeps. Sets the same value for Computer, Display, and Hard Disk. Pass ``Never'' or ``Off'' for computers that should never sleep.

Parameters **minutes** -- Can be an integer between 1 and 180 or ``Never'' or ``Off''

Ptype int, str

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_sleep 120
salt '*' power.set_sleep never
```

salt.modules.mac_power.**set_sleep_on_power_button**(*enabled*)

Set whether or not the power button can sleep the computer.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_sleep_on_power_button True
```

salt.modules.mac_power.**set_wake_on_modem**(*enabled*)

Set whether or not the computer will wake from sleep when modem activity is detected.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' power.set_wake_on_modem True
```

salt.modules.mac_power.**set_wake_on_network**(*enabled*)

Set whether or not the computer will wake from sleep when network activity is detected.

Parameters **enabled** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not
Return type bool

CLI Example:

```
salt '*' power.set_wake_on_network True
```

19.9.205 salt.modules.mac_service module

The service module for macOS .. versionadded:: 2016.3.0

salt.modules.mac_service.**available**(*name*)

Check that the given service is available.

Parameters **name** (*str*) -- The name of the service
Returns True if the service is available, otherwise False
Return type bool

CLI Example:

```
salt '*' service.available com.openssh.sshd
```

salt.modules.mac_service.**disable**(*name*, *runas=None*)

Disable a launchd service. Raises an error if the service fails to be disabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns `True` if successful or if the service is already disabled
Return type bool

CLI Example:

```
salt '*' service.disable org.cups.cupsd
```

salt.modules.mac_service.**disabled**(*name*, *runas=None*, *domain='system'*)

Check if the specified service is not enabled. This is the opposite of `service.enabled`

Parameters

- **name** (*str*) -- The name to look up
- **runas** (*str*) -- User to run launchctl commands
- **domain** (*str*) -- domain to check for disabled services. Default is system.

Returns True if the specified service is NOT enabled, otherwise False
Return type bool

CLI Example:

```
salt '*' service.disabled org.cups.cupsd
```

salt.modules.mac_service.**enable**(*name*, *runas=None*)

Enable a launchd service. Raises an error if the service fails to be enabled

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns `True` if successful or if the service is already enabled
Return type bool

CLI Example:

```
salt '*' service.enable org.cups.cupsd
```

salt.modules.mac_service.**enabled**(*name*, *runas=None*)

Check if the specified service is enabled

Parameters

- **name** (*str*) -- The name of the service to look up
- **runas** (*str*) -- User to run launchctl commands

Returns True if the specified service enabled, otherwise False

Return type bool

CLI Example:

```
salt '*' service.enabled org.cups.cupsd
```

salt.modules.mac_service.**get_all**(*runas=None*)

Return a list of services that are enabled or available. Can be used to find the name of a service.

Parameters **runas** (*str*) -- User to run launchctl commands

Returns A list of all the services available or enabled

Return type *list*

CLI Example:

```
salt '*' service.get_all
```

salt.modules.mac_service.**get_enabled**(*runas=None*)

Return a list of all services that are enabled. Can be used to find the name of a service.

Parameters **runas** (*str*) -- User to run launchctl commands

Returns A list of all the services enabled on the system

Return type *list*

CLI Example:

```
salt '*' service.get_enabled
salt '*' service.get_enabled running=True
```

salt.modules.mac_service.**launchctl**(*sub_cmd*, **args*, ***kwargs*)

Run a launchctl command and raise an error if it fails

Parameters

- **sub_cmd** (*str*) -- Sub command supplied to launchctl
- **args** (*tuple*) -- Tuple containing additional arguments to pass to launchctl
- **kwargs** (*dict*) -- Dictionary containing arguments to pass to `cmd.run_all`
- **return_stdout** (*bool*) -- A keyword argument. If true return the stdout of the launchctl command

Returns `True` if successful, raise `CommandExecutionError` if not, or the stdout of the launchctl command if requested

Return type bool, str

CLI Example:

```
salt '*' service.launchctl debug org.cups.cupsd
```

salt.modules.mac_service.**list**(*name=None*, *runas=None*)

Run launchctl list and return the output

Parameters

- **name** (*str*) -- The name of the service to list

- **runas** (*str*) -- User to run launchctl commands

Returns If a name is passed returns information about the named service, otherwise returns a list of all services and pids

Return type str

CLI Example:

```
salt '*' service.list
salt '*' service.list org.cups.cupsd
```

salt.modules.mac_service.**missing**(*name*)

The inverse of service.available Check that the given service is not available.

Parameters **name** (*str*) -- The name of the service

Returns True if the service is not available, otherwise False

Return type bool

CLI Example:

```
salt '*' service.missing com.openssh.sshd
```

salt.modules.mac_service.**restart**(*name*, *runas=None*)

Unloads and reloads a launchd service. Raises an error if the service fails to reload

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns `True` if successful

Return type bool

CLI Example:

```
salt '*' service.restart org.cups.cupsd
```

salt.modules.mac_service.**show**(*name*)

Show properties of a launchctl service

Parameters **name** (*str*) -- Service label, file name, or full path

Returns The service information if the service is found

Return type dict

CLI Example:

```
salt '*' service.show org.cups.cupsd  # service label
salt '*' service.show org.cups.cupsd.plist  # file name
salt '*' service.show /System/Library/LaunchDaemons/org.cups.cupsd.plist  # full
↪path
```

salt.modules.mac_service.**start**(*name*, *runas=None*)

Start a launchd service. Raises an error if the service fails to start

---

Note: To start a service in macOS the service must be enabled first. Use `service.enable` to enable the service.

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns `True` if successful or if the service is already running

Return type bool

CLI Example:

```
salt '*' service.start org.cups.cupsd
```

salt.modules.mac_service.**status**(*name*, *sig=None*, *runas=None*)

Return the status for a service.

Parameters

- **name** (*str*) -- Used to find the service from launchctl. Can be any part of the service name or a regex expression.
- **sig** (*str*) -- Find the service with status.pid instead. Note that `name` must still be provided.
- **runas** (*str*) -- User to run launchctl commands

Returns The PID for the service if it is running, otherwise an empty string

Return type str

CLI Example:

```
salt '*' service.status cups
```

salt.modules.mac_service.**stop**(*name*, *runas=None*)

Stop a launchd service. Raises an error if the service fails to stop

---

Note: Though `service.stop` will unload a service in macOS, the service will start on next boot unless it is disabled. Use `service.disable` to disable the service

---

Parameters

- **name** (*str*) -- Service label, file name, or full path
- **runas** (*str*) -- User to run launchctl commands

Returns `True` if successful or if the service is already stopped

Return type bool

CLI Example:

```
salt '*' service.stop org.cups.cupsd
```

19.9.206 salt.modules.mac_shadow module

New in version 2016.3.0.

Manage macOS local directory passwords and policies.

Note that it is usually better to apply password policies through the creation of a configuration profile.

salt.modules.mac_shadow.**del_password**(*name*)

Deletes the account password

Parameters **name** (*str*) -- The user name of the account

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.mac_shadow.**get_account_created**(*name*)

Get the date/time the account was created

Parameters **name** (*str*) -- The username of the account

Returns The date/time the account was created (yyyy-mm-dd hh:mm:ss)

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_account_created admin
```

salt.modules.mac_shadow.**get_change**(*name*)

Gets the date on which the password expires

Parameters **name** (*str*) -- The name of the user account

Returns The date the password will expire

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_change username
```

salt.modules.mac_shadow.**get_expire**(*name*)

Gets the date on which the account expires

Parameters **name** (*str*) -- The name of the user account

Returns The date the account expires

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_expire username
```

salt.modules.mac_shadow.**get_last_change**(*name*)

Get the date/time the account was changed

Parameters **name** (*str*) -- The username of the account

Returns The date/time the account was modified (yyyy-mm-dd hh:mm:ss)

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_last_change admin
```

salt.modules.mac_shadow.**get_login_failed_count**(*name*)

Get the the number of failed login attempts

Parameters **name** (*str*) -- The username of the account

Returns The number of failed login attempts

Return type int

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_count admin
```

salt.modules.mac_shadow.**get_login_failed_last**(*name*)

Get the date/time of the last failed login attempt

Parameters **name** (*str*) -- The username of the account

Returns The date/time of the last failed login attempt on this account (yyyy-mm-dd hh:mm:ss)

Return type str

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_login_failed_last admin
```

salt.modules.mac_shadow.**get_maxdays**(*name*)

Get the maximum age of the password

Parameters **name** (*str*) -- The username of the account

Returns The maximum age of the password in days

Return type int

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.get_maxdays admin 90
```

salt.modules.mac_shadow.**info**(*name*)

Return information for the specified user

Parameters **name** (*str*) -- The username

Returns A dictionary containing the user's shadow information

Return type dict

CLI Example:

```
salt '*' shadow.info admin
```

salt.modules.mac_shadow.**set_change**(*name*, *date*)

Sets the date on which the password expires. The user will be required to change their password. Format is mm/dd/yyyy

Parameters

- **name** (*str*) -- The name of the user account
- **date** (*date*) -- The date the password will expire. Must be in mm/dd/yyyy format.

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_change username 09/21/2016
```

salt.modules.mac_shadow.**set_expire**(*name*, *date*)

Sets the date on which the account expires. The user will not be able to login after this date. Date format is mm/dd/yyyy

Parameters

- **name** (*str*) -- The name of the user account
- **date** (*datetime*) -- The date the account will expire. Format must be mm/dd/yyyy.

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_expire username 07/23/2015
```

salt.modules.mac_shadow.**set_inactdays**(*name*, *days*)

Set the number if inactive days before the account is locked. Not available in macOS

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:

```
salt '*' shadow.set_inactdays admin 90
```

salt.modules.mac_shadow.**set_maxdays**(*name*, *days*)

Set the maximum age of the password in days

Parameters

- **name** (*str*) -- The username of the account
- **days** (*int*) -- The maximum age of the account in days

Returns True if successful, False if not

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' shadow.set_maxdays admin 90
```

salt.modules.mac_shadow.**set_mindays**(*name*, *days*)

Set the minimum password age in days. Not available in macOS.

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns Will always return False until macOS supports this feature.

Return type bool

CLI Example:

```
salt '*' shadow.set_mindays admin 90
```

salt.modules.mac_shadow.**set_password**(*name*, *password*)

Set the password for a named user (insecure, the password will be in the process list while the command is running)

Parameters

- **name** (*str*) -- The name of the local user, which is assumed to be in the local directory service
- **password** (*str*) -- The plaintext password to set

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on user not found or any other unknown error

CLI Example:

```
salt '*' mac_shadow.set_password macuser macpassword
```

salt.modules.mac_shadow.**set_warndays**(*name*, *days*)

Set the number of days before the password expires that the user will start to see a warning. Not available in macOS

Parameters

- **name** (*str*) -- The user name
- **days** (*int*) -- The number of days

Returns Will always return False until macOS supports this feature.
Return type bool

CLI Example:

```
salt '*' shadow.set_warndays admin 90
```

19.9.207 salt.modules.mac_softwareupdate module

Support for the softwareupdate command on MacOS.

salt.modules.mac_softwareupdate.**download**(*name*)

Download a named update so that it can be installed later with the update or update_all functions

Parameters **name** (*str*) -- The update to download.
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' softwareupdate.download <update name>
```

salt.modules.mac_softwareupdate.**download_all**(*recommended=False*, *restart=True*)

Download all available updates so that they can be installed later with the update or update_all functions. It returns a list of updates that are now downloaded.

Parameters

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A list containing all downloaded updates on the system.
Return type *list*

CLI Example:

```
salt '*' softwareupdate.download_all
```

salt.modules.mac_softwareupdate.**get_catalog**()

New in version 2016.3.0.

Get the current catalog being used for update lookups. Will return a url if a custom catalog has been specified. Otherwise the word `Default' will be returned

Returns The catalog being used for update lookups
Return type str

CLI Example:

```
salt '*' softwareupdates.get_catalog
```

salt.modules.mac_softwareupdate.**ignore**(*name*)

Ignore a specific program update. When an update is ignored the `-` and version number at the end will be omitted, so ``SecUpd2014-001-1.0'' becomes ``SecUpd2014-001''. It will be removed automatically if present. An update is successfully ignored when it no longer shows up after list_updates.

Parameters **name** -- The name of the update to add to the ignore list.
Ptype str
Returns True if successful, False if not
Return type bool

CLI Example:

```
salt '*' softwareupdate.ignore <update-name>
```

salt.modules.mac_softwareupdate.**list_available**(*recommended=False*, *restart=False*)

List all available updates.

Parameters

- **recommended** (*bool*) -- Show only recommended updates.
- **restart** (*bool*) -- Show only updates that require a restart.

Returns Returns a dictionary containing the updates

Return type dict

CLI Example:

```
salt '*' softwareupdate.list_available
```

salt.modules.mac_softwareupdate.**list_downloads**()

Return a list of all updates that have been downloaded locally.

Returns A list of updates that have been downloaded

Return type *list*

CLI Example:

```
salt '*' softwareupdate.list_downloads
```

salt.modules.mac_softwareupdate.**list_ignored**()

List all updates that have been ignored. Ignored updates are shown without the `-` and version number at the end, this is how the softwareupdate command works.

Returns The list of ignored updates

Return type *list*

CLI Example:

```
salt '*' softwareupdate.list_ignored
```

salt.modules.mac_softwareupdate.**reset_catalog**()

New in version 2016.3.0.

Reset the Software Update Catalog to the default.

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' softwareupdates.reset_catalog
```

salt.modules.mac_softwareupdate.**reset_ignored**()

Make sure the ignored updates are not ignored anymore, returns a list of the updates that are no longer ignored.

Returns True if the list was reset, Otherwise False

Return type bool

CLI Example:

```
salt '*' softwareupdate.reset_ignored
```

salt.modules.mac_softwareupdate.**schedule_enable**(*enable*)

Enable/disable automatic update scheduling.

Parameters **enable** -- True/On/Yes/1 to turn on automatic updates. False/No/Off/0 to turn off automatic updates. If this value is empty, the current status will be returned.

Type bool str

Returns True if scheduling is enabled, False if disabled
Return type bool

CLI Example:

```
salt '*' softwareupdate.schedule_enable on|off
```

salt.modules.mac_softwareupdate.**schedule_enabled**()

Check the status of automatic update scheduling.

Returns True if scheduling is enabled, False if disabled
Return type bool

CLI Example:

```
salt '*' softwareupdate.schedule_enabled
```

salt.modules.mac_softwareupdate.**set_catalog**(*url*)

New in version 2016.3.0.

Set the Software Update Catalog to the URL specified

Parameters **url** (*str*) -- The url to the update catalog
Returns True if successful, False if not
Return type bool

CLI Example:

```
salt '*' softwareupdates.set_catalog http://swupd.local:8888/index.sucatalog
```

salt.modules.mac_softwareupdate.**update**(*name*)

Install a named update.

Parameters **name** (*str*) -- The name of the of the update to install.
Returns True if successfully updated, otherwise False
Return type bool

CLI Example:

```
salt '*' softwareupdate.update <update-name>
```

salt.modules.mac_softwareupdate.**update_all**(*recommended=False*, *restart=True*)

Install all available updates. Returns a dictionary containing the name of the update and the status of its installation.

Parameters

- **recommended** (*bool*) -- If set to True, only install the recommended updates. If set to False (default) all updates are installed.
- **restart** (*bool*) -- Set this to False if you do not want to install updates that require a restart. Default is True

Returns A dictionary containing the updates that were installed and the status of its installation. If no updates were installed an empty dictionary is returned.
Return type dict

CLI Example:

```
salt '*' softwareupdate.update_all
```

salt.modules.mac_softwareupdate.**update_available**(*name*)

Check whether or not an update is available with a given name.

Parameters **name** (*str*) -- The name of the update to look for
Returns True if available, False if not
Return type bool

CLI Example:

```
salt '*' softwareupdate.update_available <update-name>
salt '*' softwareupdate.update_available "<update with whitespace>"
```

19.9.208 salt.modules.mac_sysctl module

Module for viewing and modifying sysctl parameters

salt.modules.mac_sysctl.**assign**(*name*, *value*)

Assign a single sysctl parameter for this minion

name The name of the sysctl value to edit.

value The sysctl value to apply.

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

salt.modules.mac_sysctl.**get**(*name*)

Return a single sysctl parameter for this minion

name The name of the sysctl value to display.

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.mac_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*, *apply_change=False*)

Assign and persist a simple sysctl parameter for this minion

name The name of the sysctl value to edit.

value The sysctl value to apply.

config The location of the sysctl configuration file.

apply_change Default is False; Default behavior only creates or edits the sysctl.conf file. If apply is set to True, the changes are applied to the system.

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
salt '*' sysctl.persist coretemp_load NO config=/etc/sysctl.conf
```

salt.modules.mac_sysctl.**show**(*config_file=False*)

Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

19.9.209 salt.modules.mac_system module

New in version 2016.3.0.

System module for sleeping, restarting, and shutting down the system on Mac OS X.

Warning: Using this module will enable `atrun` on the system if it is disabled.

salt.modules.mac_system.**get_boot_arch**()

Get the kernel architecture setting from `com.apple.Boot.plist`

Returns A string value representing the boot architecture setting

Return type str

CLI Example:

```
salt '*' system.get_boot_arch
```

salt.modules.mac_system.**get_computer_name**()

Gets the computer name

Returns The computer name

Return type str

CLI Example:

```
salt '*' system.get_computer_name
```

salt.modules.mac_system.**get_disable_keyboard_on_lock**()

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Returns True if disable keyboard on lock is on, False if off

Return type bool

CLI Example:

..code-block:: bash

salt `*' system.get_disable_keyboard_on_lock

salt.modules.mac_system.**get_remote_events**()

Displays whether remote apple events are on or off.

Returns True if remote apple events are on, False if off

Return type bool

CLI Example:

```
salt '*' system.get_remote_events
```

salt.modules.mac_system.**get_remote_login**()

Displays whether remote login (SSH) is on or off.

Returns True if remote login is on, False if off

Return type bool

CLI Example:

```
salt '*' system.get_remote_login
```

salt.modules.mac_system.**get_restart_delay**()

Get the number of seconds after which the computer will start up after a power failure.

Returns A string value representing the number of seconds the system will delay restart after power loss

Return type str

CLI Example:

```
salt '*' system.get_restart_delay
```

salt.modules.mac_system.**get_startup_disk**()

Displays the current startup disk

Returns The current startup disk

Return type str

CLI Example:

```
salt '*' system.get_startup_disk
```

salt.modules.mac_system.**get_subnet_name**()

Gets the local subnet name

Returns The local subnet name
Return type str

CLI Example:

```
salt '*' system.get_subnet_name
```

salt.modules.mac_system.**halt**(*at_time=None*)

Halt a running system

Parameters **at_time** (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no `AM/PM' designation, you have to double quote the parameter on the command line. For example: ```14:00'"

CLI Example:

```
salt '*' system.halt
salt '*' system.halt 'now + 10 minutes'
```

salt.modules.mac_system.**list_startup_disks**()

List all valid startup disks on the system.

Returns A list of valid startup disks
Return type *list*

CLI Example:

```
salt '*' system.list_startup_disks
```

salt.modules.mac_system.**restart**(*at_time=None*)

Restart the system

Parameters **at_time** (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no `AM/PM' designation, you have to double quote the parameter on the command line. For example: ```14:00'"

CLI Example:

```
salt '*' system.restart
salt '*' system.restart '12:00 PM fri'
```

salt.modules.mac_system.**set_boot_arch**(*arch='default'*)

Set the kernel to boot in 32 or 64 bit mode on next boot.

Note: When this function fails with the error `changes to kernel architecture failed to save!`, then the boot arch is not updated. This is either an Apple bug, not available on the test system, or a result of system files being locked down in macOS (SIP Protection).

Parameters **arch** (*str*) -- A string representing the desired architecture. If no value is passed, default is assumed. Valid values include:

- i386
- x86_64
- default

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_boot_arch i386
```

salt.modules.mac_system.**set_computer_name**(*name*)

Set the computer name

Parameters **name** (*str*) -- The new computer name

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_computer_name "Mike's Mac"
```

salt.modules.mac_system.**set_disable_keyboard_on_lock**(*enable*)

Get whether or not the keyboard should be disabled when the X Serve enclosure lock is engaged.

Parameters **enable** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_disable_keyboard_on_lock False
```

salt.modules.mac_system.**set_remote_events**(*enable*)

Set whether the server responds to events sent by other computers (such as AppleScripts)

Parameters **enable** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_remote_events On
```

salt.modules.mac_system.**set_remote_login**(*enable*)

Set the remote login (SSH) to either on or off.

Parameters **enable** (*bool*) -- True to enable, False to disable. ``On'' and ``Off'' are also acceptable values. Additionally you can pass 1 and 0 to represent True and False respectively

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_remote_login True
```

salt.modules.mac_system.**set_restart_delay**(*seconds*)

Set the number of seconds after which the computer will start up after a power failure.

> **Warning:** This command fails with the following error:
>
> `Error,IOServiceOpen returned 0x10000003`
>
> The setting is not updated. This is an apple bug. It seems like it may only work on certain versions of Mac Server X. This article explains the issue in more detail, though it is quite old.
>
> http://lists.apple.com/archives/macos-x-server/2006/Jul/msg00967.html

Parameters **seconds** (*int*) -- The number of seconds. Must be a multiple of 30

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_restart_delay 180
```

salt.modules.mac_system.**set_startup_disk**(*path*)

Set the current startup disk to the indicated path. Use `system.list_startup_disks` to find valid startup disks on the system.

Parameters **path** (*str*) -- The valid startup disk path

Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' system.set_startup_disk /System/Library/CoreServices
```

salt.modules.mac_system.**set_subnet_name**(*name*)

Set the local subnet name

Parameters **name** (*str*) -- The new local subnet name

> **Note:** Spaces are changed to dashes. Other special characters are removed.

Returns True if successful, False if not

Return type bool

CLI Example:

```
The following will be set as 'Mikes-Mac'
salt '*' system.set_subnet_name "Mike's Mac"
```

salt.modules.mac_system.**shutdown**(*at_time=None*)

Shutdown the system

Parameters **at_time** (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no `AM/PM' designation, you have to double quote the parameter on the command line. For example: ```14:00'''

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 'now + 1 hour'
```

salt.modules.mac_system.**sleep**(*at_time=None*)

Sleep the system. If a user is active on the system it will likely fail to sleep.

Parameters **at_time** (*str*) -- Any valid *at* expression. For example, some valid at expressions could be:

- noon
- midnight
- fri
- 9:00 AM
- 2:30 PM tomorrow
- now + 10 minutes

Note: If you pass a time only, with no `AM/PM' designation, you have to double quote the parameter on the command line. For example: ```14:00'''

CLI Example:

```
salt '*' system.sleep
salt '*' system.sleep '10:00 PM'
```

19.9.210 salt.modules.mac_timezone module

Module for editing date/time settings on macOS

New in version 2016.3.0.

salt.modules.mac_timezone.**get_date**()

Displays the current date

Returns the system date

Return type str

CLI Example:

```
salt '*' timezone.get_date
```

salt.modules.mac_timezone.**get_hwclock**()
Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.mac_timezone.**get_offset**()
Displays the current time zone offset
Returns The current time zone offset
Return type str
CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.mac_timezone.**get_time**()
Get the current system time.
Returns The current time in 24 hour format
Return type str
CLI Example:

```
salt '*' timezone.get_time
```

salt.modules.mac_timezone.**get_time_server**()
Display the currently set network time server.
Returns the network time server
Return type str
CLI Example:

```
salt '*' timezone.get_time_server
```

salt.modules.mac_timezone.**get_using_network_time**()
Display whether network time is on or off
Returns True if network time is on, False if off
Return type bool
CLI Example:

```
salt '*' timezone.get_using_network_time
```

salt.modules.mac_timezone.**get_zone**()
Displays the current time zone
Returns The current time zone
Return type str
CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.mac_timezone.**get_zonecode**()
Displays the current time zone abbreviated code
Returns The current time zone code
Return type str
CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.mac_timezone.**list_zones**()
Displays a list of available time zones. Use this list when setting a time zone using `timezone.set_zone`

Returns a list of time zones
Return type *list*

CLI Example:

```
salt '*' timezone.list_zones
```

salt.modules.mac_timezone.**set_date**(*date*)

Set the current month, day, and year

Parameters **date** (*str*) -- The date to set. Valid date formats are:

- %m:%d:%y
- %m:%d:%Y
- %m/%d/%y
- %m/%d/%Y

Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Date format
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_date 1/13/2016
```

salt.modules.mac_timezone.**set_hwclock**(*clock*)

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.mac_timezone.**set_time**(*time*)

Sets the current time. Must be in 24 hour format.

Parameters **time** (*str*) -- The time to set in 24 hour format. The value must be double quoted.
ie: ```17:46'''
Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Time format
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time '"17:34"'
```

salt.modules.mac_timezone.**set_time_server**(*time_server='time.apple.com'*)

Designates a network time server. Enter the IP address or DNS name for the network time server.

Parameters **time_server** -- IP or DNS name of the network time server. If nothing is passed
the time server will be set to the macOS default of `time.apple.com'
Type str
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_time_server time.acme.com
```

salt.modules.mac_timezone.**set_using_network_time**(*enable*)

Set whether network time is on or off.

Parameters **enable** -- True to enable, False to disable. Can also use `on' or `off'
Type str bool
Returns True if successful, False if not
Return type bool
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_using_network_time True
```

salt.modules.mac_timezone.**set_zone**(*time_zone*)

Set the local time zone. Use `timezone.list_zones` to list valid time_zone arguments

Parameters **time_zone** (*str*) -- The time zone to apply
Returns True if successful, False if not
Return type bool
Raises SaltInvocationError on Invalid Timezone
Raises CommandExecutionError on failure

CLI Example:

```
salt '*' timezone.set_zone America/Denver
```

salt.modules.mac_timezone.**zone_compare**(*time_zone*)

Compares the given timezone name with the system timezone name.

Returns True if they are the same, False if not
Return type bool

CLI Example:

```
salt '*' timezone.zone_compare America/Boise
```

19.9.211 salt.modules.mac_user

Manage users on Mac OS 10.7+

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *`user.info' is not available*), see *here*.

salt.modules.mac_user.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *fullname=None*, *createhome=True*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.mac_user.**chfullname**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo 'Foo Bar'
```

salt.modules.mac_user.**chgid**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.mac_user.**chgroups**(*name*, *groups*, *append=False*)

Change the groups to which the user belongs. Note that the user's primary group does not have to be one of the groups passed, membership in the user's primary group is automatically assumed.

groups Groups to which the user should belong, can be passed either as a python list or a comma-separated string

append Instead of removing user from groups not included in the `groups` parameter, just add user to any groups for which they are not members

CLI Example:

```
salt '*' user.chgroups foo wheel,root
```

salt.modules.mac_user.**chhome**(*name*, *home*, ***kwargs*)

Change the home directory of the user

CLI Example:

```
salt '*' user.chhome foo /Users/foo
```

salt.modules.mac_user.**chshell**(*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.mac_user.**chuid**(*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.mac_user.**delete**(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.mac_user.**disable_auto_login**()

New in version 2016.3.0.

Disables auto login on the machine

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' user.disable_auto_login
```

salt.modules.mac_user.**enable_auto_login**(*name*, *password*)

New in version 2016.3.0.

Configures the machine to auto login with the specified user

Parameters

- **name** (*str*) -- The user account use for auto login

- **password** (*str*) -- The password to user for auto login

  New in version 2017.7.3.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' user.enable_auto_login stevej
```

salt.modules.mac_user.**get_auto_login**()

New in version 2016.3.0.

Gets the current setting for Auto Login

Returns If enabled, returns the user name, otherwise returns False

Return type str, bool

CLI Example:

```
salt '*' user.get_auto_login
```

salt.modules.mac_user.**getent**(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.mac_user.**info**(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.mac_user.**list_groups**(*name*)

Return a list of groups the named user belongs to.

name

The name of the user for which to list groups. Starting in Salt 2016.11.0, all groups for the user, including groups beginning with an underscore will be listed.

Changed in version 2016.11.0.

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.mac_user.**list_users**()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.mac_user.**primary_group**(*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

salt.modules.mac_user.**rename**(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

19.9.212 salt.modules.mac_xattr module

This module allows you to manage extended attributes on files or directories

```
salt '*' xattr.list /path/to/file
```

salt.modules.mac_xattr.**clear**(*path*)

Causes the all attributes on the file/directory to be removed

Parameters **path** (*str*) -- The file(s) to get attributes from

Returns True if successful, otherwise False

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.**delete**(*path*, *attribute*)

Removes the given attribute from the file

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be deleted from the file/directory

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.delete /path/to/file "com.test.attr"
```

salt.modules.mac_xattr.**list**(*path*, ***kwargs*)

List all of the extended attributes on the given file/directory

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **hex** (*bool*) -- Return the values with forced hexadecimal values

Returns A dictionary containing extended attributes and values for the given file

Return type dict

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.list /path/to/file
salt '*' xattr.list /path/to/file hex=True
```

salt.modules.mac_xattr.**read**(*path*, *attribute*, ***kwargs*)

Read the given attributes on the given file/directory

Parameters

- **path** (*str*) -- The file to get attributes from
- **attribute** (*str*) -- The attribute to read
- **hex** (*bool*) -- Return the values with forced hexadecimal values

Returns A string containing the value of the named attribute

Return type str

Raises CommandExecutionError on file not found, attribute not found, and any other unknown error

CLI Example:

```
salt '*' xattr.read /path/to/file com.test.attr
salt '*' xattr.read /path/to/file com.test.attr hex=True
```

salt.modules.mac_xattr.**write**(*path*, *attribute*, *value*, ***kwargs*)

Causes the given attribute name to be assigned the given value

Parameters

- **path** (*str*) -- The file(s) to get attributes from
- **attribute** (*str*) -- The attribute name to be written to the file/directory
- **value** (*str*) -- The value to assign to the given attribute
- **hex** (*bool*) -- Set the values with forced hexadecimal values

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError on file not found or any other unknown error

CLI Example:

```
salt '*' xattr.write /path/to/file "com.test.attr" "value"
```

19.9.213 salt.modules.makeconf

Support for modifying make.conf under Gentoo

salt.modules.makeconf.**append_cflags**(*value*)

Add to or create a new CFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cflags '-pipe'
```

salt.modules.makeconf.**append_cxxflags**(*value*)

Add to or create a new CXXFLAGS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_cxxflags '-pipe'
```

salt.modules.makeconf.**append_emerge_default_opts**(*value*)
Add to or create a new EMERGE_DEFAULT_OPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**append_features**(*value*)
Add to or create a new FEATURES in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_features 'webrsync-gpg'
```

salt.modules.makeconf.**append_gentoo_mirrors**(*value*)
Add to or create a new GENTOO_MIRRORS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**append_makeopts**(*value*)
Add to or create a new MAKEOPTS in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_makeopts '-j3'
```

salt.modules.makeconf.**append_var**(*var*, *value*)
Add to or create a new variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.append_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**cflags_contains**(*value*)
Verify if CFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cflags_contains '-pipe'
```

salt.modules.makeconf.**chost_contains**(*value*)
Verify if CHOST variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.chost_contains 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.**cxxflags_contains**(*value*)
Verify if CXXFLAGS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.cxxflags_contains '-pipe'
```

salt.modules.makeconf.**emerge_default_opts_contains**(*value*)
Verify if EMERGE_DEFAULT_OPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.emerge_default_opts_contains '--jobs'
```

salt.modules.makeconf.**features_contains**(*value*)
Verify if FEATURES variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.features_contains 'webrsync-gpg'
```

salt.modules.makeconf.**gentoo_mirrors_contains**(*value*)
Verify if GENTOO_MIRRORS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.gentoo_mirrors_contains 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**get_cflags**()
Get the value of CFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cflags
```

salt.modules.makeconf.**get_chost**()
Get the value of CHOST variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_chost
```

salt.modules.makeconf.**get_cxxflags**()
Get the value of CXXFLAGS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_cxxflags
```

salt.modules.makeconf.**get_emerge_default_opts**()
Get the value of EMERGE_DEFAULT_OPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_emerge_default_opts
```

salt.modules.makeconf.**get_features**()
Get the value of FEATURES variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_features
```

salt.modules.makeconf.**get_gentoo_mirrors**()
Get the value of GENTOO_MIRRORS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_gentoo_mirrors
```

salt.modules.makeconf.**get_makeopts**()
Get the value of MAKEOPTS variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_makeopts
```

salt.modules.makeconf.**get_sync**()
Get the value of SYNC variable in the make.conf

Return the value of the variable or None if the variable is not in the make.conf

CLI Example:

```
salt '*' makeconf.get_sync
```

salt.modules.makeconf.**get_var**(*var*)
Get the value of a variable in make.conf

Return the value of the variable or None if the variable is not in make.conf

CLI Example:

```
salt '*' makeconf.get_var 'LINGUAS'
```

salt.modules.makeconf.**makeopts_contains**(*value*)
Verify if MAKEOPTS variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.makeopts_contains '-j3'
```

salt.modules.makeconf.**remove_var**(*var*)
Remove a variable from the make.conf

Return a dict containing the new value for the variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.remove_var 'LINGUAS'
```

salt.modules.makeconf.**set_cflags**(*value*)
Set the CFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.**set_chost**(*value*)
Set the CHOST variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_chost 'x86_64-pc-linux-gnu'
```

salt.modules.makeconf.**set_cxxflags**(*value*)
Set the CXXFLAGS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_cxxflags '-march=native -O2 -pipe'
```

salt.modules.makeconf.**set_emerge_default_opts**(*value*)
Set the EMERGE_DEFAULT_OPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**set_gentoo_mirrors**(*value*)
Set the GENTOO_MIRRORS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**set_makeopts**(*value*)
Set the MAKEOPTS variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_makeopts '-j3'
```

salt.modules.makeconf.**set_sync**(*value*)
Set the SYNC variable

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_sync 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

salt.modules.makeconf.**set_var**(*var*, *value*)
Set a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.set_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**sync_contains**(*value*)

Verify if SYNC variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.sync_contains 'rsync://rsync.namerica.gentoo.org/gentoo-portage'
```

salt.modules.makeconf.**trim_cflags**(*value*)

Remove a value from CFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cflags '-pipe'
```

salt.modules.makeconf.**trim_cxxflags**(*value*)

Remove a value from CXXFLAGS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_cxxflags '-pipe'
```

salt.modules.makeconf.**trim_emerge_default_opts**(*value*)

Remove a value from EMERGE_DEFAULT_OPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_emerge_default_opts '--jobs'
```

salt.modules.makeconf.**trim_features**(*value*)

Remove a value from FEATURES variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_features 'webrsync-gpg'
```

salt.modules.makeconf.**trim_gentoo_mirrors**(*value*)
Remove a value from GENTOO_MIRRORS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_gentoo_mirrors 'http://distfiles.gentoo.org'
```

salt.modules.makeconf.**trim_makeopts**(*value*)
Remove a value from MAKEOPTS variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_makeopts '-j3'
```

salt.modules.makeconf.**trim_var**(*var*, *value*)
Remove a value from a variable in the make.conf

Return a dict containing the new value for variable:

```
{'<variable>': {'old': '<old-value>',
                'new': '<new-value>'}}
```

CLI Example:

```
salt '*' makeconf.trim_var 'LINGUAS' 'en'
```

salt.modules.makeconf.**var_contains**(*var*, *value*)
Verify if variable contains a value in make.conf

Return True if value is set for var

CLI Example:

```
salt '*' makeconf.var_contains 'LINGUAS' 'en'
```

19.9.214 salt.modules.marathon module

Module providing a simple management interface to a marathon cluster.

Currently this only works when run through a proxy minion.

New in version 2015.8.2.

salt.modules.marathon.**app**(*id*)
Return the current server configuration for the specified app.

CLI Example:

```
salt marathon-minion-id marathon.app my-app
```

salt.modules.marathon.**apps**()
Return a list of the currently installed app ids.

CLI Example:

```
salt marathon-minion-id marathon.apps
```

salt.modules.marathon.**has_app**(*id*)
Return whether the given app id is currently configured.

CLI Example:

```
salt marathon-minion-id marathon.has_app my-app
```

salt.modules.marathon.**info**()
Return configuration and status information about the marathon instance.

CLI Example:

```
salt marathon-minion-id marathon.info
```

salt.modules.marathon.**restart_app**(*id*, *restart=False*, *force=True*)
Restart the current server configuration for the specified app.

Parameters

- **restart** -- Restart the app
- **force** -- Override the current deployment

CLI Example:

```
salt marathon-minion-id marathon.restart_app my-app
```

By default, this will only check if the app exists in marathon. It does not check if there are any tasks associated with it or if the app is suspended.

```
salt marathon-minion-id marathon.restart_app my-app true true
```

The restart option needs to be set to True to actually issue a rolling restart to marathon.

The force option tells marathon to ignore the current app deployment if there is one.

salt.modules.marathon.**rm_app**(*id*)
Remove the specified app from the server.

CLI Example:

```
salt marathon-minion-id marathon.rm_app my-app
```

salt.modules.marathon.**update_app**(*id*, *config*)
Update the specified app with the given configuration.

CLI Example:

```
salt marathon-minion-id marathon.update_app my-app '<config yaml>'
```

19.9.215 salt.modules.match

The match module allows for match routines to be run and determine target specs

salt.modules.match.**compound**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given compound target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.compound 'L@cheese,foo and *'
```

salt.modules.match.**data**(*tgt*)

Return True if the minion matches the given data target

CLI Example:

```
salt '*' match.data 'spam:eggs'
```

salt.modules.match.**filter_by**(*lookup*, *tgt_type='compound'*, *minion_id=None*, *expr_form=None*, *default='default'*)

Return the first match in a dictionary of target patterns

New in version 2014.7.0.

CLI Example:

```
salt '*' match.filter_by '{foo*: Foo!, bar*: Bar!}' minion_id=bar03
```

Pillar Example:

```
# Filter the data for the current minion into a variable:
{% set roles = salt['match.filter_by']({
    'web*': ['app', 'caching'],
    'db*': ['db'],
}, default='web*') %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

salt.modules.match.**glob**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given glob target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.glob '*'
```

salt.modules.match.**grain**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain 'os:Ubuntu'
salt '*' match.grain 'ipv6|2001:db8::ff00:42:8329' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.**grain_pcre**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given grain_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.grain_pcre 'os:Fedo.*'
salt '*' match.grain_pcre 'ipv6|2001:.*' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.**ipcidr**(*tgt*)

Return True if the minion matches the given ipcidr target

CLI Example:

```
salt '*' match.ipcidr '192.168.44.0/24'
```

delimiter Pillar Example:

```
'172.16.0.0/12':
  - match: ipcidr
  - nodeclass: internal
```

salt.modules.match.**list**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given list target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.list 'server1,server2'
```

salt.modules.match.**pcre**(*tgt*, *minion_id=None*)

Return True if the minion ID matches the given pcre target

minion_id Specify the minion ID to match against the target expression

New in version 2014.7.0.

CLI Example:

```
salt '*' match.pcre '.*'
```

salt.modules.match.**pillar**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar 'cheese:foo'
salt '*' match.pillar 'clone_url|https://github.com/saltstack/salt.git' delimiter=
 ↪'|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.**pillar_pcre**(*tgt*, *delimiter=':'*)

Return True if the minion matches the given pillar_pcre target. The `delimiter` argument can be used to specify a different delimiter.

CLI Example:

```
salt '*' match.pillar_pcre 'cheese:(swiss|american)'
salt '*' match.pillar_pcre 'clone_url|https://github\.com/.*\.git' delimiter='|'
```

delimiter Specify an alternate delimiter to use when traversing a nested dict

New in version 2014.7.0.

delim Specify an alternate delimiter to use when traversing a nested dict

New in version 0.16.4.

Deprecated since version 2015.8.0.

salt.modules.match.**search_by**(*lookup*, *tgt_type='compound'*, *minion_id=None*)

Search a dictionary of target strings for matching targets

This is the inverse of *match.filter_by* and allows matching values instead of matching keys. A minion can be matched by multiple entries.

New in version 2017.7.0.

CLI Example:

```
salt '*' match.search_by '{web: [node1, node2], db: [node2, node]}'
```

Pillar Example:

```
{% set roles = salt.match.search_by({
    'web': ['G@os_family:Debian not nodeX'],
    'db': ['L@node2,node3 and G@datacenter:west'],
    'caching': ['node3', 'node4'],
}) %}

# Make the filtered data available to Pillar:
roles: {{ roles | yaml() }}
```

19.9.216 salt.modules.mattermost module

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

`salt.modules.mattermost.`**`post_message`**(*message*, *channel=None*, *username=None*, *api_url=None*, *hook=None*)

Send a message to a Mattermost channel.

Parameters

- **`channel`** -- The channel name, either will work.
- **`username`** -- The username of the poster.
- **`message`** -- The message to send to the Mattermost channel.
- **`api_url`** -- The Mattermost api url, if not specified in the configuration.
- **`hook`** -- The Mattermost hook, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' mattermost.post_message message='Build is done'
```

19.9.217 salt.modules.mdadm

Salt module to manage RAID arrays with mdadm

`salt.modules.mdadm.`**`assemble`**(*name*, *devices*, *test_mode=False*, ***kwargs*)

Assemble a RAID device.

CLI Examples:

```
salt '*' raid.assemble /dev/md0 ['/dev/xvdd', '/dev/xvde']
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

---

name The name of the array to assemble.
devices The list of devices comprising the array to assemble.
kwargs Optional arguments to be passed to mdadm.
returns
test_mode=True: Prints out the full command.
test_mode=False (Default): Executes command on the host(s) and prints out the mdadm output.

For more info, read the `mdadm` manpage.

`salt.modules.mdadm.`**`create`**(*name*, *level*, *devices*, *metadata='default'*, *test_mode=False*, ***kwargs*)

Create a RAID device.

Changed in version 2014.7.0.

Warning: Use with CAUTION, as this function can be very destructive if not used properly!

CLI Examples:

```
salt '*' raid.create /dev/md0 level=1 chunk=256 devices="['/dev/xvdd', '/dev/xvde
↪']" test_mode=True
```

Note: Adding `test_mode=True` as an argument will print out the mdadm command that would have been run.

name The name of the array to create.
level The RAID level to use when creating the raid.
devices A list of devices used to build the array.
metadata Version of metadata to use when creating the array.
kwargs Optional arguments to be passed to mdadm.
returns
test_mode=True: Prints out the full command.
test_mode=False (Default): Executes command on remote the host(s) and Prints out the mdadm output.

Note: It takes time to create a RAID array. You can check the progress in ``resync_status:" field of the results from the following command:

```
salt '*' raid.detail /dev/md0
```

For more info, read the `mdadm(8)` manpage

`salt.modules.mdadm.`**`destroy`**(*device*)
Destroy a RAID device.

WARNING This will zero the superblock of all members of the RAID array..

CLI Example:

```
salt '*' raid.destroy /dev/md0
```

`salt.modules.mdadm.`**`detail`**(*device='/dev/md0'*)
Show detail for a specified RAID device

CLI Example:

```
salt '*' raid.detail '/dev/md0'
```

`salt.modules.mdadm.`**`list`**()
List the RAID devices.

CLI Example:

```
salt '*' raid.list
```

`salt.modules.mdadm.`**`save_config`**()
Save RAID configuration to config file.

Same as: mdadm --detail --scan >> /etc/mdadm/mdadm.conf

Fixes this issue with Ubuntu REF: http://askubuntu.com/questions/209702/why-is-my-raid-dev-md1-showing-up-as-dev-md126-is-mdadm-conf-being-ignored

CLI Example:

```
salt '*' raid.save_config
```

salt.modules.mdadm.**stop**()

Shut down all arrays that can be shut down (i.e. are not currently in use).

CLI Example:

```
salt '*' raid.stop
```

19.9.218 salt.modules.mdata

Module for managaging metadata in SmartOS Zones

New in version 2016.3.0.

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform smartos

salt.modules.mdata.**delete**(**keyname*)

Delete metadata

prop [string] name of property

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.**get**(**keyname*)

Get metadata

keyname [string] name of key

Note: If no keynames are specified, we get all (public) properties

---

CLI Example:

```
salt '*' mdata.get salt:role
salt '*' mdata.get user-script salt:role
```

salt.modules.mdata.**list**()

List available metadata

CLI Example:

```
salt '*' mdata.list
```

salt.modules.mdata.**put**(*keyname*, *val*)

Put metadata

prop [string] name of property

val [string] value to set

CLI Example:

```
salt '*' mdata.list
```

19.9.219 salt.modules.memcached

Module for Management of Memcached Keys

New in version 2014.1.0.

salt.modules.memcached.**add**(*key*, *value*, *host=`127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)
Add a key to the memcached server, but only if it does not exist. Returns False if the key already exists.

CLI Example:

```
salt '*' memcached.add <key> <value>
```

salt.modules.memcached.**decrement**(*key*, *delta=1*, *host=`127.0.0.1'*, *port=11211*)
Decrement the value of a key

CLI Example:

```
salt '*' memcached.decrement <key>
salt '*' memcached.decrement <key> 2
```

salt.modules.memcached.**delete**(*key*, *host=`127.0.0.1'*, *port=11211*, *time=0*)
Delete a key from memcache server

CLI Example:

```
salt '*' memcached.delete <key>
```

salt.modules.memcached.**get**(*key*, *host=`127.0.0.1'*, *port=11211*)
Retrieve value for a key

CLI Example:

```
salt '*' memcached.get <key>
```

salt.modules.memcached.**increment**(*key*, *delta=1*, *host=`127.0.0.1'*, *port=11211*)
Increment the value of a key

CLI Example:

```
salt '*' memcached.increment <key>
salt '*' memcached.increment <key> 2
```

salt.modules.memcached.**replace**(*key*, *value*, *host=`127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)
Replace a key on the memcached server. This only succeeds if the key already exists. This is the opposite of *memcached.add*

CLI Example:

```
salt '*' memcached.replace <key> <value>
```

salt.modules.memcached.**set**(*key*, *value*, *host=`127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)
Set a key on the memcached server, overwriting the value if it exists.

CLI Example:

```
salt '*' memcached.set <key> <value>
```

salt.modules.memcached.**status**(*host='127.0.0.1'*, *port=11211*)
Get memcached status

CLI Example:

```
salt '*' memcached.status
```

19.9.220 salt.modules.mine

The function cache system allows for data to be stored on the master so it can be easily read by other minions

salt.modules.mine.**delete**(*fun*)
Remove specific function contents of minion. Returns True on success.

CLI Example:

```
salt '*' mine.delete 'network.interfaces'
```

salt.modules.mine.**flush**()
Remove all mine contents of minion. Returns True on success.

CLI Example:

```
salt '*' mine.flush
```

salt.modules.mine.**get**(*tgt*, *fun*, *tgt_type='glob'*, *exclude_minion=False*, *expr_form=None*)
Get data from the mine based on the target, function and tgt_type

Targets can be matched based on any standard matching system that can be matched on the master via these keywords:

- glob
- pcre
- grain
- grain_pcre
- compound
- pillar
- pillar_pcre

Note that all pillar matches, whether using the compound matching system or the pillar matching system, will be exact matches, with globbing disabled.
exclude_minion Excludes the current minion from the result set
CLI Example:

```
salt '*' mine.get '*' network.interfaces
salt '*' mine.get 'os:Fedora' network.interfaces grain
salt '*' mine.get 'os:Fedora and S@192.168.5.0/24' network.ipaddrs compound
```

See also:

Retrieving Mine data from Pillar and Orchestrate

This execution module is intended to be executed on minions. Master-side operations such as Pillar or Orchestrate that require Mine data should use the *Mine Runner module* instead; it can be invoked from a Pillar SLS file using the *saltutil.runner* module. For example:

```
{% set minion_ips = salt.saltutil.runner('mine.get',
    tgt='*',
    fun='network.ip_addrs',
    tgt_type='glob') %}
```

salt.modules.mine.**get_docker**(*interfaces=None*, *cidrs=None*, *with_container_id=False*)

Get all mine data for `docker.get_containers' and run an aggregation routine. The ``interfaces" parameter allows for specifying which network interfaces to select ip addresses from. The ``cidrs" parameter allows for specifying a list of cidrs which the ip address must match.

with_container_id Boolean, to expose container_id in the list of results

New in version 2015.8.2.

CLI Example:

```
salt '*' mine.get_docker
salt '*' mine.get_docker interfaces='eth0'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]'
salt '*' mine.get_docker cidrs='107.170.147.0/24'
salt '*' mine.get_docker cidrs='["107.170.147.0/24", "172.17.42.0/24"]'
salt '*' mine.get_docker interfaces='["eth0", "eth1"]' cidrs='["107.170.147.0/24
↪", "172.17.42.0/24"]'
```

salt.modules.mine.**send**(*func*, **args*, ***kwargs*)

Send a specific function to the mine.

CLI Example:

```
salt '*' mine.send network.ip_addrs eth0
salt '*' mine.send eth0_ip_addrs mine_function=network.ip_addrs eth0
```

salt.modules.mine.**update**(*clear=False*, *mine_functions=None*)

Execute the configured functions and send the data back up to the master. The functions to be executed are merged from the master config, pillar and minion config under the option *mine_functions*:

```
mine_functions:
  network.ip_addrs:
    - eth0
  disk.usage: []
```

This function accepts the following arguments:

clear: **False** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: *False* (update).

mine_functions Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under *mine_functions* in the minion/master config or pillar. A potential use would be together with the *scheduler*, for example:

```
schedule:
  lldp_mine_update:
    function: mine.update
    kwargs:
        mine_functions:
          net.lldp: []
    hours: 12
```

In the example above, the mine for *net.lldp* would be refreshed every 12 hours, while *network.ip_addrs* would continue to be updated as specified in *mine_interval*.

The function cache will be populated with information from executing these functions

CLI Example:

```
salt '*' mine.update
```

salt.modules.mine.**valid**()

List valid entries in mine configuration.

CLI Example:

```
salt '*' mine.valid
```

19.9.221 salt.modules.minion module

Module to provide information about minions

salt.modules.minion.**kill**(*timeout=15*)

Kill the salt minion.

timeout int seconds to wait for the minion to die.

If you have a monitor that restarts `salt-minion` when it dies then this is a great way to restart after a minion upgrade.

CLI example:

```
>$ salt minion[12] minion.kill
minion1:
    ----------
    killed:
        7874
    retcode:
        0
minion2:
    ----------
    killed:
        29071
    retcode:
        0
```

The result of the salt command shows the process ID of the minions and the results of a kill signal to the minion in as the `retcode` value: `0` is success, anything else is a failure.

salt.modules.minion.**list**()

Return a list of accepted, denied, unaccepted and rejected keys. This is the same output as *salt-key -L*

CLI Example:

```
salt 'master' minion.list
```

salt.modules.minion.**restart**()

Kill and restart the salt minion.

The configuration key `minion_restart_command` is an argv list for the command to restart the minion. If `minion_restart_command` is not specified or empty then the `argv` of the current process will be used.

if the configuration value `minion_restart_command` is not set and the `-d` (daemonize) argument is missing from `argv` then the minion *will* be killed but will *not* be restarted and will require the parent process to perform the restart. This behavior is intended for managed salt minion processes.

CLI example:

```
>$ salt minion[12] minion.restart
minion1:
    ----------
    comment:
        - Restart using process argv:
        -     /home/omniture/install/bin/salt-minion
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
    killed:
        10070
    restart:
        ----------
        stderr:
        stdout:
    retcode:
        0
minion2:
    ----------
    comment:
        - Using configuration minion_restart_command:
        -     /home/omniture/install/bin/salt-minion
        -     --not-an-option
        -     -d
        -     -c
        -     /home/omniture/install/etc/salt
        - Restart failed
    killed:
        10896
    restart:
        ----------
        stderr:
            Usage: salt-minion

            salt-minion: error: no such option: --not-an-option
        stdout:
    retcode:
        64
```

The result of the command shows the process ID of `minion1` that is shutdown (killed) and the results of the restart. If there is a failure in the restart it will be reflected in a non-zero `retcode` and possibly output in the `stderr` and/or `stdout` values along with addition information in the `comment` field as is demonstrated with `minion2`.

19.9.222 salt.modules.mod_random

Provides access to randomness generators.

New in version 2014.7.0.

`salt.modules.mod_random.`**`get_str`**(*length=20*)

New in version 2014.7.0.

Returns a random string of the specified length.

length [20] Any valid number of bytes.

CLI Example:

```
salt '*' random.get_str 128
```

salt.modules.mod_random.**hash**(*value*, *algorithm='sha512'*)

New in version 2014.7.0.

Encodes a value with the specified encoder.
value The value to be hashed.
algorithm [sha512] The algorithm to use. May be any valid algorithm supported by hashlib.
CLI Example:

```
salt '*' random.hash 'I am a string' md5
```

salt.modules.mod_random.**rand_int**(*start=1*, *end=10*)

Returns a random integer number between the start and end number.
start [1] Any valid integer number
end [10] Any valid integer number
CLI Example:

```
salt '*' random.rand_int 1 10
```

salt.modules.mod_random.**seed**(*range=10*, *hash=None*)

Returns a random number within a range. Optional hash argument can be any hashable object. If hash is omitted or None, the id of the minion is used.
hash: **None** Any hashable object.
range: **10** Any valid integer number
CLI Example:

```
salt '*' random.seed 10 hash=None
```

salt.modules.mod_random.**shadow_hash**(*crypt_salt=None*, *password=None*, *algorithm='sha512'*)

Generates a salted hash suitable for /etc/shadow.
crypt_salt [None] Salt to be used in the generation of the hash. If one is not provided, a random salt will be generated.
password [None] Value to be salted and hashed. If one is not provided, a random password will be generated.
algorithm [sha512] Hash algorithm to use.
CLI Example:

```
salt '*' random.shadow_hash 'My5alT' 'MyP@asswd' md5
```

salt.modules.mod_random.**str_encode**(*value*, *encoder='base64'*)

New in version 2014.7.0.
value The value to be encoded.
encoder [base64] The encoder to use on the subsequent string.
CLI Example:

```
salt '*' random.str_encode 'I am a new string' base64
```

19.9.223 salt.modules.modjk

Control Modjk via the Apache Tomcat ``Status'' worker (http://tomcat.apache.org/connectors-doc/reference/status.html)

Below is an example of the configuration needed for this module. This configuration data can be placed either in *grains* or *pillar*.

If using grains, this can be accomplished *statically* or via a *grain module*.

If using pillar, the yaml configuration can be placed directly into a pillar SLS file, making this both the easier and more dynamic method of configuring this module.

```
modjk:
  default:
    url: http://localhost/jkstatus
    user: modjk
    pass: secret
    realm: authentication realm for digest passwords
    timeout: 5
  otherVhost:
    url: http://otherVhost/jkstatus
    user: modjk
    pass: secret2
    realm: authentication realm2 for digest passwords
    timeout: 600
```

salt.modules.modjk.**bulk_activate**(*workers*, *lbn*, *profile='default'*)

Activate all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_activate node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_activate ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.**bulk_disable**(*workers*, *lbn*, *profile='default'*)

Disable all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_disable node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_disable ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.**bulk_recover**(*workers*, *lbn*, *profile='default'*)

Recover all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_recover node1,node2,node3 loadbalancer1 other-profile

salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_recover ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.**bulk_stop**(*workers*, *lbn*, *profile='default'*)

Stop all the given workers in the specific load balancer

CLI Examples:

```
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1
salt '*' modjk.bulk_stop node1,node2,node3 loadbalancer1 other-profile
```

```
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1
salt '*' modjk.bulk_stop ["node1","node2","node3"] loadbalancer1 other-profile
```

salt.modules.modjk.**dump_config**(*profile='default'*)

Dump the original configuration that was loaded from disk

CLI Examples:

```
salt '*' modjk.dump_config
salt '*' modjk.dump_config other-profile
```

salt.modules.modjk.**get_running**(*profile='default'*)

Get the current running config (not from disk)

CLI Examples:

```
salt '*' modjk.get_running
salt '*' modjk.get_running other-profile
```

salt.modules.modjk.**lb_edit**(*lbn*, *settings*, *profile='default'*)

Edit the loadbalancer settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}"
salt '*' modjk.lb_edit loadbalancer1 "{'vlr': 1, 'vlt': 60}" other-profile
```

salt.modules.modjk.**list_configured_members**(*lbn*, *profile='default'*)

Return a list of member workers from the configuration files

CLI Examples:

```
salt '*' modjk.list_configured_members loadbalancer1
salt '*' modjk.list_configured_members loadbalancer1 other-profile
```

salt.modules.modjk.**recover_all**(*lbn*, *profile='default'*)

Set the all the workers in lbn to recover and activate them if they are not

CLI Examples:

```
salt '*' modjk.recover_all loadbalancer1
salt '*' modjk.recover_all loadbalancer1 other-profile
```

salt.modules.modjk.**reset_stats**(*lbn*, *profile='default'*)

Reset all runtime statistics for the load balancer

CLI Examples:

```
salt '*' modjk.reset_stats loadbalancer1
salt '*' modjk.reset_stats loadbalancer1 other-profile
```

salt.modules.modjk.**version**(*profile='default'*)

Return the modjk version

CLI Examples:

```
salt '*' modjk.version
salt '*' modjk.version other-profile
```

salt.modules.modjk.**worker_activate**(*worker*, *lbn*, *profile='default'*)
Set the worker to activate state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.**worker_disable**(*worker*, *lbn*, *profile='default'*)
Set the worker to disable state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_disable node1 loadbalancer1
salt '*' modjk.worker_disable node1 loadbalancer1 other-profile
```

salt.modules.modjk.**worker_edit**(*worker*, *lbn*, *settings*, *profile='default'*)
Edit the worker settings

Note: http://tomcat.apache.org/connectors-doc/reference/status.html Data Parameters for the standard Update Action

CLI Examples:

```
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}"
salt '*' modjk.worker_edit node1 loadbalancer1 "{'vwf': 500, 'vwd': 60}" other-
↪profile
```

salt.modules.modjk.**worker_recover**(*worker*, *lbn*, *profile='default'*)
Set the worker to recover this module will fail if it is in OK state

CLI Examples:

```
salt '*' modjk.worker_recover node1 loadbalancer1
salt '*' modjk.worker_recover node1 loadbalancer1 other-profile
```

salt.modules.modjk.**worker_status**(*worker*, *profile='default'*)
Return the state of the worker

CLI Examples:

```
salt '*' modjk.worker_status node1
salt '*' modjk.worker_status node1 other-profile
```

salt.modules.modjk.**worker_stop**(*worker*, *lbn*, *profile='default'*)
Set the worker to stopped state in the lbn load balancer

CLI Examples:

```
salt '*' modjk.worker_activate node1 loadbalancer1
salt '*' modjk.worker_activate node1 loadbalancer1 other-profile
```

salt.modules.modjk.**workers**(*profile='default'*)
Return a list of member workers and their status

CLI Examples:

```
salt '*' modjk.workers
salt '*' modjk.workers other-profile
```

19.9.224 salt.modules.mongodb

Module to provide MongoDB functionality to Salt

configuration This module uses PyMongo, and accepts configuration details as parameters as well as configuration settings:

```
mongodb.host: 'localhost'
mongodb.port: 27017
mongodb.user: ''
mongodb.password: ''
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

salt.modules.mongodb.**db_exists**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a database exists in Mongodb

CLI Example:

```
salt '*' mongodb.db_exists <name> <user> <password> <host> <port>
```

salt.modules.mongodb.**db_list**(*user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

List all Mongodb databases

CLI Example:

```
salt '*' mongodb.db_list <user> <password> <host> <port>
```

salt.modules.mongodb.**db_remove**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Remove a Mongodb database

CLI Example:

```
salt '*' mongodb.db_remove <name> <user> <password> <host> <port>
```

salt.modules.mongodb.**find**(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Find an object or list of objects in a collection

CLI Example:

```
salt '*' mongodb.find mycollection '[{"foo": "FOO", "bar": "BAR"}]' <user>
↪<password> <host> <port> <database>
```

salt.modules.mongodb.**insert**(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Insert an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.insert '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ", "bar": "BAM
↪"}]' mycollection <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**remove**(*collection*, *query=None*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *w=1*, *authdb=None*)

Remove an object or list of objects into a collection

CLI Example:

```
salt '*' mongodb.remove mycollection '[{"foo": "FOO", "bar": "BAR"}, {"foo": "BAZ
↪", "bar": "BAM"}]' <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**update_one**(*objects*, *collection*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Update an object into a collection http://api.mongodb.com/python/current/api/pymongo/collection.html#pymongo.collection.Collection.update_one

New in version 2016.11.0.

CLI Example:

```
salt '*' mongodb.update_one '{"_id": "my_minion"} {"bar": "BAR"}' mycollection
↪<user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_create**(*name*, *passwd*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*, *roles=None*)

Create a Mongodb user

CLI Example:

```
salt '*' mongodb.user_create <user_name> <user_password> <roles> <user> <password>
↪ <host> <port> <database>
```

salt.modules.mongodb.**user_exists**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Checks if a user exists in Mongodb

CLI Example:

```
salt '*' mongodb.user_exists <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_find**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get single user from MongoDB

CLI Example:

```
salt '*' mongodb.user_find <name> <user> <password> <host> <port> <database>
↪<authdb>
```

salt.modules.mongodb.**user_grant_roles**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Grant one or many roles to a Mongodb user

CLI Examples:

```
salt '*' mongodb.user_grant_roles johndoe '["readWrite"]' dbname admin adminpwd
↪localhost 27017
```

```
salt '*' mongodb.user_grant_roles janedoe '[{"role": "readWrite", "db": "dbname" }
↪, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.**user_list**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

List users of a Mongodb database

CLI Example:

```
salt '*' mongodb.user_list <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_remove**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Remove a Mongodb user

CLI Example:

```
salt '*' mongodb.user_remove <name> <user> <password> <host> <port> <database>
```

salt.modules.mongodb.**user_revoke_roles**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Revoke one or many roles to a Mongodb user

CLI Examples:

```
salt '*' mongodb.user_revoke_roles johndoe '["readWrite"]' dbname admin adminpwd
↪localhost 27017
```

```
salt '*' mongodb.user_revoke_roles janedoe '[{"role": "readWrite", "db": "dbname"
↪}, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.**user_roles_exists**(*name*, *roles*, *database*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Checks if a user of a Mongodb database has specified roles

CLI Examples:

```
salt '*' mongodb.user_roles_exists johndoe '["readWrite"]' dbname admin adminpwd
↪localhost 27017
```

```
salt '*' mongodb.user_roles_exists johndoe '[{"role": "readWrite", "db": "dbname"
↪}, {"role": "read", "db": "otherdb"}]' dbname admin adminpwd localhost 27017
```

salt.modules.mongodb.**version**(*user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Get MongoDB instance version

CLI Example:

```
salt '*' mongodb.version <user> <password> <host> <port> <database>
```

19.9.225 salt.modules.monit

Monit service module. This module will create a monit type service watcher.

salt.modules.monit.**configtest**()

New in version 2016.3.0.

Test monit configuration syntax

CLI Example:

```
salt '*' monit.configtest
```

salt.modules.monit.**id**(*reset=False*)

New in version 2016.3.0.

Return monit unique id.

reset [False] Reset current id and generate a new id when it's True.

CLI Example:

```
salt '*' monit.id [reset=True]
```

salt.modules.monit.**monitor**(*name*)

monitor service via monit

CLI Example:

```
salt '*' monit.monitor <service name>
```

salt.modules.monit.**reload**()

New in version 2016.3.0.

Reload monit configuration

CLI Example:

```
salt '*' monit.reload
```

salt.modules.monit.**restart**(*name*)

Restart service via monit

CLI Example:

```
salt '*' monit.restart <service name>
```

salt.modules.monit.**start**(*name*)

CLI Example:

```
salt '*' monit.start <service name>
```

salt.modules.monit.**status**(*svc_name=''*)

Display a process status from monit

CLI Example:

```
salt '*' monit.status
salt '*' monit.status <service name>
```

salt.modules.monit.**stop**(*name*)

Stops service via monit

CLI Example:

```
salt '*' monit.stop <service name>
```

salt.modules.monit.**summary**(*svc_name=''*)

Display a summary from monit

CLI Example:

```
salt '*' monit.summary
salt '*' monit.summary <service name>
```

salt.modules.monit.**unmonitor**(*name*)
Unmonitor service via monit

CLI Example:

```
salt '*' monit.unmonitor <service name>
```

salt.modules.monit.**validate**()
New in version 2016.3.0.

Check all services

CLI Example:

```
salt '*' monit.validate
```

salt.modules.monit.**version**()
New in version 2016.3.0.

Return version from monit -V

CLI Example:

```
salt '*' monit.version
```

19.9.226 salt.modules.moosefs

Module for gathering and managing information about MooseFS

salt.modules.moosefs.**dirinfo**(*path*, *opts=None*)
Return information on a directory located on the Moose

CLI Example:

```
salt '*' moosefs.dirinfo /path/to/dir/ [-[n][h|H]]
```

salt.modules.moosefs.**fileinfo**(*path*)
Return information on a file located on the Moose

CLI Example:

```
salt '*' moosefs.fileinfo /path/to/dir/
```

salt.modules.moosefs.**getgoal**(*path*, *opts=None*)
Return goal(s) for a file or directory

CLI Example:

```
salt '*' moosefs.getgoal /path/to/file [-[n][h|H]]
salt '*' moosefs.getgoal /path/to/dir/ [-[n][h|H][r]]
```

salt.modules.moosefs.**mounts**()
Return a list of current MooseFS mounts

CLI Example:

```
salt '*' moosefs.mounts
```

19.9.227 salt.modules.mount

Salt module to manage Unix mounts and the fstab file

salt.modules.mount.**active**(*extended=False*)
List the active mounts.

CLI Example:

```
salt '*' mount.active
```

salt.modules.mount.**automaster**(*config='/etc/auto_salt'*)
List the contents of the auto master

CLI Example:

```
salt '*' mount.automaster
```

salt.modules.mount.**fstab**(*config='/etc/fstab'*)
Changed in version 2016.3.2.

List the contents of the fstab

CLI Example:

```
salt '*' mount.fstab
```

salt.modules.mount.**is_fuse_exec**(*cmd*)
Returns true if the command passed is a fuse mountable application.

CLI Example:

```
salt '*' mount.is_fuse_exec sshfs
```

salt.modules.mount.**is_mounted**(*name*)
New in version 2014.7.0.

Provide information if the path is mounted

CLI Example:

```
salt '*' mount.is_mounted /mnt/share
```

salt.modules.mount.**mount**(*name*, *device*, *mkmnt=False*, *fstype=''*, *opts='defaults'*, *user=None*, *util='mount'*)
Mount a device

CLI Example:

```
salt '*' mount.mount /mnt/foo /dev/sdz1 True
```

salt.modules.mount.**remount**(*name*, *device*, *mkmnt=False*, *fstype=''*, *opts='defaults'*, *user=None*)
Attempt to remount a device, if the device is not already mounted, mount is called

CLI Example:

```
salt '*' mount.remount /mnt/foo /dev/sdz1 True
```

salt.modules.mount.**rm_automaster**(*name*, *device*, *config='/etc/auto_salt'*)
Remove the mount point from the auto_master

CLI Example:

```
salt '*' mount.rm_automaster /mnt/foo /dev/sdg
```

salt.modules.mount.**rm_fstab**(*name*, *device*, *config='/etc/fstab'*)
Changed in version 2016.3.2.

Remove the mount point from the fstab

CLI Example:

```
salt '*' mount.rm_fstab /mnt/foo /dev/sdg
```

salt.modules.mount.**rm_vfstab**(*name*, *device*, *config='/etc/vfstab'*)
New in version 2016.3.2.

Remove the mount point from the vfstab

CLI Example:

```
salt '*' mount.rm_vfstab /mnt/foo /device/c0t0d0p0
```

salt.modules.mount.**set_automaster**(*name*, *device*, *fstype*, *opts=''*, *config='/etc/auto_salt'*, *test=False*, ***kwargs*)
Verify that this mount is represented in the auto_salt, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_automaster /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.**set_fstab**(*name*, *device*, *fstype*, *opts='defaults'*, *dump=0*, *pass_num=0*, *config='/etc/fstab'*, *test=False*, *match_on='auto'*, ***kwargs*)
Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_fstab /mnt/foo /dev/sdz1 ext4
```

salt.modules.mount.**set_vfstab**(*name*, *device*, *fstype*, *opts='-'*, *device_fsck='-'*, *pass_fsck='-'*, *mount_at_boot='yes'*, *config='/etc/vfstab'*, *test=False*, *match_on='auto'*, ***kwargs*)
..verionadded:: 2016.3.2 Verify that this mount is represented in the fstab, change the mount to match the data passed, or add the mount if it is not present.

CLI Example:

```
salt '*' mount.set_vfstab /mnt/foo /device/c0t0d0p0 ufs
```

salt.modules.mount.**swapoff**(*name*)
Deactivate a named swap mount

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapoff /root/swapfile
```

salt.modules.mount.**swapon**(*name*, *priority=None*)
Activate a swap disk

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swapon /root/swapfile
```

salt.modules.mount.**swaps**()
Return a dict containing information on active swap

Changed in version 2016.3.2.

CLI Example:

```
salt '*' mount.swaps
```

salt.modules.mount.**umount**(*name*, *device=None*, *user=None*, *util='mount'*)
Attempt to unmount a device by specifying the directory it is mounted on

CLI Example:

```
salt '*' mount.umount /mnt/foo
```

New in version 2015.5.0.

```
salt '*' mount.umount /mnt/foo /dev/xvdc1
```

salt.modules.mount.**vfstab**(*config='/etc/vfstab'*)
New in version 2016.3.2.

List the contents of the vfstab

CLI Example:

```
salt '*' mount.vfstab
```

19.9.228 salt.modules.mssql

Module to provide MS SQL Server compatibility to salt.

depends

- FreeTDS
- pymssql Python module

configuration In order to connect to MS SQL Server, certain configuration is required in minion configs/pillars on the relevant minions. Some sample pillars might look like:

```
mssql.server: 'localhost'
mssql.port:   1433
mssql.user:   'sysdba'
mssql.password:   'Some preferable complex password'
mssql.database: ''
```

The default for the port is `1433' and for the database is `' (empty string); in most cases they can be left at the default setting. Options that are directly passed into functions will overwrite options from configs or pillars.

salt.modules.mssql.**db_exists**(*database_name*, ***kwargs*)
Find if a specific database exists on the MS SQL server.

CLI Example:

```
salt minion mssql.db_exists database_name='DBNAME'
```

salt.modules.mssql.**db_list**(***kwargs*)
Return the database list created on a MS SQL server.

CLI Example:

```
salt minion mssql.db_list
```

salt.modules.mssql.**db_remove**(*database_name*, ***kwargs*)
Drops a specific database from the MS SQL server. It will not drop any of `master', `model', `msdb' or `tempdb'.

CLI Example:

```
salt minion mssql.db_remove database_name='DBNAME'
```

salt.modules.mssql.**login_exists**(*login*, ***kwargs*)
Find if a login exists in the MS SQL server.

CLI Example:

```
salt minion mssql.login_exists 'LOGIN'
```

salt.modules.mssql.**role_create**(*role*, *owner=None*, ***kwargs*)
Creates a new database role. If no owner is specified, the role will be owned by the user that executes CREATE ROLE, which is the user argument or mssql.user option.

CLI Example:

```
salt minion mssql.role_create role=product01 owner=sysdba
```

salt.modules.mssql.**role_exists**(*role*, ***kwargs*)
Checks if a role exists.

CLI Example:

```
salt minion mssql.role_exists db_owner
```

salt.modules.mssql.**role_list**(***kwargs*)
Lists database roles.

CLI Example:

```
salt minion mssql.role_list
```

salt.modules.mssql.**role_remove**(*role*, ***kwargs*)
Remove a database role.

CLI Example:

```
salt minion mssql.role_create role=test_role01
```

salt.modules.mssql.**tsql_query**(*query*, ***kwargs*)

Run a SQL query and return query result as list of tuples, or a list of dictionaries if as_dict was passed, or an empty list if no data is available.

CLI Example:

```
salt minion mssql.tsql_query 'SELECT @@version as version' as_dict=True
```

salt.modules.mssql.**user_create**(*username*, *new_login_password=None*, ***kwargs*)

Creates a new user. If new_login_password is not specified, the user will be created without a login.

CLI Example:

```
salt minion mssql.user_create USERNAME database=DBNAME [new_login_
↪password=PASSWORD]
```

salt.modules.mssql.**user_exists**(*username*, ***kwargs*)

Find if an user exists in a specific database on the MS SQL server.

Note: *database* argument is mandatory

CLI Example:

```
salt minion mssql.user_exists 'USERNAME' [database='DBNAME']
```

salt.modules.mssql.**user_list**(***kwargs*)

Get the user list for a specific database on the MS SQL server.

CLI Example:

```
salt minion mssql.user_list [database='DBNAME']
```

salt.modules.mssql.**user_remove**(*username*, ***kwargs*)

Removes an user.

CLI Example:

```
salt minion mssql.user_remove USERNAME database=DBNAME
```

salt.modules.mssql.**version**(***kwargs*)

Return the version of a MS SQL server.

CLI Example:

```
salt minion mssql.version
```

19.9.229 salt.modules.msteams module

Module for sending messages to MS Teams

New in version 2017.7.0.

configuration This module can be used by either passing a hook_url directly or by specifying it in a configuration profile in the salt master/minion config. For example:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

salt.modules.msteams.**post_card**(*message*, *hook_url=None*, *title=None*, *theme_color=None*)

Send a message to an MS Teams channel. :param message: The message to send to the MS Teams channel. :param hook_url: The Teams webhook URL, if not specified in the configuration. :param title: Optional title for the posted card :param theme_color: Optional hex color highlight for the posted card :return: Boolean if message was sent successfully.

CLI Example:

```
salt '*' msteams.post_card message="Build is done"
```

19.9.230 salt.modules.munin

Run munin plugins/checks from salt and format the output as data.

salt.modules.munin.**list_plugins**()

List all the munin plugins

CLI Example:

```
salt '*' munin.list_plugins
```

salt.modules.munin.**run**(*plugins*)

Run one or more named munin plugins

CLI Example:

```
salt '*' munin.run uptime
salt '*' munin.run uptime,cpu,load,memory
```

salt.modules.munin.**run_all**()

Run all the munin plugins

CLI Example:

```
salt '*' munin.run_all
```

19.9.231 salt.modules.mysql

Module to provide MySQL compatibility to salt.

depends

- MySQLdb Python module

Note: On CentOS 5 (and possibly RHEL 5) both MySQL-python and python26-mysqldb need to be installed.

configuration In order to connect to MySQL, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
mysql.host: 'localhost'
mysql.port: 3306
mysql.user: 'root'
mysql.pass: ''
mysql.db: 'mysql'
mysql.unix_socket: '/tmp/mysql.sock'
mysql.charset: 'utf8'
```

You can also use a defaults file:

```
mysql.default_file: '/etc/mysql/debian.cnf'
```

Changed in version 2014.1.0: `charset' connection argument added. This is a MySQL charset, not a python one.

Changed in version 0.16.2: Connection arguments from the minion config file can be overridden on the CLI by using the arguments defined *here*. Additionally, it is now possible to setup a user with no password.

salt.modules.mysql.**alter_db**(*name*, *character_set=None*, *collate=None*, ***connection_args*)

Modify database using `ALTER DATABASE %(dbname)s CHARACTER SET %(charset)s COLLATE %(collation)s;` query.

CLI Example:

```
salt '*' mysql.alter_db testdb charset='latin1'
```

salt.modules.mysql.**db_check**(*name*, *table=None*, ***connection_args*)

Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_check dbname
salt '*' mysql.db_check dbname dbtable
```

salt.modules.mysql.**db_create**(*name*, *character_set=None*, *collate=None*, ***connection_args*)

Adds a databases to the MySQL server.

name The name of the database to manage

character_set The character set, if left empty the MySQL default will be used

collate The collation, if left empty the MySQL default will be used

CLI Example:

```
salt '*' mysql.db_create 'dbname'
salt '*' mysql.db_create 'dbname' 'utf8' 'utf8_general_ci'
```

salt.modules.mysql.**db_exists**(*name*, ***connection_args*)

Checks if a database exists on the MySQL server.

CLI Example:

```
salt '*' mysql.db_exists 'dbname'
```

salt.modules.mysql.**db_get**(*name*, ***connection_args*)

Return a list of databases of a MySQL server using the output from the `SELECT DEFAULT_CHARACTER_SET_NAME,DEFAULT_COLLATION_NAME FROM INFORMATION_SCHEMA.SCHEMATA WHERE SCHEMA_NAME='dbname';` query.

CLI Example:

```
salt '*' mysql.db_get test
```

salt.modules.mysql.**db_list**(***connection_args*)
Return a list of databases of a MySQL server using the output from the SHOW DATABASES query.

CLI Example:

```
salt '*' mysql.db_list
```

salt.modules.mysql.**db_optimize**(*name*, *table=None*, ***connection_args*)
Optimizes the full database or just a given table

CLI Example:

```
salt '*' mysql.db_optimize dbname
```

salt.modules.mysql.**db_remove**(*name*, ***connection_args*)
Removes a databases from the MySQL server.

CLI Example:

```
salt '*' mysql.db_remove 'dbname'
```

salt.modules.mysql.**db_repair**(*name*, *table=None*, ***connection_args*)
Repairs the full database or just a given table

CLI Example:

```
salt '*' mysql.db_repair dbname
```

salt.modules.mysql.**db_tables**(*name*, ***connection_args*)
Shows the tables in the given MySQL database (if exists)

CLI Example:

```
salt '*' mysql.db_tables 'database'
```

salt.modules.mysql.**file_query**(*database*, *file_name*, ***connection_args*)
Run an arbitrary SQL query from the specified file and return the the number of affected rows.

New in version 2017.7.0.

database
: database to run script inside

file_name
: File name of the script. This can be on the minion, or a file that is reachable by the fileserver

CLI Example:

```
salt '*' mysql.file_query mydb file_name=/tmp/sqlfile.sql
salt '*' mysql.file_query mydb file_name=salt://sqlfile.sql
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

salt.modules.mysql.**free_slave**(***connection_args*)
Frees a slave from its master. This is a WIP, do not use.

CLI Example:

```
salt '*' mysql.free_slave
```

salt.modules.mysql.**get_master_status**(***connection_args*)

Retrieves the master status from the minion.

Returns:

```
{'host.domain.com': {'Binlog_Do_DB': '',
                     'Binlog_Ignore_DB': '',
                     'File': 'mysql-bin.000021',
                     'Position': 107}}
```

CLI Example:

```
salt '*' mysql.get_master_status
```

salt.modules.mysql.**get_slave_status**(***connection_args*)

Retrieves the slave status from the minion.

Returns:

```
{'host.domain.com': {'Connect_Retry': 60,
                     'Exec_Master_Log_Pos': 107,
                     'Last_Errno': 0,
                     'Last_Error': '',
                     'Last_IO_Errno': 0,
                     'Last_IO_Error': '',
                     'Last_SQL_Errno': 0,
                     'Last_SQL_Error': '',
                     'Master_Host': 'comet.scion-eng.com',
                     'Master_Log_File': 'mysql-bin.000021',
                     'Master_Port': 3306,
                     'Master_SSL_Allowed': 'No',
                     'Master_SSL_CA_File': '',
                     'Master_SSL_CA_Path': '',
                     'Master_SSL_Cert': '',
                     'Master_SSL_Cipher': '',
                     'Master_SSL_Key': '',
                     'Master_SSL_Verify_Server_Cert': 'No',
                     'Master_Server_Id': 1,
                     'Master_User': 'replu',
                     'Read_Master_Log_Pos': 107,
                     'Relay_Log_File': 'klo-relay-bin.000071',
                     'Relay_Log_Pos': 253,
                     'Relay_Log_Space': 553,
                     'Relay_Master_Log_File': 'mysql-bin.000021',
                     'Replicate_Do_DB': '',
                     'Replicate_Do_Table': '',
                     'Replicate_Ignore_DB': '',
                     'Replicate_Ignore_Server_Ids': '',
                     'Replicate_Ignore_Table': '',
                     'Replicate_Wild_Do_Table': '',
                     'Replicate_Wild_Ignore_Table': '',
                     'Seconds_Behind_Master': 0,
                     'Skip_Counter': 0,
                     'Slave_IO_Running': 'Yes',
                     'Slave_IO_State': 'Waiting for master to send event',
                     'Slave_SQL_Running': 'Yes',
                     'Until_Condition': 'None',
                     'Until_Log_File': '',
                     'Until_Log_Pos': 0}}
```

CLI Example:

```
salt '*' mysql.get_slave_status
```

salt.modules.mysql.**grant_add**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, *ssl_option=False*, ***connection_args*)

Adds a grant to the MySQL server.

For database, make sure you specify database.table or database.*

CLI Example:

```
salt '*' mysql.grant_add 'SELECT,INSERT,UPDATE,...' 'database.*' 'frank
↪' 'localhost'
```

salt.modules.mysql.**grant_exists**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Checks to see if a grant exists in the database

CLI Example:

```
salt '*' mysql.grant_exists 'SELECT,INSERT,UPDATE,...' 'database.*'
↪'frank' 'localhost'
```

salt.modules.mysql.**grant_revoke**(*grant*, *database*, *user*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Removes a grant from the MySQL server.

CLI Example:

```
salt '*' mysql.grant_revoke 'SELECT,INSERT,UPDATE' 'database.*' 'frank
↪' 'localhost'
```

salt.modules.mysql.**processlist**(***connection_args*)

Retrieves the processlist from the MySQL server via ``SHOW FULL PROCESSLIST''.

Returns: a list of dicts, with each dict representing a process:

{`**Command**': `**Query**', `Host': `localhost', `Id': 39, `Info': `SHOW FULL PROCESSLIST', `Rows_examined': 0, `Rows_read': 1, `Rows_sent': 0, `State': None, `Time': 0, `User': `root', `db': `mysql'}

CLI Example:

```
salt '*' mysql.processlist
```

salt.modules.mysql.**query**(*database*, *query*, ***connection_args*)

Run an arbitrary SQL query and return the results or the number of affected rows.

CLI Example:

```
salt '*' mysql.query mydb "UPDATE mytable set myfield=1 limit 1"
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb "SELECT id,name,cash from users limit 3"
```

Return data:

```
{'columns': ('id', 'name', 'cash'),
    'query time': {'human': '1.0ms', 'raw': '0.001'},
    'results': ((1L, 'User 1', Decimal('110.000000')),
                (2L, 'User 2', Decimal('215.636756')),
                (3L, 'User 3', Decimal('0.040000'))),
    'rows returned': 3L}
```

CLI Example:

```
salt '*' mysql.query mydb 'INSERT into users values (null,"user 4", 5)'
```

Return data:

```
{'query time': {'human': '25.6ms', 'raw': '0.02563'}, 'rows affected': 1L}
```

CLI Example:

```
salt '*' mysql.query mydb 'DELETE from users where id = 4 limit 1'
```

Return data:

```
{'query time': {'human': '39.0ms', 'raw': '0.03899'}, 'rows affected': 1L}
```

Jinja Example: Run a query on `mydb` and use row 0, column 0's data.

```
{{ salt['mysql.query']('mydb', 'SELECT info from mytable limit 1')['results
 ↪'][0][0] }}
```

`salt.modules.mysql.`**`quote_identifier`**(*identifier*, *for_grants=False*)

Return an identifier name (column, table, database, etc) escaped for MySQL

This means surrounded by ```" character and escaping this character inside. It also means doubling the `%' character for MySQLdb internal usage.

Parameters

- **`identifier`** -- the table, column or database identifier
- **`for_grants`** -- is False by default, when using database names on grant queries you should set it to True to also escape ``_" and ``%" characters as requested by MySQL. Note that theses characters should only be escaped when requesting grants on the database level (*my_%db.**) but not for table level grants (*my_%db.*`foo`)

CLI Example:

```
salt '*' mysql.quote_identifier 'foo`bar'
```

`salt.modules.mysql.`**`showglobal`**(***connection_args*)

Retrieves the show global variables from the minion.

Returns:: show global variables full dict

CLI Example:

```
salt '*' mysql.showglobal
```

`salt.modules.mysql.`**`showvariables`**(***connection_args*)

Retrieves the show variables from the minion.

Returns:: show variables full dict

CLI Example:

```
salt '*' mysql.showvariables
```

salt.modules.mysql.**slave_lag**(***connection_args*)

Return the number of seconds that a slave SQL server is lagging behind the master, if the host is not a slave it will return -1. If the server is configured to be a slave for replication but slave IO is not running then -2 will be returned. If there was an error connecting to the database or checking the slave status, -3 will be returned.

CLI Example:

```
salt '*' mysql.slave_lag
```

salt.modules.mysql.**status**(***connection_args*)

Return the status of a MySQL server using the output from the SHOW STATUS query.

CLI Example:

```
salt '*' mysql.status
```

salt.modules.mysql.**tokenize_grant**(*grant*)

External wrapper function :param grant: :return: dict

CLI Example:

```
salt '*' mysql.tokenize_grant             "GRANT SELECT, INSERT ON testdb.* TO
↪'testuser'@'localhost'"
```

salt.modules.mysql.**user_chpass**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *allow_passwordless=False*, *unix_socket=None*, *password_column=None*, ***connection_args*)

Change password for a MySQL user

host Host for which this user/password combo applies

password The password to set for the new user. Will take precedence over the password_hash option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the *. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If True, then password and password_hash can be omitted (or set to None) to permit a passwordless login.

New in version 0.16.2: The allow_passwordless option was added.

CLI Examples:

```
salt '*' mysql.user_chpass frank localhost newpassword
salt '*' mysql.user_chpass frank localhost password_hash='hash'
salt '*' mysql.user_chpass frank localhost allow_passwordless=True
```

salt.modules.mysql.**user_create**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *allow_passwordless=False*, *unix_socket=False*, *password_column=None*, ***connection_args*)

Creates a MySQL user

host Host for which this user/password combo applies

password The password to use for the new user. Will take precedence over the `password_hash` option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If `True`, then `password` and `password_hash` can be omitted (or set to `None`) to permit a passwordless login.

unix_socket If `True` and allow_passwordless is `True` then will be used unix_socket auth plugin.

New in version 0.16.2: The `allow_passwordless` option was added.

CLI Examples:

```
salt '*' mysql.user_create 'username' 'hostname' 'password'
salt '*' mysql.user_create 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_create 'username' 'hostname' allow_passwordless=True
```

salt.modules.mysql.**user_exists**(*user*, *host='localhost'*, *password=None*, *password_hash=None*, *passwordless=False*, *unix_socket=False*, *password_column=None*, ***connection_args*)

Checks if a user exists on the MySQL server. A login can be checked to see if passwordless login is permitted by omitting `password` and `password_hash`, and using `passwordless=True`.

New in version 0.16.2: The `passwordless` option was added.

CLI Example:

```
salt '*' mysql.user_exists 'username' 'hostname' 'password'
salt '*' mysql.user_exists 'username' 'hostname' password_hash='hash'
salt '*' mysql.user_exists 'username' passwordless=True
salt '*' mysql.user_exists 'username' password_column='authentication_string'
```

salt.modules.mysql.**user_grants**(*user*, *host='localhost'*, ***connection_args*)

Shows the grants for the given MySQL user (if it exists)

CLI Example:

```
salt '*' mysql.user_grants 'frank' 'localhost'
```

salt.modules.mysql.**user_info**(*user*, *host='localhost'*, ***connection_args*)

Get full info on a MySQL user

CLI Example:

```
salt '*' mysql.user_info root localhost
```

salt.modules.mysql.**user_list**(***connection_args*)

Return a list of users on a MySQL server

CLI Example:

```
salt '*' mysql.user_list
```

salt.modules.mysql.**user_remove**(*user*, *host='localhost'*, ***connection_args*)

Delete MySQL user

CLI Example:

```
salt '*' mysql.user_remove frank localhost
```

salt.modules.mysql.**version**(***connection_args*)

Return the version of a MySQL server using the output from the `SELECT VERSION()` query.

CLI Example:

```
salt '*' mysql.version
```

19.9.232 salt.modules.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

When generating keys and encrypting passwords use --local when using salt-call for extra security. Also consider using just the salt runner nacl when encrypting pillar passwords.

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *key* or *keyfile* you can use:

```
salt-call --local nacl.keygen keyfile=/root/.nacl
```

Now with your key, you can encrypt some data:

```
salt-call --local nacl.enc mypass keyfile=/root/.nacl
DRB7Q6/X5gGSRCTpZyxS6hXO5LnlJIIJ4ivbmUlbWj0llUA+uaVyvou3vJ4=
```

To decrypt the data:

```
salt-call --local nacl.dec data='DRB7Q6/
↪X5gGSRCTpZyxS6hXO5LnlJIIJ4ivbmUlbWj0llUA+uaVyvou3vJ4=' keyfile=/root/.nacl
mypass
```

The following optional configurations can be defined in the minion or master config. Avoid storing the config in pillars!

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
    key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
    keyfile: /root/.nacl
```

When the key is defined in the master config you can use it from the nacl runner:

```
salt-run nacl.enc 'myotherpass'
```

Now you can create a pillar with protected data like:

```
pillarexample:
    user: root
    password: {{ salt.nacl.dec('DRB7Q6/
 ↪X5gGSRCTpZyxS6hXO5LnlJIIJ4ivbmUlbWj0llUA+uaVyvou3vJ4=') }}
```

Or do something interesting with grains like:

```
salt-call nacl.enc minionname:dbrole
AL24Z2C5OlkReer3DuQTFdrNLchLuz3NGIhGjZkLtKRYry/b/CksWM8O9yskLwH2AGVLoEXI5jAa

salt minionname grains.setval role 'AL24Z2C5OlkReer3DuQTFdrNLchLuz3NGIhGjZkLtKRYry/b/
 ↪CksWM8O9yskLwH2AGVLoEXI5jAa'

{%- set r = grains.get('role') %}
{%- set role = None %}
{%- if r and 'nacl.dec' in salt %}
    {%- set r = salt['nacl.dec'](r,keyfile='/root/.nacl').split(':') %}
    {%- if opts['id'] == r[0] %}
        {%- set role = r[1] %}
    {%- endif %}
{%- endif %}
base:
    {%- if role %}
    '{{ opts['id'] }}':
        - {{ role }}
    {%- endif %}
```

Multi-line text items like certificates require a bit of extra work. You have to strip the new lines and replace them with `/n' characters. Certificates specifically require some leading white space when calling nacl.enc so that the `--` in the first line (commonly -----BEGIN CERTIFICATE-----) doesn't get interpreted as an argument to nacl.enc. For instance if you have a certificate file that lives in cert.crt:

```
cert=$(cat cert.crt |awk '{printf "%s\n",$0} END {print ""}'); salt-run nacl.enc "
 ↪$cert"
```

Pillar data should look the same, even though the secret will be quite long. However, when calling multiline encrypted secrets from pillar in a state, use the following format to avoid issues with /n creating extra whitespace at the beginning of each line in the cert file:

```
secret.txt:
    file.managed:
        - template: jinja
        - user: user
        - group: group
        - mode: 700
        - contents: "{{- salt['pillar.get']('secret') }}"
```

The `{{-` will tell jinja to strip the whitespace from the beginning of each of the new lines.

`salt.modules.nacl.`**`dec`**(*data*, ***kwargs*)

Takes a key generated from *nacl.keygen* and decrypt some data.

CLI Examples:

```
salt-call --local nacl.dec pEXHQM6cuaF7A=
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl
salt-call --local nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/
 ↪nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

salt.modules.nacl.**enc**(*data*, ***kwargs*)
Takes a key generated from *nacl.keygen* and encrypt some data.

CLI Examples:

```
salt-call --local nacl.enc datatoenc
salt-call --local nacl.enc datatoenc keyfile=/root/.nacl
salt-call --local nacl.enc datatoenc key='cKEzd4kXsbeCE7/
↪nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

salt.modules.nacl.**keygen**(*keyfile=None*)
Use libnacl to generate a private key

CLI Examples:

```
salt-call --local nacl.keygen
salt-call --local nacl.keygen keyfile=/root/.nacl
salt-call --local --out=newline_values_only nacl.keygen > /root/.nacl
```

19.9.233 salt.modules.nagios

Run nagios plugins/checks from salt and get the return as data.

salt.modules.nagios.**list_plugins**()
List all the nagios plugins

CLI Example:

```
salt '*' nagios.list_plugins
```

salt.modules.nagios.**retcode**(*plugin*, *args=''*, *key_name=None*)
Run one nagios plugin and return retcode of the execution

salt.modules.nagios.**retcode_pillar**(*pillar_name*)
Run one or more nagios plugins from pillar data and get the result of cmd.retcode The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You must to group different checks(one o more) and always it will return the highest value of all the checks

CLI Example:

```
salt '*' nagios.retcode webserver
```

salt.modules.nagios.**run**(*plugin*, *args=''*)
Run nagios plugin and return all the data execution with cmd.run

CLI Example:

```
salt '*' nagios.run check_apt
salt '*' nagios.run check_icmp '8.8.8.8'
```

salt.modules.nagios.**run_all**(*plugin*, *args=''*)

Run nagios plugin and return all the data execution with cmd.run_all

salt.modules.nagios.**run_all_pillar**(*pillar_name*)

Run one or more nagios plugins from pillar data and get the result of cmd.run_all The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

salt.modules.nagios.**run_pillar**(*pillar_name*)

Run one or more nagios plugins from pillar data and get the result of cmd.run The pillar have to be in this format:

```
------
webserver:
    Ping_google:
        - check_icmp: 8.8.8.8
        - check_icmp: google.com
    Load:
        - check_load: -w 0.8 -c 1
    APT:
        - check_apt
-------
```

webserver is the role to check, the next keys are the group and the items the check with the arguments if needed

You have to group different checks in a group

CLI Example:

```
salt '*' nagios.run webserver
```

19.9.234 salt.modules.nagios_rpc

Check Host & Service status from Nagios via JSON RPC.

New in version 2015.8.0.

salt.modules.nagios_rpc.**host_status**(*hostname=None*, ***kwargs*)

Check status of a particular host By default statuses are returned in a numeric format.

Parameters:
hostname The hostname to check the status of the service in Nagios.
numeric Turn to false in order to return status in text format (`OK' instead of 0, `Warning' instead of 1 etc)

Returns status: `OK', `Warning', `Critical' or `Unknown'

CLI Example:

```
salt '*' nagios_rpc.host_status hostname=webserver.domain.com
salt '*' nagios_rpc.host_status hostname=webserver.domain.com numeric=False
```

salt.modules.nagios_rpc.**service_status**(*hostname=None*, *service=None*, ***kwargs*)

Check status of a particular service on a host on it in Nagios. By default statuses are returned in a numeric format.

Parameters:
hostname The hostname to check the status of the service in Nagios.
service The service to check the status of in Nagios.
numeric Turn to false in order to return status in text format (`OK' instead of 0, `Warning' instead of 1 etc)

Returns status: `OK', `Warning', `Critical' or `Unknown'

CLI Example:

```
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
salt '*' nagios_rpc.service_status hostname=webserver.domain.com service='HTTP'
 ↪numeric=False
```

19.9.235 salt.modules.namecheap_dns module

Namecheap DNS Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
```

```
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

salt.modules.namecheap_dns.**get_hosts**(*sld*, *tld*)

Retrieves DNS host record settings for the requested domain.

returns a dictionary of information about the requested domain
sld SLD of the domain name
tld TLD of the domain name
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_hosts sld tld
```

salt.modules.namecheap_dns.**get_list**(*sld*, *tld*)

Gets a list of DNS servers associated with the requested domain.

returns a dictionary of information about requested domain
sld SLD of the domain name
tld TLD of the domain name
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.get_list sld tld
```

salt.modules.namecheap_dns.**set_custom**(*sld*, *tld*, *nameservers*)

Sets domain to use custom DNS servers.

returns True if the custom nameservers were set successfully
sld SLD of the domain name
tld TLD of the domain name
nameservers array of strings List of nameservers to be associated with this domain
CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_custom sld tld nameserver
```

salt.modules.namecheap_dns.**set_default**(*sld*, *tld*)

Sets domain to use namecheap default DNS servers. Required for free services like Host record management, URL forwarding, email forwarding, dynamic DNS and other value added services.
sld SLD of the domain name
tld TLD of the domain name
Returns `True` if the domain was successfully pointed at the default DNS servers.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_default sld tld
```

salt.modules.namecheap_dns.**set_hosts**(*sld*, *tld*, *hosts*)

Sets DNS host records settings for the requested domain.

returns True if the host records were set successfully
sld SLD of the domain name
tld TLD of the domain name
hosts Must be passed as a list of Python dictionaries, with each dictionary containing the following keys:

- **hostname**
- **recordtype** - One of `A`, `AAAA`, `CNAME`, `MX`, `MXE`, `TXT`, `URL`, `URL301`, or `FRAME`
- **address** - URL or IP address
- **ttl** - An integer between 60 and 60000 (default: `1800`)

Additonally, the `mxpref` key can be present, but must be accompanied by an `emailtype` key.

CLI Example:

```
salt 'my-minion' namecheap_domains_dns.set_hosts sld tld hosts
```

19.9.236 salt.modules.namecheap_domains module

Namecheap Domain Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_domains.`**`check`**(**domains_to_check*)

Checks the availability of domains

domains_to_check array of strings List of domains to check

Returns a dictionary mapping the each domain name to a boolean denoting whether or not it is available.

CLI Example:

```
salt 'my-minion' namecheap_domains.check domain-to-check
```

`salt.modules.namecheap_domains.`**`create`**(*domain_name*, *years*, ***kwargs*)

Try to register the specified domain name

domain_name The domain name to be registered

years Number of years to register

Returns the following information:

- Whether or not the domain was renewed successfully
- Whether or not WhoisGuard is enabled
- Whether or not registration is instant
- The amount charged for registration
- The domain ID
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.create my-domain-name 2
```

`salt.modules.namecheap_domains.`**`get_info`**(*domain_name*)

Returns information about the requested domain

returns a dictionary of information about the domain_name

domain_name string Domain name to get information about
CLI Example:

```
salt 'my-minion' namecheap_domains.get_info my-domain-name
```

salt.modules.namecheap_domains.**get_list**(*list_type=None*, *search_term=None*, *page=None*, *page_size=None*, *sort_by=None*)
Returns a list of domains for the particular user as a list of objects offset by `page` length of `page_size`
list_type [ALL] One of `ALL`, `EXPIRING`, `EXPIRED`
search_term Keyword to look for on the domain list
page [1] Number of result page to return
page_size [20] Number of domains to be listed per page (minimum: `10`, maximum: `100`)
sort_by One of `NAME`, `NAME_DESC`, `EXPIREDATE`, `EXPIREDATE_DESC`, `CREATEDATE`, or `CREATEDATE_DESC`
CLI Example:

```
salt 'my-minion' namecheap_domains.get_list
```

salt.modules.namecheap_domains.**get_tld_list**()
Returns a list of TLDs as objects

CLI Example:

```
salt 'my-minion' namecheap_domains.get_tld_list
```

salt.modules.namecheap_domains.**reactivate**(*domain_name*)
Try to reactivate the expired domain name

Returns the following information:
- Whether or not the domain was reactivated successfully
- The amount charged for reactivation
- The order ID
- The transaction ID

CLI Example:

```
salt 'my-minion' namecheap_domains.reactivate my-domain-name
```

salt.modules.namecheap_domains.**renew**(*domain_name*, *years*, *promotion_code=None*)
Try to renew the specified expiring domain name for a specified number of years
domain_name The domain name to be renewed
years Number of years to renew
Returns the following information:
- Whether or not the domain was renewed successfully
- The domain ID
- The order ID
- The transaction ID
- The amount charged for renewal

CLI Example:

```
salt 'my-minion' namecheap_domains.renew my-domain-name 5
```

19.9.237 salt.modules.namecheap_ns module

Namecheap Nameserver Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_ns.`**`create`**(*sld*, *tld*, *nameserver*, *ip*)

Creates a new nameserver. Returns `True` if the nameserver was created successfully.

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
ip Nameserver IP address
CLI Example:

```
salt '*' namecheap_domains_ns.create sld tld nameserver ip
```

`salt.modules.namecheap_ns.`**`delete`**(*sld*, *tld*, *nameserver*)

Deletes a nameserver. Returns `True` if the nameserver was deleted successfully

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to delete
CLI Example:

```
salt '*' namecheap_domains_ns.delete sld tld nameserver
```

`salt.modules.namecheap_ns.`**`get_info`**(*sld*, *tld*, *nameserver*)

Retrieves information about a registered nameserver. Returns the following information:

- IP Address set for the nameserver
- Domain name which was queried
- A list of nameservers and their statuses

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to retrieve

CLI Example:

```
salt '*' namecheap_domains_ns.get_info sld tld nameserver
```

`salt.modules.namecheap_ns.`**`update`**(*sld*, *tld*, *nameserver*, *old_ip*, *new_ip*)

Deletes a nameserver. Returns `True` if the nameserver was updated successfully.

sld SLD of the domain name
tld TLD of the domain name
nameserver Nameserver to create
old_ip Current ip address
new_ip New ip address

CLI Example:

```
salt '*' namecheap_domains_ns.update sld tld nameserver old_ip new_ip
```

19.9.238 salt.modules.namecheap_ssl module

Namecheap SSL Certificate Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_ssl.`**`activate`**(*csr_file*, *certificate_id*, *web_server_type*, *approver_email=None*, *http_dc_validation=False*, ***kwargs*)

Activates a newly-purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file

certificate_id Unique ID of the SSL certificate you wish to activate

web_server_type The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape

- other
- plesk
- tomcat
- weblogic
- website
- webstar
- zeusv3

approver_email The email ID which is on the approver email list.

Note: `http_dc_validation` must be set to `False` if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.

Note: For other parameters which may be required, see here.

CLI Example:

```
salt 'my-minion' namecheap_ssl.activate my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.`**`create`**(*years*, *certificate_type*, *promotion_code=None*, *sans_to_add=None*)

Creates a new SSL certificate. Returns the following information:

- Whether or not the SSL order was successful
- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order
- The date on which the certificate was created
- The date on which the certificate will expire
- The type of SSL certificate
- The number of years for which the certificate was purchased
- The current status of the SSL certificate

years [1] Number of years to register

certificate_type Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV

- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

promotional_code An optional promo code to use when creating the certificate

sans_to_add [0] This parameter defines the number of add-on domains to be purchased in addition to the default number of domains included with a multi-domain certificate. Each certificate that supports SANs has the default number of domains included. You may check the default number of domains included and the maximum number of domains that can be added to it in the table below.

Provider	Product name	Default number of domains (domain from CSR is counted here)	Maximum number of total domains	Maximum number of domains that can be passed in sans_to_add parameter
Comodo	PositiveSSL Multi-Domain	3	100	97
Comodo	Multi-Domain SSL	3	100	97
Comodo	EV Multi-Domain SSL	3	100	97
Comodo	Unified Communications	3	100	97
GeoTrust	QuickSSL Premium	1	1 domain + 4 subdomains	The only supported value is 4
GeoTrust	True BusinessID with EV Multi-Domain	5	25	20
GeoTrust	True Business ID Multi-Domain	5	25	20
Thawte	SSL Web Server	1	25	24
Thawte	SSL Web Server with EV	1	25	24
Thawte	SGC Supercerts	1	25	24
Symantec	Secure Site Pro with EV	1	25	24
Symantec	Secure Site with EV	1	25	24
Symantec	Secure Site	1	25	24
Symantec	Secure Site Pro	1	25	24

CLI Example:

```
salt 'my-minion' namecheap_ssl.create 2 RapidSSL
```

salt.modules.namecheap_ssl.**get_info**(*certificate_id*, *returncertificate=False*, *returntype=None*)

Retrieves information about the requested SSL certificate. Returns a dictionary of information about the SSL

certificate with two keys:

- **ssl** - Contains the metadata information
- **certificate** - Contains the details for the certificate such as the CSR, Approver, and certificate data

certificate_id Unique ID of the SSL certificate

returncertificate [False] Set to `True` to ask for the certificate in response

returntype Optional type for the returned certificate. Can be either ``Individual'' (for X.509 format) or ``PKCS7''

> **Note:** Required if `returncertificate` is `True`

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_info my-cert-id
```

`salt.modules.namecheap_ssl.`**`get_list`**`(`*`**kwargs`*`)`

Returns a list of SSL certificates for a particular user

ListType [All] Possible values:

- All
- Processing
- EmailSent
- TechnicalProblem
- InProgress
- Completed
- Deactivated
- Active
- Cancelled
- NewPurchase
- NewRenewal

SearchTerm Keyword to look for on the SSL list

Page [1] Page number to return

PageSize [20] Total number of SSL certificates to display per page (minimum: `10`, maximum: `100`)

SoryBy One of `PURCHASEDATE`, `PURCHASEDATE_DESC`, `SSLTYPE`, `SSLTYPE_DESC`, `EXPIREDATETIME`, `EXPIREDATETIME_DESC`, `Host_Name`, or `Host_Name_DESC`

CLI Example:

```
salt 'my-minion' namecheap_ssl.get_list Processing
```

`salt.modules.namecheap_ssl.`**`parse_csr`**`(`*`csr_file`*`, `*`certificate_type`*`, `*`http_dc_validation=False`*`)`

Parses the CSR. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file

certificate_type Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL

- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV
- True BusinessID with EV Multi Domain
- Unified Communications

http_dc_validation [False] Set to `True` if a Comodo certificate and validation should be done with files instead of emails and to return the info to do so

CLI Example:

```
salt 'my-minion' namecheap_ssl.parse_csr my-csr-file PremiumSSL
```

salt.modules.namecheap_ssl.**reissue**(*csr_file*, *certificate_id*, *web_server_type*, *approver_email=None*, *http_dc_validation=False*, ***kwargs*)

Reissues a purchased SSL certificate. Returns a dictionary of result values.

csr_file Path to Certificate Signing Request file

certificate_id Unique ID of the SSL certificate you wish to activate

web_server_type The type of certificate format to return. Possible values include:

- apache2
- apacheapachessl
- apacheopenssl
- apacheraven
- apachessl
- apachessleay
- c2net
- cobaltseries
- cpanel
- domino
- dominogo4625
- dominogo4626
- ensim
- hsphere
- ibmhttp
- iis
- iis4
- iis5
- iplanet
- ipswitch
- netscape
- other
- plesk
- tomcat

- weblogic
- website
- webstar
- zeusv3

approver_email The email ID which is on the approver email list.

> **Note:** `http_dc_validation` must be set to `False` if this option is used.

http_dc_validation [False] Whether or not to activate using HTTP-based validation.

> **Note:** For other parameters which may be required, see here.

CLI Example:

```
salt 'my-minion' namecheap_ssl.reissue my-csr-file my-cert-id apachessl
```

`salt.modules.namecheap_ssl.`**`renew`**(*years*, *certificate_id*, *certificate_type*, *promotion_code=None*)

Renews an SSL certificate if it is ACTIVE and Expires <= 30 days. Returns the following information:

- The certificate ID
- The order ID
- The transaction ID
- The amount charged for the order

years [1] Number of years to register
certificate_id Unique ID of the SSL certificate you wish to renew
certificate_type Type of SSL Certificate. Possible values include:

- EV Multi Domain SSL
- EV SSL
- EV SSL SGC
- EssentialSSL
- EssentialSSL Wildcard
- InstantSSL
- InstantSSL Pro
- Multi Domain SSL
- PositiveSSL
- PositiveSSL Multi Domain
- PositiveSSL Wildcard
- PremiumSSL
- PremiumSSL Wildcard
- QuickSSL Premium
- RapidSSL
- RapidSSL Wildcard
- SGC Supercert
- SSL Web Server
- SSL Webserver EV
- SSL123
- Secure Site
- Secure Site Pro
- Secure Site Pro with EV
- Secure Site with EV
- True BusinessID
- True BusinessID Multi Domain
- True BusinessID Wildcard
- True BusinessID with EV

- True BusinessID with EV Multi Domain
- Unified Communications

promotional_code An optional promo code to use when renewing the certificate

CLI Example:

```
salt 'my-minion' namecheap_ssl.renew 1 my-cert-id RapidSSL
```

19.9.239 salt.modules.namecheap_users module

Namecheap User Management

New in version 2017.7.0.

Prerequisites

This module uses the `requests` Python module to communicate to the namecheap API.

Configuration

The Namecheap username, API key and URL should be set in the minion configuration file, or in the Pillar data.

```
namecheap.name: companyname
namecheap.key: a1b2c3d4e5f67a8b9c0d1e2f3
namecheap.client_ip: 162.155.30.172
#Real url
namecheap.url: https://api.namecheap.com/xml.response
#Sandbox url
#namecheap.url: https://api.sandbox.namecheap.xml.response
```

`salt.modules.namecheap_users.`**`check_balances`**`(`*minimum=100*`)`

Checks if the provided minimum value is present in the user's account.

Returns a boolean. Returns `False` if the user's account balance is less than the provided minimum or `True` if greater than the minimum.

minimum [100] The value to check

CLI Example:

```
salt 'my-minion' namecheap_users.check_balances
salt 'my-minion' namecheap_users.check_balances minimum=150
```

`salt.modules.namecheap_users.`**`get_balances`**`()`

Gets information about fund in the user's account. This method returns the following information: Available Balance, Account Balance, Earned Amount, Withdrawable Amount and Funds Required for AutoRenew.

Note: If a domain setup with automatic renewal is expiring within the next 90 days, the FundsRequiredForAutoRenew attribute shows the amount needed in your Namecheap account to complete auto renewal.

CLI Example:

```
salt 'my-minion' namecheap_users.get_balances
```

19.9.240 salt.modules.napalm module

NAPALM helpers

Helpers for the NAPALM modules.

New in version 2017.7.0.

salt.modules.napalm.**alive**(**args*, ***kwargs*)

Returns the alive status of the connection layer. The output is a dictionary under the usual dictionary output of the NAPALM modules.

CLI Example:

```
salt '*' napalm.alive
```

Output Example:

```
result: True
out:
    is_alive: False
comment: ''
```

salt.modules.napalm.**call**(**args*, ***kwargs*)

Execute arbitrary methods from the NAPALM library. To see the expected output, please consult the NAPALM documentation.

Note: This feature is not recommended to be used in production. It should be used for testing only!

CLI Example:

```
salt '*' napalm.call get_lldp_neighbors
salt '*' napalm.call get_firewall_policies
salt '*' napalm.call get_bgp_config group='my-group'
```

salt.modules.napalm.**compliance_report**(**args*, ***kwargs*)

Return the compliance report.

filepath The absolute path to the validation file.

CLI Example:

```
salt '*' napalm.compliance_report ~/validate.yml
```

Validation File Example:

```
- get_facts:
    os_version: 4.17

- get_interfaces_ip:
    Management1:
        ipv4:
            10.0.2.14:
                prefix_length: 24
            _mode: strict
```

Output Example:

```
device1:
    ----------
    comment:
    out:
        ----------
        complies:
            False
        get_facts:
            ----------
            complies:
                False
            extra:
            missing:
            present:
                ----------
                os_version:
                    ----------
                    actual_value:
                        15.1F6-S1.4
                    complies:
                        False
                    nested:
                        False
        get_interfaces_ip:
            ----------
            complies:
                False
            extra:
            missing:
                - Management1
            present:
                ----------
        skipped:
    result:
        True
```

salt.modules.napalm.**reconnect**(**args*, ***kwargs*)

Reconnect the NAPALM proxy when the connection is dropped by the network device. The connection can be forced to be restarted using the `force` argument.

Note: This function can be used only when running proxy minions.

CLI Example:

```
salt '*' napalm.reconnect
salt '*' napalm.reconnect force=True
```

19.9.241 salt.modules.napalm_acl module

NAPALM ACL

Generate and load ACL (firewall) configuration on network devices.

New in version 2017.7.0.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends capirca, napalm

platform unix

Dependencies

The firewall configuration is generated by Capirca.

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.modules.napalm_acl.`**`get_filter_pillar`**(*filter_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the filter configuration given its name.

filter_name The name of the filter.

pillar_key The root key of the whole policy config.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.napalm_acl.`**`get_term_pillar`**(*filter_name*, *term_name*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*)

Helper that can be used inside a state SLS, in order to get the term configuration given its name, under a certain filter uniquely identified by its name.

filter_name The name of the filter.

term_name The name of the term.

pillar_key: **`acl`** The root key of the whole policy config. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

`salt.modules.napalm_acl.`**`load_filter_config`**(**args*, ***kwargs*)

Generate and load the configuration of a policy filter.

Note: The order of the terms is very important. The configuration loaded on the device respects the order defined in the `terms` and/or inside the pillar.

When merging the `terms` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

terms List of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`** Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

only_lower_merge: **`False`** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id Add a comment in the filter config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the filter configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as *`net.load_config`*.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_filter_config my-filter pillar_key=netacl
 ↪debug=True
```

Output Example:

```
edge01.bjm01:
    ----------
    already_configured:
        False
    comment:
    diff:
        [edit firewall]
        +    family inet {

                **
                */
                filter my-filter {
                    interface-specific;
                    term my-term {
                        from {
                            source-port [ 1234 1235 ];
                        }
                        then {
                            reject;
                        }
                    }
                    term my-other-term {
                        from {
                            protocol tcp;
                            source-port 5678-5680;
                        }
                        then accept;
                    }
                }
            }
        }
    result:
        True
```

The filter configuration has been loaded from the pillar, having the following structure:

```
netacl:
  - my-filter:
      terms:
        - my-term:
            source_port:
             - 1234
             - 1235
            action: reject
        - my-other-term:
            source_port:
              - - 5678
                - 5680
            protocol: tcp
            action: accept
```

salt.modules.napalm_acl.**load_policy_config**(**args*, ***kwargs*)

Generate and load the configuration of the whole policy.

Note: The order of the filters and their terms is very important. The configuration loaded on the device respects the order defined in the `filters` and/or inside the pillar.

When merging the `filters` with the pillar data, consider the `prepend` argument to make sure the order is correct!

---

filters List of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **True** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: **acl** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

merge_pillar: **True** Merge the CLI variables with the pillar. Default: `True`.

The merge logic depends on the `prepend` argument and the CLI has higher priority than the pillar.

only_lower_merge: **False** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: **True** Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: **%Y/%m/%d** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

test: **False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True** Commit? Default: `True`.

debug: **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.flw01' netacl.load_policy_config debug=True
```

Output Example:

```
edge01.flw01:

              - icmp
            action: reject
```

salt.modules.napalm_acl.**load_term_config**(**args*, ***kwargs*)

Generate and load the configuration of a policy term.

filter_name The name of the policy filter.

term_name The name of the term.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

pillar_key: **acl** The key in the pillar containing the default attributes values. Default: `acl`. If the pillar contains the following structure:

```
firewall:
  - my-filter:
      terms:
```

```
        - my-term:
            source_port: 1234
            source_address:
                - 1.2.3.4/32
                - 5.6.7.8/32
```

The `pillar_key` field would be specified as `firewall`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`True`** Merge the CLI variables with the pillar. Default: `True`.

The properties specified through the CLI have higher priority than the pillar.

revision_id Add a comment in the term config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the term configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

source_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the *`file state`*.

destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.

term_fields Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have a few other optional keywords.

Note: The following fields are accepted (some being platform-specific):

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer

- port
- precedence
- principals
- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option

- port
- precedence
- principals
- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - - 1000
      - 2000
    - - 3000
      - 4000
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

The output is a dictionary having the same form as *net.load_config*.

CLI Example:

```
salt 'edge01.bjm01' netacl.load_term_config filter-name term-name source_
↪address=1.2.3.4 destination_address=5.6.7.8 action=accept test=True debug=True
```

Output Example:

```
edge01.bjm01:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:

```

19.9.242 salt.modules.napalm_bgp module

NAPALM BGP

Manages BGP configuration on network devices and provides statistics.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

salt.modules.napalm_bgp.**config**(**args*, ***kwargs*)

Provides the BGP configuration on the device.

Parameters

- **group** -- Name of the group selected to display the configuration.
- **neighbor** -- IP Address of the neighbor to display the configuration. If the group parameter is not specified, the neighbor setting will be ignored.

Returns A dictionary containing the BGP configuration from the network device. The keys of the main dictionary are the group names.

Each group has the following properties:

•type (string)
•description (string)
•apply_groups (string list)
•multihop_ttl (int)
•multipath (True/False)
•local_address (string)
•local_as (int)
•remote_as (int)
•import_policy (string)
•export_policy (string)
•remove_private_as (True/False)
•prefix_limit (dictionary)
•neighbors (dictionary)

Each neighbor in the dictionary of neighbors provides:

•description (string)
•import_policy (string)
•export_policy (string)
•local_address (string)
•local_as (int)
•remote_as (int)
•authentication_key (string)

- prefix_limit (dictionary)
- route_reflector_client (True/False)
- nhs (True/False)

CLI Example:

```
salt '*' bgp.config # entire BGP config
salt '*' bgp.config PEERS-GROUP-NAME # provides detail only about BGP group PEERS-
↪GROUP-NAME
salt '*' bgp.config PEERS-GROUP-NAME 172.17.17.1 # provides details only about
↪BGP neighbor 172.17.17.1,
# configured in the group PEERS-GROUP-NAME
```

Output Example:

```
{
    'PEERS-GROUP-NAME':{
        'type'          : u'external',
        'description'   : u'Here we should have a nice description',
        'apply_groups'  : [u'BGP-PREFIX-LIMIT'],
        'import_policy' : u'PUBLIC-PEER-IN',
        'export_policy' : u'PUBLIC-PEER-OUT',
        'remove_private': True,
        'multipath'     : True,
        'multihop_ttl'  : 30,
        'neighbors'     : {
            '192.168.0.1': {
                'description'   : 'Facebook [CDN]',
                'prefix_limit'  : {
                    'inet': {
                        'unicast': {
                            'limit': 100,
                            'teardown': {
                                'threshold' : 95,
                                'timeout'   : 5
                            }
                        }
                    }
                }
                'peer-as'        : 32934,
                'route_reflector': False,
                'nhs'            : True
            },
            '172.17.17.1': {
                'description'   : 'Twitter [CDN]',
                'prefix_limit'  : {
                    'inet': {
                        'unicast': {
                            'limit': 500,
                            'no-validate': 'IMPORT-FLOW-ROUTES'
                        }
                    }
                }
                'peer_as'        : 13414
                'route_reflector': False,
                'nhs'            : False
            }
        }
    }
```

```
}
```

salt.modules.napalm_bgp.**neighbors**(**args*, ***kwargs*)

Provides details regarding the BGP sessions configured on the network device.

Parameters **neighbor** -- IP Address of a specific neighbor.

Returns

A dictionary with the statistics of the all/selected BGP neighbors. Outer dictionary keys represent the VRF name. Keys of inner dictionary represent the AS numbers, while the values are lists of dictionaries, having the following keys:

- up (True/False)
- local_as (int)
- remote_as (int)
- local_address (string)
- routing_table (string)
- local_address_configured (True/False)
- local_port (int)
- remote_address (string)
- remote_port (int)
- multihop (True/False)
- multipath (True/False)
- remove_private_as (True/False)
- import_policy (string)
- export_policy (string)
- input_messages (int)
- output_messages (int)
- input_updates (int)
- output_updates (int)
- messages_queued_out (int)
- connection_state (string)
- previous_connection_state (string)
- last_event (string)
- suppress_4byte_as (True/False)
- local_as_prepend (True/False)
- holdtime (int)
- configured_holdtime (int)
- keepalive (int)
- configured_keepalive (int)
- active_prefix_count (int)

- received_prefix_count (int)
- accepted_prefix_count (int)
- suppressed_prefix_count (int)
- advertised_prefix_count (int)
- flap_count (int)

CLI Example:

```
salt '*' bgp.neighbors  # all neighbors
salt '*' bgp.neighbors 172.17.17.1  # only session with BGP neighbor(s) 172.17.17.1
```

Output Example:

```
{
    'default': {
        8121: [
            {
                'up'                        : True,
                'local_as'                  : 13335,
                'remote_as'                 : 8121,
                'local_address'             : u'172.101.76.1',
                'local_address_configured'  : True,
                'local_port'                : 179,
                'remote_address'            : u'192.247.78.0',
                'router_id':                : u'192.168.0.1',
                'remote_port'               : 58380,
                'multihop'                  : False,
                'import_policy'             : u'4-NTT-TRANSIT-IN',
                'export_policy'             : u'4-NTT-TRANSIT-OUT',
                'input_messages'            : 123,
                'output_messages'           : 13,
                'input_updates'             : 123,
                'output_updates'            : 5,
                'messages_queued_out'       : 23,
                'connection_state'          : u'Established',
                'previous_connection_state' : u'EstabSync',
                'last_event'                : u'RecvKeepAlive',
                'suppress_4byte_as'         : False,
                'local_as_prepend'          : False,
                'holdtime'                  : 90,
                'configured_holdtime'       : 90,
                'keepalive'                 : 30,
                'configured_keepalive'      : 30,
                'active_prefix_count'       : 132808,
                'received_prefix_count'     : 566739,
                'accepted_prefix_count'     : 566479,
                'suppressed_prefix_count'   : 0,
                'advertise_prefix_count'    : 0,
                'flap_count'                : 27
            }
        ]
    }
}
```

19.9.243 salt.modules.napalm_network module

NAPALM Network

Basic methods for interaction with the network device through the virtual proxy `napalm'.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm proxy minion*

New in version 2016.11.0.

Changed in version 2017.7.0.

salt.modules.napalm_network.**arp**(**args*, ***kwargs*)

NAPALM returns a list of dictionaries with details of the ARP entries.

Parameters

- **interface** -- interface name to filter on
- **ipaddr** -- IP address to filter on
- **macaddr** -- MAC address to filter on

Returns List of the entries in the ARP table

CLI Example:

```
salt '*' net.arp
salt '*' net.arp macaddr='5c:5e:ab:da:3c:f0'
```

Example output:

```
[
    {
        'interface' : 'MgmtEth0/RSP0/CPU0/0',
        'mac'       : '5c:5e:ab:da:3c:f0',
        'ip'        : '172.17.17.1',
        'age'       : 1454496274.84
    },
    {
        'interface': 'MgmtEth0/RSP0/CPU0/0',
        'mac'       : '66:0e:94:96:e0:ff',
        'ip'        : '172.17.17.2',
        'age'       : 1435641582.49
    }
]
```

salt.modules.napalm_network.**cli**(**args*, ***kwargs*)

Returns a dictionary with the raw output of all commands passed as arguments.

Parameters **commands** -- list of commands to be executed on the device

Returns a dictionary with the mapping between each command and its raw output

CLI Example:

```
salt '*' net.cli "show version" "show chassis fan"
```

Example output:

```
{
    u'show version and haiku':  u'Hostname: re0.edge01.arn01
                                  Model: mx480
                                  Junos: 13.3R6.5
                                    Help me, Obi-Wan
                                    I just saw Episode Two
                                    You're my only hope
                                ',
    u'show chassis fan' :   u'Item                      Status   RPM     Measurement
                             Top Rear Fan               OK       3840    Spinning at␛
 ↪intermediate-speed
                             Bottom Rear Fan            OK       3840    Spinning at␛
 ↪intermediate-speed
                             Top Middle Fan             OK       3900    Spinning at␛
 ↪intermediate-speed
                             Bottom Middle Fan          OK       3840    Spinning at␛
 ↪intermediate-speed
                             Top Front Fan              OK       3810    Spinning at␛
 ↪intermediate-speed
                             Bottom Front Fan           OK       3840    Spinning at␛
 ↪intermediate-speed
                              '
}
```

salt.modules.napalm_network.**commit**(**args*, ***kwargs*)

Commits the configuration changes made on the network device.

CLI Example:

```
salt '*' net.commit
```

salt.modules.napalm_network.**compare_config**(**args*, ***kwargs*)

Returns the difference between the running config and the candidate config.

CLI Example:

```
salt '*' net.compare_config
```

salt.modules.napalm_network.**config**(**args*, ***kwargs*)

New in version 2017.7.0.

Return the whole configuration of the network device. By default, it will return all possible configuration sources supported by the network device. At most, there will be:

- running config
- startup config
- candidate config

To return only one of the configurations, you can use the `source` argument.

source Which configuration type you want to display, default is all of them.

Options:

- running
- candidate
- startup

Returns

The object returned is a dictionary with the following keys:

- running (string): Representation of the native running configuration.
- **candidate (string)**: **Representation of the native candidate configuration**. If the device doesn't differentiate between running and startup configuration this will an empty string.
- **startup (string)**: **Representation of the native startup configuration**. If the device doesn't differentiate between running and startup configuration this will an empty string.

CLI Example:

```
salt '*' net.config
salt '*' net.config source=candidate
```

salt.modules.napalm_network.**config_changed**(**args*, ***kwargs*)

Will prompt if the configuration has been changed.

Returns A tuple with a boolean that specifies if the config was changed on the device. And a string that provides more details of the reason why the configuration was not changed.

CLI Example:

```
salt '*' net.config_changed
```

salt.modules.napalm_network.**config_control**(**args*, ***kwargs*)

Will check if the configuration was changed. If differences found, will try to commit. In case commit unsuccessful, will try to rollback.

Returns A tuple with a boolean that specifies if the config was changed/committed/rollbacked on the device. And a string that provides more details of the reason why the configuration was not committed properly.

CLI Example:

```
salt '*' net.config_control
```

salt.modules.napalm_network.**connected**(**args*, ***kwargs*)

Specifies if the connection to the device succeeded.

CLI Example:

```
salt '*' net.connected
```

salt.modules.napalm_network.**discard_config**(**args*, ***kwargs*)

Discards the changes applied.

CLI Example:

```
salt '*' net.discard_config
```

salt.modules.napalm_network.**environment**(**args*, ***kwargs*)

Returns the environment of the device.

CLI Example:

```
salt '*' net.environment
```

Example output:

```
{
    'fans': {
        'Bottom Rear Fan': {
            'status': True
        },
        'Bottom Middle Fan': {
            'status': True
        },
        'Top Middle Fan': {
            'status': True
        },
        'Bottom Front Fan': {
            'status': True
        },
        'Top Front Fan': {
            'status': True
        },
        'Top Rear Fan': {
            'status': True
        }
    },
    'memory': {
        'available_ram': 16349,
        'used_ram': 4934
    },
    'temperature': {
       'FPC 0 Exhaust A': {
            'is_alert': False,
            'temperature': 35.0,
            'is_critical': False
        }
    },
    'cpu': {
        '1': {
            '%usage': 19.0
        },
        '0': {
            '%usage': 35.0
        }
    }
}
```

salt.modules.napalm_network.**facts**(**args*, ***kwargs*)

Returns characteristics of the network device. :return: a dictionary with the following keys:

- •uptime - Uptime of the device in seconds.
- •vendor - Manufacturer of the device.
- •model - Device model.
- •hostname - Hostname of the device
- •fqdn - Fqdn of the device
- •os_version - String with the OS version running on the device.
- •serial_number - Serial number of the device
- •interface_list - List of the interfaces of the device

CLI Example:

```
salt '*' net.facts
```

Example output:

```
{
    'os_version': u'13.3R6.5',
    'uptime': 10117140,
    'interface_list': [
        'lc-0/0/0',
        'pfe-0/0/0',
        'pfh-0/0/0',
        'xe-0/0/0',
        'xe-0/0/1',
        'xe-0/0/2',
        'xe-0/0/3',
        'gr-0/0/10',
        'ip-0/0/10'
    ],
    'vendor': u'Juniper',
    'serial_number': u'JN131356FBFA',
    'model': u'MX480',
    'hostname': u're0.edge05.syd01',
    'fqdn': u're0.edge05.syd01'
}
```

salt.modules.napalm_network.**interfaces**(**args*, ***kwargs*)

Returns details of the interfaces on the device.

Returns Returns a dictionary of dictionaries. The keys for the first dictionary will be the interfaces in the devices.

CLI Example:

```
salt '*' net.interfaces
```

Example output:

```
{
    u'Management1': {
        'is_up': False,
        'is_enabled': False,
        'description': u'',
        'last_flapped': -1,
        'speed': 1000,
        'mac_address': u'dead:beef:dead',
    },
    u'Ethernet1':{
        'is_up': True,
        'is_enabled': True,
        'description': u'foo',
        'last_flapped': 1429978575.1554043,
        'speed': 1000,
        'mac_address': u'beef:dead:beef',
    }
}
```

salt.modules.napalm_network.**ipaddrs**(**args*, ***kwargs*)

Returns IP addresses configured on the device.

Returns A dictionary with the IPv4 and IPv6 addresses of the interfaces. Returns all configured IP addresses on all interfaces as a dictionary of dictionaries. Keys of the main dictionary represent the name of the interface. Values of the main dictionary represent are dictionaries that may consist of two keys `ipv4' and `ipv6' (one, both or none) which are themselvs dictionaries with the IP addresses as keys.

CLI Example:

```
salt '*' net.ipaddrs
```

Example output:

```
{
    u'FastEthernet8': {
        u'ipv4': {
            u'10.66.43.169': {
                'prefix_length': 22
            }
        }
    },
    u'Loopback555': {
        u'ipv4': {
            u'192.168.1.1': {
                'prefix_length': 24
            }
        },
        u'ipv6': {
            u'1::1': {
                'prefix_length': 64
            },
            u'2001:DB8:1::1': {
                'prefix_length': 64
            },
            u'FE80::3': {
                'prefix_length': u'N/A'
            }
        }
    }
}
```

salt.modules.napalm_network.**lldp**(**args*, ***kwargs*)

Returns a detailed view of the LLDP neighbors.

Parameters **interface** -- interface name to filter on

Returns A dictionary with the LLDL neighbors. The keys are the interfaces with LLDP activated on.

CLI Example:

```
salt '*' net.lldp
salt '*' net.lldp interface='TenGigE0/0/0/8'
```

Example output:

```
{
    'TenGigE0/0/0/8': [
        {
            'parent_interface': u'Bundle-Ether8',
            'interface_description': u'TenGigE0/0/0/8',
            'remote_chassis_id': u'8c60.4f69.e96c',
            'remote_system_name': u'switch',
            'remote_port': u'Eth2/2/1',
            'remote_port_description': u'Ethernet2/2/1',
            'remote_system_description': u'Cisco Nexus Operating System (NX-OS)
↪Software 7.1(0)N1(1a)
                  TAC support: http://www.cisco.com/tac
```

```
                Copyright (c) 2002-2015, Cisco Systems, Inc. All rights reserved.',
            'remote_system_capab': u'B, R',
            'remote_system_enable_capab': u'B'
        }
    ]
}
```

salt.modules.napalm_network.**load_config**(**args*, ***kwargs*)

Applies configuration changes on the device. It can be loaded from a file or from inline string. If you send both a filename and a string containing the configuration, the file has higher precedence.

By default this function will commit the changes. If there are no changes, it does not commit and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To keep the changes but not commit, set `commit` to `False`.

To replace the config, set `replace` to `True`.

filename Path to the file containing the desired configuration. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.
- `http://` or `https://`
- `ftp://`
- `s3://`
- `swift://`

Changed in version 2017.7.3.

text String containing the desired configuration. This argument is ignored when `filename` is specified.

test: **False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True** Commit? Default: `True`.

debug: **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

New in version 2016.11.2.

replace: **False** Load and replace the configuration. Default: `False`.

New in version 2016.11.2.

saltenv: **`base`** Specifies the Salt environment name.

New in version 2017.7.3.

Returns a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' net.load_config text='ntp peer 192.168.0.1'
salt '*' net.load_config filename='/absolute/path/to/your/file'
salt '*' net.load_config filename='/absolute/path/to/your/file' test=True
salt '*' net.load_config filename='/absolute/path/to/your/file' commit=False
```

Example output:

```
{
    'comment': 'Configuration discarded.',
    'already_configured': False,
    'result': True,
    'diff': '[edit interfaces xe-0/0/5]+   description "Adding a description";'
}
```

salt.modules.napalm_network.**load_template**(**args*, ***kwargs*)

Renders a configuration template (default: Jinja) and loads the result on the device.

By default this function will commit the changes. If there are no changes, it does not commit, discards he config and the flag `already_configured` will be set as `True` to point this out.

To avoid committing the configuration, set the argument `test` to `True` and will discard (dry run).

To preserve the changes, set `commit` to `False`. However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`.

> **Warning:** The support for native NAPALM templates will be dropped in Salt Fluorine. Implicitly, the `template_path` argument will be removed.

template_name Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
    base:
        - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https:/example.com/template.mako`
- `ftp://example.com/template.py`

template_source: **None** Inline config template to be rendered and loaded on the device.

template_path: **None** Required only in case the argument `template_name` provides only the file basename when referencing a local template using the absolute path. E.g.: if `template_name` is specified as `my_template.jinja`, in order to find the template, this argument must be provided: `template_path: /absolute/path/to/`.

> **Note:** This argument will be deprecated beginning with release codename `Fluorine`.

template_hash: **None** Hash of the template file. Format: `{hash_type: 'md5','hsum': <md5sum>}`

New in version 2016.11.2.

template_hash_name: **None** When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

New in version 2016.11.2.

template_group: **root** Owner of file.

New in version 2016.11.2.

template_user: **root** Group owner of file.

New in version 2016.11.2.

template_user: **755** Permissions of file.

New in version 2016.11.2.

saltenv: **base** Specifies the template environment. This will influence the relative imports inside the templates.

New in version 2016.11.2.

template_engine: **jinja** The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

New in version 2016.11.2.

skip_verify: **True** If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.11.2.

test: **False** Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True** Commit? (default: `True`)

debug: **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

New in version 2016.11.2.

replace: **False** Load and replace the configuration.

New in version 2016.11.2.

defaults: **None** Default variables/context passed to the template.

New in version 2016.11.2.

template_vars Dictionary with the arguments/context to be used when the template is rendered.

Note: Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see the examples below!

Returns a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is `False` only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still `True` and so will be the `already_configured` flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- loaded_config (str): the configuration loaded on the device, after rendering the template. Requires `debug` to be set as `True`
- diff (str): returns the config changes applied

The template can use variables from the `grains`, `pillar` or `opts`, for example:

```
{% set router_model = grains.get('model') -%}
{% set router_vendor = grains.get('vendor') -%}
{% set os_version = grains.get('version') -%}
{% set hostname = pillar.get('proxy', {}).get('host') -%}
{% if router_vendor|lower == 'juniper' %}
system {
    host-name {{hostname}};
}
{% elif router_vendor|lower == 'cisco' %}
hostname {{hostname}}
{% endif %}
```

CLI Examples:

```
salt '*' net.load_template set_ntp_peers peers=[192.168.0.1]  # uses NAPALM default templates

# inline template:
salt -G 'os:junos' net.load_template set_hostname template_source='system { host-name {{host_name}}; }'         host_name='MX480.lab'

# inline template using grains info:
salt -G 'os:junos' net.load_template set_hostname         template_source='system { host-name {{grains.model}}.lab; }'
# if the device is a MX480, the command above will set the hostname as: MX480.lab

# inline template using pillar data:
salt -G 'os:junos' net.load_template set_hostname template_source='system { host-name {{pillar.proxy.host}}; }'

salt '*' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa'  # will commit
salt '*' net.load_template my_template template_path='/tmp/tpl/' my_param='aaa' test=True  # dry run

salt '*' net.load_template salt://templates/my_stuff.jinja debug=True  # equivalent of the next command
salt '*' net.load_template my_stuff.jinja template_path=salt://templates/ debug=True

# in case the template needs to include files that are not under the same path (e.g. http://),
# to help the templating engine find it, you will need to specify the `saltenv` argument:
salt '*' net.load_template my_stuff.jinja template_path=salt://templates saltenv=/path/to/includes debug=True

# render a mako template:
salt '*' net.load_template salt://templates/my_stuff.mako template_engine=mako debug=True

# render remote template
salt -G 'os:junos' net.load_template http://bit.ly/2fReJg7 test=True debug=True peers=['192.168.0.1']
salt -G 'os:ios' net.load_template http://bit.ly/2gKOj20 test=True debug=True peers=['192.168.0.1']
```

Example output:

```
{
    'comment': '',
    'already_configured': False,
    'result': True,
    'diff': '[edit system]+  host-name edge01.bjm01',
    'loaded_config': 'system { host-name edge01.bjm01; }''
}
```

salt.modules.napalm_network.**mac**(**args*, ***kwargs*)

Returns the MAC Address Table on the device.

Parameters

- **address** -- MAC address to filter on
- **interface** -- Interface name to filter on
- **vlan** -- VLAN identifier

Returns A list of dictionaries representing the entries in the MAC Address Table

CLI Example:

```
salt '*' net.mac
salt '*' net.mac vlan=10
```

Example output:

```
[
    {
        'mac'       : '00:1c:58:29:4a:71',
        'interface' : 'xe-3/0/2',
        'static'    : False,
        'active'    : True,
        'moves'     : 1,
        'vlan'      : 10,
        'last_move' : 1454417742.58
    },
    {
        'mac'       : '8c:60:4f:58:e1:c1',
        'interface' : 'xe-1/0/1',
        'static'    : False,
        'active'    : True,
        'moves'     : 2,
        'vlan'      : 42,
        'last_move' : 1453191948.11
    }
]
```

salt.modules.napalm_network.**optics**(**args*, ***kwargs*)

New in version 2017.7.0.

Fetches the power usage on the various transceivers installed on the network device (in dBm), and returns a view that conforms with the OpenConfig model openconfig-platform-transceiver.yang.

Returns

Returns a dictionary where the keys are as listed below:

- **intf_name (unicode)**
  - **physical_channels**

* **channels (list of dicts)**
  - index (int)
  - **state**
    input_power
    instant (float)
    avg (float)
    min (float)
    max (float)
    output_power
    instant (float)
    avg (float)
    min (float)
    max (float)
    laser_bias_current
    instant (float)
    avg (float)
    min (float)
    max (float)

CLI Example:

```
salt '*' net.optics
```

salt.modules.napalm_network.**ping**(**args*, ***kwargs*)

Executes a ping on the network device and returns a dictionary as a result.
destination Hostname or IP address of remote host
source Source address of echo request
ttl IP time-to-live value (IPv6 hop-limit value) (1..255 hops)
timeout Maximum wait time after sending final packet (seconds)
size Size of request packets (0..65468 bytes)
count Number of ping requests to send (1..2000000000 packets)
vrf VRF (routing instance) for ping attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.ping 8.8.8.8
salt '*' net.ping 8.8.8.8 ttl=3 size=65468
salt '*' net.ping 8.8.8.8 source=127.0.0.1 timeout=1 count=100
```

salt.modules.napalm_network.**rollback**(**args*, ***kwargs*)

Rollbacks the configuration.

CLI Example:

```
salt '*' net.rollback
```

salt.modules.napalm_network.**traceroute**(**args*, ***kwargs*)

Calls the method traceroute from the NAPALM driver object and returns a dictionary with the result of the traceroute command executed on the device.

destination Hostname or address of remote host
source Source address to use in outgoing traceroute packets
ttl IP maximum time-to-live value (or IPv6 maximum hop-limit value)
timeout Number of seconds to wait for response (seconds)
vrf VRF (routing instance) for traceroute attempt

New in version 2016.11.4.

CLI Example:

```
salt '*' net.traceroute 8.8.8.8
salt '*' net.traceroute 8.8.8.8 source=127.0.0.1 ttl=5 timeout=1
```

19.9.244 salt.modules.napalm_ntp module

NAPALM NTP

Manages NTP on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

NTP peers management state

New in version 2016.11.0.

salt.modules.napalm_ntp.**delete_peers**(**args*, ***kwargs*)

Removes NTP peers configured on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names to be removed as NTP peers
- **(bool)** (commit) -- discard loaded config. By default *test* is False (will not dicard the changes)
- **(bool)** -- commit loaded config. By default *commit* is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the commit option. For a dry run, use the test argument.

CLI Example:

```
salt '*' ntp.delete_peers 8.8.8.8 time.apple.com
salt '*' ntp.delete_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_peers 192.168.0.1 commit=False  # preserves the changes, but
↪does not commit
```

salt.modules.napalm_ntp.**delete_servers**(**args*, ***kwargs*)

Removes NTP servers configured on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names to be removed as NTP servers
- **(bool)** (commit) -- discard loaded config. By default *test* is False (will not dicard the changes)
- **(bool)** -- commit loaded config. By default *commit* is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the `commit` option. For dry run use the `test` argument.

CLI Example:

```
salt '*' ntp.delete_servers 8.8.8.8 time.apple.com
salt '*' ntp.delete_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.delete_servers 192.168.0.1 commit=False  # preserves the changes,
↪but does not commit
```

salt.modules.napalm_ntp.**peers**(**args*, ***kwargs*)

Returns a list the NTP peers configured on the network device.

Returns configured NTP peers as list.

CLI Example:

```
salt '*' ntp.peers
```

Example output:

```
[
    '192.168.0.1',
    '172.17.17.1',
    '172.17.17.2',
    '2400:cb00:6:1024::c71b:840a'
]
```

salt.modules.napalm_ntp.**servers**(**args*, ***kwargs*)

Returns a list of the configured NTP servers on the device.

CLI Example:

```
salt '*' ntp.servers
```

salt.modules.napalm_ntp.**set_peers**(**args*, ***kwargs*)

Configures a list of NTP peers on the device.

Parameters

- **peers** -- list of IP Addresses/Domain Names
- **(bool)** (test) -- discard loaded config. By default *test* is False (will not dicard the changes)

Commit commit (bool) commit loaded config. By default *commit* is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_peers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_peers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_peers 192.168.0.1 commit=False  # preserves the changes, but
↪does not commit
```

salt.modules.napalm_ntp.**set_servers**(**args*, ***kwargs*)

Configures a list of NTP servers on the device.

Parameters

- **servers** -- list of IP Addresses/Domain Names
- **(bool)** (test) -- discard loaded config. By default *test* is False (will not dicard the changes)

Commit commit (bool) commit loaded config. By default *commit* is True (will commit the changes). Useful when the user does not want to commit after each change, but after a couple.

By default this function will commit the config changes (if any). To load without committing, use the *commit* option. For dry run use the *test* argument.

CLI Example:

```
salt '*' ntp.set_servers 192.168.0.1 172.17.17.1 time.apple.com
salt '*' ntp.set_servers 172.17.17.1 test=True  # only displays the diff
salt '*' ntp.set_servers 192.168.0.1 commit=False  # preserves the changes, but
↪does not commit
```

salt.modules.napalm_ntp.**stats**(**args*, ***kwargs*)

Returns a dictionary containing synchronization details of the NTP peers.

Parameters **peer** -- Returns only the details of a specific NTP peer.

Returns

a list of dictionaries, with the following keys:

- remote
- referenceid
- synchronized
- stratum
- type
- when
- hostpoll
- reachability
- delay
- offset
- jitter

CLI Example:

```
salt '*' ntp.stats
```

Example output:

```
[
    {
        'remote'        : u'188.114.101.4',
        'referenceid'   : u'188.114.100.1',
        'synchronized'  : True,
        'stratum'       : 4,
        'type'          : u'-',
        'when'          : u'107',
        'hostpoll'      : 256,
```

```
        'reachability'  : 377,
        'delay'         : 164.228,
        'offset'        : -13.866,
        'jitter'        : 2.695
    }
]
```

19.9.245 salt.modules.napalm_probes module

NAPALM Probes

Manages RPM/SLA probes on the network device.

Probes configuration management state

New in version 2016.11.0.

salt.modules.napalm_probes.**config**(**args*, ***kwargs*)

Returns the configuration of the RPM probes.

Returns A dictionary containing the configuration of the RPM/SLA probes.

CLI Example:

```
salt '*' probes.config
```

Output Example:

```
{
    'probe1':{
        'test1': {
            'probe_type'    : 'icmp-ping',
            'target'        : '192.168.0.1',
            'source'        : '192.168.0.2',
            'probe_count'   : 13,
            'test_interval': 3
        },
        'test2': {
            'probe_type'    : 'http-ping',
            'target'        : '172.17.17.1',
            'source'        : '192.17.17.2',
            'probe_count'   : 5,
            'test_interval': 60
```

```
        }
    }
}
```

salt.modules.napalm_probes.**delete_probes**(**args*, ***kwargs*)

Removes RPM/SLA probes from the network device. Calls the configuration template `delete_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be removed from the configuration of the device.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```
probes = {
    'existing_probe':{
        'existing_test1': {},
        'existing_test2': {}
    }
}
```

salt.modules.napalm_probes.**results**(**args*, ***kwargs*)

Provides the results of the measurements of the RPM/SLA probes.

:return a dictionary with the results of the probes.

CLI Example:

```
salt '*' probes.results
```

Output example:

```
{
    'probe1':  {
        'test1': {
            'last_test_min_delay'    : 63.120,
            'global_test_min_delay' : 62.912,
            'current_test_avg_delay': 63.190,
            'global_test_max_delay' : 177.349,
            'current_test_max_delay': 63.302,
            'global_test_avg_delay' : 63.802,
```

```
            'last_test_avg_delay'    : 63.438,
            'last_test_max_delay'    : 65.356,
            'probe_type'             : 'icmp-ping',
            'rtt'                    : 63.138,
            'last_test_loss'         : 0,
            'round_trip_jitter'      : -59.0,
            'target'                 : '192.168.0.1',
            'source'                 : '192.168.0.2'
            'probe_count'            : 15,
            'current_test_min_delay': 63.138
        },
        'test2': {
            'last_test_min_delay'    : 176.384,
            'global_test_min_delay' : 169.226,
            'current_test_avg_delay': 177.098,
            'global_test_max_delay' : 292.628,
            'current_test_max_delay': 180.055,
            'global_test_avg_delay' : 177.959,
            'last_test_avg_delay'    : 177.178,
            'last_test_max_delay'    : 184.671,
            'probe_type'             : 'icmp-ping',
            'rtt'                    : 176.449,
            'last_test_loss'         : 0,
            'round_trip_jitter'      : -34.0,
            'target'                 : '172.17.17.1',
            'source'                 : '172.17.17.2'
            'probe_count'            : 15,
            'current_test_min_delay': 176.402
        }
    }
}
```

salt.modules.napalm_probes.**schedule_probes**(**args*, ***kwargs*)

Will schedule the probes. On Cisco devices, it is not enough to define the probes, it is also necessary to schedule them.

This function calls the configuration template `schedule_probes` from the NAPALM library, providing as input a rich formatted dictionary with the names of the probes and the tests to be scheduled.

Parameters

- **probes** -- Dictionary with a similar format as the output dictionary of the function config(), where the details are not necessary.
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns a dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example:

```
probes = {
    'new_probe':{
        'new_test1': {},
        'new_test2': {}
    }
}
```

salt.modules.napalm_probes.**set_probes**(**args*, ***kwargs*)

Configures RPM/SLA probes on the device. Calls the configuration template `set_probes' from the NAPALM library, providing as input a rich formatted dictionary with the configuration details of the probes to be configured.

Parameters

- **probes** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

Input example - via state/script:

```
probes = {
    'new_probe':{
        'new_test1': {
            'probe_type'    : 'icmp-ping',
            'target'        : '192.168.0.1',
            'source'        : '192.168.0.2',
            'probe_count'   : 13,
            'test_interval': 3
        },
        'new_test2': {
            'probe_type'    : 'http-ping',
            'target'        : '172.17.17.1',
            'source'        : '192.17.17.2',
            'probe_count'   : 5,
            'test_interval': 60
        }
    }
}
set_probes(probes)
```

CLI Example - to push cahnges on the fly (not recommended):

```
salt 'junos_minion' probes.set_probes "{'new_probe':{'new_test1':{'probe_type':
 ↪'icmp-ping',            'target':'192.168.0.1','source':'192.168.0.2','probe_
 ↪count':13,'test_interval':3}}}" test=True
```

Output example - for the CLI example above:

```
junos_minion:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
        [edit services rpm]
             probe transit { ... }
        +    probe new_probe {
        +        test new_test1 {
        +            probe-type icmp-ping;
        +            target address 192.168.0.1;
        +            probe-count 13;
        +            test-interval 3;
        +            source-address 192.168.0.2;
        +        }
        +    }
    result:
        True
```

19.9.246 salt.modules.napalm_route module

NAPALM Route

Retrieves route details from network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*

New in version 2016.11.0.

salt.modules.napalm_route.**show**(**args*, ***kwargs*)

Displays all details for a certain route learned via a specific protocol. If the protocol is not specified, will return all possible routes.

Note: This function return the routes from the RIB. In case the destination prefix is too short, there may be too many routes matched. Therefore in cases of devices having a very high number of routes it may be necessary to adjust the prefix length and request using a longer prefix.

---

destination destination prefix.
protocol (optional) protocol used to learn the routes to the destination.

Changed in version 2017.7.0.

CLI Example:

```
salt 'my_router' route.show
salt 'my_router' route.show 172.16.0.0/25 bgp
```

Output example:

```
{
    '172.16.0.0/25': [
        {
            'protocol': 'BGP',
            'last_active': True,
            'current_active': True,
            'age': 1178693,
            'routing_table': 'inet.0',
            'next_hop': '192.168.0.11',
            'outgoing_interface': 'xe-1/1/1.100',
            'preference': 170,
            'selected_next_hop': False,
            'protocol_attributes': {
                'remote_as': 65001,
                'metric': 5,
                'local_as': 13335,
                'as_path': '',
                'remote_address': '192.168.0.11',
                'metric2': 0,
                'local_preference': 0,
                'communities': [
                    '0:2',
                    'no-export'
                ],
                'preference2': -1
            },
            'inactive_reason': ''
        },
        {
            'protocol': 'BGP',
            'last_active': False,
            'current_active': False,

```

```
                'preference2': -1
            },
            'inactive_reason': 'Not Best in its group - Router ID'
        }
    ]
}
```

19.9.247 salt.modules.napalm_snmp module

NAPALM SNMP

Manages SNMP on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *NET basic features*

See also:

SNMP configuration management state

New in version 2016.11.0.

salt.modules.napalm_snmp.**config**(**args*, ***kwargs*)

Returns the SNMP configuration

CLI Example:

```
salt '*' snmp.config
```

salt.modules.napalm_snmp.**remove_config**(**args*, ***kwargs*)

Removes a configuration element from the SNMP configuration.

Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:

•acl (if any policy / ACL need to be set)
•mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also,

from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Returns A dictionary having the following keys:

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' snmp.remove_config community='abcd'
```

salt.modules.napalm_snmp.**update_config**(**args*, ***kwargs*)

Updates the SNMP configuration.

Parameters

- **chassis_id** -- (optional) Chassis ID
- **community** -- (optional) A dictionary having the following optional keys:

- acl (if any policy / ACL need to be set)
- mode: rw or ro. Default: ro

Parameters

- **contact** -- Contact details
- **location** -- Location
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt 'edge01.lon01' snmp.update_config location="Greenwich, UK" test=True
```

Output example (for the CLI example above):

```
edge01.lon01:
    ----------
    already_configured:
        False
    comment:
        Configuration discarded.
    diff:
```

```
        [edit snmp]
        -  location "London, UK";
        +  location "Greenwich, UK";
    result:
        True
```

19.9.248 salt.modules.napalm_users module

NAPALM Users

Manages the configuration of the users on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*

See also:

Users management state

New in version 2016.11.0.

salt.modules.napalm_users.**config**(**args*, ***kwargs*)

Returns the configuration of the users on the device

CLI Example:

```
salt '*' users.config
```

Output example:

```
{
    'mircea': {
        'level': 15,
        'password': '$1$0P70xKPa$4jt5/10cBTckk6I/w/',
        'sshkeys': [
            'ssh-rsa

 ↪                   nTs8zhOrGScSrtb mircea@master-roshi'
        ]
    }
}
```

salt.modules.napalm_users.**delete_users**(**args*, ***kwargs*)

Removes users from the configuration of network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.delete_users "{'mircea': {}}"
```

salt.modules.napalm_users.**set_users**(**args*, ***kwargs*)

Configures users on network devices.

Parameters

- **users** -- Dictionary formatted as the output of the function config()
- **test** -- Dry run? If set as True, will apply the config, discard and return the changes. Default: False
- **commit** -- Commit? (default: True) Sometimes it is not needed to commit the config immediately after loading the changes. E.g.: a state loads a couple of parts (add / remove / update) and would not be optimal to commit after each operation. Also, from the CLI when the user needs to apply the similar changes before committing, can specify commit=False and will not discard the config.

Raises **MergeConfigException** -- If there is an error on the configuration sent.

Return a dictionary having the following keys

- result (bool): if the config was applied successfully. It is *False* only in case of failure. In case there are no changes to be applied and successfully performs all operations it is still *True* and so will be the *already_configured* flag (example below)
- comment (str): a message for the user
- already_configured (bool): flag to check if there were no changes applied
- diff (str): returns the config changes applied

CLI Example:

```
salt '*' users.set_users "{'mircea': {}}"
```

19.9.249 salt.modules.napalm_yang_mod module

NAPALM YANG

NAPALM YANG basic operations.

New in version 2017.7.0.

salt.modules.napalm_yang_mod.**compliance_report**(**args*, ***kwargs*)

Return the compliance report using YANG objects.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

filepath The absolute path to the validation file.

CLI Example:

```
salt '*' napalm_yang.compliance_report {} models.openconfig_interfaces filepath=~/
↪validate.yml
```

Output Example:

```
{
  "skipped": [],
  "complies": true,
  "get_interfaces_ip": {
    "missing": [],
    "complies": true,
    "present": {
      "ge-0/0/0.0": {
        "complies": true,
        "nested": true
      }
    },
    "extra": []
  }
}
```

salt.modules.napalm_yang_mod.**diff**(*candidate*, *running*, *models*)

Returns the difference between two configuration entities structured according to the YANG model.

Note: This function is recommended to be used mostly as a state helper.

candidate First model to compare.

running Second model to compare.

models A list of models to be used when comparing.

CLI Example:

```
salt '*' napalm_yang.diff {} {} models.openconfig_interfaces
```

Output Example:

```
{
    "interfaces": {
        "interface": {
            "both": {
                "Port-Channel1": {
                    "config": {
                        "mtu": {
                            "first": "0",
                            "second": "9000"
                        }
                    }
                }
            },
            "first_only": [
```

```
                "Loopback0"
            ],
            "second_only": [
                "Loopback1"
            ]
        }
    }
}
```

salt.modules.napalm_yang_mod.**get_config**(**args*, ***kwargs*)

Return the native config.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: **None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

CLI Example:

```
salt '*' napalm_yang.get_config {} models.openconfig_interfaces
```

Output Example:

```
interface et1
    ip address 192.168.1.1/24
    description Uplink1
    mtu 9000
interface et2
    ip address 192.168.2.1/24
    description Uplink2
    mtu 9000
```

salt.modules.napalm_yang_mod.**load_config**(**args*, ***kwargs*)

Generate and load the config on the device using the OpenConfig or IETF models and device profiles.

data Dictionary structured with respect to the models referenced.

models A list of models to be used when generating the config.

profiles: **None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

test: **False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True** Commit? Default: `True`.

debug: **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **False** Should replace the config with the new generate one?

CLI Example:

```
salt '*' napalm_yang.load_config {} models.openconfig_interfaces test=True
 ↪debug=True
```

Output Example:

```
device1:
    ----------
    already_configured:
        False
    comment:
    diff:
        [edit interfaces ge-0/0/0]
```

```
        -   mtu 1400;
        [edit interfaces ge-0/0/0 unit 0 family inet]
        -       dhcp;
        [edit interfaces lo0]
        -    unit 0 {
        -        description lo0.0;
        -    }
        +    unit 1 {
        +        description "new loopback";
        +    }
    loaded_config:
        <configuration>
          <interfaces replace="replace">
            <interface>
              <name>ge-0/0/0</name>
              <unit>
                <name>0</name>
                <family>
                  <inet/>
                </family>
                <description>ge-0/0/0.0</description>
              </unit>
              <description>management interface</description>
            </interface>
            <interface>
              <name>ge-0/0/1</name>
              <disable/>

              <unit>
                <name>1</name>
                <description>new loopback</description>
              </unit>
              <description>lo0</description>
            </interface>
          </interfaces>
        </configuration>
    result:
        True
```

salt.modules.napalm_yang_mod.**parse**(**args*, ***kwargs*)

Parse configuration from the device.

models A list of models to be used when parsing.

config: **False** Parse config.

state: **False** Parse state.

profiles: **None** Use certain profiles to parse. If not specified, will use the device default profile(s).

CLI Example:

```
salt '*' napalm_yang.parse models.openconfig_interfaces
```

Output Example:

```
{
    "interfaces": {
        "interface": {
            ".local.": {
                "name": ".local.",
                "state": {
                    "admin-status": "UP",
                    "counters": {
                        "in-discards": 0,
                        "in-errors": 0,
                        "out-errors": 0
                    },
                    "enabled": True,
                    "ifindex": 0,
                    "last-change": 0,
```

        }
    }
}
```

19.9.250 salt.modules.netaddress

Module for getting information about network addresses.

New in version 2016.3.0.

depends netaddr

salt.modules.netaddress.**cidr_broadcast**(*cidr*)
Get the broadcast address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.**cidr_netmask**(*cidr*)
Get the netmask address associated with a CIDR address.

CLI example:

```
salt myminion netaddress.cidr_netmask 192.168.0.0/20
```

salt.modules.netaddress.**list_cidr_ips**(*cidr*)
Get a list of IP addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips 192.168.0.0/20
```

salt.modules.netaddress.**list_cidr_ips_ipv6**(*cidr*)
Get a list of IPv6 addresses from a CIDR.

CLI example:

```
salt myminion netaddress.list_cidr_ips_ipv6 192.168.0.0/20
```

19.9.251 salt.modules.netbsd_sysctl

Module for viewing and modifying sysctl parameters

salt.modules.netbsd_sysctl.**assign**(*name*, *value*)
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.**get**(*name*)
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.netbsd_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*)
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.icmp.icmplim 50
```

salt.modules.netbsd_sysctl.**show**(*config_file=False*)
Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

19.9.252 salt.modules.netbsdservice

The service module for NetBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

salt.modules.netbsdservice.**available**(*name*)
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.netbsdservice.**disable**(*name*, ***kwargs*)
Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.netbsdservice.**disabled**(*name*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.netbsdservice.**enable**(*name*, ***kwargs*)
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.netbsdservice.**enabled**(*name*, ***kwargs*)
Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.netbsdservice.**force_reload**(*name*)
Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.netbsdservice.**get_all**()
Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.netbsdservice.**get_disabled**()
Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.netbsdservice.**get_enabled**()
Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.netbsdservice.**missing**(*name*)
The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.netbsdservice.**reload**(*name*)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.netbsdservice.**restart**(*name*)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.netbsdservice.**start**(*name*)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.netbsdservice.**status**(*name*, *sig=None*)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.netbsdservice.**stop**(*name*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.253 salt.modules.netscaler

Module to provide Citrix Netscaler compatibility to Salt (compatible with netscaler 9.2+)

New in version 2015.2.0.

depends

- nsnitro Python module

Note: You can install nsnitro using:

```
pip install nsnitro
```

---

configuration This module accepts connection configuration details either as parameters, or as configuration settings in /etc/salt/minion on the relevant minions

```
netscaler.host: 1.2.3.4
netscaler.user: user
netscaler.pass: password
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

CLI Examples Calls relying on configuration passed using /etc/salt/minion, grains, or pillars: .. code-block:: bash

salt-call netscaler.server_exists server_name

Calls passing configuration as opts .. code-block:: bash

salt-call netscaler.server_exists server_name netscaler_host=1.2.3.4 netscaler_user=username netscaler_pass=password salt-call netscaler.server_exists server_name netscaler_host=1.2.3.5 netscaler_user=username2 netscaler_pass=password2 salt-call netscaler.server_enable server_name2 netscaler_host=1.2.3.5 salt-call netscaler.server_up server_name3 netscaler_host=1.2.3.6 netscaler_useSSL=False

salt.modules.netscaler.**server_add**(*s_name*, *s_ip*, *s_state=None*, ***connection_args*)
Add a server Note: The default server state is ENABLED

CLI Example:

```
salt '*' netscaler.server_add 'serverName' 'serverIpAddress'
salt '*' netscaler.server_add 'serverName' 'serverIpAddress' 'serverState'
```

salt.modules.netscaler.**server_delete**(*s_name*, ***connection_args*)
Delete a server

CLI Example:

```
salt '*' netscaler.server_delete 'serverName'
```

salt.modules.netscaler.**server_disable**(*s_name*, ***connection_args*)
Disable a server globally

CLI Example:

```
salt '*' netscaler.server_disable 'serverName'
```

salt.modules.netscaler.**server_enable**(*s_name*, ***connection_args*)
Enables a server globally

CLI Example:

```
salt '*' netscaler.server_enable 'serverName'
```

salt.modules.netscaler.**server_enabled**(*s_name*, ***connection_args*)
Check if a server is enabled globally

CLI Example:

```
salt '*' netscaler.server_enabled 'serverName'
```

salt.modules.netscaler.**server_exists**(*s_name*, *ip=None*, *s_state=None*, ***connection_args*)
Checks if a server exists

CLI Example:

```
salt '*' netscaler.server_exists 'serverName'
```

salt.modules.netscaler.**server_update**(*s_name*, *s_ip*, ***connection_args*)
Update a server's attributes

CLI Example:

```
salt '*' netscaler.server_update 'serverName' 'serverIP'
```

salt.modules.netscaler.**service_disable**(*s_name*, *s_delay=None*, ***connection_args*)
Disable a service

CLI Example:

```
salt '*' netscaler.service_disable 'serviceName'
salt '*' netscaler.service_disable 'serviceName' 'delayInSeconds'
```

salt.modules.netscaler.**service_enable**(*s_name*, ***connection_args*)
Enable a service

CLI Example:

```
salt '*' netscaler.service_enable 'serviceName'
```

salt.modules.netscaler.**service_exists**(*s_name*, ***connection_args*)
Checks if a service exists

CLI Example:

```
salt '*' netscaler.service_exists 'serviceName'
```

salt.modules.netscaler.**service_up**(*s_name*, ***connection_args*)

Checks if a service is UP

CLI Example:

```
salt '*' netscaler.service_up 'serviceName'
```

salt.modules.netscaler.**servicegroup_add**(*sg_name*, *sg_type='HTTP'*, ***connection_args*)

Add a new service group If no service type is specified, HTTP will be used. Most common service types: HTTP, SSL, and SSL_BRIDGE

CLI Example:

```
salt '*' netscaler.servicegroup_add 'serviceGroupName'
salt '*' netscaler.servicegroup_add 'serviceGroupName' 'serviceGroupType'
```

salt.modules.netscaler.**servicegroup_delete**(*sg_name*, ***connection_args*)

Delete a new service group

CLI Example:

```
salt '*' netscaler.servicegroup_delete 'serviceGroupName'
```

salt.modules.netscaler.**servicegroup_exists**(*sg_name*, *sg_type=None*, ***connection_args*)

Checks if a service group exists

CLI Example:

```
salt '*' netscaler.servicegroup_exists 'serviceGroupName'
```

salt.modules.netscaler.**servicegroup_server_add**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Add a server:port member to a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_add 'serviceGroupName' 'serverName'
↪'serverPort'
```

salt.modules.netscaler.**servicegroup_server_delete**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Remove a server:port member from a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_delete 'serviceGroupName' 'serverName'
↪'serverPort'
```

salt.modules.netscaler.**servicegroup_server_disable**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Disable a server:port member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_disable 'serviceGroupName' 'serverName'
↪'serverPort'
```

salt.modules.netscaler.**servicegroup_server_enable**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Enable a server:port member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_enable 'serviceGroupName' 'serverName'
 ↪'serverPort'
```

salt.modules.netscaler.**servicegroup_server_exists**(*sg_name*, *s_name*, *s_port=None*, ***connection_args*)

Check if a server:port combination is a member of a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_exists 'serviceGroupName' 'serverName'
 ↪'serverPort'
```

salt.modules.netscaler.**servicegroup_server_up**(*sg_name*, *s_name*, *s_port*, ***connection_args*)

Check if a server:port combination is in state UP in a servicegroup

CLI Example:

```
salt '*' netscaler.servicegroup_server_up 'serviceGroupName' 'serverName'
 ↪'serverPort'
```

salt.modules.netscaler.**vserver_add**(*v_name*, *v_ip*, *v_port*, *v_type*, ***connection_args*)

Add a new lb vserver

CLI Example:

```
salt '*' netscaler.vserver_add 'vserverName' 'vserverIP' 'vserverPort'
 ↪'vserverType'
salt '*' netscaler.vserver_add 'alex.patate.chaude.443' '1.2.3.4' '443' 'SSL'
```

salt.modules.netscaler.**vserver_delete**(*v_name*, ***connection_args*)

Delete a lb vserver

CLI Example:

```
salt '*' netscaler.vserver_delete 'vserverName'
```

salt.modules.netscaler.**vserver_exists**(*v_name*, *v_ip=None*, *v_port=None*, *v_type=None*, ***connection_args*)

Checks if a vserver exists

CLI Example:

```
salt '*' netscaler.vserver_exists 'vserverName'
```

salt.modules.netscaler.**vserver_servicegroup_add**(*v_name*, *sg_name*, ***connection_args*)

Bind a servicegroup to a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_add 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.**vserver_servicegroup_delete**(*v_name*, *sg_name*, ***connection_args*)

Unbind a servicegroup from a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_delete 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.**vserver_servicegroup_exists**(*v_name*, *sg_name*, ***connection_args*)

Checks if a servicegroup is tied to a vserver

CLI Example:

```
salt '*' netscaler.vserver_servicegroup_exists 'vserverName' 'serviceGroupName'
```

salt.modules.netscaler.**vserver_sslcert_add**(*v_name*, *sc_name*, ***connection_args*)

Binds a SSL certificate to a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_add 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.**vserver_sslcert_delete**(*v_name*, *sc_name*, ***connection_args*)

Unbinds a SSL certificate from a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_delete 'vserverName' 'sslCertificateName'
```

salt.modules.netscaler.**vserver_sslcert_exists**(*v_name*, *sc_name*, ***connection_args*)

Checks if a SSL certificate is tied to a vserver

CLI Example:

```
salt '*' netscaler.vserver_sslcert_exists 'vserverName' 'sslCertificateName'
```

19.9.254 salt.modules.network

Module for gathering and managing network information

salt.modules.network.**active_tcp**()

Return a dict containing information on all of the running TCP connections (currently linux and solaris only)

Changed in version 2015.8.4: Added support for SunOS

CLI Example:

```
salt '*' network.active_tcp
```

salt.modules.network.**arp**()

Return the arp table from the minion

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.arp
```

salt.modules.network.**calc_net**(*ip_addr*, *netmask=None*)

Returns the CIDR of a subnet based on an IP address (CIDR notation supported) and optional netmask.

CLI Example:

```
salt '*' network.calc_net 172.17.0.5 255.255.255.240
salt '*' network.calc_net 2a02:f6e:a000:80:84d8:8332:7866:4e07/64
```

New in version 2015.8.0.

salt.modules.network.**connect**(*host*, *port=None*, ***kwargs*)
Test connectivity to a host using a particular port from the minion.

New in version 2014.7.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4

salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

salt.modules.network.**convert_cidr**(*cidr*)
returns the network and subnet mask of a cidr addr

New in version 2016.3.0.

CLI Example:

```
salt '*' network.convert_cidr 172.31.0.0/16
```

salt.modules.network.**default_route**(*family=None*)
Return default route(s) from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.default_route
```

salt.modules.network.**dig**(*host*)
Performs a DNS lookup with dig

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.network.**get_bufsize**(*iface*)
Return network buffer sizes as a dict (currently linux only)

CLI Example:

```
salt '*' network.get_bufsize eth0
```

salt.modules.network.**get_fqdn**()
Get fully qualified domain name

CLI Example:

```
salt '*' network.get_fqdn
```

salt.modules.network.**get_hostname**()
Get hostname

CLI Example:

```
salt '*' network.get_hostname
```

salt.modules.network.**get_route**(*ip*)
Return routing information for given destination ip

New in version 2015.5.3.

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS) Added support for OpenBSD

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.network.**hw_addr**(*iface*)
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

salt.modules.network.**hwaddr**(*iface*)
This function is an alias of hw_addr.
Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr eth0
```

salt.modules.network.**ifacestartswith**(*cidr*)
Retrieve the interface name from a specific CIDR

New in version 2016.11.0.

CLI Example:

```
salt '*' network.ifacestartswith 10.0
```

salt.modules.network.**in_subnet**(*cidr*)
Returns True if host is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.network.**interface**(*iface*)
Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface eth0
```

salt.modules.network.**interface_ip**(*iface*)
Return the inet address for a given interface

New in version 2014.7.0.

CLI Example:

```
salt '*' network.interface_ip eth0
```

salt.modules.network.**interfaces**()
Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

salt.modules.network.**ip_addrs**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If `type' is `public', then only public addresses will be returned. Ditto for `type'='private'.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.network.**ip_addrs6**(*interface=None*, *include_loopback=False*, *cidr=None*)
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"' will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.network.**ip_in_subnet**(*ip_addr*, *cidr*)
Returns True if given IP is within specified subnet, otherwise False.

CLI Example:

```
salt '*' network.ip_in_subnet 172.17.0.4 172.16.0.0/12
```

salt.modules.network.**ipaddrs**(*interface=None*, *include_loopback=False*, *cidr=None*, *type=None*)
This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="10.0.0.0/8"' will return only the addresses which are within that subnet. If `type' is `public', then only public addresses will be returned. Ditto for `type'='private'.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.network.**ipaddrs6**(*interface=None*, *include_loopback=False*, *cidr=None*)
This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned. Providing a CIDR via `cidr="2000::/3"' will return only the addresses which are within that subnet.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.network.**iphexval**(*ip*)

Retrieve the hexadecimal representation of an IP address

New in version 2016.11.0.

CLI Example:

```
salt '*' network.iphexval 10.0.0.1
```

salt.modules.network.**is_loopback**(*ip_addr*)

Check if the given IP address is a loopback address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_loopback 127.0.0.1
```

salt.modules.network.**is_private**(*ip_addr*)

Check if the given IP address is a private address

New in version 2014.7.0.

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.is_private 10.0.0.3
```

salt.modules.network.**mod_bufsize**(*iface*, **args*, ***kwargs*)

Modify network interface buffers (currently linux only)

CLI Example:

```
salt '*' network.mod_bufsize tx=<val> rx=<val> rx-mini=<val> rx-jumbo=<val>
```

salt.modules.network.**mod_hostname**(*hostname*)

Modify hostname

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

CLI Example:

```
salt '*' network.mod_hostname master.saltstack.com
```

salt.modules.network.**netstat**()

Return information on open ports and states

Note: On BSD minions, the output contains PID info (where available) for each netstat entry, fetched from sockstat/fstat output.

Changed in version 2014.1.4: Added support for OpenBSD, FreeBSD, and NetBSD

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.netstat
```

salt.modules.network.**ping**(*host*, *timeout=False*, *return_boolean=False*)

Performs an ICMP ping to a host

Changed in version 2015.8.0: Added support for SunOS

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2015.5.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

salt.modules.network.**reverse_ip**(*ip_addr*)

Returns the reversed IP address

Changed in version 2015.8.0: IPv6 support

CLI Example:

```
salt '*' network.reverse_ip 172.17.0.4
```

salt.modules.network.**routes**(*family=None*)

Return currently configured routes from routing table

Changed in version 2015.8.0: Added support for SunOS (Solaris 10, Illumos, SmartOS)

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.routes
```

salt.modules.network.**subnets**(*interfaces=None*)

Returns a list of IPv4 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
salt '*' network.subnets interfaces=eth1
```

salt.modules.network.**subnets6**()

Returns a list of IPv6 subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

salt.modules.network.**traceroute**(*host*)

Performs a traceroute to a 3rd party host

Changed in version 2015.8.0: Added support for SunOS

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

salt.modules.network.**wol**(*mac*, *bcast='255.255.255.255'*, *destport=9*)

Send Wake On Lan packet to a host

CLI Example:

```
salt '*' network.wol 08-00-27-13-69-77
salt '*' network.wol 080027136977 255.255.255.255 7
salt '*' network.wol 08:00:27:13:69:77 255.255.255.255 7
```

19.9.255 salt.modules.neutron

Module for handling OpenStack Neutron calls

depends

- neutronclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: 'admin'
keystone.password: 'password'
keystone.tenant: 'admin'
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'

openstack2:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

With this configuration in place, any of the neutron functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' neutron.network_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the *use_keystoneauth* option in the pillar or minion config.

Note: this is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: by default the neutron module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own.(defaults to True)

salt.modules.neutron.**add_gateway_router**(*router*, *ext_network*, *profile=None*)

Adds an external network gateway to the specified router

CLI Example:

```
salt '*' neutron.add_gateway_router router-name ext-network-name
```

Parameters

- **router** -- ID or name of the router
- **ext_network** -- ID or name of the external network the gateway
- **profile** -- Profile to build on (Optional)

Returns Added Gateway router information

salt.modules.neutron.**add_interface_router**(*router*, *subnet*, *profile=None*)

Adds an internal network interface to the specified router

CLI Example:

```
salt '*' neutron.add_interface_router router-name subnet-name
```

Parameters

- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns Added interface information

salt.modules.neutron.**create_firewall_rule**(*protocol*, *action*, *profile=None*, ***kwargs*)

Creates a new firewall rule

CLI Example:

```
salt '*' neutron.create_firewall_rule protocol action
       tenant_id=TENANT_ID name=NAME description=DESCRIPTION ip_version=IP_VERSION
```

```
        source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
↪ADDRESS source_port=SOURCE_PORT
        destination_port=DESTINATION_PORT shared=SHARED enabled=ENABLED
```

Parameters

- **protocol** -- Protocol for the firewall rule, choose ``tcp'',''udp'',''icmp'' or ``None''.
- **action** -- Action for the firewall rule, choose ``allow'' or ``deny''.
- **tenant_id** -- The owner tenant ID. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)

salt.modules.neutron.**create_floatingip**(*floating_network*, *port=None*, *profile=None*)

Creates a new floatingIP

CLI Example:

```
salt '*' neutron.create_floatingip network-name port-name
```

Parameters

- **floating_network** -- Network name or ID to allocate floatingIP from
- **port** -- Of the port to be associated with the floatingIP (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created floatingIP information

salt.modules.neutron.**create_ikepolicy**(*name*, *profile=None*, ***kwargs*)

Creates a new IKEPolicy

CLI Example:

```
salt '*' neutron.create_ikepolicy ikepolicy-name
        phase1_negotiation_mode=main auth_algorithm=sha1
        encryption_algorithm=aes-128 pfs=group5
```

Parameters

- **name** -- Name of the IKE policy
- **phase1_negotiation_mode** -- IKE Phase1 negotiation mode in lowercase, default: main (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase. default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IKE lifetime attribute. default: seconds (Optional)
- **value** -- IKE lifetime attribute. default: 3600 (Optional)
- **ike_version** -- IKE version in lowercase, default: v1 (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns Created IKE policy information

salt.modules.neutron.**create_ipsec_site_connection**(*name*, *ipsecpolicy*, *ikepolicy*, *vpnservice*, *peer_cidrs*, *peer_address*, *peer_id*, *psk*, *admin_state_up=True*, *profile=None*, ***kwargs*)

Creates a new IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
        ipsec-policy-name ikepolicy-name vpnservice-name
        192.168.XXX.XXX/24 192.168.XXX.XXX 192.168.XXX.XXX secret
```

Parameters

- **name** -- Set friendly name for the connection
- **ipsecpolicy** -- IPSec policy ID or name associated with this connection
- **ikepolicy** -- IKE policy ID or name associated with this connection
- **vpnservice** -- VPN service instance ID or name associated with this connection
- **peer_cidrs** -- Remote subnet(s) in CIDR format
- **peer_address** -- Peer gateway public IPv4/IPv6 address or FQDN
- **peer_id** -- Peer router identity for authentication Can be IPv4/IPv6 address, e-mail address, key id, or FQDN
- **psk** -- Pre-shared key string
- **initiator** -- Initiator state in lowercase, default:bi-directional
- **admin_state_up** -- Set admin state up to true or false, default: True (Optional)
- **mtu** -- size for the connection, default:1500 (Optional)
- **dpd_action** -- Dead Peer Detection attribute: hold/clear/disabled/ restart/restart-by-peer (Optional)
- **dpd_interval** -- Dead Peer Detection attribute (Optional)
- **dpd_timeout** -- Dead Peer Detection attribute (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created IPSec site connection information

salt.modules.neutron.**create_ipsecpolicy**(*name*, *profile=None*, ***kwargs*)

Creates a new IPsecPolicy

CLI Example:

```
salt '*' neutron.create_ipsecpolicy ipsecpolicy-name
        transform_protocol=esp auth_algorithm=sha1
        encapsulation_mode=tunnel encryption_algorithm=aes-128
```

Parameters

- **name** -- Name of the IPSec policy
- **transform_protocol** -- Transform protocol in lowercase, default: esp (Optional)
- **auth_algorithm** -- Authentication algorithm in lowercase, default: sha1 (Optional)
- **encapsulation_mode** -- Encapsulation mode in lowercase, default: tunnel (Optional)
- **encryption_algorithm** -- Encryption algorithm in lowercase, default:aes-128 (Optional)
- **pfs** -- Prefect Forward Security in lowercase, default: group5 (Optional)
- **units** -- IPSec lifetime attribute. default: seconds (Optional)
- **value** -- IPSec lifetime attribute. default: 3600 (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created IPSec policy information

salt.modules.neutron.**create_network**(*name*, *router_ext=None*, *admin_state_up=True*, *network_type=None*, *physical_network=None*, *segmentation_id=None*, *shared=None*, *profile=None*)

Creates a new network

CLI Example:

```
salt '*' neutron.create_network network-name
salt '*' neutron.create_network network-name profile=openstack1
```

Parameters

- **name** -- Name of network to create
- **admin_state_up** -- should the state of the network be up? default: True (Optional)
- **router_ext** -- True then if create the external network (Optional)
- **network_type** -- the Type of network that the provider is such as GRE, VXLAN, VLAN, FLAT, or LOCAL (Optional)
- **physical_network** -- the name of the physical network as neutron knows it (Optional)
- **segmentation_id** -- the vlan id or GRE id (Optional)
- **shared** -- is the network shared or not (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created network information

salt.modules.neutron.**create_port**(*name*, *network*, *device_id=None*, *admin_state_up=True*, *profile=None*)

Creates a new port

CLI Example:

```
salt '*' neutron.create_port network-name port-name
```

Parameters

- **name** -- Name of port to create
- **network** -- Network name or ID
- **device_id** -- ID of device (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created port information

salt.modules.neutron.**create_router**(*name*, *ext_network=None*, *admin_state_up=True*, *profile=None*)

Creates a new router

CLI Example:

```
salt '*' neutron.create_router new-router-name
```

Parameters

- **name** -- Name of router to create (must be first)
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default:true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created router information

salt.modules.neutron.**create_security_group**(*name=None*, *description=None*, *profile=None*)

Creates a new security group

CLI Example:

```
salt '*' neutron.create_security_group security-group-name
 ↪description='Security group for servers'
```

Parameters

- **name** -- Name of security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created security group information

salt.modules.neutron.**create_security_group_rule**(*security_group*, *remote_group_id=None*, *direction='ingress'*, *protocol=None*, *port_range_min=None*, *port_range_max=None*, *ethertype='IPv4'*, *profile=None*)

Creates a new security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters

- **security_group** -- Security group name or ID to add rule
- **remote_group_id** -- Remote security group name or ID to apply rule (Optional)
- **direction** -- Direction of traffic: ingress/egress, default: ingress (Optional)
- **protocol** -- Protocol of packet: null/icmp/tcp/udp, default: null (Optional)
- **port_range_min** -- Starting port range (Optional)
- **port_range_max** -- Ending port range (Optional)
- **ethertype** -- IPv4/IPv6, default: IPv4 (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created security group rule information

salt.modules.neutron.**create_subnet**(*network*, *cidr*, *name=None*, *ip_version=4*, *profile=None*)

Creates a new subnet

CLI Example:

```
salt '*' neutron.create_subnet network-name 192.168.1.0/24
```

Parameters

- **network** -- Network ID or name this subnet belongs to
- **cidr** -- CIDR of subnet to create (Ex. `192.168.1.0/24')
- **name** -- Name of the subnet to create (Optional)
- **ip_version** -- Version to use, default is 4(IPv4) (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created subnet information

salt.modules.neutron.**create_vpnservice**(*subnet*, *router*, *name*, *admin_state_up=True*, *profile=None*)

Creates a new VPN service

CLI Example:

```
salt '*' neutron.create_vpnservice router-name name
```

Parameters

- **subnet** -- Subnet unique identifier for the VPN service deployment
- **router** -- Router unique identifier for the VPN service

- **name** -- Set a name for the VPN service
- **admin_state_up** -- Set admin state up to true or false, default:True (Optional)
- **profile** -- Profile to build on (Optional)

Returns Created VPN service information

salt.modules.neutron.**delete_firewall_rule**(*firewall_rule*, *profile=None*)

Deletes the specified firewall_rule

CLI Example:

```
salt '*' neutron.delete_firewall_rule firewall-rule
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_floatingip**(*floatingip_id*, *profile=None*)

Deletes the specified floating IP

CLI Example:

```
salt '*' neutron.delete_floatingip floatingip-id
```

Parameters

- **floatingip_id** -- ID of floatingIP to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_ikepolicy**(*ikepolicy*, *profile=None*)

Deletes the specified IKEPolicy

CLI Example:

```
salt '*' neutron.delete_ikepolicy ikepolicy-name
```

Parameters

- **ikepolicy** -- ID or name of IKE policy to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_ipsec_site_connection**(*ipsec_site_connection*, *profile=None*)

Deletes the specified IPsecSiteConnection

CLI Example:

```
salt '*' neutron.delete_ipsec_site_connection connection-name
```

Parameters

- **ipsec_site_connection** -- ID or name of ipsec site connection to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_ipsecpolicy**(*ipsecpolicy*, *profile=None*)

Deletes the specified IPsecPolicy

CLI Example:

```
salt '*' neutron.delete_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPSec policy to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_network**(*network*, *profile=None*)

Deletes the specified network

CLI Example:

```
salt '*' neutron.delete_network network-name
salt '*' neutron.delete_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_port**(*port*, *profile=None*)

Deletes the specified port

CLI Example:

```
salt '*' neutron.delete_network port-name
salt '*' neutron.delete_network port-name profile=openstack1
```

Parameters
- **port** -- port name or ID
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_quota**(*tenant_id*, *profile=None*)

Delete the specified tenant's quota value

CLI Example:

```
salt '*' neutron.update_quota tenant-id
salt '*' neutron.update_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant to quota delete
- **profile** -- Profile to build on (Optional)

Returns True(Delete succeed) or False(Delete failed)

salt.modules.neutron.**delete_router**(*router*, *profile=None*)

Delete the specified router

CLI Example:

```
salt '*' neutron.delete_router router-name
```

Parameters
- **router** -- ID or name of router to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_security_group**(*security_group*, *profile=None*)
Deletes the specified security group

CLI Example:

```
salt '*' neutron.delete_security_group security-group-name
```

Parameters
- **security_group** -- ID or name of security group to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_security_group_rule**(*security_group_rule_id*, *profile=None*)
Deletes the specified security group rule

CLI Example:

```
salt '*' neutron.delete_security_group_rule security-group-rule-id
```

Parameters
- **security_group_rule_id** -- ID of security group rule to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_subnet**(*subnet*, *profile=None*)
Deletes the specified subnet

CLI Example:

```
salt '*' neutron.delete_subnet subnet-name
salt '*' neutron.delete_subnet subnet-name profile=openstack1
```

Parameters
- **subnet** -- ID or name of subnet to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**delete_vpnservice**(*vpnservice*, *profile=None*)
Deletes the specified VPN service

CLI Example:

```
salt '*' neutron.delete_vpnservice vpnservice-name
```

Parameters
- **vpnservice** -- ID or name of vpn service to delete
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**get_quotas_tenant**(*profile=None*)
Fetches tenant info in server's context for following quota operation

CLI Example:

```
salt '*' neutron.get_quotas_tenant
salt '*' neutron.get_quotas_tenant profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)

Returns Quotas information

salt.modules.neutron.**list_agents**(*profile=None*)
List agents.

CLI Example:

```
salt '*' neutron.list_agents
```

Parameters **profile** -- Profile to build on (Optional)
Returns agents message.

salt.modules.neutron.**list_extensions**(*profile=None*)
Fetches a list of all extensions on server side

CLI Example:

```
salt '*' neutron.list_extensions
salt '*' neutron.list_extensions profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of extensions

salt.modules.neutron.**list_firewall_rules**(*profile=None*)
Fetches a list of all firewall rules for a tenant CLI Example:

```
salt '*' neutron.list_firewall_rules
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of firewall rules

salt.modules.neutron.**list_firewalls**(*profile=None*)
Fetches a list of all firewalls for a tenant CLI Example:

```
salt '*' neutron.list_firewalls
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of firewalls

salt.modules.neutron.**list_floatingips**(*profile=None*)
Fetch a list of all floatingIPs for a tenant

CLI Example:

```
salt '*' neutron.list_floatingips
salt '*' neutron.list_floatingips profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of floatingIP

salt.modules.neutron.**list_ikepolicies**(*profile=None*)
Fetches a list of all configured IKEPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ikepolicies
salt '*' neutron.list_ikepolicies profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of IKE policy

salt.modules.neutron.**list_ipsec_site_connections**(*profile=None*)
Fetches all configured IPsec Site Connections for a tenant

CLI Example:

```
salt '*' neutron.list_ipsec_site_connections
salt '*' neutron.list_ipsec_site_connections profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of IPSec site connection

salt.modules.neutron.**list_ipsecpolicies**(*profile=None*)
Fetches a list of all configured IPsecPolicies for a tenant

CLI Example:

```
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name
salt '*' neutron.list_ipsecpolicies ipsecpolicy-name profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of IPSec policy

salt.modules.neutron.**list_l3_agent_hosting_routers**(*router*, *profile=None*)
List L3 agents hosting a router.

CLI Example:

```
salt '*' neutron.list_l3_agent_hosting_routers router
```

:param router:router name or ID to query. :param profile: Profile to build on (Optional) :return: L3 agents message.

salt.modules.neutron.**list_networks**(*profile=None*)
Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_networks
salt '*' neutron.list_networks profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of network

salt.modules.neutron.**list_ports**(*profile=None*)
Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_ports
salt '*' neutron.list_ports profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of port

salt.modules.neutron.**list_quotas**(*profile=None*)
Fetches all tenants quotas

CLI Example:

```
salt '*' neutron.list_quotas
salt '*' neutron.list_quotas profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of quotas

salt.modules.neutron.**list_routers**(*profile=None*)
Fetches a list of all routers for a tenant

CLI Example:

```
salt '*' neutron.list_routers
salt '*' neutron.list_routers profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of router

salt.modules.neutron.**list_security_group_rules**(*profile=None*)
Fetches a list of all security group rules for a tenant

CLI Example:

```
salt '*' neutron.list_security_group_rules
salt '*' neutron.list_security_group_rules profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of security group rule

salt.modules.neutron.**list_security_groups**(*profile=None*)
Fetches a list of all security groups for a tenant

CLI Example:

```
salt '*' neutron.list_security_groups
salt '*' neutron.list_security_groups profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of security group

salt.modules.neutron.**list_subnets**(*profile=None*)
Fetches a list of all networks for a tenant

CLI Example:

```
salt '*' neutron.list_subnets
salt '*' neutron.list_subnets profile=openstack1
```

Parameters **profile** -- Profile to build on (Optional)
Returns List of subnet

salt.modules.neutron.**list_vpnservices**(*retrieve_all=True*, *profile=None*, ***kwargs*)
Fetches a list of all configured VPN services for a tenant

CLI Example:

```
salt '*' neutron.list_vpnservices
```

Parameters
- **retrieve_all** -- True or False, default: True (Optional)
- **profile** -- Profile to build on (Optional)

Returns List of VPN service

salt.modules.neutron.**remove_gateway_router**(*router*, *profile=None*)
Removes an external network gateway from the specified router

CLI Example:

```
salt '*' neutron.remove_gateway_router router-name
```

Parameters
- **router** -- ID or name of router
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**remove_interface_router**(*router*, *subnet*, *profile=None*)

Removes an internal network interface from the specified router

CLI Example:

```
salt '*' neutron.remove_interface_router router-name subnet-name
```

Parameters
- **router** -- ID or name of the router
- **subnet** -- ID or name of the subnet
- **profile** -- Profile to build on (Optional)

Returns True(Succeed) or False

salt.modules.neutron.**show_firewall**(*firewall*, *profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall firewall
```

Parameters
- **firewall** -- ID or name of firewall to look up
- **profile** -- Profile to build on (Optional)

Returns firewall information

salt.modules.neutron.**show_firewall_rule**(*firewall_rule*, *profile=None*)

Fetches information of a specific firewall rule

CLI Example:

```
salt '*' neutron.show_firewall_rule firewall-rule-name
```

Parameters
- **ipsecpolicy** -- ID or name of firewall rule to look up
- **profile** -- Profile to build on (Optional)

Returns firewall rule information

salt.modules.neutron.**show_floatingip**(*floatingip_id*, *profile=None*)

Fetches information of a certain floatingIP

CLI Example:

```
salt '*' neutron.show_floatingip floatingip-id
```

Parameters
- **floatingip_id** -- ID of floatingIP to look up
- **profile** -- Profile to build on (Optional)

Returns Floating IP information

salt.modules.neutron.**show_ikepolicy**(*ikepolicy*, *profile=None*)

Fetches information of a specific IKEPolicy

CLI Example:

```
salt '*' neutron.show_ikepolicy ikepolicy-name
```

Parameters
- **ikepolicy** -- ID or name of ikepolicy to look up
- **profile** -- Profile to build on (Optional)

Returns IKE policy information

salt.modules.neutron.**show_ipsec_site_connection**(*ipsec_site_connection*, *profile=None*)
Fetches information of a specific IPsecSiteConnection

CLI Example:

```
salt '*' neutron.show_ipsec_site_connection connection-name
```

Parameters
- **ipsec_site_connection** -- ID or name of ipsec site connection to look up
- **profile** -- Profile to build on (Optional)

Returns IPSec site connection information

salt.modules.neutron.**show_ipsecpolicy**(*ipsecpolicy*, *profile=None*)
Fetches information of a specific IPsecPolicy

CLI Example:

```
salt '*' neutron.show_ipsecpolicy ipsecpolicy-name
```

Parameters
- **ipsecpolicy** -- ID or name of IPSec policy to look up
- **profile** -- Profile to build on (Optional)

Returns IPSec policy information

salt.modules.neutron.**show_network**(*network*, *profile=None*)
Fetches information of a certain network

CLI Example:

```
salt '*' neutron.show_network network-name
salt '*' neutron.show_network network-name profile=openstack1
```

Parameters
- **network** -- ID or name of network to look up
- **profile** -- Profile to build on (Optional)

Returns Network information

salt.modules.neutron.**show_port**(*port*, *profile=None*)
Fetches information of a certain port

CLI Example:

```
salt '*' neutron.show_port port-id
salt '*' neutron.show_port port-id profile=openstack1
```

Parameters
- **port** -- ID or name of port to look up
- **profile** -- Profile to build on (Optional)

Returns Port information

salt.modules.neutron.**show_quota**(*tenant_id*, *profile=None*)
Fetches information of a certain tenant's quotas

CLI Example:

```
salt '*' neutron.show_quota tenant-id
salt '*' neutron.show_quota tenant-id profile=openstack1
```

Parameters
- **tenant_id** -- ID of tenant
- **profile** -- Profile to build on (Optional)

Returns Quota information

salt.modules.neutron.**show_router**(*router*, *profile=None*)

Fetches information of a certain router

CLI Example:

```
salt '*' neutron.show_router router-name
```

Parameters
- **router** -- ID or name of router to look up
- **profile** -- Profile to build on (Optional)

Returns Router information

salt.modules.neutron.**show_security_group**(*security_group*, *profile=None*)

Fetches information of a certain security group

CLI Example:

```
salt '*' neutron.show_security_group security-group-name
```

Parameters
- **security_group** -- ID or name of security group to look up
- **profile** -- Profile to build on (Optional)

Returns Security group information

salt.modules.neutron.**show_security_group_rule**(*security_group_rule_id*, *profile=None*)

Fetches information of a certain security group rule

CLI Example:

```
salt '*' neutron.show_security_group_rule security-group-rule-id
```

Parameters
- **security_group_rule_id** -- ID of security group rule to look up
- **profile** -- Profile to build on (Optional)

Returns Security group rule information

salt.modules.neutron.**show_subnet**(*subnet*, *profile=None*)

Fetches information of a certain subnet

CLI Example:

```
salt '*' neutron.show_subnet subnet-name
```

Parameters
- **subnet** -- ID or name of subnet to look up
- **profile** -- Profile to build on (Optional)

Returns Subnet information

salt.modules.neutron.**show_vpnservice**(*vpnservice*, *profile=None*, ***kwargs*)

Fetches information of a specific VPN service

CLI Example:

```
salt '*' neutron.show_vpnservice vpnservice-name
```

Parameters

- **vpnservice** -- ID or name of vpn service to look up
- **profile** -- Profile to build on (Optional)

Returns VPN service information

salt.modules.neutron.**update_firewall_rule**(*firewall_rule*, *protocol=None*, *action=None*, *name=None*, *description=None*, *ip_version=None*, *source_ip_address=None*, *destination_ip_address=None*, *source_port=None*, *destination_port=None*, *shared=None*, *enabled=None*, *profile=None*)

Update a firewall rule

CLI Example:

```
salt '*' neutron.update_firewall_rule firewall_rule protocol=PROTOCOL
↪action=ACTION
        name=NAME description=DESCRIPTION ip_version=IP_VERSION
        source_ip_address=SOURCE_IP_ADDRESS destination_ip_address=DESTINATION_IP_
↪ADDRESS
        source_port=SOURCE_PORT destination_port=DESTINATION_PORT shared=SHARED
↪enabled=ENABLED
```

Parameters

- **firewall_rule** -- ID or name of firewall rule to update.
- **protocol** -- Protocol for the firewall rule, choose ``tcp'',''udp'',''icmp'' or ``None''. (Optional)
- **action** -- Action for the firewall rule, choose ``allow'' or ``deny''. (Optional)
- **name** -- Name for the firewall rule. (Optional)
- **description** -- Description for the firewall rule. (Optional)
- **ip_version** -- IP protocol version, default: 4. (Optional)
- **source_ip_address** -- Source IP address or subnet. (Optional)
- **destination_ip_address** -- Destination IP address or subnet. (Optional)
- **source_port** -- Source port (integer in [1, 65535] or range in a:b). (Optional)
- **destination_port** -- Destination port (integer in [1, 65535] or range in a:b). (Optional)
- **shared** -- Set shared to True, default: False. (Optional)
- **enabled** -- To enable this rule, default: True. (Optional)
- **profile** -- Profile to build on (Optional)

salt.modules.neutron.**update_floatingip**(*floatingip_id*, *port=None*, *profile=None*)

Updates a floatingIP

CLI Example:

```
salt '*' neutron.update_floatingip network-name port-name
```

Parameters

- **floatingip_id** -- ID of floatingIP
- **port** -- ID or name of port, to associate floatingip to *None* or do not specify to disassociate the floatingip (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated floating IP information

salt.modules.neutron.**update_network**(*network*, *name*, *profile=None*)

Updates a network

CLI Example:

```
salt '*' neutron.update_network network-name new-network-name
```

Parameters

- **network** -- ID or name of network to update
- **name** -- Name of this network
- **profile** -- Profile to build on (Optional)

Returns Value of updated network information

salt.modules.neutron.**update_port**(*port*, *name*, *admin_state_up=True*, *profile=None*)

Updates a port

CLI Example:

```
salt '*' neutron.update_port port-name network-name new-port-name
```

Parameters

- **port** -- Port name or ID
- **name** -- Name of this port
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated port information

salt.modules.neutron.**update_quota**(*tenant_id*, *subnet=None*, *router=None*, *network=None*, *floatingip=None*, *port=None*, *security_group=None*, *security_group_rule=None*, *profile=None*)

Update a tenant's quota

CLI Example:

```
salt '*' neutron.update_quota tenant-id subnet=40 router=50
                              network=10 floatingip=30 port=30
```

Parameters

- **tenant_id** -- ID of tenant
- **subnet** -- Value of subnet quota (Optional)
- **router** -- Value of router quota (Optional)
- **network** -- Value of network quota (Optional)
- **floatingip** -- Value of floatingip quota (Optional)
- **port** -- Value of port quota (Optional)
- **security_group** -- Value of security group (Optional)
- **security_group_rule** -- Value of security group rule (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated quota

salt.modules.neutron.**update_router**(*router*, *name=None*, *admin_state_up=None*, *profile=None*, ***kwargs*)

Updates a router

CLI Example:

```
salt '*' neutron.update_router router_id name=new-router-name
        admin_state_up=True
```

Parameters

- **router** -- ID or name of router to update
- **name** -- Name of this router
- **ext_network** -- ID or name of the external for the gateway (Optional)
- **admin_state_up** -- Set admin state up to true or false, default: true (Optional)
- **profile** -- Profile to build on (Optional)
- **kwargs** --

Returns Value of updated router information

salt.modules.neutron.**update_security_group**(*security_group*, *name=None*, *description=None*, *profile=None*)

Updates a security group

CLI Example:

```
salt '*' neutron.update_security_group security-group-name                    new-
↪security-group-name
```

Parameters

- **security_group** -- ID or name of security group to update
- **name** -- Name of this security group (Optional)
- **description** -- Description of security group (Optional)
- **profile** -- Profile to build on (Optional)

Returns Value of updated security group information

salt.modules.neutron.**update_subnet**(*subnet*, *name*, *profile=None*)

Updates a subnet

CLI Example:

```
salt '*' neutron.update_subnet subnet-name new-subnet-name
```

Parameters

- **subnet** -- ID or name of subnet to update
- **name** -- Name of this subnet
- **profile** -- Profile to build on (Optional)

Returns Value of updated subnet information

salt.modules.neutron.**update_vpnservice**(*vpnservice*, *desc*, *profile=None*)

Updates a VPN service

CLI Example:

```
salt '*' neutron.update_vpnservice vpnservice-name desc='VPN Service1'
```

Parameters

- **vpnservice** -- ID or name of vpn service to update
- **desc** -- Set a description for the VPN service
- **profile** -- Profile to build on (Optional)

Returns Value of updated VPN service information

19.9.256 salt.modules.nfs3

Module for managing NFS version 3.

salt.modules.nfs3.**del_export**(*exports='/etc/exports'*, *path=None*)

Remove an export

CLI Example:

```
salt '*' nfs.del_export /media/storage
```

salt.modules.nfs3.**list_exports**(*exports='/etc/exports'*)

List configured exports

CLI Example:

```
salt '*' nfs.list_exports
```

19.9.257 salt.modules.nftables

Support for nftables

salt.modules.nftables.**append**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Append a rule to the specified table & chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.append filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**build_rule**(*table=None*, *chain=None*, *command=None*, *position=''*, *full=None*, *family='ipv4'*, ***kwargs*)

Build a well-formatted nftables rule based on kwargs. A *table* and *chain* are not required, unless *full* is True.

If *full* is *True*, then *table*, *chain* and *command* are required. *command* may be specified as either insert, append, or delete. This will return the nftables command, exactly as it would be used from the command line.

If a position is required (as with *insert* or *delete*), it may be specified as *position*. This will only be useful if *full* is True.

If *connstate* is passed in, it will automatically be changed to *state*.

CLI Examples:

```
salt '*' nftables.build_rule match=state \
    connstate=RELATED,ESTABLISHED jump=ACCEPT
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept

IPv6:
salt '*' nftables.build_rule match=state \
    connstate=related,established jump=accept \
    family=ipv6
salt '*' nftables.build_rule filter input command=insert position=3 \
    full=True match=state state=related,established jump=accept \
    family=ipv6
```

salt.modules.nftables.**check**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Check for the existence of a rule in the table and chain

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.check filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.check filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**check_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.7.0.

Check for the existence of a chain in the table

CLI Example:

```
salt '*' nftables.check_chain filter input

IPv6:
salt '*' nftables.check_chain filter input family=ipv6
```

salt.modules.nftables.**check_table**(*table=None*, *family='ipv4'*)

Check for the existence of a table

CLI Example:

```
salt '*' nftables.check_table nat
```

salt.modules.nftables.**delete**(*table*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Delete a rule from the specified table & chain, specifying either the rule in its entirety, or the rule's position in the chain.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.delete filter input position=3

salt '*' nftables.delete filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.delete filter input position=3 family=ipv6

salt '*' nftables.delete filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**delete_chain**(*table='filter'*, *chain=None*, *family='ipv4'*)

New in version 2014.7.0.

Delete the chain from the specified table.

CLI Example:

```
salt '*' nftables.delete_chain filter input

salt '*' nftables.delete_chain filter foo

IPv6:
salt '*' nftables.delete_chain filter input family=ipv6

salt '*' nftables.delete_chain filter foo family=ipv6
```

salt.modules.nftables.**delete_table**(*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.delete_table filter

IPv6:
salt '*' nftables.delete_table filter family=ipv6
```

salt.modules.nftables.**flush**(*table='filter'*, *chain=''*, *family='ipv4'*)

Flush the chain in the specified table, flush all chains in the specified table if chain is not specified.

CLI Example:

```
salt '*' nftables.flush filter

salt '*' nftables.flush filter input

IPv6:
salt '*' nftables.flush filter input family=ipv6
```

salt.modules.nftables.**get_rule_handle**(*table='filter'*, *chain=None*, *rule=None*, *family='ipv4'*)

Get the handle for a particular rule

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Example:

```
salt '*' nftables.get_rule_handle filter input \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.get_rule_handle filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**get_rules**(*family='ipv4'*)

Return a data structure of the current, in-memory rules

CLI Example:

```
salt '*' nftables.get_rules

salt '*' nftables.get_rules family=ipv6
```

salt.modules.nftables.**get_saved_rules**(*conf_file=None*, *family='ipv4'*)

Return a data structure of the rules in the conf file

CLI Example:

```
salt '*' nftables.get_saved_rules
```

salt.modules.nftables.**insert**(*table='filter'*, *chain=None*, *position=None*, *rule=None*, *family='ipv4'*)

Insert a rule into the specified table & chain, at the specified position.

If position is not specified, rule will be inserted in first position.

This function accepts a rule in a standard nftables command format, starting with the chain. Trying to force users to adapt to a new method of creating rules would be irritating at best, and we already have a parser that can handle it.

CLI Examples:

```
salt '*' nftables.insert filter input \
    rule='input tcp dport 22 log accept'

salt '*' nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept'

IPv6:
salt '*' nftables.insert filter input \
    rule='input tcp dport 22 log accept' \
    family=ipv6

salt '*' nftables.insert filter input position=3 \
    rule='input tcp dport 22 log accept' \
    family=ipv6
```

salt.modules.nftables.**new_chain**(*table='filter'*, *chain=None*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)

New in version 2014.7.0.

Create new chain to the specified table.

CLI Example:

```
salt '*' nftables.new_chain filter input

salt '*' nftables.new_chain filter input \
        table_type=filter hook=input priority=0

salt '*' nftables.new_chain filter foo

IPv6:
salt '*' nftables.new_chain filter input family=ipv6

salt '*' nftables.new_chain filter input \
        table_type=filter hook=input priority=0 family=ipv6

salt '*' nftables.new_chain filter foo family=ipv6
```

salt.modules.nftables.**new_table**(*table*, *family='ipv4'*)

New in version 2014.7.0.

Create new custom table.

CLI Example:

```
salt '*' nftables.new_table filter
```

```
IPv6:
salt '*' nftables.new_table filter family=ipv6
```

salt.modules.nftables.**save**(*filename=None*, *family='ipv4'*)
Save the current in-memory rules to disk

CLI Example:

```
salt '*' nftables.save /etc/nftables
```

salt.modules.nftables.**version**()
Return version from nftables --version

CLI Example:

```
salt '*' nftables.version
```

19.9.258 salt.modules.nginx

Support for nginx

salt.modules.nginx.**build_info**()
Return server and build arguments

CLI Example:

```
salt '*' nginx.build_info
```

salt.modules.nginx.**configtest**()
test configuration and exit

CLI Example:

```
salt '*' nginx.configtest
```

salt.modules.nginx.**signal**(*signal=None*)
Signals nginx to start, reload, reopen or stop.

CLI Example:

```
salt '*' nginx.signal reload
```

salt.modules.nginx.**status**(*url='http://127.0.0.1/status'*)
Return the data from an Nginx status page as a dictionary. http://wiki.nginx.org/HttpStubStatusModule
url The URL of the status page. Defaults to `http://127.0.0.1/status`
CLI Example:

```
salt '*' nginx.status
```

salt.modules.nginx.**version**()
Return server version from nginx -v

CLI Example:

```
salt '*' nginx.version
```

19.9.259 salt.modules.nilrt_ip module

The networking module for NI Linux Real-Time distro

salt.modules.nilrt_ip.**apply_network_settings**(***settings*)
Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

salt.modules.nilrt_ip.**build_interface**(*iface*, *iface_type*, *enable*, ***settings*)
Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.nilrt_ip.**build_network_settings**(***settings*)
Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.nilrt_ip.**disable**(*interface*)
Disable the specified interface
Parameters **interface** (*str*) -- interface label
Returns True if the service was disabled, otherwise an exception will be thrown.
Return type bool
CLI Example:

```
salt '*' ip.disable interface-label
```

salt.modules.nilrt_ip.**down**(*interface*, *iface_type=None*)
Disable the specified interface
Parameters **interface** (*str*) -- interface label
Returns True if the service was disabled, otherwise an exception will be thrown.
Return type bool
CLI Example:

```
salt '*' ip.down interface-label
```

salt.modules.nilrt_ip.**enable**(*interface*)
Enable the specified interface
Parameters **interface** (*str*) -- interface label
Returns True if the service was enabled, otherwise an exception will be thrown.
Return type bool
CLI Example:

```
salt '*' ip.enable interface-label
```

salt.modules.nilrt_ip.**get_interface**(*iface*)
Returns details about given interface.

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.nilrt_ip.**get_interfaces_details**()

Get details about all the interfaces on the minion

Returns information about all connmans interfaces

Return type dictionary

CLI Example:

```
salt '*' ip.get_interfaces_details
```

salt.modules.nilrt_ip.**get_network_settings**()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.nilrt_ip.**set_dhcp_linklocal_all**(*interface*)

Configure specified adapter to use DHCP with linklocal fallback

Parameters **interface** (*str*) -- interface label

Returns True if the settings ware applied, otherwise an exception will be thrown.

Return type bool

CLI Example:

```
salt '*' ip.dhcp_linklocal_all interface-label
```

salt.modules.nilrt_ip.**set_static_all**(*interface*, *address*, *netmask*, *gateway*, *domains*)

Configure specified adapter to use ipv4 manual settings

Parameters

- **interface** (*str*) -- interface label
- **address** (*str*) -- ipv4 address
- **netmask** (*str*) -- ipv4 netmask
- **gateway** (*str*) -- ipv4 gateway
- **domains** (*str*) -- list of domains servers separated by spaces

Returns True if the settings were applied, otherwise an exception will be thrown.

Return type bool

CLI Example:

```
salt '*' ip.dhcp_linklocal_all interface-label address netmask gateway domains
```

salt.modules.nilrt_ip.**up**(*interface*, *iface_type=None*)

Enable the specified interface

Parameters **interface** (*str*) -- interface label

Returns True if the service was enabled, otherwise an exception will be thrown.

Return type bool

CLI Example:

```
salt '*' ip.up interface-label
```

19.9.260 salt.modules.nix

Work with Nix packages

New in version 2017.7.0.

Does not require the machine to be Nixos, just have Nix installed and available to use for the user running this command. Their profile must be located in their home, under `$HOME/.nix-profile/`, and the nix store, unless specially set up, should be in `/nix`. To easily use this with multiple users or a root user, set up the nix-daemon.

This module exposes most of the common nix operations. Currently not meant to be run as a `pkg` module, but explicitly as `nix.*`.

For more information on nix, see the nix documentation.

`salt.modules.nix.`**`collect_garbage`**`()`

Completely removed all currently `uninstalled' packages in the nix store.

Tells the user how many store paths were removed and how much space was freed.

Returns How much space was freed and how many derivations were removed

Return type str

Warning: This is a destructive action on the nix store.

```
salt '*' nix.collect_garbage
```

`salt.modules.nix.`**`install`**`(*pkgs, **kwargs)`

Installs a single or multiple packages via nix

Parameters

- **pkgs** (*list(str)*) -- packages to update
- **attributes** (*bool*) -- Pass the list of packages or single package as attribues, not package names. default: False

Returns Installed packages. Example element: `gcc-3.3.2`

Return type list(str)

```
salt '*' nix.install package [package2 ...]
salt '*' nix.install attributes=True attr.name [attr.name2 ...]
```

`salt.modules.nix.`**`list_pkgs`**`(installed=True, attributes=True)`

Lists installed packages. Due to how nix works, it defaults to just doing a `nix-env -q`.

Parameters

- **installed** (*bool*) -- list only installed packages. This can be a very long list (12,000+ elements), so caution is advised. Default: True
- **attributes** (*bool*) -- show the attributes of the packages when listing all packages. Default: True

Returns Packages installed or available, along with their attributes.

Return type list(list(str))

```
salt '*' nix.list_pkgs
salt '*' nix.list_pkgs installed=False
```

`salt.modules.nix.`**`uninstall`**`(*pkgs)`

Erases a package from the current nix profile. Nix uninstalls work differently than other package managers, and the symlinks in the profile are removed, while the actual package remains. There is also a `nix.purge` function, to clear the package cache of unused packages.

Parameters **pkgs** (*list(str)*) -- List, single package to uninstall

Returns Packages that have been uninstalled

Return type list(str)

```
salt '*' nix.uninstall pkg1 [pkg2 ...]
```

salt.modules.nix.**upgrade**(**pkgs*)

Runs an update operation on the specified packages, or all packages if none is specified.

Parameters **pkgs** (*list(str)*) -- List of packages to update

Returns The upgraded packages. Example element: `['libxslt-1.1.0','libxslt-1.1.10']`

Return type list(tuple(str, str))

```
salt '*' nix.update
salt '*' nix.update pkgs=one,two
```

19.9.261 salt.modules.nova

Module for handling OpenStack Nova calls

depends

- novaclient Python module

configuration This module is not usable until the user, password, tenant, and auth URL are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.password: verybadpass
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
# Optional
keystone.region_name: 'RegionOne'
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'

openstack2:
  keystone.user: admin
  keystone.password: verybadpass
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
```

With this configuration in place, any of the nova functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' nova.flavor_list profile=openstack1
```

To use keystoneauth1 instead of keystoneclient, include the *use_keystoneauth* option in the pillar or minion config.

Note: This is required to use keystone v3 as for authentication.

```
keystone.user: admin
keystone.password: verybadpass
```

```
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v3/'
keystone.use_keystoneauth: true
keystone.verify: '/path/to/custom/certs/ca-bundle.crt'
```

Note: By default the nova module will attempt to verify its connection utilizing the system certificates. If you need to verify against another bundle of CA certificates or want to skip verification altogether you will need to specify the *verify* option. You can specify True or False to verify (or not) against system certificates, a path to a bundle or CA certs to check against, or None to allow keystoneauth to search for the certificates on its own. (defaults to True)

salt.modules.nova.**boot**(*name*, *flavor_id=0*, *image_id=0*, *profile=None*, *timeout=300*)

Boot (create) a new instance

name Name of the new instance (must be first)

flavor_id Unique integer ID for the flavor

image_id Unique integer ID for the image

timeout How long to wait, after creating the instance, for the provider to return information about it (default 300 seconds).

New in version 2014.1.0.

CLI Example:

```
salt '*' nova.boot myinstance flavor_id=4596 image_id=2
```

The flavor_id and image_id are obtained from nova.flavor_list and nova.image_list

```
salt '*' nova.flavor_list
salt '*' nova.image_list
```

salt.modules.nova.**delete**(*instance_id*, *profile=None*)

Delete an instance

instance_id ID of the instance to be deleted

CLI Example:

```
salt '*' nova.delete 1138
```

salt.modules.nova.**flavor_create**(*name*, *flavor_id=0*, *ram=0*, *disk=0*, *vcpus=1*, *profile=None*)

Add a flavor to nova (nova flavor-create). The following parameters are required:

name Name of the new flavor (must be first)

flavor_id Unique integer ID for the new flavor

ram Memory size in MB

disk Disk size in GB

vcpus Number of vcpus

CLI Example:

```
salt '*' nova.flavor_create myflavor flavor_id=6 ram=4096 disk=10 vcpus=1
```

salt.modules.nova.**flavor_delete**(*flavor_id*, *profile=None*)

Delete a flavor from nova by id (nova flavor-delete)

CLI Example:

```
salt '*' nova.flavor_delete 7
```

salt.modules.nova.**flavor_list**(*profile=None*)
Return a list of available flavors (nova flavor-list)

CLI Example:

```
salt '*' nova.flavor_list
```

salt.modules.nova.**image_list**(*name=None*, *profile=None*)
Return a list of available images (nova images-list + nova image-show) If a name is provided, only that image will be displayed.

CLI Examples:

```
salt '*' nova.image_list
salt '*' nova.image_list myimage
```

salt.modules.nova.**image_meta_delete**(*image_id=None*, *name=None*, *keys=None*, *profile=None*)
Delete a key=value pair from the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_delete 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 keys=cheese
salt '*' nova.image_meta_delete name=myimage keys=salad,beans
```

salt.modules.nova.**image_meta_set**(*image_id=None*, *name=None*, *profile=None*, ***kwargs*)
Sets a key=value pair in the metadata for an image (nova image-meta set)

CLI Examples:

```
salt '*' nova.image_meta_set 6f52b2ff-0b31-4d84-8fd1-af45b84824f6 cheese=gruyere
salt '*' nova.image_meta_set name=myimage salad=pasta beans=baked
```

salt.modules.nova.**keypair_add**(*name*, *pubfile=None*, *pubkey=None*, *profile=None*)
Add a keypair to nova (nova keypair-add)

CLI Examples:

```
salt '*' nova.keypair_add mykey pubfile=/home/myuser/.ssh/id_rsa.pub
salt '*' nova.keypair_add mykey pubkey='ssh-rsa <key> myuser@mybox'
```

salt.modules.nova.**keypair_delete**(*name*, *profile=None*)
Add a keypair to nova (nova keypair-delete)

CLI Example:

```
salt '*' nova.keypair_delete mykey
```

salt.modules.nova.**keypair_list**(*profile=None*)
Return a list of available keypairs (nova keypair-list)

CLI Example:

```
salt '*' nova.keypair_list
```

salt.modules.nova.**list**(*profile=None*)
To maintain the feel of the nova command line, this function simply calls the server_list function.

CLI Example:

```
salt '*' nova.list
```

salt.modules.nova.**lock**(*instance_id*, *profile=None*)

Lock an instance

instance_id ID of the instance to be locked

CLI Example:

```
salt '*' nova.lock 1138
```

salt.modules.nova.**resume**(*instance_id*, *profile=None*)

Resume an instance

instance_id ID of the instance to be resumed

CLI Example:

```
salt '*' nova.resume 1138
```

salt.modules.nova.**secgroup_create**(*name*, *description*, *profile=None*)

Add a secgroup to nova (nova secgroup-create)

CLI Example:

```
salt '*' nova.secgroup_create mygroup 'This is my security group'
```

salt.modules.nova.**secgroup_delete**(*name*, *profile=None*)

Delete a secgroup to nova (nova secgroup-delete)

CLI Example:

```
salt '*' nova.secgroup_delete mygroup
```

salt.modules.nova.**secgroup_list**(*profile=None*)

Return a list of available security groups (nova items-list)

CLI Example:

```
salt '*' nova.secgroup_list
```

salt.modules.nova.**server_by_name**(*name*, *profile=None*)

Return information about a server

name Server Name

CLI Example:

```
salt '*' nova.server_by_name myserver profile=openstack
```

salt.modules.nova.**server_list**(*profile=None*)

Return list of active servers

CLI Example:

```
salt '*' nova.server_list
```

salt.modules.nova.**server_list_detailed**(*profile=None*)

Return detailed list of active servers

CLI Example:

```
salt '*' nova.server_list_detailed
```

salt.modules.nova.**server_show**(*server_id*, *profile=None*)
Return detailed information for an active server

CLI Example:

```
salt '*' nova.server_show <server_id>
```

salt.modules.nova.**show**(*server_id*, *profile=None*)
To maintain the feel of the nova command line, this function simply calls the server_show function.

CLI Example:

```
salt '*' nova.show
```

salt.modules.nova.**suspend**(*instance_id*, *profile=None*)
Suspend an instance
instance_id ID of the instance to be suspended
CLI Example:

```
salt '*' nova.suspend 1138
```

salt.modules.nova.**volume_attach**(*name*, *server_name*, *device='/dev/xvdb'*, *profile=None*, *timeout=300*)
Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to attach to
device Name of the device on the server
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_attach myblock slice.example.com profile=openstack
salt '*' nova.volume_attach myblock server.example.com device=/dev/xvdb
 ↪profile=openstack
```

salt.modules.nova.**volume_create**(*name*, *size=100*, *snapshot=None*, *voltype=None*, *profile=None*)
Create a block storage volume
name Name of the new volume (must be first)
size Volume size
snapshot Block storage snapshot id
voltype Type of storage
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_create myblock size=300 profile=openstack
```

salt.modules.nova.**volume_delete**(*name*, *profile=None*)
Destroy the volume
name Name of the volume
profile Profile to build on
CLI Example:

```
salt '*' nova.volume_delete myblock profile=openstack
```

salt.modules.nova.**volume_detach**(*name*, *profile=None*, *timeout=300*)
Attach a block storage volume
name Name of the new volume to attach
server_name Name of the server to detach from

profile Profile to build on
CLI Example:

```
salt '*' nova.volume_detach myblock profile=openstack
```

salt.modules.nova.**volume_list**(*search_opts=None*, *profile=None*)
List storage volumes
search_opts Dictionary of search options
profile Profile to use
CLI Example:

```
salt '*' nova.volume_list search_opts='{"display_name": "myblock"}'
 ↪profile=openstack
```

salt.modules.nova.**volume_show**(*name*, *profile=None*)
Create a block storage volume
name Name of the volume
profile Profile to use
CLI Example:

```
salt '*' nova.volume_show myblock profile=openstack
```

19.9.262 salt.modules.npm

Manage and query NPM packages.

salt.modules.npm.**cache_clean**(*path=None*, *runas=None*, *env=None*, *force=False*)
Clean cached NPM packages.

If no path for a specific package is provided the entire cache will be cleared.
path The cache subpath to delete, or None to clear the entire cache
runas The user to run NPM with
env Environment variables to set when invoking npm. Uses the same env format as the *cmd.run* execution function.
force Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

CLI Example:

```
salt '*' npm.cache_clean force=True
```

salt.modules.npm.**cache_list**(*path=None*, *runas=None*, *env=None*)
List NPM cached packages.

If no path for a specific package is provided this will list all the cached packages.
path The cache subpath to list, or None to list the entire cache
runas The user to run NPM with
env Environment variables to set when invoking npm. Uses the same env format as the *cmd.run* execution function.
CLI Example:

```
salt '*' npm.cache_clean
```

salt.modules.npm.**cache_path**(*runas=None*, *env=None*)
List path of the NPM cache directory.
runas The user to run NPM with

env Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

CLI Example:

```
salt '*' npm.cache_path
```

salt.modules.npm.**install**(*pkg=None*, *pkgs=None*, *dir=None*, *runas=None*, *registry=None*, *env=None*, *dry_run=False*, *silent=True*)

Install an NPM package.

If no directory is specified, the package will be installed globally. If no package is specified, the dependencies (from package.json) of the package in the given directory will be installed.

pkg A package name in any format accepted by NPM, including a version identifier

pkgs A list of package names in the same format as the `name` parameter

New in version 2014.7.0.

dir The target directory in which to install the package, or None for global installation

runas The user to run NPM with

registry The NPM registry to install the package from.

New in version 2014.7.0.

env Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

New in version 2014.7.0.

silent Whether or not to run NPM install with --silent flag.

New in version 2016.3.0.

dry_run Whether or not to run NPM install with --dry-run flag.

New in version 2015.8.4.

silent Whether or not to run NPM install with --silent flag.

New in version 2015.8.5.

CLI Example:

```
salt '*' npm.install coffee-script

salt '*' npm.install coffee-script@1.0.1
```

salt.modules.npm.**list**(*pkg=None*, *dir=None*, *runas=None*, *env=None*, *depth=None*)

List installed NPM packages.

If no directory is specified, this will return the list of globally- installed packages.

pkg Limit package listing by name

dir The directory whose packages will be listed, or None for global installation

runas The user to run NPM with

New in version 2014.7.0.

env Environment variables to set when invoking npm. Uses the same `env` format as the *cmd.run* execution function.

New in version 2014.7.0.

depth Limit the depth of the packages listed

New in version 2016.11.6,: 2017.7.0

CLI Example:

```
salt '*' npm.list
```

salt.modules.npm.**uninstall**(*pkg*, *dir=None*, *runas=None*, *env=None*)
Uninstall an NPM package.

If no directory is specified, the package will be uninstalled globally.
pkg A package name in any format accepted by NPM
dir The target directory from which to uninstall the package, or None for global installation
runas The user to run NPM with
env Environment variables to set when invoking npm. Uses the same env format as the *cmd.run* execution function.

New in version 2015.5.3.
CLI Example:

```
salt '*' npm.uninstall coffee-script
```

19.9.263 salt.modules.nspawn

Manage nspawn containers

New in version 2015.8.0.

systemd-nspawn(1) is a tool used to manage lightweight namespace containers. This execution module provides several functions to help manage these containers.

Minions running systemd >= 219 will place new containers in /var/lib/machines, while those running systemd < 219 will place them in /var/lib/container.

salt.modules.nspawn.**bootstrap_container**(*name*, *dist=None*, *version=None*)
Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt myminion nspawn.bootstrap_container <name>
```

salt.modules.nspawn.**bootstrap_salt**(*name*, *config=None*, *approve_key=True*, *install=True*, *pub_key=None*, *priv_key=None*, *bootstrap_url=None*, *force_install=False*, *unconditional_install=False*, *bootstrap_delay=None*, *bootstrap_args=None*, *bootstrap_shell=None*)
Bootstrap a container from package servers, if dist is None the os the minion is running as will be created, otherwise the needed bootstrapping tools will need to be available on the host.

CLI Example:

```
salt '*' nspawn.bootstrap_salt arch1
```

salt.modules.nspawn.**copy_to**(*name*, **args*, ***kwargs*)
Copy a file from the host into a container
name Container name
source File to be copied to the container
dest Destination on the container. Must be an absolute path.
overwrite [False] Unless this option is set to True, then if a file exists at the location specified by the dest argument, an error will be raised.
makedirs : False
Create the parent directory on the container if it does not already exist.
CLI Example:

```
salt 'minion' nspawn.copy_to /tmp/foo /root/foo
```

salt.modules.nspawn.**disable**(*name*, **args*, ***kwargs*)

Set the named container to *not* be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.**enable**(*name*, **args*, ***kwargs*)

Set the named container to be launched at boot

CLI Example:

```
salt myminion nspawn.enable <name>
```

salt.modules.nspawn.**exists**(*name*)

Returns true if the named container exists

CLI Example:

```
salt myminion nspawn.exists <name>
```

salt.modules.nspawn.**info**(*name*, ***kwargs*)

Return info about a container

Note: The container must be running for `machinectl` to gather information about it. If the container is stopped, then this function will start it.

---

start [False] If `True`, then the container will be started to retrieve the info. A `Started` key will be in the return data if the container was started.

CLI Example:

```
salt myminion nspawn.info arch1
salt myminion nspawn.info arch1 force_start=False
```

salt.modules.nspawn.**list_all**()

Lists all nspawn containers

CLI Example:

```
salt myminion nspawn.list_all
```

salt.modules.nspawn.**list_running**()

Lists running nspawn containers

Note: `nspawn.list` also works to list running containers

CLI Example:

```
salt myminion nspawn.list_running
salt myminion nspawn.list
```

salt.modules.nspawn.**list_stopped**()

Lists stopped nspawn containers

CLI Example:

```
salt myminion nspawn.list_stopped
```

salt.modules.nspawn.**pid**(*name*, **args*, ***kwargs*)

Returns the PID of a container

name Container name

CLI Example:

```
salt myminion nspawn.pid arch1
```

salt.modules.nspawn.**poweroff**(*name*)

Issue a clean shutdown to the container. Equivalent to running `machinectl poweroff` on the named container.

For convenience, running `nspawn.stop``(as shown in the CLI examples below) is equivalent to running ``nspawn.poweroff`.

Note: `machinectl poweroff` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.poweroff arch1
salt myminion nspawn.stop arch1
```

salt.modules.nspawn.**pull_dkr**(*url*, *name*, *index*)

Execute a `machinectl pull-dkr` to download a docker image and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

---

url URL from which to download the container

name Name for the new container

index URL of the Docker index server from which to pull (must be an `http://` or `https://` URL).

CLI Examples:

```
salt myminion nspawn.pull_dkr centos/centos6 cent6 index=https://get.docker.com
salt myminion nspawn.pull_docker centos/centos6 cent6 index=https://get.docker.com
```

salt.modules.nspawn.**pull_raw**(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .qcow2 or raw disk image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

---

url URL from which to download the container

name Name for the new container

verify [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled ``Image Transfer Commands'') for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_raw http://ftp.halifax.rwth-aachen.de/fedora/linux/
 ↪releases/21/Cloud/Images/x86_64/Fedora-Cloud-Base-20141203-21.x86_64.raw.xz
 ↪fedora21
```

salt.modules.nspawn.**pull_tar**(*url*, *name*, *verify=False*)

Execute a `machinectl pull-raw` to download a .tar container image, and add it to /var/lib/machines as a new container.

Note: Requires systemd >= 219

---

url URL from which to download the container

name Name for the new container

verify [False] Perform signature or checksum verification on the container. See the `machinectl(1)` man page (section titled ``Image Transfer Commands'') for more information on requirements for image verification. To perform signature verification, use `verify=signature`. For checksum verification, use `verify=checksum`. By default, no verification will be performed.

CLI Examples:

```
salt myminion nspawn.pull_tar http://foo.domain.tld/containers/archlinux-2015.02.
 ↪01.tar.gz arch2
```

salt.modules.nspawn.**reboot**(*name*, **args*, ***kwargs*)

Reboot the container by sending a SIGINT to its init process. Equivalent to running `machinectl reboot` on the named container.

For convenience, running `nspawn.restart` (as shown in the CLI examples below) is equivalent to running `nspawn.reboot`.

Note: `machinectl reboot` is only supported in systemd >= 219. On earlier systemd versions, running this function will instead restart the container via `systemctl`.

CLI Examples:

```
salt myminion nspawn.reboot arch1
salt myminion nspawn.restart arch1
```

salt.modules.nspawn.**remove**(*name*, **args*, ***kwargs*)

Remove the named container

Warning: This function will remove all data associated with the container. It will not, however, remove the btrfs subvolumes created by pulling container images (*nspawn.pull_raw*, *nspawn.pull_tar*, *nspawn.pull_dkr*).

stop [False] If `True`, the container will be destroyed even if it is running/frozen.

CLI Examples:

```
salt '*' nspawn.remove foo
salt '*' nspawn.remove foo stop=True
```

salt.modules.nspawn.**retcode**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.retcode* within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.retcode mycontainer 'ip addr show'
```

salt.modules.nspawn.**run**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run* within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run mycontainer 'ifconfig -a'
```

salt.modules.nspawn.**run_all**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_all* within a container

Note: While the command is run within the container, it is initiated from the host. Therefore, the PID in the return dict is from the host, not from the container.

---

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_all mycontainer 'ip addr show'
```

`salt.modules.nspawn.`**`run_stderr`**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_stderr* within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stderr mycontainer 'ip addr show'
```

`salt.modules.nspawn.`**`run_stdout`**(*name*, *cmd*, *no_start=False*, *preserve_state=True*, *stdin=None*, *python_shell=True*, *output_loglevel='debug'*, *use_vt=False*, *ignore_retcode=False*, *keep_env=None*)

Run *cmd.run_stdout* within a container

name Name of the container in which to run the command

cmd Command to run

no_start [False] If the container is not running, don't start it

preserve_state [True] After running the command, return the container to its previous state

stdin [None] Standard input to be used for the command

output_loglevel [debug] Level at which to log the output from the command. Set to `quiet` to suppress logging.

use_vt [False] Use SaltStack's utils.vt to stream output to console. Assumes `output=all`.

keep_env [None] If not passed, only a sane default PATH environment variable will be set. If `True`, all environment variables from the container's host will be kept. Otherwise, a comma-separated list (or Python list) of environment variable names can be passed, and those environment variables will be kept.

CLI Example:

```
salt myminion nspawn.run_stdout mycontainer 'ifconfig -a'
```

`salt.modules.nspawn.`**`start`**(*name*, **args*, ***kwargs*)

Start the named container

CLI Example:

```
salt myminion nspawn.start <name>
```

`salt.modules.nspawn.`**`state`**(*name*, **args*, ***kwargs*)

Return state of container (running or stopped)

CLI Example:

```
salt myminion nspawn.state <name>
```

salt.modules.nspawn.**terminate**(*name*)

Kill all processes in the container without issuing a clean shutdown. Equivalent to running `machinectl terminate` on the named container.

For convenience, running `nspawn.stop` and passing `kill=True` (as shown in the CLI examples below) is equivalent to running `nspawn.terminate`.

Note: `machinectl terminate` is only supported in systemd >= 219. On earlier systemd versions, running this function will simply issue a clean shutdown via `systemctl`.

CLI Examples:

```
salt myminion nspawn.terminate arch1
salt myminion nspawn.stop arch1 kill=True
```

19.9.264 salt.modules.nxos module

Execution module for Cisco NX OS Switches Proxy minions

New in version 2016.11.0.

For documentation on setting up the nxos proxy minion look in the documentation for *salt.proxy.nxos*.

salt.modules.nxos.**cmd**(*command*, **args*, ***kwargs*)

run commands from __proxy__ *salt.proxy.nxos*
command function from *salt.proxy.nxos* to run
args positional args to pass to *command* function
kwargs key word arguments to pass to *command* function

```
salt '*' nxos.cmd sendline 'show ver'
salt '*' nxos.cmd show_run
salt '*' nxos.cmd check_password username=admin password='$5$lkjsdfoi$blahblahblah
 ↪' encrypted=True
```

salt.modules.nxos.**system_info**()

Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

19.9.265 salt.modules.omapi

This module interacts with an ISC DHCP Server via OMAPI. server_ip and server_port params may be set in the minion config or pillar:

```
omapi.server_ip: 127.0.0.1
omapi.server_port: 7991
```

depends pypureomapi Python module

salt.modules.omapi.**add_host**(*mac*, *name=None*, *ip=None*, *ddns=False*, *group=None*, *supersede_host=False*)

Add a host object for the given mac.

CLI Example:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1
```

Add ddns-hostname and a fixed-ip statements:

```
salt dhcp-server omapi.add_host ab:ab:ab:ab:ab:ab name=host1 ip=10.1.1.1 ddns=true
```

salt.modules.omapi.**delete_host**(*mac=None*, *name=None*)
Delete the host with the given mac or name.

CLI Examples:

```
salt dhcp-server omapi.delete_host name=host1
salt dhcp-server omapi.delete_host mac=ab:ab:ab:ab:ab:ab
```

19.9.266 salt.modules.openbsd_sysctl

Module for viewing and modifying OpenBSD sysctl parameters

salt.modules.openbsd_sysctl.**assign**(*name*, *value*)
Assign a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.assign net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.**get**(*name*)
Return a single sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.get hw.physmem
```

salt.modules.openbsd_sysctl.**persist**(*name*, *value*, *config='/etc/sysctl.conf'*)
Assign and persist a simple sysctl parameter for this minion

CLI Example:

```
salt '*' sysctl.persist net.inet.ip.forwarding 1
```

salt.modules.openbsd_sysctl.**show**(*config_file=False*)
Return a list of sysctl parameters for this minion

CLI Example:

```
salt '*' sysctl.show
```

19.9.267 salt.modules.openbsdpkg

Package support for OpenBSD

Note: The package repository is configured on each host using `/etc/pkg.conf`

Changed in version 2016.3.5: Package versions on OpenBSD are not normally specified explicitly; instead packages may be available in multiple *flavors*, and *branches* which are specified by the format of the package name. This module allows you to use the same formatting as `pkg_add(1)`, and will select the empty flavor and default branch by default. Examples:

```
- rsync
- vim--no_x11
- ruby%2.3
```

`salt.modules.openbsdpkg.`**`install`**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Install the passed package

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example, Install one package:

```
salt '*' pkg.install <package name>
```

CLI Example, Install more than one package:

```
salt '*' pkg.install pkgs='["<package name>", "<package name>"]'
```

CLI Example, Install more than one package from a alternate source (e.g. salt file-server, HTTP, FTP, local filesystem):

```
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
```

`salt.modules.openbsdpkg.`**`latest_version`**(**names*, ***kwargs*)

The available version of the package in the repository

CLI Example:

```
salt '*' pkg.latest_version <package name>
```

`salt.modules.openbsdpkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.openbsdpkg.`**`purge`**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.openbsdpkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove a single package with pkg_delete

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.openbsdpkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.268 salt.modules.openbsdrcctl

The rcctl service module for OpenBSD

salt.modules.openbsdrcctl.**available**(*name*)

Return True if the named service is available.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.openbsdrcctl.**disable**(*name*, ***kwargs*)

Disable the named service to not start at boot.

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.openbsdrcctl.**disabled**(*name*)

Return True if the named service is disabled at boot, False otherwise.

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.openbsdrcctl.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot.

flags [None] Set optional flags to run the service with.

service.flags can be used to change the default flags.

CLI Example:

```
salt '*' service.enable <service name>
salt '*' service.enable <service name> flags=<flags>
```

salt.modules.openbsdrcctl.**enabled**(*name*, ***kwargs*)

Return True if the named service is enabled at boot and the provided flags match the configured ones (if any). Return False otherwise.

name Service name

CLI Example:

```
salt '*' service.enabled <service name>
salt '*' service.enabled <service name> flags=<flags>
```

salt.modules.openbsdrcctl.**get_all**()

Return all installed services.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.openbsdrcctl.**get_disabled**()

Return what services are available but not enabled to start at boot.

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdrcctl.**get_enabled**()

Return what services are set to run on boot.

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.openbsdrcctl.**missing**(*name*)

The inverse of service.available. Return True if the named service is not available.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.openbsdrcctl.**reload**(*name*)

Reload the named service.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.openbsdrcctl.**restart**(*name*)

Restart the named service.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.openbsdrcctl.**start**(*name*)

Start the named service.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.openbsdrcctl.**status**(*name*, *sig=None*)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.openbsdrcctl.**stop**(*name*)
Stop the named service.

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.269 salt.modules.openbsdservice

The service module for OpenBSD

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

salt.modules.openbsdservice.**available**(*name*)
New in version 2014.7.0.

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.openbsdservice.**disabled**(*name*)
New in version 2014.7.0.

Return True if the named service is disabled, false otherwise

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.openbsdservice.**enabled**(*name*, ***kwargs*)
New in version 2014.7.0.

Return True if the named service is enabled, false otherwise

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.openbsdservice.**get_all**()
New in version 2014.7.0.

Return all available boot services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.openbsdservice.**get_disabled**()
New in version 2014.7.0.

Return a set of services that are installed but disabled

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.openbsdservice.**get_enabled**()
New in version 2014.7.0.

Return a list of service that are enabled on boot

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.openbsdservice.**missing**(*name*)
New in version 2014.7.0.

The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.openbsdservice.**reload**(*name*)
New in version 2014.7.0.

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.openbsdservice.**restart**(*name*)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.openbsdservice.**start**(*name*)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.openbsdservice.**status**(*name*, *sig=None*)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.openbsdservice.**stop**(*name*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.270 salt.modules.openscap module

salt.modules.openscap.**xccdf**(*params*)
Run `oscap xccdf` commands on minions. It uses cp.push_dir to upload the generated files to the salt master in the master's minion files cachedir (defaults to `/var/cache/salt/master/minions/minion-id/files`)

It needs `file_recv` set to `True` in the master configuration file.

CLI Example:

```
salt '*'  openscap.xccdf "eval --profile Default /usr/share/openscap/scap-
↪yast2sec-xccdf.xml"
```

19.9.271 salt.modules.openstack_config

Modify, retrieve, or delete values from OpenStack configuration files.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>

maturity new

depends

platform linux

salt.modules.openstack_config.**delete**(*filename*, *section*, *parameter*)
Delete a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to delete the parameter
parameter The parameter to delete
CLI Example:

```
salt-call openstack_config.delete /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.**get**(*filename*, *section*, *parameter*)
Get a value from an OpenStack configuration file.
filename The full path to the configuration file
section The section from which to search for the parameter
parameter The parameter to return
CLI Example:

```
salt-call openstack_config.get /etc/keystone/keystone.conf sql connection
```

salt.modules.openstack_config.**set**(*filename*, *section*, *parameter*, *value*)
Set a value in an OpenStack configuration file.
filename The full path to the configuration file
section The section in which the parameter will be set
parameter The parameter to change

value The value to set
CLI Example:

```
salt-call openstack_config.set /etc/keystone/keystone.conf sql connection foo
```

19.9.272 salt.modules.openstack_mng module

Module for OpenStack Management

codeauthor Konrad Mosoń <mosonkonrad@gmail.com>

maturity new

depends openstack-utils

platform linux

salt.modules.openstack_mng.**restart_service**(*service_name*, *minimum_running_time=None*)
Restart OpenStack service immediately, or only if it's running longer than specified value

CLI Example:

```
salt '*' openstack_mng.restart_service neutron
salt '*' openstack_mng.restart_service neutron minimum_running_time=600
```

salt.modules.openstack_mng.**start_service**(*service_name*)
Start OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.start_service neutron
```

salt.modules.openstack_mng.**stop_service**(*service_name*)
Stop OpenStack service immediately

CLI Example:

```
salt '*' openstack_mng.stop_service neutron
```

19.9.273 salt.modules.openvswitch module

Support for Open vSwitch - module with basic Open vSwitch commands.

Suitable for setting up Openstack Neutron.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.openvswitch.**bridge_create**(*br*, *may_exist=True*)
Creates a new bridge.
Parameters
- **br** -- A string - bridge name
- **may_exist** -- Bool, if False - attempting to create a bridge that exists returns False.

Returns True on success, else False.
New in version 2016.3.0.

CLI Example: .. code-block:: bash
salt `*' openvswitch.bridge_create br0

salt.modules.openvswitch.**bridge_delete**(*br*, *if_exists=True*)

Deletes bridge and all of its ports.

Parameters

- **br** -- A string - bridge name
- **if_exists** -- Bool, if False - attempting to delete a bridge that does not exist returns False.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.bridge_delete br0

salt.modules.openvswitch.**bridge_exists**(*br*)

Tests whether bridge exists as a real or fake bridge.

Returns True if Bridge exists, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.bridge_exists br0

salt.modules.openvswitch.**bridge_list**()

Lists all existing real and fake bridges.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.bridge_list

salt.modules.openvswitch.**interface_get_options**(*port*)

Port's interface's optional parameters.

Parameters **port** -- A string - port name.

Returns String containing optional parameters of port's interface, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.interface_get_options tap0

salt.modules.openvswitch.**interface_get_type**(*port*)

Type of port's interface.

Parameters **port** -- A string - port name.

Returns String - type of interface or empty string, False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.interface_get_type tap0

salt.modules.openvswitch.**port_add**(*br*, *port*, *may_exist=False*)

Creates on bridge a new port named port.

Returns True on success, else False.

Parameters

- **br** -- A string - bridge name
- **port** -- A string - port name
- **may_exist** -- Bool, if False - attempting to create a port that exists returns False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_add br0 8080

salt.modules.openvswitch.**port_create_gre**(*br*, *port*, *id*, *remote*)

Generic Routing Encapsulation - creates GRE tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 32-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_create_gre br0 gre1 5001 192.168.1.10

salt.modules.openvswitch.**port_create_vlan**(*br*, *port*, *id*, *internal=False*)

Isolate VM traffic using VLANs.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer in the valid range 0 to 4095 (inclusive), name of VLAN.
- **internal** -- A boolean to create an internal interface if one does not exist.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_create_vlan br0 tap0 100

salt.modules.openvswitch.**port_create_vxlan**(*br*, *port*, *id*, *remote*, *dst_port=None*)

Virtual eXtensible Local Area Network - creates VXLAN tunnel between endpoints.

Parameters

- **br** -- A string - bridge name.
- **port** -- A string - port name.
- **id** -- An integer - unsigned 64-bit number, tunnel's key.
- **remote** -- A string - remote endpoint's IP address.
- **dst_port** -- An integer - port to use when creating tunnelport in the switch.

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_create_vxlan br0 vx1 5001 192.168.1.10 8472

salt.modules.openvswitch.**port_get_tag**(*port*)

Lists tags of the port.

Parameters **port** -- A string - port name.

Returns List of tags (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_get_tag tap0

salt.modules.openvswitch.**port_list**(*br*)

Lists all of the ports within bridge.

Parameters **br** -- A string - bridge name.

Returns List of bridges (or empty list), False on failure.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_list br0

salt.modules.openvswitch.**port_remove**(*br*, *port*, *if_exists=True*)

Deletes port.

Parameters

- **br** -- A string - bridge name (If bridge is None, port is removed from whatever bridge contains it)
- **port** -- A string - port name.
- **if_exists** -- Bool, if False - attempting to delete a por that does not exist returns False. (Default True)

Returns True on success, else False.

New in version 2016.3.0.

CLI Example: .. code-block:: bash

salt `*' openvswitch.port_remove br0 8080

19.9.274 salt.modules.opkg module

Support for Opkg

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

Note: For version comparison support on opkg < 0.3.4, the `opkg-utils` package must be installed.

`salt.modules.opkg.`**`available_version`**`(`**names*, ***kwargs*`)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.`**`del_repo`**`(`*alias*, ***kwargs*`)`

Delete a repo from `/etc/opkg/*.conf`

If the file does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

`salt.modules.opkg.`**`file_dict`**`(`**packages*, ***kwargs*`)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.**file_list**(**packages*, ***kwargs*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.opkg.**get_repo**(*alias*, ***kwargs*)

Display a repo from the `/etc/opkg/*.conf`

CLI Examples:

```
salt '*' pkg.get_repo alias
```

salt.modules.opkg.**hold**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package in `hold' state, meaning it will not be upgraded.

name The name of the package, e.g., `tmux'

CLI Example:

```
salt '*' pkg.hold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

salt.modules.opkg.**info_installed**(**names*, ***kwargs*)

Return the information of the named package(s), installed on the system.

New in version 2017.7.0.

Parameters

- **names** -- Names of the packages to get information about. If none are specified, will return information for all installed packages.
- **attr** -- Comma-separated package attributes. If no `attr' is specified, all available attributes returned.

  Valid attributes are: arch, conffiles, conflicts, depends, description, filename, group, install_date_time_t, md5sum, packager, provides, recommends, replaces, size, source, suggests, url, version

CLI example:

```
salt '*' pkg.info_installed
salt '*' pkg.info_installed attr=version,packager
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,packager
salt '*' pkg.info_installed <package1> <package2> <package3> ...
 ↪attr=version,packager
```

salt.modules.opkg.**install**(*name=None*, *refresh=False*, *pkgs=None*, *sources=None*, *reinstall=False*, ***kwargs*)

Install the passed package, add refresh=True to update the opkg database.

name The name of the package to be installed. Note that this parameter is ignored if either ``pkgs'' or ``sources'' is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources'' option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

version Install a specific version of the package, e.g. 1.2.3~0ubuntu0. Ignored if ``pkgs'' or ``sources'' is passed.

New in version 2017.7.0.

reinstall [False] Specifying reinstall=True will use `opkg install --force-reinstall` rather than simply `opkg install` for requested packages that are already installed.

If a version is specified with the requested package, then `opkg install --force-reinstall` will only be used if the installed version matches the requested version.

New in version 2017.7.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-0ubuntu0"}]'
```

sources A list of IPK packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package. Dependencies are automatically resolved and marked as auto-installed.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
↪deb"}]'
```

install_recommends Whether to install the packages marked as recommended. Default is True.

only_upgrade Only upgrade the packages (disallow downgrades), if they are already installed. Default is False.

New in version 2017.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.opkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.opkg.`**`list_pkgs`**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.opkg.**list_repos**(***kwargs*)

Lists all repos on `/etc/opkg/*.conf`

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.opkg.**list_upgrades**(*refresh=True*, ***kwargs*)

List all available package upgrades.

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.opkg.**mod_repo**(*alias*, ***kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as uri is defined.

The following options are available to modify a repo definition:
alias alias by which opkg refers to the repo.
uri the URI to the repo.
compressed defines (True or False) if the index file is compressed
enabled enable or disable (True or False) repository but do not remove if disabled.
refresh enable or disable (True or False) auto-refresh of the repositories
CLI Examples:

```
salt '*' pkg.mod_repo alias uri=http://new/uri
salt '*' pkg.mod_repo alias enabled=False
```

salt.modules.opkg.**owner**(**paths*, ***kwargs*)

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version <salt.modules.opkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

salt `*' pkg.owner /usr/bin/apachectl salt `*' pkg.owner /usr/bin/apachectl /usr/bin/basename

salt.modules.opkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported by opkg, this function is identical to *pkg.remove*.
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.
Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.opkg.**refresh_db**(***kwargs*)

Updates the opkg database to latest packages based upon repositories

Returns a dict, with the keys being package databases and the values being the result of the update attempt. Values can be one of the following:

- `True`: Database updated successfully
- `False`: Problem updating database

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.opkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove packages using `opkg remove`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.opkg.**unhold**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Set package current in `hold' state to install state, meaning it will be upgraded.

name The name of the package, e.g., `tmux'

CLI Example:

```
salt '*' pkg.unhold <package name>
```

pkgs A list of packages to hold. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

salt.modules.opkg.**upgrade**(*refresh=True*, ***kwargs*)

Upgrades all packages via `opkg upgrade`

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.opkg.**upgrade_available**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.opkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

salt.modules.opkg.**version_cmp**(*pkg1*, *pkg2*, *ignore_epoch=False*, ***kwargs*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to `True` to ignore the epoch when comparing versions

New in version 2016.3.4.

CLI Example:

```
salt '*' pkg.version_cmp '0.2.4-0' '0.2.4.1-0'
```

19.9.275 salt.modules.oracle

Oracle DataBase connection module

maintainer Vladimir Bormotov <bormotov@gmail.com>

maturity new

depends cx_Oracle

platform all

configuration module provide connections for multiple Oracle DB instances.

OS Environment

```
ORACLE_HOME: path to oracle product
PATH: path to Oracle Client libs need to be in PATH
```

pillar

```
oracle.dbs: list of known based
oracle.dbs.<db>.uri: connection credentials in format:
    user/password@host[:port]/sid[ as {sysdba|sysoper}]
```

salt.modules.oracle.**client_version**()

Oracle Client Version

CLI Example:

```
salt '*' oracle.client_version
```

salt.modules.oracle.**run_query**(*db*, *query*)

Run SQL query and return result

CLI Example:

```
salt '*' oracle.run_query my_db "select * from my_table"
```

salt.modules.oracle.**show_dbs**(**dbs*)

Show databases configuration from pillar. Filter by **args*

CLI Example:

```
salt '*' oracle.show_dbs
salt '*' oracle.show_dbs my_db
```

salt.modules.oracle.**show_env**()
Show Environment used by Oracle Client

CLI Example:

```
salt '*' oracle.show_env
```

Note: at first _connect() NLS_LANG will forced to `.AL32UTF8'

salt.modules.oracle.**show_pillar**(*item=None*)
Show Pillar segment oracle.* and subitem with notation ``item:subitem''

CLI Example:

```
salt '*' oracle.show_pillar
salt '*' oracle.show_pillar dbs:my_db
```

salt.modules.oracle.**version**(**dbs*)
Server Version (select banner from v$version)

CLI Example:

```
salt '*' oracle.version
salt '*' oracle.version my_db
```

19.9.276 salt.modules.osquery

Support for OSQuery - https://osquery.io.

New in version 2015.8.0.

salt.modules.osquery.**acpi_tables**(*attrs=None*, *where=None*)
Return acpi_tables information from osquery

CLI Example:

```
salt '*' osquery.acpi_tables
```

salt.modules.osquery.**alf**(*attrs=None*, *where=None*)
Return alf information from osquery

CLI Example:

```
salt '*' osquery.alf
```

salt.modules.osquery.**alf_exceptions**(*attrs=None*, *where=None*)
Return alf_exceptions information from osquery

CLI Example:

```
salt '*' osquery.alf_exceptions
```

salt.modules.osquery.**alf_explicit_auths**(*attrs=None*, *where=None*)
Return alf_explicit_auths information from osquery

CLI Example:

```
salt '*' osquery.alf_explicit_auths
```

salt.modules.osquery.**alf_services**(*attrs=None*, *where=None*)
Return alf_services information from osquery

CLI Example:

```
salt '*' osquery.alf_services
```

salt.modules.osquery.**apps**(*attrs=None*, *where=None*)
Return apps information from osquery

CLI Example:

```
salt '*' osquery.apps
```

salt.modules.osquery.**apt_sources**(*attrs=None*, *where=None*)
Return apt_sources information from osquery

CLI Example:

```
salt '*' osquery.apt_sources
```

salt.modules.osquery.**arp_cache**(*attrs=None*, *where=None*)
Return arp_cache information from osquery

CLI Example:

```
salt '*' osquery.arp_cache
```

salt.modules.osquery.**block_devices**(*attrs=None*, *where=None*)
Return block_devices information from osquery

CLI Example:

```
salt '*' osquery.block_devices
```

salt.modules.osquery.**certificates**(*attrs=None*, *where=None*)
Return certificates information from osquery

CLI Example:

```
salt '*' osquery.certificates
```

salt.modules.osquery.**chrome_extensions**(*attrs=None*, *where=None*)
Return chrome_extensions information from osquery

CLI Example:

```
salt '*' osquery.chrome_extensions
```

salt.modules.osquery.**cpuid**(*attrs=None*, *where=None*)
Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.cpuid
```

salt.modules.osquery.**crontab**(*attrs=None*, *where=None*)
Return crontab information from osquery

CLI Example:

```
salt '*' osquery.crontab
```

salt.modules.osquery.**deb_packages**(*attrs=None*, *where=None*)
Return deb_packages information from osquery

CLI Example:

```
salt '*' osquery.deb_packages
```

salt.modules.osquery.**etc_hosts**(*attrs=None*, *where=None*)
Return etc_hosts information from osquery

CLI Example:

```
salt '*' osquery.etc_hosts
```

salt.modules.osquery.**etc_services**(*attrs=None*, *where=None*)
Return etc_services information from osquery

CLI Example:

```
salt '*' osquery.etc_services
```

salt.modules.osquery.**file**(*attrs=None*, *where=None*)
Return file information from osquery

CLI Example:

```
salt '*' osquery.file
```

salt.modules.osquery.**file_changes**(*attrs=None*, *where=None*)
Return file_changes information from osquery

CLI Example:

```
salt '*' osquery.file_changes
```

salt.modules.osquery.**firefox_addons**(*attrs=None*, *where=None*)
Return firefox_addons information from osquery

CLI Example:

```
salt '*' osquery.firefox_addons
```

salt.modules.osquery.**groups**(*attrs=None*, *where=None*)
Return groups information from osquery

CLI Example:

```
salt '*' osquery.groups
```

salt.modules.osquery.**hardware_events**(*attrs=None*, *where=None*)
Return hardware_events information from osquery

CLI Example:

```
salt '*' osquery.hardware_events
```

salt.modules.osquery.**hash**(*attrs=None*, *where=None*)
Return hash information from osquery

CLI Example:

```
salt '*' osquery.hash
```

salt.modules.osquery.**homebrew_packages**(*attrs=None*, *where=None*)
Return homebrew_packages information from osquery

CLI Example:

```
salt '*' osquery.homebrew_packages
```

salt.modules.osquery.**interface_addresses**(*attrs=None*, *where=None*)
Return interface_addresses information from osquery

CLI Example:

```
salt '*' osquery.interface_addresses
```

salt.modules.osquery.**interface_details**(*attrs=None*, *where=None*)
Return interface_details information from osquery

CLI Example:

```
salt '*' osquery.interface_details
```

salt.modules.osquery.**iokit_devicetree**(*attrs=None*, *where=None*)
Return iokit_devicetree information from osquery

CLI Example:

```
salt '*' osquery.iokit_devicetree
```

salt.modules.osquery.**iokit_registry**(*attrs=None*, *where=None*)
Return iokit_registry information from osquery

CLI Example:

```
salt '*' osquery.iokit_registry
```

salt.modules.osquery.**kernel_extensions**(*attrs=None*, *where=None*)
Return kernel_extensions information from osquery

CLI Example:

```
salt '*' osquery.kernel_extensions
```

salt.modules.osquery.**kernel_info**(*attrs=None*, *where=None*)
Return kernel_info information from osquery

CLI Example:

```
salt '*' osquery.kernel_info
```

salt.modules.osquery.**kernel_integrity**(*attrs=None*, *where=None*)
Return kernel_integrity information from osquery

CLI Example:

```
salt '*' osquery.kernel_integrity
```

salt.modules.osquery.**kernel_modules**(*attrs=None*, *where=None*)
Return kernel_modules information from osquery

CLI Example:

```
salt '*' osquery.kernel_modules
```

salt.modules.osquery.**keychain_items**(*attrs=None*, *where=None*)
Return keychain_items information from osquery

CLI Example:

```
salt '*' osquery.keychain_items
```

salt.modules.osquery.**last**(*attrs=None*, *where=None*)
Return last information from osquery

CLI Example:

```
salt '*' osquery.last
```

salt.modules.osquery.**launchd**(*attrs=None*, *where=None*)
Return launchd information from osquery

CLI Example:

```
salt '*' osquery.launchd
```

salt.modules.osquery.**listening_ports**(*attrs=None*, *where=None*)
Return listening_ports information from osquery

CLI Example:

```
salt '*' osquery.listening_ports
```

salt.modules.osquery.**logged_in_users**(*attrs=None*, *where=None*)
Return logged_in_users information from osquery

CLI Example:

```
salt '*' osquery.logged_in_users
```

salt.modules.osquery.**memory_map**(*attrs=None*, *where=None*)
Return memory_map information from osquery

CLI Example:

```
salt '*' osquery.memory_map
```

salt.modules.osquery.**mounts**(*attrs=None*, *where=None*)
Return mounts information from osquery

CLI Example:

```
salt '*' osquery.mounts
```

salt.modules.osquery.**nfs_shares**(*attrs=None*, *where=None*)
Return nfs_shares information from osquery

CLI Example:

```
salt '*' osquery.nfs_shares
```

salt.modules.osquery.**nvram**(*attrs=None*, *where=None*)
Return nvram information from osquery

CLI Example:

```
salt '*' osquery.nvram
```

salt.modules.osquery.**os_version**(*attrs=None*, *where=None*)
Return os_version information from osquery

CLI Example:

```
salt '*' osquery.os_version
```

salt.modules.osquery.**osquery_extensions**(*attrs=None*, *where=None*)
Return osquery_extensions information from osquery

CLI Example:

```
salt '*' osquery.osquery_extensions
```

salt.modules.osquery.**osquery_flags**(*attrs=None*, *where=None*)
Return osquery_flags information from osquery

CLI Example:

```
salt '*' osquery.osquery_flags
```

salt.modules.osquery.**osquery_info**(*attrs=None*, *where=None*)
Return osquery_info information from osquery

CLI Example:

```
salt '*' osquery.osquery_info
```

salt.modules.osquery.**osquery_registry**(*attrs=None*, *where=None*)
Return osquery_registry information from osquery

CLI Example:

```
salt '*' osquery.osquery_registry
```

salt.modules.osquery.**passwd_changes**(*attrs=None*, *where=None*)
Return passwd_changes information from osquery

CLI Example:

```
salt '*' osquery.passwd_changes
```

salt.modules.osquery.**pci_devices**(*attrs=None*, *where=None*)
Return pci_devices information from osquery

CLI Example:

```
salt '*' osquery.pci_devices
```

salt.modules.osquery.**preferences**(*attrs=None*, *where=None*)
Return preferences information from osquery

CLI Example:

```
salt '*' osquery.preferences
```

salt.modules.osquery.**process_envs**(*attrs=None*, *where=None*)
Return process_envs information from osquery

CLI Example:

```
salt '*' osquery.process_envs
```

salt.modules.osquery.**process_memory_map**(*attrs=None*, *where=None*)
Return process_memory_map information from osquery

CLI Example:

```
salt '*' osquery.process_memory_map
```

salt.modules.osquery.**process_open_files**(*attrs=None*, *where=None*)
Return process_open_files information from osquery

CLI Example:

```
salt '*' osquery.process_open_files
```

salt.modules.osquery.**process_open_sockets**(*attrs=None*, *where=None*)
Return process_open_sockets information from osquery

CLI Example:

```
salt '*' osquery.process_open_sockets
```

salt.modules.osquery.**processes**(*attrs=None*, *where=None*)
Return processes information from osquery

CLI Example:

```
salt '*' osquery.processes
```

salt.modules.osquery.**quarantine**(*attrs=None*, *where=None*)
Return quarantine information from osquery

CLI Example:

```
salt '*' osquery.quarantine
```

salt.modules.osquery.**query**(*sql=None*)
Return time information from osquery

CLI Example:

```
salt '*' osquery.query "select * from users;"
```

salt.modules.osquery.**routes**(*attrs=None*, *where=None*)
Return routes information from osquery

CLI Example:

```
salt '*' osquery.routes
```

salt.modules.osquery.**rpm_packages**(*attrs=None*, *where=None*)
Return cpuid information from osquery

CLI Example:

```
salt '*' osquery.rpm_packages
```

salt.modules.osquery.**safari_extensions**(*attrs=None*, *where=None*)
Return safari_extensions information from osquery

CLI Example:

```
salt '*' osquery.safari_extensions
```

salt.modules.osquery.**shared_memory**(*attrs=None*, *where=None*)
Return shared_memory information from osquery

CLI Example:

```
salt '*' osquery.shared_memory
```

salt.modules.osquery.**shell_history**(*attrs=None*, *where=None*)
Return shell_history information from osquery

CLI Example:

```
salt '*' osquery.shell_history
```

salt.modules.osquery.**smbios_tables**(*attrs=None*, *where=None*)
Return smbios_tables information from osquery

CLI Example:

```
salt '*' osquery.smbios_tables
```

salt.modules.osquery.**startup_items**(*attrs=None*, *where=None*)
Return startup_items information from osquery

CLI Example:

```
salt '*' osquery.startup_items
```

salt.modules.osquery.**suid_bin**(*attrs=None*, *where=None*)
Return suid_bin information from osquery

CLI Example:

```
salt '*' osquery.suid_bin
```

salt.modules.osquery.**system_controls**(*attrs=None*, *where=None*)
Return system_controls information from osquery

CLI Example:

```
salt '*' osquery.system_controls
```

salt.modules.osquery.**time**(*attrs=None*)
Return time information from osquery

CLI Example:

```
salt '*' osquery.time
```

salt.modules.osquery.**usb_devices**(*attrs=None*, *where=None*)
Return usb_devices information from osquery

CLI Example:

```
salt '*' osquery.usb_devices
```

salt.modules.osquery.**users**(*attrs=None*, *where=None*)
Return users information from osquery

CLI Example:

```
salt '*' osquery.users
```

salt.modules.osquery.**version**()
Return version of osquery

CLI Example:

```
salt '*' osquery.version
```

salt.modules.osquery.**xattr_where_from**(*attrs=None*, *where=None*)
Return xattr_where_from information from osquery

CLI Example:

```
salt '*' osquery.xattr_where_from
```

salt.modules.osquery.**xprotect_entries**(*attrs=None*, *where=None*)
Return xprotect_entries information from osquery

CLI Example:

```
salt '*' osquery.xprotect_entries
```

salt.modules.osquery.**xprotect_reports**(*attrs=None*, *where=None*)
Return xprotect_reports information from osquery

CLI Example:

```
salt '*' osquery.xprotect_reports
```

19.9.277 salt.modules.pacman

A module to wrap pacman calls, since Arch is the best (https://wiki.archlinux.org/index.php/Arch_is_the_best)

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

salt.modules.pacman.**file_dict**(**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacman.**file_list**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's package database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.pacman.**group_diff**(*name*)

New in version 2016.11.0.

Lists which of a group's packages are installed and which are not installed

Compatible with yumpkg.group_diff for easy support of state.pkg.group_installed

CLI Example:

```
salt '*' pkg.group_diff 'xorg'
```

salt.modules.pacman.**group_info**(*name*)

New in version 2016.11.0.

Lists all packages in the specified group

CLI Example:

```
salt '*' pkg.group_info 'xorg'
```

salt.modules.pacman.**group_list**()

New in version 2016.11.0.

Lists all groups known by pacman on this system

CLI Example:

```
salt '*' pkg.group_list
```

salt.modules.pacman.**install**(*name=None*, *refresh=False*, *sysupgrade=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage

of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install (`pacman -S`) the specified packag(s). Add `refresh=True` to install with `-y`, add `sysupgrade=True` to install with `-u`.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to refresh the package database before installing.

sysupgrade Whether or not to upgrade the system packages before installing. If refresh is set to `True` but sysupgrade is not specified, `-u` will be applied

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install                 sources='[{"foo": "salt://foo.pkg.tar.xz
↪"},                 {"bar": "salt://bar.pkg.tar.xz"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pacman.`**`latest_version`**`(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pacman.`**`list_pkgs`**`(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.pacman.**list_repo_pkgs**(**args*, ***kwargs*)

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.4.005-2'],
    'nginx': ['1.10.2-2']
}
# With byrepo=True
{
    'core': {
        'bash': ['4.4.005-2']
    },
    'extra': {
        'nginx': ['1.10.2-2']
    }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When `True`, the return data for each package will be organized by repository.

refresh [False] When `True`, the package database will be refreshed (i.e. `pacman -Sy`) before checking for available versions.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

salt.modules.pacman.**list_upgrades**(*refresh=False*, *root=None*, ***kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.pacman.**owner**(**paths*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version` <salt.modules.yumpkg.version, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Example:

salt `*' pkg.owner /usr/bin/apachectl salt `*' pkg.owner /usr/bin/apachectl /usr/bin/zsh

salt.modules.pacman.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now

used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called systemd.scope, with a value of False (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a pacman -Rsc

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pacman.**refresh_db**(*root=None*)

Just run a pacman -Sy, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pacman.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion service is restarted. (see KillMode in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called systemd.scope, with a value of False (no quotes).

Remove packages with pacman -R.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pacman.**upgrade**(*refresh=False*, *root=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the salt-minion daemon's control group. This is done to keep systemd from killing any pacman commands spawned by Salt when the salt-minion

service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a pacman -Syu
refresh Whether or not to refresh the package database before installing.
Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pacman.`**`upgrade_available`**(*name*)
Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.pacman.`**`version`**(**names*, ***kwargs*)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.278 salt.modules.pagerduty

Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-pagerduty-account:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

`salt.modules.pagerduty.`**`create_event`**(*service_key=None*, *description=None*, *details=None*, *incident_key=None*, *profile=None*)
Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt myminion pagerduty.create_event <service_key> <description> <details>
↪profile=my-pagerduty-account
```

The following parameters are required:
service_key This key can be found by using pagerduty.list_services.
description This is a short description of the event.

details This can be a more detailed description of the event.
profile This refers to the configuration profile to use to connect to the PagerDuty service.

salt.modules.pagerduty.**list_escalation_policies**(*profile=None*, *api_key=None*)
This function is an alias of `list_policies`.
List escalation policies belonging to this account

CLI Example:
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pagerduty.list_escalation_policies my-pagerduty-account

salt.modules.pagerduty.**list_incidents**(*profile=None*, *api_key=None*)
List incidents belonging to this account

CLI Example:
salt myminion pagerduty.list_incidents my-pagerduty-account

salt.modules.pagerduty.**list_maintenance_windows**(*profile=None*, *api_key=None*)
This function is an alias of `list_windows`.
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

salt.modules.pagerduty.**list_policies**(*profile=None*, *api_key=None*)
List escalation policies belonging to this account

CLI Example:
salt myminion pagerduty.list_policies my-pagerduty-account salt myminion pagerduty.list_escalation_policies my-pagerduty-account

salt.modules.pagerduty.**list_schedules**(*profile=None*, *api_key=None*)
List schedules belonging to this account

CLI Example:
salt myminion pagerduty.list_schedules my-pagerduty-account

salt.modules.pagerduty.**list_services**(*profile=None*, *api_key=None*)
List services belonging to this account

CLI Example:
salt myminion pagerduty.list_services my-pagerduty-account

salt.modules.pagerduty.**list_users**(*profile=None*, *api_key=None*)
List users belonging to this account

CLI Example:
salt myminion pagerduty.list_users my-pagerduty-account

salt.modules.pagerduty.**list_windows**(*profile=None*, *api_key=None*)
List maintenance windows belonging to this account

CLI Example:
salt myminion pagerduty.list_windows my-pagerduty-account salt myminion pagerduty.list_maintenance_windows my-pagerduty-account

19.9.279 salt.modules.pagerduty_util

Module for manageing PagerDuty resource

configuration This module can be used by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The default configuration profile name is `pagerduty'.

For example:

```
pagerduty:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

For PagerDuty API details, see https://developer.pagerduty.com/documentation/rest

salt.modules.pagerduty_util.**create_or_update_resource**(*resource_name*, *identifier_fields*, *data*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

create or update any pagerduty resource Helper method for present().

Determining if two resources are the same is different for different PD resource, so this method accepts a diff function. The diff function will be invoked as diff(state_information, object_returned_from_pagerduty), and should return a dict of data to pass to the PagerDuty update API method, or None if no update is to be performed. If no diff method is provided, the default behavor is to scan the keys in the state_information, comparing the matching values in the object_returned_from_pagerduty, and update any values that differ.

examples

create_or_update_resource(``user'', [''id'',''name'',''email'']) create_or_update_resource(``escalation_policies'', [''id'',''name''], diff=my_diff_function)

salt.modules.pagerduty_util.**delete_resource**(*resource_name*, *key*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

delete any pagerduty resource

Helper method for absent()

example

delete_resource(``users'', key, [''id'',''name'',''email'']) # delete by id or name or email

salt.modules.pagerduty_util.**get_escalation_policies**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List escalation_policies belonging to this account

CLI Example:

salt myminion pagerduty.get_escalation_policies

salt.modules.pagerduty_util.**get_resource**(*resource_name*, *key*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*)

Get any single pagerduty resource by key.

We allow flexible lookup by any of a list of identifier_fields. So, for example, you can look up users by email address or name by calling:

get_resource(`users', key, ['name', `email'], ...)

This method is mainly used to translate state sls into pagerduty id's for dependent objects. For example, a pagerduty escalation policy contains one or more schedules, which must be passed by their pagerduty id. We look up the schedules by name (using this method), and then translate the names into id's.

This method is implemented by getting all objects of the resource type (cached into __context__), then brute force searching through the list and trying to match any of the identifier_fields. The __context__ cache is purged after any create, update or delete to the resource.

salt.modules.pagerduty_util.**get_schedules**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List schedules belonging to this account

CLI Example:

salt myminion pagerduty.get_schedules

salt.modules.pagerduty_util.**get_services**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List services belonging to this account

CLI Example:

salt myminion pagerduty.get_services

salt.modules.pagerduty_util.**get_users**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*)

List users belonging to this account

CLI Example:

salt myminion pagerduty.get_users

salt.modules.pagerduty_util.**resource_absent**(*resource*, *identifier_fields*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Generic resource.absent state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls delete_resource() and formats the result as a salt state return value.

example

resource_absent(``users'', ["id","name","email"])

salt.modules.pagerduty_util.**resource_present**(*resource*, *identifier_fields*, *diff=None*, *profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Generic resource.present state method. Pagerduty state modules should be a thin wrapper over this method, with a custom diff function.

This method calls create_or_update_resource() and formats the result as a salt state return value.

example

resource_present(``users'', ["id","name","email"])

19.9.280 salt.modules.pam

Support for pam

salt.modules.pam.**read_file**(*file_name*)

This is just a test function, to make sure parsing works

CLI Example:

```
salt '*' pam.read_file /etc/pam.d/login
```

19.9.281 salt.modules.parallels module

Manage Parallels Desktop VMs with `prlctl` and `prlsrvctl`. Only some of the prlctl commands implemented so far. Of those that have been implemented, not all of the options may have been provided yet. For a complete reference, see the Parallels Desktop Reference Guide.

What has not been implemented yet can be accessed through `parallels.prlctl` and `parallels.prlsrvctl` (note the preceding double dash `--` as necessary):

```
salt '*' parallels.prlctl installtools macvm runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

New in version 2016.3.0.

`salt.modules.parallels.`**`clone`**(*name*, *new_name*, *linked=False*, *template=False*, *runas=None*)

Clone a VM

New in version 2016.11.0.

Parameters

- **`name`** (*`str`*) -- Name/ID of VM to clone
- **`new_name`** (*`str`*) -- Name of the new VM
- **`linked`** (*`bool`*) -- Create a linked virtual machine.
- **`template`** (*`bool`*) -- Create a virtual machine template instead of a real virtual machine.
- **`runas`** (*`str`*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.clone macvm macvm_new runas=macdev
salt '*' parallels.clone macvm macvm_templ template=True runas=macdev
```

`salt.modules.parallels.`**`delete`**(*name*, *runas=None*)

Delete a VM

New in version 2016.11.0.

Parameters

- **`name`** (*`str`*) -- Name/ID of VM to clone
- **`runas`** (*`str`*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

`salt.modules.parallels.`**`delete_snapshot`**(*name*, *snap_name*, *runas=None*, *all=False*)

Delete a snapshot

Note: Deleting a snapshot from which other snapshots are dervied will not delete the derived snapshots

---

Parameters

- **`name`** (*`str`*) -- Name/ID of VM whose snapshot will be deleted
- **`snap_name`** (*`str`*) -- Name/ID of snapshot to delete
- **`runas`** (*`str`*) -- The user that the prlctl command will be run as

- **all** (*bool*) -- Delete all snapshots having the name given

  New in version 2016.11.0.

Example:

```
salt '*' parallels.delete_snapshot macvm 'unneeded snapshot' runas=macdev
salt '*' parallels.delete_snapshot macvm 'Snapshot for linked clone' all=True
↪runas=macdev
```

salt.modules.parallels.**exec**(*name*, *command*, *runas=None*)

Run a command on a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose exec will be returned
- **command** (*str*) -- Command to run on the VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exec macvm 'find /etc/paths.d' runas=macdev
```

salt.modules.parallels.**exists**(*name*, *runas=None*)

Query whether a VM exists

New in version 2016.11.0.

Parameters

- **name** (*str*) -- Name/ID of VM
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.exists macvm runas=macdev
```

salt.modules.parallels.**list_snapshots**(*name*, *snap_name=None*, *tree=False*, *names=False*, *runas=None*)

List the snapshots

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots will be listed
- **snap_id** (*str*) -- Name/ID of snapshot to display information about. If `tree=True` is also specified, display the snapshot subtree having this snapshot as the root snapshot
- **tree** (*bool*) -- List snapshots in tree format rather than tabular format
- **names** (*bool*) -- List snapshots as ID, name pairs
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.list_snapshots macvm runas=macdev
salt '*' parallels.list_snapshots macvm tree=True runas=macdev
salt '*' parallels.list_snapshots macvm snap_name=original runas=macdev
salt '*' parallels.list_snapshots macvm names=True runas=macdev
```

salt.modules.parallels.**list_vms**(*name=None*, *info=False*, *all=False*, *args=None*, *runas=None*, *template=False*)

List information about the VMs

Parameters

- **name** (*str*) -- Name/ID of VM to list

  Changed in version 2016.11.0: No longer implies `info=True`
- **info** (*str*) -- List extra information
- **all** (*bool*) -- List all non-template VMs

- **args** (*tuple*) -- Additional arguments given to `prctl list`
- **runas** (*str*) -- The user that the prlctl command will be run as
- **template** (*bool*) -- List the available virtual machine templates. The real virtual machines will not be included in the output

  New in version 2016.11.0.

Example:

```
salt '*' parallels.list_vms runas=macdev
salt '*' parallels.list_vms name=macvm info=True runas=macdev
salt '*' parallels.list_vms info=True runas=macdev
salt '*' parallels.list_vms ' -o uuid,status' all=True runas=macdev
```

salt.modules.parallels.**prlctl**(*sub_cmd*, *args=None*, *runas=None*)

Execute a prlctl command

Parameters

- **sub_cmd** (*str*) -- prlctl subcommand to execute
- **args** (*str*) -- The arguments supplied to `prlctl <sub_cmd>`
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.prlctl user list runas=macdev
salt '*' parallels.prlctl exec 'macvm uname' runas=macdev
salt -- '*' parallels.prlctl capture 'macvm --file macvm.display.png' runas=macdev
```

salt.modules.parallels.**prlsrvctl**(*sub_cmd*, *args=None*, *runas=None*)

Execute a prlsrvctl command

New in version 2016.11.0.

Parameters

- **sub_cmd** (*str*) -- prlsrvctl subcommand to execute
- **args** (*str*) -- The arguments supplied to `prlsrvctl <sub_cmd>`
- **runas** (*str*) -- The user that the prlsrvctl command will be run as

Example:

```
salt '*' parallels.prlsrvctl info runas=macdev
salt '*' parallels.prlsrvctl usb list runas=macdev
salt -- '*' parallels.prlsrvctl set '--mem-limit auto' runas=macdev
```

salt.modules.parallels.**reset**(*name*, *runas=None*)

Reset a VM by performing a hard shutdown and then a restart

Parameters

- **name** (*str*) -- Name/ID of VM to reset
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.reset macvm runas=macdev
```

salt.modules.parallels.**restart**(*name*, *runas=None*)

Restart a VM by gracefully shutting it down and then restarting it

Parameters

- **name** (*str*) -- Name/ID of VM to restart
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.restart macvm runas=macdev
```

salt.modules.parallels.**revert_snapshot**(*name*, *snap_name*, *runas=None*)

Revert a VM to a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to revert to a snapshot
- **snap_name** (*str*) -- Name/ID of snapshot to revert to
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.revert_snapshot macvm base-with-updates runas=macdev
```

salt.modules.parallels.**snapshot**(*name*, *snap_name=None*, *desc=None*, *runas=None*)

Create a snapshot

Parameters

- **name** (*str*) -- Name/ID of VM to take a snapshot of
- **snap_name** (*str*) -- Name of snapshot
- **desc** (*str*) -- Description of snapshot
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.create_snapshot macvm snap_name=macvm-original runas=macdev
salt '*' parallels.create_snapshot macvm snap_name=macvm-updates desc='clean
↪install with updates' runas=macdev
```

salt.modules.parallels.**snapshot_id_to_name**(*name*, *snap_id*, *strict=False*, *runas=None*)

Attempt to convert a snapshot ID to a snapshot name. If the snapshot has no name or if the ID is not found or invalid, an empty string will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap_id** (*str*) -- ID of the snapshot
- **strict** (*bool*) -- Raise an exception if a name cannot be found for the given snap_id
- **runas** (*str*) -- The user that the prlctl command will be run as

Example data

```
ID: {a5b8999f-5d95-4aff-82de-e515b0101b66}
Name: original
Date: 2016-03-04 10:50:34
Current: yes
State: poweroff
Description: original state
```

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm a5b8999f-5d95-4aff-82de-e515b0101b66
↪runas=macdev
```

salt.modules.parallels.**snapshot_name_to_id**(*name*, *snap_name*, *strict=False*, *runas=None*)

Attempt to convert a snapshot name to a snapshot ID. If the name is not found an empty string is returned. If multiple snapshots share the same name, a list will be returned

Parameters

- **name** (*str*) -- Name/ID of VM whose snapshots are inspected
- **snap_name** (*str*) -- Name of the snapshot
- **strict** (*bool*) -- Raise an exception if multiple snapshot IDs are found
- **runas** (*str*) -- The user that the prlctl command will be run as

CLI Example:

```
salt '*' parallels.snapshot_id_to_name macvm original runas=macdev
```

salt.modules.parallels.**start**(*name*, *runas=None*)

Start a VM

Parameters

- **name** (*str*) -- Name/ID of VM to start
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.start macvm runas=macdev
```

salt.modules.parallels.**status**(*name*, *runas=None*)

Status of a VM

Parameters

- **name** (*str*) -- Name/ID of VM whose status will be returned
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.status macvm runas=macdev
```

salt.modules.parallels.**stop**(*name*, *kill=False*, *runas=None*)

Stop a VM

Parameters

- **name** (*str*) -- Name/ID of VM to stop
- **kill** (*bool*) -- Perform a hard shutdown
- **runas** (*str*) -- The user that the prlctl command will be run as

Example:

```
salt '*' parallels.stop macvm runas=macdev
salt '*' parallels.stop macvm kill=True runas=macdev
```

19.9.282 salt.modules.parted

Module for managing partitions on POSIX-like systems.

depends

- parted, partprobe, lsblk (usually parted and util-linux packages)

Some functions may not be available, depending on your version of parted.

Check the manpage for `parted(8)` for more information, or the online docs at:

http://www.gnu.org/software/parted/manual/html_chapter/parted_2.html

In light of parted not directly supporting partition IDs, some of this module has been written to utilize sfdisk instead. For further information, please reference the man page for `sfdisk(8)`.

salt.modules.parted.**align_check**(*device*, *part_type*, *partition*)

Check if partition satisfies the alignment constraint of part_type. Type must be ``minimal'' or ``optimal''.

CLI Example:

```
salt '*' partition.align_check /dev/sda minimal 1
```

salt.modules.parted.**check**(*device*, *minor*)

Checks if the file system on partition <minor> has any errors.

CLI Example:

```
salt '*' partition.check 1
```

salt.modules.parted.**cp**(*device*, *from_minor*, *to_minor*)

Copies the file system on the partition <from-minor> to partition <to-minor>, deleting the original contents of the destination partition.

CLI Example:

```
salt '*' partition.cp /dev/sda 2 3
```

salt.modules.parted.**exists**(*device=''*)

Check to see if the partition exists

CLI Example:

```
salt '*' partition.exists /dev/sdb1
```

salt.modules.parted.**get_block_device**()

Retrieve a list of disk devices

New in version 2014.7.0.

CLI Example:

```
salt '*' partition.get_block_device
```

salt.modules.parted.**get_id**(*device*, *minor*)

Prints the system ID for the partition. Some typical values are:

```
 b: FAT32 (vfat)
 7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.get_id /dev/sda 1
```

salt.modules.parted.**list**(*device*, *unit=None*)

Prints partition information of given <device>

CLI Examples:

```
salt '*' partition.list /dev/sda
salt '*' partition.list /dev/sda unit=s
salt '*' partition.list /dev/sda unit=kB
```

salt.modules.parted.**mkfs**(*device*, *fs_type*)

Makes a file system <fs_type> on partition <device>, destroying all data that resides on that partition. <fs_type> must be one of ``ext2'', ``fat32'', ``fat16'', ``linux-swap'' or ``reiserfs'' (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkfs /dev/sda2 fat32
```

salt.modules.parted.**mklabel**(*device*, *label_type*)
Create a new disklabel (partition table) of label_type.

Type should be one of ``aix'', ``amiga'', ``bsd'', ``dvh'', ``gpt'', ``loop'', ``mac'', ``msdos'', ``pc98'', or ``sun''.

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

salt.modules.parted.**mkpart**(*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)
Make a part_type partition for filesystem fs_type, beginning at start and ending at end (by default in megabytes). part_type should be one of ``primary'', ``logical'', or ``extended''.

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

salt.modules.parted.**mkpartfs**(*device*, *part_type*, *fs_type*, *start*, *end*)
Make a <part_type> partition with a new filesystem of <fs_type>, beginning at <start> and ending at <end> (by default in megabytes).

<part_type> should be one of ``primary'', ``logical'', or ``extended''. <fs_type> must be one of ``ext2'', ``fat32'', ``fat16'', ``linux-swap'' or ``reiserfs'' (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

salt.modules.parted.**name**(*device*, *partition*, *name*)
Set the name of partition to name. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

salt.modules.parted.**probe**(**devices*)
Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

salt.modules.parted.**rescue**(*device*, *start*, *end*)
Rescue a lost partition that was located somewhere between start and end. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

salt.modules.parted.**resize**(*device*, *minor*, *start*, *end*)
Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. resize never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

salt.modules.parted.**rm**(*device*, *minor*)

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

salt.modules.parted.**set**(*device*, *minor*, *flag*, *state*)

Changes a flag on the partition with number <minor>.

A flag can be either ``on'' or ``off'' (make sure to use proper quoting, see *YAML Idiosyncrasies*). Some or all of these flags will be available, depending on what disk label you are using.
Valid flags are: **bios_grub**, **legacy_boot**, **boot**, **lba**, **root**, **swap**, **hidden**, **raid**, LVM, PALO, PREP, DIAG
CLI Example:

```
salt '*' partition.set /dev/sda 1 boot '"on"'
```

salt.modules.parted.**set_id**(*device*, *minor*, *system_id*)

Sets the system ID for the partition. Some typical values are:

```
 b: FAT32 (vfat)
 7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

salt.modules.parted.**system_types**()

List the system types that are supported by the installed version of sfdisk

CLI Example:

```
salt '*' partition.system_types
```

salt.modules.parted.**toggle**(*device*, *partition*, *flag*)

Toggle the state of <flag> on <partition>. Valid flags are the same as the set command.
CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

19.9.283 salt.modules.pcs module

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Cororsync clusters with the Pacemaker/Cororsync conifguration system (PCS)

depends pcs

New in version 2016.3.0.

salt.modules.pcs.**auth**(*nodes*, *pcsuser='hacluster'*, *pcspasswd='hacluster'*, *extra_args=None*)

Authorize nodes to the cluster

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communitcation with PCS (default: hacluster)

pcspasswd password for pcsuser (default: hacluster)

extra_args list of extra option for the `pcs cluster auth' command

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]'
 ↪pcsuser=hacluster pcspasswd=hoonetorg extra_args="[ '--force' ]"
```

salt.modules.pcs.**cib_create**(*cibfile*, *scope='configuration'*, *extra_args=None*)

Create a CIB-file from the current CIB of the cluster

cibfile name/path of the file containing the CIB

scope specific section of the CIB (default: configuration)

extra_args additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

salt.modules.pcs.**cib_push**(*cibfile*, *scope='configuration'*, *extra_args=None*)

Push a CIB-file as the new CIB to the cluster

cibfile name/path of the file containing the CIB

scope specific section of the CIB (default: configuration)

extra_args additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

salt.modules.pcs.**cluster_node_add**(*node*, *extra_args=None*)

Add a node to the pacemaker cluster via pcs command

node node that should be added

extra_args list of extra option for the `pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

salt.modules.pcs.**cluster_setup**(*nodes*, *pcsclustername='pcscluster'*, *extra_args=None*)

Setup pacemaker cluster via pcs command

nodes a list of nodes which should be set up

pcsclustername Name of the Pacemaker cluster (default: pcscluster)

extra_args list of extra option for the `pcs cluster setup' command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]'
 ↪pcsclustername=pcscluster
```

salt.modules.pcs.**config_show**(*cibfile=None*)

Show config of cluster

cibfile name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

salt.modules.pcs.**is_auth**(*nodes*)

Check if nodes are already authorized

nodes a list of nodes to be checked for authorization to the cluster

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

salt.modules.pcs.**item_create**(*item*, *item_id*, *item_type*, *create='create'*, *extra_args=None*, *cibfile=None*)

Create an item via pcs command (mainly for use with the pcs state module)

item config, property, resource, constraint etc.

item_id id of the item

item_type item type

create create command (create or set f.e., default: create)

extra_args additional options for the pcs command

cibfile use cibfile instead of the live CIB

salt.modules.pcs.**item_show**(*item*, *item_id=None*, *item_type=None*, *show='show'*, *extra_args=None*, *cibfile=None*)

Show an item via pcs command (mainly for use with the pcs state module)

item config, property, resource, constraint etc.

item_id id of the item

item_type item type

show show command (probably None, default: show)

extra_args additional options for the pcs command

cibfile use cibfile instead of the live CIB

salt.modules.pcs.**prop_set**(*prop*, *value*, *extra_args=None*, *cibfile=None*)

Set the value of a cluster property

prop name of the property

value value of the property prop

extra_args additional options for the pcs property command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_
↪cluster.cib'
```

salt.modules.pcs.**prop_show**(*prop*, *extra_args=None*, *cibfile=None*)

Show the value of a cluster property

prop name of the property

extra_args additional options for the pcs property command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'
↪cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.**resource_create**(*resource_id*, *resource_type*, *resource_options=None*, *cibfile=None*)

Create a resource via pcs command

resource_id name for the resource

resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

resource_options additional options for creating the resource

cibfile use cibfile instead of the live CIB for manipulation
CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' resource_type='ocf:heartbeat:
↪galera' resource_options="['wsrep_cluster_address=gcomm://node1.example.
↪org,node2.example.org,node3.example.org', '--master']" cibfile='/tmp/cib_for_
↪galera.cib'
```

salt.modules.pcs.**resource_show**(*resource_id*, *extra_args=None*, *cibfile=None*)
Show a resource via pcs command
resource_id name of the resource
extra_args additional options for the pcs command
cibfile use cibfile instead of the live CIB
CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'
```

salt.modules.pcs.**stonith_create**(*stonith_id*, *stonith_device_type*, *stonith_device_options=None*, *cibfile=None*)
Create a stonith resource via pcs command
stonith_id name for the stonith resource
stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options additional options for creating the stonith resource
cibfile use cibfile instead of the live CIB for manipulation
CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
                            stonith_device_options="['pcmk_host_map=node1.example.
↪org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org', 'action=reboot
↪', 'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log',
↪'login=hidden', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_stonith.cib'
```

salt.modules.pcs.**stonith_show**(*stonith_id*, *extra_args=None*, *cibfile=None*)
Show the value of a cluster stonith
stonith_id name for the stonith resource
extra_args additional options for the pcs stonith command
cibfile use cibfile instead of the live CIB
CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'
```

19.9.284 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform posix

New in version 2017.7.0.

salt.modules.pdbedit.**create**(*login*, *password*, *password_hashed=False*, *machine_account=False*)
Create user account
login [string] login name
password [string] password

password_hashed [boolean] set if password is a nt hash instead of plain text
machine_account [boolean] set to create a machine trust account instead
CLI Example:

```
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 nthash
salt '*' pdbedit.create river  1sw4ll0w3d4bug
```

salt.modules.pdbedit.**delete**(*login*)
Delete user account
login [string] login name
CLI Example:

```
salt '*' pdbedit.delete wash
```

salt.modules.pdbedit.**generate_nt_hash**(*password*)
Generate a NT HASH

CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

salt.modules.pdbedit.**get**(*login*, *hashes=False*)
Get user account details
login [string] login name
hashes [boolean] include NTHASH and LMHASH in verbose output
CLI Example:

```
salt '*' pdbedit.get kaylee
```

salt.modules.pdbedit.**list**(*verbose=True*, *hashes=False*)
List user accounts
verbose [boolean] return all information
hashes [boolean] include NT HASH and LM HASH in verbose output
CLI Example:

```
salt '*' pdbedit.list
```

salt.modules.pdbedit.**modify**(*login*, *password=None*, *password_hashed=False*, *domain=None*, *profile=None*, *script=None*, *drive=None*, *homedir=None*, *fullname=None*, *account_desc=None*, *account_control=None*, *machine_sid=None*, *user_sid=None*, *reset_login_hours=False*, *reset_bad_password_count=False*)
Modify user account
login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
domain [string] users domain
profile [string] profile path
script [string] logon script
drive [string] home drive
homedir [string] home directory
fullname [string] full name
account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid
user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'
salt '*' pdbedit.modify simon password=r1v3r
salt '*' pdbedit.modify jane drive='V:' homedir='\\serenity\jane\profile'
salt '*' pdbedit.modify mal account_control=NX
```

19.9.285 salt.modules.pecl

Manage PHP pecl extensions.

salt.modules.pecl.**install**(*pecls*, *defaults=False*, *force=False*, *preferred_state='stable'*)
New in version 0.17.0.

Installs one or several pecl extensions.
pecls The pecl extensions to install.
defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.
force Whether to force the installed version or not
CLI Example:

```
salt '*' pecl.install fuse
```

salt.modules.pecl.**list**(*channel=None*)
List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

salt.modules.pecl.**uninstall**(*pecls*)
Uninstall one or several pecl extensions.
pecls The pecl extensions to uninstall.
CLI Example:

```
salt '*' pecl.uninstall fuse
```

salt.modules.pecl.**update**(*pecls*)
Update one or several pecl extensions.
pecls The pecl extensions to update.
CLI Example:

```
salt '*' pecl.update fuse
```

19.9.286 salt.modules.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

19.9.287 salt.modules.pillar

Extract the pillar data for this minion

salt.modules.pillar.**ext**(*external*, *pillar=None*)

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported ext_pillar types are now tunable using the *on_demand_ext_pillar* config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

external A single ext_pillar to add to the ext_pillar configuration. This must be passed as a single section from the ext_pillar configuration (see CLI examples below). For more complicated `ext_pillar` configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import yaml
>>> ext_pillar = yaml.safe_load("""
... ext_pillar:
...   - git:
...     - issue38440 https://github.com/terminalmage/git_pillar:
...       - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env
 ↪': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}
```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar [None] If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. These pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext "{'git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext "{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env
 ↪': 'base'}]}]}"
```

salt.modules.pillar.**fetch**(*key*, *default=<type `exceptions.KeyError'>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```
pkg:apache
```

key The pillar key to get value from

default The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless *pillar_raise_on_missing* is set to True, in which case an error will be raised.

merge [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists If set to False, lists nested within the retrieved pillar dictionary will *overwrite* lists in default. If set to True, nested lists will be *merged* into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

Note: This option is ignored when merge is set to False.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.**file_exists**(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the saltenv argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.
path The path to the file in question. Will be treated as a relative path
saltenv Optional argument to restrict the search to a specific saltenv
CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

`salt.modules.pillar.`**`filter_by`**(*lookup_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

Parameters

- **`lookup_dict`** -- A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could the name of a package on that particular OS.

  The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pilalr value matches the pattern. For example:

  ```
  # this will render 'got some salt' if ``role`` begins with 'salt'
  salt '*' pillar.filter_by '{salt*: got some salt, default: salt
   ↪is not here}' role
  ```

- **`pillar`** -- The name of a pillar to match with the system's pillar. For example, the value of the ``role'' pillar could be used to pull values from the `lookup_dict` dictionary.

  The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.
- **`merge`** -- A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.
- **`default`** -- default lookup_dict's key used if the pillar does not exist or if the pillar value has no match on lookup_dict. If unspecified the value is ``default''.
- **`base`** -- A lookup_dict key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

`salt.modules.pillar.`**`get`**(*key*, *default=<type `exceptions.KeyError'>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the apache key in the pkg dict this key can be passed as:

```
pkg:apache
```

key The pillar key to get value from

default The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless *pillar_raise_on_missing* is set to True, in which case an error will be raised.

merge [False] If True, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists If set to False, lists nested within the retrieved pillar dictionary will *overwrite* lists in default. If set to True, nested lists will be *merged* into lists in default. If unspecified (the default), this option is inherited from the pillar_merge_lists minion config option.

Note: This option is ignored when merge is set to False.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

salt.modules.pillar.**item**(**args*, ***kwargs*)

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

delimiter Delimiter used to traverse nested dictionaries.

Note: This is different from *pillar.get* in that no default value can be specified. *pillar.get* should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible.

One reason to use this function instead of `pillar.get` however is when it is desirable to retrieve the values of more than one key, since `pillar.get` can only retrieve one key at a time.

New in version 2015.8.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.`**`items`**(**args*, ***kwargs*)

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

pillar If specified, allows for a dictionary of pillar data to be made available to pillar and ext_pillar rendering. these pillar variables will also override any variables of the same name in pillar or ext_pillar.

New in version 2015.5.0.

pillar_enc If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the *Pillar Encryption* documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/ext_pillar rendering.

New in version 2017.7.0.

pillarenv Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

`salt.modules.pillar.`**`keys`**(*key*, *delimiter=':'*)

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how pillar.get works.
delimiter Specify an alternate delimiter to use when traversing a nested dict
CLI Example:

```
salt '*' pillar.keys web:sites
```

salt.modules.pillar.**ls**(**args*)
New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as *items()*), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

salt.modules.pillar.**obfuscate**(**args*)
New in version 2015.8.0.

Same as *items()*, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- `'secret password'` becomes `'<str>'`
- `['secret',1]` becomes `['<str>','<int>']`
- `{'login': 'somelogin','pwd': 'secret'}` becomes `{'login': '<str>','pwd': '<str>'}`

CLI Examples:

```
salt '*' pillar.obfuscate
```

salt.modules.pillar.**raw**(*key=None*)
Return the raw pillar data that is currently loaded into the minion.

Contrast with *items()* which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

19.9.288 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, cwd: `C:\salt\bin\scripts'. Sometimes python thinks the single back slash is an escape character.

`salt.modules.pip.`**`freeze`**(*bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*, *env_vars=None*, ***kwargs*)

Return a list of installed packages either globally or in the specified virtualenv

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.
user The user under which to run pip
cwd Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

salt.modules.pip.**install**(*pkgs=None*, *requirements=None*, *bin_env=None*, *use_wheel=False*, *no_use_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *editable=None*, *find_links=None*, *index_url=None*, *extra_index_url=None*, *no_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download_cache=None*, *source=None*, *upgrade=False*, *force_reinstall=False*, *ignore_installed=False*, *exists_action=None*, *no_deps=False*, *no_install=False*, *no_download=False*, *global_options=None*, *install_options=None*, *user=None*, *cwd=None*, *pre_releases=False*, *cert=None*, *allow_all_external=False*, *allow_external=None*, *allow_unverified=None*, *process_dependency_links=False*, *saltenv='base'*, *env_vars=None*, *use_vt=False*, *trusted_host=None*, *no_cache_dir=False*, *cache_dir=None*, *no_binary=None*, ***kwargs*)

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.
pkgs Comma separated list of packages to install
requirements Path to requirements
bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.
use_wheel Prefer wheel archives (requires pip>=1.4)
no_use_wheel Force to not use wheel archives (requires pip>=1.4,<10.0.0)
no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or one or more package names with commas between them
log Log file where a complete (maximum verbosity) record will be kept
proxy Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.
timeout Set the socket timeout (default 15 seconds)
editable install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=dja`
find_links URL to search for packages
index_url Base URL of Python Package Index
extra_index_url Extra URLs of package indexes to use in addition to `index_url`
no_index Ignore package index
mirrors Specific mirror URL(s) to query (automatically adds --use-mirrors)

> **Warning:** This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

build Unpack packages into `build` dir

target Install packages into `target` dir
download Download packages into `download` instead of installing them
download_cache | cache_dir Cache downloaded packages in `download_cache` or `cache_dir` dir
source Check out `editable` packages into `source` dir
upgrade Upgrade all packages to the newest available version
force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed Ignore the installed packages (reinstalling instead)
exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps Ignore package dependencies
no_install Download and unpack all packages, but don't actually install them
no_download Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)
install_options Extra arguments to be supplied to the setup.py install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple --install-option options to pass multiple options to setup.py install. If you are using an option with a directory path, be sure to use absolute path.
global_options Extra global options to be supplied to the setup.py call before the install command.
user The user under which to run pip
cwd Directory from which to run pip
pre_releases Include pre-releases in the available versions
cert Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
env_vars Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs INCLUDE_PATH set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{'CUSTOM_PATH': '/opt/django_app'}"
```

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.
use_vt Use VT terminal emulation (see output while installing)
no_cache_dir Disable the cache.
CLI Example:

```
salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
```

Complicated CLI example:

```
salt '*' pip.install markdown,django                    editable=git+https://github.
↪com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
```

salt.modules.pip.**list**(*prefix=None*, *bin_env=None*, *user=None*, *cwd=None*, *env_vars=None*, ***kwargs*)

Filter list of installed apps from `freeze` and check to see if `prefix` exists in the list of packages installed.

Note: If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not be reported by this function even if they are installed. Unlike *`pip.freeze`*, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list salt
```

salt.modules.pip.**list_all_versions**(*pkg*, *bin_env=None*, *include_alpha=False*, *include_beta=False*, *include_rc=False*, *user=None*, *cwd=None*)

New in version 2017.7.3.

List all available versions of a pip package

pkg The package to check

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

include_alpha Include alpha versions in the list

include_beta Include beta versions in the list

include_rc Include release candidates versions in the list

user The user under which to run pip

cwd Directory from which to run pip

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

salt.modules.pip.**list_upgrades**(*bin_env=None*, *user=None*, *cwd=None*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

salt.modules.pip.**uninstall**(*pkgs=None*, *requirements=None*, *bin_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *saltenv='base'*, *use_vt=False*)

Uninstall packages individually or from a pip requirements file

pkgs comma separated list of packages to install

requirements Path to requirements file

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`. If a directory path is specified, it is assumed to be a virtualenv.

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the format `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

user The user under which to run pip

cwd Directory from which to run pip

use_vt Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

salt.modules.pip.**upgrade**(*bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages.

Note: On Windows you can't update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.
{`<package>': {`old': `<old-version>', `new': `<new-version>'}}
CLI Example:

```
salt '*' pip.upgrade
```

salt.modules.pip.**upgrade_available**(*pkg*, *bin_env=None*, *user=None*, *cwd=None*)
New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

salt.modules.pip.**version**(*bin_env=None*)
New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns `None`.

CLI Example:

```
salt '*' pip.version
```

19.9.289 salt.modules.pkg_resource

Resources needed by pkg providers

salt.modules.pkg_resource.**add_pkg**(*pkgs*, *name*, *pkgver*)
Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{}' bind 9
```

salt.modules.pkg_resource.**check_extra_requirements**(*pkgname*, *pkgver*)
Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>
```

salt.modules.pkg_resource.**pack_sources**(*sources*, *normalize=True*)
Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

`'[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.rpm"}]'` would become `{"foo": "salt://foo.rpm","bar": "salt://bar.rpm"}`

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar": "salt://
↪bar.rpm"}]'
```

salt.modules.pkg_resource.**parse_targets**(*name=None*, *pkgs=None*, *sources=None*, *saltenv='base'*, *normalize=True*, ***kwargs*)

Parses the input to pkg.install and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

salt.modules.pkg_resource.**sort_pkglist**(*pkgs*)

Accepts a dict obtained from pkg.list_pkgs() and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

salt.modules.pkg_resource.**stringify**(*pkgs*)

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

salt.modules.pkg_resource.**version**(**names*, ***kwargs*)

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

salt.modules.pkg_resource.**version_clean**(*verstr*)

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

19.9.290 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsdpkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

salt.modules.pkgin.**available_version**(**names*, ***kwargs*)

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.**file_dict**(**packages*)

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

salt.modules.pkgin.**file_list**(*package*)

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

salt.modules.pkgin.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Install the passed package

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo Specify a package repository to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
↪deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

salt.modules.pkgin.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

salt.modules.pkgin.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.pkgin.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgin.**refresh_db**()

Use pkg update to get latest pkg_summary

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.pkgin.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgin.**search**(*pkg_name*)

Searches for an exact match using pkgin ^package$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

salt.modules.pkgin.**upgrade**()
Run pkg upgrade, if pkgin used. Otherwise do nothing

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.pkgin.**version**(**names*, ***kwargs*)
Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.291 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the pkgng module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as pkgng, as it will behave like a normal Salt pkg provider. The documentation below should not be considered to apply to this module in versions <= 0.17.x. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use pkgng, you will need to override the pkg provider by setting the *`providers`* parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

salt.modules.pkgng.**audit**(*jail=None*, *chroot=None*, *root=None*)
Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

jail Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if `jail` is specified)
root Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`autoremove`**(*jail=None*, *chroot=None*, *root=None*, *dryrun=False*)
Delete packages which were automatically installed as dependencies and are not required anymore.
dryrun Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.
CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

`salt.modules.pkgng.`**`backup`**(*file_name*, *jail=None*, *chroot=None*, *root=None*)
Export installed packages into yaml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

jail Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.
root Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`check`**(*jail=None*, *chroot=None*, *root=None*, *depends=False*, *recompute=False*, *checksum=False*)
Sanity checks installed packages
jail Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

chroot Perform the sanity check in the specified chroot (ignored if `jail` is specified)
root Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.
depends Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check recompute=True
```

recompute Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check depends=True
```

checksum Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

salt.modules.pkgng.**clean**(*jail=None*, *chroot=None*, *root=None*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
salt '*' pkg.clean jail=<jail name or id>
salt '*' pkg.clean chroot=/path/to/chroot
```

salt.modules.pkgng.**fetch**(*name*, *jail=None*, *chroot=None*, *root=None*, *fetch_all=False*, *quiet=False*, *fromrepo=None*, *glob=True*, *regex=False*, *pcre=False*, *local=False*, *depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

jail Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot Fetch package in the specified chroot (ignored if `jail` is specified)

root Fetch package in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob Treat pkg_name as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex Treat pkg_name as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre Treat pkg_name is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

depends Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

salt.modules.pkgng.**install**(*name=None*, *fromrepo=None*, *pkgs=None*, *sources=None*, *jail=None*, *chroot=None*, *root=None*, *orphan=False*, *force=False*, *glob=False*, *local=False*, *dryrun=False*, *quiet=False*, *reinstall_requires=False*, *regex=False*, *pcre=False*, ***kwargs*)

Install package(s) from a repository

name The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail Install the package into the specified jail

chroot Install the package into the specified chroot (ignored if `jail` is specified)

root Install the package into the specified root (ignored if `jail` is specified)

orphan Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to `pkg-autoremove(8)`.

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg install`.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

fromrepo In multi-repo mode, override the pkg.conf ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

regex Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

pcre Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.install <extended regular expression> pcre=True
```

`salt.modules.pkgng.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`list_pkgs`**(*versions_as_list=False*, *jail=None*, *chroot=None*, *root=None*, *with_origin=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

jail List the packages in the specified jail

chroot List the packages in the specified chroot (ignored if `jail` is specified)

root List the packages in the specified root (ignored if `jail` is specified)
with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.`**`parse_config`**(*file_name='/usr/local/etc/pkg.conf'*)
Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

`NOTE:` not working properly right now

`salt.modules.pkgng.`**`refresh_db`**(*jail=None*, *chroot=None*, *root=None*, *force=False*)
Refresh PACKAGESITE contents

Note: This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail Refresh the pkg database within the specified jail
chroot Refresh the pkg database within the specified chroot (ignored if `jail` is specified)
root Refresh the pkg database within the specified root (ignored if `jail` is specified)
force Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.`**`remove`**(*name=None*, *pkgs=None*, *jail=None*, *chroot=None*, *root=None*, *all_installed=False*, *force=False*, *glob=False*, *dryrun=False*, *recurse=False*, *regex=False*, *pcre=False*, ***kwargs*)
Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

---

name The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail Delete the package from the specified jail
chroot Delete the package from the specified chroot (ignored if `jail` is specified)

root Delete the package from the specified root (ignored if `jail` is specified)
all_installed Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.`**`restore`**(*file_name*, *jail=None*, *chroot=None*, *root=None*)
Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

jail Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

chroot Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.
root Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

salt.modules.pkgng.**search**(*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcre=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

jail Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

chroot Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

root Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

exact Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

glob Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

regex Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

pcre Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

comment Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

desc Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

full Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

depends Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

size Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

quiet Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

origin Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

prefix Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

`salt.modules.pkgng.`**`stats`**(*local=False*, *remote=False*, *jail=None*, *chroot=None*, *root=None*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

local Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

remote Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

jail Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

chroot Retrieve stats from the specified chroot (ignored if `jail` is specified).
root Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

salt.modules.pkgng.**update_package_site**(*new_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

salt.modules.pkgng.**updating**(*name*, *jail=None*, *chroot=None*, *root=None*, *filedate=None*, *filename=None*)

` Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

jail Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

chroot Perform the action in the specified chroot (ignored if `jail` is specified)
root Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

filedate Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.updating foo filedate=20130101
```

filename Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

salt.modules.pkgng.**upgrade**(**names*, ***kwargs*)

Upgrade named or all packages (run a `pkg upgrade`). If <package name> is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

jail Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if `jail` is specified)
root Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.
force Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

local Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

dryrun Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the local option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

`salt.modules.pkgng.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

---

jail Get package version information for the specified jail
chroot Get package version information for the specified chroot (ignored if `jail` is specified)
root Get package version information for the specified root (ignored if `jail` is specified)
with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.`**`version_cmp`**(*pkg1*, *pkg2*, *ignore_epoch=False*)

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

salt.modules.pkgng.**which**(*path*, *jail=None*, *chroot=None*, *root=None*, *origin=False*, *quiet=False*)
Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

jail Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot Perform the check in the specified chroot (ignored if `jail` is specified)
root Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

quiet Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

19.9.292 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

---

salt.modules.pkgutil.**install**(*name=None*, *refresh=False*, *version=None*, *pkgs=None*, ***kwargs*)
Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:
pkgs A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

salt.modules.pkgutil.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

salt.modules.pkgutil.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.pkgutil.**list_upgrades**(*refresh=True*, ***kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

salt.modules.pkgutil.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.**refresh_db**()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

salt.modules.pkgutil.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Remove a package and all its dependencies which are not in use by other packages.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.pkgutil.**upgrade**(*refresh=True*)

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

salt.modules.pkgutil.**upgrade_available**(*name*)

Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

salt.modules.pkgutil.**version**(**names*, ***kwargs*)

Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

19.9.293 salt.modules.portage_config

Configure `portage(5)`

salt.modules.portage_config.**append_to_package_conf**(*conf*, *atom=''*, *flags=None*, *string=''*, *overwrite=False*)

Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -
↪libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1
↪" flags="['ldap', '-libvirt']"
```

salt.modules.portage_config.**append_use_flags**(*atom*, *uses=None*, *overwrite=False*)

Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "['ldap', '-
↪libvirt']"
```

salt.modules.portage_config.**enforce_nice_config**()

Enforce a nice tree structure for /etc/portage/package.* configuration files.

See also:

salt.modules.ebuild.ex_mod_init() for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

salt.modules.portage_config.**filter_flags**(*use*, *use_expand_hidden*, *usemasked*, *useforced*)
New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

salt.modules.portage_config.**get_all_cpv_use**(*cp*)
New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

salt.modules.portage_config.**get_cleared_flags**(*cp*)
New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist int /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

salt.modules.portage_config.**get_flags_from_package_conf**(*conf*, *atom*)
Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

salt.modules.portage_config.**get_installed_use**(*cp*, *use='USE'*)
New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type: cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", ``PKGUSE"] @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.**get_iuse**(*cp*)
New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type: cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

salt.modules.portage_config.**get_missing_flags**(*conf*, *atom*, *flags*)
Find out which of the given flags are currently not set. CLI Example:

```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl
↪']"
```

salt.modules.portage_config.**has_flag**(*conf*, *atom*, *flag*)
Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

salt.modules.portage_config.**has_use**(*atom*, *use*)
Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

salt.modules.portage_config.**is_changed_uses**(*cp*)
New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

salt.modules.portage_config.**is_present**(*conf*, *atom*)
Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by enforce_nice_config)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

19.9.294 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the master.cf file (which is one style) and files in the style of main.cf (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

salt.modules.postfix.**delete**(*queue_id*)
Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA

salt '*' postfix.delete ALL
```

salt.modules.postfix.**hold**(*queue_id*)
Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA

salt '*' postfix.hold ALL
```

salt.modules.postfix.**requeue**(*queue_id*)

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA

salt '*' postfix.requeue ALL
```

salt.modules.postfix.**set_main**(*key*, *value*, *path='/etc/postfix/main.cf'*)

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

salt <minion> postfix.set_main mailq_path /usr/bin/mailq

salt.modules.postfix.**set_master**(*service*, *conn_type*, *private='y'*, *unpriv='y'*, *chroot='y'*, *wakeup='n'*, *maxproc='100'*, *command=''*, *write_conf=True*, *path='/etc/postfix/master.cf'*)

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, `-` cannot be set as a value, as is normal in the master.cf file; either `y', `n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a `-`. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

salt <minion> postfix.set_master smtp inet n y n n 100 smtpd

salt.modules.postfix.**show_main**(*path='/etc/postfix/main.cf'*)

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf

salt.modules.postfix.**show_master**(*path='/etc/postfix/master.cf'*)

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf

salt.modules.postfix.**show_queue**()

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

salt.modules.postfix.**unhold**(*queue_id*)

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA

salt '*' postfix.unhold ALL
```

19.9.295 salt.modules.postgres

Module to provide Postgres compatibility to salt.

configuration In order to connect to Postgres, certain configuration is required in /etc/salt/minion on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the maintenance_db is `postgres' and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar

note This module uses MD5 hashing which may not be compliant with certain security audits.

note When installing postgres from the official postgres repos, on certain linux distributions, either the psql or the initdb binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

salt.modules.postgres.**available_extensions**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

salt.modules.postgres.**create_extension**(*name*, *if_not_exists=None*, *schema=None*, *ext_version=None*, *from_version=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

salt.modules.postgres.**create_metadata**(*name*, *ext_version=None*, *schema=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

salt.modules.postgres.**datadir_exists**(*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name Name of the directory to check

salt.modules.postgres.**datadir_init**(*name*, *auth='password'*, *user=None*, *password=None*, *encoding='UTF8'*, *locale=None*, *runas=None*)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name The name of the directory to initialize
auth The default authentication method for local connections
password The password to set for the postgres user
user The database superuser name
encoding The default encoding for new databases
locale The default locale for new databases
runas The system user the operation should be performed on behalf of

salt.modules.postgres.**db_alter**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *tablespace=None*, *owner=None*, *owner_recurse=False*, *runas=None*)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

salt.modules.postgres.**db_create**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *tablespace=None*, *encoding=None*, *lc_collate=None*, *lc_ctype=None*, *owner=None*, *template=None*, *runas=None*)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'

salt '*' postgres.db_create 'dbname' template=template_postgis
```

salt.modules.postgres.**db_exists**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

salt.modules.postgres.**db_list**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

salt.modules.postgres.**db_remove**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

salt.modules.postgres.**drop_extension**(*name*, *if_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

salt.modules.postgres.**get_available_extension**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

salt.modules.postgres.**get_installed_extension**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

salt.modules.postgres.**group_create**(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword'
```

salt.modules.postgres.**group_remove**(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

salt.modules.postgres.**group_update**(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword'
```

salt.modules.postgres.**has_privileges**(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
SELECT,INSERT maintenance_db=db_name
```

name Name of the role whose privileges should be checked on object_type
object_name Name of the object on which the check is to be performed
object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If grant_option is set to True, the grant option check is performed

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**installed_extensions**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

salt.modules.postgres.**is_available_extension**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

salt.modules.postgres.**is_installed_extension**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

salt.modules.postgres.**language_create**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

name Language to install
maintenance_db The database to install the language in
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**language_exists**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name Language to check for
maintenance_db The database to check in
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**language_list**(*maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db The database to check
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**language_remove**(*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

name Language to remove
maintenance_db The database to install the language in
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**owner_to**(*dbname*, *ownername*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

salt.modules.postgres.**privileges_grant**(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name Name of the role to which privileges should be granted
object_name Name of the object on which the grant is to be performed
object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others
prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**privileges_list**(*name*, *object_type*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name Name of the object for which the permissions should be returned
object_type The object type, which can be one of the following:

- table
- sequence
- schema

- tablespace
- language
- database
- group
- function

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema
maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**privileges_revoke**(*name*, *object_name*, *object_type*, *privileges=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name Name of the role whose privileges should be revoked
object_name Name of the object on which the revoke is to be performed
object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

maintenance_db The database to connect to
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default

port Database port if different from config or default
runas System user all operations should be performed on behalf of

salt.modules.postgres.**psql_query**(*query*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *write=False*)

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This limitation can be worked around with a query like this:

WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = `rolename' RETURNING rolconnlimit) SELECT * FROM updated;
query The query string.
user Database username, if different from config or default.
host Database host, if different from config or default.
port Database port, if different from the config or default.
maintenance_db The database to run the query against.
password User password, if different from the config or default.
runas User to run the command as.
write Mark query as READ WRITE transaction.
CLI Example:

```
salt '*' postgres.psql_query 'select * from pg_stat_activity'
```

salt.modules.postgres.**role_get**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *return_password=False*)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

salt.modules.postgres.**schema_create**(*dbname*, *name*, *owner=None*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
        user='user' \
        db_user='user' db_password='password'
        db_host='hostname' db_port='port'
```

salt.modules.postgres.**schema_exists**(*dbname*, *name*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname Database name we query on
name Schema name we look for
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.**schema_get**(*dbname*, *name*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname Database name we query on
name Schema name we look for
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.**schema_list**(*dbname*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname Database name we query on
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.**schema_remove**(*dbname*, *name*, *user=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

dbname Database name we work on
schemaname The schema's name we'll remove
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.modules.postgres.**tablespace_alter**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *new_name=None*, *new_owner=None*, *set_option=None*, *reset_option=None*, *runas=None*)

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{'seq_page_cost': '1.1'}"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_create**(*name*, *location*, *options=None*, *owner=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_exists**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_list**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

salt.modules.postgres.**tablespace_remove**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

salt.modules.postgres.**user_create**(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *inherit=None*, *login=None*, *connlimit=None*, *encrypted=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
       host='hostname' port='port' password='password' \
       rolepassword='rolepassword'
```

salt.modules.postgres.**user_exists**(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

salt.modules.postgres.**user_list**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*, *return_password=False*)

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

salt.modules.postgres.**user_remove**(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

salt.modules.postgres.**user_update**(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *superuser=None*, *inherit=None*, *login=None*, *connlimit=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
        host='hostname' port='port' password='password' \
        rolepassword='rolepassword'
```

salt.modules.postgres.**version**(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

19.9.296 salt.modules.poudriere

Support for poudriere

salt.modules.poudriere.**bulk_build**(*jail*, *pkg_file*, *keep=False*)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

salt.modules.poudriere.**create_jail**(*name*, *arch*, *version='9.0-RELEASE'*)

Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

salt.modules.poudriere.**create_ports_tree**()
Not working need to run portfetch non interactive

salt.modules.poudriere.**delete_jail**(*name*)
Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

salt.modules.poudriere.**is_jail**(*name*)
Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

salt.modules.poudriere.**list_jails**()
Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

salt.modules.poudriere.**list_ports**()
Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

salt.modules.poudriere.**make_pkgng_aware**(*jname*)
Make jail `jname` pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

salt.modules.poudriere.**parse_config**(*config_file=None*)
Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

salt.modules.poudriere.**update_jail**(*name*)
Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

salt.modules.poudriere.**update_ports_tree**(*ports_tree*)
Updates the ports tree, either the default or the *ports_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

salt.modules.poudriere.**version**()
Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

19.9.297 salt.modules.powerpath

powerpath support.

Assumes RedHat

salt.modules.powerpath.**add_license**(*key*)
Add a license

salt.modules.powerpath.**list_licenses**()
returns a list of applied powerpath license keys

salt.modules.powerpath.**remove_license**(*key*)
Remove a license

19.9.298 salt.modules.proxy module

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

salt.modules.proxy.**get_ftp_proxy**(*network_service='Ethernet'*)
Returns the current ftp proxy settings
network_service The network service to apply the changes to, this only necessary on macOS
CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

salt.modules.proxy.**get_http_proxy**(*network_service='Ethernet'*)
Returns the current http proxy settings
network_service The network service to apply the changes to, this only necessary on macOS
CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

salt.modules.proxy.**get_https_proxy**(*network_service='Ethernet'*)
Returns the current https proxy settings
network_service The network service to apply the changes to, this only necessary on macOS
CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

salt.modules.proxy.**get_proxy_bypass**(*network_service='Ethernet'*)
Returns the current domains that can bypass the proxy
network_service The network service to get the bypass domains from, this is only necessary on macOS
CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

salt.modules.proxy.**get_proxy_win**()

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

salt.modules.proxy.**set_ftp_proxy**(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the ftp proxy settings

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on macOS

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
 ↪network_service=Ethernet
```

salt.modules.proxy.**set_http_proxy**(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on macOS

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_
 ↪pass network_service=Ethernet
```

salt.modules.proxy.**set_https_proxy**(*server*, *port*, *user=None*, *password=None*, *network_service='Ethernet'*, *bypass_hosts=None*)

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using set_proxy.

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on macOS

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use set_proxy_bypass to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_
 ↪pass network_service=Ethernet
```

salt.modules.proxy.**set_proxy_bypass**(*domains*, *network_service='Ethernet'*)

Sets the domains that can bypass the proxy

domains An array of domains allowed to bypass the proxy

network_service The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

salt.modules.proxy.**set_proxy_win**(*server*, *port*, *types=None*, *bypass_hosts=None*)

Sets the http proxy settings, only works with Windows.

server The proxy server to use

password The password to use if required by the server

types The types of proxy connections should be setup with this server. Valid types are http and https.

bypass_hosts The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

19.9.299 salt.modules.ps

A salt interface to psutil, a system and process library. See http://code.google.com/p/psutil.

depends

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

salt.modules.ps.**boot_time**(*time_format=None*)

Return the boot time in number of seconds since the epoch began.

CLI Example:

time_format Optionally specify a strftime format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. `Fri May 2 19:08:32 2014`).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

salt.modules.ps.**cpu_percent**(*interval=0.1*, *per_cpu=False*)

Return the percent of time the CPU is busy.

interval the number of seconds to sample CPU usage over

per_cpu if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

salt.modules.ps.**cpu_times**(*per_cpu=False*)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

per_cpu if True return an array of percents for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_times
```

salt.modules.ps.**disk_io_counters**(*device=None*)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters

salt '*' ps.disk_io_counters device=sda1
```

salt.modules.ps.**disk_partition_usage**(*all=False*)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

salt.modules.ps.**disk_partitions**(*all=False*)

Return a list of disk partitions and their device, mount point, and filesystem type.

all if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

salt.modules.ps.**disk_usage**(*path*)

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

salt.modules.ps.**get_pid_list**()

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

salt.modules.ps.**get_users**()

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

salt.modules.ps.**kill_pid**(*pid*, *signal=15*)

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid PID of process to kill.

signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

salt.modules.ps.**lsof**(*name*)

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

salt.modules.ps.**netstat**(*name*)

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

salt.modules.ps.**network_io_counters**(*interface=None*)

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters

salt '*' ps.network_io_counters interface=eth0
```

salt.modules.ps.**num_cpus**()

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

salt.modules.ps.**pgrep**(*pattern*, *user=None*, *full=False*)

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Find all httpd processes on all `www' minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user `tom':

```
salt '*' ps.pgrep bash user=tom
```

salt.modules.ps.**pkill**(*pattern*, *user=None*, *signal=15*, *full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
        [full=(true|false)]
```

pattern Pattern to search for in the process list.
user Limit matches to the given username. Default: All users.
signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Send SIGHUP to all httpd processes on all `www' minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user `tom':

```
salt '*' ps.pkill bash signal=9 user=tom
```

salt.modules.ps.**proc_info**(*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

pid PID of process to query.

attrs Optional list of desired process attributes. The list of possible attributes can be found here: http://pythonhosted.org/psutil/#psutil.Process

salt.modules.ps.**psaux**(*name*)

Retrieve information corresponding to a ``ps aux'' filtered with the given pattern. It could be just a name or a regular expression (using python search from ``re'' module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

salt.modules.ps.**ss**(*name*)

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

salt.modules.ps.**swap_memory**()

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.swap_memory
```

salt.modules.ps.**top**(*num_processes=5*, *interval=3*)

Return a list of top CPU consuming processes during the interval. num_processes = return the top N CPU consuming processes interval = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top

salt '*' ps.top 5 10
```

salt.modules.ps.**total_physical_memory**()
Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

salt.modules.ps.**virtual_memory**()
New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

19.9.300 salt.modules.publish

Publish a command from a minion to a target

salt.modules.publish.**full_data**(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=''*, *timeout=5*, *expr_form=None*)
Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

salt.modules.publish.**publish**(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=''*, *timeout=5*, *via_master=None*, *expr_form=None*)
Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain

- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam','spam=cheese']"
```

When running via salt-call, the *via_master* flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.`**`runner`**(*fun*, *arg=None*, *timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

19.9.301 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.`**`disable`**(*message=None*)

New in version 2014.7.0.

Disable the puppet agent

message New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

salt.modules.puppet.**enable**()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

salt.modules.puppet.**fact**(*name*, *puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

salt.modules.puppet.**facts**(*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

salt.modules.puppet.**noop**(**args*, ***kwargs*)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for puppet.run.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
 ↪tags=basefiles::edit,apache::server
```

salt.modules.puppet.**plugin_sync**()

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

salt.modules.puppet.**run**(**args*, ***kwargs*)

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. -- http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
 ↪ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules tags=basefiles:
 ↪:edit,apache::server
```

```
```

salt.modules.puppet.**status**()

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

salt.modules.puppet.**summary**()

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

19.9.302 salt.modules.pushbullet module

Module for sending messages to Pushbullet (https://www.pushbullet.com)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

salt.modules.pushbullet.**push_note**(*device=None*, *title=None*, *body=None*)

Pushing a text note.

Parameters

- **device** -- Pushbullet target device
- **title** -- Note title
- **body** -- Note body

Returns Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example
↪body."
```

19.9.303 salt.modules.pushover_notify

Module for sending messages to Pushover (https://www.pushover.net)

New in version 2016.3.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

salt.modules.pushover_notify.**post_message**(*user=None*, *device=None*, *message=None*, *title=None*, *priority=None*, *expire=None*, *retry=None*, *sound=None*, *api_version=1*, *token=None*)

Send a message to a Pushover user or group.

Parameters

- **user** -- The user or group to send to, must be key of user or group not email address.
- **message** -- The message to send to the PushOver user or group.
- **title** -- Specify who the message is from.
- **priority** -- The priority of the message, defaults to 0.
- **expire** -- The message should expire after N number of seconds.
- **retry** -- The number of times the message should be retried.
- **sound** -- The sound to associate with the message.
- **api_version** -- The PushOver API version, if not specified in the configuration.
- **token** -- The PushOver token, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↪'Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↪'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

19.9.304 salt.modules.pw_group

Manage groups on FreeBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *`group.info' is not available*), see *here*.

salt.modules.pw_group.**add**(*name*, *gid=None*, ***kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.pw_group.**adduser**(*name*, *username*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username `bar' as a member of an existing group `foo', if not then adds it.

salt.modules.pw_group.**chgid**(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.pw_group.**delete**(*name*)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.pw_group.**deluser**(*name*, *username*)
Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user `bar' from a group `foo'. If group is not present then returns True.

salt.modules.pw_group.**getent**(*refresh=False*)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.pw_group.**info**(*name*)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

salt.modules.pw_group.**members**(*name*, *members_list*)
Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:
salt `*' group.members foo `user1,user2,user3,...'

Replaces a membership list for a local group `foo'. foo:x:1234:user1,user2,user3,...

19.9.305 salt.modules.pw_user

Manage users with the pw command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *`user.info' is not available*), see *here*.

---

salt.modules.pw_user.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, *loginclass=None*, ***kwargs*)
Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.pw_user.**chfullname**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.pw_user.**chgid**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.pw_user.**chgroups**(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append [False] Set to `True` to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.pw_user.**chhome**(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name Username to modify

home New home directory to set

persist [False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.pw_user.**chhomephone**(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.pw_user.**chloginclass**(*name*, *loginclass*, *root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

salt.modules.pw_user.**chroomnumber**(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.pw_user.**chshell**(*name*, *shell*)
Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.pw_user.**chuid**(*name*, *uid*)
Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.pw_user.**chworkphone**(*name*, *workphone*)
Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

salt.modules.pw_user.**delete**(*name*, *remove=False*, *force=False*)
Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.pw_user.**get_loginclass**(*name*)
Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

salt.modules.pw_user.**getent**(*refresh=False*)
Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.pw_user.**info**(*name*)
Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.pw_user.**list_groups**(*name*)
Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.pw_user.**list_users**()
Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.pw_user.**rename**(*name*, *new_name*)
Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

19.9.306 salt.modules.pyenv

Manage python installations with pyenv.

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.

salt.modules.pyenv.**default**(*python=None*, *runas=None*)
Returns or sets the currently defined default python.
python=None The version to set as the default. Should match one of the versions listed by *pyenv.versions*. Leave blank to return the current default.
CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

salt.modules.pyenv.**do**(*cmdline=None*, *runas=None*)
Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

salt.modules.pyenv.**do_with_python**(*python*, *cmdline*, *runas=None*)
Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

salt.modules.pyenv.**install**(*runas=None*, *path=None*)
Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

salt.modules.pyenv.**install_python**(*python*, *runas=None*)
Install a python implementation.

python The version of python to install, should match one of the versions listed by pyenv.list
CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

salt.modules.pyenv.**is_installed**(*runas=None*)
Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

salt.modules.pyenv.**list**(*runas=None*)
List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

salt.modules.pyenv.**rehash**(*runas=None*)
Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

salt.modules.pyenv.**uninstall_python**(*python*, *runas=None*)
Uninstall a python implementation.
python The version of python to uninstall. Should match one of the versions listed by *pyenv.versions*
CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

salt.modules.pyenv.**update**(*runas=None*, *path=None*)
Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

salt.modules.pyenv.**versions**(*runas=None*)
List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

19.9.307 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

depends qemu-img

salt.modules.qemu_img.**convert**(*orig*, *dest*, *fmt*)
Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

salt.modules.qemu_img.**make_image**(*location*, *size*, *fmt*)

Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

19.9.308 salt.modules.qemu_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

salt.modules.qemu_nbd.**clear**(*mnt*)

Pass in the mnt dict returned from nbd_mount to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"/mnt/foo": "/dev/nbd0p1"}'
```

salt.modules.qemu_nbd.**connect**(*image*)

Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

salt.modules.qemu_nbd.**init**(*image*, *root=None*)

Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

salt.modules.qemu_nbd.**mount**(*nbd*, *root=None*)

Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

19.9.309 salt.modules.quota

Module for managing quotas on POSIX-like systems.

salt.modules.quota.**get_mode**(*device*)

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

salt.modules.quota.**off**(*device*)
Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

salt.modules.quota.**on**(*device*)
Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

salt.modules.quota.**report**(*mount*)
Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

salt.modules.quota.**set**(*device*, ***kwargs*)
Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

salt.modules.quota.**stats**()
Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

salt.modules.quota.**warn**()
Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

19.9.310 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

salt.modules.rabbitmq.**add_user**(*name*, *password=None*, *runas=None*)
Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

salt.modules.rabbitmq.**add_vhost**(*vhost*, *runas=None*)
Adds a vhost via rabbitmqctl add_vhost.

CLI Example:

```
salt '*' rabbitmq add_vhost '<vhost_name>'
```

salt.modules.rabbitmq.**change_password**(*name*, *password*, *runas=None*)
Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

salt.modules.rabbitmq.**check_password**(*name*, *password*, *runas=None*)
New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

salt.modules.rabbitmq.**clear_password**(*name*, *runas=None*)
Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

salt.modules.rabbitmq.**cluster_status**(*runas=None*)
return rabbitmq cluster_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

salt.modules.rabbitmq.**delete_policy**(*vhost*, *name*, *runas=None*)
Delete a policy based on rabbitmqctl clear_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA
```

salt.modules.rabbitmq.**delete_user**(*name*, *runas=None*)
Deletes a user via rabbitmqctl delete_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

salt.modules.rabbitmq.**delete_vhost**(*vhost*, *runas=None*)
Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

salt.modules.rabbitmq.**disable_plugin**(*name*, *runas=None*)
Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

salt.modules.rabbitmq.**enable_plugin**(*name*, *runas=None*)
Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

salt.modules.rabbitmq.**force_reset**(*runas=None*)
Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

salt.modules.rabbitmq.**join_cluster**(*host*, *user='rabbit'*, *ram_node=None*, *runas=None*)
Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

salt.modules.rabbitmq.**list_available_plugins**(*runas=None*)
Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

salt.modules.rabbitmq.**list_enabled_plugins**(*runas=None*)
Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

salt.modules.rabbitmq.**list_permissions**(*vhost*, *runas=None*)
Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions /myvhost
```

salt.modules.rabbitmq.**list_policies**(*vhost='/'*, *runas=None*)
Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.list_policies
```

salt.modules.rabbitmq.**list_queues**(*runas=None*, **args*)
Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.**list_queues_vhost**(*vhost*, *runas=None*, **args*)
Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost `/`, use *`list_queues`* instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

salt.modules.rabbitmq.**list_user_permissions**(*name*, *runas=None*)
List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions user
```

salt.modules.rabbitmq.**list_users**(*runas=None*)
Return a list of users based off of rabbitmqctl user_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

salt.modules.rabbitmq.**list_vhosts**(*runas=None*)
Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

salt.modules.rabbitmq.**plugin_is_enabled**(*name*, *runas=None*)
Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

salt.modules.rabbitmq.**policy_exists**(*vhost*, *name*, *runas=None*)
Return whether the policy exists based on rabbitmqctl list_policies.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

salt.modules.rabbitmq.**reset**(*runas=None*)
Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

salt.modules.rabbitmq.**set_permissions**(*vhost*, *user*, *conf='.*'*, *write='.*'*, *read='.*'*, *runas=None*)
Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions myvhost myuser
```

salt.modules.rabbitmq.**set_policy**(*vhost*, *name*, *pattern*, *definition*, *priority=None*, *runas=None*)
Set a policy based on rabbitmqctl set_policy.

Reference: http://www.rabbitmq.com/ha.html

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

salt.modules.rabbitmq.**set_user_tags**(*name*, *tags*, *runas=None*)
Add user tags via rabbitmqctl set_user_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

salt.modules.rabbitmq.**start_app**(*runas=None*)
Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

salt.modules.rabbitmq.**status**(*runas=None*)
return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

salt.modules.rabbitmq.**stop_app**(*runas=None*)
Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

salt.modules.rabbitmq.**user_exists**(*name*, *runas=None*)
Return whether the user exists based on rabbitmqctl list_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

salt.modules.rabbitmq.**vhost_exists**(*name*, *runas=None*)
Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

19.9.311 salt.modules.raet_publish

Publish a command from a minion to a target

salt.modules.raet_publish.**full_data**(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=''*, *timeout=5*, *expr_form=None*)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

---

salt.modules.raet_publish.**publish**(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=''*, *timeout=5*, *expr_form=None*)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

---

salt.modules.raet_publish.**runner**(*fun*, *arg=None*, *timeout=5*)
Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

19.9.312 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a `username` and a `password` in `/etc/salt/minion`:

salt.modules.rallydev.**list_items**(*name*)
List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

salt.modules.rallydev.**list_users**()
List the users

CLI Example:

```
salt myminion rallydev.list_users
```

salt.modules.rallydev.**query_item**(*name*, *query_string*, *order='Rank'*)
Query a type of record for one or more items. Requires a valid query string. See https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

salt.modules.rallydev.**query_user**(*query_string*, *order='UserName'*)
Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

salt.modules.rallydev.**show_artifact**(*id_*)
Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

salt.modules.rallydev.**show_item**(*name*, *id_*)
Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

salt.modules.rallydev.**show_user**(*id_*)
Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

salt.modules.rallydev.**update_item**(*name*, *id_*, *field=None*, *value=None*, *postdata=None*)
Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

salt.modules.rallydev.**update_user**(*id_*, *field*, *value*)
Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

19.9.313 salt.modules.random_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

salt.modules.random_org.**generateBlobs**(*api_key=None*, *api_version=None*, ***kwargs*)
List all Slack users.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **format** -- Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

Returns The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6

salt '*' get_integers number=5 min=1 max=6
```

salt.modules.random_org.**generateDecimalFractions**(*api_key=None*, *api_version=None*, ***kwargs*)

Generates true random decimal fractions

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** -- The number of decimal places to use. Must be within the [1,20] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of decimal fraction

CLI Example:

```
salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4

salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
 ↪replacement=True
```

salt.modules.random_org.**generateGaussians**(*api_key=None*, *api_version=None*, ***kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random numbers you need. Must be within the [1,1e4] range.
- **mean** -- The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** -- The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** -- The number of significant digits to use. Must be within the [2,20] range.

Returns The user list.

CLI Example:

```
salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0
 ↪significantDigits=8
```

salt.modules.random_org.**generateIntegers**(*api_key=None*, *api_version=None*, ***kwargs*)

Generate random integers

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of integers to generate
- **minimum** -- The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** -- The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** -- Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a con-

tainer), set this value to false.

- **base** -- Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns A list of integers.

CLI Example:

```
salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6

salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2
```

salt.modules.random_org.**generateStrings**(*api_key=None*, *api_version=None*, ***kwargs*)

Generate random strings.

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- The number of strings to generate.
- **length** -- The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** -- A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** -- Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=
↪'abcdefghijklmnopqrstuvwxyz'

salt '*' random_org.generateStrings number=10 length=16 characters
↪'abcdefghijklmnopqrstuvwxyz'
```

salt.modules.random_org.**generateUUIDs**(*api_key=None*, *api_version=None*, ***kwargs*)

Generate a list of random UUIDs

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.
- **number** -- How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

salt.modules.random_org.**getUsage**(*api_key=None*, *api_version=None*)

Show current usages statistics

Parameters

- **api_key** -- The Random.org api key.
- **api_version** -- The Random.org api version.

Returns The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage

salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↪version=1
```

19.9.314 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

salt.modules.rbac_solaris.**auth_add**(*user*, *auth*)

Add authorization to user

user [string] username

auth [string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.**auth_get**(*user*, *computed=True*)

List authorization for user

user [string] username

computed [boolean] merge results from *auths* command into data from user_attr

CLI Example:

```
salt '*' rbac.auth_get leo
```

salt.modules.rbac_solaris.**auth_list**()

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

salt.modules.rbac_solaris.**auth_rm**(*user*, *auth*)

Remove authorization from user

user [string] username

auth [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

salt.modules.rbac_solaris.**profile_add**(*user*, *profile*)

Add profile to user

user [string] username

profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

salt.modules.rbac_solaris.**profile_get**(*user*, *default_hidden=True*)

List profiles for user

user [string] username

default_hidden [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

salt.modules.rbac_solaris.**profile_list**(*default_only=False*)

List all available profiles

default_only [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

salt.modules.rbac_solaris.**profile_rm**(*user*, *profile*)

Remove profile from user

user [string] username

profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

salt.modules.rbac_solaris.**role_add**(*user*, *role*)

Add role to user

user [string] username

role [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg
salt '*' rbac.role_add martine netcfg,zfssnap
```

salt.modules.rbac_solaris.**role_get**(*user*)

List roles for user

user [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

salt.modules.rbac_solaris.**role_list**()

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

salt.modules.rbac_solaris.**role_rm**(*user*, *role*)

Remove role from user

user [string] username

role [string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

19.9.315 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/

New in version 0.16.0.

salt.modules.rbenv.**default**(*ruby=None*, *runas=None*)

Returns or sets the currently defined default ruby

ruby The version to set as the default. Should match one of the versions listed by *rbenv.versions*. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default
salt '*' rbenv.default 2.0.0-p0
```

salt.modules.rbenv.**do**(*cmdline*, *runas=None*, *env=None*)

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

salt.modules.rbenv.**do_with_ruby**(*ruby*, *cmdline*, *runas=None*)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

salt.modules.rbenv.**install**(*runas=None*, *path=None*)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

salt.modules.rbenv.**install_ruby**(*ruby*, *runas=None*)

Install a ruby implementation.

ruby The version of Ruby to install, should match one of the versions listed by *rbenv.list*

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

salt.modules.rbenv.**is_installed**(*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

salt.modules.rbenv.**list**(*runas=None*)

List the installable versions of ruby

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

salt.modules.rbenv.**rehash**(*runas=None*)

Run `rbenv rehash` to update the installed shims

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

salt.modules.rbenv.**uninstall_ruby**(*ruby*, *runas=None*)

Uninstall a ruby implementation.

ruby The version of ruby to uninstall. Should match one of the versions listed by *rbenv.versions*.

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

salt.modules.rbenv.**update**(*runas=None*, *path=None*)

Updates the current versions of rbenv and ruby-build

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

salt.modules.rbenv.**versions**(*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

19.9.316 salt.modules.rdp

Manage RDP Service on Windows servers

salt.modules.rdp.**disable**()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

salt.modules.rdp.**disconnect_session**(*session_id*)

Disconnect a session.

New in version 2016.11.0.

Parameters **session_id** -- The numeric Id of the session.

Returns A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id

salt '*' rdp.disconnect_session 99
```

salt.modules.rdp.**enable**()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

salt.modules.rdp.**get_session**(*session_id*)

Get information about a session.

New in version 2016.11.0.

Parameters **session_id** -- The numeric Id of the session.

Returns A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id

salt '*' rdp.get_session 99
```

salt.modules.rdp.**list_sessions**(*logged_in_users_only=False*)

List information about the sessions.

New in version 2016.11.0.

Parameters **logged_in_users_only** -- If True, only return sessions with users logged in.

Returns A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

salt.modules.rdp.**logoff_session**(*session_id*)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters **session_id** -- The numeric Id of the session.

Returns A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id

salt '*' rdp.logoff_session 99
```

salt.modules.rdp.**status**()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

19.9.317 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

configuration This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

salt.modules.redismod.**bgrewriteaof**(*host=None*, *port=None*, *db=None*, *password=None*)
Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

salt.modules.redismod.**bgsave**(*host=None*, *port=None*, *db=None*, *password=None*)
Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

salt.modules.redismod.**config_get**(*pattern='**', *host=None*, *port=None*, *db=None*, *password=None*)
Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

salt.modules.redismod.**config_set**(*name*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)
Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

salt.modules.redismod.**dbsize**(*host=None*, *port=None*, *db=None*, *password=None*)
Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

salt.modules.redismod.**delete**(**keys*, ***connection_args*)
Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

salt.modules.redismod.**exists**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

salt.modules.redismod.**expire**(*key*, *seconds*, *host=None*, *port=None*, *db=None*, *password=None*)
Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

salt.modules.redismod.**expireat**(*key*, *timestamp*, *host=None*, *port=None*, *db=None*, *password=None*)
Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

salt.modules.redismod.**flushall**(*host=None*, *port=None*, *db=None*, *password=None*)
Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

salt.modules.redismod.**flushdb**(*host=None*, *port=None*, *db=None*, *password=None*)
Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

salt.modules.redismod.**get_key**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

salt.modules.redismod.**get_master_ip**(*host=None*, *port=None*, *password=None*)
Get host information about slave

CLI Example:

```
salt '*' redis.get_master_ip
```

salt.modules.redismod.**hdel**(*key*, **fields*, ***options*)
Delete one of more hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

salt.modules.redismod.**hexists**(*key*, *field*, *host=None*, *port=None*, *db=None*, *password=None*)
Determine if a hash fields exists.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

salt.modules.redismod.**hget**(*key*, *field*, *host=None*, *port=None*, *db=None*, *password=None*)
Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

salt.modules.redismod.**hgetall**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

salt.modules.redismod.**hincrby**(*key*, *field*, *increment=1*, *host=None*, *port=None*, *db=None*, *password=None*)
Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

salt.modules.redismod.**hincrbyfloat**(*key*, *field*, *increment=1.0*, *host=None*, *port=None*, *db=None*, *password=None*)
Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

salt.modules.redismod.**hlen**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

salt.modules.redismod.**hmget**(*key*, **fields*, ***options*)
Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

salt.modules.redismod.**hmset**(*key*, ***fieldsvals*)
Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

salt.modules.redismod.**hscan**(*key*, *cursor=0*, *match=None*, *count=None*, *host=None*, *port=None*, *db=None*, *password=None*)

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

salt.modules.redismod.**hset**(*key*, *field*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

salt.modules.redismod.**hsetnx**(*key*, *field*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

salt.modules.redismod.**hvals**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

salt.modules.redismod.**info**(*host=None*, *port=None*, *db=None*, *password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

salt.modules.redismod.**key_type**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

salt.modules.redismod.**keys**(*pattern='*'*, *host=None*, *port=None*, *db=None*, *password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

salt.modules.redismod.**lastsave**(*host=None*, *port=None*, *db=None*, *password=None*)
Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

salt.modules.redismod.**llen**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

salt.modules.redismod.**lrange**(*key*, *start*, *stop*, *host=None*, *port=None*, *db=None*, *password=None*)
Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

salt.modules.redismod.**ping**(*host=None*, *port=None*, *db=None*, *password=None*)
Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

salt.modules.redismod.**save**(*host=None*, *port=None*, *db=None*, *password=None*)
Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

salt.modules.redismod.**sentinel_get_master_ip**(*master*, *host=None*, *port=None*, *password=None*)
Get ip for sentinel master

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

salt.modules.redismod.**set_key**(*key*, *value*, *host=None*, *port=None*, *db=None*, *password=None*)
Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

salt.modules.redismod.**shutdown**(*host=None*, *port=None*, *db=None*, *password=None*)
Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

salt.modules.redismod.**slaveof**(*master_host=None*, *master_port=None*, *host=None*, *port=None*, *db=None*, *password=None*)
Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

salt.modules.redismod.**smembers**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

salt.modules.redismod.**time**(*host=None*, *port=None*, *db=None*, *password=None*)
Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

salt.modules.redismod.**zcard**(*key*, *host=None*, *port=None*, *db=None*, *password=None*)
Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

salt.modules.redismod.**zrange**(*key*, *start*, *stop*, *host=None*, *port=None*, *db=None*, *password=None*)
Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

19.9.318 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY. - HKEY_LOCAL_MACHINE - HKEY_CURRENT_USER - HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

Values or Entries

Values/Entries are name/data pairs. There can be many values in a key. The (Default) value corresponds to the Key, the rest are their own value pairs.

depends

- PyWin32

class salt.modules.reg.**Registry**
Delay usage until this module is used

salt.modules.reg.**broadcast_change**()
Refresh the windows environment.

Returns (bool): True if successful, otherwise False

CLI Example:

```
salt '*' reg.broadcast_change
```

salt.modules.reg.**delete_key_recursive**(*hive*, *key*, *use_32bit_registry=False*)
New in version 2015.5.4.

Delete a registry key to include all subkeys.

Parameters

- **hive** -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** -- The key to remove (looks like a path)
- **use_32bit_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns A dictionary listing the keys that deleted successfully as well as those that failed to delete.

Return type dict

The following example will remove `salt` and all its subkeys from the `SOFTWARE` key in `HKEY_LOCAL_MACHINE`:

CLI Example:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\salt
```

salt.modules.reg.**delete_value**(*hive*, *key*, *vname=None*, *use_32bit_registry=False*)
Delete a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use_32bit_registry** (*bool*) -- Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\Salt' 'version'
```

salt.modules.reg.**key_exists**(*hive*, *key*, *use_32bit_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters

- **hive** (*str*) -- The hive to connect to.
- **key** (*str*) -- The key to check
- **use_32bit_registry** (*bool*) -- Look in the 32bit portion of the registry

Returns Returns True if found, False if not found

Return type bool

salt.modules.reg.**list_keys**(*hive*, *key=None*, *use_32bit_registry=False*)

Enumerates the subkeys in a registry key or hive.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns A list of keys/subkeys under the hive or key.

Return type *list*

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

salt.modules.reg.**list_values**(*hive*, *key=None*, *use_32bit_registry=False*, *include_default=True*)

Enumerates the values in a registry key or hive.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
- **include_default** (*bool*) -- Toggle whether to include the `(Default)' value.

Returns A list of values under the hive or key.

Return type *list*

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'
```

salt.modules.reg.**read_value**(*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Reads a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM

- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU
- HKEY_CLASSES_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC

- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be returned
- **use_32bit_registry** (*bool*) -- Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns A dictionary containing the passed settings as well as the value_data if successful. If unsuccessful, sets success to False.

Return type dict

If vname is not passed:

•Returns the first unnamed value (Default) as a string.

•Returns none if first unnamed value is empty.

•Returns False if key not found.

CLI Example:

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

salt.modules.reg.**set_value**(*hive*, *key*, *vname=None*, *vdata=None*, *vtype=u'REG_SZ'*, *use_32bit_registry=False*, *volatile=False*)

Sets a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) -- The name of the hive. Can be one of the following
  - HKEY_LOCAL_MACHINE or HKLM
  - HKEY_CURRENT_USER or HKCU
  - HKEY_USER or HKU
  - HKEY_CLASSES_ROOT or HKCR
  - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) -- The key (looks like a path) to the value name.
- **vname** (*str*) -- The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (*object*) -- The value data to be set. Which type this parameter should be is determined by the value of the vtype parameter. The correspondence is as follows:
  REG_BINARY binary data (i.e. str in python version < 3 and bytes in version >=3)
  REG_DWORD int
  REG_EXPAND_SZ str
  REG_MULTI_SZ list of objects of type str
  REG_SZ str
- **vtype** (*str*) -- The value type. The possible values of the vtype parameter are indicated above in the description of the vdata parameter.
- **use_32bit_registry** (*bool*) -- Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** (*bool*) -- When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

Returns Returns True if successful, False if not

Return type bool

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2'
```

This function is strict about the type of vdata. For instance the the next example will fail because vtype has a value of REG_SZ and vdata has a type of int (as opposed to str as expected).

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_SZ vdata=0
```

However, this next example where vdata is properly quoted should succeed.

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_SZ vdata="'0'"
```

An example of using vtype REG_BINARY is as follows:

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_BINARY vdata='!!binary d2hhdCdzIHRoZSBwb2ludA=='
```

An example of using vtype REG_LIST is as follows:

CLI Example:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version' '2015.5.2' \
vtype=REG_LIST vdata='[a,b,c]'
```

19.9.319 salt.modules.rest_package

Package support for the REST example

salt.modules.rest_package.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.320 salt.modules.rest_sample_utils module

Utility functions for the rest_sample

salt.modules.rest_sample_utils.**fix_outage**()

``Fix'' the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

salt.modules.rest_sample_utils.**get_test_string**()

Helper function to test cross-calling to the __proxy__ dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

19.9.321 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

salt.modules.rest_service.**enabled**(*name*, *sig=None*)
Only the `redbull' service is `enabled' in the test

New in version 2015.8.1.

salt.modules.rest_service.**get_all**()
Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

salt.modules.rest_service.**list**()
Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

salt.modules.rest_service.**restart**(*name*, *sig=None*)
Restart the specified service with rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rest_service.**running**(*name*, *sig=None*)
Return whether this service is running.

New in version 2015.8.0.

salt.modules.rest_service.**start**(*name*, *sig=None*)
Start the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rest_service.**status**(*name*, *sig=None*)
Return the status for a service via rest_sample, returns a bool whether the service is running.

New in version 2015.8.0.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.rest_service.**stop**(*name*, *sig=None*)
Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.322 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, https://packages.debian.org/debian-goodies) and psdel by Sam Morris.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.restartcheck.**restartcheck**(*ignorelist=None*, *blacklist=None*, *excludepid=None*, *verbose=True*)

Analyzes files openeded by running processes and seeks for packages which need to be restarted.

Parameters

- **ignorelist** -- string or list of packages to be ignored
- **blacklist** -- string or list of file paths to be ignored
- **excludepid** -- string or list of process IDs to be ignored
- **verbose** -- boolean, enables extensive output

Returns True if no packages for restart found. False on failure. String with checkrestart output if some package seems to need to be restarted.

New in version 2015.8.3.

CLI Example: .. code-block:: bash
salt `*' restartcheck.restartcheck

19.9.323 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

salt.modules.ret.**get_fun**(*returner*, *fun*)

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

salt.modules.ret.**get_jid**(*returner*, *jid*)

Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

salt.modules.ret.**get_jids**(*returner*)

Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

salt.modules.ret.**get_minions**(*returner*)

Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

19.9.324 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

salt.modules.rh_ip.**apply_network_settings**(***settings*)
Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

salt.modules.rh_ip.**build_bond**(*iface*, ***settings*)
Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

salt.modules.rh_ip.**build_interface**(*iface*, *iface_type*, *enabled*, ***settings*)
Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

salt.modules.rh_ip.**build_network_settings**(***settings*)
Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

salt.modules.rh_ip.**build_routes**(*iface*, ***settings*)
Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

salt.modules.rh_ip.**down**(*iface*, *iface_type*)
Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

salt.modules.rh_ip.**get_bond**(*iface*)
Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

salt.modules.rh_ip.**get_interface**(*iface*)
Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

salt.modules.rh_ip.**get_network_settings**()
Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

salt.modules.rh_ip.**get_routes**(*iface*)
Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

salt.modules.rh_ip.**up**(*iface*, *iface_type*)
Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

19.9.325 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

---

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

---

salt.modules.rh_service.**available**(*name*, *limit=''*)
Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

salt.modules.rh_service.**delete**(*name*, ***kwargs*)
Delete the named service

New in version 2016.3.

CLI Example:

```
salt '*' service.delete <service name>
```

salt.modules.rh_service.**disable**(*name*, ***kwargs*)
Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.rh_service.**disabled**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.rh_service.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.rh_service.**enabled**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.rh_service.**get_all**(*limit=''*)

Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

salt.modules.rh_service.**get_disabled**(*limit=''*)

Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

salt.modules.rh_service.**get_enabled**(*limit=''*)

Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

salt.modules.rh_service.**missing**(*name*, *limit=''*)

The inverse of service.available. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

salt.modules.rh_service.**reload**(*name*)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.rh_service.**restart**(*name*)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.rh_service.**start**(*name*)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.rh_service.**status**(*name*, *sig=None*)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.rh_service.**stop**(*name*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.326 salt.modules.riak

Riak Salt Module

salt.modules.riak.**cluster_commit**()
Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

salt.modules.riak.**cluster_join**(*username*, *hostname*)
Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

salt.modules.riak.**cluster_leave**(*username*, *hostname*)
Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

salt.modules.riak.**cluster_plan**()
Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

salt.modules.riak.**member_status**()
Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

salt.modules.riak.**services**()
List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

salt.modules.riak.**start**()
Start Riak

CLI Example:

```
salt '*' riak.start
```

salt.modules.riak.**status**()
Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

salt.modules.riak.**stop**()
Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

salt.modules.riak.**test**()
Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

19.9.327 salt.modules.rpm

Support for rpm

salt.modules.rpm.**bin_pkg_info**(*path*, *saltenv='base'*)
New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver envrionment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

salt.modules.rpm.**checksum**(**paths*)
Return if the signature of a RPM file is valid.

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

salt.modules.rpm.**diff**(*package*, *path*)
Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters

- **package** -- The name of the package
- **path** -- Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI example:

```
salt '*' lowpkg.diff apache2 /etc/apache2/httpd.conf
```

salt.modules.rpm.**file_dict**(**packages*)
List the files that belong to a package, sorted by group. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

salt.modules.rpm.**file_list**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of _every_ file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

salt.modules.rpm.**info**(**packages*, ***attr*)

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters

- **packages** --
- **attr** -- Comma-separated package attributes. If no `attr' is specified, all available attributes returned.

  Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

Returns

CLI example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
```

salt.modules.rpm.**list_pkgs**(**packages*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm.**modified**(**packages*, ***flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm.**owner**(**paths*)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm.**verify**(**packages*, ***kwargs*)

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

salt.modules.rpm.**version_cmp**(*ver1*, *ver2*, *ignore_epoch=False*)

New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

19.9.328 salt.modules.rpmbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

salt.modules.rpmbuild.**build**(*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html https://raw.
↪githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-libnacl.specX
↪https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

salt.modules.rpmbuild.**make_repo**(*repodir*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repodir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQO+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
  R5OmgHqvydEnO4pWbn8JzQO9YX/Us0SMHBVzLC8eIi5ZIopzalvX
  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vlZcN4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making yum repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in keyid. Passphrase is received from Pillar data which could be passed on the command line with pillar parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with keyid.

runas [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

salt.modules.rpmbuild.**make_src_pkg**(*dest_dir*, *spec*, *sources*, *env=None*, *template=None*, *saltenv='base'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/ https://raw.githubusercontent.com/
↪saltstack/libnacl/master/pkg/rpm/python-libnacl.spec https://pypi.python.org/
↪packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

Changed in version 2017.7.0.

Note: using SHA256 as digest and minimum level dist el6

19.9.329 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into opts will overwrite options passed into pillar.

salt.modules.rsync.**config**(*conf_path='/etc/rsyncd.conf'*)

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

conf_path [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

salt.modules.rsync.**rsync**(*src*, *dst*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *dryrun=False*, *rsh=None*)

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from src to dst

CLI Example:

```
salt '*' rsync.rsync {src} {dst} {delete=True} {update=True} {passwordfile=/etc/
↪pass.crt} {exclude=xx} {rsh}
salt '*' rsync.rsync {src} {dst} {delete=True} {excludefrom=/xx.ini} {rsh}
```

salt.modules.rsync.**version**()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from *cmd.run_all*.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

19.9.330 salt.modules.runit

runit service module (http://smarden.org/runit)

This module is compatible with the *service* states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual *service* module on systems using runit as init.

Service management rules (*sv* command):

service $n is ENABLED if file SERVICE_DIR/$n/run exists service $n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/$n/run exists service $n is DISABLED if AVAILABLE but not ENABLED

SERVICE_DIR/$n is normally a symlink to a AVAIL_SVR_DIR/$n folder

Service auto-start/stop mechanism:

sv (auto)starts/stops service as soon as SERVICE_DIR/<service> is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file SERVICE_DIR/<n>/down exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service *sva* is an alias of service *svc* when *AVAIL_SVR_DIR/sva* symlinks to folder *AVAIL_SVR_DIR/svc*. *svc* can't be enabled if it is already enabled through an alias already enabled, since *sv* files are stored in folder *SERVICE_DIR/svc/*.

XBPS package management uses a service's alias to provides service alternative(s), such as chrony and openntpd both aliased to ntpd.

salt.modules.runit.**add_svc_avail_path**(*path*)

Add a path that may contain available services. Return `True` if added (or already present), `False` on error.
path directory to add to AVAIL_SVR_DIRS

salt.modules.runit.**available**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.
name the service's name
CLI Example:

```
salt '*' runit.available <service name>
```

salt.modules.runit.**disable**(*name*, *stop=False*, ***kwargs*)

Don't start service `name` at boot Returns `True` if operation is successful

name the service's name

stop if True, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

salt.modules.runit.**disabled**(*name*)

Return `True` if the named service is disabled, `False` otherwise

name the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.runit.**enable**(*name*, *start=False*, ***kwargs*)

Start service `name` at boot. Returns `True` if operation is successful

name the service's name

start [False] If `True`, start the service once enabled.

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

salt.modules.runit.**enabled**(*name*)

Return `True` if the named service is enabled, `False` otherwise

name the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.runit.**full_restart**(*name*)

Calls runit.restart()

name the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

salt.modules.runit.**get_all**()

Return a list of all available services

CLI Example:

```
salt '*' runit.get_all
```

salt.modules.runit.**get_disabled**()

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.runit.**get_enabled**()

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.runit.**get_svc_alias**()
Returns the list of service's name that are aliased and their alias path(s)

salt.modules.runit.**get_svc_avail_path**()
Return list of paths that may contain available services

salt.modules.runit.**get_svc_broken_path**(*name='*'*)
Return list of broken path(s) in SERVICE_DIR that match `name`

A path is broken if it is a broken symlink or can not be a runit service
name a glob for service name. default is `*'
CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

salt.modules.runit.**missing**(*name*)
The inverse of runit.available. Returns `True` if the specified service is not available, otherwise returns `False`.
name the service's name
CLI Example:

```
salt '*' runit.missing <service name>
```

salt.modules.runit.**reload**(*name*)
Reload service
name the service's name
CLI Example:

```
salt '*' runit.reload <service name>
```

salt.modules.runit.**remove**(*name*)
Remove the service <name> from system. Returns `True` if operation is successful. The service will be also stopped.
name the service's name
CLI Example:

```
salt '*' service.remove <name>
```

salt.modules.runit.**restart**(*name*)
Restart service
name the service's name
CLI Example:

```
salt '*' runit.restart <service name>
```

salt.modules.runit.**show**(*name*)
Show properties of one or more units/jobs or the manager
name the service's name
CLI Example:
salt `*' service.show <service name>

salt.modules.runit.**start**(*name*)
Start service
name the service's name
CLI Example:

```
salt '*' runit.start <service name>
```

salt.modules.runit.**status**(*name*, *sig=None*)

Return `True` if service is running

name the service's name

sig signature to identify with ps

CLI Example:

```
salt '*' runit.status <service name>
```

salt.modules.runit.**status_autostart**(*name*)

Return `True` if service <name> is autostarted by sv (file $service_folder/down does not exist) NB: return `False` if the service is not enabled.

name the service's name

CLI Example:

```
salt '*' runit.status_autostart <service name>
```

salt.modules.runit.**stop**(*name*)

Stop service

name the service's name

CLI Example:

```
salt '*' runit.stop <service name>
```

19.9.331 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

salt.modules.rvm.**do**(*ruby*, *command*, *runas=None*, *cwd=None*)

Execute a command in an RVM controlled environment.

ruby Which ruby to use

command The rvm command to execute

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

cwd The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

salt.modules.rvm.**gemset_copy**(*source*, *destination*, *runas=None*)

Copy all gems from one gemset to another.

source The name of the gemset to copy, complete with ruby version

destination The destination gemset

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

salt.modules.rvm.**gemset_create**(*ruby*, *gemset*, *runas=None*)

Creates a gemset.

ruby The ruby version for which to create the gemset

gemset The name of the gemset to create

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

salt.modules.rvm.**gemset_delete**(*ruby*, *gemset*, *runas=None*)

Delete a gemset

ruby The ruby version to which the gemset belongs

gemset The gemset to delete

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

salt.modules.rvm.**gemset_empty**(*ruby*, *gemset*, *runas=None*)

Remove all gems from a gemset.

ruby The ruby version to which the gemset belongs

gemset The gemset to empty

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

salt.modules.rvm.**gemset_list**(*ruby='default'*, *runas=None*)

List all gemsets for the given ruby.

ruby [default] The ruby version for which to list the gemsets

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

salt.modules.rvm.**gemset_list_all**(*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

salt.modules.rvm.**get**(*version='stable'*, *runas=None*)

Update RVM

version [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

salt.modules.rvm.**install**(*runas=None*)

Install RVM system-wide

runas The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

salt.modules.rvm.**install_ruby**(*ruby*, *runas=None*)

Install a ruby implementation.

ruby The version of ruby to install

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

salt.modules.rvm.**is_installed**(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

salt.modules.rvm.**list**(*runas=None*)

List all rvm-installed rubies

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

salt.modules.rvm.**reinstall_ruby**(*ruby*, *runas=None*)

Reinstall a ruby implementation

ruby The version of ruby to reinstall

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

salt.modules.rvm.**rubygems**(*ruby*, *version*, *runas=None*)

Installs a specific rubygems version in the given ruby

ruby The ruby for which to install rubygems

version The version of rubygems to install, or `remove' to use the version that ships with 1.9

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

salt.modules.rvm.**set_default**(*ruby*, *runas=None*)

Set the default ruby

ruby The version of ruby to make the default

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

salt.modules.rvm.**wrapper**(*ruby_string*, *wrapper_prefix*, *runas=None*, **binaries*)

Install RVM wrapper scripts

ruby_string Ruby/gemset to install wrappers for

wrapper_prefix What to prepend to the name of the generated wrapper binaries

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

binaries [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

19.9.332 salt.modules.s3

Connection module for Amazon S3

configuration This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-
↪ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

(Note: this is literally the pillar key `s3.keyid' or the config option `s3.keyid', not ``s3:n keyid: blah".)

A service_url may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A role_arn may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a service_url is not specified, the default is s3.amazonaws.com. This may appear in various documentation as an ``endpoint". A comprehensive list for Amazon S3 may be found at:

```
http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region
```

The service_url will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

    s3.path_style: True

This can be useful if you need to use salt with a proxy for an s3 compatible storage

You can use either https protocol or http protocol:

    s3.https_enable: True

SSL verification may also be turned off in the configuration:

    s3.verify_ssl: False

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

s3.location: eu-central-1

Default is us-east-1.

This module should be usable to query other S3-like services, such as Eucalyptus.

depends requests

salt.modules.s3.**delete**(*bucket*, *path=None*, *action=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

salt.modules.s3.**get**(*bucket=''*, *path=''*, *return_bin=False*, *action=None*, *local_file=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

List the contents of a bucket, or return an object from a bucket. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
```

```
versioning
website
```

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

salt.modules.s3.**head**(*bucket*, *path=''*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

salt.modules.s3.**put**(*bucket*, *path=None*, *return_bin=False*, *action=None*, *local_file=None*, *key=None*, *keyid=None*, *service_url=None*, *verify_ssl=None*, *kms_keyid=None*, *location=None*, *role_arn=None*, *path_style=None*, *https_enable=None*)

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

19.9.333 salt.modules.s6 module

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the `provider` argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the `enabled` argument is not available with this provider.

codeauthor Marek Skrobacki <skrobul@skrobul.com>

salt.modules.s6.**available**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' s6.available foo
```

salt.modules.s6.**full_restart**(*name*)

Calls s6.restart() function

CLI Example:

```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.**get_all**()
Return a list of all available services

CLI Example:

```
salt '*' s6.get_all
```

salt.modules.s6.**missing**(*name*)
The inverse of s6.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' s6.missing foo
```

salt.modules.s6.**reload**(*name*)
Send a HUP to service via s6

CLI Example:

```
salt '*' s6.reload <service name>
```

salt.modules.s6.**restart**(*name*)
Restart service via s6. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

salt.modules.s6.**start**(*name*)
Starts service via s6

CLI Example:

```
salt '*' s6.start <service name>
```

salt.modules.s6.**status**(*name*, *sig=None*)
Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

salt.modules.s6.**stop**(*name*)
Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

salt.modules.s6.**term**(*name*)
Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

19.9.334 salt.modules.salt_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

salt.modules.salt_proxy.**configure_proxy**(*proxyname*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **proxyname** -- Name to be used for this proxy (should match entries in pillar)
- **start** -- Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

salt.modules.salt_proxy.**is_running**(*proxyname*)

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters **proxyname** -- String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

19.9.335 salt.modules.saltcloudmod

Control a salt cloud system

salt.modules.saltcloudmod.**create**(*name*, *profile*)

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

19.9.336 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

salt.modules.saltutil.**clear_cache**()

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

salt.modules.saltutil.**cmd**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *ssh=False*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

salt.modules.saltutil.**cmd_iter**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *kwarg=None*, *ssh=False*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

salt.modules.saltutil.**find_cached_job**(*jid*)

Return the data for a specific cached job id. Note this only works if cache_jobs has previously been set to True on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

salt.modules.saltutil.**find_job**(*jid*)

Return the data for a specific job id that is currently running.

jid The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the find_job function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    ----------
    arg:
        - 30
    fun:
        test.sleep
    jid:
        20160503150049487736
    pid:
        9601
    ret:
    tgt:
        my-minion
    tgt_type:
        glob
    user:
        root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
    ----------
```

salt.modules.saltutil.**is_running**(*fun*)

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

salt.modules.saltutil.**kill_all_jobs**()

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

salt.modules.saltutil.**kill_job**(*jid*)

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

salt.modules.saltutil.**list_extmods**()

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

salt.modules.saltutil.**mmodule**(*saltenv*, *fun*, **args*, ***kwargs*)

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

salt.modules.saltutil.**refresh_beacons**()

Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

salt.modules.saltutil.**refresh_grains**(***kwargs*)

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

Note: The available execution modules will be reloaded as part of this proceess, as grains can affect which modules are available.

refresh_pillar [True] Set to `False` to keep pillar data from being refreshed.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

salt.modules.saltutil.**refresh_modules**(*async=True*)

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the `async' flag to False.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

salt.modules.saltutil.**refresh_pillar**()

Signal the minion to refresh the pillar data.

CLI Example:

```
salt '*' saltutil.refresh_pillar
```

salt.modules.saltutil.**regen_keys**()

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

salt.modules.saltutil.**revoke_auth**(*preserve_minion_cache=False*)

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the `preserve_minion_cache' flag is set to True, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

salt.modules.saltutil.**runner**(*name*, *arg=None*, *kwarg=None*, *full_return=False*, *saltenv='base'*, *jid=None*, ***kwargs*)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{'foo': 'bar'}"
```

salt.modules.saltutil.**running**()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

salt.modules.saltutil.**signal_job**(*jid*, *sig*)

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

salt.modules.saltutil.**sync_all**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when `refresh` is set to `True`.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See *here* for a more detailed explanation of why this is necessary.

---

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

salt.modules.saltutil.**sync_beacons**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

salt.modules.saltutil.**sync_clouds**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync utility modules from `salt://_cloud` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

salt.modules.saltutil.**sync_engines**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev
```

salt.modules.saltutil.**sync_grains**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev
```

salt.modules.saltutil.**sync_log_handlers**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev
```

salt.modules.saltutil.**sync_modules**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to `False` to prevent this refresh.

Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See *here* for a more detailed explanation of why this is necessary.

---

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

salt.modules.saltutil.**sync_output**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync outputters from `salt://_output` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.**sync_outputters**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.**sync_pillar**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

refresh [True] Also refresh the execution modules available to the minion, and refresh pillar data.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

---

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

---

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

salt.modules.saltutil.**sync_proxymodules**(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_renderers`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to `False` to prevent this refresh. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev
```

`salt.modules.saltutil.`**`sync_returners`**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync beacons from `salt://_returners` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev
```

salt.modules.saltutil.**sync_sdb**(*saltenv=None*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [False] This argument has no affect and is included for consistency with the other sync functions.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev
```

salt.modules.saltutil.**sync_states**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for state modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev
```

salt.modules.saltutil.**sync_utils**(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev
```

salt.modules.saltutil.**term_all_jobs**()
Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```
salt '*' saltutil.term_all_jobs
```

salt.modules.saltutil.**term_job**(*jid*)
Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```
salt '*' saltutil.term_job <job id>
```

salt.modules.saltutil.**update**(*version=None*)
Update the salt minion from the URL defined in opts['update_url'] SaltStack, Inc provides the latest builds here: update_url: https://repo.saltstack.com/windows/

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the update_url can be downloaded and installed.

This feature requires the minion to be running a bdist_esky build.

The version number is optional and will default to the most recent version available at opts['update_url'].

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

salt.modules.saltutil.**wheel**(*name*, **args*, ***kwargs*)
Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

name The name of the function to run

args Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version v2015.8.11.

kwargs Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, ``empty'' returns are expected. The remote minion does not have access to wheel functions and their return data.

19.9.337 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

salt.modules.schedule.**add**(*name*, ***kwargs*)
Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log']
↪" seconds=60
```

salt.modules.schedule.**build_schedule_item**(*name*, ***kwargs*)
Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

salt.modules.schedule.**copy**(*name*, *target*, ***kwargs*)
Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

salt.modules.schedule.**delete**(*name*, ***kwargs*)
Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

salt.modules.schedule.**disable**(***kwargs*)
Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

salt.modules.schedule.**disable_job**(*name*, ***kwargs*)
Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

salt.modules.schedule.**enable**(***kwargs*)
Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

salt.modules.schedule.**enable_job**(*name*, ***kwargs*)
Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

salt.modules.schedule.**is_enabled**(*name*)
List a Job only if its enabled

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
```

salt.modules.schedule.**list**(*show_all=False*, *show_disabled=True*, *where=None*, *return_yaml=True*)
List the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False
```

salt.modules.schedule.**modify**(*name*, ***kwargs*)
Modify an existing job in the schedule

CLI Example:

```
salt '*' schedule.modify job1 function='test.ping' seconds=3600
```

salt.modules.schedule.**move**(*name*, *target*, ***kwargs*)
Move scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.move jobname target
```

salt.modules.schedule.**purge**(***kwargs*)
Purge all the jobs currently scheduled on the minion

CLI Example:

```
salt '*' schedule.purge
```

salt.modules.schedule.**reload**()
Reload saved scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.reload
```

salt.modules.schedule.**run_job**(*name*, *force=False*)
Run a scheduled job on the minion immediately

CLI Example:

```
salt '*' schedule.run_job job1

salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.
```

salt.modules.schedule.**save**(***kwargs*)
Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

19.9.338 salt.modules.scsi

SCSI administration module

salt.modules.scsi.**ls**(*get_size=True*)
List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

get_size [True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the `-s' option in lsscsi.

New in version 2015.5.10.

salt.modules.scsi.**rescan_all**(*host*)
List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

19.9.339 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

salt.modules.sdb.**delete**(*uri*)
Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

salt.modules.sdb.**get**(*uri*)
Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

salt.modules.sdb.**get_or_set_hash**(*uri*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'*)
Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt['sdb.get_or_set_hash']('some_mysql_user_pass') }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.sdb.`**`set`**(*uri*, *value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

19.9.340 salt.modules.seed

Virtual machine image management tools

`salt.modules.seed.`**`apply`**(*path*, *id_=None*, *config=None*, *approve_key=True*, *install=True*, *prep_install=False*, *pub_key=None*, *priv_key=None*, *mount_point=None*)

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
        [gen_key=(true|false)] [approve_key=(true|false)] \
        [install=(true|false)]
```

path Full path to the directory, device, or disk image on the target minion's file system.
id Minion id with which to seed the path.
config Minion configuration options. By default, the `master' option is set to the target host's `master'.
approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.
install Install salt-minion, if absent. Default: true.
prep_install Prepare the bootstrap script, but don't run it. Default: false

`salt.modules.seed.`**`mkconfig`**(*config=None*, *tmp=None*, *id_=None*, *approve_key=True*, *pub_key=None*, *priv_key=None*)

Generate keys and config and put them in a tmp directory.
pub_key absolute path or file content of an optional preseeded salt key
priv_key absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
        [id_=minion_id] [approve_key=(true|false)]
```

salt.modules.seed.**prep_bootstrap**(*mpt*)

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

19.9.341 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

---

salt.modules.selinux.**fcontext_add_or_delete_policy**(*action*, *name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2017.7.0.

Sets or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to semanage.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with semanage automatically overwrites a previously configured SELinux context.

name filespec of the file or directory. Regex syntax is allowed.

file_type The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to `a' (all files).

sel_type SELinux context type. There are many.

sel_user SELinux user. Use `semanage login -l` to determine which ones are available to you.

sel_level The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```

salt.modules.selinux.**fcontext_apply_policy**(*name*, *recursive=False*)

New in version 2017.7.0.

Applies SElinux policies to filespec using *restorecon [-R] filespec*. Returns dict with changes if successful, the output of the restorecon command otherwise.

name filespec of the file or directory. Regex syntax is allowed.

recursive Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

salt.modules.selinux.**fcontext_get_policy**(*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

For a more in-depth explanation of the selinux context, go to https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html

name filespec of the file or directory. Regex syntax is allowed.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to `a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

salt.modules.selinux.**fcontext_policy_is_applied**(*name*, *recursive=False*)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

name filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

salt.modules.selinux.**filetype_id_to_string**(*filetype='a'*)

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in *semanage fcontext -l*).

salt.modules.selinux.**getconfig**()

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

salt.modules.selinux.**getenforce**()

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

salt.modules.selinux.**getsebool**(*boolean*)

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

salt.modules.selinux.**getsemod**(*module*)

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

salt.modules.selinux.**install_semod**(*module_path*)
Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

salt.modules.selinux.**list_sebool**()
Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

salt.modules.selinux.**list_semod**()
Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

salt.modules.selinux.**remove_semod**(*module*)
Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

salt.modules.selinux.**selinux_fs_path**(**args*, ***kwargs*)
Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

salt.modules.selinux.**setenforce**(*mode*)
Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

salt.modules.selinux.**setsebool**(*boolean*, *value*, *persist=False*)
Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

salt.modules.selinux.**setsebools**(*pairs*, *persist=False*)
Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

salt.modules.selinux.**setsemod**(*module*, *state*)
Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

19.9.342 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

maintainer Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

maturity new

depends sense_hat Python module

You can specify the rotation of the Pi in a pillar. This is useful if it is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
    rotation: 90
```

salt.modules.sensehat.**clear**(*color=None*)
Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberry' sensehat.clear
salt 'raspberry' sensehat.clear '[255, 0, 0]'
```

salt.modules.sensehat.**get_humidity**()
Get the percentage of relative humidity from the humidity sensor.

salt.modules.sensehat.**get_pixel**(*x*, *y*)
Returns the color of a single pixel on the LED matrix.
x The x coodrinate of th pixel. Ranges from 0 on the left to 7 on the right.
y The y coodrinate of th pixel. Ranges from 0 at the top to 7 at the bottom.

Note: Please read the note for *get_pixels*

salt.modules.sensehat.**get_pixels**()
Returns a list of 64 smaller lists of *[R, G, B]* pixels representing the the currently displayed image on the LED matrix.

Note: When using *set_pixels* the pixel values can sometimes change when you read them again using *get_pixels*. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The *get_pixels* method provides an accurate representation of how the pixels end up in frame buffer memory after you have called *set_pixels*.

salt.modules.sensehat.**get_pressure**()
Gets the current pressure in Millibars from the pressure sensor.

salt.modules.sensehat.**get_temperature**()
Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling *get_temperature_from_humidity*.

If you get strange results try using `get_temperature_from_pressure'.

salt.modules.sensehat.**get_temperature_from_humidity**()
Gets the temperature in degrees Celsius from the humidity sensor.

salt.modules.sensehat.**get_temperature_from_pressure**()
Gets the temperature in degrees Celsius from the pressure sensor.

salt.modules.sensehat.**low_light**(*low_light=True*)
Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```
salt 'raspberry' sensehat.low_light
salt 'raspberry' sensehat.low_light False
```

salt.modules.sensehat.**set_pixel**(*x*, *y*, *color*)
Sets the a single pixel on the LED matrix to a specified color.
x The x coodrinate of th pixel. Ranges from 0 on the left to 7 on the right.
y The y coodrinate of th pixel. Ranges from 0 at the top to 7 at the bottom.
color The new color of the pixel as a list of *[R, G, B]* values.
CLI Example:

```
salt 'raspberry' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

salt.modules.sensehat.**set_pixels**(*pixels*)
Sets the entire LED matrix based on a list of 64 pixel values
pixels A list of 64 color values [R, G, B].

salt.modules.sensehat.**show_image**(*image*)
Displays a 8 x 8 image on the LED matrix.
image The path to the image to display. The image must be 8 x 8 pixels in size.
CLI Example:

```
salt 'raspberry' sensehat.show_image /tmp/my_image.png
```

salt.modules.sensehat.**show_letter**(*letter*, *text_color=None*, *back_color=None*)
Displays a single letter on the LED matrix.
letter The letter to display
text_color The color in which the letter is shown. Defaults to `[255, 255, 255]' (white).
back_color The background color of the display. Defaults to `[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberry' sensehat.show_letter O
salt 'raspberry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

salt.modules.sensehat.**show_message**(*message*, *msg_type=None*, *text_color=None*, *back_color=None*, *scroll_speed=None*)

Displays a message on the LED matrix.

message The message to display

msg_type The type of the message. Changes the appearance of the message.

Available types are:

```
error:      red text
warning:    orange text
success:    green text
info:       blue text
```

scroll_speed The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to `0.1'.

text_color The color in which the message is shown. Defaults to `[255, 255, 255]' (white).

back_color The background color of the display. Defaults to `[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberry' sensehat.show_message 'Status ok'
salt 'raspberry' sensehat.show_message 'Something went wrong' error
salt 'raspberry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255,
 ↪255, 0]' 0.2
```

19.9.343 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

salt.modules.sensors.**sense**(*chip*, *fahrenheit=False*)

Gather lm-sensors data from a given chip

To determine the chip to query, use the `sensors' command and see the leading line in the block.

Example:

/usr/bin/sensors

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0℃ (high = +87.0℃, crit = +105.0℃) Core 0: +52.0℃ (high = +87.0℃, crit = +105.0℃) Core 1: +50.0℃ (high = +87.0℃, crit = +105.0℃) Core 2: +56.0℃ (high = +87.0℃, crit = +105.0℃) Core 3: +53.0℃ (high = +87.0℃, crit = +105.0℃)

Given the above, the chip is `coretemp-isa-0000'.

19.9.344 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

salt.modules.serverdensity_device.**create**(*name*, ***params*)
Function to create device in Server Density. For more info, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.**delete**(*device_id*)
Delete a device from Server Density. For more information, see the API docs.

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

salt.modules.serverdensity_device.**get_sd_auth**(*val*, *sd_auth_pillar_name='serverdensity'*)
Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

salt.modules.serverdensity_device.**install_agent**(*agent_key*, *agent_version=1*)
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498 2
```

salt.modules.serverdensity_device.**ls**(***params*)
List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the API docs on listing and searching.

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

salt.modules.serverdensity_device.**update**(*device_id*, ***params*)
Updates device information in Server Density. For more information see the API docs.

CLI Example:

```
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
 ↪group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama
 ↪group=rock_lamas swapSpace=512
```

19.9.345 salt.modules.servicenow module

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

depends servicenow_rest python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `servicenow' key by default, if defined.

For example:

```
servicenow:
  instance_name: ''
  username: ''
  password: ''
```

salt.modules.servicenow.**delete_record**(*table*, *sys_id*)

Delete an existing record

Parameters

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record

CLI Example:

```
salt myminion servicenow.delete_record sys_computer 2134566
```

salt.modules.servicenow.**non_structured_query**(*table*, *query=None*, ***kwargs*)

Run a non-structed (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

Parameters

- **table** (str) -- The table name, e.g. sys_user
- **query** (str) -- The query to run (or use keyword arguments to filter data)

CLI Example:

```
salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer
```

salt.modules.servicenow.**set_change_request_state**(*change_id*, *state='approved'*)

Set the approval state of a change request/record

Parameters

- **change_id** (str) -- The ID of the change request, e.g. CHG123545
- **state** (str) -- The target state, e.g. approved

CLI Example:

```
salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved
```

salt.modules.servicenow.**update_record_field**(*table*, *sys_id*, *field*, *value*)

Update the value of a record's field in a servicenow table

Parameters

- **table** (str) -- The table name, e.g. sys_user
- **sys_id** (str) -- The unique ID of the record
- **field** (str) -- The new value
- **value** (str) -- The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

19.9.346 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**call_hook**(*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon_emoji=None*)

Send message to Slack incoming webhook.

Parameters

- **message** -- The topic of message.
- **attachment** -- The message to send to the Slacke WebHook.
- **color** -- The color of border of left side
- **short** -- An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** -- The identifier of WebHook.
- **channel** -- The channel to use instead of the WebHook default.
- **username** -- Username to use instead of WebHook default.
- **icon_emoji** -- Icon to use instead of WebHook default.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_hook message='Hello, from SaltStack'
```

salt.modules.slack_notify.**find_room**(*name*, *api_key=None*)

Find a room by name and return it.

Parameters

- **name** -- The room name.
- **api_key** -- The Slack admin api key.

Returns The room object.

CLI Example:

```
salt '*' slack.find_room name="random"

salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**find_user**(*name*, *api_key=None*)

Find a user by name and return it.

Parameters

- **name** -- The user name.
- **api_key** -- The Slack admin api key.

Returns The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"

salt '*' slack.find_user name="ThomasHatch" api_
 ↪key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**list_rooms**(*api_key=None*)

List all Slack rooms.

Parameters **api_key** -- The Slack admin api key.

Returns The room list.

CLI Example:

```
salt '*' slack.list_rooms

salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**list_users**(*api_key=None*)

List all Slack users.

Parameters **api_key** -- The Slack admin api key.

Returns The user list.

CLI Example:

```
salt '*' slack.list_users

salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

salt.modules.slack_notify.**post_message**(*channel*, *message*, *from_name*, *api_key=None*, *icon=None*)

Send a message to a Slack channel.

Parameters

- **channel** -- The channel name, either will work.
- **message** -- The message to send to the Slack channel.
- **from_name** -- Specify who the message is from.
- **api_key** -- The Slack api key, if not specified in the configuration.
- **icon** -- URL to an image to use as the icon for this message

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is done"
↪from_name="Build Server"
```

19.9.347 salt.modules.slsutil

Utility functions for use with or in SLS files

salt.modules.slsutil.**merge**(*obj_a*, *obj_b*, *strategy='smart'*, *renderer='yaml'*, *merge_lists=False*)

Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

salt.modules.slsutil.**renderer**(*path=None*, *string=None*, *default_renderer='jinja|yaml'*, ***kwargs*)

Parse a string or file through Salt's renderer system

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's ``renderer pipes'' system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** -- The path to a file on the filesystem.
- **string** -- An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the `py' renderer requires a file, for example.
- **default_renderer** -- The renderer pipe to send the file through; this is overridden by a ``she-bang'' at the top of the file.
- **kwargs** -- Keyword args to pass to Salt's compile_template() function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing ``map files'', as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default `jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal `jinja|yaml' and the other is using `py':

```
#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}, merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!py
def run():
    apache = __salt__.grains.filter_by({
        ...normal map here but as a python dict...
    }, merge=__salt__.pillar.get('apache:lookup'))
    return apache
```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'
```

`salt.modules.slsutil.`**`update`**(*dest*, *upd*, *recursive_update=True*, *merge_lists=False*)

Merge `upd` recursively into `dest`

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

19.9.348 salt.modules.smartos_imgadm

Module for running imgadm command on SmartOS

salt.modules.smartos_imgadm.**avail**(*search=None*, *verbose=False*)

Return a list of available images

search [string] search keyword

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True
```

salt.modules.smartos_imgadm.**delete**(*uuid*)

Remove an installed image

uuid [string] Specifies uuid to import

CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.**get**(*uuid*)

Return info on an installed image

uuid [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.**import**(*uuid*, *verbose=False*)

Import an image from the repository

uuid [string] uuid to import

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.**list**(*verbose=False*)

Return a list of installed images

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.list [verbose=True]
```

salt.modules.smartos_imgadm.**show**(*uuid*)

Show manifest of a given image

uuid [string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.**update**(*uuid=''*)

Gather info on unknown image(s) (locally installed)

uuid [string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

salt.modules.smartos_imgadm.**vacuum**(*verbose=False*)
Remove unused images
verbose [boolean (False)] toggle verbose output
CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

salt.modules.smartos_imgadm.**version**()
Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```

19.9.349 salt.modules.smartos_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

..versionadded:: 2016.11.0

salt.modules.smartos_nictagadm.**add**(*name*, *mac*, *mtu=1500*)
Add a new nictag
name [string] name of new nictag
mac [string] mac of parent interface or `etherstub' to create a ether stub
mtu [int] MTU
CLI Example:

```
salt '*' nictagadm.add storage etherstub
salt '*' nictagadm.add trunk 'DE:AD:OO:OO:BE:EF' 9000
```

salt.modules.smartos_nictagadm.**delete**(*name*, *force=False*)
Delete nictag
name [string] nictag to delete
force [boolean] force delete even if vms attached
CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.**exists**(**nictag*, ***kwargs*)
Check if nictags exists
nictag [string] one or more nictags to check
verbose [boolean] return list of nictags
CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.**list**(*include_etherstubs=True*)
List all nictags
include_etherstubs [boolean] toggle include of etherstubs
CLI Example:

```
salt '*' nictagadm.list
```

salt.modules.smartos_nictagadm.**update**(*name*, *mac=None*, *mtu=None*)
Update a nictag

name [string] name of nictag
mac [string] optional new mac for nictag
mtu [int] optional new MTU for nictag
CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.**vms**(*nictag*)
List all vms connect to nictag
nictag [string] name of nictag
CLI Example:

```
salt '*' nictagadm.vms admin
```

19.9.350 salt.modules.smartos_virt

virst compatibility module for managing VMs on SmartOS

salt.modules.smartos_virt.**get_macs**(*domain*)
Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.smartos_virt.**init**(***kwargs*)
Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

salt.modules.smartos_virt.**list_active_vms**()
Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.smartos_virt.**list_domains**()
Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.smartos_virt.**list_inactive_vms**()
Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.smartos_virt.**reboot**(*domain*)
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

salt.modules.smartos_virt.**setmem**(*domain*, *memory*)
Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

salt.modules.smartos_virt.**shutdown**(*domain*)
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

salt.modules.smartos_virt.**start**(*domain*)
Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

salt.modules.smartos_virt.**stop**(*domain*)
Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

salt.modules.smartos_virt.**vm_info**(*domain*)
Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

salt.modules.smartos_virt.**vm_virt_type**(*domain*)
Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

19.9.351 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

salt.modules.smartos_vmadm.**create**(*from_file=None*, ***kwargs*)
Create a new vm
from_file [string] json file to create the vm from -- if present, all other options will be ignored
kwargs [string|int|...] options to set for the vm
CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{ "nic_tag": "admin",
 ↪"ip": "198.51.100.123", ...}, {...}]' [...]
```

salt.modules.smartos_vmadm.**create_snapshot**(*vm*, *name*, *key='uuid'*)

Create snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.**delete**(*vm*, *key='uuid'*)

Delete a vm

vm [string] vm to be deleted

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

salt.modules.smartos_vmadm.**delete_snapshot**(*vm*, *name*, *key='uuid'*)

Delete snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.**get**(*vm*, *key='uuid'*)

Output the JSON object describing a VM

vm [string] vm to be targeted

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

salt.modules.smartos_vmadm.**info**(*vm*, *info_type='all'*, *key='uuid'*)

Lookup info on running kvm

vm [string] vm to be targeted

info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

salt.modules.smartos_vmadm.**list**(*search=None*, *sort=None*, *order='uuid, type, ram, state, alias'*, *keyed=True*)

Return a list of VMs
search [string] vmadm filter property
sort [string] vmadm sort (-s) property
order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
keyed [boolean]
specified if the output should be an array (False) or dict (True) For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.
CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

salt.modules.smartos_vmadm.**lookup**(*search=None*, *order=None*, *one=False*)

Return a list of VMs using lookup
search [string] vmadm filter property
order [string] vmadm order (-o) property -- Default: uuid,type,ram,state,alias
one [boolean] return only one result (vmadm's -1)
CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

salt.modules.smartos_vmadm.**reboot**(*vm*, *force=False*, *key='uuid'*)

Reboot a vm
vm [string] vm to be rebooted
force [boolean] force reboot of vm if true
key [string [uuid|alias|hostname]] value type of `vm' parameter
CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.**receive**(*uuid*, *source*)

Receive a vm from a directory
uuid [string] uuid of vm to be received
source [string] source directory
CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

salt.modules.smartos_vmadm.**reprovision**(*vm*, *image*, *key='uuid'*)

Reprovision a vm
vm [string] vm to be reprovisioned
image [string] uuid of new image
key [string [uuid|alias|hostname]] value type of `vm' parameter
CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-
↪11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

salt.modules.smartos_vmadm.**rollback_snapshot**(*vm*, *name*, *key='uuid'*)

Rollback snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

salt.modules.smartos_vmadm.**send**(*vm*, *target*, *key='uuid'*)

Send a vm to a directory

vm [string] vm to be sent

target [string] target directory

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.**start**(*vm*, *options=None*, *key='uuid'*)

Start a vm

vm [string] vm to be started

options [string] optional additional options

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=/
↪path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.**stop**(*vm*, *force=False*, *key='uuid'*)

Stop a vm

vm [string] vm to be stopped

force [boolean] force stop of vm if true

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.**sysrq**(*vm*, *action='nmi'*, *key='uuid'*)

Send non-maskable interrupt to vm or capture a screenshot

vm [string] vm to be targeted

action [string] nmi or screenshot -- Default: nmi

key [string [uuid|alias|hostname]] value type of `vm' parameter

CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
```

```
salt '*' vmadm.sysrq nacl nmi key=alias
```

salt.modules.smartos_vmadm.**update**(*vm*, *from_file=None*, *key='uuid'*, ***kwargs*)

Update a new vm

vm [string] vm to be updated

from_file [string] json file to update the vm with -- if present, all other options will be ignored

key [string [uuid|alias|hostname]] value type of `vm' parameter

kwargs [string|int|...] options to update for the vm

CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_
↪vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_
↪memory=1024
```

19.9.352 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)
System Management BIOS
DMIdecode

salt.modules.smbios.**get**(*string*, *clean=True*)

Get an individual DMI string from SMBIOS info

string

The string to fetch. DMIdecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family

- processor-manufacturer
- processor-version
- processor-frequency

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

salt.modules.smbios.**records**(*rec_type=None*, *fields=None*, *clean=True*)

Return DMI records from SMBIOS

type Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device

Continued on next page

Table 19.10 -- continued from previous page

Type	Information
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

clean

Don't return well-known false information
(invalid UUID's, serial 000000000's, etcetera)
Defaults to `True`

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

19.9.353 salt.modules.smf

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

`salt.modules.smf.`**`available`**(*name*)

Returns `True` if the specified service is available, otherwise returns `False`.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

`salt.modules.smf.`**`disable`**(*name*, ***kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.smf.`**`disabled`**(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.smf.`**`enable`**(*name*, ***kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.smf.**enabled**(*name*, ***kwargs*)
Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.smf.**get_all**()
Return all installed services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.smf.**get_disabled**()
Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.smf.**get_enabled**()
Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.smf.**get_running**()
Return the running services

CLI Example:

```
salt '*' service.get_running
```

salt.modules.smf.**get_stopped**()
Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

salt.modules.smf.**missing**(*name*)
The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing net-snmp
```

salt.modules.smf.**reload**(*name*)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.smf.**restart**(*name*)

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.smf.**start**(*name*)

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.smf.**status**(*name*, *sig=None*)

Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.smf.**stop**(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.354 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

depends

- smtplib python module

configuration This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
```

```
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass

another-smtp-login:
    smtp.server: smtp.domain.com
    smtp.tls: True
    smtp.sender: admin@domain.com
    smtp.username: myuser
    smtp.password: verybadpass
```

salt.modules.smtp.**send_msg**(*recipient*, *message*, *subject='Message from Salt'*, *sender=None*, *server=None*, *use_ssl='True'*, *username=None*, *password=None*, *profile=None*)

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```
smtp.send_msg 'admin@example.com' 'This is a salt module test'             profile=
↪'my-smtp-account'
smtp.send_msg 'admin@example.com' 'This is a salt module test'             
↪username='myuser' password='verybadpass' sender="admin@example.com'           
↪server='smtp.domain.com'
```

19.9.355 salt.modules.solaris_fmadm

Module for running fmadm and fmdump on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform solaris,illumos

New in version 2016.3.0.

salt.modules.solaris_fmadm.**acquit**(*fmri*)

Acquit resource or acquit case
fmri: **string** fmri or uuid
CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

salt.modules.solaris_fmadm.**config**()

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

salt.modules.solaris_fmadm.**faulty**()

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

salt.modules.solaris_fmadm.**flush**(*fmri*)

Flush cached state for resource

fmri: **string** fmri
CLI Example:

```
salt '*' fmadm.flush fmri
```

salt.modules.solaris_fmadm.**healthy**()
Return whether fmadm is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

salt.modules.solaris_fmadm.**list**(*after=None*, *before=None*)
Display fault management logs
after [string] filter events after time, see man fmdump for format
before [string] filter events before time, see man fmdump for format
CLI Example:

```
salt '*' fmadm.list
```

salt.modules.solaris_fmadm.**load**(*path*)
Load specified fault manager module
path: **string** path of fault manager module
CLI Example:

```
salt '*' fmadm.load /module/path
```

salt.modules.solaris_fmadm.**repaired**(*fmri*)
Notify fault manager that resource has been repaired
fmri: **string** fmri
CLI Example:

```
salt '*' fmadm.repaired fmri
```

salt.modules.solaris_fmadm.**replaced**(*fmri*)
Notify fault manager that resource has been replaced
fmri: **string** fmri
CLI Example:

```
salt '*' fmadm.repaired fmri
```

salt.modules.solaris_fmadm.**reset**(*module*, *serd=None*)
Reset module or sub-component
module: **string** module to unload
serd [string] serd sub module
CLI Example:

```
salt '*' fmadm.reset software-response
