```

salt.modules.solaris_fmadm.**show**(*uuid*)
Display log details
uuid: **string** uuid of fault
CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

salt.modules.solaris_fmadm.**unload**(*module*)
Unload specified fault manager module
module: **string** module to unload
CLI Example:

```
salt '*' fmadm.unload software-response
```

19.9.356 salt.modules.solaris_group

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *`group.info' is not available*), see *here*.

salt.modules.solaris_group.**add**(*name*, *gid=None*, ***kwargs*)
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

salt.modules.solaris_group.**chgid**(*name*, *gid*)
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

salt.modules.solaris_group.**delete**(*name*)
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.solaris_group.**getent**(*refresh=False*)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

salt.modules.solaris_group.**info**(*name*)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

19.9.357 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *`shadow.info' is not available*), see *here*.

salt.modules.solaris_shadow.**default_hash**()
Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

salt.modules.solaris_shadow.**del_password**(*name*)
New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

salt.modules.solaris_shadow.**gen_password**(*password*, *crypt_salt=None*, *algorithm='sha512'*)
New in version 2015.8.8.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password Plaintext password to be hashed.
crypt_salt Crpytographic salt. If not given, a random 8-character salt will be generated.
algorithm The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
 ↪algorithm=sha256
```

salt.modules.solaris_shadow.**info**(*name*)
Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.solaris_shadow.**set_maxdays**(*name*, *maxdays*)
Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

salt.modules.solaris_shadow.**set_mindays**(*name*, *mindays*)
Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

salt.modules.solaris_shadow.**set_password**(*name*, *password*)
Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

salt.modules.solaris_shadow.**set_warndays**(*name*, *warndays*)
Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

19.9.358 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module is assumes we are using solaris-like shutdown

New in version 2016.3.0.

salt.modules.solaris_system.**halt**()
Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.solaris_system.**init**(*state*)
Change the system runlevel on sysV compatible systems

CLI Example:
state [string] Init state

```
salt '*' system.init 3
```

salt.modules.solaris_system.**poweroff**()
Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

salt.modules.solaris_system.**reboot**(*delay=0*, *message=None*)
Reboot the system
delay [int] Optional wait time in seconds before the system will be rebooted.
message [string] Optional message to broadcast before rebooting.
CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

salt.modules.solaris_system.**shutdown**(*delay=0*, *message=None*)

Shutdown a running system

delay [int] Optional wait time in seconds before the system will be shutdown.

message [string] Optional message to broadcast before rebooting.

CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

19.9.359 salt.modules.solaris_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *`user.info' is not available*), see *here*.

---

salt.modules.solaris_user.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.solaris_user.**chfullname**(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.solaris_user.**chgid**(*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.solaris_user.**chgroups**(*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append [False] Set to `True` to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.solaris_user.**chhome**(*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name Username to modify

home New home directory to set

persist [False] Set to `True` to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.solaris_user.**chhomephone**(*name*, *homephone*)
Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.solaris_user.**chroomnumber**(*name*, *roomnumber*)
Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.solaris_user.**chshell**(*name*, *shell*)
Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.solaris_user.**chuid**(*name*, *uid*)
Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.solaris_user.**chworkphone**(*name*, *workphone*)
Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

salt.modules.solaris_user.**delete**(*name*, *remove=False*, *force=False*)
Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.solaris_user.**getent**(*refresh=False*)
Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.solaris_user.**info**(*name*)
Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.solaris_user.**list_groups**(*name*)
Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.solaris_user.**list_users**()
Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.solaris_user.**rename**(*name*, *new_name*)
Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

19.9.360 salt.modules.solarisips

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

salt.modules.solarisips.**available_version**(*name*, ***kwargs*)
This function is an alias of latest_version.
The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use pkg.latest_version as pkg.available_version is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

salt.modules.solarisips.**get_fmri**(*name*, ***kwargs*)

Returns FMRI from partial name. Returns empty string (`') if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

salt.modules.solarisips.**install**(*name=None*, *refresh=False*, *pkgs=None*, *version=None*, *test=False*, ***kwargs*)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Multiple Package Installation Options:

pkgs A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs='["foo", "bar"]'
```

salt.modules.solarisips.**is_installed**(*name*, ***kwargs*)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

salt.modules.solarisips.**latest_version**(*name*, ***kwargs*)

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use pkg.latest_version as pkg.available_version is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

salt.modules.solarisips.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.solarisips.**list_upgrades**(*refresh=True*, ***kwargs*)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

refresh [True] Runs a full package database refresh before listing. Set to `False` to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to `False`. This was changed to default to `True` in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to `True`.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

`salt.modules.solarisips.`**`normalize_name`**(*name*, ***kwargs*)

Internal function. Normalizes pkg name to full FMRI before running pkg.install. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisips.`**`purge`**(*name*, ***kwargs*)

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisips.`**`refresh_db`**(*full=False*)

Updates the remote repos database.

full : False
: Set to `True` to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisips.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
```

```
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.solarisips.**search**(*name*, *versions_as_list=False*, ***kwargs*)

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

salt.modules.solarisips.**upgrade**(*refresh=False*, ***kwargs*)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of pkg://solaris/entire.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.solarisips.**upgrade_available**(*name*)

Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

salt.modules.solarisips.**version**(**names*, ***kwargs*)

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using pkg_resource, full FMRI is required.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

19.9.361 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

---

salt.modules.solarispkg.**install**(*name=None*, *sources=None*, *saltenv='base'*, ***kwargs*)

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion

salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-
 ↪sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-
 ↪local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg
 ↪filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/gcc-3.4.
 ↪6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass `current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing `-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
 ↪sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source' option

providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
 ↪instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state

SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
 ↪admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states

<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
    - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

`salt.modules.solarispkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

salt.modules.solarispkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.solarispkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.solarispkg.**remove**(*name=None*, *pkgs=None*, *saltenv='base'*, ***kwargs*)

Remove packages with pkgrm

name The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the `admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.solarispkg.**upgrade_available**(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.solarispkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.362 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

Override these in the minion config

solr.cores A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.

solr.baseurl The root level URL to access solr via HTTP

solr.request_timeout The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

solr.type Possible values are `master' or `slave'

solr.backup_path The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

solr.num_backups For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

solr.init_script The full path to your init script with start/stop options

solr.dih.options A list of options to pass to the DIH.

Required Options for DIH

clean [False] Clear the index before importing

commit [True] Commit the documents to the index upon completion

optimize [True] Optimize the index after commit is complete

verbose [True] Get verbose output

salt.modules.solr.**abort_import**(*handler*, *host=None*, *core_name=None*, *verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with solr.type=master

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__['host'] is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

salt.modules.solr.**backup**(*host=None*, *core_name=None*, *append_core_to_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: `OK' in the response simply means that solr received the request successfully.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

append_core_to_path [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

salt.modules.solr.**core_status**(*host=None*, *core_name=None*)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

salt.modules.solr.**delta_import**(*handler*, *host=None*, *core_name=None*, *options=None*, *extra=None*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__['host'] is default.

core [str (None)] The core the handler belongs to.

options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__

extra [dict ([])] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

salt.modules.solr.**full_import**(*handler*, *host=None*, *core_name=None*, *options=None*, *extra=None*)

MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type=master

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__['host'] is default.

core [str (None)] The core the handler belongs to.

options [dict (__opts__)] A list of options such as clean, optimize commit, verbose, and pause_replication. leave blank to use __opts__ defaults. options will be merged with __opts__

extra [dict ([])] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

salt.modules.solr.**import_status**(*handler*, *host=None*, *core_name=None*, *verbose=False*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with solr.type: `master'

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__['host'] is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Specifies verbose output

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

salt.modules.solr.**is_replication_enabled**(*host=None*, *core_name=None*)

SLAVE CALL Check for errors, and determine if a slave is replicating or not.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

salt.modules.solr.**lucene_version**(*core_name=None*)

Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

salt.modules.solr.**match_index_versions**(*host=None*, *core_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

salt.modules.solr.**optimize**(*host=None*, *core_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

salt.modules.solr.**ping**(*host=None*, *core_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

salt.modules.solr.**reload_core**(*host=None*, *core_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the ``new'' core is initializing, the ``old'' one will continue to accept requests. Once it has finished, all new request will go to the ``new'' core, and the ``old'' core will be unloaded.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

salt.modules.solr.**reload_import_config**(*handler*, *host=None*, *core_name=None*, *verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a `master' type

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. __opts__['host'] is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

salt.modules.solr.**replication_details**(*host=None*, *core_name=None*)

Get the full replication details.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

salt.modules.solr.**set_is_polling**(*polling*, *host=None*, *core_name=None*)

SLAVE CALL Prevent the slaves from polling the master for updates.

polling [boolean] True will enable polling. False will disable it.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

salt.modules.solr.**set_replication_enabled**(*status*, *host=None*, *core_name=None*)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

status [boolean] Sets the replication status to the specified state.

host [str (None)] The solr host to query. __opts__['host'] is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

salt.modules.solr.**signal**(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

signal [str (None)] The command to pass to the apache solr init valid values are `start', `stop', and `restart'

CLI Example:

```
salt '*' solr.signal restart
```

salt.modules.solr.**version**(*core_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

19.9.363 salt.modules.solrcloud module

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

salt.modules.solrcloud.**BOOL_PROPS_LIST** = ['transient', `loadOnStartup']
Collections options type definition Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1

salt.modules.solrcloud.**DICT_OPTIONS_LIST** = ['properties']
Collection unmodifiable options Reference: https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll

salt.modules.solrcloud.**alias_exists**(*alias_name*, ***kwargs*)
Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

salt.modules.solrcloud.**alias_get_collections**(*alias_name*, ***kwargs*)
Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

salt.modules.solrcloud.**alias_set_collections**(*alias_name*, *collections=None*, ***kwargs*)
Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1, colletion2]
```

salt.modules.solrcloud.**cluster_status**(***kwargs*)
Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.cluster_status
```

salt.modules.solrcloud.**collection_backup**(*collection_name*, *location*, *backup_name=None*, ***kwargs*)
Create a backup for a collection.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

salt.modules.solrcloud.**collection_backup_all**(*location*, *backup_name=None*, ***kwargs*)
Create a backup for all collection present on the server.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

salt.modules.solrcloud.**collection_check_options**(*options*)
Check collections options

CLI Example:

```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'
```

salt.modules.solrcloud.**collection_create**(*collection_name*, *options=None*, ***kwargs*)
Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the ``options'' parameter. Do not include option ``name'' since it already specified by the mandatory parameter ``collection_name''

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":
↪2, "numShards":3}
```

Cores options may be passed using the ``properties'' key in options. Do not include property ``name''

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":
↪2, "numShards":3,             "properties":{"dataDir":"/srv/solr/
↪hugePartitionSollection"}}
```

salt.modules.solrcloud.**collection_creation_options**()
Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

salt.modules.solrcloud.**collection_exists**(*collection_name*, ***kwargs*)
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

salt.modules.solrcloud.**collection_get_options**(*collection_name*, ***kwargs*)
Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

salt.modules.solrcloud.**collection_list**(***kwargs*)
List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

salt.modules.solrcloud.**collection_reload**(*collection*, ***kwargs*)
Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

salt.modules.solrcloud.**collection_set_options**(*collection_name*, *options*, ***kwargs*)
Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={
↪"replicationFactor":4}
```

salt.modules.solrcloud.**log** = **<salt.log.setup.SaltLoggingClass object>**
Core properties type definition. Reference: https://cwiki.apache.org/confluence/display/solr/Defining+core.properties

19.9.364 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0..

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk' key by default, if defined.

For example:

```
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

salt.modules.splunk.**create_user**(*email*, *profile='splunk'*, ***kwargs*)
create a splunk user by name/email

CLI Example:

salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User" name=testuser

`salt.modules.splunk.`**`delete_user`**(*email*, *profile='splunk'*)
Delete a splunk user by email

CLI Example:
salt myminion splunk_user.delete `user@example.com`

`salt.modules.splunk.`**`get_user`**(*email*, *profile='splunk'*, ***kwargs*)
Get a splunk user by name/email

CLI Example:
salt myminion splunk.get_user `user@example.com` user_details=false salt myminion splunk.get_user `user@example.com` user_details=true

`salt.modules.splunk.`**`list_users`**(*profile='splunk'*)
List all users in the splunk DB

CLI Example:
salt myminion splunk.list_users

`salt.modules.splunk.`**`update_user`**(*email*, *profile='splunk'*, ***kwargs*)
Create a splunk user by email

CLI Example:
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"

19.9.365 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the `splunk' key by default, if defined.

For example:

```
splunk:
    username: alice
    password: abc123
    host: example.splunkcloud.com
    port: 8080
```

`salt.modules.splunk_search.`**`create`**(*name*, *profile='splunk'*, ***kwargs*)
Create a splunk search

CLI Example:
splunk_search.create `my search name' search='error msg'

`salt.modules.splunk_search.`**`delete`**(*name*, *profile='splunk'*)
Delete a splunk search

CLI Example:
splunk_search.delete `my search name'

salt.modules.splunk_search.**get**(*name*, *profile='splunk'*)
Get a splunk search

CLI Example:
splunk_search.get `my search name'

salt.modules.splunk_search.**list**(*profile='splunk'*)
List splunk searches (names only)
CLI Example: splunk_search.list

salt.modules.splunk_search.**list_all**(*prefix=None*, *app=None*, *owner=None*, *description_contains=None*, *name_not_contains=None*, *profile='splunk'*)
Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if description_contains is specified, results will be limited to those where ``description_contains in description'' is true if name_not_contains is specified, results will be limited to those where ``name_not_contains not in name'' is true.

If prefix parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:
1. **Make a ``backup'' of all existing searches** $ salt-call splunk_search.list_all --out=txt | sed ``s/local: //'' > legacy_searches.sls
2. **Get all searches with new prefixed names** $ salt-call splunk_search.list_all ``prefix=**MANAGED BY SALT** '' --out=txt | sed ``s/local: //'' > managed_searches.sls
3. **Insert the managed searches into splunk** $ salt-call state.sls managed_searches.sls
4. Manually verify that the new searches look right
5. Delete the original searches $ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls $ salt-call state.sls remove_legacy_searches.sls
6. Get all searches again, verify no changes $ salt-call splunk_search.list_all --out=txt | sed ``s/local: //'' > final_searches.sls $ diff final_searches.sls managed_searches.sls

salt.modules.splunk_search.**update**(*name*, *profile='splunk'*, ***kwargs*)
Update a splunk search

CLI Example:
splunk_search.update `my search name' sharing=app

19.9.366 salt.modules.sqlite3

Support for SQLite3

salt.modules.sqlite3.**fetch**(*db=None*, *sql=None*)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

salt.modules.sqlite3.**indexes**(*db=None*)
Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

salt.modules.sqlite3.**indices**(*db=None*)
Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

salt.modules.sqlite3.**modify**(*db=None*, *sql=None*)
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

salt.modules.sqlite3.**sqlite_version**()
Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

salt.modules.sqlite3.**tables**(*db=None*)
Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

salt.modules.sqlite3.**version**()
Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

19.9.367 salt.modules.ssh

Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

salt.modules.ssh.**auth_keys**(*user=None*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*)
Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

salt.modules.ssh.**check_key**(*user*, *key*, *enc*, *comment*, *options*, *config='.ssh/authorized_keys'*, *cache_keys=None*, *fingerprint_hash_type=None*)
Check to see if a key needs updating, returns ``update", ``add" or ``exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

salt.modules.ssh.**check_key_file**(*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fingerprint_hash_type=None*)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

salt.modules.ssh.**check_known_host**(*user=None*, *hostname=None*, *key=None*, *fingerprint=None*, *config=None*, *port=None*, *fingerprint_hash_type=None*)

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return ``update'', if no value is found for a given host, return ``add'', otherwise return ``exists''.

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

salt.modules.ssh.**get_known_host**(*user*, *hostname*, *config=None*, *port=None*, *fingerprint_hash_type=None*)

Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:

```
salt '*' ssh.get_known_host <user> <hostname>
```

salt.modules.ssh.**hash_known_hosts**(*user=None*, *config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user hash known hosts of this user

config path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

salt.modules.ssh.**host_keys**(*keydir=None*, *private=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
```

salt.modules.ssh.**key_is_encrypted**(*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a `Proc-Type` header with `ENCRYPTED` in the value. If found, returns `True`, otherwise returns `False`.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

salt.modules.ssh.**recv_known_host**(*hostname*, *enc=None*, *port=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

Retrieve information about host public key from remote server

hostname The name of the remote host (e.g. ``github.com'')

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>
```

salt.modules.ssh.**rm_auth_key**(*user*, *key*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

salt.modules.ssh.**rm_auth_key_from_file**(*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.**rm_known_host**(*user=None*, *hostname=None*, *config=None*, *port=None*)

Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

salt.modules.ssh.**set_auth_key**(*user*, *key*, *enc='ssh-rsa'*, *comment=''*, *options=None*, *config='.ssh/authorized_keys'*, *cache_keys=None*, *fingerprint_hash_type=None*)

Add a key to the authorized_keys file. The ``key'' parameter must only be the string of text that is the encoded key. If the key begins with ``ssh-rsa'' or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

salt.modules.ssh.**set_auth_key_from_file**(*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fingerprint_hash_type=None*)

Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

salt.modules.ssh.**set_known_host**(*user=None*, *hostname=None*, *fingerprint=None*, *key=None*, *port=None*, *enc=None*, *config=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

Download SSH public key from remote host ``hostname'', optionally validate its fingerprint against ``fingerprint'' variable and save the record in the known_hosts file.

If such a record does already exists in there, do nothing.

user The user who owns the ssh authorized keys file to modify

hostname The name of the remote host (e.g. ``github.com'')

fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key The public key which must be presented in the known_hosts file (optional if fingerprint specified)

port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to ``/etc/ssh/ssh_known_hosts''. If present, must be an absolute path when a user is not specified.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to `sha256` if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from `md5` to `sha256`

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config=
↪'.ssh/known_hosts'
```

salt.modules.ssh.**user_keys**(*user=None*, *pubfile=None*, *prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/
↪home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user="['user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to `False`. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

19.9.368 salt.modules.ssh_package module

Service support for the REST example

19.9.369 salt.modules.ssh_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

`salt.modules.ssh_service.`**`enabled`**(*name*, *sig=None*)
Only the `redbull' service is `enabled' in the test

`salt.modules.ssh_service.`**`get_all`**()
Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.ssh_service.`**`list`**()
Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.ssh_service.`**`restart`**(*name*, *sig=None*)
Restart the specified service with rest_sample CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.`**`running`**(*name*, *sig=None*)
Return whether this service is running.

`salt.modules.ssh_service.`**`start`**(*name*, *sig=None*)
Start the specified service on the rest_sample

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.ssh_service.`**`status`**(*name*, *sig=None*)
Return the status for a service via rest_sample, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.ssh_service.`**`stop`**(*name*, *sig=None*)
Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.370 salt.modules.snapper module

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>

depends dbus Python module.

depends snapper http://snapper.io, available in most distros

maturity new

platform Linux

salt.modules.snapper.**changed_files**(*config='root'*, *num_pre=None*, *num_post=None*)

Returns the files changed between two snapshots

config Configuration name.

num_pre first snapshot ID to compare. Default is last snapshot

num_post last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.**create_baseline**(*tag='baseline'*, *config='root'*)

Creates a snapshot marked as baseline

tag Tag name for the baseline

config Configuration name.

CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.**create_config**(*name=None*, *subvolume=None*, *fstype=None*, *template=None*, *extra_opts=None*)

Creates a new Snapper configuration

name Name of the new Snapper configuration.

subvolume Path to the related subvolume.

fstype Filesystem type of the subvolume.

template Configuration template to use. (Default: default)

extra_opts Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).

CLI example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
 ↪template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
 ↪extra_opts='{"NUMBER_CLEANUP": False}'
```

salt.modules.snapper.**create_snapshot**(*config='root'*, *snapshot_type='single'*, *pre_number=None*, *description=None*, *cleanup_algorithm='number'*, *userdata=None*, ***kwargs*)

Creates an snapshot

config Configuration name.

snapshot_type Specifies the type of the new snapshot. Possible values are single, pre and post.
pre_number For post snapshots the number of the pre snapshot must be provided.
description Description for the snapshot. If not given, the salt job will be used.
cleanup_algorithm Set the cleanup algorithm for the snapshot.
number Deletes old snapshots when a certain number of snapshots is reached.
timeline Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post Deletes pre/post snapshot pairs with empty diffs.
userdata Set userdata for the snapshot (key-value pairs).
Returns the number of the created snapshot.

CLI example:

```
salt '*' snapper.create_snapshot
```

salt.modules.snapper.**delete_snapshot**(*snapshots_ids=None*, *config='root'*)
Deletes an snapshot
config Configuration name. (Default: root)
snapshots_ids List of the snapshots IDs to be deleted.
CLI example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

salt.modules.snapper.**diff**(*config='root'*, *filename=None*, *num_pre=None*, *num_post=None*)
Returns the differences between two snapshots
config Configuration name.
filename if not provided the showing differences between snapshots for all ``text'' files
num_pre first snapshot ID to compare. Default is last snapshot
num_post last snapshot ID to compare. Default is 0 (current state)
CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

salt.modules.snapper.**diff_jid**(*jid*, *config='root'*)
Returns the changes applied by a *jid*
jid The job id to lookup
config Configuration name.
CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.**get_config**(*name='root'*)
Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.**get_snapshot**(*number=0*, *config='root'*)
Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot 1
```

salt.modules.snapper.**list_configs**()
List all available configs

CLI example:

```
salt '*' snapper.list_configs
```

salt.modules.snapper.**list_snapshots**(*config='root'*)
List available snapshots

CLI example:

```
salt '*' snapper.list_snapshots config=myconfig
```

salt.modules.snapper.**modify_snapshot**(*snapshot_id=None*, *description=None*, *userdata=None*, *cleanup=None*, *config='root'*)
Modify attributes of an existing snapshot.
config Configuration name. (Default: root)
snapshot_id ID of the snapshot to be modified.
cleanup Change the cleanup method of the snapshot. (str)
description Change the description of the snapshot. (str)
userdata Change the userdata dictionary of the snapshot. (dict)
CLI example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata='{"foo": "bar"}'
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

salt.modules.snapper.**run**(*function*, **args*, ***kwargs*)
Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.
function Salt function to call.
config Configuration name. (default: ``root'')
description A description for the snapshots. (default: None)
userdata Data to include in the snapshot metadata. (default: None)
cleanup_algorithm Snapper cleanup algorithm. (default: ``number'')
***args** args for the function to call. (default: None)
****kwargs** kwargs for the function to call (default: None)
This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The jid will be available as salt_jid in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='["/etc/motd", "some text"]'
```

salt.modules.snapper.**set_config**(*name='root'*, ***kwargs*)
Set configuration values

CLI example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.**status**(*config='root'*, *num_pre=None*, *num_post=None*)

Returns a comparison between two snapshots

config Configuration name.

num_pre first snapshot ID to compare. Default is last snapshot

num_post last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.**status_to_string**(*dbus_status*)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

salt.modules.snapper.**undo**(*config='root'*, *files=None*, *num_pre=None*, *num_post=None*)

Undo all file changes that happened between num_pre and num_post, leaving the files into the state of num_pre.

> **Warning:** If one of the files has changes after num_post, they will be overwritten The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in num_pre.
>
> You to undo changes between num_pre and the current version of the files use num_post=0.

CLI Example:

```
salt '*' snapper.undo
```

salt.modules.snapper.**undo_jid**(*jid*, *config='root'*)

Undo the changes applied by a salt job

jid The job id to lookup

config Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

19.9.371 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with cache=True it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

salt.modules.state.**apply**(*mods=None*, ***kwargs*)

New in version 2015.5.0.

This function will call *state.highstate* or *state.sls* based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in top.sls:
test Run states in test-only (dry-run) mode
pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
↪exclude'}]"
```

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE.SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://test.sls (or salt://test/init.sls)
salt '*' state.apply test
# Run the states configured in salt://test.sls (or salt://test/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply test,pkgs
```

The following additional arguments are also accepted when applying individual SLS files:
test Run states in test-only (dry-run) mode
pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

```
salt '*' state.apply test localconfig=/path/to/minion.yml
```

`salt.modules.state.`**`check_request`**(*name=None*)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.`**`clear_cache`**()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if cache=True is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.`**`clear_request`**(*name=None*)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

salt.modules.state.**disable**(*states*)

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate

salt '*' state.disable highstate,test.succeed_without_changes
```

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.

salt `*' state.disable bind.config

---

salt.modules.state.**enable**(*states*)

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate

salt '*' state.enable test.succeed_without_changes
```

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.

salt `*' state.disable bind.config

---

salt.modules.state.**event**(*tagmatch='*'*, *count=-1*, *quiet=False*, *sock_dir=None*, *pretty=False*, *node='minion'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

salt.modules.state.**high**(*data*, *test=None*, *queue=False*, ***kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

salt.modules.state.**highstate**(*test=None*, *queue=False*, ***kwargs*)

Retrieve the state data from the salt master for this minion and execute it

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See *here* for details.

pillar_enc Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
 ↪exclude'}]"
```

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```
salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
 ↪exclude'}]"
```

```
salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.**list_disabled**()
List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

salt.modules.state.**low**(*data*, *queue=False*, ***kwargs*)
Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.**orchestrate**(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*)
New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation
- *Full Orchestrate Tutorial*
- Docs for the ``salt` state module <salt.states.saltmod>`

CLI Examples:

```
salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws
```

salt.modules.state.**pkg**(*pkg_path*, *pkg_sum*, *hash_type*, *test=None*, ***kwargs*)
Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

salt.modules.state.**request**(*mods=None*, ***kwargs*)
New in version 2015.5.0.

Request that the local admin execute a state run via *salt-call state.run_request* All arguments match state.apply

CLI Example:

```
salt '*' state.request
salt '*' state.request test
salt '*' state.request test,pkgs
```

salt.modules.state.**run_request**(*name='default'*, ***kwargs*)
New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

salt.modules.state.**running**(*concurrent=False*)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

salt.modules.state.**show_highstate**(*queue=False*, ***kwargs*)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

salt.modules.state.**show_low_sls**(*mods*, *test=None*, *queue=False*, ***kwargs*)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

salt.modules.state.**show_lowstate**(*queue=False*, ***kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

salt.modules.state.**show_sls**(*mods*, *test=None*, *queue=False*, ***kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim dev
```

salt.modules.state.**show_state_usage**(*queue=False*, ***kwargs*)

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

salt.modules.state.**show_top**(*queue=False*, ***kwargs*)

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

salt.modules.state.**single**(*fun*, *name*, *test=None*, *queue=False*, ***kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

salt.modules.state.**sls**(*mods*, *test=None*, *exclude=None*, *queue=False*, ***kwargs*)

Execute the states in one or more SLS files

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply test pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See *here* for details.

pillar_enc Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="[{'id': 'id_to_exclude'}, {'sls':
↪'sls_to_exclude'}]"
```

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no saltenv is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the saltenv was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig
Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Example:

```
salt '*' state.sls core,edit.vim dev
salt '*' state.sls core exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude
↪'}]"

salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

`salt.modules.state.`**`sls_id`**(*id_*, *mods*, *test=None*, *queue=False*, ***kwargs*)
Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.
id ID to call
mods Comma-delimited list of modules to search for given id and its requisites
New in version 2014.7.0.
saltenv [base] Specify a salt fileserver environment to be used when applying states
pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *`pillarenv`* option. When neither the *`pillarenv`* minion config option nor this CLI argument is used, all Pillar environments will be merged together.
CLI Example:

```
salt '*' state.sls_id my_state my_module

salt '*' state.sls_id my_state my_module,a_common_module
```

`salt.modules.state.`**`template`**(*tem*, *queue=False*, ***kwargs*)
Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.`**`template_str`**(*tem*, *queue=False*, ***kwargs*)
Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

salt.modules.state.**top**(*topfn*, *test=None*, *queue=False*, ***kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
↪exclude'}]"
```

19.9.372 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

salt.modules.status.**all_status**()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

salt.modules.status.**cpuinfo**()

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.cpuinfo
```

salt.modules.status.**cpustats**()

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.cpustats
```

salt.modules.status.**custom**()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cpustats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cpustats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

salt.modules.status.**diskstats**()

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

salt.modules.status.**diskusage**(**args*)

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage         # usage for all filesystems
salt '*' status.diskusage / /tmp  # usage for / and /tmp
salt '*' status.diskusage ext?    # usage for ext[234] filesystems
salt '*' status.diskusage / ext?  # usage for / and all ext filesystems
```

salt.modules.status.**loadavg**()

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg

:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

salt.modules.status.**master**(*master=None*, *connected=True*)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

salt.modules.status.**meminfo**()
Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.meminfo
```

salt.modules.status.**netdev**()
Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

salt.modules.status.**netstats**()
Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netstats
```

salt.modules.status.**nproc**()
Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.nproc
```

salt.modules.status.**pid**(*sig*)
Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

salt.modules.status.**ping_master**(*master*)
New in version 2016.3.0.

Sends ping request to the given master. Fires `__master_failback' event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

salt.modules.status.**procs**()
Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

salt.modules.status.**proxy_reconnect**(*proxy_name*, *opts=None*)

Forces proxy minion reconnection when not alive.

proxy_name The virtual name of the proxy module.

opts: **None** Opts dictionary. Not intended for CLI usage.

CLI Example:

salt `*' status.proxy_reconnect rest_sample

salt.modules.status.**time**(*format='%A, %d. %B %Y %I:%M%p'*)

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time

salt '*' status.time '%s'
```

salt.modules.status.**uptime**()

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

salt.modules.status.**version**()

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.version
```

salt.modules.status.**vmstats**()

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

salt.modules.status.**w**()

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```

19.9.373 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:
  api_key: <API_KEY>
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

salt.modules.statuspage.**create**(*endpoint='incidents'*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*)

Insert a new entry under a specific endpoint.

endpoint: **incidents** Insert under this specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: **1** API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_
↪id='993vgplshj12'
```

Example output:

```
minion:
    ----------
    comment:
    out:
        ----------
        created_at:
            2017-01-05T19:35:27.135Z
        description:
            None
        group_id:
            993vgplshj12
        id:
            mjkmtt5lhdgc
        name:
            my component
        page_id:
            ksdhgfyiuhaa
        position:
            7
        status:
            operational
        updated_at:
            2017-01-05T19:35:27.135Z
    result:
        True
```

salt.modules.statuspage.**delete**(*endpoint='incidents'*, *id=None*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*)

Remove an entry from an endpoint.

endpoint: **incidents** Request a specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: **1** API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.
CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```
minion:
    ----------
    comment:
    out:
        None
    result:
        True
```

salt.modules.statuspage.**retrieve**(*endpoint='incidents'*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*)

Retrieve a specific endpoint from the Statuspage API.
endpoint: **incidents** Request a specific endpoint.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: **1** API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.
CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion:
    ----------
    comment:
    out:
        |_
          ----------
          backfilled:
              False
          created_at:

```

salt.modules.statuspage.**update**(*endpoint='incidents'*, *id=None*, *api_url=None*, *page_id=None*, *api_key=None*, *api_version=None*, ***kwargs*)

Update attribute(s) of a specific endpoint.

id The unique ID of the enpoint entry.
endpoint: incidents Endpoint name.
page_id Page ID. Can also be specified in the config file.
api_key API key. Can also be specified in the config file.
api_version: 1 API version. Can also be specified in the config file.
api_url Custom API URL in case the user has a StatusPage service running in a custom environment.
CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```
minion:
    ----------
    comment:
    out:
        ----------
        created_at:

    result:
        True
```

19.9.374 salt.modules.stormpath

Support for Stormpath

New in version 2015.8.0.

`salt.modules.stormpath.`**`create_account`**(*directory_id*, *email*, *password*, *givenName*, *surname*, ***kwargs*)

Create an account

CLI Examples:

salt myminion stormpath.create_account <directory_id> shemp@example.com letmein Shemp Howard

`salt.modules.stormpath.`**`delete_account`**(*account_id*)

Delete an account.

CLI Examples:

salt myminion stormpath.delete_account <account_id>

salt.modules.stormpath.**list_accounts**()
Show all accounts.

CLI Example:
salt myminion stormpath.list_accounts

salt.modules.stormpath.**list_directories**()
Show all directories.

CLI Example:
salt myminion stormpath.list_directories

salt.modules.stormpath.**show_account**(*account_id=None*, *email=None*, *directory_id=None*, *application_id=None*, *group_id=None*, ***kwargs*)
Show a specific account.

CLI Example:
salt myminion stormpath.show_account <account_id>

salt.modules.stormpath.**show_tenant**()
Get the tenant for the login being used.

salt.modules.stormpath.**update_account**(*account_id*, *key=None*, *value=None*, *items=None*)
Update one or more items for this account. Specifying an empty value will clear it for that account.

CLI Examples:
salt myminion stormpath.update_account <account_id> givenName shemp salt myminion stormpath.update_account <account_id> middleName `' salt myminion stormpath.update_account <account_id> items='{``givenName'': ``Shemp''} salt myminion stormpath.update_account <account_id> items='{``middlename'': ``''}

19.9.375 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.**add**(*name*, *user=None*, *conf_file=None*, *bin_env=None*)
Activates any updates in config for process/group.
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.add <name>
```

salt.modules.supervisord.**custom**(*command*, *user=None*, *conf_file=None*, *bin_env=None*)
Run any custom supervisord command
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

salt.modules.supervisord.**options**(*name*, *conf_file=None*)
New in version 2014.1.0.

Read the config file and return the config options for a given process
name Name of the configured process
conf_file path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

salt.modules.supervisord.**remove**(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Removes process/group from active config

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

salt.modules.supervisord.**reread**(*user=None*, *conf_file=None*, *bin_env=None*)

Reload the daemon's configuration files

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.reread
```

salt.modules.supervisord.**restart**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Restart the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.restart <service>
salt '*' supervisord.restart <group>:
```

salt.modules.supervisord.**start**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Start the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.start <service>
salt '*' supervisord.start <group>:
```

salt.modules.supervisord.**status**(*name=None*, *user=None*, *conf_file=None*, *bin_env=None*)

List programs and its state

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status
```

salt.modules.supervisord.**status_raw**(*name=None*, *user=None*, *conf_file=None*, *bin_env=None*)

Display the raw output of status

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.status_raw
```

salt.modules.supervisord.**stop**(*name='all'*, *user=None*, *conf_file=None*, *bin_env=None*)

Stop the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.stop <service>
salt '*' supervisord.stop <group>:
```

salt.modules.supervisord.**update**(*user=None*, *conf_file=None*, *bin_env=None*, *name=None*)

Reload config and add/remove/update as necessary

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

name name of the process group to update. if none then update any process group that has changes

CLI Example:

```
salt '*' supervisord.update
```

19.9.376 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

salt.modules.suse_apache.**a2dismod**(*mod*)

Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

salt.modules.suse_apache.**a2enmod**(*mod*)

Runs a2enmod for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

salt.modules.suse_apache.**check_mod_enabled**(*mod*)

Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support *a2enmod -l* to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

19.9.377 salt.modules.svn

Subversion SCM

salt.modules.svn.**add**(*cwd*, *targets*, *user=None*, *username=None*, *password=None*, **opts*)

Add files to be tracked by the Subversion working-copy checkout

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

salt.modules.svn.**checkout**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

Download a working copy of the remote Subversion repository directory or file

cwd The path to the Subversion repository

remote [None] URL to checkout

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

salt.modules.svn.**commit**(*cwd*, *targets=None*, *msg=None*, *user=None*, *username=None*, *password=None*, **opts*)

Commit the current directory, files, or directories to the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses `.'

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

salt.modules.svn.**diff**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses `.'

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

salt.modules.svn.**export**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *revision='HEAD'*, **opts*)

Create an unversioned copy of a tree.

cwd The path to the Subversion repository

remote [None] URL and path to file or directory checkout

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

salt.modules.svn.**info**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *fmt='str'*)

Display the Subversion information from the checkout.

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments svn uses `.' by default

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

fmt [str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

salt.modules.svn.**remove**(*cwd*, *targets*, *msg=None*, *user=None*, *username=None*, *password=None*, **opts*)

Remove files and directories from the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

salt.modules.svn.**status**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Display the status of the current directory, files, or directories in the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses `.'

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.status /path/to/repo
```

salt.modules.svn.**switch**(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory
cwd The path to the Subversion repository
remote [None] URL to switch
target [None] The name to give the file or directory working copy Default: svn uses the remote basename
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password
CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

salt.modules.svn.**update**(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Update the current directory, files, or directories from the remote Subversion repository
cwd The path to the Subversion repository
targets [None] files and directories to pass to the command as arguments Default: svn uses `.'
user [None] Run svn as a user other than what the minion runs as
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

username [None] Connect to the Subversion server as another user
CLI Example:

```
salt '*' svn.update /path/to/repo
```

19.9.378 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

depends

- swiftclient Python module

configuration This module is not usable until the user, tenant, auth URL, and password or auth_key are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

```
  keystone.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k

openstack2:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 303802934809284k2j34lkj2l3kj43k
```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting keystone.auth_version = 1 is recommended.

`salt.modules.swift.`**`delete`**(*cont*, *path=None*, *profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.`**`get`**(*cont=None*, *path=None*, *local_file=None*, *return_bin=False*, *profile=None*)

List the contents of a container, or return an object from a container. Set return_bin to True in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

`salt.modules.swift.`**`put`**(*cont*, *path=None*, *local_file=None*, *profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

19.9.379 salt.modules.sysbench

The `sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

salt.modules.sysbench.**cpu**()
Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

salt.modules.sysbench.**fileio**()
This tests for the file read and write operations Various modes of operations are
•sequential write
•sequential rewrite
•sequential read
•random read
•random write
•random read and write
The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

salt.modules.sysbench.**memory**()
This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

salt.modules.sysbench.**mutex**()
Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

salt.modules.sysbench.**threads**()
This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

19.9.380 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt

New in version 2016.3.0.

salt.modules.sysfs.**attr**(*key*, *value=None*)

Access/write a SysFS attribute. If the attribute is a symlink, it's destination is returned

Returns value or bool

CLI example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

salt.modules.sysfs.**interfaces**(*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
   "r": [
     "state",
     "partial_stripes_expensive",
     "writeback_rate_debug",
     "stripe_size",
     "dirty_data",
     "stats_total/cache_hits",
     "stats_total/cache_bypass_misses",
     "stats_total/bypassed",
     "stats_total/cache_readaheads",
     "stats_total/cache_hit_ratio",
     "stats_total/cache_miss_collisions",
     "stats_total/cache_misses",
     "stats_total/cache_bypass_hits",
   ],
   "rw": [
     "writeback_rate",
     "writeback_rate_update_seconds",
     "cache_mode",
     "writeback_delay",
     "label",
     "writeback_running",
     "writeback_metadata",
     "running",
     "writeback_rate_p_term_inverse",
     "sequential_cutoff",
     "writeback_percent",
     "writeback_rate_d_term",
     "readahead"
   ],
   "w": [
     "stop",
     "clear_stats",
     "attach",
     "detach"
   ]
}
```

Note:

- `r' interfaces are read-only

- `w' interfaces are write-only (e.g. actions)
- `rw' are interfaces that can both be read or written

---

salt.modules.sysfs.**read**(*key*, *root=''*)

Read from SysFS

Parameters **key** -- file or path in SysFS; if key is a list then root will be prefixed on each key

Returns the full (tree of) SysFS attributes under key

CLI example:

```
salt '*' sysfs.read class/net/em1/statistics
```

salt.modules.sysfs.**target**(*key*, *full=True*)

Return the basename of a SysFS key path

Parameters

- **key** -- the location to resolve within SysFS
- **full** -- full path instead of basename

Returns fullpath or basename of path

CLI example:

```
salt '*' sysfs.read class/ttyS0
```

salt.modules.sysfs.**write**(*key*, *value*)

Write a SysFS attribute/action

CLI example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor
 ↪'performance'
```

19.9.381 salt.modules.syslog_ng

Module for getting information about syslog-ng

maintainer Tibor Benke <btibi@sch.bme.hu>

maturity new

depends cmd

platform all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with *syslog_ng.set_binary_path*.

Similarly, users can specify the location of the configuration file with *syslog_ng.set_config_file*, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

class salt.modules.syslog_ng.**Argument**(*value=''*)

A TypedParameterValue has one or more Arguments. For example this can be the value of key_file.

Does not need examples.

class salt.modules.syslog_ng.**Buildable**(*iterable*, *join_body_on=''*, *append_extra_newline=True*)
Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

build()
Builds the textual representation of the whole configuration object with it's children.

build_body()
Builds the body of a syslog-ng configuration object.

build_header()
Builds the header of a syslog-ng configuration object.

build_tail()
Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.**GivenStatement**(*value*, *add_newline=True*)
This statement returns a string without modification. It can be used to use existing configuration snippets.
Does not need examples.

class salt.modules.syslog_ng.**NamedStatement**(*type*, *id=''*, *options=None*)
It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

class salt.modules.syslog_ng.**Option**(*type=''*, *params=None*)
A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

class salt.modules.syslog_ng.**Parameter**(*iterable=None*, *join_body_on=''*)
An Option has one or more Parameter instances.

Does not need examples.

class salt.modules.syslog_ng.**ParameterValue**(*iterable=None*, *join_body_on=''*)
A TypedParameter can have one or more values.

Does not need examples.

class salt.modules.syslog_ng.**SimpleParameter**(*value=''*)
A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {
    file(
        '/var/log/messages'
    );
};
```

`/var/log/messages` is a SimpleParameter.

Does not need examples.

class salt.modules.syslog_ng.**SimpleParameterValue**(*value=''*)
A ParameterValuem which holds a simple type, like a string or a number.

For example in ip(127.0.0.1) 127.0.0.1 is a SimpleParameterValue.

Does not need examples.

class salt.modules.syslog_ng.**Statement**(*type*, *id=''*, *options=None*, *has_name=True*)
It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

class salt.modules.syslog_ng.**TypedParameter**(*type=''*, *values=None*)
A Parameter, which has a type:

```
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};
```

`ip(127.0.0.1)` is a TypedParameter.

Does not need examples.

class salt.modules.syslog_ng.**TypedParameterValue**(*type=''*, *arguments=None*)
We have to go deeper...

A TypedParameter can have a `parameter', which also have a type. For example key_file and cert_file:

```
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
};
```

Does not need examples.

class salt.modules.syslog_ng.**UnnamedStatement**(*type*, *options=None*)
It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog_ng.**config**(*name*, *config*, *write=True*)
Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id config : the parsed YAML code write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```
salt '*' syslog_ng.config name='s_local' config="[{'tcp':[{'ip':'127.0.0.1'},{
↪'port':1233}]}]"
```

salt.modules.syslog_ng.**config_test**(*syslog_ng_sbin_dir=None*, *cfgfile=None*)
Runs syntax check against cfgfile. If syslog_ng_sbin_dir is specified, it is added to the PATH during the test.

CLI Example:

```
salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/
↪syslog-ng.conf
```

salt.modules.syslog_ng.**get_config_file**()

Returns the configuration directory, which contains syslog-ng.conf.

CLI Example:

```
salt '*' syslog_ng.get_config_file
```

salt.modules.syslog_ng.**modules**(*syslog_ng_sbin_dir=None*)

Returns the available modules. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**reload**(*name*)

Reloads syslog-ng. This function is intended to be used from states.

If *syslog_ng.set_config_file*, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

salt.modules.syslog_ng.**set_binary_path**(*name*)

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

salt.modules.syslog_ng.**set_config_file**(*name*)

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

salt.modules.syslog_ng.**set_parameters**(*version=None*, *binary_path=None*, *config_file=None*, **args*, ***kwargs*)

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters  binary_path=/home/user/install/syslog-ng/sbin
 ↪config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

salt.modules.syslog_ng.**start**(*name=None*, *user=None*, *group=None*, *chroot=None*, *caps=None*, *no_caps=False*, *pidfile=None*, *enable_core=False*, *fd_limit=None*, *verbose=False*, *debug=False*, *trace=False*, *yydebug=False*, *persist_file=None*, *control=None*, *worker_threads=None*)

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If *syslog_ng.set_config_file*, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

salt.modules.syslog_ng.**stats**(*syslog_ng_sbin_dir=None*)

Returns statistics from the running syslog-ng instance. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng-ctl.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**stop**(*name=None*)

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If *syslog_ng.set_config_file* is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

salt.modules.syslog_ng.**version**(*syslog_ng_sbin_dir=None*)

Returns the version of the installed syslog-ng. If syslog_ng_sbin_dir is specified, it is added to the PATH during the execution of the command syslog-ng.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

salt.modules.syslog_ng.**write_config**(*config*, *newlines=2*)

Writes the given parameter config into the config file. This function is intended to be used from states.

If *syslog_ng.set_config_file*, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

salt.modules.syslog_ng.**write_version**(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If *syslog_ng.set_config_file*, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

19.9.382 salt.modules.sysmod

The sys module provides information about the available functions on the minion

salt.modules.sysmod.**argspec**(*module=''*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

salt.modules.sysmod.**doc**(**args*)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

salt.modules.sysmod.**list_functions**(**args*, ***kwargs*)

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

salt.modules.sysmod.**list_modules**(**args*)

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

salt.modules.sysmod.**list_renderers**(**args*)

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

salt.modules.sysmod.**list_returner_functions**(**args*, ***kwargs*)

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

salt.modules.sysmod.**list_returners**(**args*)

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

salt.modules.sysmod.**list_runner_functions**(**args*, ***kwargs*)

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

salt.modules.sysmod.**list_runners**(**args*)

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

salt.modules.sysmod.**list_state_functions**(**args*, ***kwargs*)

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

salt.modules.sysmod.**list_state_modules**(**args*)

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

salt.modules.sysmod.**reload_modules**()

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

salt.modules.sysmod.**renderer_doc**(**args*)

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

salt.modules.sysmod.**returner_argspec**(*module=''*)

Return the argument specification of functions in Salt returner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.returner_argspec xmpp
salt '*' sys.returner_argspec xmpp smtp
salt '*' sys.returner_argspec
```

Returner names can be specified as globs.

```
salt '*' sys.returner_argspec 'sqlite3.*'
```

salt.modules.sysmod.**returner_doc**(**args*)

Return the docstrings for all returners. Optionally, specify a returner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple returners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.returner_doc
salt '*' sys.returner_doc sqlite3
salt '*' sys.returner_doc sqlite3.get_fun
salt '*' sys.returner_doc sqlite3.get_fun etcd.get_fun
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.returner_doc 'sqlite3.get_*'
```

salt.modules.sysmod.**runner_argspec**(*module=''*)

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

salt.modules.sysmod.**runner_doc**(**args*)

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

salt.modules.sysmod.**state_argspec**(*module=''*)

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

salt.modules.sysmod.**state_doc**(**args*)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

salt.modules.sysmod.**state_schema**(*module=''*)
Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

19.9.383 salt.modules.sysrc

sysrc module for FreeBSD

salt.modules.sysrc.**get**(***kwargs*)
Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

salt.modules.sysrc.**remove**(*name*, ***kwargs*)
Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

salt.modules.sysrc.**set**(*name*, *value*, ***kwargs*)
Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

19.9.384 salt.modules.system

Support for reboot, shutdown, etc

salt.modules.system.**get_computer_desc**()
Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

Returns Value of PRETTY_HOSTNAME if this does not exist False.

Return type str

CLI Example:

```
salt '*' system.get_computer_desc
```

salt.modules.system.**get_computer_name**()
Get hostname.

CLI Example:

```
salt '*' network.get_hostname
```

salt.modules.system.**get_system_date**(*utc_offset=None*)

Get the system date

Parameters **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system date.

Return type str

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.system.**get_system_date_time**(*utc_offset=None*)

Get the system date/time.

Parameters **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in YYYY-MM-DD hh:mm:ss format.

Return type str

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

salt.modules.system.**get_system_time**(*utc_offset=None*)

Get the system time.

Parameters **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type str

CLI Example:

```
salt '*' system.get_system_time
```

salt.modules.system.**halt**()

Halt a running system

CLI Example:

```
salt '*' system.halt
```

salt.modules.system.**has_settable_hwclock**()

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

salt `*' system.has_settable_hwclock

salt.modules.system.**init**(*runlevel*)

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

salt.modules.system.**poweroff**()

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

salt.modules.system.**reboot**(*at_time=None*)

Reboot the system

at_time The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

salt.modules.system.**set_computer_desc**(*desc*)

Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

Parameters **desc** (*str*) -- The computer description

Returns False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

salt.modules.system.**set_computer_name**(*hostname*)

Modify hostname.

CLI Example:

```
salt '*' system.set_conputer_name master.saltstack.com
```

salt.modules.system.**set_system_date**(*newdate*, *utc_offset=None*)

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters **newdate** (*str*) -- The date to set. Can be any of the following formats:

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.system.**set_system_date_time**(*years=None*, *months=None*, *days=None*, *hours=None*, *minutes=None*, *seconds=None*, *utc_offset=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Updates hardware clock, if present, in addition to software (kernel) clock.

Parameters

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31

- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59
- **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'''. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns True if successful. Otherwise False.

Return type bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

salt.modules.system.**set_system_time**(*newtime*, *utc_offset=None*)

Set the system time.

Parameters

- **newtime** (*str*) -- The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

  Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.
- **utc_offset** (*str*) -- The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use ``'+0000'''. Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns True if successful. Otherwise False.

Return type bool

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

salt.modules.system.**shutdown**(*at_time=None*)

Shutdown a running system

at_time The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

19.9.385 salt.modules.system_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

salt.modules.system_profiler.**applications**()

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

salt.modules.system_profiler.**receipts**()

Return the results of a call to `system_profiler -xml -detail full SPInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

19.9.386 salt.modules.systemd

Provides the service module for systemd

New in version 0.10.0.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

salt.modules.systemd.**available**(*name*)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd.**disable**(*name*, *no_block=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

no_block [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd.**disabled**(*name*)

Return if the named service is disabled from starting on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.systemd.**enable**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is

done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called systemd.scope, with a value of False (no quotes).

Enable the named service to start when the system boots

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.systemd.**enabled**(*name*, ***kwargs*)

Return if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.systemd.**execs**()

New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

CLI Example:

salt `*' service.execs

salt.modules.systemd.**force_reload**(*name*, *no_block=True*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the salt-minion daemon's control group. This is done to avoid a race condition in cases where the salt-minion service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called systemd.scope, with a value of False (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block [False] Set to True to start the service using --no-block.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.systemd.**get_all**()
Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.systemd.**get_disabled**()
Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.systemd.**get_enabled**()
Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.systemd.**get_running**()
Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

salt.modules.systemd.**get_static**()
New in version 2015.8.5.

Return a list of all static services

CLI Example:

```
salt '*' service.get_static
```

salt.modules.systemd.**mask**(*name*, *runtime=False*)
New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd
runtime [False] Set to `True` to mask this service only until the next reboot

New in version 2015.8.5.

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

salt.modules.systemd.**masked**(*name*, *runtime=False*)
New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

runtime [False] Set to `True` to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to `True`. Otherwise, it will check for an indefinite mask.

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

`salt.modules.systemd.`**`missing`**(*name*)

New in version 2014.1.0.

The inverse of *service.available*. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.systemd.`**`reload`**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Reload the specified service with systemd

no_block [False] Set to `True` to reload the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to `True` to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime [False] Set to `True` to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.systemd.`**`restart`**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Restart the specified service with systemd

no_block [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to `True` to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime [False] Set to `True` to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.systemd.`**`show`**(*name*)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

CLI Example:

salt `*' service.show <service name>

`salt.modules.systemd.`**`start`**(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with systemd

no_block [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

unmask_runtime [False] Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.systemd.`**`status`**(*name*, *sig=None*)

Return the status for a service via systemd, returns `True` if the service is running and `False` if it is not.

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.systemd.`**`stop`**(*name*, *no_block=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with systemd

no_block [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.systemd.`**`systemctl_reload`**`()`

New in version 0.15.0.

Reloads systemctl, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

`salt.modules.systemd.`**`unmask`**`(`*name*, *runtime=False*`)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with systemd

runtime [False] Set to `True` to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to `True`, and otherwise removes an indefinite mask.

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

19.9.387 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md

configuration This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available here.

In the minion's config file:

```
telemetry.telemetry_api_keys:
  - abc123  # Key 1
  - efg321  # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends requests

`salt.modules.telemetry.`**`create_alarm`**`(`*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*`)`

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry

salt.modules.telemetry.**delete_alarms**(*deployment_id*, *alert_id=None*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment. Returns (bool success, str message) tuple.

CLI Example:

salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.**get_alarms**(*deployment_id*, *profile='telemetry'*)

get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry

salt.modules.telemetry.**get_alert_config**(*deployment_id*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

Get all alert definitions associated with a given deployment or if metric_name is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry salt myminion telemetry.get_alert_config rs-ds033197 profile=telemetry

salt.modules.telemetry.**get_notification_channel_id**(*notify_channel*, *profile='telemetry'*)

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

notify_channel Email escalation policy

profile A dict of telemetry config information.

CLI Example:

salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry

salt.modules.telemetry.**update_alarm**(*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*)

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry

19.9.388 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Pythons tempfile module

New in version 2015.8.0.

salt.modules.temp.**dir**(*suffix=''*, *prefix='tmp'*, *parent=None*)

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

salt.modules.temp.**file**(*suffix=''*, *prefix='tmp'*, *parent=None*)
Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

19.9.389 salt.modules.test

Module for running arbitrary tests

salt.modules.test.**arg**(**args*, ***kwargs*)
Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {``args'': args, ``kwargs'': kwargs}.

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.**arg_clean**(**args*, ***kwargs*)
Like test.arg but cleans kwargs of the __pub* items CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.**arg_repr**(**args*, ***kwargs*)
Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {``args'': repr(args), ``kwargs'': repr(kwargs)}.

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

salt.modules.test.**arg_type**(**args*, ***kwargs*)
Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the minion

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

salt.modules.test.**assertion**(*assertion*)
Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

salt.modules.test.**attr_call**()
Call grains.items via the attribute

CLI Example:

```
salt '*' test.attr_call
```

salt.modules.test.**collatz**(*start*)

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

salt.modules.test.**conf_test**()

Return the value for test.foo in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

salt.modules.test.**cross_test**(*func*, *args=None*)

Execute a minion function via the __salt__ object in the test module, used to verify that the minion functions can be called via the __salt__ module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

salt.modules.test.**echo**(*text*)

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

salt.modules.test.**exception**(*message='Test Exception'*)

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

salt.modules.test.**false**()

Always return False

CLI Example:

```
salt '*' test.false
```

salt.modules.test.**fib**(*num*)

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

salt.modules.test.**get_opts**()
Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

salt.modules.test.**kwarg**(***kwargs*)
Print out the data passed into the function `**kwargs`, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

salt.modules.test.**module_report**()
Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

salt.modules.test.**not_loaded**()
List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

salt.modules.test.**opts_pkg**()
Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

salt.modules.test.**outputter**(*data*)
Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

salt.modules.test.**ping**()
Used to make sure the minion is up and responding. Not an ICMP ping.

Returns `True`.

CLI Example:

```
salt '*' test.ping
```

salt.modules.test.**provider**(*module*)
Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

salt.modules.test.**providers**()

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

salt.modules.test.**rand_sleep**(*max=60*)

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

salt.modules.test.**rand_str**(*size=9999999999*, *hash_type=None*)

Return a random string

size size of the string to generate

hash_type hash type to use

New in version 2015.5.2.

CLI Example:

```
salt '*' test.rand_str
```

salt.modules.test.**retcode**(*code=42*)

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

salt.modules.test.**sleep**(*length*)

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

salt.modules.test.**stack**()

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

salt.modules.test.**true**()

Always return True

CLI Example:

```
salt '*' test.true
```

salt.modules.test.**try_**(*module*, *return_try_exception=False*, ***kwargs*)

Try to run a module command. On an exception return None. If *return_try_exception* is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:

```
<pre>
{% for i in range(0,230) %}
    {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
↪'+i)|yaml(False) }}
{% endfor %}
</pre>
```

salt.modules.test.**tty**(**args*, ***kwargs*)

Deprecated! Moved to cmdmod.

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

salt.modules.test.**version**()

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

salt.modules.test.**versions**()

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

salt.modules.test.**versions_information**()

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

salt.modules.test.**versions_report**()

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

19.9.390 salt.modules.testinframod module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the testinfra.modules namespace.

19.9.391 salt.modules.test_virtual

Module for running arbitrary tests with a __virtual__ function

19.9.392 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

salt.modules.timezone.**get_hwclock**()
Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.timezone.**get_offset**()
Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.timezone.**get_zone**()
Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values can also be returned `CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.timezone.**get_zonecode**()
Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.timezone.**set_hwclock**(*clock*)
Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.timezone.**set_zone**(*timezone*)
Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automagically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

salt.modules.timezone.**zone_compare**(*timezone*)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in /etc/localtime. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-link operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

19.9.393 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

configuration Add the following values in /etc/salt/minion for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \
days=5 \
CN='My Little CA' \
C=US \
ST=Utah \
L=Salt Lake City \
O=Saltstack \
emailAddress=pleasedontemail@example.com

Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"

# salt-call tls.create_csr my_little CN=www.example.com
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.crt
 ↪"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs//DBReplica_No.1.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2  \
    cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt"

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
 ↪MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_
 ↪server.csr."

# salt-call tls_create_ca_signed_cert my_little CN=www.anothersometh.ing \
    cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_
 ↪completely_different.crt
```

`salt.modules.tls.`**`ca_exists`**(*ca_name*, *cacert_path=None*, *ca_filename=None*)

Verify whether a Certificate Authority (CA) already exists

ca_name name of the CA

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

salt.modules.tls.**cert_base_path**(*cacert_path=None*)

Return the base path for certs from CLI or from options
cacert_path absolute path to ca certificates root directory
CLI Example:

```
salt '*' tls.cert_base_path
```

salt.modules.tls.**cert_info**(*cert_path*, *digest='sha256'*)

Return information for a particular certificate
cert_path path to the cert file
digest what digest to use for fingerprinting
CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

salt.modules.tls.**create_ca**(*ca_name*, *bits=2048*, *days=365*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress='xyz@pdq.net'*, *fixmode=False*, *cacert_path=None*, *ca_filename=None*, *digest='sha256'*, *onlyif=None*, *unless=None*, *replace=False*)

Create a Certificate Authority (CA)
ca_name name of the CA
bits number of RSA key bits, default is 2048
days number of days the CA will be valid, default is 365
CN common name in the request, default is ``localhost''
C country, default is ``US''
ST state, default is ``Utah''
L locality, default is ``Centerville'', the city where SaltStack originated
O organization, default is ``SaltStack''
OU organizational unit, default is None
emailAddress email address for the CA owner, default is `xyz@pdq.net`
cacert_path absolute path to ca certificates root directory
ca_filename alternative filename for the CA

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, ``md5'' or ``sha1''. Default: `sha256'
replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

salt.modules.tls.**create_ca_signed_cert**(*ca_name*, *CN*, *days=365*, *cacert_path=None*, *ca_filename=None*, *cert_path=None*, *cert_filename=None*, *digest='sha256'*, *cert_type=None*, *type_ext=False*, *replace=False*)

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by create_csr. If it does not, this method does nothing.

ca_name name of the CA

CN common name matching the certificate signing request

days number of days certificate is valid, default is 365 (1 year)

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

cert_path full path to the certificates directory

cert_filename alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of `cert_type`. `type_ext` will be completely overridden.

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, ``md5'' or ``sha1''. Default: `sha256'

replace Replace this certificate even if it exists

New in version 2015.5.1.

cert_type string. Either `server' or `client' (see create_csr() for details).

If create_csr(type_ext=True) this function **must** be called with the same cert_type so it can find the CSR file.

Note: create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

---

type_ext bool. If set True, use `cert_type` as an extension to the CN when formatting the filename.

e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

salt.modules.tls.**create_csr**(*ca_name*, *bits=2048*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress='xyz@pdq.net'*, *subjectAltName=None*, *cacert_path=None*, *ca_filename=None*, *csr_path=None*, *csr_filename=None*, *digest='sha256'*, *type_ext=False*, *cert_type='server'*, *replace=False*)

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

ca_name name of the CA

bits number of RSA key bits, default is 2048

CN common name in the request, default is ``localhost''

C country, default is ``US''

ST state, default is ``Utah''

L locality, default is ``Centerville'', the city where SaltStack originated

O organization, default is ``SaltStack'' NOTE: Must the same as CA certificate or an error will be raised

OU organizational unit, default is None

emailAddress email address for the request, default is `xyz@pdq.net`

subjectAltName valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:

examples: **['DNS:somednsname.com`**, `DNS:1.2.3.4`, `IP:1.2.3.4', `IP:2001:4801:7821:77:be76:4eff:fe11:e51', `email:me@i.like.pie.com']

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to https://1.2.3.4 will fail from python's requests library w/out the second entry in the above list

---

New in version 2015.8.0.

cert_type Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
   'basicConstraints': 'CA:FALSE',
   'extendedKeyUsage': 'serverAuth',
   'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
   'basicConstraints': 'CA:FALSE',
   'extendedKeyUsage': 'clientAuth',
   'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

type_ext boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved

replace Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

salt.modules.tls.**create_empty_crl**(*ca_name*, *cacert_path=None*, *ca_filename=None*, *crl_file=None*)

Create an empty Certificate Revocation List.

New in version 2015.8.0.

ca_name name of the CA

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

crl_file full path to the CRL file

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji'                    ca_filename='ca'
↪           crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.**create_pkcs12**(*ca_name*, *CN*, *passphrase=''*, *cacert_path=None*, *replace=False*)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

ca_name name of the CA

CN common name matching the certificate signing request

passphrase used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path absolute path to ca certificates root directory

replace Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

salt.modules.tls.**create_self_signed_cert**(*tls_dir='tls'*, *bits=2048*, *days=365*, *CN='localhost'*, *C='US'*, *ST='Utah'*, *L='Salt Lake City'*, *O='SaltStack'*, *OU=None*, *emailAddress='xyz@pdq.net'*, *cacert_path=None*, *cert_filename=None*, *digest='sha256'*, *replace=False*)

Create a Self-Signed Certificate (CERT)
tls_dir location appended to the ca.cert_base_path, default is `tls'
bits number of RSA key bits, default is 2048
CN common name in the request, default is ``localhost''
C country, default is ``US''
ST state, default is ``Utah''
L locality, default is ``Centerville'', the city where SaltStack originated
O organization, default is ``SaltStack'' NOTE: Must the same as CA certificate or an error will be raised
OU organizational unit, default is None
emailAddress email address for the request, default is `xyz@pdq.net`
cacert_path absolute path to ca certificates root directory
digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, ``md5'' or ``sha1''. Default: `sha256'
replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

salt.modules.tls.**get_ca**(*ca_name*, *as_text=False*, *cacert_path=None*)

Get the certificate path or content
ca_name name of the CA
as_text if true, return the certificate content instead of the path
cacert_path absolute path to ca certificates root directory
CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

salt.modules.tls.**get_ca_signed_cert**(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *cert_filename=None*)

Get the certificate path or content
ca_name name of the CA
CN common name of the certificate
as_text if true, return the certificate content instead of the path
cacert_path absolute path to certificates root directory
cert_filename alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/
↪etc/certs
```

salt.modules.tls.**get_ca_signed_key**(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *key_filename=None*)

Get the certificate path or content

ca_name name of the CA

CN common name of the certificate

as_text if true, return the certificate content instead of the path

cacert_path absolute path to certificates root directory

key_filename alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key test_ca CN=localhost
↪as_text=False cacert_path=/etc/certs
```

salt.modules.tls.**get_extensions**(*cert_type*)

Fetch X509 and CSR extension definitions from tls:extensions: (common|server|client) or set them to standard defaults.

New in version 2015.8.0.

cert_type: The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

salt.modules.tls.**maybe_fix_ssl_version**(*ca_name*, *cacert_path=None*, *ca_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

ca_name ca authority name

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

salt.modules.tls.**revoke_cert**(*ca_name*, *CN*, *cacert_path=None*, *ca_filename=None*, *cert_path=None*, *cert_filename=None*, *crl_file=None*)

Revoke a certificate.

New in version 2015.8.0.

ca_name Name of the CA.

CN Common name matching the certificate signing request.

cacert_path Absolute path to ca certificates root directory.

ca_filename Alternative filename for the CA.

cert_path Path to the cert file.

cert_filename Alternative filename for the certificate, useful when using special characters in the CN.

crl_file Full path to the CRL file.

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji'                    ca_filename='ca'
 ↪     crl_file='/etc/openvpn/team1/crl.pem'
```

salt.modules.tls.**set_ca_path**(*cacert_path*)

If wanted, store the aforementioned cacert_path in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

19.9.394 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface ``0:0:0:0:0:0:0:1''
- If you are using tomcat.tar.gz it has to be installed or symlinked under `/opt`, preferably using name tomcat
- ``tomcat.signal start/stop'' works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
  user: <username>
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the conf/tomcat-users.xml file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
    <role rolename="manager-script"/>
    <user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:

- More information about tomcat manager: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html
- if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:

  JVM Vendor: Sun Microsystems Inc.

JVM Version: 1.6.0_43-b01

OS Architecture: amd64

OS Name: Linux

OS Version: 2.6.32-358.el6.x86_64

Tomcat Version: Apache Tomcat/7.0.37

---

salt.modules.tomcat.**deploy_war**(*war*, *context*, *force='no'*, *url='http://localhost:8080/manager'*, *saltenv='base'*, *timeout=180*, *temp_war_location=None*, *version=True*)

Deploy a WAR file

war absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function

context the context path to deploy

force [False] set True to deploy the webapp even one is deployed in the context

url [http://localhost:8080/manager] the URL of the server manager webapp

saltenv [base] the environment for WAR file in used by salt.modules.cp.get_url function

timeout [180] timeout for HTTP request

temp_war_location [None] use another location to temporarily copy to war file by default the system's temp directory is used

version [``] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
 ↪manager
```

minion local file system

```
salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
 ↪manager
```

salt.modules.tomcat.**extract_war_version**(*war*)

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:

```
/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None
```

salt.modules.tomcat.**fullversion**()

Return all server information from catalina.sh version

CLI Example:

```
salt '*' tomcat.fullversion
```

salt.modules.tomcat.**leaks**(*url='http://localhost:8080/manager'*, *timeout=180*)

Find memory leaks in tomcat

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.leaks
```

salt.modules.tomcat.**ls**(*url='http://localhost:8080/manager'*, *timeout=180*)

list all the deployed webapps

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager
```

salt.modules.tomcat.**passwd**(*passwd*, *user=''*, *alg='sha1'*, *realm=None*)

This function replaces the $CATALINA_HOME/bin/digest.sh script convert a clear-text password to the $CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```
salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'
```

salt.modules.tomcat.**reload**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Reload the webapp

app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**serverinfo**(*url='http://localhost:8080/manager'*, *timeout=180*)

return details about the server

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

salt.modules.tomcat.**sessions**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

return the status of the webapp sessions

app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**signal**(*signal=None*)

Signals catalina to start, stop, securestart, forcestop.

CLI Example:

```
salt '*' tomcat.signal start
```

salt.modules.tomcat.**start**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Start the webapp

app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**status**(*url='http://localhost:8080/manager'*, *timeout=180*)

Used to test if the tomcat manager is up

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

salt.modules.tomcat.**status_webapp**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

return the status of the webapp (stopped | running | missing)

app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**stop**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Stop the webapp

app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**undeploy**(*app*, *url='http://localhost:8080/manager'*, *timeout=180*)

Undeploy a webapp

app the webapp context path

url [http://localhost:8080/manager] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.**version**()
Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```

19.9.395 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

`traffic_ctl` is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.**alarms**()
List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

salt.modules.trafficserver.**bounce_cluster**()
Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

salt.modules.trafficserver.**bounce_local**(*drain=False*)
Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.
drain This option modifies the restart behavior such that traffic_server is not shut down until the number of active client connections drops to the number given by the proxy.config.restart.active_client_threshold configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

salt.modules.trafficserver.**clear_alarms**(*alarm*)
Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. ‘‘1’‘), or an alarm string identifier (e.g. ‘’MGMT_ALARM_PROXY_CONFIG_ERROR‘‘).

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

salt.modules.trafficserver.**clear_cluster**()
Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

salt.modules.trafficserver.**clear_node**()
Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

salt.modules.trafficserver.**match_config**(*regex*)
Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

salt.modules.trafficserver.**match_metric**(*regex*)
Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

salt.modules.trafficserver.**match_var**(*regex*)
Display the current values of all performance statistics or configuration variables whose names match the given regular expression.

Deprecated since version Fluorine: Use `match_metric` or `match_config` instead.

```
salt '*' trafficserver.match_var regex
```

salt.modules.trafficserver.**offline**(*path*)
Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in storage.config. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the traffic_server process.

```
salt '*' trafficserver.offline /path/to/cache
```

salt.modules.trafficserver.**read_config**(**args*)
Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

salt.modules.trafficserver.**read_metric**(**args*)
Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

salt.modules.trafficserver.**read_var**(**args*)
Read variable definitions from the traffic_line command.

Deprecated since version Fluorine: Use `read_metric` or `read_config` instead. Note that this function does not work for Traffic Server versions >= 7.0.

```
salt '*' trafficserver.read_var proxy.process.http.tcp_hit_count_stat
```

salt.modules.trafficserver.**refresh**()
Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the proxy.node.config.reconfigure_time metric.

```
salt '*' trafficserver.refresh
```

salt.modules.trafficserver.**restart_cluster**()

Restart the traffic_manager process and the traffic_server process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

salt.modules.trafficserver.**restart_local**(*drain=False*)

Restart the traffic_manager and traffic_server processes on the local node.

drain This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

salt.modules.trafficserver.**set_config**(*variable*, *value*)

Set the value of a Traffic Server configuration variable.

variable Name of a Traffic Server configuration variable.

value The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

salt.modules.trafficserver.**set_var**(*variable*, *value*)

```

```

Deprecated since version Fluorine: Use `set_config` instead. Note that this function does not work for Traffic Server versions >= 7.0.

salt `*' trafficserver.set_var proxy.config.http.server_ports

salt.modules.trafficserver.**shutdown**()

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

salt.modules.trafficserver.**startup**()

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

salt.modules.trafficserver.**status**()

Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

salt.modules.trafficserver.**zero_cluster**()

Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

salt.modules.trafficserver.**zero_node**()

Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

19.9.396 salt.modules.travisci

Commands for working with travisci.

depends pyOpenSSL >= 16.0.0

salt.modules.travisci.**verify_webhook**(*signature*, *body*)
Verify the webhook signature from travisci
signature The signature header from the webhook header
body The full payload body from the webhook post

Note: The body needs to be the urlencoded version of the body.

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
↪%3A183791261%2C%22repository...'
```

19.9.397 salt.modules.tuned

Interface to Red Hat tuned-adm module

maintainer Syed Ali <alicsyed@gmail.com>

maturity new

depends tuned-adm

platform Linux

salt.modules.tuned.**active**()
Return current active profile

CLI Example:

```
salt '*' tuned.active
```

salt.modules.tuned.**list**()
List the profiles available

CLI Example:

```
salt '*' tuned.list
```

salt.modules.tuned.**off**()
Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

salt.modules.tuned.**profile**(*profile_name*)
Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

19.9.398 salt.modules.twilio_notify

Module for notifications via Twilio

New in version 2014.7.0.

depends

- twilio python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-twilio-account:
    twilio.account_sid: AC32a3c83990934481addd5ce1659f04d2
    twilio.auth_token: mytoken
```

salt.modules.twilio_notify.**send_sms**(*profile*, *body*, *to*, *from_*)

Send an sms

CLI Example:

twilio.send_sms twilio-account `Test sms' `+18019999999' `+18011111111'

19.9.399 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

salt.modules.udev.**env**(*dev*)

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

salt.modules.udev.**exportdb**()

Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

salt.modules.udev.**info**(*dev*)

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

salt.modules.udev.**links**(*dev*)
Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

salt.modules.udev.**name**(*dev*)
Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

salt.modules.udev.**path**(*dev*)
Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

19.9.400 salt.modules.upstart

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to *`service.start' is not available*), see *here*.

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of ``initctl show-config'' to determine if all service dependencies are enabled to start on boot. For example, see the ``start on'' condition for the lightdm service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on ((((filesystem and runlevel [!06]) and started dbus) and (drm-device-added
 ↪card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel
 ↪PREVLEVEL=S)
stop on runlevel [016]
```

Warning: This module should not be used on Red Hat systems. For these, the *rh_service* module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

salt.modules.upstart.**available**(*name*)
Returns `True` if the specified service is available, otherwise returns `False`.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.upstart.**disable**(*name*, ***kwargs*)
Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.upstart.**disabled**(*name*)
Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.upstart.**enable**(*name*, ***kwargs*)
Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.upstart.**enabled**(*name*, ***kwargs*)
Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.upstart.**force_reload**(*name*)
Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

salt.modules.upstart.**full_restart**(*name*)
Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

salt.modules.upstart.**get_all**()
Return all installed services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.upstart.**get_disabled**()
Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.upstart.**get_enabled**()
Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.upstart.**missing**(*name*)
The inverse of service.available. Returns `True` if the specified service is not available, otherwise returns `False`.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.upstart.**reload**(*name*)
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.upstart.**restart**(*name*)
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.upstart.**start**(*name*)
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.upstart.**status**(*name*, *sig=None*)
Return the status for a service, returns a bool whether the service is running.

CLI Example:

```
salt '*' service.status <service name>
```

salt.modules.upstart.**stop**(*name*)
Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.401 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.**check_exists**(*name*)
Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.**checks_list**()
List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

salt.modules.uptime.**create**(*name*, ***params*)
Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation https://github.com/fzaninotto/uptime for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.**delete**(*name*)
Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

19.9.402 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *`user.info' is not available*), see *here*.

---

salt.modules.useradd.**add**(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *system=False*, *fullname=''*, *roomnumber=''*, *workphone=''*, *homephone=''*, *createhome=True*, *loginclass=None*, *root=None*, *nologinit=False*)
Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

salt.modules.useradd.**chfullname**(*name*, *fullname*)
Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

salt.modules.useradd.**chgid**(*name*, *gid*, *root=None*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

salt.modules.useradd.**chgroups**(*name*, *groups*, *append=False*, *root=None*)

Change the groups to which this user belongs

name User to modify

groups Groups to set for the user

append [False] If `True`, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

salt.modules.useradd.**chhome**(*name*, *home*, *persist=False*, *root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.useradd.**chhomephone**(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

salt.modules.useradd.**chloginclass**(*name*, *loginclass*, *root=None*)

Change the default login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

salt.modules.useradd.**chroomnumber**(*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.useradd.**chshell**(*name*, *shell*, *root=None*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.useradd.**chuid**(*name*, *uid*)
Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.useradd.**chworkphone**(*name*, *workphone*)
Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

salt.modules.useradd.**delete**(*name*, *remove=False*, *force=False*, *root=None*)
Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

salt.modules.useradd.**get_loginclass**(*name*)
Get the login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.get_loginclass foo
```

salt.modules.useradd.**getent**(*refresh=False*)
Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

salt.modules.useradd.**info**(*name*)
Return user information

CLI Example:

```
salt '*' user.info root
```

salt.modules.useradd.**list_groups**(*name*)
Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.useradd.**list_users**()
Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

salt.modules.useradd.**primary_group**(*name*)
Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

salt.modules.useradd.**rename**(*name*, *new_name*, *root=None*)
Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

19.9.403 salt.modules.uwsgi

uWSGI stats server https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html

maintainer Peter Baumgartner <pete@lincolnloop.com>

maturity new

platform all

salt.modules.uwsgi.**stats**(*socket*)
Return the data from *uwsgi --connect-and-read* as a dictionary.
socket The socket the uWSGI stats server is listening on
CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatsserver.sock

salt '*' uwsgi.stats 127.0.0.1:5050
```

19.9.404 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

salt.modules.varnish.**ban**(*ban_expression*)
Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

salt.modules.varnish.**ban_list**()
List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

salt.modules.varnish.**param_set**(*param*, *value*)
Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

salt.modules.varnish.**param_show**(*param=None*)
Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

salt.modules.varnish.**purge**()
Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

salt.modules.varnish.**version**()
Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

19.9.405 salt.modules.vault module

maintainer SaltStack

maturity new

platform all

Functions to interact with Hashicorp Vault.

configuration The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or /etc/salt/master.d/vault.conf:

```
vault:
    url: https://vault.service.domain:8200
    auth:
        method: token
        token: 11111111-2222-3333-4444-555555555555
    policies:
        - saltstack/minions
        - saltstack/minion/{minion}
        .. more policies
```

url Url to your Vault installation. Required.

auth Currently only token auth is supported. The token must be able to create tokens with the policies that should be assigned to minions. Required.

policies Policies that are assigned to minions when requesting a token. These can either be static, eg saltstack/minions, or templated, eg `saltstack/minion/{minion}`. `{minion}` is shorthand for grains[id]. Grains are also available, for example like this: `mypolicies/{grains[os]}`

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template `saltstack/by-role/{grains[roles]}`, and a minion having these grains:

The minion will have the policies `saltstack/by-role/web` and `saltstack/by-role/database`. Note however that list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

Optional. If policies is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

Add this segment to the master configuration file, or /etc/salt/master.d/peer_run.conf:

```
peer_run:
    .*:
        - vault.generate_token
```

salt.modules.vault.**delete_secret**(*path*)

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

salt.modules.vault.**list_secrets**(*path*)

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

salt.modules.vault.**read_secret**(*path*, *key=None*)

Return the value of key at path in vault, or entire secret

Jinja Example:

```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
    first: {{ supersecret.first }}
    second: {{ supersecret.second }}
```

salt.modules.vault.**write_secret**(*path*, ***kwargs*)

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

19.9.406 salt.modules.vbox_guest

VirtualBox Guest Additions installer

salt.modules.vbox_guest.**additions_install**(**args*, ***kwargs*)

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D' (`Host' is usually `Right Ctrl').

See https://www.virtualbox.org/manual/ch04.html#idp52733088 for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters

- **reboot** (*bool*) -- reboot computer to complete installation
- **upgrade_os** (*bool*) -- upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns version of VirtualBox Guest Additions or string with error

salt.modules.vbox_guest.**additions_mount**()

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press `Host+D' (`Host' is usually `Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

Returns True or OSError exception

salt.modules.vbox_guest.**additions_remove**(***kwargs*)

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing `/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it failes.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters **force** (*bool*) -- force VirtualBox Guest Additions removing

Returns True if VirtualBox Guest Additions were removed successfully else False

salt.modules.vbox_guest.**additions_umount**(*mount_point*)

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

Parameters **mount_point** -- directory VirtualBox Guest Additions is mounted to

Returns True or an string with error

salt.modules.vbox_guest.**additions_version**()
Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

Returns version of VirtualBox Guest Additions or False if they are not installed

salt.modules.vbox_guest.**grant_access_to_shared_folders_to**(*name*, *users=None*)
Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*. Access will be denied to the users not listed in *users* argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters
- **name** (*str*) -- name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) -- list of names of users to grant access to auto-mounted shared folders to (if specified, *name* will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

salt.modules.vbox_guest.**list_shared_folders_users**()
List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

Returns list of users who have access to auto-mounted shared folders

19.9.407 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

The default for this setting is `False`.

depends virtualbox

salt.modules.vboxmanage.**clonemedium**(*medium*, *uuid_in=None*, *file_in=None*, *uuid_out=None*, *file_out=None*, *mformat=None*, *variant=None*, *existing=False*, ***kwargs*)
Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

salt.modules.vboxmanage.**clonevm**(*name=None*, *uuid=None*, *new_name=None*, *snapshot_uuid=None*, *snapshot_name=None*, *mode='machine'*, *options=None*, *basefolder=None*, *new_uuid=None*, *register=False*, *groups=None*, ***kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

salt.modules.vboxmanage.**create**(*name*, *groups=None*, *ostype=None*, *register=True*, *basefolder=None*, *new_uuid=None*, ***kwargs*)

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

salt.modules.vboxmanage.**destroy**(*name*)

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

salt.modules.vboxmanage.**list_items**(*item*, *details=False*, *group_by='UUID'*)

Return a list of a specific type of item. The following items are available:

vms runningvms ostypes hostdvds hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks groups webcams screenshotformats

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the `UUID` field, but not all items contain that field. In those cases, another field must be specified.

salt.modules.vboxmanage.**list_nodes**()

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

salt.modules.vboxmanage.**list_nodes_full**()

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

salt.modules.vboxmanage.**list_nodes_min**()

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

salt.modules.vboxmanage.**list_ostypes**()
List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

salt.modules.vboxmanage.**register**(*filename*)
Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

salt.modules.vboxmanage.**start**(*name*)
Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

salt.modules.vboxmanage.**stop**(*name*)
Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

salt.modules.vboxmanage.**unregister**(*name*, *delete=False*)
Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

salt.modules.vboxmanage.**vboxcmd**()
Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

19.9.408 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

salt.modules.victorops.**create_event**(*message_type=None*, *routing_key='everybody'*, ***kwargs*)
Create an event in VictorOps. Designed for use in states.

The following parameters are required:

Parameters **message_type** -- One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

Parameters

- **routing_key** -- The key for where messages should be routed. By default, sent to `everyone' route.
- **entity_id** -- The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** -- Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp_fmt The date format for the timestamp parameter.

Parameters

- **state_start_time** -- The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** -- The date format for the timestamp parameter.
- **state_message** -- Any additional status information from the alert item.
- **entity_is_host** -- Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** -- Used within VictorOps to display a human-readable name for the entity.
- **ack_message** -- A user entered comment for the acknowledgment.
- **ack_author** -- The user that acknowledged the incident.

Returns A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone
 ↪'                  entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key=
 ↪'everyone'                  entity_id='hostname/diskspace' ack_message=
 ↪'Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone
 ↪'                  entity_id='hostname/diskspace'
```

The following parameters are required: message_type

19.9.409 salt.modules.virt

Work with virtual machines managed by libvirt

depends libvirt Python module

`salt.modules.virt.`**`cpu_baseline`**(*full=False*, *migratable=False*, *out='libvirt'*)

Return the optimal `custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters

- **full** -- Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** -- Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** -- `libvirt' (default) for usable libvirt XML definition, `salt' for nice dict

CLI Example:

```
salt '*' virt.cpu_baseline
```

`salt.modules.virt.`**`create_xml_path`**(*path*)

Start a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

salt.modules.virt.**create_xml_str**(*xml*)
Start a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

salt.modules.virt.**ctrl_alt_del**(*vm_*)
Sends CTRL+ALT+DEL to a VM

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

salt.modules.virt.**define_vol_xml_path**(*path*)
Define a volume based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

salt.modules.virt.**define_vol_xml_str**(*xml*)
Define a volume based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

salt.modules.virt.**define_xml_path**(*path*)
Define a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

salt.modules.virt.**define_xml_str**(*xml*)
Define a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

salt.modules.virt.**delete_snapshots**(*name*, **names*, ***kwargs*)
Delete one or more snapshots of the given VM.

Options:

- **all**: Remove all snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

salt.modules.virt.**freecpu**()
Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.virt.**freemem**()
Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.virt.**full_info**()
Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.virt.**get_disks**(*vm_*)
Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <domain>
```

salt.modules.virt.**get_graphics**(*vm_*)
Returns the information on vnc for a given vm

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

salt.modules.virt.**get_macs**(*vm_*)
Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <domain>
```

salt.modules.virt.**get_nics**(*vm_*)
Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <domain>
```

salt.modules.virt.**get_profiles**(*hypervisor=None*)
Return the virt profiles for hypervisor.

Currently there are profiles for:
- nic
- disk

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi
```

salt.modules.virt.**get_xml**(*vm_*)
Returns the XML for a given vm

CLI Example:

```
salt '*' virt.get_xml <domain>
```

salt.modules.virt.**init**(*name*, *cpu*, *mem*, *image=None*, *nic='default'*, *hypervisor='kvm'*, *start=True*, *disk='default'*, *saltenv='base'*, *seed=True*, *install=True*, *pub_key=None*, *priv_key=None*, *seed_cmd='seed.apply'*, *enable_vnc=False*, *enable_qcow=False*, ***kwargs*)

Initialize a new vm

CLI Example:

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

salt.modules.virt.**is_hyper**()

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

salt.modules.virt.**is_kvm_hyper**()

Returns a bool whether or not this node is a KVM hypervisor

CLI Example:

```
salt '*' virt.is_kvm_hyper
```

salt.modules.virt.**is_xen_hyper**()

Returns a bool whether or not this node is a XEN hypervisor

CLI Example:

```
salt '*' virt.is_xen_hyper
```

salt.modules.virt.**list_active_vms**()

Return a list of names for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.virt.**list_domains**()

Return a list of available domains.

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.virt.**list_inactive_vms**()

Return a list of names for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.virt.**list_snapshots**(*domain=None*)

List available snapshots for certain vm or for all.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

salt.modules.virt.**migrate**(*vm_*, *target*, *ssh=False*)
Shared storage migration

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor>
```

salt.modules.virt.**migrate_non_shared**(*vm_*, *target*, *ssh=False*)
Attempt to execute non-shared storage ``all'' migration

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

salt.modules.virt.**migrate_non_shared_inc**(*vm_*, *target*, *ssh=False*)
Attempt to execute non-shared storage ``all'' migration

CLI Example:

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

salt.modules.virt.**node_info**()
Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

salt.modules.virt.**pause**(*vm_*)
Pause the named vm

CLI Example:

```
salt '*' virt.pause <domain>
```

salt.modules.virt.**purge**(*vm_*, *dirs=False*)
Recursively destroy and delete a virtual machine, pass True for dir's to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

CLI Example:

```
salt '*' virt.purge <domain>
```

salt.modules.virt.**reboot**(*name*)
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

salt.modules.virt.**reset**(*vm_*)
Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <domain>
```

salt.modules.virt.**resume**(*vm_*)
Resume the named vm

CLI Example:

```
salt '*' virt.resume <domain>
```

salt.modules.virt.**revert_snapshot**(*name*, *snapshot=None*, *cleanup=False*)
Revert snapshot to the previous from current (if available) or to the specific.

Options:

- **cleanup**: Remove all newer than reverted snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

salt.modules.virt.**seed_non_shared_migrate**(*disks*, *force=False*)
Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

salt.modules.virt.**set_autostart**(*vm_*, *state='on'*)
Set the autostart flag on a VM so that the VM will start with the host system on reboot.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

salt.modules.virt.**setmem**(*vm_*, *memory*, *config=False*)
Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

memory is to be specified in MB If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

salt.modules.virt.**setvcpus**(*vm_*, *vcpus*, *config=False*)
Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

vcpus is an int representing the number to be assigned If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

salt.modules.virt.**shutdown**(*vm_*)
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

salt.modules.virt.**snapshot**(*domain*, *name=None*, *suffix=None*)

Create a snapshot of a VM.

Options:

- **name**: Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- **suffix**: Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

salt.modules.virt.**start**(*name*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

salt.modules.virt.**stop**(*name*)

Hard power down the virtual machine, this is equivalent to pulling the power.

CLI Example:

```
salt '*' virt.stop <domain>
```

salt.modules.virt.**undefine**(*vm_*)

Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

CLI Example:

```
salt '*' virt.undefine <domain>
```

salt.modules.virt.**virt_type**()

Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

salt.modules.virt.**vm_cputime**(*vm_=None*)

Return cputime used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'cputime' <int>
        'cputime_percent' <int>
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

salt.modules.virt.**vm_diskstats**(*vm_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'rd_req'   : 0,
        'rd_bytes' : 0,
        'wr_req'   : 0,
        'wr_bytes' : 0,
        'errs'     : 0
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_blockstats
```

salt.modules.virt.**vm_info**(*vm_=None*)

Return detailed information about the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'cpu': <int>,
        'maxMem': <int>,
        'mem': <int>,
        'state': '<state>',
        'cputime' <int>
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.virt.**vm_netstats**(*vm_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'rx_bytes'   : 0,
        'rx_packets' : 0,
        'rx_errs'    : 0,
        'rx_drop'    : 0,
        'tx_bytes'   : 0,
        'tx_packets' : 0,
        'tx_errs'    : 0,
        'tx_drop'    : 0
```

```
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.virt.**vm_state**(*vm_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

19.9.410 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

salt.modules.virtualenv_mod.**create**(*path*, *venv_bin=None*, *system_site_packages=False*, *distribute=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *pip=False*, *symlinks=None*, *upgrade=None*, *user=None*, *use_vt=False*, *saltenv='base'*, ***kwargs*)

Create a virtualenv

path The path to the virtualenv to be created

venv_bin The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

system_site_packages [False] Passthrough argument given to virtualenv or pyvenv

distribute [False] Passthrough argument given to virtualenv

pip [False] Install pip after creating a virtual environment. Implies `distribute=True`

clear [False] Passthrough argument given to virtualenv or pyvenv

python [None (default)] Passthrough argument given to virtualenv

extra_search_dir [None (default)] Passthrough argument given to virtualenv

never_download [None (default)] Passthrough argument given to virtualenv if True

prompt [None (default)] Passthrough argument given to virtualenv if not None

symlinks [None] Passthrough argument given to pyvenv if True

upgrade [None] Passthrough argument given to pyvenv if True

user [None] Set ownership for the virtualenv

> **Note:** On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

runas [None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

use_vt [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

saltenv [`base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

Note: The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

`salt.modules.virtualenv_mod.`**`get_distribution_path`**(*venv*, *distribution*)

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv Path to the virtualenv.

distribution Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

`salt.modules.virtualenv_mod.`**`get_resource_content`**(*venv*, *package=None*, *resource=None*)

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

venv Path to the virtualenv

package Name of the package in which the resource resides

New in version 2016.3.0.

resource Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.
↪xml
```

`salt.modules.virtualenv_mod.`**`get_resource_path`**(*venv*, *package=None*, *resource=None*)

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv Path to the virtualenv

package Name of the package in which the resource resides

New in version 2016.3.0.

resource Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

`salt.modules.virtualenv_mod.`**`get_site_packages`**(*venv*)

Return the path to the site-packages directory of a virtualenv

venv Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

19.9.411 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

codeauthor Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the pyVmomi Python library and the ESXCLI package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user>
 ↪  <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:
----------
    esxi-1.example.com:
        ----------
        Coredump Config:
            ----------
            enabled:
                False
    esxi-2.example.com:
        ----------
        Coredump Config:
            ----------
            enabled:
                True
            host_vnic:
                vmk0
            ip:
                coredump-location.example.com
            port:
                6500
```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using

the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```
# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-
 ↪password>
local:
----------
    10.4.28.150:
        ----------
        Coredump Config:
            ----------
            enabled:
                True
            host_vnic:
                vmk0
            ip:
                coredump-location.example.com
            port:
                6500
```

`salt.modules.vsphere.`**`coredump_network_enable`**(*host*, *username*, *password*, *enabled*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

enabled Python True or False to enable or disable coredumps.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
 ↪True             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`enable_firewall_ruleset`**(*host*, *username*, *password*, *ruleset_enable*, *ruleset_name*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Enable or disable an ESXi firewall rule set.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

ruleset_enable True to enable the ruleset, false to disable.

ruleset_name Name of ruleset to target.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True
 ↪'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password
 ↪True 'syslog'             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**esxcli_cmd**(*cmd_str*, *host=None*, *username=None*, *password=None*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

cmd_str The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password              'system
 ↪coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
 ↪'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_coredump_network_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard cmd.run_all dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
 ↪password             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_firewall_status**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Show status of all firewall rule sets.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Nested dictionary with two toplevel keys `rulesets` and `success` `success` will be True or False depending on query success `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
 ↪    esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**get_proxy_type**()

Returns the proxy type

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

salt.modules.vsphere.**get_syslog_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Retrieve the syslog configuration.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
 ↪  esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**gets_service_instance_via_proxy**(*fn*)

Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (vim.ServiceInstance) to the decorated function.

Notes

1. The decorated function must have a `service_instance` parameter or a `**kwarg` type argument (name of argument is not important); 2. If the `service_instance` parameter is already defined, the value is passed through to the decorated function; 3. If the `service_instance` parameter in not defined, the connection is created using the proxy details and the service instance is returned.

CLI Example: None, this is a decorator

salt.modules.vsphere.**reset_syslog_config**(*host*, *username*, *password*, *protocol=None*, *port=None*, *syslog_config=None*, *esxi_hosts=None*, *credstore=None*)

Reset the syslog service to its default settings.

Valid syslog_config values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

syslog_config List of parameters to reset, provided as a comma-delimited string, or `all' to reset all syslog configuration parameters. Required.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of `success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

`syslog_config` can be passed as a quoted, comma-separated string, e.g.

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
 ↪syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
 ↪    syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.
 ↪com]'
```

salt.modules.vsphere.**set_coredump_network_config**(*host*, *username*, *password*, *dump_ip*, *protocol=None*, *port=None*, *host_vnic='vmk0'*, *dump_port=6500*, *esxi_hosts=None*, *credstore=None*)

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see *coredump_network_enable*) before these parameters may be set.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

dump_ip IP address of host that will accept the dump.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

host_vnic Host VNic port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump, defaults to `6500`.

credstore Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary with a *success* key added, per host. *success* will be True if the set succeeded, False otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_
↪ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-password
↪'dump_ip.host.com'             esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.**set_syslog_config**(*host*, *username*, *password*, *syslog_config*, *config_value*, *protocol=None*, *port=None*, *firewall=True*, *reset_service=True*, *esxi_hosts=None*, *credstore=None*)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

host ESXi or vCenter host to connect to.

username User to connect as, usually root.

password Password to connect with.

syslog_config Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are `logdir`, `loghost`, `default-rotate`,``default-size`, `default-timeout`, and `logdir-unique`.

config_value Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is `443`.

firewall Enable the firewall rule set for syslog. Defaults to `True`.

reset_service After a successful parameter set, reset the service. Defaults to `True`.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of `success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
 ↪loghost ssl://localhost:5432,tcp://10.1.0.1:1514

# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
 ↪  loghost ssl://localhost:5432,tcp://10.1.0.1:1514             esxi_hosts=
 ↪'[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.`**`supports_proxies`**(**proxy_types*)

Decorator to specify which proxy types are supported by a function

proxy_types: Arbitrary list of strings with the supported types of proxies

`salt.modules.vsphere.`**`syslog_service_reload`**(*host*, *username*, *password*, *protocol=None*, *port=None*, *esxi_hosts=None*, *credstore=None*)

Reload the syslog service so it will pick up any changes.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use esxi_hosts to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns A standard cmd.run_all dictionary. This dictionary will at least have a *retcode* key. If *retcode* is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
 ↪       esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

19.9.412 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

`salt.modules.win_autoruns.`**`list`**()

Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

19.9.413 salt.modules.win_certutil module

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

salt.modules.win_certutil.**add_store**(*source*, *store*, *saltenv='base'*)

Add the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file

store The certificate store to add the certificate to

saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.**del_store**(*source*, *store*, *saltenv='base'*)

Delete the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file

store The certificate store to delete the certificate from

saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.**get_cert_serial**(*cert_file*)

Get the serial number of a certificate file

cert_file The certificate file to find the serial for

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

salt.modules.win_certutil.**get_stored_cert_serials**(*store*)

Get all of the certificate serials in the specified store

store The store to get all the certificate serials from

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

19.9.414 salt.modules.win_dacl

Manage DACLs on Windows

depends

- winreg Python module

salt.modules.win_dacl.**add_ace**(*path*, *objectType*, *user*, *permission*, *acetype*, *propagation*)

add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to add permission: permissions for the user acetype: either allow/deny for each user/permission (ALLOW, DENY)

propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey, propagate to this
↪key and subkeys
   salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\\SOFTWARE\\somekey'
↪'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

salt.modules.win_dacl.**check_ace**(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*, *exactPermissionMatch=False*)

Checks a path to verify the ACE (access control entry) specified exists

Parameters

- **path** -- path to the file/reg key
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- user that the ACL is for
- **permission** -- permission to test for (READ, FULLCONTROL, etc)
- **acetype** -- the type of ACE (ALLOW or DENY)
- **propagation** -- the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** -- the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): `Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c:  emp directory <username> fullcontrol
```

salt.modules.win_dacl.**check_inheritance**(*path*, *objectType*, *user=None*)

Check a specified path to verify if inheritance is enabled

Parameters

- **path** -- path of the registry key or file system object to check
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- if provided, will consider only the ACEs for that user

Returns (bool): `Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c:  emp directory <username>
```

class salt.modules.win_dacl.**daclConstants**

DACL constants used throughout the module

getAceTypeBit(*t*)

returns the acetype bit of a text value

getAceTypeText(*t*)

returns the textual representation of a acetype bit

getObjectTypeBit(*t*)

returns the bit value of the string object type

getPermissionBit(*t*, *m*)

returns a permission bit of the string permission value for the specified object type

getPermissionText(*t*, *m*)

returns the permission textual representation of a specified permission bit/object type

getPropagationBit(*t*, *p*)
returns the propagation bit of a text value

getPropagationText(*t*, *p*)
returns the textual representation of a propagation bit

getSecurityHkey(*s*)
returns the necessary string value for an HKEY for the win32security module

processPath(*path*, *objectType*)
processes a path/object type combo and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.**disable_inheritance**(*path*, *objectType*, *copy=True*)
Disable inheritance on an object

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** -- True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c:        emp directory
```

salt.modules.win_dacl.**enable_inheritance**(*path*, *objectType*, *clear=False*)
enable/disable inheritance on an object

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** -- True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

salt.modules.win_dacl.**get**(*path*, *objectType*, *user=None*)
Get the ACL of an object. Will filter by user if one is provided.

Parameters
- **path** -- The path to the object
- **objectType** -- The type of object (FILE, DIRECTORY, REGISTRY)
- **user** -- A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c:        emp directory
```

salt.modules.win_dacl.**rm_ace**(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*)
remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\\SOFTWARE\\somekey propagated
↪to this key and subkeys
   salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_
↪MACHINE\\SOFTWARE\\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
↪'
```

19.9.415 salt.modules.win_disk

Module for gathering disk information on Windows

depends

- win32api Python module

salt.modules.win_disk.**usage**()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

19.9.416 salt.modules.win_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

salt.modules.win_dism.**add_capability**(*capability*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)

Install a capability

Parameters

- **capability** (*str*) -- The capability to install
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Raises

- NotImplementedError -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.**add_feature**(*feature*, *package=None*, *source=None*, *limit_access=False*, *enable_parent=False*, *image=None*, *restart=False*)

Install a feature using DISM

Parameters

- **feature** (*str*) -- The feature to install

- **package** (*Optional[str]*) -- The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*Optional[str]*) -- The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit_access** (*Optional[bool]*) -- Prevent DISM from contacting Windows Update for the source package
- **enable_parent** (*Optional[bool]*) -- True will enable all parent features of the specified feature
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

salt.modules.win_dism.**add_package**(*package*, *ignore_check=False*, *prevent_pending=False*, *image=None*, *restart=False*)

Install a package using DISM

Parameters

- **package** (*str*) -- The package to install. Can be a .cab file, a .msu file, or a folder

  Note: An *.msu* package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** (*Optional[bool]*) -- Skip installation of the package if the applicability checks fail
- **prevent_pending** (*Optional[bool]*) -- Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If None is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

salt.modules.win_dism.**available_capabilities**(*image=None*)

List the capabilities available on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Raises

- NotImplementedError -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A list of available capabilities

Return type *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.**available_features**(*image=None*)

List the features available on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns A list of available features

Return type *list*

CLI Example:

```
salt '*' dism.available_features
```

salt.modules.win_dism.**get_capabilities**(*image=None*)

List all capabilities on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Raises

- NotImplementedError -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A list of capabilities

Return type *list*

CLI Example:

```
salt '*' dism.get_capabilities
```

salt.modules.win_dism.**get_features**(*package=None*, *image=None*)

List features on the system or in a package

Parameters

- **package** (*Optional[str]*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

  This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns A list of features

Return type *list*

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
 ↪x86~en~1.0.0.0
```

salt.modules.win_dism.**installed_capabilities**(*image=None*)

List the capabilities installed on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Raises

- NotImplementedError -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A list of installed capabilities

Return type *list*

CLI Example:

```
salt '*' dism.installed_capabilities
```

salt.modules.win_dism.**installed_features**(*image=None*)

List the features installed on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns A list of installed features

Return type *list*

CLI Example:

```
salt '*' dism.installed_features
```

salt.modules.win_dism.**installed_packages**(*image=None*)

List the packages installed on the system

Parameters **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns A list of installed packages

Return type *list*

CLI Example:

```
salt '*' dism.installed_packages
```

salt.modules.win_dism.**package_info**(*package*, *image=None*)

Display information about a package

Parameters

- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism. package_info C:\packages\package.cab
```

salt.modules.win_dism.**remove_capability**(*capability*, *image=None*, *restart=False*)

Uninstall a capability

Parameters

- **capability** (*str*) -- The capability to be removed
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Raises

- NotImplementedError -- For all versions of Windows that are not Windows 10
- and later. Server editions of Windows use ServerManager instead.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

salt.modules.win_dism.**remove_feature**(*feature*, *remove_payload=False*, *image=None*, *restart=False*)

Disables the feature.

Parameters

- **feature** (*str*) -- The feature to uninstall
- **remove_payload** (*Optional[bool]*) -- Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

salt.modules.win_dism.**remove_package**(*package*, *image=None*, *restart=False*)

Uninstall a package

Parameters

- **package** (*str*) -- The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) -- The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is None.
- **restart** (*Optional[bool]*) -- Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86~en~1.
 ↪0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

19.9.417 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.**add_dns**(*ip*, *interface='Local Area Connection'*, *index=1*)

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

salt.modules.win_dns_client.**dns_dhcp**(*interface='Local Area Connection'*)

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

salt.modules.win_dns_client.**get_dns_config**(*interface='Local Area Connection'*)

Get the type of DNS configuration (dhcp / static)

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

salt.modules.win_dns_client.**get_dns_servers**(*interface='Local Area Connection'*)
Return a list of the configured DNS servers of the specified interface

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

salt.modules.win_dns_client.**rm_dns**(*ip*, *interface='Local Area Connection'*)
Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

19.9.418 salt.modules.win_dsc

This module is Alpha

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

depends

- PowerShell 5.0

salt.modules.win_dsc.**apply_config**(*path*, *source=None*, *salt_env='base'*)
Run an compiled DSC configuration (a folder containing a .mof file). The folder can be cached from the salt master using the `source` option.

Parameters

- **path** (*str*) -- Local path to the directory that contains the .mof configuration file to apply. Required.
- **source** (*str*) -- Path to the directory that contains the .mof file on the `file_roots`. The source directory will be copied to the path directory and then executed. If the path and source directories differ, the source directory will be applied. If source is not passed, the config located at `path` will be applied. Optional.
- **salt_env** (*str*) -- The salt environment to use when copying your source. Default is `base'

Returns True if successful, otherwise False

Return type bool

CLI Example:

To apply a config that already exists on the the system

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/
↪WebSiteConfiguration
```

salt.modules.win_dsc.**compile_config**(*path*, *source=None*, *config_name=None*, *config_data=None*, *config_data_source=None*, *script_parameters=None*, *salt_env='base'*)

Compile a config from a PowerShell script (`.ps1`)

Parameters

- **path** (*str*) -- Path (local) to the script that will create the `.mof` configuration file. If no source is passed, the file must exist locally. Required.
- **source** (*str*) -- Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

  New in version 2017.7.0.
- **config_data_source** (*str*) -- The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

  New in version 2017.7.0.
- **script_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

  New in version 2017.7.0.
- **salt_env** (*str*) -- The salt environment to use when copying the source. Default is `base'

Returns A dictionary containing the results of the compilation

Return type dict

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↪WebsiteConfig.ps1
```

salt.modules.win_dsc.**get_config**()

Get the current DSC Configuration

Returns A dictionary representing the DSC Configuration on the machine

Return type dict

Raises `CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.get_config
```

salt.modules.win_dsc.**get_config_status**()

Get the status of the current DSC Configuration

Returns

A dictionary representing the status of the current DSC Configuration on the machine

Return type dict

CLI Example:

```
salt '*' dsc.get_config_status
```

salt.modules.win_dsc.**get_lcm_config**()

Get the current Local Configuration Manager settings

Returns

A dictionary representing the Local Configuration Manager settings on the machine

Return type dict

CLI Example:

```
salt '*' dsc.get_lcm_config
```

salt.modules.win_dsc.**remove_config**(*reset=False*)

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters **reset** (*bool*) -- Attempts to reset the DSC configuration by removing the following from `C:\Windows\System32\Configuration`:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

> **Warning:** `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory. If you wait a few minutes and run again, it may complete successfully.

Returns True if successful

Return type bool

Raises `CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

salt.modules.win_dsc.**restore_config**()

Reapplies the previous configuration.

New in version 2017.7.5.

Note: The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

Returns True if successfully restored

Return type bool

Raises `CommandExecutionError` -- On failure

CLI Example:

```
salt '*' dsc.restore_config
```

salt.modules.win_dsc.**run_config**(*path*, *source=None*, *config_name=None*, *config_data=None*, *config_data_source=None*, *script_parameters=None*, *salt_env='base'*)

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

Parameters

- **path** (*str*) -- The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (*str*) -- The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config_name** (*str*) -- The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** (*str*) -- Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

  New in version 2017.7.0.
- **config_data_source** (*str*) -- The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

  New in version 2017.7.0.
- **script_parameters** (*str*) -- Any additional parameters expected by the configuration script. These must be defined in the script itself.

  New in version 2017.7.0.
- **salt_env** (*str*) -- The salt environment to use when copying the source. Default is `base'

Returns True if successfully compiled and applied, otherwise False

Return type bool

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↪WebsiteConfig.ps1
```

salt.modules.win_dsc.**set_lcm_config**(*config_mode=None*, *config_mode_freq=None*, *refresh_freq=None*, *reboot_if_needed=None*, *action_after_reboot=None*, *refresh_mode=None*, *certificate_id=None*, *configuration_id=None*, *allow_module_overwrite=None*, *debug_mode=False*, *status_retention_days=None*)

For detailed descriptions of the parameters see: https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig

config_mode (str): How the LCM applies the configuration. Valid values are:

- ApplyOnly
- ApplyAndMonitor

- ApplyAndAutoCorrect

config_mode_freq (int): How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.

refresh_mode (str): How the LCM gets configurations. Valid values are:

•Disabled
•Push
•Pull

refresh_freq (int): How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.

reboot_if_needed (bool): Reboot the machine if needed after a configuration is applied. Default is False.

action_after_reboot (str): Action to take after reboot. Valid values are:

- ContinueConfiguration
- StopConfiguration

certificate_id (guid): A GUID that specifies a certificate used to access the configuration: (pull mode)

configuration_id (guid): A GUID that identifies the config file to get from a pull server. (pull mode)

allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:

•None
•ForceModuleImport
•All

status_retention_days (int): Number of days to keep status of the current config.

Note: Either `config_mode_freq` or `refresh_freq` needs to be a multiple of the other. See documentation on MSDN for more details.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

salt.modules.win_dsc.**test_config**()

Tests the current applied DSC Configuration

Returns True if successfully applied, otherwise False

Return type bool

CLI Example:

```
salt '*' dsc.test_config
```

19.9.419 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends

- win32api
- win32file
- win32con
- salt.utils.win_dacl

salt.modules.win_file.**check_perms**(*path*, *ret=None*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*)

Set owner and permissions for each directory created. Used mostly by the state system.

Parameters

- **path** (*str*) -- The full path to the directory.
- **ret** (*dict*) -- A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to':
   ↪ 'this_folder'}}
  ```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created

Returns A dictionary of changes made to the object

Return type dict

Raises `CommandExecutionError` -- If the object does not exist

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.check_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_
 ↪execute'}}"

# Locally using salt call
salt-call file.check_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_
 ↪execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_
 ↪attributes', 'read_ea'], 'applies_to': 'files_only'}}"
```

salt.modules.win_file.**chgrp**(*path*, *group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a `primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the `primary group' of a file, use `file .chpgrp`.

To set group permissions use `file.set_perms`

Parameters

- **path** (*str*) -- The path to the file or directory
- **group** (*str*) -- The group (unused)

Returns None

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

salt.modules.win_file.**chown**(*path*, *user*, *group=None*, *pgroup=None*, *follow_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a `primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the `primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns True if successful, otherwise error

Return type bool

CLI Example:

```
salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"
```

salt.modules.win_file.**chpgrp**(*path*, *group*)

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (*str*) -- The path to the file or directory
- **pgroup** (*str*) -- The primary group to assign

Returns True if successful, otherwise error

Return type bool

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"
```

salt.modules.win_file.**get_attributes**(*path*)

Return a dictionary object with the Windows file attributes for a file.

Parameters **path** (*str*) -- The path to the file or directory

Returns A dictionary of file attributes
Return type dict

CLI Example:

```
salt '*' file.get_attributes c:\temp\a.txt
```

salt.modules.win_file.**get_gid**(*path*, *follow_symlinks=True*)

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a `primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the `primary group' of a file, use *file.get_pgid*.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The gid of the owner
Return type str

CLI Example:

```
salt '*' file.get_gid c:\temp\test.txt
```

salt.modules.win_file.**get_group**(*path*, *follow_symlinks=True*)

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a `primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the `primary group' of a file, use *file.get_pgroup*.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner
Return type str

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

salt.modules.win_file.**get_mode**(*path*)

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

Parameters **path** (*str*) -- The path to the file or directory

Returns None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

salt.modules.win_file.**get_pgid**(*path*, *follow_symlinks=True*)

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The gid of the primary group

Return type str

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

salt.modules.win_file.**get_pgroup**(*path*, *follow_symlinks=True*)

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be `None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the *get_pgid* function which will return the SID, including for the system `None' group.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the primary group

Return type str

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

salt.modules.win_file.**get_uid**(*path*, *follow_symlinks=True*)

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify *follow_symlinks=False* to turn off this behavior.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The uid of the owner

Return type str

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.**get_user**(*path*, *follow_symlinks=True*)

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify *follow_symlinks=False* to turn off this behavior.

Parameters

- **path** (*str*) -- The path to the file or directory
- **follow_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner

Return type str

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

salt.modules.win_file.**gid_to_group**(*gid*)

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as uid_to_user.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the uid_to_user function instead; an info level log entry will be generated if this function is used directly.

Parameters **gid** (*str*) -- The gid of the group

Returns The name of the group

Return type str

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.**group_to_gid**(*group*)

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as user_to_uid, except if None is given, `'` is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the user_to_uid function instead; an info level log entry will be generated if this function is used directly.

Parameters **group** (*str*) -- The name of the group

Returns The gid of the group

Return type str

CLI Example:

```
salt '*' file.group_to_gid administrators
```

salt.modules.win_file.**is_link**(*path*)

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters **path** (*str*) -- The path to a file or directory

Returns True if path is a symlink, otherwise False
Return type bool

CLI Example:

```
salt '*' file.is_link /path/to/link
```

salt.modules.win_file.**lchown**(*path*, *user*, *group=None*, *pgroup=None*)

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a `primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the `primary group' property and understand the implications, pass the Windows only parameter, pgroup, instead.

To set the primary group to `None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

Parameters

- **path** (*str*) -- The path to the file or directory
- **user** (*str*) -- The name of the user to own the file
- **group** (*str*) -- The group (not used)
- **pgroup** (*str*) -- The primary group to assign

Returns True if successful, otherwise error
Return type bool

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

salt.modules.win_file.**makedirs**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*)

Ensure that the parent directory containing this path is available.

Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directly, likely SYSTEM
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to':
   ↪ 'this_folder'}}
  ```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created

---

Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

Returns True if successful
Return type bool
Raises `CommandExecutionError` -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_execute
 ↪'}}"

# Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators "{'Users': {'perms': 'read_execute
 ↪', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_
 ↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.`**`makedirs_perms`**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*)

Set owner and permissions for each directory created.

Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to':
   ↪ 'this_folder'}}
  ```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created

Returns True if successful, otherwise raises an error
Return type bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_
 ↪execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators "{'Users': {'perms': 'read_
 ↪execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators "{'jsnuffy': {'perms': [
 ↪'read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

salt.modules.win_file.**mkdir**(*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*)

Ensure that the directory is available and permissions are set.

Parameters

- **path** (*str*) -- The full path to the directory.
- **owner** (*str*) -- The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

  ```
  {'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
  ```

  To set advanced permissions use a list for the `perms` parameter, ie:

  ```
  {'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to':
   ↪ 'this_folder'}}
  ```

- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created

Returns True if successful

Return type bool

Raises `CommandExecutionError` -- If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators "{'Users': {'perms': 'read_execute',
 ↪'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators "{'jsnuffy': {'perms': ['read_
 ↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.**readlink**(*path*)

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a SaltInvocationError, not an OSError.

Parameters **path** (*str*) -- The path to the symlink

Returns The path that the symlink points to

Return type str

CLI Example:

```
salt '*' file.readlink /path/to/link
```

salt.modules.win_file.**remove**(*path*, *force=False*)

Remove the named file or directory

Parameters

- **path** (*str*) -- The path to the file or directory to remove.
- **force** (*bool*) -- Remove even if marked Read-Only. Default is False

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt '*' file.remove C:\Temp
```

salt.modules.win_file.**set_attributes**(*path*, *archive=None*, *hidden=None*, *normal=None*, *notIndexed=None*, *readonly=None*, *system=None*, *temporary=None*)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters

- **path** (*str*) -- The path to the file or directory
- **archive** (*bool*) -- Sets the archive attribute. Default is None
- **hidden** (*bool*) -- Sets the hidden attribute. Default is None
- **normal** (*bool*) -- Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- **notIndexed** (*bool*) -- Sets the indexed attribute. Default is None
- **readonly** (*bool*) -- Sets the readonly attribute. Default is None
- **system** (*bool*) -- Sets the system attribute. Default is None
- **temporary** (*bool*) -- Sets the temporary attribute. Default is None

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

salt.modules.win_file.**set_mode**(*path*, *mode*)

Set the mode of a file

This just calls get_mode, which returns None because we don't use mode on Windows

Parameters

- **path** -- The path to the file or directory
- **mode** -- The mode (not used)

Returns None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

salt.modules.win_file.**set_perms**(*path*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*)

Set permissions for the given path

Parameters

- **path** (*str*) -- The full path to the directory.
- **grant_perms** (*dict*) -- A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}}
```

  To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to':
 ↪ 'this_folder'}}
```

  To see a list of available attributes and applies to settings see the documentation for salt.utils.win_dacl
- **deny_perms** (*dict*) -- A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) -- If True the object will inherit permissions from the parent, if False, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created

Returns True if successful, otherwise raise an error

Return type bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp\ "{'Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:\Temp\ "{'Users': {'perms': 'read_execute', 'applies_to
 ↪': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp\ "{'jsnuffy': {'perms': ['read_attributes', 'read_
 ↪ea'], 'applies_to': 'this_folder_only'}}"
```

salt.modules.win_file.**stats**(*path*, *hash_type='sha256'*, *follow_symlinks=True*)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a `primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the `primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

Parameters

- **path** (*str*) -- The path to the file or directory
- **hash_type** (*str*) -- The type of hash to return

- **follow_symlinks** (*bool*) -- If the object specified by path is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns A dictionary of file/directory stats

Return type dict

CLI Example:

```
salt '*' file.stats /etc/passwd
```

salt.modules.win_file.**symlink**(*src*, *link*)

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

Parameters

- **src** (*str*) -- The path to a file or directory
- **link** (*str*) -- The path to the link

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

salt.modules.win_file.**uid_to_user**(*uid*)

Convert a uid to a user name

Parameters **uid** (*str*) -- The user id to lookup

Returns The name of the user

Return type str

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

salt.modules.win_file.**user_to_uid**(*user*)

Convert user name to a uid

Parameters **user** (*str*) -- The user to lookup

Returns The user id of the user

Return type str

CLI Example:

```
salt '*' file.user_to_uid myusername
```

19.9.420 salt.modules.win_firewall

Module for configuring Windows Firewall using netsh

salt.modules.win_firewall.**add_rule**(*name*, *localport*, *protocol='tcp'*, *action='allow'*, *dir='in'*, *remoteip='any'*)

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) -- The name of the rule. Must be unique and cannot be ``all''. Required.
- **localport** (*int*) -- The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.

- **protocol** (*Optional[str]*) -- The protocol. Can be any of the following:
  - A number between 0 and 255
  - icmpv4
  - icmpv6
  - tcp
  - udp
  - any
- **action** (*Optional[str]*) -- The action the rule performs. Can be any of the following:
  - allow
  - block
  - bypass
- **dir** (*Optional[str]*) -- The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) -- The remote IP. Can be any of the following:
  - any
  - localsubnet
  - dns
  - dhcp
  - wins
  - defaultgateway
  - Any valid IPv4 address (192.168.0.12)
  - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
  - Any valid subnet (192.168.1.0/24)
  - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
  - A list of valid IP addresses

  Can be combinations of the above separated by commas.

Returns True if successful

Return type bool

Raises `CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' '1' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1'
```

`salt.modules.win_firewall.`**`delete_rule`**(*name=None*, *localport=None*, *protocol=None*, *dir=None*, *remoteip=None*)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters

- **name** (*str*) -- The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- **localport** (*Optional[str]*) -- The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- **protocol** (*Optional[str]*) -- The protocol of the rule. Default is `tcp` when `localport` is specified
- **dir** (*Optional[str]*) -- The direction of the rule.
- **remoteip** (*Optional[str]*) -- The remote IP of the rule.

Returns True if successful

Return type bool

Raises `CommandExecutionError` -- If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'

# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip`
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

salt.modules.win_firewall.**disable**(*profile='allprofiles'*)

Disable firewall profile

Parameters **profile** (*Optional[str]*) -- The name of the profile to disable. Default is all-profiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns True if successful

Return type bool

Raises CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.disable
```

salt.modules.win_firewall.**enable**(*profile='allprofiles'*)

New in version 2015.5.0.

Enable firewall profile

Parameters **profile** (*Optional[str]*) -- The name of the profile to enable. Default is all-profiles. Valid options are:

- allprofiles
- domainprofile
- privateprofile
- publicprofile

Returns True if successful

Return type bool

Raises CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.enable
```

salt.modules.win_firewall.**get_config**()

Get the status of all the firewall profiles

Returns A dictionary of all profiles on the system

Return type dict

Raises CommandExecutionError -- If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

salt.modules.win_firewall.**get_rule**(*name='all'*)

New in version 2015.5.0.

Display all matching rules as specified by name

Parameters **name** (*Optional[str]*) -- The full name of the rule. `all` will return all rules. Default is `all`

Returns A dictionary of all rules or rules that match the name exactly

Return type dict

Raises `CommandExecutionError` -- If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

`salt.modules.win_firewall.`**`rule_exists`**(*name*)

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

Parameters **name** (*str*) -- The name of the rule

Returns True if exists, otherwise False

Return type bool

CLI Example:

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

19.9.421 salt.modules.win_groupadd

Manage groups on Windows

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to *`group.info' is not available*), see *here*.

`salt.modules.win_groupadd.`**`add`**(*name*, ***kwargs*)

Add the specified group

Parameters **name** (*str*) -- The name of the group to add

Returns A dictionary of results

Return type dict

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.`**`adduser`**(*name*, *username*, ***kwargs*)

Add a user to a group

Parameters

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to add to the group

Returns A dictionary of results

Return type dict

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.`**`delete`**(*name*, ***kwargs*)

Remove the named group

Parameters **name** (*str*) -- The name of the group to remove

Returns A dictionary of results

Return type dict

CLI Example:

```
salt '*' group.delete foo
```

salt.modules.win_groupadd.**deluser**(*name*, *username*, ***kwargs*)

Remove a user from a group

Parameters

- **name** (*str*) -- The name of the group to modify
- **username** (*str*) -- The name of the user to remove from the group

Returns A dictionary of results

Return type dict

CLI Example:

```
salt '*' group.deluser foo username
```

salt.modules.win_groupadd.**getent**(*refresh=False*)

Return info on all groups

Parameters **refresh** (*bool*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is False

Returns A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

salt.modules.win_groupadd.**info**(*name*)

Return information about a group

Parameters **name** (*str*) -- The name of the group for which to get information

Returns A dictionary of information about the group

Return type dict

CLI Example:

```
salt '*' group.info foo
```

salt.modules.win_groupadd.**list_groups**(*refresh=False*)

Return a list of groups

Parameters **refresh** (*bool*) -- Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is False

Returns A list of groups on the machine

Return type *list*

CLI Example:

```
salt '*' group.list_groups
```

salt.modules.win_groupadd.**members**(*name*, *members_list*, ***kwargs*)

Ensure a group contains only the members in the list

Parameters

- **name** (*str*) -- The name of the group to modify
- **members_list** (*str*) -- A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns A dictionary of results

Return type dict

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

19.9.422 salt.modules.win_iis module

Microsoft IIS site management via WebAdministration powershell module

maintainer Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

platform Windows

depends PowerShell

depends WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

salt.modules.win_iis.**create_app**(*name*, *site*, *sourcepath*, *apppool=None*)

Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **apppool** (*str*) -- The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
↪apppool='site0'
```

salt.modules.win_iis.**create_apppool**(*name*)

Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

salt.modules.win_iis.**create_backup**(*name*)

Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Parameters **name** (*str*) -- The name to give the backup
Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

salt.modules.win_iis.**create_binding**(*site*, *hostheader=u''*, *ipaddress=u'*'*, *port=80*, *protocol=u'http'*, *sslflags=None*)

Create an IIS Web Binding.

Note: This function only validates against the binding ipaddress:port:hostheader combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding. Usually a hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*
 ↪' port='80'
```

salt.modules.win_iis.**create_cert_binding**(*name*, *site*, *hostheader=u''*, *ipaddress=u'*'*, *port=443*, *sslflags=0*)

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*int*) -- Flags representing certificate type and certificate storage of the binding.

Returns True if successful, otherwise False
Return type bool

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader=
↪'example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.**create_site**(*name*, *sourcepath*, *apppool=u''*, *hostheader=u''*, *ipaddress=u'*'*, *port=80*, *protocol=u'http'*)

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **protocol** (*str*) -- The application protocol of the binding. (http, https, etc.)

Returns True if successful, otherwise False.

Return type bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool=
↪'TestPool'
```

salt.modules.win_iis.**create_vdir**(*name*, *site*, *sourcepath*, *app=u'/'*)

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path.
- **app** (*str*) -- The IIS application.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath='C:
↪\inetpub\vdirs\vd0'
```

salt.modules.win_iis.**get_container_setting**(*name*, *container*, *settings*)

Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the IIS container.
- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools'
    settings="['processModel.identityType']"
```

salt.modules.win_iis.**get_webapp_settings**(*name*, *site*, *settings*)

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

Note: Params are case sensitive

Parameters

- **name** (*str*) -- The name of the IIS web application.
- **site** (*str*) -- The site name contains the web application. Example: Default Web Site
- **settings** (*str*) -- A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
    settings="['physicalPath','applicationPool']"
```

salt.modules.win_iis.**list_apppools**()

List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.

Return type dict

CLI Example:

```
salt '*' win_iis.list_apppools
```

salt.modules.win_iis.**list_apps**(*site*)

Get all configured IIS applications for the specified site.

Parameters **site** (*str*) -- The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

salt.modules.win_iis.**list_backups**()

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Returns A dictionary of IIS Configurations backed up on the system.
Return type dict

CLI Example:

```
salt '*' win_iis.list_backups
```

salt.modules.win_iis.**list_bindings**(*site*)

Get all configured IIS bindings for the specified site.

Parameters **site** (*str*) -- The name if the IIS Site
Returns A dictionary of the binding names and properties.
Return type dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

salt.modules.win_iis.**list_cert_bindings**(*site*)

List certificate bindings for an IIS site.

New in version 2016.11.0.

Parameters **site** (*str*) -- The IIS site name.
Returns A dictionary of the binding names and properties.
Return type dict

CLI Example:

```
salt '*' win_iis.list_bindings site
```

salt.modules.win_iis.**list_sites**()

List all the currently deployed websites.

Returns A dictionary of the IIS sites and their properties.
Return type dict

CLI Example:

```
salt '*' win_iis.list_sites
```

salt.modules.win_iis.**list_vdirs**(*site*, *app=u'/'*)

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters

- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Returns A dictionary of the virtual directory names and properties.
Return type dict

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

salt.modules.win_iis.**list_worker_processes**(*apppool*)

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

Parameters **apppool** (*str*) -- The application pool to query
Returns A dictionary of worker processes with their process IDs

Return type dict

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

salt.modules.win_iis.**modify_binding**(*site*, *binding*, *hostheader=None*, *ipaddress=None*, *port=None*, *sslflags=None*)

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

Parameters

- **site** (*str*) -- The IIS site name.
- **binding** (*str*) -- The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: ipaddress:port:hostheader. For example, `*:80:` or `*:80:salt.com`
- **hostheader** (*str*) -- The host header of the binding. Usually the hostname.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.
- **sslflags** (*str*) -- The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False

Return type bool

CLI Example:

The following will seat the host header of binding `*:80:` for `site0` to `example.com`

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.
↪com'
```

salt.modules.win_iis.**modify_site**(*name*, *sourcepath=None*, *apppool=None*)

Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name** (*str*) -- The IIS site name.
- **sourcepath** (*str*) -- The physical path of the IIS site.
- **apppool** (*str*) -- The name of the IIS application pool.

Returns True if successful, otherwise False.

Return type bool

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool=
↪'NewTestPool'
```

salt.modules.win_iis.**remove_app**(*name*, *site*)

Remove an IIS application.

Parameters

- **name** (*str*) -- The application name.
- **site** (*str*) -- The IIS site name.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

salt.modules.win_iis.**remove_apppool**(*name*)

Remove an IIS application pool.

Parameters **name** (*str*) -- The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.remove_apppool name='MyTestPool'
```

salt.modules.win_iis.**remove_backup**(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters **name** (*str*) -- The name of the backup to remove

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

salt.modules.win_iis.**remove_binding**(*site*, *hostheader=u''*, *ipaddress=u'*'*, *port=80*)

Remove an IIS binding.

Parameters

- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*
↪' port='80'
```

salt.modules.win_iis.**remove_cert_binding**(*name*, *site*, *hostheader=u''*, *ipaddress=u'*'*, *port=443*)

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters

- **name** (*str*) -- The thumbprint of the certificate.
- **site** (*str*) -- The IIS site name.
- **hostheader** (*str*) -- The host header of the binding.
- **ipaddress** (*str*) -- The IP address of the binding.
- **port** (*int*) -- The TCP port of the binding.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader=
↪'example.com' ipaddress='*' port='443'
```

salt.modules.win_iis.**remove_site**(*name*)

Delete a website from IIS.

Parameters **name** (*str*) -- The IIS site name.

Returns True if successful, otherwise False

Return type bool

Note: This will not remove the application pool used by the site.

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

salt.modules.win_iis.**remove_vdir**(*name*, *site*, *app=u'/'*)

Remove an IIS virtual directory.

Parameters

- **name** (*str*) -- The virtual directory name.
- **site** (*str*) -- The IIS site name.
- **app** (*str*) -- The IIS application.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

salt.modules.win_iis.**restart_apppool**(*name*)

Restart an IIS application pool.

New in version 2016.11.0.

Parameters **name** (*str*) -- The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.restart_apppool name='MyTestPool'
```

salt.modules.win_iis.**restart_site**(*name*)

Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** (*str*) -- The name of the website to restart.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

salt.modules.win_iis.**set_container_setting**(*name*, *container*, *settings*)

Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the IIS container.

- **container** (*str*) -- The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) -- A dictionary of the setting names and their values.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools'
    settings="{'managedPipeLineMode': 'Integrated'}"
```

salt.modules.win_iis.**set_webapp_settings**(*name*, *site*, *settings*)

New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case sensitive.

Parameters

- **name** (*str*) -- The IIS application.
- **site** (*str*) -- The IIS site name.
- **settings** (*str*) -- A dictionary of the setting names and their values. - physicalPath: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: ``connectAs'' user - password: ``connectAs'' password for user

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{
↪'physicalPath': 'C:\site0', 'apppool': 'site0'}"
```

salt.modules.win_iis.**start_apppool**(*name*)

Start an IIS application pool.

New in version 2017.7.0.

Parameters **name** (*str*) -- The name of the App Pool to start.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.start_apppool name='MyTestPool'
```

salt.modules.win_iis.**start_site**(*name*)

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** (*str*) -- The name of the website to start.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

salt.modules.win_iis.**stop_apppool**(*name*)

Stop an IIS application pool.

New in version 2017.7.0.

Parameters **name** (*str*) -- The name of the App Pool to stop.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.stop_apppool name='MyTestPool'
```

salt.modules.win_iis.**stop_site**(*name*)

Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** (*str*) -- The name of the website to stop.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

19.9.423 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.**disable**(*iface*)

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.**enable**(*iface*)

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_ip.**get_all_interfaces**()

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_ip.**get_default_gateway**()

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

salt.modules.win_ip.**get_interface**(*iface*)

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

salt.modules.win_ip.**get_subnet_length**(*mask*)
Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

salt.modules.win_ip.**is_disabled**(*iface*)
Returns `True` if interface is disabled, otherwise `False`

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

salt.modules.win_ip.**is_enabled**(*iface*)
Returns `True` if interface is enabled, otherwise `False`

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

salt.modules.win_ip.**raw_interface_configs**()
Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

salt.modules.win_ip.**set_dhcp_all**(*iface*)
Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

salt.modules.win_ip.**set_dhcp_dns**(*iface*)
Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

salt.modules.win_ip.**set_dhcp_ip**(*iface*)
Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

salt.modules.win_ip.**set_static_dns**(*iface*, **addrs*)
Set static DNS configuration on a Windows NIC

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.
↪252' '192.168.1.253'
```

salt.modules.win_ip.**set_static_ip**(*iface*, *addr*, *gateway=None*, *append=False*)
Set static IP configuration on a Windows NIC

iface The name of the interface to manage

addr IP address with subnet length (ex. `10.1.2.3/24`). The *ip.get_subnet_length* function can be used to calculate the subnet length from a netmask.

gateway [None] If specified, the default gateway will be set to this value.

append [False] If `True`, this IP address will be added to the interface. Default is `False`, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
 ↪gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
 ↪append=True
```

19.9.424 salt.modules.win_lgpo module

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows server.

New in version 2016.11.0.

Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings

Policies contained in the ``Windows Settings'' section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's _policy_info class. The `_policy_info` class contains a ``policies'' dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all ``Security Settings'' policies exist in the _policy_info class

depends

- pywin32 Python module
- lxml
- uuid
- struct
- salt.modules.reg

`salt.modules.win_lgpo.`**`get`**(*policy_class=None*, *return_full_policy_names=True*, *hierarchical_return=False*, *adml_language=u'en-US'*, *return_not_configured=False*)

Get a policy value

Parameters

- **policy_class** (*str*) -- Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return_full_policy_names** (*bool*) -- True/False to return the policy name as it is seen in the `gpedit.msc` GUI or to only return the policy key/id.
- **hierarchical_return** (*bool*) -- True/False to return the policy data in the hierarchy as seen in the `gpedit.msc` GUI. The default of False will return data split only into User/Computer configuration sections
- **adml_language** (*str*) -- The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return_not_configured** (*bool*) -- Include Administrative Template policies that are `Not Configured' in the return data

Returns A dictionary containing the policy values for the specified class

Return type dict

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

salt.modules.win_lgpo.**get_policy_info**(*policy_name*, *policy_class*, *adml_language=u'en-US'*)

Returns information about a specified policy

Parameters

- **policy_name** (*str*) -- The name of the policy to lookup
- **policy_class** (*str*) -- The class of policy, i.e. machine, user, both
- **adml_language** (*str*) -- The ADML language to use for Administrative Template data lookup

Returns Information about the specified policy

Return type dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

salt.modules.win_lgpo.**set**(*computer_policy=None*, *user_policy=None*, *cumulative_rights_assignments=True*, *adml_language=u'en-US'*)

Set a local server policy.

Parameters

- **computer_policy** (*dict*) -- A dictionary of ``policyname: value'' pairs of computer policies to set. `value' should be how it is displayed in the gpedit GUI, i.e. if a setting can be `Enabled'/'Disabled', then that should be passed

  Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

  Policy names can be specified in a number of ways based on the type of policy:

  Windows Settings Policies:

  These policies can be specified using the GUI display name or the key name from the _policy_info class in this module. The GUI display name is also contained in the _policy_info class in this module.

  Administrative Template Policies:

  These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, ``Access data

sources across domains''). These can be differentiated by the ``path'' in the GUI (for example, ``Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains'').

Additionally, policies can be specified using the ``name'' and ``id'' attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears lbefore the policy element in the GUI.

Use the get_policy_info function for the policy name to view the element ID/names that the module will accept.

- **user_policy** (*dict*) -- The same setup as the computer_policy, except with data to configure the local user policy.
- **cumulative_rights_assignments** (*bool*) -- Determine how user rights assignment policies are configured.

  If True, user right assignment specifications are simply added to the existing policy

  If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to `en-US' (U.S. English).

Returns True is successful, otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{'LockoutDuration': 2, 'RestrictAnonymous':
↪'Enabled', 'AuditProcessTracking': 'Succes, Failure'}"
```

salt.modules.win_lgpo.**set_computer_policy**(*name*, *setting*, *cumulative_rights_assignments=True*, *adml_language=u'en-US'*)

Set a single computer policy

Parameters

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **cumulative_rights_assignments** (*bool*) -- Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to `en-US' (U.S. English).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

salt.modules.win_lgpo.**set_user_policy**(*name*, *setting*, *adml_language=u'en-US'*)

Set a single user policy

Parameters

- **name** (*str*) -- The name of the policy to configure
- **setting** (*str*) -- The setting to configure the named policy with
- **adml_language** (*str*) -- The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to `en-US' (U.S. English).

Returns True if successful, Otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control
↪Panel" Enabled
```

19.9.425 salt.modules.win_license module

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**activate**()

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

salt.modules.win_license.**info**()

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

salt.modules.win_license.**install**(*product_key*)

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**installed**(*product_key*)

Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

salt.modules.win_license.**licensed**()

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

salt.modules.win_license.**uninstall**()

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

19.9.426 salt.modules.win_network

Module for gathering and managing network information

salt.modules.win_network.**connect**(*host*, *port=None*, ***kwargs*)

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4

salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp timeout=3
```

salt.modules.win_network.**dig**(*host*)

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

salt.modules.win_network.**get_route**(*ip*)

Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

salt.modules.win_network.**hw_addr**(*iface*)

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.**hwaddr**(*iface*)

This function is an alias of hw_addr.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

salt.modules.win_network.**in_subnet**(*cidr*)

Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

salt.modules.win_network.**interfaces**()
Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

salt.modules.win_network.**interfaces_names**()
Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

salt.modules.win_network.**ip_addrs**(*interface=None*, *include_loopback=False*)
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.win_network.**ip_addrs6**(*interface=None*, *include_loopback=False*)
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.win_network.**ipaddrs**(*interface=None*, *include_loopback=False*)
This function is an alias of `ip_addrs`.
Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

salt.modules.win_network.**ipaddrs6**(*interface=None*, *include_loopback=False*)
This function is an alias of `ip_addrs6`.
Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless `include_loopback=True' is indicated. If `interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

salt.modules.win_network.**netstat**()
Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

salt.modules.win_network.**nslookup**(*host*)
Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

salt.modules.win_network.**ping**(*host*, *timeout=False*, *return_boolean=False*)
Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

salt.modules.win_network.**subnets**()
Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

salt.modules.win_network.**traceroute**(*host*)
Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

19.9.427 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

salt.modules.win_ntp.**get_servers**()
Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

salt.modules.win_ntp.**set_servers**(**servers*)
Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

19.9.428 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message http://support.microsoft.com/kb/104011

salt.modules.win_path.**add**(*path*, *index=0*)

Add the directory to the SYSTEM path in the index location

Returns boolean True if successful, False if unsuccessful

CLI Example:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

salt.modules.win_path.**exists**(*path*)

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Returns boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

salt.modules.win_path.**get_path**()

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

salt.modules.win_path.**rehash**()

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

Note: This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The `salt-minion`, if running as a service, will not see changes to the environment until the system is restarted. See MSDN Documentation

---

CLI Example:

... code-block:: bash

salt `*' win_path.rehash

salt.modules.win_path.**remove**(*path*)

Remove the directory from the SYSTEM path

Returns boolean True if successful, False if unsuccessful

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

19.9.429 salt.modules.win_pkg

A module to manage software on Windows

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

The following functions require the existence of a *windows repository* metadata DB, typically created by running *pkg.refresh_db*:

- *pkg.get_repo_data*
- *pkg.install*
- *pkg.latest_version*
- *pkg.list_available*
- *pkg.list_pkgs*
- *pkg.list_upgrades*
- *pkg.remove*

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the *winrepo_cache_expire_min* minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

Note: Version numbers can be `version number string`, `latest` and `Not Found`, where `Not Found` means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, `Not Found`, `order version numbers`, ..., `latest`.

salt.modules.win_pkg.**compare_versions**(*ver1=u'`*, *oper=u'==*', *ver2=u'`*)

Compare software package versions

Parameters

- **ver1** (*str*) -- A software version to compare
- **oper** (*str*) -- The operand to use to compare
- **ver2** (*str*) -- A software version to compare

Returns True if the comparison is valid, otherwise False

Return type bool

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

salt.modules.win_pkg.**genrepo**(***kwargs*)

Generate package metedata db based on files within the winrepo_source_dir

Kwargs:

saltenv (str): Salt environment. Default: `base`

verbose (bool): Return verbose data structure which includes `success_list', a list of all sls files and the package names contained within. Default `False`.

failhard (bool): If `True`, an error will be raised if any repo SLS files failed to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

Note:
•Hidden directories (directories beginning with `.`, such as `.git`) will be ignored.

Returns A dictionary of the results of the command
Return type dict

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

salt.modules.win_pkg.**get_repo_data**(*saltenv=u'base'*)
Returns the existing package meteadata db. Will create it, if it does not exist, however will not refresh it.
Parameters **saltenv** (*str*) -- Salt environment. Default base
Returns A dict containing contents of metadata db.
Return type dict
CLI Example:

```
salt '*' pkg.get_repo_data
```

salt.modules.win_pkg.**install**(*name=None*, *refresh=False*, *pkgs=None*, ***kwargs*)
Install the passed package(s) on the system using winrepo
Parameters
- **name** (*str*) -- The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (*bool*) -- Boolean value representing whether or not to refresh the winrepo db. Default False.
- **pkgs** (*list*) -- A list of packages to install from a software repository. All packages listed under pkgs will be installed via a single command.

  You can specify a version by passing the item as a dict:

  CLI Example:

  ```
  # will install the latest version of foo and bar
  salt '*' pkg.install pkgs='["foo", "bar"]'

  # will install the latest version of foo and version 1.2.3 of bar
  salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3"}]'
  ```

Kwargs:
version (str): The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the pkgs parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.2.3
```

If passed with a comma separated list in the name parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

extra_install_flags (str): Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

saltenv (str): Salt environment. Default `base'

report_reboot_exit_codes (bool): If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns

Return a dict containing the new package names and versions

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If the package is already installed:

```
{'<package>': {'current': '<current-version>'}}
```

Return type dict

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_file: 'salt://win/repo/ntp/install.ini'
    install_flags: '/USEFILE=C:
↪\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```
ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/USEFILE=C:
↪\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'
```

salt.modules.win_pkg.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Parameters **names** (*str*) -- A single or multiple names to lookup

Kwargs: saltenv (str): Salt environment. Default `base` refresh (bool): Refresh package metadata. Default `True`

Returns A dictionary of packages with the latest version available
Return type dict

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.win_pkg.**list_available**(**names*, ***kwargs*)

Return a list of available versions of the specified package.

Parameters **names** (*str*) -- One or more package names

Kwargs:

saltenv (str): The salt environment to use. Default `base`.

refresh (bool): Refresh package metadata. Default `False`.
return_dict_always (bool): Default `False` dict when a single package name is queried.

Returns The package name with its available versions
Return type dict

```
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

salt.modules.win_pkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed

version_as_list (bool): Returns the versions as a list saltenv (str): The salt environment to use. Default `base`. refresh (bool): Refresh package metadata. Default `False`.

Returns A dictionary of installed software with versions installed
Return type dict

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

salt.modules.win_pkg.**list_upgrades**(*refresh=True*, ***kwargs*)

List all available package upgrades on this system

Parameters **refresh** (*bool*) -- Refresh package metadata. Default `True`

Kwargs: saltenv (str): Salt environment. Default `base`

Returns A dictionary of packages with available upgrades
Return type dict

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.win_pkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

New in version 0.16.0.

Parameters

- **name** (*str*) -- The name of the package to be deleted.
- **version** (*str*) -- The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.
- **pkgs** (`list`) -- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Kwargs: saltenv (str): Salt environment. Default `base` refresh (bool): Refresh package metadata. Default `False`

Returns A dict containing the changes.
Return type dict

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.**refresh_db**(***kwargs*)

Generates the local software metadata database (*winrepo.p*) on the minion. The database is stored in a serialized format located by default at the following location:

C:saltvarcachesaltminionfilesbasewinrepo-ngwinrepo.p

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from *winrepo_source_dir* (default *salt://win/repo-ng*) and cache them in *<cachedir>files<saltenv><winrepo_source_dir>* (default: *C:saltvarcachesaltminionfilesbasewinrepo-ng*)
- Call *pkg.genrepo* to parse the package definition files and generate the repository metadata database file (*winrepo.p*)
- Return the report received from *pkg.genrepo*

The default winrepo directory on the master is */srv/salt/win/repo-ng*. All files that end with *.sls* in this and all subdirectories will be used to generate the repository metadata database (*winrepo.p*).

Note:

- Hidden directories (directories beginning with `.`, such as `.git`) will be ignored.

Note: There is no need to call *pkg.refresh_db* every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

- *winrepo_cache_expire_min*
- *winrepo_cache_expire_max*

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

Warning: Directories and files fetched from <winrepo_source_dir> (*/srv/salt/win/repo-ng*) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see *Windows Software Repository*

Arguments:

saltenv (str): Salt environment. Default: `base`

verbose (bool): Return a verbose data structure which includes `success_list', a list of all sls files and the package names contained within. Default is `False'

failhard (bool): If `True`, an error will be raised if any repo SLS files fails to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

Returns A dictionary containing the results of the database refresh.

Return type dict

Note: A result with a *total: 0* generally means that the files are in the wrong location on the master. Try running the following command on the minion: *salt-call -l debug pkg.refresh saltenv=base*

Warning: When calling this command from a state using *module.run* be sure to pass *failhard: False*. Otherwise the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.`**`remove`**(*name=None*, *pkgs=None*, ***kwargs*)

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **name** (*str*) -- The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs** (`list`) -- A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Kwargs:

version (str): The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended

using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

saltenv (str): Salt environment. Default `base` refresh (bool): Refresh package metadata. Default `False`

Returns

Returns a dict containing the changes.

If the package is removed by `pkg.remove`:
{`<package>': {`old': `<old-version>', `new': `<new-version>'}}
If the package is already uninstalled:
{`<package>': {`current': `not installed'}}

Return type dict

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.win_pkg.**upgrade**(***kwargs*)

Upgrade all software. Currently not implemented

Kwargs: saltenv (str): The salt environment to use. Default `base`. refresh (bool): Refresh package metadata. Default `True`.

Note: This feature is not yet implemented for Windows.

Returns Empty dict, until implemented
Return type dict

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.win_pkg.**upgrade_available**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

Parameters **name** (*str*) -- The name of a single package

Kwargs: refresh (bool): Refresh package metadata. Default `True` saltenv (str): The salt environment. Default `base`

Returns True if new version available, otherwise False
Return type bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.win_pkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters **name** (*str*) -- One or more package names

Kwargs: saltenv (str): The salt environment to use. Default `base`. refresh (bool): Refresh package metadata. Default `False`.

Returns version string when a single package is specified. dict: The package name(s) with the installed versions.

Return type str

```
{['<version>', '<version>', ]} OR
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

19.9.430 salt.modules.win_pki module

Microsoft certificate management via the PKI Client PowerShell module. https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx

platform Windows

depends

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

salt.modules.win_pki.**export_cert**(*name*, *thumbprint*, *cert_format='cer'*, *context='LocalMachine'*, *store='My'*, *password=''*)

Export the certificate to a file from the given certificate store.

Parameters

- **name** (*str*) -- The destination path for the exported certificate file.
- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **cert_format** (*str*) -- The certificate format. Specify `cer' for X.509, or `pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

salt.modules.win_pki.**get_cert_file**(*name*, *cert_format='cer'*, *password=''*)

Get the details of the certificate file.

Parameters

- **name** (*str*) -- The filesystem path of the certificate file.
- **cert_format** (*str*) -- The certificate format. Specify `cer' for X.509, or `pfx' for PKCS #12.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A dictionary of the certificate thumbprints and properties.

Return type dict

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

salt.modules.win_pki.**get_certs**(*context='LocalMachine'*, *store='My'*)

Get the available certificates in the given store.

Parameters

- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Returns A dictionary of the certificate thumbprints and properties.

Return type dict

CLI Example:

```
salt '*' win_pki.get_certs
```

salt.modules.win_pki.**get_stores**()

Get the certificate location contexts and their corresponding stores.

Returns A dictionary of the certificate location contexts and stores.

Return type dict

CLI Example:

```
salt '*' win_pki.get_stores
```

salt.modules.win_pki.**import_cert**(*name*, *cert_format='cer'*, *context='LocalMachine'*, *store='My'*, *exportable=True*, *password=''*, *saltenv='base'*)

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) -- The path of the certificate file to import.
- **cert_format** (*str*) -- The certificate format. Specify `cer' for X.509, or `pfx' for PKCS #12.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **exportable** (*bool*) -- Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) -- The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** (*str*) -- The environment the file resides in.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

salt.modules.win_pki.**remove_cert**(*thumbprint*, *context='LocalMachine'*, *store='My'*)

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

salt.modules.win_pki.**test_cert**(*thumbprint*, *context='LocalMachine'*, *store='My'*, *untrusted_root=False*, *dns_name=''*, *eku=''*)

Check the certificate for validity.

Parameters

- **thumbprint** (*str*) -- The thumbprint value of the target certificate.
- **context** (*str*) -- The name of the certificate store location context.
- **store** (*str*) -- The name of the certificate store.
- **untrusted_root** (*bool*) -- Whether the root certificate is required to be trusted in chain building.
- **dns_name** (*str*) -- The DNS name to verify as valid for the certificate.
- **eku** (*str*) -- The enhanced key usage object identifiers to verify for the certificate chain.

Returns A boolean representing whether the certificate was considered valid.

Return type bool

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

19.9.431 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
salt '*' powercfg.set_monitor_timeout 0 power=dc
salt '*' powercfg.set_disk_timeout 120 power=ac
```

salt.modules.win_powercfg.**get_disk_timeout**(*scheme=None*)

Get the current disk timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**get_hibernate_timeout**(*scheme=None*)

Get the current hibernate timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**get_monitor_timeout**(*scheme=None*)

Get the current monitor timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**get_standby_timeout**(*scheme=None*)
Get the current standby timeout of the given scheme

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**set_disk_timeout**(*timeout*, *power='ac'*, *scheme=None*)
Set the disk timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_disk_timeout 30 power=dc
```

timeout The amount of time in minutes before the disk will timeout
power Should we set the value for AC or DC (battery)? Valid options ac,dc.
scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**set_hibernate_timeout**(*timeout*, *power='ac'*, *scheme=None*)
Set the hibernate timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_hibernate_timeout 30 power=pc
```

timeout The amount of time in minutes before the computer hibernates
power Should we set the value for AC or DC (battery)? Valid options ac,dc.
scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**set_monitor_timeout**(*timeout*, *power='ac'*, *scheme=None*)
Set the monitor timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_monitor_timeout 30 power=ac
```

timeout The amount of time in minutes before the monitor will timeout
power Should we set the value for AC or DC (battery)? Valid options ac,dc.
scheme The scheme to use, leave as None to use the current.

salt.modules.win_powercfg.**set_standby_timeout**(*timeout*, *power='ac'*, *scheme=None*)
Set the standby timeout in minutes for the given power scheme

CLI Example:

```
salt '*' powercfg.set_standby_timeout 30 power=dc
```

timeout The amount of time in minutes before the computer sleeps
power Should we set the value for AC or DC (battery)? Valid options ac,dc.
scheme The scheme to use, leave as None to use the current.

19.9.432 salt.modules.win_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0

- PSGet

Support for PowerShell

salt.modules.win_psget.**avail_modules**(*desc=False*)

List available modules in registered Powershell module repositories.

Parameters **desc** (bool) -- If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

salt.modules.win_psget.**bootstrap**()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.**get_repository**(*name*)

Get the details of a local PSGet repository

Parameters **name** (str) -- Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.**install**(*name*, *minimum_version=None*, *required_version=None*, *scope=None*, *repository=None*)

Install a Powershell module from powershell gallery on the system.

Parameters

- **name** (str) -- Name of a Powershell module
- **minimum_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required_version** (str) -- Install a specific version
- **scope** (str) -- The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) -- The friendly name of a private repository, e.g. MyREpo

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

salt.modules.win_psget.**list_modules**(*desc=False*)

List currently installed PSGet Modules on the system.

Parameters **desc** (bool) -- If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

salt.modules.win_psget.**psversion**()

Returns the Powershell version

This has been deprecated and has been replaced by cmd.shell_info Note the minimum version return is 5 as dsc is not available for version less than 5. This function will be removed in `Oxygen' release.

CLI Example:

```
salt 'win01' dsc.psversion
```

salt.modules.win_psget.**register_repository**(*name*, *location*, *installation_policy=None*)
Register a PSGet repository on the local machine

Parameters
- **name** (str) -- The name for the repository
- **location** (str) -- The URI for the repository
- **installation_policy** (str) -- The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
↪packages
```

salt.modules.win_psget.**remove**(*name*)
Remove a Powershell DSC module from the system.

Parameters **name** (str) -- Name of a Powershell DSC module

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

salt.modules.win_psget.**update**(*name*, *maximum_version=None*, *required_version=None*)
Update a PowerShell module to a specific version, or the newest

Parameters
- **name** (str) -- Name of a Powershell module
- **maximum_version** (str) -- The maximum version to install, e.g. 1.23.2
- **required_version** (str) -- Install a specific version

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

19.9.433 salt.modules.win_repo

Module to manage Windows software repo on a Standalone Minion

`file_client: local` must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see *here*.

salt.modules.win_repo.**genrepo**()
Generate winrepo_cachefile based on sls files in the winrepo_dir

CLI Example:

```
salt-call winrepo.genrepo
```

salt.modules.win_repo.**show_sls**(*name*, *saltenv='base'*)
New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run pkg.refresh_db to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

Parameters
- **str** (*saltenv*) -- The name/path of the package you want to view. This can be the

- **path to a file on the minion file system or a file on the local** (*full*) --
- **cache.** (minion) --
- **str** -- The default environment is base

Returns Returns a dictionary containing the rendered data structure

Return type dict

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have .sls files organized in subdirectories you'll have to denote them with .. For example, if you have a test directory in the winrepo root with a gvim.sls file inside, would target that file like so: test.gvim. Directories can be targeted as well as long as they contain an init.sls inside. For example, if you have a node directory with an init.sls inside, target that like so: node.

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

salt.modules.win_repo.**update_git_repos**(*clean=False*)

Checkout git repos containing *Windows Software Package Definitions*.

Important: This function requires Git for Windows to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

---

clean [False] Clean repo cachedirs which are not configured under *winrepo_remotes*.

Note: This option only applies if either pygit2 or GitPython is installed into Salt's bundled Python.

Warning: This argument should not be set to True if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

19.9.434 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module

salt.modules.win_servermanager.**install**(*feature*, *recurse=False*, *restart=False*, *source=None*, *exclude=None*)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can

not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- **feature** (*str*) -- The name of the feature to install
- **recurse** (*bool*) -- Install all sub-features. Default is False
- **source** (*str*) -- Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **restart** (*bool*) -- Restarts the computer when installation is complete, if required by the role/feature installed. Default is False
- **exclude** (*str*) -- The name of the feature to exclude when installing the named feature.

  Note: As there is no exclude option for the `Add-WindowsFeature` command, the feature will be installed with other sub-features and will then be removed.

- **restart** -- Restarts the computer when installation is complete, if required by the role feature installed.

Returns A dictionary containing the results of the install

Return type dict

CLI Example:

```
salt '*' win_servermanager.install Telnet-Client
salt '*' win_servermanager.install SNMP-Service True
salt '*' win_servermanager.install TFTP-Client source=d:\side-by-side
```

salt.modules.win_servermanager.**list_available**()

List available features to install

Returns A list of available features

Return type *list*

CLI Example:

```
salt '*' win_servermanager.list_available
```

salt.modules.win_servermanager.**list_installed**()

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

Returns A list of installed features

Return type *list*

CLI Example:

```
salt '*' win_servermanager.list_installed
```

salt.modules.win_servermanager.**remove**(*feature*, *remove_payload=False*, *restart=False*)

Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

Parameters

- **feature** (*str*) -- The name of the feature to remove
- **remove_payload** (*bool*) -- True will cause the feature to be removed from the side-by-side store (`%SystemDrive%:\Windows\WinSxS`). Default is False
- **restart** (*bool*) -- Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

Returns A dictionary containing the results of the uninstall

Return type dict

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

19.9.435 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: - Rewritten to use PyWin32

`salt.modules.win_service.`**`available`**(*name*)

Check if a service is available on the system.

Parameters **name** (*str*) -- The name of the service to check

Returns `True` if the service is available, `False` otherwise

Return type bool

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.`**`config`**(*name*, *bin_path=None*, *display_name=None*, *svc_type=None*, *start_type=None*, *error=None*, *group=None*, *tag=None*, *depend=None*, *obj=None*, *password=None*, ***kwargs*)

Deprecated since version 2016.11.0: Use `service.modify` instead

Modify the named service. Because this is deprecated it will use the passed parameters to run `service.modify` instead.

Parameters

- **name** (*str*) -- Specifies the service name. This is not the display_name
- **bin_path** (*str*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **display_name** (*str*) -- the name to be displayed in the service manager
- **svc_type** (*str*) -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual (default): Service must be started manually
  - disabled: Service cannot be started

- **error** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **group** -- The name of the load order group to which this service belongs
- **depend** (*list*) -- A list of services or load ordering groups that must start before this service
- **obj** (*str*) -- The name of the account under which the service should run. For own type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .\LocalSystem
- **password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.

Returns a dictionary of changes made

Return type dict

CLI Example:

```
salt '*' service.config <service name> <path to exe> display_name='<display name>'
```

salt.modules.win_service.**create**(*name*, *bin_path*, *exe_args=None*, *display_name=None*, *description=None*, *service_type='own'*, *start_type='manual'*, *start_delayed=False*, *error_control='normal'*, *load_order_group=None*, *dependencies=None*, *account_name='.\\LocalSystem'*, *account_password=None*, *run_interactive=False*, ***kwargs*)

Create the named service.

New in version 2015.8.0.

Parameters

- **name** (*str*) -- Specifies the service name. This is not the display_name
- **bin_path** (*str*) -- Specifies the path to the service binary file. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args** (*str*) -- Any additional arguments required by the service binary.
- **display_name** (*str*) -- the name to be displayed in the service manager. If not passed, the `name` will be used
- **description** (*str*) -- A description of the service
- **service_type** (*str*) -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader

- system: Device driver that is started during kernel initialization
- auto: Service that automatically starts
- manual (default): Service must be started manually
- disabled: Service cannot be started

- **start_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set. Default is `False`
- **error_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal (normal): Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** -- The name of the load order group to which this service belongs
- **dependencies** (`list`) -- A list of services or load ordering groups that must start before this service
- **account_name** (*str*) -- The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
  - NT Authority\LocalService
  - NT Authority\NetworkService
  - NT Authority\LocalSystem
  - .\LocalSystem
- **account_password** (*str*) -- The password for the account name specified in `account_name`. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive** (*bool*) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns A dictionary containing information about the new service

Return type dict

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='<display name>'
```

salt.modules.win_service.**create_win_salt_restart_task**()

Create a task in Windows task scheduler to enable restarting the salt-minion

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

salt.modules.win_service.**delete**(*name*)

Delete the named service

Parameters **name** (*str*) -- The name of the service to delete

Returns True if successful, False otherwise

Return type bool

CLI Example:

```
salt '*' service.delete <service name>
```

salt.modules.win_service.**disable**(*name*, ***kwargs*)

Disable the named service to start at boot

Parameters **name** (*str*) -- The name of the service to disable

Returns `True` if disabled, `False` otherwise

Return type bool

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.win_service.**disabled**(*name*)

Check to see if the named service is disabled to start on boot

Parameters **name** (*str*) -- The name of the service to check

Returns True if the service is disabled

Return type bool

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.win_service.**enable**(*name*, ***kwargs*)

Enable the named service to start at boot

Parameters **name** (*str*) -- The name of the service to enable.

Returns `True` if successful, `False` otherwise

Return type bool

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.win_service.**enabled**(*name*, ***kwargs*)

Check to see if the named service is enabled to start on boot

Parameters **name** (*str*) -- The name of the service to check

Returns True if the service is set to start

Return type bool

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.win_service.**execute_salt_restart_task**()

Run the Windows Salt restart task

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

salt.modules.win_service.**get_all**()

Return all installed services

Returns Returns a list of all services on the system.

Return type *list*

CLI Example:

```
salt '*' service.get_all
```

salt.modules.win_service.**get_disabled**()

Return a list of disabled services. Disabled is defined as a service that is marked `Disabled' or `Manual'.

Returns A list of disabled services.

Return type *list*

CLI Example:

```
salt '*' service.get_disabled
```

salt.modules.win_service.**get_enabled**()

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

Returns A list of enabled services

Return type *list*

CLI Example:

```
salt '*' service.get_enabled
```

salt.modules.win_service.**get_service_name**(**args*)

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

Returns A dictionary of display names and service names

Return type dict

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

salt.modules.win_service.**getsid**(*name*)

Return the SID for this windows service

Parameters **name** (*str*) -- The name of the service for which to return the SID

Returns A string representing the SID for the service

Return type str

CLI Example:

```
salt '*' service.getsid <service name>
```

salt.modules.win_service.**info**(*name*)

Get information about a service on the system

Parameters **name** (*str*) -- The name of the service. This is not the display name. Use `get_service_name` to find the service name.

Returns A dictionary containing information about the service.

Return type dict

CLI Example:

```
salt '*' service.info spooler
```

salt.modules.win_service.**missing**(*name*)

The inverse of service.available.

Parameters **name** (*str*) -- The name of the service to check

Returns `True` if the service is missing, `False` otherwise

Return type bool

CLI Example:

```
salt '*' service.missing <service name>
```

salt.modules.win_service.**modify**(*name*, *bin_path=None*, *exe_args=None*, *display_name=None*, *description=None*, *service_type=None*, *start_type=None*, *start_delayed=None*, *error_control=None*, *load_order_group=None*, *dependencies=None*, *account_name=None*, *account_password=None*, *run_interactive=None*)

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- **name** (*str*) -- The name of the service. Can be found using the `service.get_service_name` function
- **bin_path** (*str*) -- The path to the service executable. Backslashes must be escaped, eg: C:\path\to\binary.exe
- **exe_args** (*str*) -- Any arguments required by the service executable
- **display_name** (*str*) -- The name to display in the service manager
- **description** (*str*) -- The description to display for the service
- **service_type** (*str*) -- Specifies the service type. Default is own. Valid options are as follows:
  - kernel: Driver service
  - filesystem: File system driver service
  - adapter: Adapter driver service (reserved)
  - recognizer: Recognizer driver service (reserved)
  - own (default): Service runs in its own process
  - share: Service shares a process with one or more other services
- **start_type** (*str*) -- Specifies the service start type. Valid options are as follows:
  - boot: Device driver that is loaded by the boot loader
  - system: Device driver that is started during kernel initialization
  - auto: Service that automatically starts
  - manual: Service must be started manually
  - disabled: Service cannot be started
- **start_delayed** (*bool*) -- Set the service to Auto(Delayed Start). Only valid if the start_type is set to `Auto`. If service_type is not passed, but the service is already set to `Auto`, then the flag will be set.
- **error_control** (*str*) -- The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
  - normal: Error is logged and a message box is displayed
  - severe: Error is logged and computer attempts a restart with the last known good configuration
  - critical: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
  - ignore: Error is logged and startup continues, no notification is given to the user
- **load_order_group** -- The name of the load order group to which this service belongs
- **dependencies** (`list`) -- A list of services or load ordering groups that must start before this service
- **account_name** (*str*) -- The name of the account under which the service should run. For own type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:

- NT Authority\LocalService
- NT Authority\NetworkService
- NT Authority\LocalSystem
- .LocalSystem

- **account_password** (*str*) -- The password for the account name specified in account_name. For the above built-in accounts, this can be None. Otherwise a password must be specified.
- **run_interactive** (*bool*) -- If this setting is True, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns a dictionary of changes made
Return type dict

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

salt.modules.win_service.**restart**(*name*)

Restart the named service. This issues a stop command followed by a start.

Parameters **name** -- The name of the service to restart.

Note: If the name passed is salt-minion a scheduled task is created and executed to restart the salt-minion service.

Returns True if successful, False otherwise
Return type bool

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.win_service.**start**(*name*)

Start the specified service.

Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

Parameters **name** (*str*) -- The name of the service to start
Returns True if successful, False otherwise
Return type bool

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.win_service.**status**(*name*, *sig=None*)

Return the status for a service

Parameters

- **name** (*str*) -- The name of the service to check
- **sig** (*str*) -- Not supported on Windows

Returns True if running, False otherwise
Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.win_service.**stop**(*name*)

Stop the specified service

Parameters **name** (*str*) -- The name of the service to stop

Returns True if successful, False otherwise

Return type bool

CLI Example:

```
salt '*' service.stop <service name>
```

19.9.436 salt.modules.win_shadow

Manage the shadow file

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to *`shadow.info' is not available*), see *here*.

salt.modules.win_shadow.**info**(*name*)

Return information for the specified user This is just returns dummy data so that salt states can work.

Parameters **name** (*str*) -- The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

salt.modules.win_shadow.**require_password_change**(*name*)

Require the user to change their password the next time they log in.

Parameters **name** -- The name of the user account to require a password change.

Returns True if successful. False if unsuccessful.

Return type bool

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

salt.modules.win_shadow.**set_expire**(*name*, *expire*)

Set the expiration date for a user account.

Parameters

- **name** -- The name of the user account to edit.
- **expire** -- The date the account will expire.

Returns True if successful. False if unsuccessful.

Return type bool

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

salt.modules.win_shadow.**set_password**(*name*, *password*)

Set the password for a named user.

Parameters

- **name** (*str*) -- The name of the user account
- **password** (*str*) -- The new password

Returns True if successful. False if unsuccessful.

Return type bool

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

salt.modules.win_shadow.**unlock_account**(*name*)

Unlocks a user account.

Parameters **name** -- The name of the user account to unlock.

Returns True if successful. False if unsuccessful.

Return type bool

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

19.9.437 salt.modules.win_smtp_server module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features `SMTP-Server' and `Web-WMI' must be installed.

depends wmi

salt.modules.win_smtp_server.**get_connection_ip_list**(*as_wmi_format=False*, *server='SmtpSvc/1'*)

Get the IPGrant list for the SMTP virtual server.

Parameters

- **as_wmi_format** (*bool*) -- Returns the connection IPs as a list in the format WMI expects.
- **server** (*str*) -- The SMTP server name.

Returns A dictionary of the IP and subnet pairs.

Return type dict

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

salt.modules.win_smtp_server.**get_log_format**(*server='SmtpSvc/1'*)

Get the active log format for the SMTP virtual server.

Parameters **server** (*str*) -- The SMTP server name.

Returns A string of the log format name.

Return type str

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

salt.modules.win_smtp_server.**get_log_format_types**()

Get all available log format names and ids.

Returns A dictionary of the log format names and ids.

Return type dict

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

salt.modules.win_smtp_server.**get_relay_ip_list**(*server='SmtpSvc/1'*)

Get the RelayIpList list for the SMTP virtual server.

Parameters **server** (*str*) -- The SMTP server name.

Returns A list of the relay IPs.

Return type *list*

Note: A return value of None corresponds to the restrictive `Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive `All except the list below' GUI parameter.

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

salt.modules.win_smtp_server.**get_server_setting**(*settings*, *server='SmtpSvc/1'*)

Get the value of the setting for the SMTP virtual server.

Parameters

- **settings** (*str*) -- A list of the setting names.
- **server** (*str*) -- The SMTP server name.

Returns A dictionary of the provided settings and their values.

Return type dict

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

salt.modules.win_smtp_server.**get_servers**()

Get the SMTP virtual server names.

Returns A list of the SMTP virtual servers.

Return type *list*

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

salt.modules.win_smtp_server.**set_connection_ip_list**(*addresses=None*, *grant_by_default=False*, *server='SmtpSvc/1'*)

Set the IPGrant list for the SMTP virtual server.

Parameters

- **addresses** (*str*) -- A dictionary of IP + subnet pairs.
- **grant_by_default** (*bool*) -- Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses="{'127.0.0.1': '255.255.
↪255.255'}"
```

salt.modules.win_smtp_server.**set_log_format**(*log_format*, *server='SmtpSvc/1'*)

Set the active log format for the SMTP virtual server.

Parameters

- **log_format** (*str*) -- The log format name.
- **server** (*str*) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

salt.modules.win_smtp_server.**set_relay_ip_list**(*addresses=None*, *server='SmtpSvc/1'*)
Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting `127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0',
 '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0',
 '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0',
 '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive `Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive `All except the list below' GUI parameter.

Parameters
- **addresses** (*str*) -- A list of the relay IPs. The order of the list is important.
- **server** (*str*) -- The SMTP server name.

Returns A boolean representing whether the change succeeded.
Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1
 ↪']"
```

salt.modules.win_smtp_server.**set_server_setting**(*settings*, *server='SmtpSvc/1'*)
Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters
- **settings** (*str*) -- A dictionary of the setting names and their values.
- **server** (*str*) -- The SMTP server name.

Returns A boolean representing whether all changes succeeded.
Return type bool

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{'MaxRecipients': '500'}"
```

19.9.438 salt.modules.win_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature `SNMP-Service' must be installed.

salt.modules.win_snmp.**get_agent_service_types**()
Get the sysServices types that can be configured.
Returns A list of service types.
Return type *list*

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

salt.modules.win_snmp.**get_agent_settings**()

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns A dictionary of the agent settings.

Return type dict

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

salt.modules.win_snmp.**get_auth_traps_enabled**()

Determine whether the host is configured to send authentication traps.

Returns True if traps are enabled, otherwise False

Return type bool

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

salt.modules.win_snmp.**get_community_names**()

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
    Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
    Read Only
```

Returns A dictionary of community names and permissions.

Return type dict

CLI Example:

```
salt '*' win_snmp.get_community_names
```

salt.modules.win_snmp.**get_permission_types**()

Get the permission types that can be configured for communities.

Returns A list of permission types.

Return type *list*

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

salt.modules.win_snmp.**set_agent_settings**(*contact=None*, *location=None*, *services=None*)

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **contact** (*str, optional*) -- The SNMP contact.
- **location** (*str, optional*) -- The SNMP location.
- **services** (*list, optional*) -- A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: ['None']

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'
↪services="['Physical']"
```

salt.modules.win_snmp.**set_auth_traps_enabled**(*status=True*)

Manage the sending of authentication traps.

Parameters **status** (*bool*) -- True to enable traps. False to disable.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

salt.modules.win_snmp.**set_community_names**(*communities*)

Manage the SNMP accepted community names and their permissions.

Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a CommandExecutionError

---

Parameters **communities** (*dict*) -- A dictionary of SNMP community names and permissions. The possible permissions can be found via win_snmp.get_permission_types.

Returns True if successful, otherwise False

Return type bool

Raises CommandExecutionError -- If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{'TestCommunity': 'Read Only'}'
```

19.9.439 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

depends

- wmi

salt.modules.win_status.**cpuload**()

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

salt.modules.win_status.**diskusage**(*human_readable=False*, *path=None*)

New in version 2015.8.0.

Return the disk usage for this minion

human_readable [False] If True, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

salt.modules.win_status.**master**(*master=None*, *connected=True*)

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If master_ip is an FQDN/Hostname, is must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

salt.modules.win_status.**procs**(*count=False*)

Return the process data

count [False] If `True`, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

salt.modules.win_status.**saltmem**(*human_readable=False*)

New in version 2015.8.0.

Returns the amount of memory that salt is using

human_readable [False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

salt.modules.win_status.**uptime**(*human_readable=False*)

New in version 2015.8.0.

Return the system uptime for this machine in seconds

human_readable [False] If `True`, then return uptime in years, days, and seconds.

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

19.9.440 salt.modules.win_system

Module for managing windows systems.

depends

- pythoncom
- pywintypes
- win32api
- win32con
- win32net

- wmi

Support for reboot, shutdown, etc

salt.modules.win_system.**get_computer_desc**()

Get the Windows computer description

Returns Returns the computer description if found. Otherwise returns `False`.

Return type str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

salt.modules.win_system.**get_computer_name**()

Get the Windows computer name

Returns Returns the computer name if found. Otherwise returns `False`.

Return type str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

salt.modules.win_system.**get_domain_workgroup**()

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

Returns The name of the domain or workgroup

Return type str

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

salt.modules.win_system.**get_hostname**()

Get the hostname of the windows minion

New in version 2016.3.0.

Returns Returns the hostname of the windows minion

Return type str

CLI Example:

```
salt 'minion-id' system.get_hostname
```

salt.modules.win_system.**get_pending_component_servicing**()

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns `True` if there are pending Component Based Servicing tasks, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

salt.modules.win_system.**get_pending_computer_name**()

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, `None` will be returned. If there was an error retrieving the pending computer name, `False` will be returned, and an error message will be logged to the minion log.

Returns Returns the pending name if pending restart. Returns `None` if not pending restart.

Return type str

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

salt.modules.win_system.**get_pending_domain_join**()

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns `True` if there is a pending domain join action, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_pending_domain_join
```

salt.modules.win_system.**get_pending_file_rename**()

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

Returns `True` if there are pending file rename operations, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_pending_file_rename
```

salt.modules.win_system.**get_pending_reboot**()

Determine whether there is a reboot pending.

New in version 2016.11.0.

Returns `True` if the system is pending reboot, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_pending_reboot
```

salt.modules.win_system.**get_pending_servermanager**()

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

Returns `True` if there are pending Server Manager tasks, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_pending_servermanager
```

salt.modules.win_system.**get_pending_update**()

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

Returns `True` if there are pending updates, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_pending_update
```

salt.modules.win_system.**get_reboot_required_witnessed**()

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return `True` if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns `True` if the `Requires reboot` registry flag is set to `1`, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

salt.modules.win_system.**get_system_date**()

Get the Windows system date

Returns Returns the system date

Return type str

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.win_system.**get_system_info**()

Get system information.

Returns Dictionary containing information about the system to include name, description, version, etc...

Return type dict

CLI Example:

```
salt 'minion-id' system.get_system_info
```

salt.modules.win_system.**get_system_time**()

Get the system time.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type str

CLI Example:

```
salt 'minion-id' system.get_system_time
```

salt.modules.win_system.**halt**(*timeout=5*, *in_seconds=False*)

Halt a running system.

Parameters

- **timeout** (*int*) -- Number of seconds before halting the system. Default is 5 seconds.
- **in_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

  New in version 2015.8.0.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.halt 5 True
```

salt.modules.win_system.**init**(*runlevel*)

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:

```
salt '*' system.init 3
```

salt.modules.win_system.**join_domain**(*domain*, *username=None*, *password=None*, *account_ou=None*, *account_exists=False*, *restart=False*)

Join a computer to an Active Directory domain. Requires a reboot.

Parameters

- **domain** (*str*) -- The domain to which the computer should be joined, e.g. `example.com`
- **username** (*str*) -- Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like `user@domain.tld` or simply `user`
- **password** (*str*) -- Password of the specified user
- **account_ou** (*str*) -- The DN of the OU below which the account for this computer should be created when joining the domain, e.g. `ou=computers,ou=departm_432,dc=my-company,dc=com`
- **account_exists** (*bool*) -- If set to `True` the computer will only join the domain if the account already exists. If set to `False` the computer account will be created if it does not exist, otherwise it will use the existing account. Default is `False`
- **restart** (*bool*) -- `True` will restart the computer after a successful join. Default is `False`

  New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise `False`

Return type dict

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
                 username='joinuser' password='joinpassword' \
                 account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
                 account_exists=False, restart=True
```

salt.modules.win_system.**lock**()

Lock the workstation.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt 'minion-id' system.lock
```

salt.modules.win_system.**poweroff**(*timeout=5*, *in_seconds=False*)

Power off a running system.

Parameters

- **timeout** (*int*) -- Number of seconds before powering off the system. Default is 5 seconds.
- **in_seconds** (*bool*) -- Whether to treat timeout as seconds or minutes.

  New in version 2015.8.0.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.poweroff 5
```

salt.modules.win_system.**reboot**(*timeout=5*, *in_seconds=False*, *wait_for_reboot=False*, *only_on_pending_reboot=False*)

Reboot a running system.

Parameters

- **timeout** (*int*) -- The number of minutes/seconds before rebooting the system. Use

of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.

- **in_seconds** (*bool*) --
  True will cause the timeout parameter to be in seconds. `False` will be in minutes. Default is `False`.
  New in version 2015.8.0.
- **wait_for_reboot** (*bool*) -- `True` will sleep for timeout + 30 seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is `False`.

  New in version 2015.8.0.
- **only_on_pending_reboot** (*bool*) -- If this is set to `True`, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to `True` could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*). Default is `False`.

Returns `True` if successful (a reboot will occur), otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
   module.run:
      - name: system.reboot
      - only_on_pending_reboot: True
      - order: last
```

`salt.modules.win_system.`**`set_computer_desc`**(*desc=None*)

Set the Windows computer description

Parameters **desc** (*str*) -- The computer description

Returns Description if successful, otherwise `False`

Return type str

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.`**`set_computer_name`**(*name*)

Set the Windows computer name

Parameters **name** (*str*) -- The new name to give the computer. Requires a reboot to take effect.

Returns Returns a dictionary containing the old and new names if successful. `False` if not.

Return type dict

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.`**`set_hostname`**(*hostname*)

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters **hostname** (*str*) -- The hostname to set

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

salt.modules.win_system.**set_reboot_required_witnessed**()

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *`Reboot required'* will be assigned the value of *1*.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

salt.modules.win_system.**set_system_date**(*newdate*)

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters **newdate** (*str*) -- The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

salt.modules.win_system.**set_system_date_time**(*years=None*, *months=None*, *days=None*, *hours=None*, *minutes=None*, *seconds=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by set_system_date and set_system_time)

Parameters

- **years** (*int*) -- Years digit, ie: 2015
- **months** (*int*) -- Months digit: 1 - 12
- **days** (*int*) -- Days digit: 1 - 31
- **hours** (*int*) -- Hours digit: 0 - 23
- **minutes** (*int*) -- Minutes digit: 0 - 59
- **seconds** (*int*) -- Seconds digit: 0 - 59

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.set_system_date_ time 2015 5 12 11 37 53
```

salt.modules.win_system.**set_system_time**(*newtime*)

Set the system time.

Parameters **newtime** (*str*) -- The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

salt.modules.win_system.**shutdown**(*message=None*, *timeout=5*, *force_close=True*, *reboot=False*, *in_seconds=False*, *only_on_pending_reboot=False*)

Shutdown a running system.

Parameters

- **message** (*str*) -- The message to display to the user before shutting down.
- **timeout** (*int*) -- The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

  If timeout is not zero, InitiateSystemShutdown displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the lpMessage parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

  If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

  Default is 5 minutes
- **in_seconds** (*bool*) --
  True will cause the timeout parameter to be in seconds. `False` will be in minutes. Default is `False`.
  New in version 2015.8.0.
- **force_close** (*bool*) -- `True` will force close all open applications. `False` will display a dialog box instructing the user to close open applications. Default is `True`.
- **reboot** (*bool*) -- `True` restarts the computer immediately after shutdown. `False` powers down the system. Default is `False`.
- **only_on_pending_reboot** (*bool*) -- If this is set to True, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.
- **only_on_pending_reboot** -- If `True` the shutdown will only proceed if there is a reboot pending. `False` will shutdown the system. Default is `False`.

Returns `True` if successful (a shutdown or reboot will occur), otherwise `False`

Return type bool

CLI Example:

```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

salt.modules.win_system.**shutdown_abort**()

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns `True` if successful, otherwise `False`

Return type bool

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

salt.modules.win_system.**shutdown_hard**()

Shutdown a running system with no timeout or warning.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.shutdown_hard
```

salt.modules.win_system.**start_time_service**()

Start the Windows time service

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.start_time_service
```

salt.modules.win_system.**stop_time_service**()

Stop the Windows time service

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.stop_time_service
```

salt.modules.win_system.**unjoin_domain**(*username=None*, *password=None*, *domain=None*, *workgroup='WORKGROUP'*, *disable=False*, *restart=False*)

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters

- **username** (*str*) -- Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like user@domain.tld or domain.tld\user. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be None.
- **password** (*str*) -- The password of the specified user
- **domain** (*str*) -- The domain from which to unjoin the computer. Can be None
- **workgroup** (*str*) -- The workgroup to join the computer to. Default is WORKGROUP

  New in version 2015.8.2/2015.5.7.
- **disable** (*bool*) -- True to disable the computer account in Active Directory. Default is False
- **restart** (*bool*) -- True will restart the computer after successful unjoin. Default is False

  New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise False

Return type dict

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \\
```

```
                password='unjoinpassword' disable=True \\
                restart=True
```

19.9.441 salt.modules.win_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

salt.modules.win_task.**add_action**(*name=None*, *location='\\'*, *action_type='Execute'*, ***kwargs*)

Add an action to a task.

Parameters

- **name** (*str*) -- The name of the task to which to add the action.
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).
- **action_type** (*str*) -- The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (kwargs). Valid values are:
  - Execute
  - Email
  - Message

Required arguments for each action_type:

Execute - Execute a command or an executable

Parameters

- **cmd** (*str*) -- (required) The command / executable to run.
- **arguments** (*str*) -- (optional) Arguments to be passed to the command / executable. To launch a script the first command will need to be the interpreter for the script. For example, to run a vbscript you would pass *cscript.exe* in the *cmd* parameter and pass the script in the *arguments* parameter as follows:
  - `cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'`

  Batch files do not need an interpreter and may be passed to the cmd parameter directly.
- **start_in** (*str*) -- (optional) The current working directory for the command.

Email - Send and email. Requires `server`, `from`, and `to` or `cc`.

Parameters

- **from** (*str*) -- The sender
- **reply_to** (*str*) -- Who to reply to
- **to** (*str*) -- The recipient
- **cc** (*str*) -- The CC recipient
- **bcc** (*str*) -- The BCC recipient
- **subject** (*str*) -- The subject of the email
- **body** (*str*) -- The Message Body of the email
- **server** (*str*) -- The server used to send the email
- **attachments** (*list*) -- A list of attachments. These will be the paths to the files to attach. ie: `attachments="['C:\attachment1.txt','C:\attachment2.txt']"`

Message - Display a dialog box. The task must be set to ``Run only when user is logged on'' in order for the dialog box to display. Both parameters are required.

Parameters

- **title** (*str*) -- The dialog box title.
- **message** (*str*) -- The dialog box message body

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

salt.modules.win_task.**add_trigger**(*name=None*, *location='\\'*, *trigger_type=None*, *trigger_enabled=True*, *start_date=None*, *start_time=None*, *end_date=None*, *end_time=None*, *random_delay=None*, *repeat_interval=None*, *repeat_duration=None*, *repeat_stop_at_duration_end=False*, *execution_time_limit=None*, ***kwargs*)

Parameters

- **name** (*str*) -- The name of the task to which to add the trigger.
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).
- **trigger_type** (*str*) -- The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:

•Event
•Once
•Daily
•Weekly
•Monthly
•MonthlyDay
•OnIdle
•OnTaskCreation
•OnBoot
•OnLogon
•OnSessionChange

Parameters

- **trigger_enabled** (*bool*) -- Boolean value that indicates whether the trigger is enabled.
- **start_date** (*str*) -- The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:

•%Y-%m-%d
•%m-%d-%y
•%m-%d-%Y
•%m/%d/%y
•%m/%d/%Y
•%Y/%m/%d

Parameters **start_time** (*str*) -- The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:

•%I:%M:%S %p
•%I:%M %p
•%H:%M:%S
•%H:%M

Parameters **end_date** (*str*) -- The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:

•%Y-%m-%d
•%m-%d-%y
•%m-%d-%Y
•%m/%d/%y
•%m/%d/%Y

•%Y/%m/%d

Parameters **end_time** (*str*) -- The time when the trigger is deactivated. If the this is not passed with `end_date` it will be set to midnight. Can be one of the following formats:

•%I:%M:%S %p
•%I:%M %p
•%H:%M:%S
•%H:%M

Parameters **random_delay** (*str*) -- The delay time that is randomly added to the start time of the trigger. Valid values are:

•30 seconds
•1 minute
•30 minutes
•1 hour
•8 hours
•1 day

Parameters **repeat_interval** (*str*) -- The amount of time between each restart of the task. Valid values are:

•5 minutes
•10 minutes
•15 minutes
•30 minutes
•1 hour

Parameters **repeat_duration** (*str*) -- How long the pattern is repeated. Valid values are:

•Indefinitely
•15 minutes
•30 minutes
•1 hour
•12 hours
•1 day

Parameters

- **repeat_stop_at_duration_end** (*bool*) -- Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.
- **execution_time_limit** (*str*) -- The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:

•30 minutes
•1 hour
•2 hours
•4 hours
•8 hours
•12 hours
•1 day
•3 days (default)

kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event

Parameters **subscription** (*str*) -- An event definition in xml format that fires the trigger. The easiest way to get this would is to create an event in windows task scheduler and then

copy the xml text.

Once

No special parameters required.

Daily

Parameters **days_interval** (*int*) -- The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly

Parameters **weeks_interval** (*int*) -- The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

param list days_of_week: Sets the days of the week on which the task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

Monthly

Parameters

- **months_of_year** (*list*) -- Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.
- **days_of_month** (*list*) -- Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, `Last']. Options are all days of the month 1 - 31 and the word `Last' to indicate the last day of the month.
- **last_day_of_month** (*bool*) -- Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

You can set the task to run on the last day of the month by either including the word `Last' in the list of days, or setting the parameter `last_day_of_month` equal to True.

MonthlyDay

Parameters

- **months_of_year** (*list*) -- Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.
- **weeks_of_month** (*list*) -- Sets the weeks of the month during which the task runs. Should be a list. ie: ['First','Third']. Valid options are:

•First
•Second
•Third
•Fourth

Parameters

- **last_week_of_month** (*bool*) -- Boolean value that indicates that the task runs on the last week of the month.
- **days_of_week** (*list*) -- Sets the days of the week during which the task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

OnIdle No special parameters required.

OnTaskCreation No special parameters required.

OnBoot No special parameters required.

OnLogon No special parameters required.

OnSessionChange

Parameters

- **session_user_name** (*str*) -- Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.
- **state_change** (*str*) -- Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:

•ConsoleConnect: When you connect to a user session (switch users)
•ConsoleDisconnect: When you disconnect a user session (switch users)
•RemoteConnect: When a user connects via Remote Desktop
•RemoteDisconnect: When a user disconnects via Remote Desktop
•SessionLock: When the workstation is locked
•SessionUnlock: When the workstation is unlocked

Returns True if successful, False if unsuccessful
Return type bool

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
↪enabled=True start_date=2016/12/1 start_time=12:01
```

salt.modules.win_task.**clear_triggers**(*name*, *location='\\'*)

Remove all triggers from the task.

Parameters

- **name** (*str*) -- The name of the task from which to clear all triggers.
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful
Return type bool

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

salt.modules.win_task.**create_folder**(*name*, *location='\\'*)

Create a folder in which to create tasks.

Parameters

- **name** (*str*) -- The name of the folder. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the folder. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful
Return type bool

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

salt.modules.win_task.**create_task**(*name*, *location='\\'*, *user_name='System'*, *password=None*, *force=False*, ***kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

•*edit_task()*
•*add_action()*
•*add_trigger()*

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.

- **location** (*str*) -- A string value representing the location in which to create the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).
- **user_name** (*str*) -- The user account under which to run the task. To specify the `System' account, use `System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **force** (*bool*) -- If the task exists, overwrite the existing task.

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_
↪type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-1
↪start_time=01:00
```

salt.modules.win_task.**create_task_from_xml**(*name*, *location='\\'*, *xml_text=None*, *xml_path=None*, *user_name='System'*, *password=None*)

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).
- **xml_text** (*str*) -- A string of xml representing the task to be created. This will be overridden by *xml_path* if passed.
- **xml_path** (*str*) -- The path to an XML file on the local system containing the xml that defines the task. This will override *xml_text*
- **user_name** (*str*) -- The user account under which to run the task. To specify the `System' account, use `System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

salt.modules.win_task.**delete_folder**(*name*, *location='\\'*)

Delete a folder from the task scheduler.

Parameters

- **name** (*str*) -- The name of the folder to delete.
- **location** (*str*) -- A string value representing the location of the folder. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

salt.modules.win_task.**delete_task**(*name*, *location='\\'*)

Delete a task from the task scheduler.

Parameters

- **name** (*str*) -- The name of the task to delete.

- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

salt.modules.win_task.**edit_task**(*name=None*, *location='\\'*, *user_name=None*, *password=None*, *description=None*, *enabled=None*, *hidden=None*, *run_if_idle=None*, *idle_duration=None*, *idle_wait_timeout=None*, *idle_stop_on_end=None*, *idle_restart=None*, *ac_only=None*, *stop_if_on_batteries=None*, *wake_to_run=None*, *run_if_network=None*, *network_id=None*, *network_name=None*, *allow_demand_start=None*, *start_when_available=None*, *restart_every=None*, *restart_count=3*, *execution_time_limit=None*, *force_stop=None*, *delete_after=None*, *multiple_instances=None*, ***kwargs*)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name** (*str*) -- The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) -- A string value representing the location in which to create the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).
- **user_name** (*str*) -- The user account under which to run the task. To specify the `System' account, use `System'. The password will be ignored.
- **password** (*str*) -- The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Note: The combination of user_name and password determine how the task runs. For example, if a username is passed without at password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass `System' as the username the task will run as the system account (the password parameter is ignored.

Parameters

- **description** (*str*) -- A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled** (*bool*) -- A boolean value representing whether or not the task is enabled.
- **hidden** (*bool*) -- A boolean value representing whether or not the task is hidden.
- **run_if_idle** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration** (*str*) -- A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:

•1 minute
•5 minutes
•10 minutes
•15 minutes
•30 minutes
•1 hour

Parameters **idle_wait_timeout** (*str*) -- A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:

•Do not wait

•1 minute
•5 minutes
•10 minutes
•15 minutes
•30 minutes
•1 hour
•2 hours

Parameters

- **idle_stop_on_end** (*bool*) -- Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.
- **idle_restart** (*bool*) -- Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
- **ac_only** (*bool*) -- Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
- **stop_if_on_batteries** (*bool*) -- Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
- **wake_to_run** (*bool*) -- Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
- **run_if_network** (*bool*) -- Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
- **network_id** (*guid*) -- GUID value that identifies a network profile.
- **network_name** (*str*) -- Sets the name of a network profile. The name is used for display purposes.
- **allow_demand_start** (*bool*) -- Boolean value that indicates that the task can be started by using either the Run command or the Context menu.
- **start_when_available** (*bool*) -- Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
- **restart_every** -- A value that specifies the interval between task restart attempts. Valid values are:

•False (to disable)
•1 minute
•5 minutes
•10 minutes
•15 minutes
•30 minutes
•1 hour
•2 hours

Parameters

- **restart_count** (*int*) -- The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
- **execution_time_limit** -- The amount of time allowed to complete the task. Valid values are:

•False (to disable)
•1 hour
•2 hours
•4 hours
•8 hours
•12 hours
•1 day
•3 days

Parameters

- **force_stop** (*bool*) -- Boolean value that indicates that the task may be terminated by using TerminateProcess.
- **delete_after** -- The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:

•False (to disable)
•Immediately
•30 days
•90 days
•180 days
•365 days

Parameters **multiple_instances** (*str*) -- Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:

•Parallel
•Queue
•No New Instance
•Stop Existing

Returns True if successful, False if unsuccessful
Return type bool

CLI Example:

```
salt 'minion-id' task.edit_task <task_name> description='This task is awesome'
```

salt.modules.win_task.**info**(*name*, *location='\\'*)

Get the details about a task in the task scheduler.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns
Return type dict

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

salt.modules.win_task.**list_actions**(*name*, *location='\\'*)

List all actions that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list actions.
- **location** (*str*) -- A string value representing the location of the task from which to list actions. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of actions.
Return type *list*

CLI Example:

```
salt 'minion-id' task.list_actions <task_name>
```

salt.modules.win_task.**list_folders**(*location='\\'*)

List all folders located in a specific location in the task scheduler.

Parameters **location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of folders.
Return type *list*

CLI Example:

```
salt 'minion-id' task.list_folders
```

salt.modules.win_task.**list_tasks**(*location='\\'*)

List all tasks located in a specific location in the task scheduler.

Parameters **location** (*str*) -- A string value representing the folder from which you want to list tasks. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).
Returns Returns a list of tasks.
Return type *list*

CLI Example:

```
salt 'minion-id' task.list_tasks
```

salt.modules.win_task.**list_triggers**(*name*, *location='\\'*)

List all triggers that pertain to a task in the specified location.

Parameters

- **name** (*str*) -- The name of the task for which list triggers.
- **location** (*str*) -- A string value representing the location of the task from which to list triggers. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of triggers.
Return type *list*

CLI Example:

```
salt 'minion-id' task.list_triggers <task_name>
```

salt.modules.win_task.**run**(*name*, *location='\\'*)

Run a scheduled task manually.

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful
Return type bool

CLI Example:

```
salt 'minion-id' task.list_run <task_name>
```

salt.modules.win_task.**run_wait**(*name*, *location='\\'*)

Run a scheduled task and return when the task finishes

Parameters

- **name** (*str*) -- The name of the task to run.
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful
Return type bool

CLI Example:

```
salt 'minion-id' task.list_run_wait <task_name>
```

salt.modules.win_task.**status**(*name*, *location='\\'*)

Determine the status of a task. Is it Running, Queued, Ready, etc.

Parameters

- **name** (*str*) -- The name of the task for which to return the status
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

Return type *string*

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

salt.modules.win_task.**stop**(*name*, *location='\\'*)

Stop a scheduled task.

Parameters

- **name** (*str*) -- The name of the task to stop.
- **location** (*str*) -- A string value representing the location of the task. Default is `\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

19.9.442 salt.modules.win_timezone

Module for managing timezone on Windows systems.

salt.modules.win_timezone.**get_hwclock**()

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.win_timezone.**get_offset**()

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.win_timezone.**get_zone**()

Get current timezone (i.e. America/Denver)

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.win_timezone.**get_zonecode**()

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.win_timezone.**set_hwclock**(*clock*)
Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.win_timezone.**set_zone**(*timezone*)
Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be magically done for you!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

salt.modules.win_timezone.**zone_compare**(*timezone*)
Checks the md5sum between the given timezone, and the one set in /etc/localtime. Returns True if they match, and False if not. Mostly useful for running state checks.

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

19.9.443 salt.modules.win_update

Module for running windows updates.

This module is being deprecated and will be removed in Salt Fluorine. Please use the `win_wua` module instead.

depends

- win32com
- win32con
- win32api
- pywintypes

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete. Optionally set `categories` to a category of your choice to only install certain updates. Default is to set to install all available but driver updates. The following example will install all Security and Critical Updates, and download but not install standard updates.

```
salt '*' win_update.install_updates categories="['Critical Updates', 'Security Updates
↪']"
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, included by default
'present' - Present on computer, included by default
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - Skip hidden updates, skipped by default
'software' - Software updates, included by default
'driver' - Driver updates, included by default
```

The following example installs all updates that don't require a reboot: .. code-block:: bash

    salt `*' win_update.install_updates skips="[{`reboot':True}]"

Once installed Salt will return a similar output:

```
2 : Windows Server 2012 Update (KB123456)
4 : Internet Explorer Security Update (KB098765)
2 : Malware Definition Update (KB321456)
...
```

The number at the beginning of the line is an OperationResultCode from the Windows Update Agent, it's enumeration is described here: https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095(v=vs.85).aspx. The result code is then followed by the update name and its KB identifier.

salt.modules.win_update.**download_updates**(*skips=None*, *retries=5*, *categories=None*)

Downloads all available updates, skipping those that require user interaction.

Various aspects of the updates can be included or excluded. this feature is still in development.
retries Number of retries to make before giving up. This is total, not per step.
categories Specify the categories to update. Must be passed as a list.

```
salt '*' win_update.download_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.download_updates

# Download critical updates only
salt '*' win_update.download_updates categories="['Critical Updates']"
```

salt.modules.win_update.**install_updates**(*skips=None*, *retries=5*, *categories=None*)

Downloads and installs all available updates, skipping those that require user interaction.

Add `cached` to only install those updates which have already been downloaded.

you can set the maximum number of retries to `n` in the search process by adding: `retries=n`

various aspects of the updates can be included or excluded. This function is still under development.
retries Number of retries to make before giving up. This is total, not per step.
categories Specify the categories to install. Must be passed as a list.

```
salt '*' win_update.install_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.install_updates

# Install all critical updates
salt '*' win_update.install_updates categories="['Critical Updates']"
```

salt.modules.win_update.**list_updates**(*verbose=False*, *fields=None*, *skips=None*, *retries=5*, *categories=None*)

Returns a summary of available updates, grouped into their non-mutually exclusive categories.

verbose Return full set of results, including several fields from the COM.

fields Return a list of specific fields for each update. The optional values here are those at the root level of the verbose list. This is superseded by the verbose option.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to list. Must be passed as a list.

```
salt '*' win_update.list_updates categories="['Updates']"
```

Categories include, but are not limited to, the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.list_updates

# Specific Fields
salt '*' win_update.list_updates fields="['Title', 'Description']"

# List all critical updates list in verbose detail
salt '*' win_update.list_updates categories="['Critical Updates']" verbose=True
```

19.9.444 salt.modules.win_useradd

Module for managing Windows Users

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to *`user.info' is not available*), see *here*.

---

depends

- pythoncom

- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile
- win32security
- win32ts
- wmi

Note: This currently only works with local user accounts, not domain accounts

---

`salt.modules.win_useradd.`**`add`**(*name*, *password=None*, *fullname=None*, *description=None*, *groups=None*, *home=None*, *homedrive=None*, *profile=None*, *logonscript=None*)

Add a user to the minion.

Parameters

- **`name`** (*`str`*) -- User name
- **`password`** (*`str, optional`*) -- User's password in plain text.
- **`fullname`** (*`str, optional`*) -- The user's full name.
- **`description`** (*`str, optional`*) -- A brief description of the user account.
- **`groups`** (*`str, optional`*) -- A list of groups to add the user to. (see chgroups)
- **`home`** (*`str, optional`*) -- The path to the user's home directory.
- **`homedrive`** (*`str, optional`*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **`profile`** (*`str, optional`*) -- An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it's default profile directory.
- **`logonscript`** (*`str, optional`*) -- Path to a login script to run when the user logs on.

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

```
salt '*' user.add name password
```

`salt.modules.win_useradd.`**`addgroup`**(*name*, *group*)

Add user to a group

Parameters

- **`name`** (*`str`*) -- The user name to add to the group
- **`group`** (*`str`*) -- The name of the group to which to add the user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.`**`chfullname`**(*name*, *fullname*)

Change the full name of the user

Parameters

- **`name`** (*`str`*) -- The user name for which to change the full name

- **fullname** (*str*) -- The new value for the full name

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

salt.modules.win_useradd.**chgroups**(*name*, *groups*, *append=True*)

Change the groups this user belongs to, add append=False to make the user a member of only the specified groups

Parameters

- **name** (*str*) -- The user name for which to change groups
- **groups** (*str, list*) -- A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append** (*bool, optional*) -- True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

salt.modules.win_useradd.**chhome**(*name*, *home*, ***kwargs*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters

- **name** (*str*) -- The name of the user whose home directory you wish to change
- **home** (*str*) -- The new location of the home directory

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.chhome foo \\fileserver\home\foo True
```

salt.modules.win_useradd.**chprofile**(*name*, *profile*)

Change the profile directory of the user

Parameters

- **name** (*str*) -- The name of the user whose profile you wish to change
- **profile** (*str*) -- The new location of the profile

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.chprofile foo \\fileserver\profiles\foo
```

salt.modules.win_useradd.**current**(*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters **sam** (*bool, optional*) -- False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: `domain\username`

Returns Returns username

Return type str

CLI Example:

```
salt '*' user.current
```

salt.modules.win_useradd.**delete**(*name*, *purge=False*, *force=False*)

Remove a user from the minion

Parameters

- **name** (*str*) -- The name of the user to delete
- **purge** (*bool, optional*) -- Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force** (*bool, optional*) -- Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.delete name
```

salt.modules.win_useradd.**getUserSid**(*username*)

Get the Security ID for the user

Parameters **username** (*str*) -- The user name for which to look up the SID

Returns The user SID

Return type str

CLI Example:

```
salt '*' user.getUserSid jsnuffy
```

salt.modules.win_useradd.**getent**(*refresh=False*)

Return the list of all info for all users

Parameters **refresh** (*bool, optional*) -- Refresh the cached user information. Useful when used from within a state function. Default is False.

Returns A dictionary containing information about all users on the system

Return type dict

CLI Example:

```
salt '*' user.getent
```

salt.modules.win_useradd.**info**(*name*)

Return user information

Parameters **name** (*str*) -- Username for which to display information

Returns

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive

- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- password_never_expires
- disallow_change_password
- gid

Return type dict

CLI Example:

```
salt '*' user.info jsnuffy
```

salt.modules.win_useradd.**list_groups**(*name*)

Return a list of groups the named user belongs to

Parameters **name** (*str*) -- The user name for which to list groups

Returns A list of groups to which the user belongs

Return type *list*

CLI Example:

```
salt '*' user.list_groups foo
```

salt.modules.win_useradd.**list_users**()

Return a list of all users on Windows

Returns A list of all users on the system

Return type *list*

CLI Example:

```
salt '*' user.list_users
```

salt.modules.win_useradd.**removegroup**(*name*, *group*)

Remove user from a group

Parameters

- **name** (*str*) -- The user name to remove from the group
- **group** (*str*) -- The name of the group from which to remove the user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

salt.modules.win_useradd.**rename**(*name*, *new_name*)

Change the username for a named user

Parameters

- **name** (*str*) -- The user name to change
- **new_name** (*str*) -- The new name for the current user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

salt.modules.win_useradd.**setpassword**(*name*, *password*)

Set the user's password

Parameters

- **name** (*str*) -- The user name for which to set the password
- **password** (*str*) -- The new password

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

salt.modules.win_useradd.**update**(*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration_date=None*, *expired=None*, *account_disabled=None*, *unlock_account=None*, *password_never_expires=None*, *disallow_change_password=None*)

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters

- **name** (*str*) -- The user name to update.
- **password** (*str, optional*) -- New user password in plain text.
- **fullname** (*str, optional*) -- The user's full name.
- **description** (*str, optional*) -- A brief description of the user account.
- **home** (*str, optional*) -- The path to the user's home directory.
- **homedrive** (*str, optional*) -- The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** (*str, optional*) -- The path to the logon script.
- **profile** (*str, optional*) -- The path to the user's profile directory.
- **expiration_date** (*date, optional*) -- The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string `Never'.
- **expired** (*bool, optional*) -- Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as `not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration_date* as well.
- **account_disabled** (*bool, optional*) -- True disables the account. False enables the account.
- **unlock_account** (*bool, optional*) -- True unlocks a locked user account. False is ignored.
- **password_never_expires** (*bool, optional*) -- True sets the password to never expire. False allows the password to expire.
- **disallow_change_password** (*bool, optional*) -- True blocks the user from changing the password. False allows the user to change the password.

Returns True if successful. False is unsuccessful.

Return type bool

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
         home=\\server\homeshare\bob homedrive=U:
```

19.9.445 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- *win_wua.available*
- win_wua.list

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- *win_wua.get*
- *win_wua.download*
- *win_wua.install*
- *win_wua.uninstall*

The get function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The win_wua.list and *win_wua.get* functions are utility functions. In addition to returning information about updates they can also download and install updates by setting download=True or install=True. So, with py:func:*win_wua.list <salt.modules.win_wua.list_>* for example, you could run the function with the filters you want to see what is available. Then just add install=True to install everything on that list.

If you want to download, install, or uninstall specific updates, use *win_wua.download*, *win_wua.install*, or *win_wua.uninstall*. To update your system with the latest updates use win_wua.list and set install=True

You can also adjust the Windows Update settings using the *win_wua.set_wu_settings* function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the lgpo module.

New in version 2015.8.0.

depends salt.utils.win_update

salt.modules.win_wua.**available**(*software=True*, *drivers=True*, *summary=False*, *skip_installed=True*, *skip_hidden=True*, *skip_mandatory=False*, *skip_reboot=False*, *categories=None*, *severities=None*)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than *list()*. Good for finding a specific GUID or KB.

Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is True)
- **summary** (*bool*) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed** (*bool*) -- Skip updates that are already installed. Default is False.

- **skip_hidden** (*bool*) -- Skip updates that have been hidden. Default is True.
- **skip_mandatory** (*bool*) -- Skip mandatory updates. Default is False.
- **skip_reboot** (*bool*) -- Skip updates that require a reboot. Default is False.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical
  - Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
 ↪reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                            '<category 2>',
                            ...]
            }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
```

```
}
```

Return type dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.available

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=["Critical Updates","Drivers"]

# List all Critical Security Updates
salt '*' win_wua.available categories=["Security Updates"] severities=["Critical"]

# List all updates with a severity of Critical
salt '*' win_wua.available severities=["Critical"]

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=["Feature Packs","Windows 8.1"] summary=True
```

`salt.modules.win_wua.`**`download`**(*names*)

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using list_updates and setting install=True.

Parameters **names** (*str, list*) -- A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

---

Returns A dictionary containing the details about the downloaded updates

Return type dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
↪'KB2131233']
```

`salt.modules.win_wua.`**`download_update`**(*name*)

Deprecated since version 2017.7.0: Use *download()* instead

Downloads a single update.

Parameters **name** (*str*) -- The name of the update to download. This can be a GUID, a KB number, or any part of the name. To ensure a single item is matched the GUID is preferred.

Note: If more than one result is returned an error will be raised.

Returns A dictionary containing the results of the download

Return type dict

CLI Examples:

```
salt '*' win_wua.download_update 12345678-abcd-1234-abcd-1234567890ab

salt '*' win_wua.download_update KB12312321
```

salt.modules.win_wua.**download_updates**(*names*)

Deprecated since version 2017.7.0: Use *download()* instead

Downloads updates that match the list of passed identifiers. It's easier to use this function by using list_updates and setting install=True.

Parameters **names** (list) -- A list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns A dictionary containing the details about the downloaded updates

Return type dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download_updates guid=['12345678-abcd-1234-abcd-1234567890ab',
 ↪'KB2131233']
```

salt.modules.win_wua.**get**(*name*, *download=False*, *install=False*)

New in version 2017.7.0.

Returns details for the named update

Parameters

- **name** (*str*) -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you're looking for.
- **download** (*bool*) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
 ↪reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                            '<category 2>',
                            ...]
```

```
            }
}
```

Return type dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'
```

salt.modules.win_wua.**get_needs_reboot**()

Determines if the system needs to be rebooted.

Returns True if the system requires a reboot, otherwise False

Return type bool

CLI Examples:

```
salt '*' win_wua.get_needs_reboot
```

salt.modules.win_wua.**get_wu_settings**()

Get current Windows Update settings.

Returns

A dictionary of Windows Update settings:

Featured Updates: Boolean value that indicates whether to display notifications for featured updates.

Group Policy Required (Read-only): Boolean value that indicates whether Group Policy requires the Automatic Updates service.

Microsoft Update: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

Needs Reboot: Boolean value that indicates whether the machine is in a reboot pending state.

Non Admins Elevated: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

Notification Level:

Number 1 to 4 indicating the update level:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

Read Only (Read-only): Boolean value that indicates whether the Automatic Update settings are read-only.

Recommended Updates: Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

Scheduled Day: Days of the week on which Automatic Updates installs or uninstalls updates.

Scheduled Time: Time at which Automatic Updates installs or uninstalls updates.

Return type dict

CLI Examples:

```
salt '*' win_wua.get_wu_settings
```

salt.modules.win_wua.**install**(*names*)

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

Parameters **names** (*str, list*) -- A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

---

Returns A dictionary containing the details about the installed updates

Return type dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install KB12323211
```

salt.modules.win_wua.**install_update**(*name*)

Deprecated since version 2017.7.0: Use *install()* instead

Installs a single update

Parameters

- **name** (*str*) -- The name of the update to install. This can be a GUID, a KB
- **or any part of the name. To ensure a single item is matched the** (*number,*) --
- **is preferred.** (*GUID*) --

Note: If no results or more than one result is returned an error will be raised.

Returns A dictionary containing the results of the install

Return type dict

CLI Examples:

```
salt '*' win_wua.install_update 12345678-abcd-1234-abcd-1234567890ab

salt '*' win_wua.install_update KB12312231
```

salt.modules.win_wua.**install_updates**(*names*)

Deprecated since version 2017.7.0: Use *install()* instead

Installs updates that match the list of identifiers. It may be easier to use the list_updates function and set install=True.

Parameters

- **names** (*list*) -- A list of updates to install. This can be any combination
- **GUIDs, KB numbers, or names. GUIDs or KBs are preferred.** (*of*) --

Returns A dictionary containing the details about the installed updates

Return type dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install_updates guid=['12345678-abcd-1234-abcd-1234567890ab',
 ↪'KB12323211']
```

salt.modules.win_wua.**list**(*software=True*, *drivers=False*, *summary=False*, *skip_installed=True*, *categories=None*, *severities=None*, *download=False*, *install=False*)

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **summary** (*bool*) --
  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed** (*bool*) -- Skip installed updates in the results (default is False)
- **download** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (`list`) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (`list`) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical
  - Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>
```

```
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
 ↪reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                            '<category 2>',
                            ...]
            }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
}
```

Return type dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True
```

`salt.modules.win_wua.`**`list_update`**(*name*, *download=False*, *install=False*)

Deprecated since version 2017.7.0: Use *get()* instead

Returns details for all updates that match the search criteria

Parameters

- **name** (*str*) -- The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list_updates` to get the GUID for the update you're looking for.
- **download** (*bool*) -- Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.

- **install** (*bool*) -- Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
 ↪reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                            '<category 2>',
                            ...]
            }
}
```

Return type dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.list_update 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number (could possibly return multiple results)
# Not all updates have an associated KB
salt '*' win_wua.list_update KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.list_update 'Microsoft Camera Codec Pack'
```

salt.modules.win_wua.**list_updates**(*software=True*, *drivers=False*, *summary=False*, *skip_installed=True*, *categories=None*, *severities=None*, *download=False*, *install=False*)

Deprecated since version 2017.7.0: Use *list()* instead

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software** (*bool*) -- Include software updates in the results (default is True)
- **drivers** (*bool*) -- Include driver updates in the results (default is False)
- **summary** (*bool*) --

  - True: Return a summary of updates available for each category.
  - False (default): Return a detailed list of available updates.
- **skip_installed** (*bool*) -- Skip installed updates in the results (default is False)
- **download** (*bool*) -- (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) -- (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (*list*) -- Specify the categories to list. Must be passed as a list. All categories returned by default.

  Categories include the following:
  - Critical Updates
  - Definition Updates
  - Drivers (make sure you set drivers=True)
  - Feature Packs
  - Security Updates
  - Update Rollups
  - Updates
  - Update Rollups
  - Windows 7
  - Windows 8.1
  - Windows 8.1 drivers
  - Windows 8.1 and later drivers
  - Windows Defender
- **severities** (*list*) -- Specify the severities to include. Must be passed as a list. All severities returned by default.

  Severities include the following:
  - Critical
  - Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
 ↪reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                            '<category 2>',
                            ...]
            }
}

Summary of Updates:
```

```
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
}
```

Return type dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.list_updates

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list_updates categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list_updates categories=['Security Updates'] severities=[
 ↪'Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list_updates severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list_updates summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list_updates categories=['Feature Packs','Windows 8.1']
 ↪summary=True
```

salt.modules.win_wua.**set_wu_settings**(*level=None*, *recommended=None*, *featured=None*, *elevated=None*, *msupdate=None*, *day=None*, *time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters

- **level** (*int*) -- Number from 1 to 4 indicating the update level:
  1. Never check for updates
  2. Check for updates but let me choose whether to download and install them
  3. Download updates but let me choose whether to install them
  4. Install updates automatically
- **recommended** (*bool*) -- Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) -- Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (*bool*) -- Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) -- Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) -- Days of the week on which Automatic Updates installs or uninstalls

updates. Accepted values:
- Everyday
- Monday
- Tuesday
- Wednesday
- Thursday
- Friday
- Saturday

- **time** (*str*) -- Time at which Automatic Updates installs or uninstalls updates. Must be in the ##:## 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns Returns a dictionary containing the results.

Return type dict

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

salt.modules.win_wua.**uninstall**(*names*)

New in version 2017.7.0.

Uninstall updates.

Parameters **names** (*str, list*) -- A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns A dictionary containing the details about the uninstalled updates

Return type dict

CLI Examples:

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
 ↪'KB1231231']
```

19.9.446 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

depends M2Crypto

salt.modules.x509.**create_certificate**(*path=None*, *text=False*, *overwrite=True*, *ca_server=None*, ***kwargs*)

Create an X509 certificate.

path: Path to write the certificate to.

text: If `True`, return the PEM text without writing to a file. Default `False`.

overwrite: If True(default), create_certificate will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

kwargs: Any of the properties below can be included as additional keyword arguments.

ca_server: Request a remotely signed certificate from ca_server. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the ca_server. See `signing_policy` for details. Also the salt master must permit peers to call the `sign_remote_certificate` function.

Example:

/etc/salt/master.d/peer.conf

```
peer:
  .*:
    - x509.sign_remote_certificate
```

subject properties: Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.
C: 2 letter Country code
CN: Certificate common name, typically the FQDN.
Email: Email address
GN: Given Name
L: Locality
O: Organization
OU: Organization Unit
SN: SurName
ST: State or Province

signing_private_key: A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

signing_private_key_passphrase: Passphrase used to decrypt the signing_private_key.

signing_cert: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key: The public key to be included in this certificate. This can be sourced from a public key, certificate, csr or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your public_key and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

public_key_passphrase: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints: X509v3 Basic Constraints extension.

extensions: The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the subjectKeyIdentifier equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the hash value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.
basicConstraints: X509v3 Basic Constraints
keyUsage: X509v3 Key Usage
extendedKeyUsage: X509v3 Extended Key Usage
subjectKeyIdentifier: X509v3 Subject Key Identifier
issuerAltName: X509v3 Issuer Alternative Name
subjectAltName: X509v3 Subject Alternative Name

crlDistributionPoints: X509v3 CRL distribution points
issuingDistributionPoint: X509v3 Issuing Distribution Point
certificatePolicies: X509v3 Certificate Policies
policyConstraints: X509v3 Policy Constraints
inhibitAnyPolicy: X509v3 Inhibit Any Policy
nameConstraints: X509v3 Name Constraints
noCheck: X509v3 OCSP No Check
nsComment: Netscape Comment
nsCertType: Netscape Certificate Type

days_valid: The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.

version: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.

serial_number: The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.

serial_bits: The number of bits to use when randomly generating a serial number. Defaults to 64.

algorithm: The hashing algorithm to be used for signing this certificate. Defaults to sha256.

copypath: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.

prepend_cn: If set to True, the CN and a dash will be prepended to the copypath's filename.
Example: /etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt

signing_policy: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a yaml formatted list of arguments which will override any arguments passed to this function. If the `minions` key is included in the signing policy, only minions matching that pattern will be permitted to remotely request certificates from that policy.

Example:

```
x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
```

The above signing policy can be invoked with `signing_policy=www`

CLI Example:

```
salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/
↪pki/myca.key' csr='/etc/pki/myca.csr'}
```

`salt.modules.x509.`**`create_crl`**(*path=None*, *text=False*, *signing_private_key=None*, *signing_private_key_passphrase=None*, *signing_cert=None*, *revoked=None*, *include_expired=False*, *days_valid=100*, *digest=''*)

Create a CRL

Depends

- PyOpenSSL Python module

path: Path to write the crl to.
text: If `True`, return the PEM text without writing to a file. Default `False`.
signing_private_key: A path or string of the private key in PEM format that will be used to sign this crl. This is required.
signing_private_key_passphrase: Passphrase to decrypt the private key.
signing_cert: A certificate matching the private key that will be used to sign this crl. This is required.
revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format ``%Y-%m-%d %H:%M:%S''.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format ``%Y-%m-%d %H:%M:%S''.

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.
include_expired: Include expired certificates in the CRL. Default is `False`.
days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.
digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key signing_private_key=/etc/pki/ca.
↪key signing_cert=/etc/pki/ca.crt revoked="{'compromized-web-key': {'certificate
↪': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-01 00:00:00'}}"
```

`salt.modules.x509.`**`create_csr`**(*path=None*, *text=False*, ***kwargs*)
Create a certificate signing request.
path: Path to write the certificate to.
text: If `True`, return the PEM text without writing to a file. Default `False`.
algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.
kwargs: The subject, extension and version arguments from *`x509.create_certificate`* can be used.
CLI Example:

```
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN=
↪'My Cert'
```

`salt.modules.x509.`**`create_private_key`**(*path=None*, *text=False*, *bits=2048*, *passphrase=None*, *cipher='aes_128_cbc'*, *verbose=True*)
Creates a private key in PEM format.
path: The path to write the file to, either `path` or `text` are required.
text: If `True`, return the PEM text without writing to a file. Default `False`.
bits: Length of the private key in bits. Default 2048
passphrase: Passphrase for encryting the private key
cipher: Cipher for encrypting the private key. Has no effect if passhprase is None.
verbose: Provide visual feedback on stdout. Default True

New in version 2016.11.0.
CLI Example:

```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

`salt.modules.x509.`**`expired`**(*certificate*)
Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

salt.modules.x509.**get_pem_entries**(*glob_path*)

Returns a dict containing PEM entries in files matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

salt.modules.x509.**get_pem_entry**(*text*, *pem_type=None*)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

text: Text containing the X509 PEM entry to be returned or path to a file containing the text.

pem_type: If specified, this function will only return a pem of a certain type, for example `CERTIFICATE' or `CERTIFICATE REQUEST'.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI..
↪.-----END CERTIFICATE REQUEST"
```

salt.modules.x509.**get_private_key_size**(*private_key*, *passphrase=None*)

Returns the bit length of a private key in PEM format.

private_key: A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

salt.modules.x509.**get_public_key**(*key*, *passphrase=None*, *asObj=False*)

Returns a string containing the public key in PEM format.

key: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

salt.modules.x509.**get_signing_policy**(*signing_policy_name*)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

salt.modules.x509.**read_certificate**(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

salt.modules.x509.**read_certificates**(*glob_path*)

Returns a dict containing details of a all certificates matching a glob

glob_path: A path to certificates to be read and returned.
CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

salt.modules.x509.**read_crl**(*crl*)

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

Depends

- OpenSSL command line tool

csl: A path or PEM encoded string containing the CSL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

salt.modules.x509.**read_csr**(*csr*)

Returns a dict containing details of a certificate request.

Depends

- OpenSSL command line tool

csr: A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

salt.modules.x509.**sign_remote_certificate**(*argdic*, ***kwargs*)

Request a certificate to be remotely signed according to a signing policy.

argdic: A dict containing all the arguments to be passed into the create_certificate function. This will become kwargs when passed to create_certificate.

kwargs: kwargs delivered from publish.publish

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{'public_key': '/etc/pki/www.key',
↪'signing_policy': 'www'}" __pub_id='www1'
```

salt.modules.x509.**verify_crl**(*crl*, *cert*)

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl: The CRL to verify

cert: The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

salt.modules.x509.**verify_private_key**(*private_key*, *public_key*, *passphrase=None*)

Verify that `private_key' matches `public_key'

private_key: The private key to verify, can be a string or path to a private key in PEM format.

public_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or another private key.

passphrase: Passphrase to decrypt the private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
        public_key=/etc/pki/myca.crt
```

salt.modules.x509.**verify_signature**(*certificate*, *signing_pub_key=None*, *signing_pub_key_passphrase=None*)

Verify that `certificate` has been signed by `signing_pub_key`

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.

signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or private key.

signing_pub_key_passphrase: Passphrase to the signing_pub_key if it is an encrypted private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
        signing_pub_key=/etc/pki/myca.crt
```

salt.modules.x509.**will_expire**(*certificate*, *days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

salt.modules.x509.**write_pem**(*text*, *path*, *overwrite=True*, *pem_type=None*)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

text: PEM string input to be written out.

path: Path of the file to write the pem out to.

overwrite: If True(default), write_pem will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

pem_type: The PEM type to be saved, for example `CERTIFICATE` or `PUBLIC KEY`. Adding this will allow the function to take input that may contain multiple pem types.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBBugA..." path=/etc/
↪pki/mycert.crt
```

19.9.447 salt.modules.xapi

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it *will* fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

. http://downloads.xen.org/Wiki/XenAPI/xenapi-1.0.6.pdf . http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/ . https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python . http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD

salt.modules.xapi.**freecpu**()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

salt.modules.xapi.**freemem**()
Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

salt.modules.xapi.**full_info**()
Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

salt.modules.xapi.**get_disks**(*vm_*)
Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

salt.modules.xapi.**get_macs**(*vm_*)
Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

salt.modules.xapi.**get_nics**(*vm_*)
Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

salt.modules.xapi.**is_hyper**()
Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

salt.modules.xapi.**list_domains**()
Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.xapi.**migrate**(*vm_*, *target*, *live=1*, *port=0*, *node=-1*, *ssl=None*, *change_home_server=0*)
Migrates the virtual machine to another hypervisor

CLI Example:

```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl]
↪[change_home_server]
```

Optional values:

live Use live migration
port Use a specified port
node Use specified NUMA node on target
ssl use ssl connection for migration
change_home_server change home server for managed domains

salt.modules.xapi.**node_info**()
Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

salt.modules.xapi.**pause**(*vm_*)
Pause the named vm

CLI Example:

```
salt '*' virt.pause <vm name>
```

salt.modules.xapi.**reboot**(*vm_*)
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <vm name>
```

salt.modules.xapi.**reset**(*vm_*)
Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <vm name>
```

salt.modules.xapi.**resume**(*vm_*)
Resume the named vm

CLI Example:

```
salt '*' virt.resume <vm name>
```

salt.modules.xapi.**setmem**(*vm_*, *memory*)
Changes the amount of memory allocated to VM.

Memory is to be specified in MB

CLI Example:

```
salt '*' virt.setmem myvm 768
```

salt.modules.xapi.**setvcpus**(*vm_*, *vcpus*)
Changes the amount of vcpus allocated to VM.

vcpus is an int representing the number to be assigned

CLI Example:

```
salt '*' virt.setvcpus myvm 2
```

salt.modules.xapi.**shutdown**(*vm_*)
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <vm name>
```

salt.modules.xapi.**start**(*config_*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <path to Xen cfg file>
```

salt.modules.xapi.**stop**(*vm_*)

Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:

```
salt '*' virt.stop <vm name>
```

salt.modules.xapi.**vcpu_pin**(*vm_*, *vcpu*, *cpus*)

Set which CPUs a VCPU can use.

CLI Example:

```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

salt.modules.xapi.**vm_cputime**(*vm_=None*)

Return cputime used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'cputime' <int>
        'cputime_percent' <int>
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

salt.modules.xapi.**vm_diskstats**(*vm_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs'   : 0,
        'io_write_kbs'  : 0
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

salt.modules.xapi.**vm_info**(*vm_=None*)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.xapi.**vm_netstats**(*vm_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
    'your-vm': {
        'io_read_kbs'           : 0,
        'io_total_read_kbs'     : 0,
        'io_total_write_kbs'    : 0,
        'io_write_kbs'          : 0
        },
    ...
    ]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

salt.modules.xapi.**vm_state**(*vm_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

19.9.448 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

salt.modules.xbpspkg.**add_repo**(*repo*, *conffile='/usr/share/xbps.d/15-saltstack.conf'*)

Add an XBPS repository to the system.

repo url of repo to add (persistent).

conffile path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conffile=/path/to/xbps/repo.conf]
```

salt.modules.xbpspkg.**available_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.**del_repo**(*repo*)

Remove an XBPS repository from the system.

repo url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

salt.modules.xbpspkg.**get_repo**(*repo*, ***kwargs*)

Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

salt.modules.xbpspkg.**install**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, ***kwargs*)

Install the passed package

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo Specify a package repository (url) to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"},{"bar": "salt://bar.
↪deb"}]'
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

salt.modules.xbpspkg.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.xbpspkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.xbpspkg.**list_repos**()

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```

salt.modules.xbpspkg.**list_upgrades**(*refresh=True*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.xbpspkg.**refresh_db**()

Update list of available packages from installed repos

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.xbpspkg.**remove**(*name=None*, *pkgs=None*, *recursive=True*, ***kwargs*)

name The name of the package to be deleted.

recursive Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

salt.modules.xbpspkg.**upgrade**(*refresh=True*)

Run a full system upgrade

refresh Whether or not to refresh the package database before installing. Default is *True*.

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

salt.modules.xbpspkg.**upgrade_available**(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

salt.modules.xbpspkg.**version**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

19.9.449 salt.modules.xfs

Module for managing XFS file systems.

salt.modules.xfs.**defragment**(*device*)

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

salt.modules.xfs.**devices**()

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

salt.modules.xfs.**dump**(*device*, *destination*, *level=0*, *label=None*, *noerase=None*)

Dump filesystem device to the media (file, tape etc).

Required parameters:

- **device**: XFS device, content of which to be dumped.
- **destination**: Specifies a dump destination.

Valid options are:

- **label**: Label of the dump. Otherwise automatically generated label is used.
- **level**: Specifies a dump level of 0 to 9.
- **noerase**: Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

salt.modules.xfs.**estimate**(*path*)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

salt.modules.xfs.**info**(*device*)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

salt.modules.xfs.**inventory**()

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

salt.modules.xfs.**mkfs**(*device*, *label=None*, *ssize=None*, *noforce=None*, *bso=None*, *gmo=None*, *ino=None*, *lso=None*, *rso=None*, *nmo=None*, *dso=None*)

Create a file system on the specified device. By default wipes out with force.

General options:

- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: Data section options. These options specify the location, size, and other parameters of the data section of the filesystem.
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

salt.modules.xfs.**modify**(*device*, *label=None*, *lazy_counting=None*, *uuid=None*)

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

salt.modules.xfs.**prune_dump**(*sessionid*)

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

19.9.450 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

depends

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

configuration This module can be used by either passing a jid and password directly to send_message, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
    xmpp.jid: myuser@jabber.example.org/resourcename
    xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
    xmpp.jid: myuser@jabber.example.org/salt
    xmpp.password: verybadpass

my-xmpp-login:
    xmpp.jid: myuser@jabber.example.org
    xmpp.password: verybadpass
```

salt.modules.xmpp.**send_msg**(*recipient*, *message*, *jid=None*, *password=None*, *profile=None*)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
 ↪profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
 ↪jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

salt.modules.xmpp.**send_msg_multi**(*message*, *recipients=None*, *rooms=None*, *jid=None*, *password=None*, *nick='SaltStack Bot'*, *profile=None*)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com']             rooms=[
↪'secret@conference.xmpp.example.com']            'This is a salt module test'
↪          profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com']             rooms=[
↪'secret@conference.xmpp.example.com']           'This is a salt module test'
↪         jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

19.9.451 salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

salt.modules.yumpkg.**clean_metadata**(***kwargs*)

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to *refresh_db()*.

CLI Example:

```
salt '*' pkg.clean_metadata
```

salt.modules.yumpkg.**del_repo**(*repo*, *basedir=None*, ***kwargs*)

Delete a repo from <basedir> (default basedir: all dirs in *reposdir* yum option).

If the .repo file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

salt.modules.yumpkg.**diff**(**paths*)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters **path** -- Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.yumpkg.**download**(**packages*)

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

Note: `yum-utils` will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.yumpkg.`**`file_dict`**(**packages*)

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.`**`file_list`**(**packages*)

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.`**`get_repo`**(*name*, *basedir=None*, ***kwargs*)

Display a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.`**`group_diff`**(*name*)

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in *pkg.group_info*.

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

`salt.modules.yumpkg.`**`group_info`**(*name*, *expand=False*)

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The `mandatory packages`, `optional packages`, and `default packages` keys have

been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

name Name of the group to query

expand [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

`salt.modules.yumpkg.`**`group_install`**(*name*, *skip=()*, *include=()*, ***kwargs*)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around *pkg.install*, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

skip Packages that would normally be installed by the package group (``default'' packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

include Packages which are included in a group, which would not normally be installed by a `yum groupinstall` (``optional'' packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]'
```

Note: Because this is essentially a wrapper around pkg.install, any argument which can be passed to pkg.install may also be included here, and it will be passed along wholesale.

`salt.modules.yumpkg.`**`group_list`**()

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.yumpkg.`**`hold`**(*name=None*, *pkgs=None*, *sources=None*, *normalize=True*, ***kwargs*)

New in version 2014.7.0.

Version-lock packages

Note: Requires the appropriate `versionlock` plugin package to be installed:
- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

---

name The name of the package to be held.

Multiple Package Options:

pkgs A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`info_installed`**(**names*)

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.`**`install`**(*name=None*, *refresh=False*, *skip_verify=False*, *pkgs=None*, *sources=None*, *downloadonly=False*, *reinstall=False*, *normalize=True*, *update_holds=False*, *saltenv='base'*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add refresh=True to clean the yum database before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either ``pkgs'' or ``sources'' is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources'' option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to update the yum database before executing.

reinstall Specifying reinstall=True will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

skip_verify Skip the GPG verification check (e.g., `--nogpgcheck`)

downloadonly Only download the packages, do not install.

version Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if ``pkgs'' or ``sources'' is passed.

update_holds [False] If `True`, and this function would update the package version, any packages held using the yum/dnf ``versionlock'' plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if `fromrepo` is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if `fromrepo` is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
↪rpm"}]'
```

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
↪normalize=False
```

New in version 2014.7.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.yumpkg.`**`latest_version`**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.`**`list_downloaded`**`()`

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.yumpkg.`**`list_holds`**`(`*pattern='\\w+(?:[.-][^-]+)*'*, *full=True*`)`

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

---

pattern [\w+(?:[.-][^-]+)*] Regular expression used to match the package name

full [True] Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.`**`list_installed_patches`**`()`

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.`**`list_patches`**`(`*refresh=False*`)`

New in version 2017.7.0.

List all known advisory patches from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on yum if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

salt.modules.yumpkg.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.yumpkg.**list_repo_pkgs**(**args*, ***kwargs*)

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using *pkg.hold* will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

Warning: Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.1.2-15.el6_5.2',
             '4.1.2-15.el6_5.1',
             '4.1.2-15.el6_4'],
    'kernel': ['2.6.32-431.29.2.el6',
               '2.6.32-431.23.3.el6',
               '2.6.32-431.20.5.el6',
               '2.6.32-431.20.3.el6',
               '2.6.32-431.17.1.el6',
               '2.6.32-431.11.2.el6',
               '2.6.32-431.5.1.el6',
               '2.6.32-431.3.1.el6',
               '2.6.32-431.1.2.0.1.el6',
               '2.6.32-431.el6']
}
# With byrepo=True
{
    'base': {
        'bash': ['4.1.2-15.el6_4'],
        'kernel': ['2.6.32-431.el6']
    },
```

```
    'updates': {
        'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
        'kernel': ['2.6.32-431.29.2.el6',
                   '2.6.32-431.23.3.el6',
                   '2.6.32-431.20.5.el6',
                   '2.6.32-431.20.3.el6',
                   '2.6.32-431.17.1.el6',
                   '2.6.32-431.11.2.el6',
                   '2.6.32-431.5.1.el6',
                   '2.6.32-431.3.1.el6',
                   '2.6.32-431.1.2.0.1.el6']
    }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablerepo (ignored if `fromrepo` is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

New in version 2017.7.0.

disablerepo (ignored if `fromrepo` is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

New in version 2017.7.0.

byrepo [False] When `True`, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly [False] When `True`, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the `-C` option to yum/dnf.

New in version 2017.7.0.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
```

`salt.modules.yumpkg.`**`list_repos`**(*basedir=None*)

Lists all repos in <basedir> (default: all dirs in *reposdir* yum option).

CLI Example:

```
salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.`**`list_upgrades`**(*refresh=True*, ***kwargs*)

Check whether or not an upgrade is available for all packages

The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in pkg states, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.list_upgrades
```

salt.modules.yumpkg.**mod_repo**(*repo*, *basedir=None*, ***kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo name by which the yum refers to the repo
name a human-readable name for the repo
baseurl the URL for yum to reference
mirrorlist the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

salt.modules.yumpkg.**modified**(**packages*, ***flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

size Include only files where size changed.
mode Include only files which file's mode has been changed.
checksum Include only files which MD5 checksum has been changed.
device Include only files which major and minor numbers has been changed.
symlink Include only files which are symbolic link contents.
owner Include only files where owner has been changed.
group Include only files where group has been changed.
time Include only files where modification time of the file has been changed.
capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

salt.modules.yumpkg.**normalize_name**(*name*)

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is `noarch`.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

salt.modules.yumpkg.**owner**(**paths*)

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version <salt.modules.yumpkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.yumpkg.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to *pkg.remove*.

name The name of the package to be purged

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

salt.modules.yumpkg.**refresh_db**(***kwargs*)

Check the yum repos for updated packages

Returns:

- `True`: Updates are available
- `False`: An error occurred
- `None`: No updates are available

repo Refresh just the specified repo

disablerepo Do not refresh the specified repo

enablerepo Refresh a disabled repo using this option

branch Add the specified branch when refreshing

disableexcludes Disable the excludes defined in your config files. Takes one of three options: - `all` - disable all excludes - `main` - disable excludes defined in [main] in yum.conf - `repoid` - disable excludes defined for that repo

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.yumpkg.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

name The name of the package to be removed

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`unhold`**(*name=None*, *pkgs=None*, *sources=None*, ***kwargs*)

New in version 2014.7.0.

Remove version locks

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
- On RHEL 6 & 7: `yum-plugin-versionlock`
- On Fedora: `python-dnf-plugins-extras-versionlock`

---

name The name of the package to be unheld

Multiple Package Options:

pkgs A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.`**`upgrade`**(*name=None*, *pkgs=None*, *refresh=True*, *skip_verify=False*, *normalize=True*, ***kwargs*)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a yum upgrade

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if `fromrepo` is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if `fromrepo` is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.

name The name of the package to be upgraded. Note that this parameter is ignored if ``pkgs'' is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

Warning: if you forget `name=' and run pkg.upgrade openssl, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

pkgs A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
salt '*' pkg.upgrade pkgs='["foo", {"bar": "1.2.3-4.el5"}]'
```

New in version 2016.3.0.

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
 ↪normalize=False
```

New in version 2016.3.0.

Note: To add extra arguments to the `yum upgrade` command, pass them as key word arguments. For arguments without assignments, pass `True`

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

`salt.modules.yumpkg.`**`upgrade_available`**(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.yumpkg.`**`verify`**(**names*, ***kwargs*)

New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

`salt.modules.yumpkg.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.`**`version_cmp`**(*pkg1*, *pkg2*, *ignore_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if pkg1 < pkg2, 0 if pkg1 == pkg2, and 1 if pkg1 > pkg2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

19.9.452 salt.modules.zabbix module

Support for Zabbix

optdepends

- zabbix server

configuration This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with _connection_ prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_
 ↪password=zabbix _connection_url=http://host/zabbix/
```

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

salt.modules.zabbix.**apiinfo_version**(***connection_args*)

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.apiinfo_version

salt.modules.zabbix.**host_create**(*host*, *groups*, *interfaces*, ***connection_args*)

New in version 2016.3.0.

Create new host

Note: This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **host** -- technical name of the host
- **groups** -- groupids of host groups to add the host to
- **interfaces** -- interfaces to be created for the host
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- string with visible name of the host, use `visible_name' instead of `name' parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "", port: 10050}'
visible_name='Host Visible Name'
```

salt.modules.zabbix.**host_delete**(*hostids*, ***connection_args*)

Delete hosts.

New in version 2016.3.0.

Parameters

- **hostids** -- Hosts (hostids) to delete.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts.

CLI Example: .. code-block:: bash

salt `*' zabbix.host_delete 10106

salt.modules.zabbix.**host_exists**(*host=None*, *hostid=None*, *name=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **host** -- technical name of the host
- **hostids** -- Hosts (hostids) to delete.
- **name** -- visible name of the host
- **node** -- name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the node the hosts must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.host_exists `Zabbix server'

salt.modules.zabbix.**host_get**(*host=None*, *name=None*, *hostids=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve hosts according to the given parameters

Note: This function accepts all optional host.get parameters: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **host** -- technical name of the host
- **name** -- visible name of the host
- **hostids** -- ids of the hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.host_get `Zabbix server'

salt.modules.zabbix.**host_list**(***connection_args*)

Retrieve all hosts.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)

- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.host_list

salt.modules.zabbix.**host_update**(*hostid*, ***connection_args*)

New in version 2016.3.0.

Update existing hosts

Note: This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for host objects and the documentation for updating hosts.

Parameters

- **hostid** -- ID of the host to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** -- string with visible name of the host, use `visible_name' instead of `name' parameter to not mess with value supplied from Salt sls file.

Returns ID of the updated host.

CLI Example: .. code-block:: bash

salt `*' zabbix.host_update 10084 name='Zabbix server2'

salt.modules.zabbix.**hostgroup_create**(*name*, ***connection_args*)

New in version 2016.3.0.

Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host group.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostgroup_create MyNewGroup

salt.modules.zabbix.**hostgroup_delete**(*hostgroupids*, ***connection_args*)

Delete the host group.

New in version 2016.3.0.

Parameters

- **hostgroupids** -- IDs of the host groups to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostgroup_delete 23

salt.modules.zabbix.**hostgroup_exists**(*name=None*, *groupid=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** -- IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostgroup_exists MyNewGroup

salt.modules.zabbix.**hostgroup_get**(*name=None*, *groupids=None*, *hostids=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

Note: This function accepts all standard hostgroup.get properities: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** -- names of the host groups
- **groupid** -- host group IDs
- **node** -- name of the node the host groups must belong to
- **nodeids** -- IDs of the nodes the host groups must belong to
- **hostids** -- return only host groups that contain the given hosts
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostgroup_get MyNewGroup

salt.modules.zabbix.**hostgroup_list**(***connection_args*)

Retrieve all host groups.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostgroup_list

salt.modules.zabbix.**hostgroup_update**(*groupid*, *name=None*, ***connection_args*)

New in version 2016.3.0.

Update existing hosts group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **groupid** -- ID of the host group to update
- **name** -- name of the host group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of updated host groups.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostgroup_update 24 name='Renamed Name'

salt.modules.zabbix.**hostinterface_create**(*hostid*, *ip*, *dns=''*, *main=1*, *type=1*, *useip=1*, *port=None*, ***connection_args*)

New in version 2016.3.0.

Create new host interface

Note: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **hostid** -- ID of the host the interface belongs to
- **ip** -- IP address used by the interface
- **dns** -- DNS name used by the interface
- **main** -- whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** -- port number used by the interface
- **type** -- Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)

- **useip** -- Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostinterface_create 10105 192.193.194.197

salt.modules.zabbix.**hostinterface_delete**(*interfaceids*, ***connection_args*)

Delete host interface

New in version 2016.3.0.

Parameters

- **interfaceids** -- IDs of the host interfaces to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostinterface_delete 50

salt.modules.zabbix.**hostinterface_get**(*hostids*, ***connection_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

Note: This function accepts all standard hostinterface.get properities: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **hostids** -- Return only host interfaces used by the given hosts.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostinterface_get 101054

salt.modules.zabbix.**hostinterface_update**(*interfaceid*, ***connection_args*)

New in version 2016.3.0.

Update host interface

Note: This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **interfaceid** -- ID of the hostinterface to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.hostinterface_update 6 ip=0.0.0.2

salt.modules.zabbix.**mediatype_create**(*name*, *mediatype*, ***connection_args*)

Create new mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **mediatype** -- media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec_path** -- exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm_modem** -- exec path - Required for sms type, see Zabbix API docs
- **smtp_email** -- email address from which notifications will be sent, required for email type
- **smtp_helo** -- SMTP HELO, required for email type
- **smtp_server** -- SMTP server, required for email type
- **status** -- whether the media type is enabled - 0: enabled, 1: disabled
- **username** -- authentication user, required for Jabber and Ez Texting types
- **passwd** -- authentication password, required for Jabber and Ez Texting types
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com'
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

salt.modules.zabbix.**mediatype_delete**(*mediatypeids*, ***connection_args*)

Delete mediatype

Parameters

- **interfaceids** -- IDs of the mediatypes to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted mediatype, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.mediatype_delete 3

salt.modules.zabbix.**mediatype_get**(*name=None*, *mediatypeids=None*, ***connection_args*)

Retrieve mediatypes according to the given parameters.

Parameters

- **name** -- Name or description of the mediatype
- **mediatypeids** -- ids of the mediatypes
- **connection_args** (*optional*) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

  all optional mediatype.get parameters: keyword argument names differ depending on your zabbix version, see:

  https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get

Returns Array with mediatype details, False if no mediatype found or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.mediatype_get name='Email' salt `*' zabbix.mediatype_get mediatypeids="[`1', `2', `3']"

salt.modules.zabbix.**mediatype_update**(*mediatypeid*, *name=False*, *mediatype=False*, ***connection_args*)

Update existing mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **mediatypeid** -- ID of the mediatype to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the updated mediatypes, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_update 8 name="Email update"

salt.modules.zabbix.**run_query**(*method*, *params*, ***connection_args*)

Send Zabbix API call

Parameters

- **method** -- actual operation to perform via the API
- **params** -- parameters required for specific method
- **connection_args** (*optional*) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names differ depending on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/

Returns Response from Zabbix API

CLI Example: .. code-block:: bash

salt `*' zabbix.run_query proxy.create `{``host'': ``zabbixproxy.domain.com'', ``status'': ``5''}'

salt.modules.zabbix.**template_get**(*name=None*, *host=None*, *templateids=None*, ***connection_args*)

Retrieve templates according to the given parameters.

Parameters

- **host** -- technical name of the template
- **name** -- visible name of the template
- **hostids** -- ids of the templates
- **connection_args** (*optional*) -- _connection_user: zabbix user (can also be set in opts or pillar, see module's docstring) _connection_password: zabbix password (can also be set in opts or pillar, see module's docstring) _connection_url: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

all optional template.get parameters: keyword argument names differ depending on your zabbix version, see:

https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get

Returns Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.template_get name='Template OS Linux' salt `*' zabbix.template_get templateids="[`10050', `10001']"

salt.modules.zabbix.**user_addmedia**(*userids*, *active*, *mediatypeid*, *period*, *sendto*, *severity*, ***connection_args*)

Add new media to multiple users.

New in version 2016.3.0.

Parameters

- **userids** -- ID of the user that uses the media
- **active** -- Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** -- ID of the media type used by the media
- **period** -- Time when the notifications can be sent as a time period
- **sendto** -- Address, user name or other identifier of the recipient
- **severity** -- Trigger severities to send notifications about
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created media.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period=`1-7,00:00-24:00' sendto='support2@example.com` severity=63

salt.modules.zabbix.**user_create**(*alias*, *passwd*, *usrgrps*, ***connection_args*)

New in version 2016.3.0.

Create new zabbix user

Note: This function accepts all standard user properties: keyword argument names differ depending on your

zabbix version, see here.

Parameters

- **alias** -- user alias
- **passwd** -- user's password
- **usrgrps** -- user groups to add the user to
- **_connection_user** -- zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** -- string with firstname of the user, use `firstname' instead of `name' parameter to not mess with value supplied from Salt sls file.

Returns On success string with id of the created user.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_create james password007 `[7, 12]' firstname='James Bond'

`salt.modules.zabbix.`**`user_delete`**(*users*, ***connection_args*)

Delete zabbix users.

New in version 2016.3.0.

Parameters

- **users** -- array of users (userids) to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success array with userids of deleted users.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_delete 15

`salt.modules.zabbix.`**`user_deletemedia`**(*mediaids*, ***connection_args*)

Delete media by id.

New in version 2016.3.0.

Parameters

- **mediaids** -- IDs of the media to delete
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_deletemedia 27

`salt.modules.zabbix.`**`user_exists`**(*alias*, ***connection_args*)

Checks if user with given alias exists.

New in version 2016.3.0.

Parameters

- **alias** -- user alias

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if user exists, else False.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_exists james

salt.modules.zabbix.**user_get**(*alias=None*, *userids=None*, ***connection_args*)

Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters

- **alias** -- user alias
- **userids** -- return only users with the given IDs
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details of convenient users, False on failure of if no user found.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_get james

salt.modules.zabbix.**user_getmedia**(*userids=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve media according to the given parameters

Note: This function accepts all standard usermedia.get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **userids** -- return only media that are used by the given users
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns List of retrieved media, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_getmedia

salt.modules.zabbix.**user_list**(***connection_args*)

Retrieve all of the configured users.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with user details.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_list

salt.modules.zabbix.**user_update**(*userid*, ***connection_args*)

New in version 2016.3.0.

Update existing users

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **userid** -- id of the user to update
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Id of the updated user on success.

CLI Example: .. code-block:: bash

salt `*' zabbix.user_update 16 visible_name='James Brown'

salt.modules.zabbix.**usergroup_create**(*name*, ***connection_args*)

New in version 2016.3.0.

Create new user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** -- name of the user group
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created user groups.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_create GroupName

salt.modules.zabbix.**usergroup_delete**(*usergroupids*, ***connection_args*)

New in version 2016.3.0.

Parameters

- **usergroupids** -- IDs of the user groups to delete

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted user groups.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_delete 28

salt.modules.zabbix.**usergroup_exists**(*name=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

Parameters

- **name** -- names of the user groups
- **node** -- name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** -- IDs of the nodes the user groups must belong to
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_exists Guests

salt.modules.zabbix.**usergroup_get**(*name=None*, *usrgrpids=None*, *userids=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve user groups according to the given parameters

Note: This function accepts all usergroup_get properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **name** -- names of the user groups
- **usrgrpids** -- return only user groups with the given IDs
- **userids** -- return only user groups that contain the given users
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_get Guests

salt.modules.zabbix.**usergroup_list**(***connection_args*)

Retrieve all enabled user groups.

New in version 2016.3.0.

Parameters

- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with enabled user groups details, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_list

salt.modules.zabbix.**usergroup_update**(*usrgrpid*, ***connection_args*)

New in version 2016.3.0.

Update existing user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see here.

Parameters

- **usrgrpid** -- ID of the user group to update.
- **_connection_user** -- Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** -- Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** -- Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash

salt `*' zabbix.usergroup_update 8 name=guestsRenamed

19.9.453 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by minitage's buildout maker

Note: The zc.buildout integration is still in beta; the API is subject to change

---

General notes

You have those following methods:

- upgrade_bootstrap
- bootstrap
- run_buildout
- buildout

salt.modules.zcbuildout.**bootstrap**(**a*, ***kw*)

Run the buildout bootstrap dance (python bootstrap.py).

directory directory to execute in
config alternative buildout configuration file to use
runas User used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
offline are we executing buildout in offline mode
distribute Forcing use of distribute
new_st Forcing use of setuptools >= 0.7
python path to a python executable to use in place of default (salt one)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
use_vt Use the new salt VT to stream output [experimental]
CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

salt.modules.zcbuildout.**buildout**(**a*, ***kw*)

Run buildout in a directory.

directory directory to execute in
config buildout config to use
parts specific buildout parts to run
runas user used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible
offline does buildout run offline
python python to use
debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

salt.modules.zcbuildout.**run_buildout**(**a*, ***kw*)

Run a buildout in a directory.

directory directory to execute in
config alternative buildout configuration file to use
offline are we executing buildout in offline mode
runas user used to run buildout as
env environment variables to set when running
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
force run buildout unconditionally
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]

CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

salt.modules.zcbuildout.**upgrade_bootstrap**(**a*, ***kw*)

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy
directory directory to execute in
offline are we executing buildout in offline mode
buildout_ver forcing to use a specific buildout version (1 | 2)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
CLI Example:

```
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

19.9.454 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

depends requests

configuration This module requires a `zenoss' entry in the master/minion config.

For example:

```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
```

salt.modules.zenoss.**add_device**(*device=None*, *device_class=None*, *collector='localhost'*, *prod_state=1000*)

A function to connect to a zenoss server and add a new device entry.

Parameters

- **device** -- (Optional) Will use the grain `fqdn' by default.
- **device_class** -- (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** -- (Optional) The collector to use for this device. Defaults to `localhost'.
- **prod_state** -- (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example: salt `*' zenoss.add_device

salt.modules.zenoss.**device_exists**(*device=None*)

Check to see if a device already exists in Zenoss.

Parameters **device** -- (Optional) Will use the grain `fqdn' by default

CLI Example: salt `*' zenoss.device_exists

salt.modules.zenoss.**find_device**(*device=None*)

Find a device in Zenoss. If device not found, returns None.

Parameters **device** -- (Optional) Will use the grain `fqdn' by default

CLI Example: salt `*' zenoss.find_device

salt.modules.zenoss.**set_prod_state**(*prod_state*, *device=None*)

A function to set the prod_state in zenoss.

Parameters

- **prod_state** -- (Required) Integer value of the state
- **device** -- (Optional) Will use the grain `fqdn' by default.

CLI Example: salt zenoss.set_prod_state 1000 hostname

19.9.455 salt.modules.zfs

Salt interface to ZFS commands

codeauthor Nitin Madhok <nmadhok@clemson.edu>

salt.modules.zfs.**bookmark**(*snapshot*, *bookmark*)

New in version 2016.3.0.

Creates a bookmark of the given snapshot

Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See zpool-features(5) for details on ZFS feature flags and the bookmarks feature.

---

snapshot [string] name of snapshot to bookmark
bookmark [string] name of bookmark

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

salt.modules.zfs.**clone**(*name_a*, *name_b*, ***kwargs*)

New in version 2016.3.0.

Creates a clone of the given snapshot.
name_a [string] name of snapshot
name_b [string] name of filesystem or volume
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
properties [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties'' and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

salt.modules.zfs.**create**(*name*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Create a ZFS File System.
name [string] name of dataset or volume
volume_size [string] if specified, a zvol will be created instead of a dataset
sparse [boolean] create sparse volume
create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the -o option is ignored.
properties [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties'' and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{'mountpoint': '/export/zfs',
 ↪'sharenfs': 'on'}"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]`
salt '*' zfs.create myzpool/volume volume_size=1G properties="{'volblocksize':
 ↪'512'}" [sparse=True|False]
```

`salt.modules.zfs.`**`destroy`**(*name*, ***kwargs*)
New in version 2015.5.0.

Destroy a ZFS File System.
name [string] name of dataset, volume, or snapshot
force [boolean] force an unmount of any file systems using the unmount -f command.
recursive [boolean] recursively destroy all children. (-r)
recursive_all [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

Warning: watch out when using recursive and recursive_all

CLI Example:

```
salt '*' zfs.destroy myzpool/mydataset [force=True|False]
```

`salt.modules.zfs.`**`diff`**(*name_a*, *name_b*, ***kwargs*)
New in version 2016.3.0.

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.
name_a [string] name of snapshot
name_b [string] name of snapshot or filesystem
show_changetime [boolean] display the path's inode change time as the first column of output. (default = False)
show_indication [boolean] display an indication of the type of file. (default = True)
CLI Example:

```
salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset
```

`salt.modules.zfs.`**`exists`**(*name*, ***kwargs*)
New in version 2015.5.0.

Check if a ZFS filesystem or volume or snapshot exists.

name [string] name of dataset

type [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

CLI Example:

```
salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume
```

salt.modules.zfs.**get**(**dataset*, ***kwargs*)

New in version 2016.3.0.

Displays properties for the given datasets.

dataset [string] name of snapshot(s), filesystem(s), or volume(s)

properties [string] comma-separated list of properties to list, defaults to all

recursive [boolean] recursively list children

depth [int] recursively list children to depth

fields [string] comma-separated list of fields to include, the name and property field will always be added

type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

source [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.

Note: If no datasets are specified, then the command displays properties for all datasets on the system.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint"
↪[recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
↪fields=value depth=1
```

salt.modules.zfs.**hold**(*tag*, **snapshot*, ***kwargs*)

New in version 2016.3.0.

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

Note: Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

---

tag [string] name of tag

snapshot [string] name of snapshot(s)

recursive [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

Note: A comma-separated list can be provided for the tag parameter to hold multiple tags.

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag,myothertag myzpool/mydataset@mysnapshot
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
↪mydataset@myothersnapshot
```

salt.modules.zfs.**holds**(*snapshot*, ***kwargs*)

New in version 2016.3.0.

Lists all existing user references for the given snapshot or snapshots.
snapshot [string] name of snapshot
recursive [boolean] lists the holds that are set on the named descendent snapshots also.
CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

salt.modules.zfs.**inherit**(*prop*, *name*, ***kwargs*)

New in version 2016.3.0.

Clears the specified property
prop [string] name of property
name [string] name of the filesystem, volume, or snapshot
recursive [boolean] recursively inherit the given property for all children.
revert [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.
CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

salt.modules.zfs.**list**(*name=None*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.
name [string] name of dataset, volume, or snapshot
recursive [boolean] recursively list children
depth [int] limit recursion to depth
properties [string] comma-separated list of properties to list, the name property will always be added
type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
sort [string] property to sort on (default = name)
order [string [ascending|descending]] sort order (default = ascending)
CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"
```

salt.modules.zfs.**mount**(*name='-a'*, ***kwargs*)

New in version 2016.3.0.

Mounts ZFS file systems
name [string] name of the filesystem, you can use `-a' to mount all unmounted filesystems. (this is the default)
overlay [boolean] perform an overlay mount.

options [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

salt.modules.zfs.**promote**(*name*)

New in version 2016.3.0.

Promotes a clone file system to no longer be dependent on its ``origin'' snapshot.

Note: This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

---

name [string] name of clone-filesystem

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

salt.modules.zfs.**release**(*tag*, **snapshot*, ***kwargs*)

New in version 2016.3.0.

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

Note: The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

---

tag [string] name of tag

snapshot [string] name of snapshot(s)

recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

Note: A comma-separated list can be provided for the tag parameter to release multiple tags.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
 ↪mydataset@myothersnapshot
```

salt.modules.zfs.**rename**(*name*, *new_name*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Rename or Relocate a ZFS File System.
name [string] name of dataset, volume, or snapshot
new_name [string] new name of dataset, volume, or snapshot
force [boolean] force unmount any filesystems that need to be unmounted in the process.
create_parent [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.
recursive [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.
CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

salt.modules.zfs.**rollback**(*name*, ***kwargs*)
New in version 2016.3.0.

Roll back the given dataset to a previous snapshot.

> **Warning:** When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.
>
> In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

name [string] name of snapshot
recursive [boolean] destroy any snapshots and bookmarks more recent than the one specified.
recursive_all [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.
force [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

salt.modules.zfs.**set**(**dataset*, ***kwargs*)
New in version 2016.3.0.

Sets the property or list of properties to the given value(s) for each dataset.
dataset [string] name of snapshot(s), filesystem(s), or volume(s)
properties [string] additional zfs properties pairs

Note: properties are passed as key-value pairs. e.g.
compression=off

Note: Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E, Z (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, exabytes, or zettabytes, respectively).

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
↪canmount=off
```

```
```

salt.modules.zfs.**snapshot**(**snapshot*, ***kwargs*)

New in version 2016.3.0.

Creates snapshots with the given names.
snapshot [string] name of snapshot(s)
recursive [boolean] recursively create snapshots of all descendent datasets.
properties [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called ``properties'' and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
 ↪myotherdataset@yesterday [recursive=True]
```

salt.modules.zfs.**unmount**(*name*, ***kwargs*)

New in version 2016.3.0.

Unmounts ZFS file systems
name [string] name of the filesystem, you can use `-a' to unmount all mounted filesystems.
force [boolean] forcefully unmount the file system, even if it is currently in use.

Warning: Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

19.9.456 salt.modules.zk_concurrency

Concurrency controls in zookeeper

This module allows you to acquire and release a slot. This is primarily useful for ensureing that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

salt.modules.zk_concurrency.**lock**(*path*, *zk_hosts*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*, *force=False*)

Get lock (with optional timeout)
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to the hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeper should be ephemeral
force Forcibly acquire the lock regardless of available slots

Example:

... code-block: bash
salt minion zk_concurrency.lock /lock/path host1:1234,host2:1234

salt.modules.zk_concurrency.**lock_holders**(*path*, *zk_hosts*, *identifier=None*, *max_concurrency=1*, *timeout=None*, *ephemeral_lease=False*)

Return an un-ordered list of lock holders
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeper should be ephemeral
Example:

... code-block: bash
salt minion zk_concurrency.lock_holders /lock/path host1:1234,host2:1234

salt.modules.zk_concurrency.**party_members**(*path*, *zk_hosts*, *min_nodes=1*, *blocking=False*)

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
min_nodes The minimum number of nodes expected to be present in the party
blocking The boolean indicating if we need to block until min_nodes are available
Example:

... code-block: bash
salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 salt minion zk_concurrency.party_members /lock/path host1:1234,host2:1234 min_nodes=3 blocking=True

salt.modules.zk_concurrency.**unlock**(*path*, *zk_hosts=None*, *identifier=None*, *max_concurrency=1*, *ephemeral_lease=False*)

Remove lease from semaphore
path The path in zookeeper where the lock is
zk_hosts zookeeper connect string
identifier Name to identify this minion, if unspecified defaults to hostname
max_concurrency Maximum number of lock holders
timeout timeout to wait for the lock. A None timeout will block forever
ephemeral_lease Whether the locks in zookeper should be ephemeral
Example:

... code-block: bash
salt minion zk_concurrency.unlock /lock/path host1:1234,host2:1234

19.9.457 salt.modules.znc

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

salt.modules.znc.**buildmod**(**modules*)

Build module using znc-buildmod

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

salt.modules.znc.**dumpconf**()

Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

salt.modules.znc.**rehashconf**()

Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

salt.modules.znc.**version**()

Return server version from znc --version

CLI Example:

```
salt '*' znc.version
```

19.9.458 salt.modules.zoneadm

Module for Solaris 10's zoneadm

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

Warning: Oracle Solaris 11's zoneadm is not supported by this module!

salt.modules.zoneadm.**attach**(*zone*, *force=False*, *brand_opts=None*)

Attach the specified zone.

zone [string] name of the zone

force [boolean] force the zone into the ``installed'' state with no validation

brand_opts [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

salt.modules.zoneadm.**boot**(*zone*, *single=False*, *altinit=None*, *smf_options=None*)

Boot (or activate) the specified zone.

zone [string] name or uuid of the zone

single [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit [string] valid path to an alternative executable to be the primordial process.

smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

salt.modules.zoneadm.**clone**(*zone*, *source*, *snapshot=None*)

Install a zone by copying an existing installed zone.

zone [string] name of the zone

source [string] zone to clone from

snapshot [string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

salt.modules.zoneadm.**detach**(*zone*)

Detach the specified zone.

zone [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

salt.modules.zoneadm.**halt**(*zone*)

Halt the specified zone.

zone [string] name or uuid of the zone

Note: To cleanly shutdown the zone use the shutdown function.

CLI Example:

```
salt '*' zoneadm.halt hector
```

salt.modules.zoneadm.**install**(*zone*, *nodataset=False*, *brand_opts=None*)

Install the specified zone from the system.

zone [string] name of the zone

nodataset [boolean] do not create a ZFS file system

brand_opts [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

salt.modules.zoneadm.**list**(*verbose=True*, *installed=False*, *configured=False*, *hide_global=True*)

List all zones

verbose [boolean] display additional zone information

installed [boolean] include installed zones in output

configured [boolean] include configured zones in output

hide_global [boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

salt.modules.zoneadm.**move**(*zone*, *zonepath*)

Move zone to new zonepath.

zone [string] name or uuid of the zone

zonepath [string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

salt.modules.zoneadm.**ready**(*zone*)

Prepares a zone for running applications.

zone [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.ready clementine
```

salt.modules.zoneadm.**reboot**(*zone*, *single=False*, *altinit=None*, *smf_options=None*)

Restart the zone. This is equivalent to a halt boot sequence.

zone [string] name or uuid of the zone

single [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit [string] valid path to an alternative executable to be the primordial process.

smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

salt.modules.zoneadm.**shutdown**(*zone*, *reboot=False*, *single=False*, *altinit=None*, *smf_options=None*)

Gracefully shutdown the specified zone.

zone [string] name or uuid of the zone

reboot [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)

single [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit [string] valid path to an alternative executable to be the primordial process.

smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

salt.modules.zoneadm.**uninstall**(*zone*)

Uninstall the specified zone from the system.

zone [string] name or uuid of the zone

> **Warning:** The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:

```
salt '*' zoneadm.uninstall teddy
```

salt.modules.zoneadm.**verify**(*zone*)

Check to make sure the configuration of the specified zone can safely be installed on the machine.

zone [string] name of the zone

CLI Example:

```
salt '*' zoneadm.verify dolores
```

19.9.459 salt.modules.zonecfg

Module for Solaris 10's zonecfg

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

depend salt.modules.file

New in version 2017.7.0.

> **Warning:** Oracle Solaris 11's zonecfg is not supported by this module!

`salt.modules.zonecfg.`**`add_resource`**(*zone*, *resource_type*, ***kwargs*)

Add a resource

zone [string] name of zone

resource_type [string] type of resource

kwargs [string|int|...] resource properties

CLI Example:

```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value=
↪'(priv=privileged,limit=33554432,action=deny)'
```

`salt.modules.zonecfg.`**`clear_property`**(*zone*, *key*)

Clear a property

zone [string] name of zone

key [string] name of property

CLI Example:

```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

`salt.modules.zonecfg.`**`create`**(*zone*, *brand*, *zonepath*, *force=False*)

Create an in-memory configuration for the specified zone.

zone [string] name of zone

brand [string] brand name

zonepath [string] path of zone

force [boolean] overwrite configuration

CLI Example:

```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

`salt.modules.zonecfg.`**`create_from_template`**(*zone*, *template*)

Create an in-memory configuration from a template for the specified zone.

zone [string] name of zone

template [string] name of template

> **Warning:** existing config will be overwritten!

CLI Example:

```
salt '*' zonecfg.create_from_template leo tallgeese
```

salt.modules.zonecfg.**delete**(*zone*)

Delete the specified configuration from memory and stable storage.
zone [string] name of zone
CLI Example:

```
salt '*' zonecfg.delete epyon
```

salt.modules.zonecfg.**export**(*zone*, *path=None*)

Export the configuration from memory to stable storage.
zone [string] name of zone
path [string] path of file to export to
CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

salt.modules.zonecfg.**import**(*zone*, *path*)

Import the configuration to memory from stable storage.
zone [string] name of zone
path [string] path of file to export to
CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

salt.modules.zonecfg.**info**(*zone*, *show_all=False*)

Display the configuration from memory
zone [string] name of zone
show_all [boolean] also include calculated values like capped-cpu, cpu-shares, ...
CLI Example:

```
salt '*' zonecfg.info tallgeese
```

salt.modules.zonecfg.**remove_resource**(*zone*, *resource_type*, *resource_key*, *resource_value*)

Remove a resource
zone [string] name of zone
resource_type [string] type of resource
resource_key [string] key for resource selection
resource_value [string] value for resource selection

Note: Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

salt.modules.zonecfg.**set_property**(*zone*, *key*, *value*)

Set a property
zone [string] name of zone
key [string] name of property
value [string] value of property
CLI Example:

```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

salt.modules.zonecfg.**update_resource**(*zone*, *resource_type*, *resource_selector*, ***kwargs*)

Add a resource

zone [string] name of zone
resource_type [string] type of resource
resource_selector [string] unique resource identifier
kwargs [string|int|...] resource properties

Note: Set resource_selector to None for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory
 ↪value='(priv=privileged,limit=33554432,action=deny)'
```

19.9.460 salt.modules.zpool

Module for running ZFS zpool command

codeauthor Nitin Madhok <nmadhok@clemson.edu>

`salt.modules.zpool.`**`add`**(*zpool*, **vdevs*, ***kwargs*)
Changed in version 2016.3.0.

Add the specified vdevs to the given storage pool
zpool [string] name of storage pool
vdevs [string] one or more devices
force [boolean] forces use of device
CLI Example:

```
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.`**`attach`**(*zpool*, *device*, *new_device*, *force=False*)
Changed in version 2016.3.0.

Attach specified device to zpool
zpool [string] name of storage pool
device [string] device to attach too
new_device [string] device to attach
force [boolean] forces use of device
CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.`**`create`**(*zpool*, **vdevs*, ***kwargs*)
New in version 2015.5.0.

Changed in version 2016.3.0.

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3
zpool [string] name of storage pool
vdevs [string] one or move devices
force [boolean] forces use of vdevs, even if they appear in use or specify a conflicting replication level.
mountpoint [string] sets the mount point for the root dataset
altroot [string] equivalent to ``-o cachefile=none,altroot=root''
properties [dict] additional pool properties
filesystem_properties [dict] additional filesystem properties
CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...]
 ↪[force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/
 ↪to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /
 ↪path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/
 ↪vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...]
 ↪[force=True|False]
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called ``properties'' and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called ``filesystem_properties'' and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{'property1': 'value1', 'property2': 'value2'}"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{'property1':
 ↪'value1', 'property2': 'value2'}"
```

`salt.modules.zpool.`**`create_file_vdev`**(*size*, **vdevs*)

Changed in version 2016.3.0.

Creates file based `virtual devices` for a zpool

`vdevs` is a list of full paths for mkfile to create

CLI Example:

```
salt '*' zpool.create_file_vdev 7g /path/to/vdev1 [/path/to/vdev2] [...]
```

Note: Depending on file size, the above command may take a while to return.

`salt.modules.zpool.`**`destroy`**(*zpool*, *force=False*)

Changed in version 2016.3.0.

Destroys a storage pool
zpool [string] name of storage pool
force [boolean] force destroy of pool
CLI Example:

```
salt '*' zpool.destroy myzpool
```

`salt.modules.zpool.`**`detach`**(*zpool*, *device*)

Changed in version 2016.3.0.

Detach specified device to zpool

zpool [string] name of storage pool
device [string] device to detach
CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```

salt.modules.zpool.**exists**(*zpool*)
Check if a ZFS storage pool is active
zpool [string] name of storage pool
CLI Example:

```
salt '*' zpool.exists myzpool
```

salt.modules.zpool.**export**(**pools*, ***kwargs*)
New in version 2015.5.0.

Changed in version 2016.3.0.

Export storage pools
pools [string] one or more storage pools to export
force [boolean] force export of storage pools
CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False]
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]
```

salt.modules.zpool.**get**(*zpool*, *prop=None*, *show_source=False*)
New in version 2016.3.0.

Retrieves the given list of properties
zpool [string] name of storage pool
prop [string] optional name of property to retrieve
show_source [boolean] show source of property
CLI Example:

```
salt '*' zpool.get myzpool
```

salt.modules.zpool.**healthy**()
New in version 2016.3.0.

Check if all zpools are healthy

CLI Example:

```
salt '*' zpool.healthy
```

salt.modules.zpool.**history**(*zpool=None*, *internal=False*, *verbose=False*)
New in version 2016.3.0.

Displays the command history of the specified pools or all pools if no pool is specified
zpool [string] optional storage pool
internal [boolean] toggle display of internally logged ZFS events
verbose [boolean] toggle display of the user name, the hostname, and the zone in which the operation was performed
CLI Example:

```
salt '*' zpool.upgrade myzpool
```

salt.modules.zpool.**import**(*zpool=None*, *new_name=None*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Import storage pools or list pools available for import
zpool [string] optional name of storage pool
new_name [string] optional new name for the storage pool
mntopts [string] comma-separated list of mount options to use when mounting datasets within the pool.
force [boolean] forces import, even if the pool appears to be potentially active.
altroot [string] equivalent to ``-o cachefile=none,altroot=root''
dir [string] searches for devices or files in dir, multiple dirs can be specified as follows:: dir="dir1,dir2"
no_mount [boolean] import the pool without mounting any file systems.
only_destroyed [boolean] imports destroyed pools only. this also sets force=True.
properties [dict] additional pool properties

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called ``properties'' and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{'property1': 'value1', 'property2': 'value2'}"
```

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

salt.modules.zpool.**iostat**(*zpool=None*, *sample_time=0*)

Changed in version 2016.3.0.

Display I/O statistics for the given pools
zpool [string] optional name of storage pool
sample_time [int] seconds to capture data before output
CLI Example:

```
salt '*' zpool.iostat myzpool
```

salt.modules.zpool.**list**(*properties='size, alloc, free, cap, frag, health'*, *zpool=None*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Return information about (all) storage pools
zpool [string] optional name of storage pool
properties [string] comma-separated list of properties to list

---

Note: the `name' property will always be included, the `frag' property will get removed if not available

---

zpool [string] optional zpool

Note: multiple storage pool can be provded as a space separated list

---

CLI Example:

```
salt '*' zpool.list
```

salt.modules.zpool.**offline**(*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Ensure that the specified devices are offline

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

zpool [string] name of storage pool
vdevs [string] one or more devices
temporary [boolean] enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

salt.modules.zpool.**online**(*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Changed in version 2016.3.0.

Ensure that the specified devices are online
zpool [string] name of storage pool
vdevs [string] one or more devices
expand [boolean] Expand the device to use all available space.

Note: If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

salt.modules.zpool.**reguid**(*zpool*)

New in version 2016.3.0.

Generates a new unique identifier for the pool

Warning: You must ensure that all devices in this pool are online and healthy before performing this action.

zpool [string] name of storage pool

CLI Example:

```
salt '*' zpool.reguid myzpool
```

salt.modules.zpool.**reopen**(*zpool*)

New in version 2016.3.0.

Reopen all the vdevs associated with the pool
zpool [string] name of storage pool

CLI Example:

```
salt '*' zpool.reopen myzpool
```

salt.modules.zpool.**replace**(*zpool*, *old_device*, *new_device=None*, *force=False*)
Changed in version 2016.3.0.

Replaces old_device with new_device.

Note: This is equivalent to attaching new_device, waiting for it to resilver, and then detaching old_device.

The size of new_device must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

---

zpool [string] name of storage pool
old_device [string] old device to replace
new_device [string] optional new device
force [boolean] Forces use of new_device, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

salt.modules.zpool.**scrub**(*zpool*, *stop=False*)
Changed in version 2016.3.0.

Scrub a storage pool
zpool [string] name of storage pool
stop [boolean] if true, cancel ongoing scrub
CLI Example:

```
salt '*' zpool.scrub myzpool
```

salt.modules.zpool.**set**(*zpool*, *prop*, *value*)
New in version 2016.3.0.

Sets the given property on the specified pool
zpool [string] name of storage pool
prop [string] name of property
value [string] value to set property to
CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

salt.modules.zpool.**status**(*zpool=None*)
Changed in version 2016.3.0.

Return the status of the named zpool
zpool [string] optional name of storage pool
CLI Example:

```
salt '*' zpool.status myzpool
```

salt.modules.zpool.**upgrade**(*zpool=None*, *version=None*)
New in version 2016.3.0.

Enables all supported features on the given pool

Warning: Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See zpool-features(5) for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

zpool [string] optional storage pool, applies to all otherwize
version [int] version to upgrade to, if unspecified upgrade to the highest possible

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

19.9.461 salt.modules.zypper

Package support for openSUSE via the zypper package manager

depends

- `rpm` Python module. Install with `zypper install rpm-python`

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *`pkg.install' is not available*), see *here*.

class salt.modules.zypper.**Wildcard**(*zypper*)
New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

`1.2.3.4*' is `1.2.3.4.whatever.is.here' and is equal to: `1.2.3.4 >= and < 1.2.3.5'
Parameters **ptn** -- Pattern
Returns Query range

salt.modules.zypper.**add_lock**(*packages*, ***kwargs*)
Add a package lock. Specify packages to lock by exact name.

CLI Example:

```
salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>,<package2>,<package3>
salt '*' pkg.add_lock pkgs='["foo", "bar"]'
```

salt.modules.zypper.**clean_locks**()
Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:

```
salt '*' pkg.clean_locks
```

salt.modules.zypper.**del_repo**(*repo*)
Delete a repo.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

salt.modules.zypper.**diff**(**paths*)
Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters **path** -- Full path to the installed file

Returns Difference string or raises and exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.zypper.**download**(**packages*, ***kwargs*)

Download packages to the local disk.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

salt.modules.zypper.**file_dict**(**packages*)

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.zypper.**file_list**(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of *every* file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

salt.modules.zypper.**get_repo**(*repo*, ***kwargs*)

Display a repo.

CLI Example:

```
salt '*' pkg.get_repo alias
```

salt.modules.zypper.**info_available**(**names*, ***kwargs*)

Return the information of the named package available for the system.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

salt.modules.zypper.**info_installed**(**names*, ***kwargs*)

Return the information of the named package(s), installed on the system.

Parameters

- **names** -- Names of the packages to get information about.
- **attr** -- Comma-separated package attributes. If no `attr' is specified, all available attributes returned.

Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

- **errors** -- Handle RPM field errors. If `ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If `report' is chonen, then a field with a mistake is not returned, instead a `N/A (broken)' (not available, broken) text is placed.
  Valid attributes are: ignore, report

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ...
 ↪attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ...
 ↪attr=version,vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ...
 ↪attr=version,vendor errors=report
```

`salt.modules.zypper.`**`install`**(*name=None*, *refresh=False*, *fromrepo=None*, *pkgs=None*, *sources=None*, *downloadonly=None*, *skip_verify=False*, *version=None*, *ignore_repo_failure=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add refresh=True to force a `zypper refresh' before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

fromrepo Specify a package repository to install from.

downloadonly Only download the packages, do not install.

skip_verify Skip the GPG verification check (e.g., `--no-gpg-checks`)

version Can be either a version number, or the combination of a comparison operator (<, >, <=, >=, =) and a version number (ex. `>1.2.3-4'). This parameter is ignored if `pkgs` or `sources` is passed.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```
salt '*' pkg.install pkgs='["foo", "bar"]'
salt '*' pkg.install pkgs='["foo", {"bar": "1.2.3-4"}]'
salt '*' pkg.install pkgs='["foo", {"bar": "<1.2.3-4"}]'
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package

names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"},{"bar": "salt://bar.
↪rpm"}]'
```

ignore_repo_failure Zypper returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to True. Default: False.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

salt.modules.zypper.**latest_version**(**names*, ***kwargs*)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypper.**list_downloaded**()

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

salt.modules.zypper.**list_installed_patches**()

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

salt.modules.zypper.**list_installed_patterns**()

List installed patterns on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

salt.modules.zypper.**list_locks**()

List current package locks.

Return a dict containing the locked package with attributes:

```
{'<package>': {'case_sensitive': '<case_sensitive>',
               'match_type': '<match_type>'
               'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

salt.modules.zypper.**list_patches**(*refresh=False*)

New in version 2017.7.0.

List all known advisory patches from available repos.
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
CLI Examples:

```
salt '*' pkg.list_patches
```

salt.modules.zypper.**list_patterns**(*refresh=False*)

List all known patterns from available repos.
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
CLI Examples:

```
salt '*' pkg.list_patterns
```

salt.modules.zypper.**list_pkgs**(*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict with versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...]'}
```

versions_as_list: If set to true, the versions are provided as a list

{`<package_name>': ['<version>', `<version>']}
removed: not supported
purge_desired: not supported

CLI Example:

```
salt '*' pkg.list_pkgs
```

salt.modules.zypper.**list_products**(*all=False*, *refresh=False*)

List all available or installed SUSE products.
all List all products available or only installed. Default is False.
refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.
Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

salt.modules.zypper.**list_repo_pkgs**(**args*, ***kwargs*)

New in version 2017.7.5,2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
    'bash': ['4.3-83.3.1',
```

```
            '4.3-82.6'],
    'vim': ['7.4.326-12.1']
}
{
    'OSS': {
        'bash': ['4.3-82.6'],
        'vim': ['7.4.326-12.1']
    },
    'OSS Update': {
        'bash': ['4.3-83.3.1']
    }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When `True`, the return data for each package will be organized by repository.

CLI Examples:

```
salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'
```

`salt.modules.zypper.`**`list_repos`**`()`

Lists all repos.

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.zypper.`**`list_upgrades`**`(`*refresh=True*, ***kwargs*`)`

List all available package upgrades on this system

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.zypper.`**`mod_repo`**`(`*repo*, ***kwargs*`)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo or alias alias by which Zypper refers to the repo

url, mirrorlist or baseurl the URL for Zypper to reference

enabled Enable or disable (True or False) repository, but do not remove if disabled.

refresh Enable or disable (True or False) auto-refresh of the repository.

cache Enable or disable (True or False) RPM files caching.

gpgcheck Enable or disable (True or False) GPG check for this repository.

gpgautoimport [False] If set to True, automatically trust and import public GPG key for the repository.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a `mirrorlist` is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url= mirrorlist=http://host.com/
```

salt.modules.zypper.**modified**(**packages*, ***flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of _all_ modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):
size Include only files where size changed.
mode Include only files which file's mode has been changed.
checksum Include only files which MD5 checksum has been changed.
device Include only files which major and minor numbers has been changed.
symlink Include only files which are symbolic link contents.
owner Include only files where owner has been changed.
group Include only files where group has been changed.
time Include only files where modification time of the file has been changed.
capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.
CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

salt.modules.zypper.**owner**(**paths*)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.zypper.**purge**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `zypper -n remove -u`
name The name of the package to be deleted.
Multiple Package Options:
pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.
New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

```
```

salt.modules.zypper.**refresh_db**()

Force a repository refresh by calling `zypper refresh --force`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

salt.modules.zypper.**remove**(*name=None*, *pkgs=None*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

salt.modules.zypper.**remove_lock**(*packages*, ***kwargs*)

Remove specified package lock.

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
salt '*' pkg.remove_lock pkgs='["foo", "bar"]'
```

salt.modules.zypper.**search**(*criteria*, *refresh=False*)

List known packags, available to the system.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.search <criteria>
```

salt.modules.zypper.**upgrade**(*refresh=True*, *dryrun=False*, *dist_upgrade=False*, *fromrepo=None*, *novendorchange=False*, *skip_verify=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd>=205, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *`config option`* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a zypper upgrade

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

dryrun If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False

dist_upgrade Perform a system dist-upgrade. Default: False

fromrepo Specify a list of package repositories to upgrade from. Default: None

novendorchange If set to True, no allow vendor changes. Default: False

skip_verify Skip the GPG verification check (e.g., `--no-gpg-checks`)

Returns a dictionary containing the changes:

```
{'<package>':  {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade dist-upgrade=True fromrepo='["MyRepoName"]'
↪novendorchange=True
salt '*' pkg.upgrade dist-upgrade=True dryrun=True
```

`salt.modules.zypper.`**`upgrade_available`**(*name*, ***kwargs*)

Check whether or not an upgrade is available for a given package

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.zypper.`**`verify`**(**names*, ***kwargs*)

Runs an rpm -Va on a system, and returns the results in a dict

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

`salt.modules.zypper.`**`version`**(**names*, ***kwargs*)

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.zypper.`**`version_cmp`**(*ver1*, *ver2*, *ignore_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if ver1 < ver2, 0 if ver1 == ver2, and 1 if ver1 > ver2. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to `True` to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

19.10 netapi modules

19.10.1 rest_cherrypy

A REST API for Salt

New in version 2014.7.0.

depends

- CherryPy Python module. Version 3.2.3 is currently recommended when SSL is enabled, since this version worked the best with SSL in internal testing. Versions 3.2.3 - 4.x can be used if SSL is not enabled. Be aware that there is a known SSL error introduced in version 3.2.5. The issue was reportedly resolved with CherryPy milestone 3.3, but the patch was committed for version 3.6.1.

optdepends

- ws4py Python module for websockets support.

client_libraries

- Java: https://github.com/SUSE/salt-netapi-client
- Python: https://github.com/saltstack/pepper

setup All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include salt-api in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)
2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

   Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

   (a) Install the PyOpenSSL package.

   (b) Generate a self-signed certificate using the *`create_self_signed_cert()`* execution function.

   ```
   salt-call --local tls.create_self_signed_cert
   ```

4. Edit the master config to create at least one external auth user or group following the *full external auth instructions*.
5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!).)

```
rest_cherrypy:
  port: 8000
  ssl_crt: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key
```

6. Restart the `salt-master` daemon.
7. Start the `salt-api` daemon.

configuration All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port **Required**

The port for the webserver to listen on.

host [`0.0.0.0`] The socket interface for the HTTP server to listen on.

debug [`False`] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file Path to a file to write HTTP access logs.

New in version 2016.11.0.

log_error_file Path to a file to write HTTP error logs.

New in version 2016.11.0.

ssl_crt The path to a SSL certificate. (See below)

ssl_key The path to the private key for your SSL certificate. (See below)

ssl_chain (Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

disable_ssl A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

webhook_disable_auth [False] The *Webhook* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

webhook_url [/hook] Configure the URL endpoint for the *Webhook* entry point.

thread_pool [`100`] The number of worker threads to start up in the pool.

socket_queue_size [`30`] Specify the maximum number of HTTP connections to queue.

expire_responses [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

Deprecated since version 2016.11.9,: 2017.7.3, Oxygen

The ``expire_responses'' configuration setting, which corresponds to the `timeout_monitor` setting in CherryPy, is no longer supported in CherryPy versions >= 12.0.0.

max_request_body_size [`1048576`] Maximum size for the HTTP request body.

collect_stats [False] Collect and report statistics about the CherryPy server

Reports are available via the *Stats* URL.

static A filesystem path to static HTML/JavaScript/CSS/image assets.

static_path [`/static`] The URL prefix to use when serving static assets out of the directory specified in the `static` setting.

enable_sessions [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

New in version 2017.7.0.

app [index.html] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentcation is vulnerable to XSRF attacks. Send the custom X-Auth-Token header instead and consider disabling the enable_sessions setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

app_path [/app] The URL prefix to use for serving the HTML file specified in the app setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

root_prefix [/] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the *Login* URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named *X-Auth-Token*.

  For example, using curl:

```
curl -sSk https://localhost:8000/login \
    -H 'Accept: application/x-yaml' \
    -d username=saltdev \
    -d password=saltdev \
    -d eauth=auto
```

  Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \
    -H 'Accept: application/x-yaml' \
    -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079'\
    -d client=local \
    -d tgt='*' \
    -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

  For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login \
      -c ~/cookies.txt \
      -H 'Accept: application/x-yaml' \
      -d username=saltdev \
```

```
      -d password=saltdev \
      -d eauth=auto

# Read the cookie file:
curl -sSk https://localhost:8000 \
      -b ~/cookies.txt \
      -H 'Accept: application/x-yaml' \
      -d client=local \
      -d tgt='*' \
      -d fun=test.ping
```

Another example using the **requests** library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'auto',
})
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'},
}])
>>> resp.json()
{u'return': [{
    ...snip...
}]}
```

See also:

You can bypass the session handling via the *Run* URL.

Usage

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000        -H 'Content-type: application/json'        -
 ↪d '[{
        "client": "local",
        "tgt": "*",
        "fun": "test.ping"
    }]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]
```

```
{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full *Client APIs* documentation, but in short:

- ``local'' uses *`LocalClient`* which sends commands to Minions. Equivalent to the `salt` CLI command.
- ``runner'' uses *`RunnerClient`* which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- ``wheel'' uses *`WheelClient`* which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the *`key wheel module`* exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the *full list of client interfaces*.

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions -- the *`test.arg execution function`* using `LocalClient` and the *`test.arg runner function`* using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000         -H 'Content-type: application/json
 ↪'         -d '
[
    {
        "client": "local",
        "tgt": "*",
        "fun": "test.arg",
        "arg": ["positional arg one", "positional arg two"],
        "kwarg": {
            "keyword arg one": "Hello from a minion",
            "keyword arg two": "Hello again from a minion"
        }
    },
    {
        "client": "runner",
        "fun": "test.arg",
        "keyword arg one": "Hello from a master",
        "keyword arg two": "Runners do not support positional args"
    }
]
'
HTTP/1.1 200 OK
[...snip...]
```

```
{
  "return": [
    {
      "jerry": {
        "args": [
          "positional arg one",
          "positional arg two"
        ],
        "kwargs": {
          "keyword arg one": "Hello from a minion",
          "keyword arg two": "Hello again from a minion",
          [...snip...]
        }
      },
      [...snip; other minion returns here...]
    },
    {
      "args": [],
      "kwargs": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
      }
    }
  ]
}
```

One more example, this time with more commonly used functions:

```
curl -b /tmp/cookies.txt -sSi localhost:8000         -H 'Content-type: application/json
↪'          -d '
[
    {
        "client": "local",
        "tgt": "*",
        "fun": "state.sls",
        "kwarg": {
            "mods": "apache",
            "pillar": {
                "lookup": {
                    "wwwdir": "/srv/httpd/htdocs"
                }
            }
        }
    },
    {
        "client": "runner",
        "fun": "cloud.create",
        "provider": "my-ec2-provider",
        "instances": "my-centos-6",
        "image": "ami-1624987f",
        "delvol_on_destroy", true
    }
]
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
```

```
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": {
            [...snip full state return here...]
        }
      }
      [...snip other minion returns here...]
    },
    {
        [...snip full salt-cloud output here...]
    }
  ]
}
```

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures -- and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt's CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```
curl -sSik https://localhost:8000 \
    -b ~/cookies.txt \
    -d client=runner \
    -d fun='jobs.lookup_jid' \
    -d jid='20150129182456704682'
```

---

urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

  Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to curl does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```
curl -ksi http://localhost:8000/login \
-H "Accept: application/json" \
-d username='myapiuser' \
--data-urlencode password='1234+' \
-d eauth='pam'
```

Deployment

The `rest_cherrypy` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

`salt-api` using the CherryPy server

The default configuration is to run this module using **`salt-api`** to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready.

Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with mod_wsgi or Nginx with FastCGI, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherrypy` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
    ServerName example.com
    ServerAlias *.example.com

    ServerAdmin webmaster@example.com

    LogLevel warn
    ErrorLog /var/www/example.com/logs/error.log
    CustomLog /var/www/example.com/logs/access.log combined

    DocumentRoot /var/www/example.com/htdocs

    WSGIScriptAlias / /path/to/salt/netapi/rest_cherrypy/wsgi.py
</VirtualHost>
```

REST URI Reference

/

class salt.netapi.rest_cherrypy.app.**LowDataAdapter**

The primary entry point to Salt's REST API

GET()

An explanation of the API with links of where to go next

GET /

Request Headers

- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
```

/login

class salt.netapi.rest_cherrypy.app.**Login**(**args*, ***kwargs*)

Log in to receive a session token

Authentication information.

GET()

Present the login interface

GET /login

An explanation of how to log in.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: text/html
```

POST (***kwargs*)

Authenticate against Salt's eauth system

POST /login

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Form Parameters

- **eauth** -- the eauth backend configured for the user
- **username** -- username
- **password** -- password

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -si localhost:8000/login \
    -c ~/cookies.txt \
    -H "Accept: application/json" \
    -H "Content-type: application/json" \
    -d '{
        "username": "saltuser",
        "password": "saltuser",
        "eauth": "auto"
    }'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT; Path=/

{"return": {
    "token": "6d1b722e",
    "start": 1363805943.776223,
```

```
    "expire": 1363849143.776224,
    "user": "saltuser",
    "eauth": "pam",
    "perms": [
        "grains.*",
        "status.*",
        "sys.*",
        "test.*"
    ]
}}
```

/logout

class salt.netapi.rest_cherrypy.app.**Logout**

Class to remove or invalidate sessions

POST()

Destroy the currently active session and expire the session cookie

/minions

class salt.netapi.rest_cherrypy.app.**Minions**

Convenience URLs for working with minions

GET(*mid=None*)

A convenience URL for getting lists of minions or getting minion details

GET /minions/(*mid*)

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
    grains.items:
        ...
```

POST(***kwargs*)

Start an execution command and immediately return the job id

POST /minions

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.
- **Content-Type** -- the format of the request body.

Response Headers

- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
    -b ~/cookies.txt \
    -H "Accept: application/x-yaml" \
    -d '[{"tgt": "*", "fun": "status.diskusage"}]'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
_links:
  jobs:
    - href: /jobs/20130603122505459265
```

/jobs

class salt.netapi.rest_cherrypy.app.**Jobs**

GET(*jid=None*, *timeout=''*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET /jobs/(*jid*)

List jobs or show a single job from the job cache.

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
    Arguments:
    - '3'
    Function: test.fib
    Start Time: 2012, Nov 30 10:46:33.606931
    Target: jerry
    Target-type: glob
```

Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
    - '3'
    Function: test.fib
    Minions:
    - jerry
    Start Time: 2012, Nov 30 10:46:33.606931
    Target: '*'
    Target-type: glob
    User: saltdev
    jid: '20121130104633606931'
return:
- jerry:
```

```
    - - 0
    - 1
    - 1
    - 2
    - 6.9141387939453125e-06
```

/run

class salt.netapi.rest_cherrypy.app.**Run**

Run commands bypassing the *normal session handling*

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept `username`/`password`/`eauth` **or** `token` kwargs that are then checked by the eauth system. The session mechanism in `rest_cherrypy` simply pairs a session with a Salt eauth token and then passes the `token` kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the *mk_token* function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a `username`, `password`, `eauth` trio, **or** a `token` kwarg and does not make use of sessions at all.

POST(***kwargs*)

Run commands bypassing the *normal session handling* Other than that this URL is identical to the `root URL (/)`.

POST /run

An array of lowstate data describing Salt commands must be sent in the request body.

Status Codes

- **200** -- success
- **400** -- bad or malformed request
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -H 'Content-type: application/json' \
    -d '[{
        "client": "local",
        "tgt": "*",
        "fun": "test.ping",
        "username": "saltdev",
        "password": "saltdev",
        "eauth": "auto"
    }]'
```

Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -H 'Content-type: application/json' \
    -d '[{
        "client": "local",
        "tgt": "*",
        "fun": "test.ping",
```

```
        "token": "<salt eauth token here>"
    }]'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping", "username": "saltdev",
 ↪"password": "saltdev", "eauth": "auto"}]
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The /run enpoint can also be used to issue commands using the salt-ssh subsystem.

When using salt-ssh, eauth credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the salt-ssh client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

Example SSH client request:

```
curl -sS localhost:8000/run \
    -H 'Accept: application/x-yaml' \
    -d client='ssh' \
    -d tgt='*' \
    -d fun='test.ping'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=ssh&tgt=*&fun=test.ping
```

Example SSH response:

```
return:
- silver:
  fun: test.ping
  fun_args: []
  id: silver
  jid: '20141203103525666185'
  retcode: 0
```

```
  return: true
  success: true
```

/events

class salt.netapi.rest_cherrypy.app.**Events**

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

Events & Reactor

GET(*token=None*, *salt_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Query Parameters

- **token** -- **optional** parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`
- **salt_token** -- **optional** parameter containing a raw Salt *eauth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialze the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
```

```
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4
 ↪', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}

tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid':
 ↪'20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd
 ↪': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream _before_ creating any events.
- Process SSE events directly as they arrive and don't wait for any other process to ``complete'' first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt's event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available adjacent to this file. It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherrypy` instance.

Or using CORS:

```
var source = new EventSource('/events?
 ↪token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events |\
        while IFS= read -r line ; do
            echo $line
        done
```

Here is an example of using awk to filter events based on tag:

```
curl -NsS localhost:8000/events |\
        awk '
            BEGIN { RS=""; FS="\\n" }
            $1 ~ /^tag: salt\/job\/[0-9]+\/new$/ { print $0 }
        '
tag: salt/job/20140112010149808995/new
```

```
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob
 ↪", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_01:
 ↪01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions":
 ↪["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid":
 ↪"20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd
 ↪": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping",
 ↪"id": "jerry"}}
```

/hook

class salt.netapi.rest_cherrypy.app.**Webhook**

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices -- always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```
language: python
script: python -m unittest tests
after_success:
    - |
        curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success
 ↪                      -d branch="${TRAVIS_BRANCH}"                      -d
 ↪commit="${TRAVIS_COMMIT}"
```

See also:

Events & Reactor, *reactor*

POST(**args*, ***kwargs*)

Fire an event in Salt with a custom event tag and data

POST /hook

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

- **413** -- request body is too large

Example request:

```
curl -sS localhost:8000/hook \
    -H 'Content-type: application/json' \
    -d '{"foo": "Foo!", "bar": "Bar!"}'
```

```
POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}
```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```
Event fired at Fri Feb 14 17:40:11 2014
*************************
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
    'headers': {
        'X-My-Secret-Key': 'F0fAgoQjIT@W',
        'Content-Length': '37',
        'Content-Type': 'application/json',
        'Host': 'localhost:8000',
        'Remote-Addr': '127.0.0.1'},
    'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
  - 'salt/netapi/hook/mycompany/build/*':
    - /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
```

```
    - kwarg:
        pillar:
          revision: {{ revision }}
{% endif %}
```

/keys

class salt.netapi.rest_cherrypy.app.**Keys**

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

GET(*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

GET /keys/(*mid*)

List all keys or show a specific key

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
  - master.pem
  - master.pub
  minions:
  - jerry
  minions_pre: []
  minions_rejected: []
```

Example request:

```
curl -i localhost:8000/keys/jerry
```

```
GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
    jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b
```

POST (***kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the *key.gen_accept*.

Note: A note about `curl` Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```
%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
        -d mid=jerry \
        -d username=kickstart \
        -d password=kickstart \
        -d eauth=pam \
    | tar -C /etc/salt/pki/minion -xf -

mkdir -p /etc/salt/minion.d
printf 'master: 10.0.0.5\nid: jerry' > /etc/salt/minion.d/id.conf
%end
```

POST /keys

Generate a public and private key and return both as a tarball

Authentication credentials must be passed in the request.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

Example request:

```
curl -sSk https://localhost:8000/keys \
        -d mid=jerry \
        -d username=kickstart \
        -d password=kickstart \
        -d eauth=pam \
        -o jerry-salt-keys.tar
```

```
POST /keys HTTP/1.1
Host: localhost:8000
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 10240
Content-Disposition: attachment; filename="saltkeys-jerry.tar"
Content-Type: application/x-tar

jerry.pub0000644000000000000000000000000007030000000000010730 0ustar 
 ↪00000000000000
```

/ws

class salt.netapi.rest_cherrypy.app.**WebsocketEndpoint**

Open a WebSocket connection to Salt's event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

See also:

Events & Reactor

GET(*token=None*, ***kwargs*)

Return a websocket connection of Salt's event stream

GET /ws/(*token*)

Query format_events The event stream will undergo server-side formatting if the `format_events` URL parameter is included in the request. This can be useful to avoid formatting on the client-side:

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

Reqheader X-Auth-Token an authentication token from *Login*.

Status 101 switching to the websockets protocol

Status 401 authentication required

Status 406 requested Content-Type not available

Example request:

```
curl -NsSk \
    -H 'X-Auth-Token: ffedf49d' \
    -H 'Host: localhost:8000' \
    -H 'Connection: Upgrade' \
    -H 'Upgrade: websocket' \
    -H 'Origin: https://localhost:8000' \
    -H 'Sec-WebSocket-Version: 13' \
    -H 'Sec-WebSocket-Key: '"$(echo -n $RANDOM | base64)" \
    localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

Example response:

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new Websocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module websocket-client for example.

```
# Note, you must be authenticated!

from websocket import create_connection

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()

ws.close()
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

/stats

class salt.netapi.rest_cherrypy.app.**Stats**

Expose statistics on the running CherryPy server

GET()

Return a dump of statistics collected from the CherryPy server

GET /stats

Request Headers

- **X-Auth-Token** -- a session token from *Login*.
- **Accept** -- the desired response format.

Response Headers

- **Content-Type** -- the format of the response body; depends on the *Accept* request header.

Status Codes

- **200** -- success
- **401** -- authentication required
- **406** -- requested Content-Type not available

19.10.2 rest_tornado

A Websockets add-on to saltnado

depends

- tornado Python module

In order to enable saltnado_websockets you must add websockets: True to your saltnado config block.

```
rest_tornado:
    # can be any port
    port: 8000
    ssl_crt: /etc/pki/api/certs/server.crt
    # no need to specify ssl_key if cert and key
    # are in one single file
    ssl_key: /etc/pki/api/certs/server.key
    debug: False
    disable_ssl: False
    websockets: True
```

All Events

Exposes `all` ``real-time'' events from Salt's event bus on a websocket connection. It should be noted that ``Real-time'' here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
    -H "Accept: application/json" \
    -d username='salt' \
    -d password='salt' \
    -d eauth='pam'
```

Which results in the response

```
{
    "return": [{
        "perms": [".*", "@runner", "@wheel"],
        "start": 1400556492.277421,
        "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
        "expire": 1400599692.277422,
```

```
        "user": "salt",
        "eauth": "pam"
    }]
}
```

In this example the `token` returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new Websocket('wss://localhost:8000/all_events/
 ↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
 ↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()       #  Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
 ↪self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Formatted Events

Exposes `formatted` ``real-time'' events from Salt's event bus on a websocket connection. It should be noted that ``Real-time'' here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw ``real time'' event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
    -H "Accept: application/json" \
    -d username='salt' \
    -d password='salt' \
    -d eauth='pam'
```

Which results in the response

```
{
    "return": [{
        "perms": [".*", "@runner", "@wheel"],
        "start": 1400556492.277421,
        "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
        "expire": 1400599692.277422,
        "user": "salt",
        "eauth": "pam"
    }]
}
```

In this example the `token` returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new Websocket('wss://localhost:8000/formatted_events/
 ↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };
```

```
// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module websocket-client for example. Or the tornado client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
 ↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()       #  Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
 ↪self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Example responses

`Minion information` is a dictionary keyed by each connected minion's `id` (`mid`), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- **connection drops**
  - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minon removal

```
# Not all grains are shown
data: {
    "minions": {
        "minion1": {
            "id": "minion1",
            "grains": {
                "kernel": "Darwin",
                "domain": "local",
                "zmqversion": "4.0.3",
```

```
                "kernelrelease": "13.2.0"
            }
        }
    }
}
```

`Job information` is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's `jid`.

```
data: {
    "jobs": {
        "20140609153646699137": {
            "tgt_type": "glob",
            "jid": "20140609153646699137",
            "tgt": "*",
            "start_time": "2014-06-09T15:36:46.700315",
            "state": "complete",
            "fun": "test.ping",
            "minions": {
                "minion1": {
                    "return": true,
                    "retcode": 0,
                    "success": true
                }
            }
        }
    }
}
```

19.10.3 rest_wsgi

A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

rest_cherrypy

The *rest_cherrypy* module is more full-featured, production-ready, and has builtin security features.

Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with mod_wsgi or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

`salt-api` using a development-only server

If run directly via the salt-api daemon it uses the wsgiref.simple_server() that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption**; please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via salt-api is not recommended!

In order to start this module via the `salt-api` daemon the following must be put into the Salt master config:

```
rest_wsgi:
    port: 8001
```

Usage examples

`POST /`

Example request for a basic `test.ping`:

```
% curl -sS -i \
        -H 'Content-Type: application/json' \
        -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
↪"local","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
↪true}]}
```

Example request for an asynchronous `test.ping`:

```
% curl -sS -i \
       -H 'Content-Type: application/json' \
       -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
↪"local_async","tgt":"*","fun":"test.ping"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2
↪", "ms--1", "ms--0"]}]}
```

Example request for looking up a job ID:

```
% curl -sS -i \
       -H 'Content-Type: application/json' \
       -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
↪"runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]' localhost:8001
```

Example response:

```
HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
↪true}]}
```

form lowstate A list of lowstate data appropriate for the *client* interface you are calling.

status 200 success

status 401 authentication required

19.11 output modules

Follow one of the below links for further information and examples

highstate	Outputter for displaying results of state runs
json_out	Display return data in JSON format
key	Display salt-key output
nested	Recursively display nested data
newline_values_only	Display values only, separated by newlines
no_out	Display no output
no_return	Display output for minions that did not return
overstatestage	Display clean output of an overstate stage
pony	Display Pony output data structure
pprint_out	Python pretty-print (pprint)
progress	Display return data as a progress bar
raw	Display raw output data structure
table_out	Display output in a table format

Continued on next page

Table 19.11 -- continued from previous page

txt	Simple text outputter
virt_query	virt.query outputter
yaml_out	Display return data in YAML format

19.11.1 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

state_verbose: By default *state_verbose* is set to *True*, setting this to *False* will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of True and no changes will not be printed

state_output: The highstate outputter has six output modes, `full`, `terse`, `mixed`, `mixed_id`, `changes` and `filter`.

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `mixed_id` is used, then the mixed form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the name value might be very long and hard to read.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`.
  - for `exclude`, state.highstate expects a list of states to be excluded (or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: *exclude=True,*.
  - for `terse`, state.highstate expects simply `True` or `False`. These can be set as such from the command line, or in the Salt config as *state_output_exclude* or *state_output_terse*, respectively.

state_tabular: If *state_output* uses the terse output, set this to *True* for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If `state_output: filter` is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states `problemstate1` and `problemstate2` from the highstate, and use regular output.

Example output for the above highstate call when `top.sls` defines only one other state to apply to minion `twd`:

```
twd:

Summary for twd
------------
Succeeded: 1 (changed=1)
Failed:    0
------------
Total states run:     1
```

Example output with no special settings in configuration files:

```
myminion:
----------
          ID: test.ping
    Function: module.run
      Result: True
     Comment: Module function test.ping executed
     Changes:
              ----------
              ret:
                  True

Summary for myminion
------------
Succeeded: 1
Failed:    0
------------
Total:     0
```

`salt.output.highstate.`**`output`**(*data*, ***kwargs*)

The HighState Outputter is only meant to be used with the state.highstate function, or a function that returns highstate return data.

19.11.2 salt.output.json_out

Display return data in JSON format

configuration The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

salt.output.json_out.**output**(*data*, ***kwargs*)
Print the output data in JSON

19.11.3 salt.output.key

Display salt-key output

The `salt-key` command makes use of this outputter to format its output.

salt.output.key.**output**(*data*, ***kwargs*)
Read in the dict structure generated by the salt key API methods and print the structure.

19.11.4 salt.output.nested

Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```
myminion:
    ----------
    foo:
        ----------
        bar:
            baz
        dictionary:
            ----------
            abc:
                123
            def:
                456
        list:
            - Hello
            - World
```

class salt.output.nested.**NestDisplay**
Manage the nested display contents

display(*ret*, *indent*, *prefix*, *out*)
Recursively iterate down through data structures to determine output

salt.output.nested.**output**(*ret*, ***kwargs*)
Display ret data

19.11.5 salt.output.newline_values_only

Display values only, separated by newlines

New in version 2015.5.0.

This outputter is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion's values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

Warning: As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as `json`, `pprint`,, or `yaml`) may be more suitable.

Example 1

Input

```
{
    'myminion': ['127.0.0.1', '10.0.0.1'],
    'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

Output

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

Example 2

Input

```
{
    'myminion': 8,
    'second-minion': 10
}
```

Output

```
8
10
```

salt.output.newline_values_only.**output**(*data*, ***kwargs*)
Display modified ret data

19.11.6 salt.output.no_out

Display no output

No output is produced when this outputter is selected

salt.output.no_out.**output**(*ret*, ***kwargs*)
Don't display data. Used when you only are interested in the return.

19.11.7 salt.output.no_return

Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
    Minion did not return
```

class salt.output.no_return.**NestDisplay**
Create generator for nested output

display(*ret*, *indent*, *prefix*, *out*)
Recursively iterate down through data structures to determine output

salt.output.no_return.**output**(*ret*, ***kwargs*)
Display ret data

19.11.8 salt.output.overstatestage

Display clean output of an overstate stage

This outputter is used to display *Orchestrate Runner* stages, and should not be called directly.

salt.output.overstatestage.**output**(*data*, ***kwargs*)
Format the data for printing stage information from the overstate system

19.11.9 salt.output.pony module

Display Pony output data structure

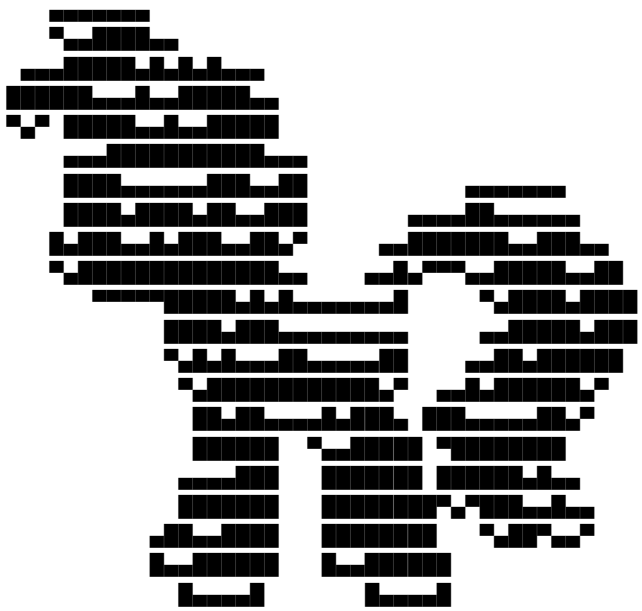
depends

- ponysay CLI program

Display output from a pony. Ponies are better than cows because everybody wants a pony.

Example output:

```
< {'local': True} >
 ------------------
 \
  \
   \
```



salt.output.pony.**output**(*data*, ***kwargs*)
Mane function

19.11.10 salt.output.pprint_out

Python pretty-print (pprint)

The python pretty-print system was once the default outputter. It simply passes the return data through to `pprint.pformat` and prints the results.

Example output:

```
{'saltmine': {'foo': {'bar': 'baz',
                      'dictionary': {'abc': 123, 'def': 456},
                      'list': ['Hello', 'World']}}}
```

salt.output.pprint_out.**output**(*data*, ***kwargs*)
Print out via pretty print

19.11.11 salt.output.progress

Display return data as a progress bar

salt.output.progress.**output**(*ret*, *bar*, ***kwargs*)
Update the progress bar

salt.output.progress.**progress_iter**(*progress*)
Initialize and return a progress bar iter

19.11.12 salt.output.raw

Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `pprint` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

Example output:

```
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc':
↪123, 'def': 456}}}}
```

`salt.output.raw.`**`output`**(*data*, ***kwargs*)
Rather basic....

19.11.13 salt.output.table_out

Display output in a table format

New in version 2017.7.0.

This outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
----------
    comment:
    ----------
    out:
    ----------
        ------------------------------------------------------------------------------
        | Active | Interface | Last Move |        Mac        | Moves | Static | Vlan |
        ------------------------------------------------------------------------------
        |  True  |  ae1.900  |    0.0    | 40:A6:77:5A:50:01 |   0   | False  | 111  |
        ------------------------------------------------------------------------------
        |  True  |  ae1.111  |    0.0    | 64:16:8D:32:26:58 |   0   | False  | 111  |
        ------------------------------------------------------------------------------
        |  True  |  ae1.111  |    0.0    | 8C:60:4F:73:2D:57 |   0   | False  | 111  |
        ------------------------------------------------------------------------------
        |  True  |  ae1.111  |    0.0    | 8C:60:4F:73:2D:7C |   0   | False  | 111  |
        ------------------------------------------------------------------------------
        |  True  |  ae1.222  |    0.0    | 8C:60:4F:73:2D:57 |   0   | False  | 222  |
        ------------------------------------------------------------------------------
        |  True  |  ae1.222  |    0.0    | F4:0F:1B:76:9D:97 |   0   | False  | 222  |
        ------------------------------------------------------------------------------
    result:
    ----------
```

class `salt.output.table_out.`**`TableDisplay`**(*has_header=True*, *row_delimiter='-`*, *delim=' | `*, *justify='center'*, *separate_rows=True*, *prefix='| `*, *suffix=' |'*, *width=50*, *wrapfunc=None*)
Manage the table display content.

`display`(*ret*, *indent*, *out*, *rows_key=None*, *labels_key=None*)
Display table(s).

display_rows(*rows*, *labels*, *indent*)
Prepares row content and displays.

prepare_rows(*rows*, *indent*, *has_header*)
Prepare rows content to be displayed.

ustring(*indent*, *color*, *msg*, *prefix=''*, *suffix=''*, *endc=None*)
Build the unicode string to be displayed.

wrap_onspace(*text*)
When the text inside the column is longer then the width, will split by space and continue on the next line.

salt.output.table_out.**output**(*ret*, ***kwargs*)
Display the output as table.

Parameters

- **nested_indent** (***) -- integer, specify the left alignment.
- **has_header** (***) -- boolean specifying if header should be displayed. Default: True.
- **row_delimiter** (***) -- character to separate rows. Default: _.
- **delim** (***) -- character to separate columns. Default: " | ".
- **justify** (***) -- text alignment. Default: `center`.
- **separate_rows** (***) -- boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- **prefix** (***) -- character at the beginning of the row. Default: "| ".
- **suffix** (***) -- character at the end of the row. Default: " |".
- **width** (***) -- column max width. Default: `50`.
- **rows_key** (***) -- display the rows under a specific key.
- **labels_key** (***) -- use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- **title** (***) -- display title when only one table is selected (using the `rows_key` argument).

19.11.14 salt.output.txt

Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

salt.output.txt.**output**(*data*, ***kwargs*)
Output the data in lines, very nice for running commands

19.11.15 salt.output.virt_query

virt.query outputter

Used to display the output from the *virt.query* runner.

salt.output.virt_query.**output**(*data*, ***kwargs*)
Display output for the salt-run virt.query function

19.11.16 salt.output.yaml_out

Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

Example output:

```
saltmine:
  foo:
    bar: baz
    dictionary:
      abc: 123
      def: 456
    list:
      - Hello
      - World
```

salt.output.yaml_out.**output**(*data*, ***kwargs*)
Print out YAML using the block mode

19.12 pillar modules

cmd_json	Execute a command and read the output as JSON.
cmd_yaml	Execute a command and read the output as YAML.
cmd_yamlex	Execute a command and read the output as YAMLEX.
cobbler	A module to pull data from Cobbler via its API into the Pillar dictionary
confidant	An external pillar module for getting credentials from confidant.
consul_pillar	Use Consul K/V as a Pillar source with values parsed as YAML
csvpillar	Store key/value pairs in a CSV file
digicert	Digicert Pillar Certificates
django_orm	Generate Pillar data from Django models through the Django ORM
ec2_pillar	Retrieve EC2 instance data for minions for ec2_tags and ec2_tags_list
etcd_pillar	Use etcd data as a Pillar source
file_tree	The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.
foreman	A module to pull data from Foreman via its API into the Pillar dictionary
git_pillar	Use a git repository as a Pillar source
gpg	Decrypt pillar data through the builtin GPG renderer
hg_pillar	Use remote Mercurial repository as a Pillar source.
hiera	Use hiera data as a Pillar source
http_json	A module that adds data to the Pillar structure retrieved by an http request
http_yaml	A module that adds data to the Pillar structure retrieved by an http request

Continued on next page

Table 19.12 -- continued from previous page

libvirt	Load up the libvirt keys into Pillar for a given minion if said keys have been
makostack	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
mongo	Read Pillar data from a mongodb collection
mysql	Retrieve Pillar data by doing a MySQL query
neutron	Use Openstack Neutron data as a Pillar source.
nodegroups	
pepa	Pepa
pillar_ldap	Use LDAP data as a Pillar source
postgres	Retrieve Pillar data by doing a postgres query
puppet	Execute an unmodified puppet_node_classifier and read the output as YAML.
reclass_adapter	Use the ``reclass'' database as a Pillar source
redismod	Read pillar data from a Redis backend
s3	Copy pillar data from a bucket in Amazon S3
sql_base	Retrieve Pillar data by doing a SQL query
sqlcipher	Retrieve Pillar data by running a SQLCipher query
sqlite3	Retrieve Pillar data by doing a SQLite3 query
stack	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
svn_pillar	Clone a remote SVN repository and use the filesystem as a Pillar source
varstack_pillar	Use Varstack data as a Pillar source
vault	Vault Pillar Module
venafi	Venafi Pillar Certificates
virtkey	Accept a key from a hypervisor if the virt runner has already submitted an authorization request
vmware_pillar	Pillar data from vCenter or an ESXi host

19.12.1 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

salt.pillar.cmd_json.**ext_pillar**(*minion_id*, *pillar*, *command*)
Execute a command and read the output as JSON

19.12.2 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

salt.pillar.cmd_yaml.**ext_pillar**(*minion_id*, *pillar*, *command*)
Execute a command and read the output as YAML

19.12.3 salt.pillar.cmd_yamlex

Execute a command and read the output as YAMLEX. The YAMLEX data is then directly overlaid onto the minion's Pillar data

salt.pillar.cmd_yamlex.**ext_pillar**(*minion_id*, *pillar*, *command*)
Execute a command and read the output as YAMLEX

19.12.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

Configuring the Cobbler ext_pillar

The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```
ext_pillar:
- cobbler:
    key: cobbler # Nest results within this key. By default, values are not nested.
    only: [parameters] # Add only these keys to pillar.

cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password
```

Module Documentation

salt.pillar.cobbler.**ext_pillar**(*minion_id*, *pillar*, *key=None*, *only=()*)
Read pillar data from Cobbler via its API.

19.12.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via ext_pillar in the minion config:

```

```

ext_pillar:

- **confidant**:

  profile: # The URL of the confidant web service url: `https://confidant-production.example.com` # The context to use for KMS authentication auth_context: from: example-production-iad to: confidant-production-iad user_type: service # The KMS master key to use for authentication auth_key: ``alias/authnz'' # Cache file for KMS auth token token_cache_file: /run/confidant/confidant_token # The duration of the validity of a token, in minutes token_duration: 60 # key, keyid and region can be defined in the profile, but it's # generally best to use IAM roles or environment variables for AWS # auth. keyid: 98nh9h9h908h09kjjk key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0 region: us-east-1

depends confidant-common, confidant-client

Module Documentation

salt.pillar.confidant.**ext_pillar**(*minion_id*, *pillar*, *profile=None*)
Read pillar data from Confidant via its API.

19.12.6 salt.pillar.consul_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

depends

- python-consul

In order to use an consul server, a profile must be created in the master configuration file:

```
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The `consul.token` requires python-consul >= 0.4.7.

If you have a multi-datacenter Consul cluster you can map your `pillarenv``s to your data centers by providing a dictionary of mappings in ``consul.dc` field:

```
my_consul_config:
  consul.dc:
    dev: us-east-1
    prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
  consul.dc:
    ^dev-.*$: dev-datacenter
    ^(?P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
  consul.dc:
    ^(?P<env>.*)$: '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - consul: my_consul_config

ext_pillar:
  - consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
  - consul: my_consul_config
  - consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
  - consul: my_consul_config root=salt/%(minion_id)s
  - consul: my_consul_config root=salt/%(role)s
  - consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - consul: my_consul_config root=salt-shared
  - consul: my_other_consul_config root=salt-private/%(minion_id)s
```

If using the `role` or `environment` grain in the consul key path, be sure to define it using */etc/salt/grains*, or similar:

```
role: my-minion-role
environment: dev
```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes " are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```
ext_pillar:
  - consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"
```

`salt.pillar.consul_pillar.`**`consul_fetch`**(*client*, *path*)
Query consul for all keys/values within base path

`salt.pillar.consul_pillar.`**`ext_pillar`**(*minion_id*, *pillar*, *conf*)
Check consul for all data

`salt.pillar.consul_pillar.`**`fetch_tree`**(*client*, *path*)
Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.`**`get_conn`**(*opts*, *profile*)
Return a client object for accessing consul

`salt.pillar.consul_pillar.`**`pillar_format`**(*ret*, *keys*, *value*)
Perform data formatting to be used as pillar data and merge it with the current pillar data

19.12.7 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```
ext_pillar:
  - csv: /path/to/file.csv

# or

ext_pillar:
  - csv:
      path: /path/to/file.csv
      namespace: 'subkey'
      fieldnames:
      - col1
      - col2
      - col2
```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

id	role	env
jerry	web	prod
stuart	web	stage
dave	web	qa
phil	db	prod
kevin	db	stage
mike	db	qa

Will produce the following Pillar values for a minion named ``jerry'':

```
{
    'role': 'web',
    'env': 'prod',
}
```

salt.pillar.csvpillar.**ext_pillar**(*mid*, *pillar*, *path*, *idkey='id'*, *namespace=None*, *fieldnames=None*, *restkey=None*, *restval=None*, *dialect='excel'*)

Read a CSV into Pillar

Parameters

- **path** (*str*) -- Absolute path to a CSV file.
- **idkey** (*str*) -- (Optional) The column name of minion IDs.
- **namespace** (*str*) -- (Optional) A pillar key to namespace the values under.
- **fieldnames** (*list*) -- (Optional) if the first row of the CSV is not column names they may be specified here instead.

19.12.8 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your `master` configuration file:

```
ext_pillar:
  - digicert: True
```

salt.pillar.digicert.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Return an existing set of certificates

19.12.9 salt.pillar.django_orm

Generate Pillar data from Django models through the Django ORM

maintainer Micah Hausler <micah.hausler@gmail.com>

maturity new

Configuring the django_orm ext_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.

```
ext_pillar:
  - django_orm:
      pillar_name: my_application
      project_path: /path/to/project/
      settings_module: my_application.settings
      env_file: /path/to/env/file.sh
      # Optional: If your project is not using the system python,
      # add your virtualenv path below.
      env: /path/to/virtualenv/

      django_app:

        # Required: the app that is included in INSTALLED_APPS
        my_application.clients:

          # Required: the model name
          Client:

            # Required: model field to use as the key in the rendered
            # Pillar. Must be unique; must also be included in the
            # ``fields`` list below.
            name: shortname

            # Optional:
            # See Django's QuerySet documentation for how to use .filter()
            filter:  {'kw': 'args'}

            # Required: a list of field names
            # List items will be used as arguments to the .values() method.
            # See Django's QuerySet documentation for how to use .values()
            fields:
              - field_1
              - field_2
```

This would return pillar data that would look like

```
my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2
```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```
ext_pillar:
  - django_orm:
      pillar_name: djangotutorial
      project_path: /path/to/mysite
      settings_module: mysite.settings

      django_app:
        mysite.polls:
          Choices:
            name: poll__question
            fields:
              - poll__question
              - poll__id
              - choice_text
              - votes
```

Module Documentation

salt.pillar.django_orm.**ext_pillar**(*minion_id*, *pillar*, *pillar_name*, *project_path*, *settings_module*, *django_app*, *env=None*, *env_file=None*, **args*, ***kwargs*)

Connect to a Django database through the ORM and retrieve model fields

Parameters

- **pillar_name** (*str*) -- The name of the pillar to be returned
- **project_path** (*str*) -- The full path to your Django project (the directory manage.py is in)
- **settings_module** (*str*) -- The settings module for your project. This can be found in your manage.py file
- **django_app** (*str*) -- A dictionary containing your apps, models, and fields
- **env** (*str*) -- The full path to the virtualenv for your Django project
- **env_file** (*str*) -- An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

19.12.10 salt.pillar.ec2_pillar

Retrieve EC2 instance data for minions for ec2_tags and ec2_tags_list

The minion id must be the AWS instance-id or value in `tag_match_key'. For example set `tag_match_key' to `Name', to have the minion-id matched against the tag `Name'. The tag contents must be unique. The value of tag_match_value can be `uqdn' or `asis'. if `uqdn' strips any domain before comparison.

The option use_grain can be set to True. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

The optional `tag_list_key' indicates which keys should be added to `ec2_tags_list' and be split by tag_list_sep (default ;). If a tag key is included in `tag_list_key' it is removed from ec2_tags. If a tag does not exist it is still included as an empty list.

Note: restart the salt-master for changes to take effect.

```
ext_pillar:
  - ec2_pillar:
      tag_match_key: 'Name'
      tag_match_value: 'asis'
      tag_list_key:
        - Role
      tag_list_sep: ';'
      use_grain: True
      minion_ids:
        - trusted-minion-1
        - trusted-minion-2
        - trusted-minion-3
```

This is a very simple pillar that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

`salt.pillar.ec2_pillar.`**`ext_pillar`**(*minion_id*, *pillar*, *use_grain=False*, *minion_ids=None*, *tag_match_key=None*, *tag_match_value='asis'*, *tag_list_key=None*, *tag_list_sep=';'*)

Execute a command and read the output as YAML

19.12.11 salt.pillar.etcd_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

depends

- python-etcd

In order to use an etcd server, a profile must be created in the master configuration file:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - etcd: my_etcd_config

ext_pillar:
  - etcd: my_etcd_config root=/salt
```

Using these configuration profiles, multiple etcd sources may also be used:

```
ext_pillar:
  - etcd: my_etcd_config
  - etcd: my_other_etcd_config
```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```
ext_pillar:
  - etcd: my_etcd_config root=/salt/%(minion_id)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
  - etcd: my_etcd_config root=/salt-shared
  - etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

salt.pillar.etcd_pillar.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Check etcd for all data

19.12.12 salt.pillar.file_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

Note: This is an external pillar and is subject to the *rules and constraints* governing external pillars.

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

Example `file_tree` Pillar

Master Configuration

```
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      follow_dir_links: False
      keep_newline: True

node_groups:
  internal_servers: 'L@bob,stuart,kevin'
```

Pillar Configuration

```
(salt-master) # tree /srv/ext_pillar
/srv/ext_pillar/
|-- hosts
|   |-- bob
|   |   |-- apache
|   |   |   `-- config.d
|   |   |       |-- 00_important.conf
|   |   |       `-- 20_bob_extra.conf
|   |   `-- corporate_app
|   |       `-- settings
|   |           `-- bob_settings.cfg
|   `-- kevin
|       |-- apache
|       |   `-- config.d
|       |       `-- 00_important.conf
|       `-- corporate_app
|           `-- settings
|               `-- kevin_settings.cfg
`-- nodegroups
    `-- internal_servers
        `-- corporate_app
            `-- settings
                `-- common_settings.cfg
```

Verify Pillar Data

```
(salt-master) # salt bob pillar.items
bob:
    ----------
    apache:
        ----------
        config.d:
            ----------
            00_important.conf:
                <important_config important_setting="yes" />
            20_bob_extra.conf:
                <bob_specific_cfg has_freeze_ray="yes" />
    corporate_app:
        ----------
        settings:
            ----------
            common_settings:
                // This is the main settings file for the corporate
                // internal web app
                main_setting: probably
            bob_settings:
                role: bob
```

Note: The leaf data in the example shown is the contents of the pillar files.

salt.pillar.file_tree.**ext_pillar**(*minion_id*, *pillar*, *root_dir=None*, *follow_dir_links=False*, *debug=False*, *keep_newline=False*, *render_default=None*, *renderer_blacklist=None*, *renderer_whitelist=None*, *template=False*)

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion's ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
  - file_tree:
    root_dir: /path/to/root/directory
    render_default: jinja|yaml
    renderer_blacklist:
      - gpg
    renderer_whitelist:
      - jinja
      - yaml
    template: True
```

Parameters

- **minion_id** -- The ID of the Minion whose pillar data is to be collected
- **pillar** -- Unused by the `file_tree` pillar module
- **root_dir** -- Filesystem directory used as the root for pillar data (e.g. `/srv/ext_pillar`)
- **follow_dir_links** -- Follow symbolic links to directories while collecting pillar files. Defaults to `False`.

  Warning: Care should be exercised when enabling this option as it will follow links that point outside of `root_dir`.

  Warning: Symbolic links that lead to infinite recursion are not filtered.

- **debug** -- Enable debug information at log level `debug`. Defaults to `False`. This option may be useful to help debug errors when setting up the `file_tree` pillar module.
- **keep_newline** -- Preserve the end-of-file newline in files. Defaults to `False`. This option may either be a boolean or a list of file globs (as defined by the Python fnmatch package) for which end-of-file newlines are to be kept.

  `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *`file.managed`* state.

  Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup namess underneath the `root_dir`.

```
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      keep_newline:
        - apache/config.d/*
        - corporate_app/settings/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not affected by the `keep_newline`. However, this module does not actually distinguish between binary and text files.

- **`render_default`** -- Override Salt's *`default global renderer`* for the `file_tree` pillar.

```
render_default: jinja
```

- **`renderer_blacklist`** -- Disallow renderers for pillar files.

```
renderer_blacklist:
  - json
```

- **`renderer_whitelist`** -- Allow renderers for pillar files.

```
renderer_whitelist:
  - yaml
  - jinja
```

- **`template`** -- Enable templating of pillar files. Defaults to `False`.

19.12.13 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

Configuring the Foreman ext_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
  - foreman:
      key: foreman # Nest results within this key
      only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme
```

The following options are optional:

```
foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cafile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on GitHub.

Module Documentation

salt.pillar.foreman.**ext_pillar**(*minion_id*, *pillar*, *key=None*, *only=()*)
Read pillar data from Foreman via its API.

19.12.14 salt.pillar.git_pillar

Use a git repository as a Pillar source

Note: This external pillar has been rewritten for the *2015.8.0* release. The old method of configuring this external pillar will be maintained for a couple releases, allowing time for configurations to be updated to reflect the new usage.

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since git_pillar does not have an equivalent to the *pillar_roots* parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

Important: Each branch/tag used for git_pillar must have its own top file. This is different from how the top file works when configuring *States*. The reason for this is that each git_pillar branch/tag is processed separately from the rest. Therefore, if the qa branch is to be used for git_pillar, it would need to have its own top file, with the qa environment defined within it, like this:

```
qa:
  'dev-*':
    - bar
```

Additionally, while git_pillar allows for the branch/tag to be overridden (see *here*, or *here* for Salt releases before 2015.8.0), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a git_pillar top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in git_pillar are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

Configuring git_pillar for Salt releases before 2015.8.0

Note: This legacy configuration for git_pillar will no longer be supported as of the **Oxygen** release of Salt.

For Salt releases earlier than *2015.8.0*, GitPython is the only supported provider for git_pillar. Individual repositories can be configured under the *ext_pillar* configuration parameter like so:

```
ext_pillar:
  - git: master https://gitserver/git-pillar.git root=subdirectory
```

The repository is specified in the format `<branch> <repo_url>`, with an optional `root` parameter (added in the *2014.7.0* release) which allows the pillar SLS files to be served up from a subdirectory (similar to *gitfs_root* in gitfs).

To use more than one branch from the same repo, multiple lines must be specified under *ext_pillar*:

```
ext_pillar:
  - git: master https://gitserver/git-pillar.git
  - git: dev https://gitserver/git-pillar.git
```

To remap a specific branch to a specific Pillar environment, use the format `<branch>:<env>`:

```
ext_pillar:
  - git: develop:dev https://gitserver/git-pillar.git
  - git: master:prod https://gitserver/git-pillar.git
```

In this case, the `develop` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

The `master` branch would need its own `top.sls` with a `prod` section in it:

```
prod:
  '*':
    - bar
```

If `__env__` is specified as the branch name, then git_pillar will first look at the minion's *environment* option. If unset, it will fall back to using branch specified by the master's *gitfs_base*:

```
ext_pillar:
  - git: __env__ https://gitserver/git-pillar.git root=pillar
```

The corresponding Pillar top file would look like this:

```
{{saltenv}}:
  '*':
    - bar
```

Note: This feature was unintentionally omitted when git_pillar was rewritten for the 2015.8.0 release. It was added again in the 2016.3.4 release, but it has changed slightly in that release. On Salt masters running 2015.8.0 through 2016.3.3, this feature can only be accessed using the legacy config described above. For 2016.3.4 and later, refer to explanation of the `__env__` parameter in the below section.

Versions 2016.3.0 through 2016.3.4 incorrectly check the *master's* `environment` config option (instead of the minion's) before falling back to *gitfs_base*. This has been fixed in the 2016.3.5 and 2016.11.1 releases (2016.11.0 contains the incorrect behavior).

Additionally, in releases before 2016.11.0, both `{{env}}` and `{{saltenv}}` could be used as a placeholder for the environment. Starting in 2016.11.0, `{{env}}` is no longer supported.

Configuring git_pillar for Salt releases 2015.8.0 and later

Note: In version 2015.8.0, the method of configuring git external pillars has changed, and now more closely resembles that of the *Git Fileserver Backend*. If Salt detects the old configuration schema, it will use the pre-2015.8.0 code to compile the external pillar. A warning will also be logged.

Beginning with Salt version 2015.8.0, pygit2 is now supported in addition to GitPython. The requirements for GitPython and pygit2 are the same as for GitFS, as described *here*.

Important: git_pillar has its own set of global configuration parameters. While it may seem intuitive to use the global gitfs configuration parameters (`gitfs_base`, etc.) to manage git_pillar, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in git_pillar it is necessary to specify which branch/tag to be used for git_pillar remotes. This is the reverse behavior from gitfs, where branches/tags make up your environments.

See *here* for documentation on the git_pillar configuration options and their usage.

Here is an example git_pillar configuration:

```
ext_pillar:
  - git:
    # Use 'prod' instead of the branch name 'production' as the environment
    - production https://gitserver/git-pillar.git:
      - env: prod
    # Use 'dev' instead of the branch name 'develop' as the environment
    - develop https://gitserver/git-pillar.git:
      - env: dev
    # No per-remote config parameters (and no trailing colon), 'qa' will
    # be used as the environment
    - qa https://gitserver/git-pillar.git
    # SSH key authentication
    - master git@other-git-server:pillardata-ssh.git:
      # Pillar SLS files will be read from the 'pillar' subdirectory in
      # this repository
      - root: pillar
      - privkey: /path/to/key
      - pubkey: /path/to/key.pub
      - passphrase: CorrectHorseBatteryStaple
    # HTTPS authentication
    - master https://other-git-server/pillardata-https.git:
      - user: git
      - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring git_pillar is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to *gitfs*), and global versions of the git_pillar configuration parameters can also be set. To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
  - git:
    - production https://gitserver/git-pillar.git:
      - env: prod
```

If `__env__` is specified as the branch name, then git_pillar will decide which branch to use based on the following criteria:

- If the minion has a *pillarenv* configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's *git_pillar_base* will be used.

Note: The use of *environment* to choose the pillar environment dates from a time before the *pillarenv* parameter was added. In a future release, it will be ignored and either the minion's *pillarenv* or the master's *git_pillar_base* will be used.

Here's an example of using `__env__` as the git_pillar environment:

```
ext_pillar:
  - git:
    - __env__ https://gitserver/git-pillar.git:
      - root: pillar
```

The corresponding Pillar top file would look like this:

```
{{saltenv}}:
  '*':
    - bar
```

Note: This feature was unintentionally omitted when git_pillar was rewritten for the 2015.8.0 release. It was added again in the 2016.3.4 release, but it has changed slightly in that release. The fallback value replaced by `{{env}}` is :conf_master: is *git_pillar_base*, while the legacy config's version of this feature replaces `{{env}}` with *gitfs_base*.

On Salt masters running 2015.8.0 through 2016.3.3, this feature can only be accessed using the legacy config in the previous section of this page.

The same issue which affected the behavior of the minion's *environment* config value using the legacy configuration syntax (see the documentation in the pre-2015.8.0 section above for the legacy support of this feature) also affects the new-style git_pillar syntax in version 2016.3.4. This has been corrected in version 2016.3.5 and 2016.11.1 (2016.11.0 contains the incorrect behavior).

2016.3.4 incorrectly checks the *master's* `environment` config option (instead of the minion's) before falling back to the master's *git_pillar_base*.

Additionally, in releases before 2016.11.0, both `{{env}}` and `{{saltenv}}` could be used as a placeholder for the environment. Starting in 2016.11.0, `{{env}}` is no longer supported.

With the addition of pygit2 support, git_pillar can now interact with authenticated remotes. Authentication works just like in gitfs (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authenication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. *git_pillar_pubkey*, *git_pillar_privkey*, *git_pillar_passphrase*, etc.).

Note: The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git` ext_pillar configuration. Consider the following:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

ext_pillar:
  - etcd: my_etcd_config
  - git:
    - master https://mydomain.tld/foo.git:
      - root: pillar
    - master https://mydomain.tld/bar.git
    - master https://mydomain.tld/baz.git
    - dev https://mydomain.tld/qux.git
  - git:
    - master https://mydomain.tld/abc.git
    - dev https://mydomain.tld/123.git
```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each ext_pillar is called separately from the others. So, in the above example, the `etcd` ext_pillar will be evaluated first, with the first group of git_pillar remotes evaluated next (and merged into the etcd pillar data). Lastly, the second group of git_pillar remotes will be evaluated, and then merged into the ext_pillar data evaluated before it.
2. Within a single group of git_pillar remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

   Note: Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of git_pillar remotes, the top file and pillar SLS files in the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a *`pillarenv`* in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that pillarenv. A pillarenv can also be specified for a given minion or set of minions when *`running states`*, by using he `pillarenv` argument. The CLI pillarenv will override one set in the minion config file. So, assuming that a pillarenv of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way

to get its pillar data would be to specify a pillarenv of `dev`, which would mean that it would then ignore any items from the `base` pillarenv. A more detailed explanation of pillar environments can be found *here*.

Moving on to point #3, and looking at the example ext_pillar configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced by the `bar` remote's top file will first be looked for in the `bar` remote, followed by `foo`, and `baz`, and when the `baz` remote is processed, SLS files will be looked for in `baz`, followed by `foo` and `bar`. This ``failover'' logic is called a *directory overlay*, and it is also used by *`file_roots`* and :conf_minion`pillar_roots`. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of git_pillar remotes having access to files in other repos which share the same environment can be disabled by setting *`git_pillar_includes`* to `False`. If this is done, then all git_pillar remotes will only have access to their own SLS files. Another way of ensuring that a git_pillar remote will not have access to SLS files from other git_pillar remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of git_pillar remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following ext_pillar configuration (assuming that *`git_pillar_includes`* has not been set to `False`):

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
    - master https://mydomain.tld/pillar-nginx.git
    - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third git_pillar remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like gitfs, git_pillar now supports a ``mountpoint'' feature. Using the following ext_pillar configuration, the SLS files in the second and third git_pillar remotes can be placed in the root of the git repository:

```
ext_pillar:
  - git:
    - master https://mydomain.tld/pillar-common.git
```

```
    - master https://mydomain.tld/pillar-nginx.git:
      - mountpoint: web/server/
    - master https://mydomain.tld/pillar-appdata.git:
      - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

Note:

- Leading and trailing slashes on the mountpoints are optional.
- Use of the `mountpoint` feature requires that *`git_pillar_includes`* is not disabled.
- Content from mounted git_pillar repos can only be referenced by a top file in the same pillar environment.

`salt.pillar.git_pillar.`**`ext_pillar`**(*minion_id*, *repo*, *pillar_dirs*)
Checkout the ext_pillar sources and compile the resulting pillar SLS

19.12.15 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```
ext_pillar:
  - stack: /path/to/stack.cfg
  - gpg: {}
```

Set `gpg_keydir` in your config to adjust the homedir the renderer uses.

`salt.pillar.gpg.`**`ext_pillar`**(*minion_id*, *pillar*, **args*, ***kwargs*)

19.12.16 salt.pillar.hg_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for hgfs_ so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```
ext_pillar:
  - hg: ssh://hg@example.co/user/repo
```

class `salt.pillar.hg_pillar.`**`Repo`**(*repo_uri*)
Deal with remote hg (mercurial) repository for Pillar

`close`()
Cleanup mercurial command server

`update`(*branch='default'*)
Ensure we are using the latest revision in the hg repository

salt.pillar.hg_pillar.**ext_pillar**(*minion_id*, *pillar*, *repo*, *branch='default'*, *root=None*)
Extract pillar from an hg repository

salt.pillar.hg_pillar.**update**(*repo_uri*)
Execute an hg pull on all the repos

19.12.17 salt.pillar.hiera

Use hiera data as a Pillar source

salt.pillar.hiera.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Execute hiera and return the data

19.12.18 salt.pillar.http_json module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_JSON ext_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
  - http_json:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

Module Documentation

salt.pillar.http_json.**ext_pillar**(*minion_id*, *pillar*, *url=None*)
Read pillar data from HTTP response.

:param url String to make request :returns dict with pillar data to add :returns empty if error

19.12.19 salt.pillar.http_yaml module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_YAML ext_pillar

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
  - http_yaml:
      url: http://example.com/api/minion_id
      ::TODO::
      username: username
      password: password
```

Module Documentation

salt.pillar.http_yaml.**ext_pillar**(*minion_id*, *pillar*, *url*)
Read pillar data from HTTP response.

:param url String to make request :returns dict with pillar data to add :returns empty if error

19.12.20 salt.pillar.libvirt

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

depends certtool

salt.pillar.libvirt.**ext_pillar**(*minion_id*, *pillar*, *command*)
Read in the generated libvirt keys

salt.pillar.libvirt.**gen_hyper_keys**(*minion_id*, *country='US'*, *state='Utah'*, *locality='Salt Lake City'*, *organization='Salted'*)
Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

19.12.21 salt.pillar.makostack module

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack `ext_pillar` is a direct ripoff of the `stack' ext_pillar, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- all these rendered files are then parsed as `yaml`.
- then all yaml dicts are merged in order, with support for the following. merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`.
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments.

Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure MakoStack in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
  - makostack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
  - makostack:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
```

Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
  - makostack:
      pillar:environment:
        dev: /path/to/dev/stack.cfg
        prod: /path/to/prod/stack.cfg
      grains:custom:grain:
        value:
          - /path/to/stack1.cfg
          - /path/to/stack2.cfg
      opts:custom:opt:
        value: /path/to/stack0.cfg
```

Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining ``graft points'' on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```
foo:
  - bar
  - baz
```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```
yummy:
  fur:
    foo:
      - bar
      - baz
```

MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these `yaml` files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with `/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/%{ __grains__['osarch'] }}.yml
oscodenames/%{ __grains__['oscodename'] }.yml
% for role in pillar.get('roles', []):
roles/%{ role }.yml
% endfor
minions/%{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── osarchs/
|   ├── amd64.yml
|   └── armhf.yml
├── oscodenames/
|   ├── wheezy.yml
|   └── jessie.yml
├── roles/
|   ├── web.yml
|   └── db.yml
└── minions/
    ├── test-1-dev.yml
    └── test-2-dev.yml
```

Overall process

In the above MakoStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- core.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of yaml files:

- stack: the MakoStack pillar data object that has currently been merged (data from previous yaml files in MakoStack configuration)
- pillar: the pillar data (as passed by Salt to our ext_pillar function)
- minion_id: the minion id ;-)
- __opts__: a dictionary of mostly Salt configuration options
- __grains__: a dictionary of the grains of the minion making this pillar call
- __salt__: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous yaml files in MakoStack configuration) through the stack variable.

Once a yaml file has been preprocessed by mako, we obtain a Python dict - let's call it yml_data - then, MakoStack will merge this yml_data dict in the main stack dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge yml_data in stack (similarly to the recurse salt pillar_source_merging_strategy), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the stack dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack ext_pillar returns the stack dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new yaml_data dict is merged with the existing stack data can be controlled by specifying a merging strategy. Right now this strategy can either be merge-last (the default), merge-first, remove, or overwrite.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the overwrite strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

merge-last (default) strategy

If the merge-last strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the recurse salt pillar_source_merging_strategy). This allows for extending previously defined data.

`merge-first` strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

`remove` strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

`overwrite` strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

`stack`	`yaml_data`	`stack` (after merge)

`users:`
`  tom:`
`  uid: 500`
`  roles:`
`  - sysadmin`
`  root:`
`  uid: 0`
	`users:`
	`  tom:`
	`  uid: 1000`
	`  roles:`
	`  - developer`
	`  mat:`
	`  uid: 1001`
		`users:`
		`  tom:`
		`  uid: 1000`
		`  roles:`
		`  - sysadmin`
		`  - developer`
		`  mat:`
		`  uid: 1001`
		`  root:`
		`  uid: 0`

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: merge-last
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 1000
		  roles:
		  - sysadmin
		  - developer
		  mat:
		  uid: 1001
		  root:
		  uid: 0

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: merge-first
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 500
		  roles:
		  - developer
		  - sysadmin
		  mat:
		  uid: 1001
		  root:
		  uid: 0

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: remove
	  tom:
	  mat:
		users:
		  root:
		  uid: 0

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: overwrite
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 1000
		  roles:
		  - developer
		  mat:
		  uid: 1001

You can also select a custom merging strategy using a __ object in a list:

stack	yaml_data	stack (after merge)
users: - tom - root	users: - __: merge-last - mat	users: - tom - root - mat
users: - tom - root	users: - __: merge-first - mat	users: - mat - tom - root
users: - tom - root	users: - __: remove - mat - tom	users: - root
users: - tom - root	users: - __: overwrite - mat	users: - mat

salt.pillar.makostack.**ext_pillar**(*minion_id*, *pillar*, **args*, ***kwargs*)

19.12.22 salt.pillar.mongo

Read Pillar data from a mongodb collection

depends pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as *salt.returners.mongo_return*. These variables go in your master config file.

- mongo.db - The mongo database to connect to. Defaults to 'salt'.
- mongo.host - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- mongo.port - The port that the mongo database is running on. Defaults to 27017.
- mongo.user - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- mongo.password - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

Configuring the Mongo ext_pillar

The Mongo ext_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for

yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields:
↪[customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

Module Documentation

`salt.pillar.mongo.`**`ext_pillar`**(*minion_id*, *pillar*, *collection='pillar'*, *id_field='_id'*, *re_pattern=None*, *re_replace=''*, *fields=None*)

Connect to a mongo database and read per-node pillar information.

Parameters

- **`collection`** (***) -- The mongodb collection to read data from. Defaults to `'pillar'`.
- **`id_field`** (***) -- The field in the collection that represents an individual minion id. Defaults to `'_id'`.
- **`re_pattern`** (***) -- If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re_pattern* will be used to match the name, and *re_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **`re_replace`** (***) -- Use as the replacement value in node ids matched with *re_pattern*. Defaults to ''. Feel free to use backreferences here.
- **`fields`** (***) -- The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

19.12.23 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the sql_base ext_pillar for MySQL.

maturity new

depends python-mysqldb

platform all

Configuring the mysql ext_pillar

Use the `mysql' key under ext_pillar for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

Complete example

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'
  port: 3306
  ssl:
    cert: /etc/mysql/client-cert.pem
    key: /etc/mysql/client-key.pem

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                  FROM some_random_table
                 WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.mysql.**MySQLExtPillar**

This class receives and processes the database rows from MySQL.

extract_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.**ext_pillar**(*minion_id*, *pillar*, **args*, ***kwargs*)

Execute queries against MySQL, merge and return as a dict

19.12.24 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

depends

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my openstack_config:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.region_name: 'RegionOne'
  keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
  - neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
  - neutron: my_openstack_config
  - neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

ext_pillar:

- neutron: my_openstack_config neutron_networks

`salt.pillar.neutron.`**`ext_pillar`**(*minion_id*, *pillar*, *conf*)

Check neutron for all data

19.12.25 salt.pillar.nodegroups

Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of *nodegroups* which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

Command Line

```
salt-call pillar.get nodegroups
local:
    - class_infra
    - colo_sj
    - state_active
    - country_US
    - type_saltmaster
```

Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
  - nodegroups:
      pillar_name: 'nodegroups'
```

`salt.pillar.nodegroups.`**`ext_pillar`**(*minion_id*, *pillar*, *pillar_name=None*)

A salt external pillar which provides the list of nodegroups of which the minion is a member.

Parameters

- **`minion_id`** -- used for compound matching nodegroups
- **`pillar`** -- provided by salt, but not used by nodegroups ext_pillar
- **`pillar_name`** -- optional name to use for the pillar, defaults to `nodegroups'

Returns a dictionary which is included by the salt master in the pillars returned to the minion

19.12.26 salt.pillar.pepa

Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

Configuring Pepa

```
extension_modules: /srv/salt/ext

ext_pillar:
  - pepa:
      resource: host                # Name of resource directory and sub-key in pillars
      sequence:                     # Sequence used for hierarchical substitution
        - hostname:                 # Name of key
            name: input             # Alias used for template directory
            base_only: True         # Only use templates from Base environment, i.e. no
 ↪staging
        - default:
        - environment:
        - location..region:
            name: region
        - location..country:
            name: country
        - location..datacenter:
            name: datacenter
        - roles:
        - osfinger:
            name: os
        - hostname:
            name: override
            base_only: True
      subkey: True                  # Create a sub-key in pillars, named after the
 ↪resource in this case [host]
      subkey_only: True             # Only create a sub-key, and leave the top level
 ↪untouched

pepa_roots:                         # Base directory for each environment
  base: /srv/pepa/base              # Path for base environment
  dev: /srv/pepa/base               # Associate dev with base
  qa: /srv/pepa/qa
  prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since some keys
 ↪may use '.' in the name
#pepa_delimiter: ..

# Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
#  environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
#  saltversion: 0.17.4

# Enable debug for Pepa, and keep Salt on warning
#log_level: debug
```

```
#log_granular_levels:
#  salt: warning
#  salt.loaded.ext.pillar.pepa: debug
```

Pepa can also be used in Master-less SaltStack setup.

Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
               hostname

positional arguments:
  hostname              Hostname

optional arguments:
  -h, --help            show this help message and exit
  -c CONFIG, --config CONFIG
                        Configuration file
  -d, --debug           Print debug info
  -g GRAINS, --grains GRAINS
                        Input Grains as YAML
  -p PILLAR, --pillar PILLAR
                        Input Pillar as YAML
  -n, --no-color        No color output
  -v, --validate        Validate output
```

Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test_example_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
  - salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
network..interfaces..eth0..netmask: 255.255.255.0
network..interfaces..eth0..fqdn: {{ hostname }}
cobbler..profile: fedora-19-x86_64
```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
```

```
time..ntp..servers:
  - ntp1.amer.example.com
  - ntp2.amer.example.com
  - ntp3.amer.example.com
time..timezone: America/Chihuahua
yum..mirror: yum.amer.example.com
```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

Example:

osfinger: Fedora-19

Would become:

fedora_19.yaml

Nested dictionaries

In order to create nested dictionaries as output you can use double dot ".." as a delimiter. You can change this using ``pepa_delimiter'' we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

Example:

```
network..dns..servers:
  - 10.0.0.1
  - 10.0.0.2
network..dns..options:
  - timeout:2
  - attempts:1
  - ndots:1
network..dns..search:
  - example.com
```

Would become:

```
network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1
      - ndots:1
    search:
      - example.com
```

Operators

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
merge()	Merge list or hash
unset()	Unset key
immutable()	Set the key as immutable, so it can't be changed
imerge()	Set immutable and merge
iunset()	Set immutable and unset

Example:

```
network..dns..search..merge():
  - foobar.com
  - dummy.nl
owner..immutable(): Operations
host..printers..unset():
```

Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <https://github.com/nicolaiarocci/cerberus>.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
  type: boolean

network..interfaces..{{ interface }}..fqdn:
```

```
  type: string
  regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
  type: string
  regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{{ interface }}..netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}
```

19.12.27 salt.pillar.pillar_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

Configuring the LDAP ext_pillar

The basic configuration is part of the master configuration.

```
ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

Note: When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the salt-master process will attempt to parse its content.

Warning: Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

Configuring the LDAP searches

The file is processed using *Salt's Renderers <renderers>* which makes it possible to reference grains within the configuration.

Warning: When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the `id' grain which is verified through the minion's key/cert.

Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- filtering for: - members of the group `it-admins` - objects with `objectclass=user`
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

Configuration

```
salt-users:
  server:    ldap.company.tld
  port:      389
  tls:       true
  dn:        'dc=company,dc=tld'
  binddn:    'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw:    bi7ieBai5Ano
  referrals: false
  anonymous: false
  mode:      map
  dn:        'ou=users,dc=company,dc=tld'
  filter:    '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
  attrs:
    - cn
    - displayName
    - givenName
    - sn
  lists:
    - memberOf

search_order:
  - salt-users
```

Result

```
{
    'salt-users': [
        {
            'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',
            'displayName': 'John Doe'
            'givenName': 'John'
            'sn': 'Doe'
            'memberOf': [
              'cn=it-admins,ou=groups,dc=company,dc=tld',
              'cn=team01,ou=groups,dc=company'
            ]
        },
        {
            'cn': 'cn=janedoe,ou=users,dc=company,dc=tld',
            'displayName': 'Jane Doe',
            'givenName': 'Jane',
            'sn': 'Doe',
            'memberOf': [
              'cn=it-admins,ou=groups,dc=company,dc=tld',
              'cn=team02,ou=groups,dc=company'
            ]
        }
    ]
}
```

salt.pillar.pillar_ldap.**ext_pillar**(*minion_id*, *pillar*, *config_file*)
Execute LDAP searches and return the aggregated data

19.12.28 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

maturity new

depends psycopg2

platform all

Complete example

```
postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                  FROM some_random_table
                 WHERE minion_pattern LIKE %s'
        depth: 5
```

```
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.postgres.**POSTGRESExtPillar**
This class receives and processes the database rows from POSTGRES.

extract_queries(*args*, *kwargs*)
This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.postgres.**ext_pillar**(*minion_id*, *pillar*, **args*, ***kwargs*)
Execute queries against POSTGRES, merge and return as a dict

19.12.29 salt.pillar.puppet

Execute an unmodified puppet_node_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

salt.pillar.puppet.**ext_pillar**(*minion_id*, *pillar*, *command*)
Execute an unmodified puppet_node_classifier and read the output as YAML

19.12.30 salt.pillar.reclass_adapter

Use the ``reclass'' database as a Pillar source

This `ext_pillar` plugin provides access to the **reclass** database, such that Pillar data for a specific minion are fetched using **reclass**.

You can find more information about **reclass** at http://reclass.pantsfullofunix.net.

To use the plugin, add it to the `ext_pillar` list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
ext_pillar:
    - reclass:
        storage_type: yaml_fs
        inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in `/srv/salt/nodes` and `/srv/salt/classes`.

If you are also using **reclass** as `master_tops` plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for `ext_pillar` and `master_tops`):

```
reclass: &reclass
    storage_type: yaml_fs
    inventory_base_uri: /srv/salt
    reclass_source_path: ~/code/reclass

ext_pillar:
    - reclass: *reclass

master_tops:
    reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

salt.pillar.reclass_adapter.**ext_pillar**(*minion_id*, *pillar*, ***kwargs*)
Obtain the Pillar data from **reclass** for the given `minion_id`.

19.12.31 salt.pillar.redismod

Read pillar data from a Redis backend

New in version 2014.7.0.

depends

- redis Python module (on master)

Salt Master Redis Configuration

The module shares the same base Redis connection variables as *salt.returners.redis_return*. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to `0`.
- `redis.host` - The Redis host to connect to. Defaults to `'salt'`.
- `redis.port` - The port that the Redis database is listening on. Defaults to `6379`.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to `None`.

Configuring the Redis ext_pillar

```
ext_pillar:
  - redis: {function: key_value}
```

salt.pillar.redismod.**ext_pillar**(*minion_id*, *pillar*, *function*, ***kwargs*)
Grabs external pillar data based on configured function

salt.pillar.redismod.**key_json**(*minion_id*, *pillar*, *pillar_key=None*)
Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar_key is not set.
pillar_key Pillar key to return data into

salt.pillar.redismod.**key_value**(*minion_id*, *pillar*, *pillar_key='redis_pillar'*)
Looks for key in redis matching minion_id, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.
pillar_key Pillar key to return data into

19.12.32 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```
ext_pillar:
  - s3:
      bucket: my.fancy.pillar.bucket
      keyid: KASKFJWAKJASJKDAJKSD
```

```
      key: ksladfDLKDALSFKSD93q032sdDasdfasdflsadkf
      multiple_env: False
      environment: base
      prefix: somewhere/overthere
      verify_ssl: True
      service_url: s3.amazonaws.com
      kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
      s3_cache_expire: 30
      s3_sync_on_update: True
      path_style: False
      https_enable: True
```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to False. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `base'. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if multiple_env is True.

The `prefix` defaults to `'. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when multiple_env is True or False. Essentially it tells ext_pillar to look for your pillar data in a `subdirectory' of your S3 bucket

The `verify_ssl` parameter defaults to True. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to False else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `s3.amazonaws.com'. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to True. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to False. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to True. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the *prefix=* parameter and specify one entry in ext_pillar for each environment rather than specifying multiple_env. This is due to issue #22471 (https://github.com/saltstack/salt/issues/22471)

salt.pillar.s3.**ext_pillar**(*minion_id*, *pillar*, *bucket*, *key=None*, *keyid=None*, *verify_ssl=True*, *location=None*, *multiple_env=False*, *environment='base'*, *prefix=''*, *service_url=None*, *kms_keyid=None*, *s3_cache_expire=30*, *s3_sync_on_update=True*, *path_style=False*, *https_enable=True*)

Execute a command and read the output as YAML

19.12.33 salt.pillar.sql_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an ext_pillar. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

maturity new

platform all

Theory of sql_base ext_pillar

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys ``query'' and ``depth'' as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

Configuring a sql_base ext_pillar

The sql_base ext_pillar cannot be used directly, but shares query configuration with its implementations. These examples use a fake `sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
  - sql_base:
      - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
  - sql_base:
      main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```
ext_pillar:
  - sql_base:
      - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
        2
```

Or as a mapping

```
ext_pillar:
  - sql_base:
      - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
        depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {``b'': b, ``c'': c, ``d'': d}}
- With depth 2: {a: {b: {``c'': c, ``d'': d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The ignore_null option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```
ext_pillar:
  - sql_base:
      - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
↪minion_id != %s"
        depth: 2
      - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
        depth: 2
        ignore_null: True
```

If you specify *as_list: True* in the mapping expression it will convert collisions to lists.

If you specify *with_lists: `...'* in the mapping expression it will convert the specified depths to list. The string `1,3' will result in:

```
a,b,c,d,e,1  # field 1 same, field 3 differs
a,b,c,f,g,2  # ^^^^
a,z,h,y,j,3  # field 1 same, field 3 same
a,z,h,y,k,4  # ^^^^
  ^   ^
```

These columns define list grouping

```
{a: [
      {c: [
          {e: 1},
          {g: 2}
          ]
      },
      {h: [
          {j: 3, k: 4 }
```

```
          ]
      }
]}
```

The range for with_lists is 1 to number_of_fields, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your minion_id is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

More complete example for MySQL (to also show configuration)

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                  FROM some_random_table
                 WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.sql_base.**SqlBaseExtPillar**

This class receives and processes the database rows in a database agnostic way.

enter_root(*root*)

Set self.focus for kwarg queries

extract_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

fetch(*minion_id*, *pillar*, **args*, ***kwargs*)

Execute queries, merge and return as a dict.

process_fields(*field_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

process_results(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

19.12.34 salt.pillar.sqlcipher module

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql_base ext_pillar for SQLCipher.

maturity new

depends pysqlcipher (for py2) or pysqlcipher3 (for py3)

platform all

Configuring the sqlcipher ext_pillar

Use the `sqlcipher' key under ext_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:
  database: /var/lib/salt/pillar-sqlcipher.db
  pass: strong_pass_phrase
  timeout: 5.0
```

Complete example

```
sqlcipher:
  database: '/var/lib/salt/pillar-sqlcipher.db'
  pass: strong_pass_phrase
  timeout: 5.0

ext_pillar:
  - sqlcipher:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                  FROM some_random_table
                 WHERE minion_pattern LIKE ?'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.sqlcipher.**SQLCipherExtPillar**
This class receives and processes the database rows from SQLCipher.

salt.pillar.sqlcipher.**ext_pillar**(*minion_id*, *pillar*, **args*, ***kwargs*)
Execute queries against SQLCipher, merge and return as a dict

19.12.35 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

`sqlite3` is included in the stdlib since Python 2.5.

This module is a concrete implementation of the sql_base ext_pillar for SQLite3.

platform all

Configuring the sqlite3 ext_pillar

Use the `sqlite3' key under ext_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

Complete Example

```
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                  FROM some_random_table
                 WHERE minion_pattern LIKE ?'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class `salt.pillar.sqlite3.`**`SQLite3ExtPillar`**

This class receives and processes the database rows from SQLite3.

`salt.pillar.sqlite3.`**`ext_pillar`**(*minion_id*, *pillar*, **args*, ***kwargs*)

Execute queries against SQLite3, merge and return as a dict

19.12.36 salt.pillar.stack

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

PillarStack is a custom saltstack `ext_pillar` which was inspired by varstack but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: https://github.com/bbinet/pillarstack/issues

It supports the following features:

- multiple config files that are jinja2 templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)

- this list of files are read in ordered as jinja2 templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects
- all these rendered files are then parsed as `yaml`
- then all yaml dicts are merged in order with support for the following merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments

Installation

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.

Installing the PillarStack `ext_pillar` is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules` is set in your salt-master configuration, see: http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules

Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure PillarStack in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
  - stack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
  - stack:
      - /path/to/stack1.cfg
      - /path/to/stack2.cfg
```

Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
  - stack:
      pillar:environment:
        dev: /path/to/dev/stack.cfg
        prod: /path/to/prod/stack.cfg
      grains:custom:grain:
        value:
          - /path/to/stack1.cfg
          - /path/to/stack2.cfg
      opts:custom:opt:
        value: /path/to/stack0.cfg
```

PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

The path of these `yaml` files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module <https://docs.python.org/2/library/glob.html>*.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── common/
|   ├── xxx.yml
|   └── yyy.yml
├── osarchs/
|   ├── amd64.yml
```

```
|   └── armhf.yml
├── oscodenames/
|   ├── wheezy.yml
|   └── jessie.yml
├── roles/
|   ├── web.yml
|   └── db.yml
└── minions/
    ├── test-1-dev.yml
    └── test-2-dev.yml
```

Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- `core.yml`
- `common/xxx.yml`
- `common/yyy.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of `yaml` files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous `yaml` files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous `yaml` files in PillarStack configuration) through the `stack` variable.

Once a `yaml` file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yml_data` - then, PillarStack will merge this `yml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yml_data` in `stack` (similarly to the `recurse` salt `pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yaml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

`merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse` salt `pillar_source_merging_strategy`). This allows for extending previously defined data.

`merge-first` strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

`remove` strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

`overwrite` strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 1000
		  roles:
		  - sysadmin
		  - developer
		  mat:
		  uid: 1001
		  root:
		  uid: 0

Then you can select a custom merging strategy using the __ key in a dict:

stack	yaml_data	stack (after merge)

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: merge-last
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 1000
		  roles:
		  - sysadmin
		  - developer
		  mat:
		  uid: 1001
		  root:
		  uid: 0

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: merge-first
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 500
		  roles:
		  - developer
		  - sysadmin
		  mat:
		  uid: 1001
		  root:
		  uid: 0

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: remove
	  tom:
	  mat:
		users:
		  root:
		  uid: 0

users:
  tom:
  uid: 500
  roles:
  - sysadmin
  root:
  uid: 0
	users:
	  __: overwrite
	  tom:
	  uid: 1000
	  roles:
	  - developer
	  mat:
	  uid: 1001
		users:
		  tom:
		  uid: 1000
		  roles:
		  - developer
		  mat:
		  uid: 1001

You can also select a custom merging strategy using a __ object in a list:

stack	yaml_data	stack (after merge)
users: - tom - root	users: - __: merge-last - mat	users: - tom - root - mat
users: - tom - root	users: - __: merge-first - mat	users: - mat - tom - root
users: - tom - root	users: - __: remove - mat - tom	users: - root
users: - tom - root	users: - __: overwrite - mat	users: - mat

19.12.37 salt.pillar.svn_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
  - svn: trunk svn://svnserver/repo root=subdirectory
```

The *root=* parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the *`pillar_roots`* parameter. The branch referenced in the *`ext_pillar`* entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
  '*':
    - foo
```

To use other environments from the same SVN repo as svn_pillar sources, just add additional lines, like so:

```
ext_pillar:
  - svn: trunk svn://svnserver/repo
  - svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:
  '*':
    - bar
```

class salt.pillar.svn_pillar.**SvnPillar**(*branch*, *repo_location*, *root*, *opts*)
Deal with the remote SVN repository for Pillar

pillar_dir()
Returns the directory of the pillars (repo cache + branch + root)

salt.pillar.svn_pillar.**ext_pillar**(*minion_id*, *pillar*, *repo_string*)
Execute a command and read the output as YAML

19.12.38 salt.pillar.varstack_pillar

Use Varstack data as a Pillar source

Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:
  - varstack: /etc/varstack.yaml
```

Varstack will then use /etc/varstack.yaml to determine which configuration data to return as pillar information. From there you can take a look at the README of varstack on how this file is evaluated.

salt.pillar.varstack_pillar.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Parse varstack data and return the result

19.12.39 salt.pillar.vault module

Vault Pillar Module

maintainer SaltStack

maturity New

platform all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the *execution module docs*. Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext_pillar section in the Salt master configuration.

```
ext_pillar:
  - vault: path=secret/salt
```

Each key needs to have all the key-value pairs with the names you require. Avoid naming every key `password' as you they will collide:

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, `auth` and `master`.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

```
ext_pillar:
  - vault: path=secret/salt
  - vault: path=secret/root
```

salt.pillar.vault.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Get pillar data from Vault for the configuration `conf`.

19.12.40 salt.pillar.venafi module

Venafi Pillar Certificates

This module will only return pillar data if the `venafi` runner module has already been used to create certificates.

To configure this module, set `venafi` to `True` in the `ext_pillar` section of your `master` configuration file:

```
ext_pillar:
  - venafi: True
```

salt.pillar.venafi.**ext_pillar**(*minion_id*, *pillar*, *conf*)
Return an existing set of certificates

19.12.41 salt.pillar.virtkey

Accept a key from a hypervisor if the virt runner has already submitted an authorization request

salt.pillar.virtkey.**ext_pillar**(*hyper_id*, *pillar*, *name*, *key*)
Accept the key for the VM on the hyper, if authorized.

19.12.42 salt.pillar.vmware_pillar module

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

depends

- pyVmomi

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the `os' or `virtual' grain are not `VMWare', `ESXi', or `VMWare ESXi'.

Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the `vmware' pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

Configuring the VMWare pillar

The required minimal configuration in the salt master ext_pillar setup:

```
ext_pillar:
    - vmware:
        host: <vcenter/esx host>
        username: <user to connect with>
        password: <password>
```

Optionally, the following keyword arguments can be passed to the ext_pillar for customized configuration:

pillar_key Optionally set the pillar key to return the data into. Default is `vmware`.

protocol Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is `443`.

property_name Property name to match the minion id against. Defaults to `name`.

property_types Optionally specify a list of pyVmomi vim types to search for the minion id in `property_name'. Default is `['VirtualMachine']`.

For example, to search both vim.VirtualMachine and vim.HostSystem object types:

```
ext_pillar:
    - vmware:
        host: myesx
        username: root
        password: complex_password
        property_types:
          - VirtualMachine
          - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

Note: Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.

```
ext_pillar:
    - vmware:
        host: myvcenter
        username: my_user
        password: my_pass
        replace_default_attributes: True
        property_types:
```

```
          - VirtualMachine:
              - config:
                 - bootOptions:
                     - bootDelay
                     - bootRetryDelay
          - HostSystem:
              - datastore:
                 - name
```

The above ext_pillar example would return a pillar like the following for a VirtualMachine object that's name matched the minion id:

```
vmware:
  config:
    bootOptions:
      bootDelay: 1000
      bootRetryDelay: 1000
```

If you were to retrieve these virtual machine attributes via pyVmomi directly, this would be the same as

```
vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptionis.bootRetryDelay
```

The above ext_pillar example would return a pillar like the following for a HostySystem object that's name matched the minion id:

```
vmware:
  datastore:
     - name: Datastore1
     - name: Datastore2
```

The `datastore' property of a HostSystem object is a list of datastores, thus a list is returned.

replace_default_attributes If custom attributes are specified by the property_types parameter, replace_default_attributes determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is `False'.

Note: vCenter ``Custom Attributes'' (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

---

salt.pillar.vmware_pillar.**ext_pillar**(*minion_id*, *pillar*, ***kwargs*)

Check vmware/vcenter for all data

19.13 proxy modules

chronos	Chronos
cisconso	Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO).
dummy	This is a dummy proxy-minion designed for testing the proxy minion subsystem.

ssh_sample	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.

19.13.1 salt.proxy.chronos module

Chronos

Proxy minion for managing a Chronos cluster.

Dependencies

- *chronos execution module (salt.modules.chronos)*

Pillar

The chronos proxy configuration requires a `base_url' property that points to the chronos endpoint:

```
proxy:
  proxytype: chronos
  base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

salt.proxy.chronos.**init**(*opts*)
Perform any needed setup.

salt.proxy.chronos.**ping**()
Is the chronos api responding?

salt.proxy.chronos.**shutdown**(*opts*)
For this proxy shutdown is a no-op

19.13.2 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series
- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- **Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS,** Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister
- Fortinet
- Nominum DCS
- Sonus SBC 5000 Series
- Allied Telesys
- Open vSwitch

New in version 2016.11.0.

codeauthor *Anthony Shaw <anthony.shaw@dimensiondata.com>*

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

Dependencies

- pynso Python module

PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
  proxytype: cisconso
  host: <ip or dns name of host>
  port: 8080
  use_ssl: false
  username: <username>
  password: password
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `cisconso`.

host

The location, or IP/dns, of the Cisco NSO API host. Required.

username

The username used to login to the Cisco NSO host, such as `admin`. Required.

passwords

The password for the given user. Required.

use_ssl

Whether to use HTTPS messaging to speak to the API.

port

The port that the Cisco NSO API is running on, 8080 by default

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisconso host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

`salt.proxy.cisconso.`**`apply_rollback`**(*datastore*, *name*)

Apply a system rollback

Parameters

- **`datastore`** (`DatastoreType` (`str` enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **`name`** (`str`) -- an ID of the rollback to restore

`salt.proxy.cisconso.`**`get_data`**(*datastore*, *path*)

Get the configuration of the device tree at the given path

Parameters

- **`datastore`** (`DatastoreType` (`str` enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types

- **path** (list of str OR tuple) -- The device path, a list of element names in order, comma separated

Returns The network configuration at that tree

Return type dict

```
salt cisco-nso cisconso.get_data devices
```

salt.proxy.cisconso.**get_rollback**(*name*)

Get the backup of stored a configuration rollback

Parameters **name** (str) -- Typically an ID of the backup

Return type str

Returns the contents of the rollback snapshot

salt.proxy.cisconso.**get_rollbacks**()

Get a list of stored configuration rollbacks

salt.proxy.cisconso.**grains**()

Get the grains from the proxy device.

salt.proxy.cisconso.**ping**()

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

salt.proxy.cisconso.**set_data_value**(*datastore*, *path*, *data*)

Get a data entry in a datastore

Parameters

- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list of str OR tuple) -- The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) -- The new value at the given path

Return type bool

Returns True if successful, otherwise error.

salt.proxy.cisconso.**shutdown**()

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

19.13.3 salt.proxy.dummy module

This is a dummy proxy-minion designed for testing the proxy minion subsystem.

salt.proxy.dummy.**fns**()

salt.proxy.dummy.**grains**()

Make up some grains

salt.proxy.dummy.**grains_refresh**()

Refresh the grains

salt.proxy.dummy.**init**(*opts*)

salt.proxy.dummy.**initialized**()

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.dummy.**package_install**(*name*, ***kwargs*)
Install a ``package'' on the REST server

salt.proxy.dummy.**package_list**()
List ``packages'' installed on the REST server

salt.proxy.dummy.**package_remove**(*name*)
Remove a ``package'' on the REST server

salt.proxy.dummy.**package_status**(*name*)
Check the installation status of a package on the REST server

salt.proxy.dummy.**ping**()
Degenerate ping

salt.proxy.dummy.**service_list**()
List ``services'' on the REST server

salt.proxy.dummy.**service_restart**(*name*)
Restart a ``service'' on the REST server

salt.proxy.dummy.**service_start**(*name*)
Start a ``service'' on the dummy server

salt.proxy.dummy.**service_status**(*name*)
Check if a service is running on the REST server

salt.proxy.dummy.**service_stop**(*name*)
Stop a ``service'' on the dummy server

salt.proxy.dummy.**shutdown**(*opts*)
For this proxy shutdown is a no-op

salt.proxy.dummy.**test_from_state**()
Test function so we have something to call from a state :return:

salt.proxy.dummy.**upgrade**()
``Upgrade'' packages

salt.proxy.dummy.**uptodate**()
Call the REST endpoint to see if the packages on the ``server'' are up to date.

19.13.4 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

Special Note: SaltStack thanks Adobe Corporation **for their support in creating this Proxy Minion integration.**

This proxy minion enables VMware ESXi (hereafter referred to as simply `ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's ``Proxy Minion'' functionality enables you to designate another machine to host a minion process that ``proxies'' communication from the Salt Master. The master does not know nor care that the target is not a ``real'' Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
  proxytype: esxi
  host: <ip or dns name of esxi host>
  username: <ESXi username>
  passwords:
    - first_password
    - second_password
    - third_password
  credstore: <path to credential store>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

host

The location, or ip/dns, of the ESXi host. Required.

username

The username used to login to the ESXi host, such as `root`. Required.

passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the *`esxi.password_present`* state function. This way, after the password is changed, you should not need to restart the proxy minion--it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

Note: When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

---

protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

port

If the ESXi host is not using the default port, set this value to an alternate port. Default is `443`.

credstore

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/.vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

Note: `HOME` variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure `HOME` is set for the proxy process.

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. *salt.modules.vsphere* is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmomi` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmomi` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a ``shim'' between the execution module and the proxy. Its first parameter is always the function from salt.modules.vsphere. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in *salt.modules.vsphere* instead of *salt.modules.esxi*.

States

Associated states are thoroughly documented in *salt.states.esxi*. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.`**`ch_config`**(*cmd*, **args*, ***kwargs*)
: This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the *salt.modules.vsphere* module. Passes the return through from the vsphere module.
  cmd The command to call inside salt.modules.vsphere
  args Arguments that need to be passed to that command.
  kwargs Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.`**`find_credentials`**(*host*)
: Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.`**`grains`**()
: Get the grains from the proxy device.

`salt.proxy.esxi.`**`grains_refresh`**()
: Refresh the grains from the proxy device.

`salt.proxy.esxi.`**`init`**(*opts*)
: This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

`salt.proxy.esxi.`**`ping`**()
: Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

  CLI Example:

```
salt esxi-host test.ping
```

`salt.proxy.esxi.`**`shutdown`**()
: Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

19.13.5 salt.proxy.fx2

Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

Dependencies

- *iDRAC Remote execution module (salt.modules.dracr)*
- *Chassis command shim (salt.modules.chassis)*
- *Dell Chassis States (salt.states.dellchassis)*
- Dell's `racadm` command line interface to CMC and iDRAC devices.

Special Note: SaltStack thanks Adobe Corporation **for their support in creating this proxy minion integration.**

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply ``chassis'', ``CMC'', or ``FX2'') chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's ``Proxy Minion'' functionality enables you to designate another machine to host a minion process that ``proxies'' communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found *in the Proxy Minion section* of Salt's documentation.

To configure this integration, follow these steps:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar topfile that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
  host: <ip or dns name of chassis controller>
  admin_username: <iDRAC username for the CMC, usually 'root'>
  fallback_admin_username: <username to try if the first fails>
  passwords:
    - first_password
    - second_password
    - third-password
  proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion--it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of ``I no longer know what the password is!!!''. To

mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. *`Salt.modules.dracr`* is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a ``shim'' between the execution module and the proxy. It's first parameter is always the function from salt.modules.dracr to execute. If the function takes more positional or keyword arguments you can

append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in *salt.modules.dracr* instead of *salt.modules.chassis*.

States

Associated states are thoroughly documented in *salt.states.dellchassis*. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

salt.proxy.fx2.**admin_password**()
Return the admin_password in the DETAILS dictionary, or `calvin' (the Dell default) if there is none present

salt.proxy.fx2.**admin_username**()
Return the admin_username in the DETAILS dictionary, or root if there is none present

salt.proxy.fx2.**chconfig**(*cmd*, **args*, ***kwargs*)
This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the *salt.modules.dracr* module.

Parameters
- **cmd** -- The command to call inside salt.modules.dracr
- **args** -- Arguments that need to be passed to that command
- **kwargs** -- Keyword arguments that need to be passed to that command

Returns Passthrough the return from the dracr module.

salt.proxy.fx2.**find_credentials**()
Cycle through all the possible credentials and return the first one that works

salt.proxy.fx2.**grains**()
Get the grains from the proxied device

salt.proxy.fx2.**grains_refresh**()
Refresh the grains from the proxied device

salt.proxy.fx2.**init**(*opts*)
This function gets called when the proxy starts up. We check opts to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent DETAILS dictionary and will be used for further communication with the chassis.

salt.proxy.fx2.**ping**()
Is the chassis responding?

Returns Returns False if the chassis didn't respond, True otherwise.

salt.proxy.fx2.**shutdown**(*opts*)
Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

19.13.6 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `/srv/pillar/details.sls'

```
proxy:
  proxytype: junos
  host: <ip or dns name of host>
  username: <username>
```

```
  port: 830
  password: <secret>
```

In `/srv/pillar/top.sls' map the device details with the proxy name.

```
base:
  'vmx':
    - details
```

After storing the device information in the pillar, configure the proxy in `/etc/salt/proxy'

```
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

salt.proxy.junos.**init**(*opts*)
Open the connection to the Junos device, login, and bind to the Resource class

salt.proxy.junos.**ping**()
Ping? Pong!

salt.proxy.junos.**proxytype**()
Returns the name of this proxy

salt.proxy.junos.**shutdown**(*opts*)
This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

19.13.7 salt.proxy.marathon module

Marathon

Proxy minion for managing a Marathon cluster.

Dependencies

- *marathon execution module (salt.modules.marathon)*

Pillar

The marathon proxy configuration requires a `base_url' property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

salt.proxy.marathon.**init**(*opts*)
Perform any needed setup.

salt.proxy.marathon.**ping**()
Is the marathon api responding?

salt.proxy.marathon.**shutdown**(*opts*)
For this proxy shutdown is a no-op

19.13.8 salt.proxy.napalm

NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

Proxy minion for managing network devices via NAPALM library.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

The `napalm` proxy module requires NAPALM library to be installed: `pip install napalm` Please check Installation for complete details.

Note: Beginning with Salt release 2017.7.3, it is recommended to use `napalm` >= `2.0.0`. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check this document. While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main `napalm` package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM's base capabilities and configure the `provider` option (see below).

Pillar

The napalm proxy configuration requires the following parameters in order to connect to the network device:

driver Specifies the network device operating system. For a complete list of the supported operating systems please refer to the NAPALM Read the Docs page.

host The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: `hostname`, `fqdn`, `ip`.

username The username to be used when connecting to the device.

passwd The password needed to establish the connection.

> **Note:** This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

optional_args Dictionary with the optional arguments. Check the complete list of supported optional arguments.

always_alive: **`True`** In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to `false`. Default: `true` (maintains the connection with the remote network device).

New in version 2017.7.0.

provider: **napalm_base** The library that provides the `get_network_device` function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the `get_network_device` function available.

New in version 2017.7.1.

multiprocessing: **False** Overrides the *multiprocessing* option, per proxy minion. The `multiprocessing` option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the `multiprocessing` option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
```

Example using a user-specific library, extending NAPALM's capabilities, e.g. `custom_napalm_base`:

```
proxy:
  proxytype: napalm
  driver: ios
  fqdn: cr1.th2.par.as1234.net
  username: salt
  password: ''
  provider: custom_napalm_base
```

New in version 2016.11.0.

salt.proxy.napalm.**alive**(*opts*)
Return the connection status with the remote device.

New in version 2017.7.0.

salt.proxy.napalm.**call**(*method*, **args*, ***kwargs*)
Calls a specific method from the network driver instance. Please check the readthedocs page for the updated list of getters.

Parameters
- **method** -- specifies the name of the method to be called
- **params** -- contains the mapping between the name and the values of the parameters needed to call the method

Returns A dictionary with three keys:

•result (True/False): if the operation succeeded
•out (object): returns the object as-is from the call
•comment (string): provides more details in case the call failed
•traceback (string): complete traceback in case of exception. Please submit an issue including this traceback on the correct driver repo and make sure to read the FAQ

Example:

```
__proxy__['napalm.call']('cli'
                         **{
                            'commands': [
                                'show version',
                                'show chassis fan'
                            ]
                         })
```

salt.proxy.napalm.**fns**()
Method called by NAPALM grains module.

salt.proxy.napalm.**get_device**()
Returns the network device object.

salt.proxy.napalm.**get_grains**()
Retrieve facts from the network device.

salt.proxy.napalm.**grains_refresh**()
Refresh the grains.

salt.proxy.napalm.**init**(*opts*)
Opens the connection with the network device.

salt.proxy.napalm.**initialized**()
Connection finished initializing?

salt.proxy.napalm.**ping**()
Connection open successfully?

salt.proxy.napalm.**shutdown**(*opts*)
Closes connection with the device.

19.13.9 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion:

```
proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True
```

proxytype (REQUIRED) Use this proxy minion *nxos*

host (REQUIRED) ip address or hostname to connect to

username (REQUIRED) username to login with

password (REQUIRED) password to use to login with

prompt_name (REQUIRED) The name in the prompt on the switch. By default, use your devices hostname.

ssh_args Any extra args to use to connect to the switch.

key_accept Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the *salt.modules.nxos* execution module.

salt.proxy.nxos.**add_config**(*lines*)
Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-
↪operator'
```

Note: For more than one config added per command, lines should be a list.

salt.proxy.nxos.**check_password**(*username*, *password*, *encrypted=False*)
Check if passed password is the one assigned to user

salt.proxy.nxos.**check_role**(*username*, *role*)
Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

salt.proxy.nxos.**delete_config**(*lines*)
Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
↪network-operator'
```

Note: For more than one config deleted per command, lines should be a list.

salt.proxy.nxos.**find**(*pattern*)
Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

Note: This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole show_run output.

salt.proxy.nxos.**get_roles**(*username*)
Get roles that the username is assigned from switch

salt.proxy.nxos.**get_user**(*username*)
Get username line from switch

salt.proxy.nxos.**grains**()
Get grains for proxy minion

salt.proxy.nxos.**grains_refresh**()
Refresh the grains from the proxy device.

salt.proxy.nxos.**init**(*opts=None*)
Required. Can be used to initialize the server connection.

salt.proxy.nxos.**ping**()
Ping the device on the other end of the connection

salt.proxy.nxos.**remove_user**(*username*)
Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

salt.proxy.nxos.**replace**(*old_value*, *new_value*, *full_match=False*)
Replace string or full line matches in switch's running config

If full_match is set to True, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTESTSTRINGHERE'
```

salt.proxy.nxos.**sendline**(*command*)
Run command through switch's cli

salt.proxy.nxos.**set_password**(*username*, *password*, *encrypted=False*, *role=None*, *crypt_salt=None*, *algorithm='sha256'*)
Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
    password='$5$2fWwO2vK$s7.Hr3YltMNHuhywQQ3nfOd.gAPHgs3SOBYYdGT3E.A' \
    encrypted=True
```

salt.proxy.nxos.**set_role**(*username*, *role*)
Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

salt.proxy.nxos.**show_run**()
Shortcut to run *show run* on switch

```
salt '*' nxos.cmd show_run
```

salt.proxy.nxos.**show_ver**()
Shortcut to run *show ver* on switch

```
salt '*' nxos.cmd show_ver
```

salt.proxy.nxos.**shutdown**(*opts*)
Disconnect

salt.proxy.nxos.**system_info**()
Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

salt.proxy.nxos.**unset_role**(*username*, *role*)
Remove role from username

```
salt '*' nxos.cmd unset_role username=daniel role=vdc-admin
```

19.13.10 salt.proxy.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

class salt.proxy.philips_hue.**Const**
Constants for the lamp operations.

salt.proxy.philips_hue.**call_alert**(**args*, ***kwargs*)
Lamp alert

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

salt.proxy.philips_hue.**call_blink**(**args*, ***kwargs*)
Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

salt.proxy.philips_hue.**call_brightness**(**args*, ***kwargs*)
Set an effect to the lamp.

Arguments:
- **value**: 0~255 brightness of the lamp.

Options:
- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **transition**: Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

salt.proxy.philips_hue.**call_color**(**args*, ***kwargs*)

Set a color to the lamp.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color**: **Fixed color. Values are: red, green, blue, orange, pink, white,** yellow, daylight, purple. Default white.
- **transition**: Transition 0~200.

Advanced:

- **gamut**: **XY coordinates. Use gamut according to the Philips HUE devices documentation.** More: http://www.developers.meethue.com/documentation/hue-xy-values

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 oolor=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

salt.proxy.philips_hue.**call_effect**(**args*, ***kwargs*)

Set an effect to the lamp.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type**: Type of the effect. Possible values are ``none'' or ``colorloop''. Default ``none''.

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

salt.proxy.philips_hue.**call_lights**(**args*, ***kwargs*)

Get info about all available lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

salt.proxy.philips_hue.**call_ping**(**args*, ***kwargs*)

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

salt.proxy.philips_hue.**call_rename**(**args*, ***kwargs*)

Rename a device.

Options:

- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

salt.proxy.philips_hue.**call_status**(**args*, ***kwargs*)
Return the status of the lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

salt.proxy.philips_hue.**call_switch**(**args*, ***kwargs*)
Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

salt.proxy.philips_hue.**call_temperature**(**args*, ***kwargs*)
Set the mired color temperature. More: http://en.wikipedia.org/wiki/Mired

Arguments:

- **value**: 150~500.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

salt.proxy.philips_hue.**init**(*cnf*)
Initialize the module.

salt.proxy.philips_hue.**ping**(**args*, ***kw*)
Ping the lamps.

salt.proxy.philips_hue.**shutdown**(*opts*, **args*, ***kw*)
Shuts down the service.

19.13.11 salt.proxy.rest_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example

salt.proxy.rest_sample.**grains**()
Get the grains from the proxied device

salt.proxy.rest_sample.**grains_refresh**()
Refresh the grains from the proxied device

salt.proxy.rest_sample.**id**(*opts*)
Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

salt.proxy.rest_sample.**initialized**()
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.rest_sample.**package_install**(*name*, ***kwargs*)
Install a ``package'' on the REST server

salt.proxy.rest_sample.**package_list**()
List ``packages'' installed on the REST server

salt.proxy.rest_sample.**package_remove**(*name*)
Remove a ``package'' on the REST server

salt.proxy.rest_sample.**package_status**(*name*)
Check the installation status of a package on the REST server

salt.proxy.rest_sample.**ping**()
Is the REST server up?

salt.proxy.rest_sample.**service_list**()
List ``services'' on the REST server

salt.proxy.rest_sample.**service_restart**(*name*)
Restart a ``service'' on the REST server

salt.proxy.rest_sample.**service_start**(*name*)
Start a ``service'' on the REST server

salt.proxy.rest_sample.**service_status**(*name*)
Check if a service is running on the REST server

salt.proxy.rest_sample.**service_stop**(*name*)
Stop a ``service'' on the REST server

salt.proxy.rest_sample.**shutdown**(*opts*)
For this proxy shutdown is a no-op

salt.proxy.rest_sample.**test_from_state**()
Test function so we have something to call from a state :return:

salt.proxy.rest_sample.**uptodate**(*name*)
Call the REST endpoint to see if the packages on the ``server'' are up to date.

19.13.12 salt.proxy.ssh_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

salt.proxy.ssh_sample.**grains**()
Get the grains from the proxied device

salt.proxy.ssh_sample.**grains_refresh**()
Refresh the grains from the proxied device

salt.proxy.ssh_sample.**init**(*opts*)
Required. Can be used to initialize the server connection.

salt.proxy.ssh_sample.**initialized**()
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

salt.proxy.ssh_sample.**package_install**(*name*, ***kwargs*)
Install a ``package'' on the ssh server

salt.proxy.ssh_sample.**package_list**()
List ``packages'' by executing a command via ssh This function is called in response to the salt command ..**code-block**::**bash** salt target_minion pkg.list_pkgs

salt.proxy.ssh_sample.**package_remove**(*name*)
Remove a ``package'' on the ssh server

salt.proxy.ssh_sample.**parse**(*out*)
Extract json from out.
Parameter out: Type string. The data returned by the ssh command.

salt.proxy.ssh_sample.**ping**()
Required. Ping the device on the other end of the connection

salt.proxy.ssh_sample.**service_list**()
Start a ``service'' on the ssh server

New in version 2015.8.2.

salt.proxy.ssh_sample.**service_restart**(*name*)
Restart a ``service'' on the ssh server

New in version 2015.8.2.

salt.proxy.ssh_sample.**service_start**(*name*)
Start a ``service'' on the ssh server

New in version 2015.8.2.

salt.proxy.ssh_sample.**service_stop**(*name*)
Stop a ``service'' on the ssh server

New in version 2015.8.2.

salt.proxy.ssh_sample.**shutdown**(*opts*)
Disconnect

19.14 queue modules

pgjsonb_queue	New in version 2016.3.0.
sqlite_queue	New in version 2014.7.0.

19.14.1 salt.queues.pgjsonb_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

depends python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.pass: 'salt'
queue.pgjsonb.db: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE  salt WITH ENCODING 'utf-8';

--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
   id SERIAL PRIMARY KEY,
   data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'
 ↪backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

salt.queues.pgjsonb_queue.**delete**(*queue*, *items*)
Delete an item or items from a queue

salt.queues.pgjsonb_queue.**insert**(*queue*, *items*)
Add an item or items to a queue

salt.queues.pgjsonb_queue.**list_items**(*queue*)
List contents of a queue

salt.queues.pgjsonb_queue.**list_length**(*queue*)
Provide the number of items in a queue

salt.queues.pgjsonb_queue.**list_queues**()
Return a list of Salt Queues on the Salt Master

salt.queues.pgjsonb_queue.**pop**(*queue*, *quantity=1*)
Pop one or more or all items from the queue return them.

19.14.2 salt.queues.sqlite_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the *sqlite_queue_dir* which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting *sqlite_queue_dir* to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

salt.queues.sqlite_queue.**delete**(*queue*, *items*)
Delete an item or items from a queue

salt.queues.sqlite_queue.**insert**(*queue*, *items*)
Add an item or items to a queue

salt.queues.sqlite_queue.**list_items**(*queue*)
List contents of a queue

salt.queues.sqlite_queue.**list_length**(*queue*)
Provide the number of items in a queue

salt.queues.sqlite_queue.**list_queues**()
Return a list of Salt Queues on the Salt Master

salt.queues.sqlite_queue.**pop**(*queue*, *quantity=1*)
Pop one or more or all items from the queue return them.

19.15 roster modules

ansible	Read in an Ansible inventory file or script
cache	The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over salt-ssh.
cloud	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
clustershell	This roster resolves hostname in a pdsh/clustershell style.
flat	Read in the roster from a flat file using the renderer system
range	This roster resolves targets from a range server.
scan	Scan a netmask or ipaddr for open ssh ports

19.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
 ↪port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23
 ↪ansible_ssh_pass='password'

[computers:children]
desktop
servers

[names:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh all test.ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh desktop test.ping
home:
    True
[~]# salt-ssh computers test.ping
salt.gtmanfred.com:
    True
home:
    True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
    True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
    "hostvars": {
      "salt.gtmanfred.com": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "127.0.0.1",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 22
      },
      "home": {
        "ansible_ssh_user": "gtmanfred",
        "ansible_ssh_host": "12.34.56.78",
        "ansible_sudo_pass": "password",
        "ansible_ssh_port": 23
      }
    }
  }
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
        True
```

Any of the [groups] or direct hostnames will return. The `all' is special, and returns everything.

class salt.roster.ansible.**Inventory**(*tgt*, *tgt_type='glob'*, *inventory_file='/etc/salt/roster'*)
Matcher for static inventory files

class salt.roster.ansible.**Script**(*tgt*, *tgt_type='glob'*, *inventory_file='/etc/salt/roster'*)
Matcher for Inventory scripts

salt.roster.ansible.**targets**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the ansible inventory_file Default: /etc/salt/roster

19.15.2 salt.roster.cache

The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over salt-ssh.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster_order per config key default order changed to industry-wide best practices CIDR range selection

Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

The Roster Order

The roster's composition can be configured using roster_order. In the roster_order you can define *any* roster key and fill it with a parameter overriding the one in roster_defaults:

-

roster_order: host: id # use the minion id as hostname

You can define lists of parameters as well, the first result from the list will become the value.

Selecting a host

```
# default
roster_order:
    host:
      - ipv6-private  # IPv6 addresses in private ranges
      - ipv6-global   # IPv6 addresses in global ranges
      - ipv4-private  # IPv4 addresses in private ranges
      - ipv4-public   # IPv4 addresses in public ranges
      - ipv4-local    # loopback addresses
```

This is the default roster_order. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the host key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local    # Both IPv6 and IPv4 addresses in that range
    - 2000::/3                       # CIDR networks, both IPv4 and IPv6 are supported
```

Using cached data

Several cached libraries can be selected using the `library: `` prefix,followed by the library key. This can be referenced using the same ``:` syntax as e.g. *pillar.get*. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4                # Lookup this grain
    - mine: network.ip_addrs         # Mine data lookup works the same

  password: sdb://vault/ssh_pass     # Salt SDB URLs are also supported

  user:
    - pillar: ssh:auth:user          # Lookup this pillar key
    - sdb://osenv/USER               # Lookup this env var through sdb

  priv:
    - pillar:                        # Lists are also supported
        - salt:ssh:private_key
        - ssh:auth:private_key
```

`salt.roster.cache.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

19.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at /etc/salt/cloud. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.`**`extract_ipv4`**(*roster_order*, *ipv4*)

Extract the preferred IP address from the ipv4 grain

`salt.roster.cloud.`**`targets`**(*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

19.15.4 salt.roster.clustershell

This roster resolves hostname in a pdsh/clustershell style.

depends clustershell, https://github.com/cea-hpc/clustershell

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

salt.roster.clustershell.**targets**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets

19.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

class salt.roster.flat.**RosterMatcher**(*raw*, *tgt*, *tgt_type*, *ipv='ipv4'*)
Matcher for the roster data structure

get_data(*minion*)
Return the configured ip

ret_glob_minions()
Return minions that match via glob

ret_list_minions()
Return minions that match via list

ret_nodegroup_minions()
Return minions which match the special list-only groups defined by ssh_list_nodegroups

ret_pcre_minions()
Return minions that match via pcre

ret_range_minions()
Return minions that are returned by a range query

targets()
Execute the correct tgt_type routine and return

salt.roster.flat.**targets**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

19.15.6 salt.roster.range module

This roster resolves targets from a range server.

depends seco.range, https://github.com/ytoolshed/range

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%%example.range.cluster' test.ping
```

salt.roster.range.**targets**(*tgt*, *tgt_type='range'*, ***kwargs*)
Return the targets from a range query

19.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

class salt.roster.scan.**RosterMatcher**(*tgt*, *tgt_type*)
Matcher for the roster data structure

targets()
Return ip addrs based on netmask, sitting in the ``glob'' spot because it is the default

salt.roster.scan.**targets**(*tgt*, *tgt_type='glob'*, ***kwargs*)
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

19.16 runner modules

asam	Novell ASAM Runner
auth	Authentication runner for creating, deleting, and managing eauth tokens.
bgp	BGP Finder
cache	Return cached data from minions
cloud	The Salt Cloud Runner
ddns	Dynamic DNS Runner
digicertapi	Support for Digicert.
doc	A runner module to collect and display the inline documentation from the
drac	Manage Dell DRAC from the Master
error	Error generator to enable integration testing of salt runner error handling
event	Module for sending events using the runner system.
f5	Runner to provide F5 Load Balancer functionality
fileserver	Directly manage the Salt fileserver plugins
git_pillar	Runner module to directly manage the git external pillar
http	Module for making various web calls.
jobs	A convenience system to manage jobs, both active and already run
launchd	Manage launchd plist files
lxc	Control Linux Containers via Salt
manage	General management functions for salt, tools like seeing what hosts are up
mattermost	Module for sending messages to Mattermost
mine	A runner to access data from the salt mine
nacl	This runner helps create encrypted passwords that can be included in pillars.
net	NET Finder
network	Network tools to run from the Master
pagerduty	Runner Module for Firing Events via PagerDuty
pillar	Functions to interact with the pillar compiler on the master
pkg	Package helper functions using `salt.modules.pkg`
queue	General management and processing of queues.
reactor	A convenience system to manage reactors
salt	This runner makes Salt's execution modules available on the salt master.
saltutil	Sync custom types to the Master
sdb	Runner for setting and querying data via the sdb API on the master
smartos_vmadm	Runner for SmartOS minions control vmadm
search	Runner frontend to search system
spacewalk	Spacewalk Runner

Continued on next page

Table 19.16 -- continued from previous page

ssh	A Runner module interface on top of the salt-ssh Python API.
state	Execute orchestration functions
survey	A general map/reduce style salt runner for aggregating results returned by several different minions.
test	This runner is used only for test purposes and servers no production purpose
thin	The thin runner is used to manage the salt thin systems.
vault	**maintainer** SaltStack
venafiapi	Support for Venafi
virt	Control virtual machines via Salt
vistara	Vistara Runner
winrepo	Runner to manage Windows software repo

19.16.1 salt.runners.asam

Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

codeauthor Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
```

Note: Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

`salt.runners.asam.`**`add_platform`**(*name*, *platform_set*, *server_url*)

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.`**`list_platform_sets`**(*server_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

salt.runners.asam.**list_platforms**(*server_url*)
To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

salt.runners.asam.**remove_platform**(*name*, *server_url*)
To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

19.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

salt.runners.auth.**del_token**(*token*)
Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

salt.runners.auth.**mk_token**(***load*)
Create an eauth token using provided credentials

Non-root users may specify an expiration date -- if allowed via the *token_expire_user_override* setting -- by passing an additional `token_expire` param. This overrides the *token_expire* setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \) \* 3)
```

19.16.3 salt.runners.bgp

BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

Configuration

- Minion (proxy) config

  The `bgp.neighbors` function must be appened in the list of `mine_functions`:

  ```
  mine_functions:
    bgp.neighbors: []
  ```

  Which instructs Salt to cache the data returned by the `neighbors` function from the *NAPALM BGP module*.

  How often the mines are refreshed, can be specified using:

  ```
  mine_interval: <X minutes>
  ```

- Master config

  By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

  tgt: `*` From what minions will collect the mine data. Default: `*` (collect mine data from all minions)

  tgt_type: **`glob`** Minion matching expression form. Default: `glob`.

  return_fields What fields to return in the output. It can display all the fields from the `neighbors` function from the *NAPALM BGP module*.

  Some fields cannot be removed:

  - `as_number`: the AS number of the neighbor
  - `device`: the minion ID
  - `neighbor_address`: the neighbor remote IP address

  By default, the following extra fields are returned (displayed):

  - `connection_stats`: connection stats, as described below
  - `import_policy`: the name of the import policy
  - `export_policy`: the name of the export policy

  Special fields:

  - `vrf`: return the name of the VRF.
  - `connection_stats`: returning an output of the form `<State> <Active>/<Received>/<Accepted>/<Damped>`, e.g. `Established 398/399/399/0` similar to the usual output from network devices.
  - `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the *net runner*, so the user needs to enable the mines as specified in the documentation.
  - `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the *net runner*, so the user needs to enable the mines as specified in the documentation.

  display: **`True`** Display on the screen or return structured object? Default: `True` (return on the CLI).

outputter: **table** Specify the outputter name when displaying on the CLI. Default: *table*.

Configuration example:

```
runners:
  bgp:
    tgt: 'edge*'
    tgt_type: 'glob'
    return_fields:
      - up
      - connection_state
      - previous_connection_state
      - suppress_4byte_as
      - holdtime
      - flap_count
    outputter: yaml
```

salt.runners.bgp.**neighbors**(**asns*, ***kwargs*)

Search for BGP neighbors details in the mines of the bgp.neighbors function.

Arguments:

asns A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

device Filter by device name (minion ID).

ip Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

network Search neighbors within a certain IP network.

title Custom title.

display: **True** Display on the screen or return structured object? Default: True (return on the CLI).

outputter: **table** Specify the outputter name when displaying on the CLI. Default: *table*.

In addition, any field from the output of the neighbors function from the *NAPALM BGP module* can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169
-------------------------------------------------------------------------------
 ↪-------------------------------------------------------------------------------
|    Device    | AS Number |         Neighbor Address         | State|#Active/

```

19.16.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.`**`clear_all`**(*tgt=None*, *tgt_type='glob'*, *expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.`**`clear_git_lock`**(*role*, *remote=None*, ***kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (gitfs, git_pillar, winrepo) which use gitfs backend code from salt.utils.gitfs.

Note: Running *`cache.clear_all`* will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a `role` of `gitfs` is equivalent to running `salt-run fileserver.clear_lock backend=git`.

---

role Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of **github** will remove the lock from all github.com remotes.

type [update,checkout] The types of lock to clear. Can be `update`, `checkout`, or both of them (either comma-separated or as a Python list).

New in version 2015.8.8.

CLI Example:

```
salt-run cache.clear_git_lock git_pillar
```

salt.runners.cache.**clear_grains**(*tgt=None*, *tgt_type='glob'*, *expr_form=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

salt.runners.cache.**clear_mine**(*tgt=None*, *tgt_type='glob'*, *expr_form=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

salt.runners.cache.**clear_mine_func**(*tgt=None*, *tgt_type='glob'*, *clear_mine_func_flag=None*, *expr_form=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

salt.runners.cache.**clear_pillar**(*tgt=None*, *tgt_type='glob'*, *expr_form=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

salt.runners.cache.**cloud**(*tgt*, *provider=None*)
Return cloud cache data for target.

Note: Only works with glob matching

---

tgt Glob Target to match minion ids
provider Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

salt.runners.cache.**fetch**(*bank*, *key*, *cachedir=None*)
Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

salt.runners.cache.**flush**(*bank*, *key=None*, *cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

salt.runners.cache.**grains**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions

CLI Example:

```
salt-run cache.grains
```

salt.runners.cache.**list**(*bank*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

salt.runners.cache.**mine**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

salt.runners.cache.**pillar**(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions

CLI Example:

```
salt-run cache.pillar
```

salt.runners.cache.**store**(*bank*, *key*, *data*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

19.16.5 salt.runners.cloud

The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

salt.runners.cloud.**action**(*func=None*, *cloudmap=None*, *instances=None*, *provider=None*, *instance=None*, ***kwargs*)
Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

salt.runners.cloud.**create**(*provider*, *instances*, *opts=None*, ***kwargs*)
Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance image=ami-1624987f size=
↪'t1.micro' ssh_username=ec2-user securitygroup=default delvol_on_
↪destroy=True
```

salt.runners.cloud.**destroy**(*instances*)
Destroy the named vm(s)

salt.runners.cloud.**full_query**(*query_type='list_nodes_full'*)
List all available cloud provider data

salt.runners.cloud.**list_images**(*provider='all'*)
List cloud provider images for the given providers

salt.runners.cloud.**list_locations**(*provider='all'*)
List cloud provider sizes for the given providers

salt.runners.cloud.**list_sizes**(*provider='all'*)
List cloud provider sizes for the given providers

salt.runners.cloud.**map_run**(*path=None*, ***kwargs*)
Execute a salt cloud map file

salt.runners.cloud.**profile**(*prof=None*, *instances=None*, *opts=None*, ***kwargs*)
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

salt.runners.cloud.**query**(*query_type='list_nodes'*)
List cloud provider data for all providers

salt.runners.cloud.**select_query**(*query_type='list_nodes_select'*)
List selected nodes

19.16.6 salt.runners.ddns

Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

codeauthor Nitin Madhok <nmadhok@clemson.edu>

salt.runners.ddns.**add_host**(*zone*, *name*, *ttl*, *ip*, *keyname*, *keyfile*, *nameserver*, *timeout*, *port=53*, *keyalgorithm='hmac-md5'*)

Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↪salt/tsig.keyring 10.0.0.1 5
```

salt.runners.ddns.**create**(*zone*, *name*, *ttl*, *rdtype*, *data*, *keyname*, *keyfile*, *nameserver*, *timeout*, *port=53*, *keyalgorithm='hmac-md5'*)

Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↪salt/tsig.keyring 10.0.0.1 5
```

salt.runners.ddns.**delete**(*zone*, *name*, *keyname*, *keyfile*, *nameserver*, *timeout*, *rdtype=None*, *data=None*, *port=53*, *keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↪0.0.1 5 A
```

salt.runners.ddns.**delete_host**(*zone*, *name*, *keyname*, *keyfile*, *nameserver*, *timeout*, *port=53*, *keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↪keyring 10.0.0.1 5
```

salt.runners.ddns.**update**(*zone*, *name*, *ttl*, *rdtype*, *data*, *keyname*, *keyfile*, *nameserver*, *timeout*, *replace=False*, *port=53*, *keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

Note: If `replace` is set to True, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↪salt/tsig.keyring 10.0.0.1 5
```

19.16.7 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall (jphall@saltstack.com).

Before using this module you need to register an account with Digicert's CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the `Account` item in the left sidebar, and select `Account Access`. The right hand pane should show ``Account Access'' and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key:
 ↪ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABC
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key:
 ↪ABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABCDEFGHIJKLMNOPQRSTUVWXYZABC
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.

`salt.runners.digicertapi.`**`del_cached_domain`**(*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run digicert.del_cached_domain domain1.example.com,domain2.example.com
```

`salt.runners.digicertapi.`**`gen_csr`**(*minion_id*, *dns_name*, *organization_id*, *ou_name=None*, *key_len=2048*, *shatype='sha256'*, *password=None*)

CLI Example:

```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

`salt.runners.digicertapi.`**`gen_key`**(*minion_id*, *dns_name=None*, *password=None*, *key_len=2048*)

Generate and return a private_key. If a `dns_name` is passed in, the private_key will be cached under that name.

CLI Example:

```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

`salt.runners.digicertapi.`**`get_certificate`**(*order_id=None*, *certificate_id=None*, *minion_id=None*, *cert_format='pem_all'*, *filename=None*)

Retrieve a certificate by order_id or certificate_id and write it to stdout or a filename.

A list of permissible cert_formats is here: https://www.digicert.com/services/v2/documentation/appendix-certificate-formats

CLI Example:

```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a `filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs_csr, and needs_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the `filename` argument and make sure to include `--no-color` so there will be no terminal ANSI escape sequences.

salt.runners.digicertapi.**get_org_details**(*organization_id*)

Return the details for an organization

CLI Example:

```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with `error' and `status' keys.

salt.runners.digicertapi.**list_domain_cache**()

List domains that have been cached

CLI Example:

```
salt-run digicert.list_domain_cache
```

salt.runners.digicertapi.**list_domains**(*container_id=None*)

List domains that CertCentral knows about. You can filter by container_id (also known as ``Division'') by passing a container_id.

CLI Example:

```
salt-run digicert.list_domains
```

salt.runners.digicertapi.**list_orders**(*status=None*)

List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

salt.runners.digicertapi.**list_organizations**(*container_id=None*, *include_validation=True*)

List organizations that CertCentral knows about. You can filter by container_id (also known as ``Division'') by passing a container_id. This function returns validation information by default; pass `include_validation=False` to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

salt.runners.digicertapi.**list_requests**(*status=None*)

List certificate requests made to CertCentral. You can filter by status: `pending`, `approved`, `rejected`

CLI Example:

```
salt-run digicert.list_requests pending
```

salt.runners.digicertapi.**order_certificate**(*minion_id*, *common_name*, *organization_id*, *validity_years*, *cert_key_passphrase=None*, *signature_hash=None*, *key_len=2048*, *dns_names=None*, *organization_units=None*, *server_platform=None*, *custom_expiration_date=None*, *comments=None*, *disable_renewal_notifications=False*, *product_type_hint=None*, *renewal_of_order_id=None*)

Order a certificate. Requires that an Organization has been created inside Digicert's CertCentral.

See here for API documentation: https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10 3
↪signature_hash=sha256 dns_names=['this.domain.com', 'that.domain.com
↪'] organization_units='My Domain Org Unit' comments=
↪'Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing *renewal_of_order_id*. Previous order details can be retrieved with digicertapi.list_orders.

salt.runners.digicertapi.**show_csrs**()

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```

salt.runners.digicertapi.**show_organization**(*domain*)

Show organization information, especially the company id

CLI Example:

```
salt-run digicert.show_company example.com
```

salt.runners.digicertapi.**show_rsa**(*minion_id*, *dns_name*)

Show a private RSA key

CLI Example:

```
salt-run digicert.show_rsa myminion domain.example.com
```

19.16.8 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

salt.runners.doc.**execution**()

Collect all the sys.doc output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

salt.runners.doc.**runner**()

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

salt.runners.doc.**wheel**()
Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

19.16.9 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

salt.runners.drac.**poweroff**(*hostname*, *timeout=20*, *username=None*, *password=None*)
Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

salt.runners.drac.**poweron**(*hostname*, *timeout=20*, *username=None*, *password=None*)
Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

salt.runners.drac.**pxe**(*hostname*, *timeout=20*, *username=None*, *password=None*)
Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

salt.runners.drac.**reboot**(*hostname*, *timeout=20*, *username=None*, *password=None*)
Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

salt.runners.drac.**version**(*hostname*, *timeout=20*, *username=None*, *password=None*)
Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

19.16.10 salt.runners.error

Error generator to enable integration testing of salt runner error handling

salt.runners.error.**error**(*name=None*, *message=''*)

If name is None Then return empty dict

Otherwise raise an exception with __name__ from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

19.16.11 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

salt.runners.event.**send**(*tag*, *data=None*)

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

Parameters

- **tag** -- the tag to send with the event
- **data** -- an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
        foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
```

```
    - data:
        baz: qux
    - onfail:
      - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

19.16.12 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends

- pycontrol Python module

configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

salt.runners.f5.**add_pool_member**(*lb*, *name*, *port*, *pool_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

salt.runners.f5.**check_member_pool**(*lb*, *member*, *pool_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

salt.runners.f5.**check_pool**(*lb*, *name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

salt.runners.f5.**check_virtualserver**(*lb*, *name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

salt.runners.f5.**create_pool**(*lb*, *name*, *method='ROUND_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

salt.runners.f5.**create_vs**(*lb*, *name*, *ip*, *port*, *protocol*, *profile*, *pool_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

19.16.13 salt.runners.fileserver

Directly manage the Salt fileserver plugins

salt.runners.fileserver.**clear_cache**(*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (`git`, `hg`, `svn`). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the `backend` argument.

backend Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (`-`), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

salt.runners.fileserver.**clear_file_list_cache**(*saltenv=None*, *backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

saltenv By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

backend Similar to the `saltenv` parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache']()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
```

```
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

Note: In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See this GitHub issue for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'fileserver.clear_file_list_cache'

# Clear all file list_caches
opts['arg'] = []  # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()
```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```
# Clear all file list caches
salt-run fileserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run fileserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run fileserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run fileserver.clear_file_list_cache backend=roots
```

`salt.runners.fileserver.`**`clear_lock`**(*backend=None*, *remote=None*)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (`git`, `hg`, `svn`). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's

log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

backend Only clear the update lock for the specified backend(s).

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of **github** will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.clear_lock
salt-run fileserver.clear_lock backend=git,hg
salt-run fileserver.clear_lock backend=git remote=github
salt-run fileserver.clear_lock remote=bitbucket
```

`salt.runners.fileserver.`**`dir_list`**(*saltenv='base'*, *backend=None*)

Return a list of directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.`**`empty_dir_list`**(*saltenv='base'*, *backend=None*)

New in version 2015.5.0.

Return a list of empty directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Note: Some backends (such as *`git`* and *`hg`*) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.`**`envs`**(*backend=None*, *sources=False*)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="['roots','git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.`**`file_list`**(*saltenv='base'*, *backend=None*)

Return a list of files from the salt fileserver

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.`**`lock`**(*backend=None*, *remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git*, *hg*, *svn*).

Note: This will only operate on enabled backends (those configured in *fileserver_backend*).

backend Only set the update lock for the specified backend(s).

remote If not None, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.`**`symlink_list`**(*saltenv='base'*, *backend=None*)

Return a list of symlinked files and dirs

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
```

```
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

salt.runners.fileserver.**update**(*backend=None*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend="['roots','git']"`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

19.16.14 salt.runners.git_pillar

Runner module to directly manage the git external pillar

salt.runners.git_pillar.**update**(*branch=None*, *repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *new git_pillar configuration schema* introduced in 2015.8.0. Additionally, the branch and repo can now be omitted to update all git_pillar remotes. The return data has also changed. For releases 2015.8.3 and earlier, there is no value returned. Starting with 2015.8.4, the return data is a dictionary. If using the *old git_pillar configuration schema*, then the dictionary values will be `True` if the update completed without error, and `False` if an error occurred. If using the *new git_pillar configuration schema*, the values will be `True` only if new commits were fetched, and `False` if there were errors or no new commits were fetched.

Fetch one or all configured git_pillar remotes.

Note: This will *not* fast-forward the git_pillar cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches git_pillar repos roughly every 60 seconds (or whatever *`loop_interval`* is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using *`saltutil.refresh_pillar`* and then use *`pillar.item`* to check if the pillar data has changed as expected.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos (2015.8.4 and later)
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

19.16.15 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.`**`query`**(*url*, *output=True*, ***kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```
salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST             params='key1=val1&
↪key2=val2'
salt-run http.query http://somelink.com/ method=POST              data='<xml>
↪somecontent</xml>'
```

`salt.runners.http.`**`update_ca_bundle`**(*target=None*, *source=None*, *merge_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```
salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem
```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```
salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem
```

19.16.16 salt.runners.jobs

A convenience system to manage jobs, both active and already run

`salt.runners.jobs.`**`active`**(*display_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```
salt-run jobs.active
```

`salt.runners.jobs.`**`exit_success`**(*jid*, *ext_source=None*)

Check if a job has been executed and exit successfully

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.exit_success 20160520145827701627
```

salt.runners.jobs.**last_run**(*ext_source=None*, *outputter=None*, *metadata=None*, *function=None*, *target=None*, *display_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{'foo': 'bar'}"
```

salt.runners.jobs.**list_job**(*jid*, *ext_source=None*, *display_progress=False*)

List a specific job given by its jid

ext_source If provided, specifies which external job cache to use.

display_progress [False] If `True`, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

salt.runners.jobs.**list_jobs**(*ext_source=None*, *outputter=None*, *search_metadata=None*, *search_function=None*, *search_target=None*, *start_time=None*, *end_time=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source If provided, specifies which external job cache to use.

FILTER OPTIONS

Note: If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

---

search_metadata Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{"foo": "bar", "baz": "qux"}'
```

search_function Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function='["test.*", "pkg.install"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

search_target Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target='["db*", "myminion"]'
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

start_time Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

end_time Accepts any timestamp supported by the dateutil Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↪metadata='{"bar": "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18 22:
↪00'
```

salt.runners.jobs.**list_jobs_filter**(*count*, *filter_find_job=True*, *ext_source=None*, *outputter=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

salt.runners.jobs.**lookup_jid**(*jid*, *ext_source=None*, *returned=True*, *missing=False*, *display_progress=False*)

Return the printout from a previously executed job

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

returned [True] If `True`, include the minions that did return from the command.

New in version 2015.8.0.

missing [False] If `True`, include the minions that did *not* return from the command.

display_progress [False] If `True`, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

salt.runners.jobs.**print_job**(*jid*, *ext_source=None*)

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

19.16.17 salt.runners.launchd

Manage launchd plist files

salt.runners.launchd.**write_launchd_plist**(*program*)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

19.16.18 salt.runners.lxc

Control Linux Containers via Salt

depends lxc execution module

salt.runners.lxc.**cloud_init**(*names*, *host=None*, *quiet=False*, ***kwargs*)

Wrapper for using lxc.init in saltcloud compatibility mode

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion to start the container on. Required.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead

salt.runners.lxc.**find_guest**(*name*, *quiet=False*, *path=None*)

Returns the host for a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

salt.runners.lxc.**find_guests**(*names*, *path=None*)

Return a dict of hosts and named guests

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

salt.runners.lxc.**freeze**(*name*, *quiet=False*, *path=None*)

Freeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

salt.runners.lxc.**info**(*name*, *quiet=False*, *path=None*)

Returns information about a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

salt.runners.lxc.**init**(*names*, *host=None*, *saltcloud_mode=False*, *quiet=False*, ***kwargs*)

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
        [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
        [template=lxc_template_name] [clone=original name] \
        [profile=lxc_profile] [network_proflile=network_profile] \
        [nic=network_profile] [nic_opts=nic_opts] \
        [start=(true|false)] [seed=(true|false)] \
```

```
        [install=(true|false)] [config=minion_config] \
        [snapshot=(true|false)]
```

names Name of the containers, supports a single name or a comma delimited list of names.
host Minion on which to initialize the container **(required)**
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead See lxc.init_interface module documentation
cpuset cgroups cpuset.
cpushare cgroups cpu shares.
memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

template Name of LXC template on which to base this container
clone Clone this container from an existing container
profile A LXC profile (defined in config or pillar).
network_profile Network profile to use for the container

New in version 2015.5.2.

nic Deprecated since version 2015.5.0: Use `network_profile` instead
nic_opts Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff","ipv4": "10.1.1.1","ipv6":
"2001:db8::ff00:42:8329"}}
```

start Start the newly created container.
seed Seed the container with the minion config and autosign its key. Default: true
install If salt-minion is not already installed, install it. Default: true
config Optional config parameters. By default, the id is set to the name of the container.

`salt.runners.lxc.`**`list`**(*host=None*, *quiet=False*, *path=None*)
List defined containers (running, stopped, and frozen) for the named (or all) host(s).
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

`salt.runners.lxc.`**`purge`**(*name*, *delete_key=True*, *quiet=False*, *path=None*)
Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

`salt.runners.lxc.`**`start`**(*name*, *quiet=False*, *path=None*)
Start the named container.
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

salt.runners.lxc.**stop**(*name*, *quiet=False*, *path=None*)

Stop the named container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

salt.runners.lxc.**unfreeze**(*name*, *quiet=False*, *path=None*)

Unfreeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

19.16.19 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

salt.runners.manage.**alived**(*subset=None*, *show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

salt.runners.manage.**allowed**(*subset=None*, *show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

salt.runners.manage.**bootstrap**(*version='develop'*, *script=None*, *hosts=''*, *root_user=False*, *script_args=''*, *roster='flat'*, *ssh_user=None*, *ssh_password=None*, *ssh_priv_key=None*, *tmp_dir='/tmp/.bootstrap'*, *http_backend='tornado'*)

Bootstrap minions with salt-bootstrap

version [develop] Git tag of version to install

script [https://bootstrap.saltstack.com] URL containing the script to execute

hosts Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

root_user [False] Prepend `root@` to each host. Default changed in Salt 2016.11.0 from `True` to `False`.

Changed in version 2016.11.0.

Deprecated since version Oxygen.

script_args Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

roster [flat] The roster to use for Salt SSH. More information about roster files can be found in *Salt's Roster Documentation*.

A full list of roster types, see the *builtin roster modules* documentation.

New in version 2016.11.0.

ssh_user If `user` isn't found in the `roster`, a default SSH user can be set here. Keep in mind that `ssh_user` will not override the roster `user` value if it is already defined.

New in version 2016.11.0.

ssh_password If `passwd` isn't found in the `roster`, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

ssh_privkey If `priv` isn't found in the `roster`, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

tmp_dir [/tmp/.bootstrap] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/.bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

http_backend [tornado] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'              script=
↪'https://bootstrap.saltstack.com/develop'
salt-run manage.bootstrap hosts='ec2-user@host1,ec2-user@host2'              root_
↪user=False
```

`salt.runners.manage.`**`bootstrap_psexec`**(*hosts=''*, *master=None*, *version=None*, *arch='win32'*, *installer_url=None*, *username=None*, *password=None*)

Bootstrap Windows minions via PsExec.

hosts Comma separated list of hosts to deploy the Windows Salt minion.

master Address of the Salt master passed as an argument to the installer.

version Point release of installer to download. Defaults to the most recent.

arch Architecture of installer to download. Defaults to win32.

installer_url URL of minion installer executable. Defaults to the latest version from https://repo.saltstack.com/windows/

username Optional user name for login on remote computer.

password Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↪'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↪exampledomain/salt-installer.exe'
```

salt.runners.manage.**down**(*removekeys=False*, *tgt='*'*, *tgt_type='glob'*, *expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" tgt_type="nodegroup"
```

salt.runners.manage.**get_stats**(*estate=None*, *stack='road'*)

Print the stack stats

estate [None] The name of the target estate. Master stats would be requested by default

stack [`road'] Show stats on either road or lane stack Allowed values are `road' or `lane'.

CLI Example:

```
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

salt.runners.manage.**joined**(*subset=None*, *show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

salt.runners.manage.**key_regen**()

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The key_regen routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a salt-key -A command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

salt.runners.manage.**lane_stats**(*estate=None*)

Print the estate manor lane stack stats

estate [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.lane_stats [estate=alpha_minion]
```

salt.runners.manage.**list_not_state**(*subset=None*, *show_ipv4=False*, *state=None*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
state [`available'] Show minions being in specific state that is one of `available', `joined', `allowed', `alived' or `reaped'.
CLI Example:

```
salt-run manage.list_not_state
```

salt.runners.manage.**list_state**(*subset=None*, *show_ipv4=False*, *state=None*)
New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
state [`available'] Show minions being in specific state that is one of `available', `joined', `allowed', `alived' or `reaped'.
CLI Example:

```
salt-run manage.list_state
```

salt.runners.manage.**not_alived**(*subset=None*, *show_ipv4=False*)
New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_alived
```

salt.runners.manage.**not_allowed**(*subset=None*, *show_ipv4=False*)
New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_allowed
```

salt.runners.manage.**not_joined**(*subset=None*, *show_ipv4=False*)
New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_joined
```

salt.runners.manage.**not_present**(*subset=None*, *show_ipv4=False*)
New in version 2015.5.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_present
```

salt.runners.manage.**not_reaped**(*subset=None*, *show_ipv4=False*)
New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.not_reaped
```

salt.runners.manage.**present**(*subset=None*, *show_ipv4=False*)
Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.present
```

salt.runners.manage.**reaped**(*subset=None*, *show_ipv4=False*)
New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)
subset [None] Pass in a CIDR range to filter minions by IP address.
show_ipv4 [False] Also show the IP address each minion is connecting from.
CLI Example:

```
salt-run manage.reaped
```

salt.runners.manage.**road_stats**(*estate=None*)
Print the estate road stack stats
estate [None] The name of the target estate. Master stats would be requested by default
CLI Example:

```
salt-run manage.road_stats [estate=alpha_minion]
```

salt.runners.manage.**safe_accept**(*target*, *tgt_type='glob'*, *expr_form=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

salt.runners.manage.**status**(*output=True*, *tgt='*'*, *tgt_type='glob'*, *expr_form=None*, *timeout=None*, *gather_job_timeout=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

salt.runners.manage.**up**(*tgt='*'*, *tgt_type='glob'*, *expr_form=None*, *timeout=None*, *gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

salt.runners.manage.**versions**()

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

19.16.20 salt.runners.mattermost

Note for 2017.7 releases!

Due to the salt.runners.config module not being available in this release series, importing the salt.runners.config module from the develop branch is required to make this module work.

Ref: Mattermost runner failing to retrieve config values due to unavailable config runner #43479 Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an api_url and hook directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

salt.runners.mattermost.**post_event**(*event*, *channel=None*, *username=None*, *api_url=None*, *hook=None*)

Send an event to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param event: The event to send to the Mattermost channel. :param api_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

salt.runners.mattermost.**post_message**(*message*, *channel=None*, *username=None*, *api_url=None*, *hook=None*)

Send a message to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param message: The message to send to the Mattermost channel.

:param api_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

CLI Example:

```
salt-run mattermost.post_message message='Build is done'
```

19.16.21 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.`**`get`**(*tgt*, *fun*, *tgt_type='glob'*)

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.`**`update`**(*tgt*, *tgt_type='glob'*, *clear=False*, *mine_functions=None*)

New in version 2017.7.0.

Update the mine data on a certain group of minions.

tgt Which minions to target for the execution.

tgt_type: **`glob`** The type of `tgt`.

clear: **`False`** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: `False` (update).

mine_functions Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under `mine_functions` in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

19.16.22 salt.runners.nacl

This runner helps create encrypted passwords that can be included in pillars.

depends libnacl, https://github.com/saltstack/libnacl

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

The following configurations can be defined in the master config so your users can create encrypted passwords using the runner nacl:

```
cat /etc/salt/master.d/nacl.conf
nacl.config:
    key: 'cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
    keyfile: /root/.nacl
```

Now with the config in the master you can use the runner nacl like:

```
salt-run nacl.enc 'data'
```

salt.runners.nacl.**dec**(*data*, ***kwargs*)

Takes a key generated from *nacl.keygen* and decrypt some data.

CLI Examples:

```
salt-run nacl.dec pEXHQM6cuaF7A=
salt-run nacl.dec data='pEXHQM6cuaF7A=' keyfile=/root/.nacl
salt-run nacl.dec data='pEXHQM6cuaF7A=' key='cKEzd4kXsbeCE7/
↪nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

salt.runners.nacl.**enc**(*data*, ***kwargs*)

Takes a key generated from *nacl.keygen* and encrypt some data.

CLI Examples:

```
salt-run nacl.enc datatoenc
salt-run nacl.enc datatoenc keyfile=/root/.nacl
salt-run nacl.enc datatoenc key='cKEzd4kXsbeCE7/nLTIqXwnUiD1ulg4NoeeYcCFpd9k='
```

salt.runners.nacl.**keygen**(*keyfile=None*)

Use libnacl to generate a private key

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen keyfile=/root/.nacl
salt-run --out=newline_values_only nacl.keygen > /root/.nacl
```

19.16.23 salt.runners.net

NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

Configuration

- Minion (proxy) config

  To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

  ```
  mine_functions:
    net.ipaddrs: []
    net.lldp: []
    net.mac: []
    net.arp: []
    net.interfaces: []
  ```

  Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

  How often the mines are refreshed, can be specified using:

  ```
  mine_interval: <X minutes>
  ```

- Master config

  By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

  target: `*` From what minions will collect the mine data. Default: `*` (collect from all minions).

  expr_form: `glob` Minion matching expression form. Default: `glob`.

  ignore_interfaces A list of interfaces name to ignore. By default will consider all interfaces.

  display: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

  outputter: `table` Specify the outputter name when displaying on the CLI. Default: `table`.

  Configuration example:

```
runners:
  net.find:
    target: 'edge*'
    expr_form: 'glob'
    ignore_interfaces:
      - lo0
      - em1
      - jsrv
      - fxp0
    outputter: yaml
```

`salt.runners.net.find`(*addr*, *best=True*, *display=True*)

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac
- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

best: `True` Return only the best match with the interfaces IP networks when the saerching pattern is a valid IP Address or Network.

display: `True` Display on the screen or return structured object? Default: `True` (return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match
 ↪returned
------------------------------------------------------------------------------
 ↪-------------------------------------
|    Device    | Interface | Interface Description |  UP  | Enabled | Speed [Mbps]
 ↪|    MAC Address    |  IP Addresses |
------------------------------------------------------------------------------
 ↪-------------------------------------
| edge01.flw01 |    irb    |                       | True |   True  |      -1      |
 ↪5C:5E:AB:AC:52:B4 | 10.10.10.1/22 |
```

```
------------------------------------------------------------------------------
 ↪--------------------------------------

ARP Entries for IP 10.10.10.7
------------------------------------------------------------------------------
|    Device    |     Interface     |        MAC        |     IP     |  Age  |
------------------------------------------------------------------------------
| edge01.flw01 | irb.349 [ae0.349] | 2C:60:0C:2A:4C:0A | 10.10.10.7 | 832.0 |
------------------------------------------------------------------------------
```

salt.runners.net.**findarp**(*device=None*, *interface=None*, *mac=None*, *ip=None*, *display=True*)

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

mac Search using a specific MAC Address.

ip Search using a specific IP Address.

display: **`True`** Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

```
ARP Entries for MAC 8C:60:0F:78:EC:41
------------------------------------------------------------------------------
|    Device    |     Interface     |        MAC        |       IP      |  Age  |
------------------------------------------------------------------------------
| edge01.bjm01 | irb.171 [ae0.171] | 8C:60:0F:78:EC:41 | 172.172.17.19 | 956.0 |
------------------------------------------------------------------------------
```

salt.runners.net.**findmac**(*device=None*, *mac=None*, *interface=None*, *vlan=None*, *display=True*)

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

mac Search using a specific MAC Address.

vlan Search using a VLAN ID.

display: **`True`** Display on the screen or return structured object? Default: `True`, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

```
MAC Address(es)
------------------------------------------------------------------------------
 ↪-----------
|    Device    | Interface |        MAC        | VLAN | Static | Active | Moves |
 ↪Last move |
------------------------------------------------------------------------------
 ↪-----------
| edge01.bjm01 |  ae0.171  | 8C:60:0F:78:EC:41 | 171  | False  |  True  |   0   |
 ↪  0.0     |
```

```
-------------------------------------------------------------------------------
 ↪-----------
```

salt.runners.net.**interfaces**(*device=None*, *interface=None*, *title=None*, *pattern=None*, *ipnet=None*, *best=True*, *display=True*)

Search for interfaces details in the following mine functions:

- net.interfaces
- net.ipaddrs

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return interfaces that contain a certain pattern in their description.

ipnet Return interfaces whose IP networks associated include this IP network.

best: **True** When `ipnet` is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: `True` (return only the best match).

display: **True** Display on the screen or return structured object? Default: `True` (return on the CLI).

title Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

```
Details for interface xe-0/0/0
-------------------------------------------------------------------------------
 ↪-------------------------------
|    Device    | Interface | Interface Description |  UP  | Enabled | Speed [Mbps]
 ↪| MAC Address | IP Addresses |

-------------------------------------------------------------------------------
 ↪-------------------------------
```

salt.runners.net.**lldp**(*device=None*, *interface=None*, *title=None*, *pattern=None*, *chassis=None*, *display=True*)

Search in the LLDP neighbors, using the following mine functions:

- net.lldp

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID

- Remote Port Description
- Remote System Name
- Remote System Description

chassis Search using a specific Chassis ID.
display: **True** Display on the screen or return structured object? Default: True (return on the CLI).
display: **True** Display on the screen or return structured object? Default: True (return on the CLI).
title Display a custom title for the table.
CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```
Pattern "Ethernet1/48" found in one of the following LLDP details
----------------------------------------------------------------------------------------
 ↪--------------------------------------------------------------------------------------

salt.runners.net.**multi_find**(**patterns*, ***kwargs*)

Execute multiple search tasks. This function is based on the *find* function. Depending on the search items, some information might overlap.

Optional arguments:

best: **`True`** Return only the best match with the interfaces IP networks when the saerching pattern is a valid IP Address or Network.

display: **`True`** Display on the screen or return structured object? Default: *True* (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```
Pattern "Ethernet1/49" found in one of the following LLDP details

19.16.24 salt.runners.network

Network tools to run from the Master

salt.runners.network.**wol**(*mac*, *bcast='255.255.255.255'*, *destport=9*)

Send a ``Magic Packet'' to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

salt.runners.network.**wollist**(*maclist*, *bcast='255.255.255.255'*, *destport=9*)

Send a ``Magic Packet'' to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wollist '/path/to/maclist'
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
salt-run network.wollist '/path/to/maclist' 255.255.255.255 7
```

19.16.25 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the master config.

For example:

```
my-pagerduty-account:
    pagerduty.api_key: F3Rbyjbve43rfFWf2214
    pagerduty.subdomain: mysubdomain
```

salt.runners.pagerduty.**create_event**(*service_key=None*, *description=None*, *details=None*, *incident_key=None*, *profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```
salt-run pagerduty.create_event <service_key> <description> <details>
↪profile=my-pagerduty-account
```

The following parameters are required:
service_key This key can be found by using pagerduty.list_services.
description This is a short description of the event.
details This can be a more detailed description of the event.
profile This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.`**`list_escalation_policies`**(*profile=None*, *api_key=None*)
This function is an alias of `list_policies`.
List escalation policies belonging to this account

CLI Example:
salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies my-pagerduty-account

`salt.runners.pagerduty.`**`list_incidents`**(*profile=None*, *api_key=None*)
List incidents belonging to this account

CLI Example:
salt-run pagerduty.list_incidents my-pagerduty-account

`salt.runners.pagerduty.`**`list_maintenance_windows`**(*profile=None*, *api_key=None*)
This function is an alias of `list_windows`.
List maintenance windows belonging to this account

CLI Example:
salt-run pagerduty.list_windows my-pagerduty-account salt-run pagerduty.list_maintenance_windows my-pagerduty-account

`salt.runners.pagerduty.`**`list_policies`**(*profile=None*, *api_key=None*)
List escalation policies belonging to this account

CLI Example:
salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies my-pagerduty-account

`salt.runners.pagerduty.`**`list_schedules`**(*profile=None*, *api_key=None*)
List schedules belonging to this account

CLI Example:
salt-run pagerduty.list_schedules my-pagerduty-account

`salt.runners.pagerduty.`**`list_services`**(*profile=None*, *api_key=None*)
List services belonging to this account

CLI Example:
salt-run pagerduty.list_services my-pagerduty-account

`salt.runners.pagerduty.`**`list_users`**(*profile=None*, *api_key=None*)
List users belonging to this account

CLI Example:
salt-run pagerduty.list_users my-pagerduty-account

`salt.runners.pagerduty.`**`list_windows`**(*profile=None*, *api_key=None*)
List maintenance windows belonging to this account

CLI Example:

salt-run pagerduty.list_windows my-pagerduty-account salt-run pagerduty.list_maintenance_windows my-pagerduty-account

19.16.26 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.`**`show_pillar`**(*minion='*'*, ***kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id `*`. Function also accepts pillarenv as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for `dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option pillar_source_merging_strategy.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for `dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.`**`show_top`**(*minion=None*, *saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

19.16.27 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.`**`list_upgrades`**(*jid*, *style='group'*, *outputter='nested'*, *ext_source=None*)

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

19.16.28 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included sqlite3 queue or the planned AWS SQS and Redis queues

The queue functions such as *insert*, *delete*, and *pop* can be used for typical management of the queue.

The *process_queue* function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The *process_queue* function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the *process_queue* runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use salt-cloud to destroy the vm, or some other custom action.

Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: *pgjsonb*).

Once the queue is setup, the *runner_queue* will need to be configured.

```
runner_queue:
  queue: runners
  backend: pgjsonb
```

Note: only the queue is required, this defaults to using pgjsonb

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```
schedule:
  runner queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2
```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the process_runner task was executed.

salt.runners.queue.**delete**(*queue*, *items*, *backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```
salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue "['item1', 'item2', 'item3']"
```

salt.runners.queue.**insert**(*queue*, *items*, *backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```
salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue "['item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue "['item1', 'item2', 'item3']" backend=sqlite
```

salt.runners.queue.**insert_runner**(*fun*, *args=None*, *kwargs=None*, *queue=None*, *backend=None*)

Insert a reference to a runner into the queue so that it can be run later.

fun The runner function that is going to be run

args list or comma-seperated string of args to send to fun

kwargs dictionary of keyword arguments to send to fun

queue queue to insert the runner reference into

backend backend that to use for the queue

CLI Example:

```
salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data": {"foo
↪": "bar"}}'
```

salt.runners.queue.**list_items**(*queue*, *backend='sqlite'*)

List contents of a queue

CLI Example:

```
salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite
```

salt.runners.queue.**list_length**(*queue*, *backend='sqlite'*)

Provide the number of items in a queue

CLI Example:

```
salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite
```

salt.runners.queue.**list_queues**(*backend='sqlite'*)

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

salt.runners.queue.**pop**(*queue*, *quantity=1*, *backend='sqlite'*)

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

salt.runners.queue.**process_queue**(*queue*, *quantity=1*, *backend='sqlite'*)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

salt.runners.queue.**process_runner**(*quantity=1*, *queue=None*, *backend=None*)

Process queued runners

quantity number of runners to process

queue queue to insert the runner reference into

backend backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

19.16.29 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including `reactor` in the engine configuration for the Salt master.

```

```

engines:

- reactor

salt.runners.reactor.**add**(*event*, *reactors*, *saltenv='base'*, *test=None*)

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls
↪'
```

salt.runners.reactor.**delete**(*event*, *saltenv='base'*, *test=None*)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

salt.runners.reactor.**list**(*saltenv='base'*, *test=None*)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

19.16.30 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.`**`cmd`**(*fun*, **args*, ***kwargs*)

Execute `fun` with the given `args` and `kwargs`. Parameter `fun` should be the string *name* of the execution module to call.

Note that execution modules will be *loaded every time* this function is called.

CLI example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
```

`salt.runners.salt.`**`execute`**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=''*, *jid=''*, *kwarg=None*, ***kwargs*)

New in version 2017.7.0.

Execute `fun` on all minions matched by `tgt` and `tgt_type`. Parameter `fun` is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
    collect_bgp_stats:
        function: salt.execute
        args:
            - edge-routers
            - bgp.neighbors
        kwargs:
            tgt_type: nodegroup
        days: 1
        returner: redis
```

19.16.31 salt.runners.saltutil

Sync custom types to the Master

New in version 2016.3.0.

salt.runners.saltutil.**sync_all**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync all custom types

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'], 'grains
↪': []}
```

salt.runners.saltutil.**sync_cache**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync utils modules from `salt://_cache` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_cache
```

salt.runners.saltutil.**sync_clouds**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync utils modules from `salt://_clouds` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

salt.runners.saltutil.**sync_engines**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync engines from `salt://_engines` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

salt.runners.saltutil.**sync_grains**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync grains modules from `salt://_grains` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_grains
```

salt.runners.saltutil.**sync_modules**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync execution modules from `salt://_modules` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_modules
```

salt.runners.saltutil.**sync_output**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync output modules from `salt://_output` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_output
```

salt.runners.saltutil.**sync_pillar**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync pillar modules from `salt://_pillar` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_pillar
```

salt.runners.saltutil.**sync_proxymodules**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync proxy modules from `salt://_proxy` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_proxy
```

salt.runners.saltutil.**sync_queues**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync queue modules from `salt://_queues` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_queues
```

salt.runners.saltutil.**sync_renderers**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync renderer modules from from `salt://_renderers` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_renderers
```

salt.runners.saltutil.**sync_returners**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync returner modules from `salt://_returners` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_returners
```

salt.runners.saltutil.**sync_roster**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
New in version 2017.7.0.

Sync utils modules from `salt://_roster` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_roster
```

salt.runners.saltutil.**sync_runners**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
Sync runners from `salt://_runners` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-seperated list of modules to sync
extmod_blacklist [None] comma-seperated list of modules to blacklist based on type
CLI Example:

```
salt-run saltutil.sync_runners
```

salt.runners.saltutil.**sync_sdb**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)
New in version 2017.7.0.

Sync utils modules from `salt://_sdb` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

`salt.runners.saltutil.`**`sync_states`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync state modules from `salt://_states` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.`**`sync_tops`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master_tops modules from `salt://_tops` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.`**`sync_utils`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.`**`sync_wheel`**(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync wheel modules from `salt://_wheel` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-seperated list of modules to sync

extmod_blacklist [None] comma-seperated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_wheel
```

19.16.32 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

salt.runners.sdb.**delete**(*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

salt.runners.sdb.**get**(*uri*)

Get a value from a db, using a uri in the form of sdb://<profile>/<key>. If the uri provided does not start with sdb://, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

salt.runners.sdb.**get_or_set_hash**(*uri*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#$%^&*(-_=+)'*)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

> **Warning:** This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with %. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

salt.runners.sdb.**set**(*uri*, *value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

19.16.33 salt.runners.smartos_vmadm

Runner for SmartOS minions control vmadm

salt.runners.smartos_vmadm.**get**(*search*, *one=True*)

Return information for vms
search [string] filter vms, see the execution module.
one [boolean] return only one vm

> **Note:** If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

salt.runners.smartos_vmadm.**is_running**(*search*)

Return true if vm is running

search [string] filter vms, see the execution module.

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

Note: If multiple vms are matched, the result will be true of ALL vms are running

---

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

salt.runners.smartos_vmadm.**list**(*search=None*, *verbose=False*)

List all vms

search [string] filter vms, see the execution module

verbose [boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

salt.runners.smartos_vmadm.**nodes**(*verbose=False*)

List all compute nodes

verbose [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

salt.runners.smartos_vmadm.**reboot**(*search*, *one=True*, *force=False*)

Reboot one or more vms

search [string] filter vms, see the execution module.

one [boolean] reboot only one vm

force [boolean] force reboot, faster but no graceful shutdown

---

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

salt.runners.smartos_vmadm.**start**(*search*, *one=True*)

Start one or more vms

search [string] filter vms, see the execution module.
one [boolean] start only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

salt.runners.smartos_vmadm.**stop**(*search*, *one=True*)

Stop one or more vms
search [string] filter vms, see the execution module.
one [boolean] stop only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

19.16.34 salt.runners.search

Runner frontend to search system

salt.runners.search.**query**(*term*)

Query the search system

CLI Example:

```
salt-run search.query foo
```

19.16.35 salt.runners.spacewalk

Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

codeauthor Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benediktwerner@gmail.com>

maintainer Benedikt Werner <1benediktwerner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com:
    username: 'testuser'
    password: 'verybadpass'
  spacewalk02.domain.com:
    username: 'testuser'
    password: 'verybadpass'
```

Note: Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

`salt.runners.spacewalk.`**`addGroupsToKey`**(*server*, *activation_key*, *groups*)

Add server groups to a activation key

CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1,
↪group2]'
```

`salt.runners.spacewalk.`**`api`**(*server*, *command*, **args*, ***kwargs*)

Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup
↪Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[
↪"MyGroup", "Description"]'
```

State Example:

```
create_group:
  salt.runner:
    - name: spacewalk.api
    - server: spacewalk01.domain.com
    - command: systemgroup.create
    - arguments:
      - MyGroup
      - Description
```

`salt.runners.spacewalk.`**`deleteAllActivationKeys`**(*server*)

Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

`salt.runners.spacewalk.`**`deleteAllGroups`**(*server*)

Delete all server groups from Spacewalk

`salt.runners.spacewalk.`**`deleteAllSystems`**(*server*)

Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

salt.runners.spacewalk.**unregister**(*name*, *server_url*)

Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

19.16.36 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

salt.runners.ssh.**cmd**(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *kwarg=None*, *expr_form=None*)

New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the *SSHClient.cmd* method.

19.16.37 salt.runners.state

Execute orchestration functions

salt.runners.state.**event**(*tagmatch='*'*, *count=-1*, *quiet=False*, *sock_dir=None*, *pretty=False*, *node='master'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** -- the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** -- this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** -- do not print to stdout; just block
- **sock_dir** -- path to the Salt master's event socket file.
- **pretty** -- Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** -- Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \\
    salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \\
    salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\
    salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\
    salt -L 'kevin,stewart,dave' state.highstate
```

```
# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
    echo $tag
    echo $data | jq --color-output .
done
```

See also:

See https://github.com/saltstack/salt/blob/develop/tests/eventlisten.sh for an example of usage within a shell script.

salt.runners.state.**orchestrate**(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*, *pillar_enc=None*, *orchestration_jid=None*)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *Docs for the master-side state module*

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the pillar_enc variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

salt.runners.state.**orchestrate_high**(*data*, *test=None*, *queue=False*, *pillar=None*, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
        {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
    stage_two:
        {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
            require: [{salt: stage_one}],
        }]},
    }'
```

salt.runners.state.**orchestrate_single**(*fun*, *name*, *test=None*, *queue=False*, *pillar=None*, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

19.16.38 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: ``*some of these things are not like the others...*'' when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.`**`diff`**`(`**args*, ***kwargs*`)`

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the ``diffs'' as a series of 2-way differences -- namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
            <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the ``differences of files'')

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.`**`hash`**`(`**args*, ***kwargs*`)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
          <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an ``outlier'' minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

19.16.39 salt.runners.test

This runner is used only for test purposes and servers no production purpose

salt.runners.test.**arg**(**args*, ***kwargs*)
Output the given args and kwargs

Kwargs will be filtered for `private' keynames.

salt.runners.test.**metasyntactic**(*locality='us'*)
Return common metasyntactic variables for the given locality

salt.runners.test.**raw_arg**(**args*, ***kwargs*)
Output the given args and kwargs

salt.runners.test.**sleep**(*s_time=10*)
Sleep t seconds, then return True

salt.runners.test.**stdout_print**()
Print `foo' and return `bar'

salt.runners.test.**stream**()
Return True

19.16.40 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

salt.runners.thin.**generate**(*extra_mods=''*, *overwrite=False*, *so_mods=''*, *python2_bin='python2'*, *python3_bin='python3'*, *absonly=True*, *compress='gzip'*)
Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

salt.runners.thin.**generate_min**(*extra_mods=''*, *overwrite=False*, *so_mods=''*, *python2_bin='python2'*, *python3_bin='python3'*)
Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

19.16.41 salt.runners.vault

maintainer SaltStack

maturity new

platform all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

salt.runners.vault.**generate_token**(*minion_id*, *signature*, *impersonated_by_master=False*)

Generate a Vault token for minion minion_id

minion_id The id of the minion that requests a token

signature Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see impersonated_by_master).

impersonated_by_master If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

salt.runners.vault.**show_policies**(*minion_id*)

Show the Vault policies that are applied to tokens for the given minion

minion_id The minions id

CLI Example:

```
salt-run vault.show_policies myminion
```

19.16.42 salt.runners.venafiapi

Support for Venafi

Before using this module you need to register an account with Venafi, and configure it in your `master` configuration file.

First, you need to add a placeholder to the `master` file. This is because the module will not load unless it finds an `api_key` setting, valid or not. Open up `/etc/salt/master` and add:

```
venafi:
  api_key: None
```

Then register your email address with Venafi using the following command:

```
salt-run venafi.register <youremail@yourdomain.com>
```

This command will not return an `api_key` to you; that will be sent to you via email from Venafi. Once you have received that key, open up your `master` file and set the `api_key` to it:

```
venafi:
  api_key: abcdef01-2345-6789-abcd-ef0123456789
```

salt.runners.venafiapi.**del_cached_domain**(*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com,domain2.example.com
```

salt.runners.venafiapi.**gen_csr**(*minion_id*, *dns_name*, *zone='default'*, *country=None*, *state=None*, *loc=None*, *org=None*, *org_unit=None*, *password=None*)

Generate a csr using the host's private_key. Analogous to:

```
VCert gencsr -cn [CN Value] -o "Beta Organization" -ou "Beta Group"              -l
 ↪"Palo Alto" -st "California" -c US
```

CLI Example:

```
salt-run venafi.gen_csr <minion_id> <dns_name>
```

salt.runners.venafiapi.**gen_key**(*minion_id*, *dns_name=None*, *zone='default'*, *password=None*)

Generate and return an private_key. If a dns_name is passed in, the private_key will be cached under that name. The type of key and the parameters used to generate the key are based on the default certificate use policy associated with the specified zone.

CLI Example:

```
salt-run venafi.gen_key <minion_id> [dns_name] [zone] [password]
```

salt.runners.venafiapi.**get_zone_id**(*zone_name*)

Get the zone ID for the given zone name

CLI Example:

```
salt-run venafi.get_zone_id default
```

salt.runners.venafiapi.**list_domain_cache**()

List domains that have been cached

CLI Example:

```
salt-run venafi.list_domain_cache
```

salt.runners.venafiapi.**pickup**(*id_*)

Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

salt.runners.venafiapi.**register**(*email*)

Register a new user account

CLI Example:

```
salt-run venafi.register email@example.com
```

salt.runners.venafiapi.**renew**(*minion_id*, *dns_name=None*, *zone='default'*, *request_id=None*, *country='US'*, *state='California'*, *loc='Palo Alto'*, *org='Beta Organization'*, *org_unit='Beta Group'*, *password=None*, *zone_id=None*)

Request a new certificate

Uses the following command:

```
VCert enroll -z <zone> -k <api key> -cn <domain name>
```

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

salt.runners.venafiapi.**request**(*minion_id*, *dns_name=None*, *zone='default'*, *request_id=None*, *country='US'*, *state='California'*, *loc='Palo Alto'*, *org='Beta Organization'*, *org_unit='Beta Group'*, *password=None*, *zone_id=None*)

Request a new certificate

Uses the following command:

```
VCert enroll -z <zone> -k <api key> -cn <domain name>
```

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

salt.runners.venafiapi.**show_cert**(*id_*)
Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

salt.runners.venafiapi.**show_company**(*domain*)
Show company information, especially the company id

CLI Example:

```
salt-run venafi.show_company example.com
```

salt.runners.venafiapi.**show_csrs**()
Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_csrs
```

salt.runners.venafiapi.**show_policies**()
Show zone details for the API key owner's company

CLI Example:

```
salt-run venafi.show_zones
```

salt.runners.venafiapi.**show_rsa**(*minion_id*, *dns_name*)
Show a private RSA key

CLI Example:

```
salt-run venafi.show_rsa myminion domain.example.com
```

salt.runners.venafiapi.**show_zones**()
Show zone details for the API key owner's company

CLI Example:

```
salt-run venafi.show_zones
```

19.16.43 salt.runners.virt

Control virtual machines via Salt

salt.runners.virt.**force_off**(*name*)
Force power down the named virtual machine

salt.runners.virt.**host_info**(*host=None*)
Return information about the host connected to this master

salt.runners.virt.**init**(*name*, *cpu*, *mem*, *image*, *hypervisor='kvm'*, *host=None*, *seed=True*, *nic='default'*, *install=True*, *start=True*, *disk='default'*, *saltenv='base'*, *enable_vnc=False*)

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

name The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

cpu The number of cpus to allocate to this new virtual machine.

mem The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

image The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

hypervisor The hypervisor to use for the new virtual machine. Default is `kvm'.

host The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

seed Set to False to prevent Salt from seeding the new virtual machine.

nic The nic profile to use, defaults to the ``default'' nic profile which assumes a single network interface per VM associated with the ``br0'' bridge on the master.

install Set to False to prevent Salt from installing a minion on the new VM before it spins up.

disk The disk profile to use

saltenv The Salt environment to use

salt.runners.virt.**list**(*host=None*, *quiet=False*, *hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

salt.runners.virt.**migrate**(*name*, *target=''*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

salt.runners.virt.**next_host**()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math the determine the most ``available'' next host.

salt.runners.virt.**pause**(*name*)

Pause the named VM

salt.runners.virt.**purge**(*name*, *delete_key=True*)

Destroy the named VM

salt.runners.virt.**query**(*host=None*, *quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

salt.runners.virt.**reset**(*name*)

Force power down and restart an existing VM

salt.runners.virt.**resume**(*name*)

Resume a paused VM

salt.runners.virt.**start**(*name*)

Start a named virtual machine

salt.runners.virt.**vm_info**(*name*, *quiet=False*)

Return the information on the named VM

19.16.44 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (http://www.vistarait.com/) REST API

codeauthor Brad Thurber <brad.thurber@gmail.com>

To use this runner, the Vistara client_id and Vistara oauth2 client_key and client_secret must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

```
vistara:
  client_id: client_012345
  client_key: N0tReallyaR3alKeyButShouldB12345
  client_secret: ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00
```

`salt.runners.vistara.`**`delete_device`**(*name*, *safety_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, delete_device will only perform the delete if a single host is returned. Set safety_on=False to delete all matches (up to default API search page size)

CLI Example:

```
salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False
```

19.16.45 salt.runners.winrepo

Runner to manage Windows software repo

`salt.runners.winrepo.`**`genrepo`**(*opts=None*, *fire_event=True*)

Generate winrepo_cachefile based on sls files in the winrepo_dir

opts Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

fire_event [True] Fire an event on failure. Only supported on the master.

CLI Example:

```
salt-run winrepo.genrepo
```

`salt.runners.winrepo.`**`update_git_repos`**(*opts=None*, *clean=False*, *masterless=False*)

Checkout git repos containing Windows Software Package Definitions

opts Specify an alternate opts dict. Should not be used unless this function is imported into an execution module.

clean [False] Clean repo cachedirs which are not configured under *`winrepo_remotes`*.

> **Warning:** This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```
salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True
```

19.17 sdb modules

cache	cache Module
confidant	An SDB module for getting credentials from confidant.
consul	Consul sdb Module
couchdb	CouchDB sdb Module
env	Environment sdb Module
etcd_db	etcd Database Module
keyring_db	Keyring Database Module
memcached	Memcached sdb Module
rest	Generic REST API SDB Module
sqlite3	SQLite sdb Module
tism	tISM - the Immutalbe Secrets Manager SDB Module
vault	Vault SDB Module
yaml	Pull sdb values from a YAML file

19.17.1 salt.sdb.cache module

cache Module

maintainer SaltStack

maturity New

platform all

New in version 2017.7.0.

This module provides access to Salt's cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
  driver: cache
  bank: cloud/active/ec2/my-ec2-conf/saltmaster
  cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
master_ip: sdb://mastercloudcache/public_ips?cachedir=/var/cache/salt
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
master_ip: sdb://mastercloudcache/public_ips?bank=cloud/active/ec2/my-ec2-conf/
 ↪saltmaster
```

`salt.sdb.cache.`**`delete`**(*key*, *service=None*, *profile=None*)

Get a value from the cache service

salt.sdb.cache.**get**(*key*, *service=None*, *profile=None*)
Get a value from the cache service

salt.sdb.cache.**set**(*key*, *value*, *service=None*, *profile=None*)
Set a key/value pair in the cache service

19.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1
```

depends confidant-common, confidant-client

Module Documentation

salt.sdb.confidant.**get**(*key*, *profile=None*)
Read pillar data from Confidant via its API.

CLI Example:
salt myminion sdb.get `sdb://confidant/credentials'
Valid keys are: credentials, credentials_metadata, result. credentials returns a dict of joined credential_pairs, credentials_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials_metadata can't be trusted.

19.17.3 salt.sdb.consul module

Consul sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to Consul using an `sdb://` URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
myconsul:
  driver: consul
  host: 127.0.0.1
  port: 8500
  token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  scheme: http
  consistency: default
  dc: dev
  verify: True
```

The `driver` refers to the Consul module, all other options are optional. For option details see: https://python-consul.readthedocs.io/en/latest/#consul

`salt.sdb.consul.`**`get_conn`**(*profile*)
Return a client object for accessing consul

19.17.4 salt.sdb.couchdb

CouchDB sdb Module

maintainer SaltStack

maturity New

depends python2-couchdb

platform all

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's *sdb* system to allow for inserts and retrevals using the *sdb://* prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb
```

One could then query the CouchDB instance via an *sdb://* URI such as the following:

```
password: sdb://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

`salt.sdb.couchdb.`**`get`**(*key*, *profile=None*)
Get a value from couchdb by id

salt.sdb.couchdb.**set**(*key*, *value*, *profile=None*)
Set a key/value pair in couchdb

19.17.5 salt.sdb.env module

Environment sdb Module

maintainer SaltStack

maturity New

depends None

platform all

This module allows access to environment variables using an sdb:// URI.

Example configuration for this module:

```
osenv:
  driver: env
```

WARNING:

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:
  cmd.run:
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}
    - order: 1

{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}
always-changes-and-succeeds:
  test.succeed_with_changes:
    - name: foo
{% else %}
always-changes-and-fails:
  test.fail_with_changes:
    - name: foo
{% endif  %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named compute (and have osenv defined). The example below will look for the salt cloud config key compute_name in the environment:

```
my-openstack-config:
  compute_name: sdb://osenv/compute
  ..snip
```

salt.sdb.env.**get**(*key*, *profile=None*)
Get a value

salt.sdb.env.**set**(*key*, *value*, *profile=None*)
Set a key/value pair

19.17.6 salt.sdb.etcd_db

etcd Database Module

maintainer SaltStack

maturity New

depends python-etcd

platform all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at `https://pypi.python.org/pypi/python-etcd`.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

The `driver` refers to the etcd module, `etcd.host` refers to the host that is hosting the etcd database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.`**`delete`**(*key*, *service=None*, *profile=None*)
Get a value from the etcd service

`salt.sdb.etcd_db.`**`get`**(*key*, *service=None*, *profile=None*)
Get a value from the etcd service

`salt.sdb.etcd_db.`**`set`**(*key*, *value*, *service=None*, *profile=None*)
Set a key/value pair in the etcd service

19.17.7 salt.sdb.keyring_db

Keyring Database Module

maintainer SaltStack

maturity New

depends keyring

platform all

This module allows access to the keyring package using an `sdb://` URI. This package is located at `https://pypi.python.org/pypi/keyring`.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the ``Secret Service'' backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The keyczar backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

https://pypi.python.org/pypi/keyring

New in version 2014.1.4.

`salt.sdb.keyring_db.`**`get`**(*key*, *service=None*, *profile=None*)
Get a value from a keyring service

`salt.sdb.keyring_db.`**`set`**(*key*, *value*, *service=None*, *profile=None*)
Set a key/value pair in a keyring service

19.17.8 salt.sdb.memcached

Memcached sdb Module

maintainer SaltStack

maturity New

depends python-memcached

platform all

This module allows access to memcached using an `sdb://` URI. This package is located at `https://pypi.python.org/pypi/python-memcached`.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  host: localhost
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

`salt.sdb.memcached.`**`get`**(*key*, *profile=None*)
Get a value from memcached

`salt.sdb.memcached.`**`set`**(*key*, *value*, *profile=None*)
Set a key/value pair in memcached

19.17.9 salt.sdb.rest module

Generic REST API SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URI.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
    backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
    params:
      user: myuser
```

`salt.sdb.rest.`**`get`**(*key*, *service=None*, *profile=None*)
Get a value from the REST interface

`salt.sdb.rest.`**`query`**(*key*, *value=None*, *service=None*, *profile=None*)
Get a value from the REST interface

`salt.sdb.rest.`**`set`**(*key*, *value*, *service=None*, *profile=None*)
Set a key/value pair in the REST interface

19.17.10 salt.sdb.sqlite3

SQLite sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to sqlite3 using an `sdb://` URI

Like all sdb modules, the sqlite3 module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the sqlite3 module, `database` refers to the sqlite3 database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

`salt.sdb.sqlite3.get`(*key*, *profile=None*)
Get a value from sqlite3

`salt.sdb.sqlite3.set`(*key*, *value*, *profile=None*)
Set a key/value pair in sqlite3

19.17.11 salt.sdb.tism module

tISM - the Immutalbe Secrets Manager SDB Module

maintainer tISM

maturity New

platform all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>

sdb://tism/
 ↪hQEMAzJ+GfdAB3KqAQf9E3cyvrPEWR1sf1tMvH0nrJ0bZa9kDFLPxvtwAOqlRiNp0F7IpiiVRF+h+sW5Mb4ffB1TElMzQ+/
 ↪G5ptd6CjmgBfBsuGeajWmvLEi4lC6/
 ↪9v1rYGjjLeOCCcN4Dl5AHlxUUaSrxB8akTDvSAnPvGhtRTZqDlltl5UEHsyYXM8RaeCrBw5Or1yvC9Ctx2saVp3xmALQvyhzkU
 ↪H30L/r50+CBkuI/u4M2pXDcMYsvvt4ajCbJn91qaQ7BDI=
```

A profile must be setup in the minion configuration or pillar. If you want to use sdb in a runner or pillar you must also place a profile in the master configuration.

```
tism:
  driver: tism
  url: https://my.tismd:8080/decrypt
  token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
↪eyJhZG1pbiI6MSwiZXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWNiMWdtdmw4Iiwia2V5cyI6WyJBTEwiXX0.
↪RtAhG6Uorf5xnSf4Ya_GwJnoHkCsql4r1_hiOeDSLzo
```

salt.sdb.tism.**get**(*key*, *service=None*, *profile=None*)
Get a decrypted secret from the tISMd API

19.17.12 salt.sdb.vault module

Vault SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the sdb module, but the base configuration must also be completed.

Like all sdb modules, the vault module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```
myvault:
  driver: vault
```

Once configured you can access data using a URL such as:

```
password: sdb://myvault/secret/passwords?mypassword
```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```
$ vault read -field=mypassword secret/passwords
```

salt.sdb.vault.**get**(*key*, *profile=None*)
Get a value from the vault service

salt.sdb.vault.**set**(*key*, *value*, *profile=None*)
Set a key/value pair in the vault service

19.17.13 salt.sdb.yaml module

Pull sdb values from a YAML file

maintainer SaltStack

maturity New

platform all

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge:
    strategy: smart
    merge_list: false
```

salt.sdb.yaml.**get**(*key*, *profile=None*)
Get a value from the REST interface

salt.sdb.yaml.**set**(**args*, ***kwargs*)
Setting a value is not supported; edit the YAML files directly

19.18 serializer modules

configparser	salt.serializers.configparser
json	salt.serializers.json
msgpack	salt.serializers.msgpack
python	salt.serializers.python
yaml	salt.serializers.yaml
yamlex	salt.serializers.yamlex

19.18.1 salt.serializers.configparser module

salt.serializers.configparser

New in version 2016.3.0.

Implements a configparser serializer.

salt.serializers.configparser.**deserialize**(*stream_or_string*, ***options*)
Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower configparser module.

salt.serializers.configparser.**serialize**(*obj*, ***options*)
Serialize Python data to a configparser formatted string or file.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower configparser module.

19.18.2 salt.serializers.json

salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.`**`deserialize`**(*stream_or_string*, ***options*)

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower json/simplejson module.

`salt.serializers.json.`**`serialize`**(*obj*, ***options*)

Serialize Python data to JSON.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower json/simplejson module.

19.18.3 salt.serializers.msgpack

salt.serializers.msgpack

Implements MsgPack serializer.

`salt.serializers.msgpack.`**`deserialize`**(*stream_or_string*, ***options*)

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower msgpack module.

`salt.serializers.msgpack.`**`serialize`**(*obj*, ***options*)

Serialize Python data to MsgPack.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower msgpack module.

19.18.4 salt.serializers.python module

salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

`salt.serializers.python.`**`serialize`**(*obj*, ***options*)

Serialize Python data to a Python string representation (via pprint.format)

Parameters

- **obj** -- the data structure to serialize

- **options** -- options given to pprint.format

19.18.5 salt.serializers.yaml

salt.serializers.yaml

Implements YAML serializer.

Underneath, it is based on pyyaml and use the safe dumper and loader. It also use C bindings if they are available.

salt.serializers.yaml.**deserialize**(*stream_or_string*, ***options*)

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** -- stream or string to deserialize.
- **options** -- options given to lower yaml module.

salt.serializers.yaml.**serialize**(*obj*, ***options*)

Serialize Python data to YAML.

Parameters

- **obj** -- the data structure to serialize
- **options** -- options given to lower yaml module.

19.18.6 salt.serializers.yamlex

salt.serializers.yamlex

YAMLEX is a format that allows for things like sls files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies omap for any dict like. - it implies that string like data are str, not unicode - ...

For example, the file *states.sls* has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an OrderedDict

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex *__repr__* and *__str__* objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yml_obj = yaml.deserialize(str(obj))
assert yml_obj == obj
```

yamlex implements also custom tags:

!aggregate

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

!reset

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.`**`deserialize`**(*stream_or_string*, ***options*)

Deserialize any string of stream like object into a Python data structure.

Parameters

- **`stream_or_string`** -- stream or string to deserialize.
- **`options`** -- options given to lower yaml module.

`salt.serializers.yamlex.`**`serialize`**(*obj*, ***options*)

Serialize Python data to YAML.

Parameters

- **`obj`** -- the data structure to serialize
- **`options`** -- options given to lower yaml module.

19.19 state modules

acme	ACME / Let's Encrypt certificate management state

Continued on next page

Table 19.19 -- continued from previous page

alias	Configuration of email aliases
alternatives	Configuration of the alternatives system
apache	Apache state
apache_conf	Manage Apache Confs
apache_module	Manage Apache Modules
apache_site	Manage Apache Sites
aptpkg	Package management operations specific to APT- and DEB-based systems
archive	Extract an archive
artifactory	This state downloads artifacts from artifactory.
at	Configuration disposable regularly scheduled tasks for at.
augeas	Configuration management using Augeas
aws_sqs	Manage SQS Queues
beacon	Management of the Salt beacons
bigip	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
blockdev	Management of Block Devices
boto3_elasticache	Manage Elasticache with boto3
boto3_route53	Manage Route53 records with Boto 3
boto_apigateway	Manage Apigateway Rest APIs
boto_asg	Manage Autoscale Groups
boto_cfn	Connection module for Amazon Cloud Formation
boto_cloudtrail	Manage CloudTrail Objects
boto_cloudwatch_alarm	Manage Cloudwatch alarms
boto_cloudwatch_event	Manage CloudTrail Objects
boto_cognitoidentity	Manage CognitoIdentity Functions
boto_datapipeline	Manage Data Pipelines
boto_dynamodb	Manage DynamoDB Tables
boto_ec2	Manage EC2
boto_elasticache	Manage Elasticache
boto_elasticsearch_domain	Manage Elasticsearch Domains
boto_elb	Manage ELBs
boto_elbv2	Manage AWS Application Load Balancer
boto_iam	Manage IAM objects
boto_iam_role	Manage IAM roles
boto_iot	Manage IoT Objects
boto_kinesis	Manage Kinesis Streams
boto_kms	Manage KMS keys, key policies and grants.
boto_lambda	Manage Lambda Functions
boto_lc	Manage Launch Configurations
boto_rds	Manage RDSs
boto_route53	Manage Route53 records
boto_s3_bucket	Manage S3 Buckets
boto_secgroup	Manage Security Groups
boto_sns	Manage SNS Topics
boto_sqs	Manage SQS Queues
boto_vpc	Manage VPCs
bower	Installation of Bower Packages
cabal	Installation of Cabal Packages
ceph	Manage ceph with salt.

Continued on next page

Table 19.19 -- continued from previous page

chef	Execute Chef client runs
chocolatey	Manage Chocolatey package installs ..
chronos_job	Configure Chronos jobs via a salt proxy.
cisconso	State module for Cisco NSO Proxy minions
cloud	Using states instead of maps to deploy clouds
cmd	Execution of arbitrary commands
composer	Installation of Composer Packages
cron	Management of cron, the Unix command scheduler
csf	
cyg	Installation of Cygwin packages.
ddns	Dynamic DNS updates
debconfmod	Management of debconf selections
dellchassis	Manage chassis via Salt Proxies.
disk	Disk monitoring state
docker	States to manage Docker containers, images, volumes, and networks
docker_container	Management of Docker containers
docker_image	Management of Docker images
docker_network	Management of Docker networks
docker_volume	Management of Docker volumes
drac	Management of Dell DRAC
elasticsearch	State module to manage Elasticsearch.
elasticsearch_index	State module to manage Elasticsearch indices
elasticsearch_index_template	State module to manage Elasticsearch index templates
environ	Support for getting and setting the environment variables of the current salt process.
eselect	Management of Gentoo configuration using eselect
etcd_mod	Manage etcd Keys
ethtool	Configuration of network device
esxi	Manage VMware ESXi Hosts.
event	Send events through Salt's event system during state runs
file	Operations on regular files, special files, directories, and symlinks
firewall	State to check firewall configurations ..
firewalld	Management of firewalld
gem	Installation of Ruby modules packaged as gems
git	States to manage git repositories and git configuration
github	Github User State Module
glance	Managing Images in OpenStack Glance
glusterfs	Manage GlusterFS pool.
gnomedesktop	Configuration of the GNOME desktop
gpg	Management of the GPG keychains
grafana	Manage Grafana Dashboards
grafana4_dashboard	Manage Grafana v4.0 Dashboards
grafana4_datasource	Manage Grafana v4.0 data sources
grafana4_org	Manage Grafana v4.0 orgs
grafana4_user	Manage Grafana v4.0 users
grafana_dashboard	Manage Grafana v2.0 Dashboards
grafana_datasource	Manage Grafana v2.0 data sources
grains	Manage grains on the minion

Continued on next page

Table 19.19 -- continued from previous page

group	Management of user groups
heat	Management of Heat
hg	Interaction with Mercurial repositories
hipchat	Send a message to Hipchat
host	Management of addresses and names in hosts file
htpasswd	Support for htpasswd module.
http	HTTP monitoring states
icinga2	Icinga2 state
ifttt	Trigger an event in IFTTT
incron	Management of incron, the inotify cron
influxdb08_database	Management of Influxdb 0.8 databases
influxdb08_user	Management of InfluxDB 0.8 users
influxdb_continuous_query	Management of Influxdb continuous queries
influxdb_database	Management of Influxdb databases
influxdb_retention_policy	Management of Influxdb retention policies
influxdb_user	Management of InfluxDB users
infoblox	states for infoblox stuff
ini_manage	Manage ini files
ipmi	Manage IPMI devices over LAN
ipset	Management of ipsets
iptables	Management of iptables
jboss7	Manage JBoss 7 Application Server via CLI interface
jenkins	Management of Jenkins
junos	State modules to interact with Junos devices.
k8s	Manage Kubernetes
kapacitor	Kapacitor state module.
keyboard	Management of keyboard layouts
keystone	Management of Keystone users
kmod	Loading and unloading of kernel modules
kubernetes	Manage kubernetes resources as salt states
layman	Management of Gentoo Overlays using layman
ldap	Manage entries in an LDAP database
libcloud_dns	Manage DNS records and zones using libcloud
linux_acl	Linux File Access Control Lists
locale	Management of languages/locales
logrotate	Module for managing logrotate.
loop	Loop state
lvm	Management of Linux logical volumes
lvs_server	Management of LVS (Linux Virtual Server) Real Server
lvs_service	Management of LVS (Linux Virtual Server) Service
lxc	Manage Linux Containers
mac_assistive	Allows you to manage assistive access on macOS minions with 10.9+
mac_defaults	Writing/reading defaults from a macOS minion
mac_keychain	Installing of certificates to the keychain
mac_package	Installing of mac pkg files
mac_xattr	Allows you to manage extended attributes on files or directories
makeconf	Management of Gentoo make.conf
marathon_app	Configure Marathon apps via a salt proxy.

mdadm	Managing software RAID with mdadm
memcached	States for Management of Memcached Keys
modjk	State to control Apache modjk
modjk_worker	Manage modjk workers
module	Execution of Salt modules from within states
mongodb_database	Management of Mongodb databases
mongodb_user	Management of Mongodb users
monit	Monit state
mount	Mounting of filesystems
msteams	Send a message card to Microsoft Teams
mysql_database	Management of MySQL databases (schemas)
mysql_grants	Management of MySQL grants (user permissions)
mysql_query	Execution of MySQL queries
mysql_user	Management of MySQL users
netacl	Network ACL
netconfig	Network Config
netntp	Network NTP
netsnmp	Network SNMP
netusers	Network Users
network	Configuration of network interfaces
netyang	NAPALM YANG state
nftables	Management of nftables
npm	Installation of NPM Packages
ntp	Management of NTP servers
nxos	State module for Cisco NX OS Switches Proxy minions
openstack_config	Manage OpenStack configuration file settings.
openvswitch_bridge	Management of Open vSwitch bridges.
openvswitch_port	Management of Open vSwitch ports.
pagerduty	Create an Event in PagerDuty
pagerduty_escalation_policy	Manage PagerDuty escalation policies.
pagerduty_schedule	Manage PagerDuty schedules.
pagerduty_service	Manage PagerDuty services
pagerduty_user	Manage PagerDuty users.
pcs	Management of Pacemaker/Corosync clusters with PCS
pecl	Installation of PHP Extensions Using pecl
pdbedit	Manage accounts in Samba's passdb using pdbedit
pip_state	Installation of Python Packages Using pip
pkg	Installation of packages using OS package managers such as yum or apt-get
pkgbuild	The pkgbuild state is the front of Salt package building backend.
pkgng	Manage package remote repo using FreeBSD pkgng
pkgrepo	Management of APT/DNF/YUM/Zypper package repos
portage_config	Management of Portage package configuration on Gentoo
ports	Manage software from FreeBSD ports
postgres_cluster	Management of PostgreSQL clusters
postgres_database	Management of PostgreSQL databases
postgres_extension	Management of PostgreSQL extensions
postgres_group	Management of PostgreSQL groups (roles)

postgres_user	Management of PostgreSQL users (roles)
powerpath	Powerpath configuration support
probes	Network Probes
process	Process Management
proxy	Allows you to manage proxy settings on minions
pushover	Send a message to PushOver
pyenv	Managing python installations with pyenv
pyrax_queues	Manage Rackspace Queues
quota	Management of POSIX Quotas
rabbitmq_cluster	Manage RabbitMQ Clusters
rabbitmq_plugin	Manage RabbitMQ Plugins
rabbitmq_policy	Manage RabbitMQ Policies
rabbitmq_user	Manage RabbitMQ Users
rabbitmq_vhost	Manage RabbitMQ Virtual Hosts
rbac_solaris	Management of Solaris RBAC
rbenv	Managing Ruby installations with rbenv
rdp	Manage RDP Service on Windows servers
redismod	Management of Redis server
reg	Manage the Windows registry ========== Many python developers think of registry keys as if they were python keys in a dictionary which is not the case.
rsync	State to synchronize files and directories with rsync.
rvm	Managing Ruby installations and gemsets with Ruby Version Manager (RVM)
salt_proxy	Salt proxy state
saltmod	Control the Salt command interface
schedule	Management of the Salt scheduler
selinux	Management of SELinux rules
serverdensity_device	Monitor Server with Server Density
service	Starting or restarting of services and daemons
slack	Send a message to Slack
smartos	Management of SmartOS Standalone Compute Nodes
smtp	Sending Messages via SMTP
snapper	Managing implicit state and baselines using snapshots
solrcloud	States for solrcloud alias and collection configuration
splunk	Splunk User State Module
splunk_search	Splunk Search State Module
sqlite3	Management of SQLite3 databases
ssh_auth	Control of entries in SSH authorized_key files
ssh_known_hosts	Control of SSH known_hosts entries
stateconf	Stateconf System
status	Minion status monitoring
statuspage	StatusPage
stormpath_account	Support for Stormpath.

win_network	Configuration of network interfaces on Windows hosts
win_path	Manage the Windows System PATH
win_pki	Microsoft certificate management via the Pki PowerShell module.
win_powercfg	This module allows you to control the power settings of a windows minion via powercfg.
win_servermanager	Manage Windows features via the ServerManager powershell module
win_smtp_server	Module for managing IIS SMTP server configuration on Windows servers.
win_snmp	Module for managing SNMP service settings on Windows servers.
win_system	Management of Windows system information
win_update	Management of the windows update agent
win_wua	Installation of Windows Updates using the Windows Update Agent
winrepo	Manage Windows Package Repository
x509	Manage X509 Certificates

Continued on next page

Table 19.19 -- continued from previous page

xmpp	Sending Messages over XMPP
zabbix_host	Management of Zabbix hosts.
zabbix_hostgroup	Management of Zabbix host groups.
zabbix_mediatype	Management of Zabbix mediatypes.
zabbix_user	Management of Zabbix users.
zabbix_usergroup	Management of Zabbix user groups.
zcbuildout	Management of zc.buildout
zenoss	State to manage monitoring in Zenoss.
zk_concurrency	Control concurrency of steps within state execution using zookeeper
zfs	Management zfs datasets
zone	Management of Solaris Zones
zpool	Management zpool

19.19.1 salt.states.acme module

ACME / Let's Encrypt certificate management state

See also the module documentation

```
reload-gitlab:
  cmd.run:
    - name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab
```

salt.states.acme.**cert**(*name*, *aliases=None*, *email=None*, *webroot=None*, *test_cert=False*, *renew=None*, *keysize=None*, *server=None*, *owner='root'*, *group='root'*, *certname=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- **name** -- Common Name of the certificate (DNS name of certificate)
- **aliases** -- subjectAltNames (Additional DNS names on certificate)
- **email** -- e-mail address for interaction with ACME provider
- **webroot** -- True or a full path to webroot. Otherwise use standalone mode
- **test_cert** -- Request a certificate from the Happy Hacker Fake CA (mutually exclusive with `server')
- **renew** -- True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** -- RSA key bits
- **server** -- API endpoint to talk to
- **owner** -- owner of private key
- **group** -- group of private key
- **certname** -- Name of the certificate to save

19.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```
username:
  alias.present:
    - target: user@example.com
```

```
thomas:
  alias.present:
    - target: thomas@example.com
```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```
aliases.file: /my/alias/file
```

`salt.states.alias.`**`absent`**(*name*)

Ensure that the named alias is absent

name The alias to remove

`salt.states.alias.`**`present`**(*name*, *target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

name The local user/address to assign an alias to

target The forwarding address

19.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

`salt.states.alternatives.`**`auto`**(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>
name is the master name for this link group (e.g. pager)

salt.states.alternatives.**install**(*name*, *link*, *path*, *priority*)
Install new alternative for defined <name>
name is the master name for this link group (e.g. pager)
link is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)
path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)
priority is an integer; options with higher numbers have higher priority in automatic mode.

salt.states.alternatives.**remove**(*name*, *path*)
Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.
name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

salt.states.alternatives.**set**(*name*, *path*)
New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.
name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

19.19.4 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
            Order: Deny,Allow
            Deny from: all
            Allow from:
              - 127.0.0.1
              - 192.168.100.0/24
            Options:
              - Indexes
              - FollowSymlinks
            AllowOverride: All
```

19.19.5 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

salt.states.apache_conf.**disabled**(*name*)
Ensure an Apache conf is disabled.
name Name of the Apache conf

salt.states.apache_conf.**enabled**(*name*)
Ensure an Apache conf is enabled.
name Name of the Apache conf

19.19.6 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

salt.states.apache_module.**disabled**(*name*)
Ensure an Apache module is disabled.

New in version 2016.3.0.
name Name of the Apache module

salt.states.apache_module.**enabled**(*name*)
Ensure an Apache module is enabled.

New in version 2016.3.0.
name Name of the Apache module

19.19.7 salt.states.apache_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default

Disable default site:
  apache_site.disabled:
    - name: default
```

salt.states.apache_site.**disabled**(*name*)
Ensure an Apache site is disabled.
name Name of the Apache site

salt.states.apache_site.**enabled**(*name*)
Ensure an Apache site is enabled.
name Name of the Apache site

19.19.8 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

salt.states.aptpkg.**held**(*name*)
Set package in `hold' state, meaning it will not be upgraded.
name The name of the package, e.g., `tmux'

19.19.9 salt.states.archive

Extract an archive

New in version 2014.1.0.

salt.states.archive.**extracted**(*name*, *source*, *source_hash=None*, *source_hash_name=None*, *source_hash_update=False*, *skip_verify=False*, *password=None*, *options=None*, *list_options=None*, *force=False*, *overwrite=False*, *clean=False*, *user=None*, *group=None*, *if_missing=None*, *trim_output=False*, *use_cmd_unzip=None*, *extract_perms=True*, *enforce_toplevel=True*, *enforce_ownership_on=None*, *archive_format=None*, ***kwargs*)
New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - tar_options: --strip-components=1
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called *archive.list* to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

Important: ZIP Archive Handling

Note: this information applies to 2016.11.0 and later.

Salt has two different functions for extracting ZIP archives:

1. *archive.unzip*, which uses Python's zipfile module to extract ZIP files.
2. *archive.cmd_unzip*, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of *archive.cmd_unzip* when CLI options are specified (via the `options` argument), and will otherwise prefer the *archive.unzip* function. Use of *archive.cmd_unzip* can be forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of *archive.unzip*. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by *archive.cmd_unzip*) - When the `options` argument is used, *archive.cmd_unzip* is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an upstream bug in Python, permissions are not preserved when the zipfile module is used to extract an archive. As of the 2016.11.0 release, *archive.unzip* (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

---

name Directory into which the archive should be extracted

source Archive to be extracted

> **Note:** This argument uses the same syntax as its counterpart in the *file.managed* state.

source_hash Hash of source file, or file with list of hash-to-file mappings

> **Note:** This argument uses the same syntax as its counterpart in the *file.managed* state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the `source` URI. When managing a file with a `source` of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
  archive.extracted:
    - source: https://mydomain.tld/dir2/foo.tar.gz
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.tar.gz
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.11.0.

source_hash_update [False] Set this to `True` if archive should be extracted if source_hash has changed. This would extract regardless of the `if_missing` parameter.

New in version 2016.3.0.

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

keep_source [True] For `source` archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

keep [True] Same as `keep_source`, kept for backward-compatibility.

Note: If both `keep_source` and `keep` are used, `keep` will be ignored.

password **For ZIP archives only.** Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added *`archive.is_encrypted`* function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

options **For tar and zip archives only.** This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native tarfile/zipfile support to extract it. For zip archives, this argument is mostly used to overwrite exsiting files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar`/`unzip` implementation on the minion's OS.

New in version 2016.11.0: The `tar_options` and `zip_options` parameters have been deprecated in favor of a single argument name.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the xz CLI command and extracted using `tar xvf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

Note: For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f`/`--file` should *not* be used here.

---

tar_options Deprecated since version 2016.11.0: Use `options` instead.

zip_options New in version 2016.3.1.

Deprecated since version 2016.11.0: Use `options` instead.

list_options **For tar archives only.** This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` ``just works''. Archives compressed using gzip, bzip2, and xz/lzma (with the help of the xz CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

force [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option *very* carefully.

New in version 2016.11.0.

overwrite [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

clean [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

New in version 2016.11.1.

user The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce

ownership can be specified using the `enforce_ownership_on` argument.

group The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

if_missing If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if if is present.

trim_output [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

use_cmd_unzip [False] Set to `True` for zip files to force usage of the *archive.cmd_unzip* function to extract.

New in version 2016.11.0.

extract_perms [True] **For ZIP archives only.** When using *archive.unzip* to extract ZIP archives, Salt works around an upstream bug in Python to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

enforce_toplevel [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a `tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the `name` argument.

New in version 2016.11.0.

archive_format One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

Examples

1.tar with lmza (i.e. xz) compression:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
```

```
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
```

2.tar archive with flag for verbose output, and enforcement of user/group ownership:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.gz
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - options: v
    - user: foo
    - group: foo
```

3.tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```
graylog2-server:
  archive.extracted:
    - name: /opt/
    - source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
    - source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
    - source_hash_update: True
```

19.19.10 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.`**`downloaded`**(*name*, *artifact*, *target_dir='/tmp'*, *target_file=None*)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. It it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from artifactory. Various options are:

- artifactory_url: URL of the artifactory instance
- repository: Repository in artifactory
- artifact_id: Artifact ID
- group_id: Group ID
- packaging: Packaging
- classifier: Classifier .. versionadded:: 2015.8.0
- **version: Version** One of the following: - Version to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- username: Artifactory username .. versionadded:: 2015.8.0
- password: Artifactory password .. versionadded:: 2015.8.0

target_dir Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

target_file Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```
jboss_module_downloaded:
  artifactory.downloaded:
   - artifact:
       artifactory_url: http://artifactory.intranet.example.com/artifactory
       repository: 'libs-release-local'
```

```
      artifact_id: 'module'
      group_id: 'com.company.module'
      packaging: 'jar'
      classifier: 'sources'
      version: '1.0'
  - target_file: /opt/jboss7/modules/com/company/lib/module.jar
```

Download artifact to the folder (automatically resolves file name):

```
jboss_module_downloaded:
  artifactory.downloaded:
   - artifact:
       artifactory_url: http://artifactory.intranet.example.com/artifactory
       repository: 'libs-release-local'
       artifact_id: 'module'
       group_id: 'com.company.module'
       packaging: 'jar'
       classifier: 'sources'
       version: '1.0'
   - target_dir: /opt/jboss7/modules/com/company/lib
```

19.19.11 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.`**`absent`**(*name*, *jobid=None*, ***kwargs*)

Changed in version 2017.7.0.

Remove a job from queue
jobid: **string|int** Specific jobid to remove
tag [string] Job's tag
runas [string] Runs user-specified jobs
kwargs Addition kwargs can be provided to filter jobs. See output of *at.jobcheck* for more.

```
example1:
  at.absent:
```

> **Warning**: this will remove all jobs!

```
example2:
  at.absent:
    - year: 13
```

```
example3:
  at.absent:
    - tag: rose
```

```
example4:
  at.absent:
    - tag: rose
```

```
    - day: 13
    - hour: 16
```

```
example5:
  at.absent:
    - jobid: 4
```

salt.states.at.**mod_watch**(*name*, ***kwargs*)

The at watcher, called to invoke the watch command.

name The name of the atjob

salt.states.at.**present**(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*)

Changed in version 2017.7.0.

Add a job to queue.

job [string] Command to run.

timespec [string] The `timespec' follows the format documented in the at(1) manpage.

tag [string] Make a tag for the job.

user [string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
rose:
  at.present:
    - job: 'echo "I love saltstack" > love'
    - timespec: '9:09 11/09/13'
    - tag: love
    - user: jam
```

salt.states.at.**watch**(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*)

New in version 2017.7.0.

Add an at job if trigger by watch

job [string] Command to run.

timespec [string] The `timespec' follows the format documented in the at(1) manpage.

tag [string] Make a tag for the job.

user [string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```
minion_restart:
  at.watch:
    - job: 'salt-call --local service.restart salt-minion'
    - timespec: 'now +1 min'
    - tag: minion_restart
    - unique_tag: trye
    - watch:
        - file: /etc/salt/minion
```

19.19.12 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

Augeas can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with python-augeas, causing the augeas module to fail to import. If the minion has the augeas module installed, and the state fails with a comment saying that the state is unavailable, first restart the salt-minion service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.`**`change`**(*name*, *context=None*, *changes=None*, *lens=None*, *load_path=None*, ***kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

name State name

context A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary augeas path). This is used to avoid duplicating the file name for each item in the changes list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set maxmemory 1G
```

changes List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv`/`move`, `ins`/`insert`, and `rm`/`remove`.

lens The lens to use, needs to be suffixed with *.lns*, e.g.: *Nginx.lns*. See the list of stock lenses shipped with Augeas.

New in version 2016.3.0.

load_path A list of directories that modules should be searched in. This is in addition to the standard load path and the directories in AUGEAS_LENS_LIB.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
  augeas.change:
    - changes:
      - set /files/etc/redis/redis.conf/bind 0.0.0.0
```

Note: Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

```
      - set databases 4
      - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many preconfigured lenses that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
  augeas.change:
    - lens: redis
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

Note: Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
  augeas.change:
    - lens: services
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] zabbix-agent
      - set service-name[. = 'zabbix-agent']/#comment "Zabbix Agent service"
      - set service-name[. = 'zabbix-agent']/port 10050
      - set service-name[. = 'zabbix-agent']/protocol tcp
      - rm service-name[. = 'im-obsolete']
    - unless: grep "zabbix-agent" /etc/services
```

Warning: Don't forget the `unless` here, otherwise a new entry will be added every time this state is run.

19.19.13 salt.states.aws_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the awscli tool provided by Amazon. This can be downloaded from pip. Also check the documentation for awscli for configuration information.

```
myqueue:
    aws_sqs.exists:
        - region: eu-west-1
```

salt.states.aws_sqs.**absent**(*name*, *region*, *user=None*, *opts=False*)
Remove the named SQS queue if it exists.
name Name of the SQS queue.
region Region to remove the queue from
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

salt.states.aws_sqs.**exists**(*name*, *region*, *user=None*, *opts=False*)
Ensure the SQS queue exists.
name Name of the SQS queue.
region Region to create the queue
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

19.19.14 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - enable: False
    - salt-master: running
    - apache2: stopped

sh:
  beacon.present:

load:
  beacon.present:
    - 1m:
        - 0.0
        - 2.0
    - 5m:
        - 0.0
        - 1.5
    - 15m:
        - 0.1
        - 1.0
```

salt.states.beacon.**absent**(*name*, ***kwargs*)
Ensure beacon is absent.
name The name of the beacon ensured absent.

salt.states.beacon.**disabled**(*name*, ***kwargs*)
Disable a beacon.
name The name of the beacon to disable.

salt.states.beacon.**enabled**(*name*, ***kwargs*)
Enable a beacon.
name The name of the beacon to enable.

salt.states.beacon.**present**(*name*, ***kwargs*)
Ensure beacon is configured with the included beacon data.
name The name of the beacon ensure is configured.

19.19.15 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

maturity develop

platform f5_bigip_11.6

salt.states.bigip.**add_pool_member**(*hostname*, *username*, *password*, *name*, *member*)
A function to connect to a bigip device and add a new member to an existing pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The member to add to the pool

salt.states.bigip.**create_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)
A function to connect to a bigip device and create a monitor.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

salt.states.bigip.**create_node**(*hostname*, *username*, *password*, *name*, *address*)
Create a new node if it does not already exist.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to create
address The address of the node

salt.states.bigip.**create_pool**(*hostname*, *username*, *password*, *name*, *members=None*, *allow_nat=None*, *allow_snat=None*, *description=None*, *gateway_failsafe_device=None*, *ignore_persisted_weight=None*, *ip_tos_to_client=None*, *ip_tos_to_server=None*, *link_qos_to_client=None*, *link_qos_to_server=None*, *load_balancing_mode=None*, *min_active_members=None*, *min_up_members=None*, *min_up_members_action=None*, *min_up_members_checking=None*, *monitor=None*, *profiles=None*, *queue_depth_limit=None*, *queue_on_connection_limit=None*, *queue_time_limit=None*, *reselect_tries=None*, *service_down_action=None*, *slow_ramp_time=None*)
Create a new node if it does not already exist.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create

members List of members to be added to the pool

salt.states.bigip.**delete_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*)

Modify an existing monitor. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create

name The name of the monitor to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

salt.states.bigip.**delete_node**(*hostname*, *username*, *password*, *name*)
Delete an existing node.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node which will be deleted.

salt.states.bigip.**delete_pool**(*hostname*, *username*, *password*, *name*)
Delete an existing pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool which will be deleted

salt.states.bigip.**delete_pool_member**(*hostname*, *username*, *password*, *name*, *member*)
Delete an existing pool member.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to be modified
member The name of the member to delete from the pool

salt.states.bigip.**delete_profile**(*hostname*, *username*, *password*, *profile_type*, *name*)
Modify an existing profile. If it does exists, only the parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

salt.states.bigip.**delete_virtual**(*hostname*, *username*, *password*, *name*)
Delete an existing virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual which will be deleted

salt.states.bigip.**list_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*)
A function to list an exsiting monitor.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to list
name The name of the monitor to list

salt.states.bigip.**list_node**(*hostname*, *username*, *password*, *name*)
A function to connect to a bigip device and list a specific node.
hostname The host/address of the bigip device

username The iControl REST username
password The iControl REST password
name The name of the node to list.

salt.states.bigip.**list_pool**(*hostname*, *username*, *password*, *name*)
A function to connect to a bigip device and list a specific pool.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to list.

salt.states.bigip.**list_profile**(*hostname*, *username*, *password*, *profile_type*, *name*)
A function to list an existing profile.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to list
name The name of the profile to list

salt.states.bigip.**list_virtual**(*hostname*, *username*, *password*, *name*)
A function to list a specific virtual.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to list

salt.states.bigip.**manage_monitor**(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)
Create a new monitor if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
monitor_type The type of monitor to create
name The name of the monitor to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

salt.states.bigip.**manage_node**(*hostname*, *username*, *password*, *name*, *address*, *connection_limit=None*, *description=None*, *dynamic_ratio=None*, *logging=None*, *monitor=None*, *rate_limit=None*, *ratio=None*, *session=None*, *node_state=None*)
Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the node to manage.
address The address of the node
connection_limit [integer]
description [string]
dynam c_ratio: [integer]
logging [enabled | disabled]

salt.states.bigip.**manage_pool_members**(*hostname*, *username*, *password*, *name*, *members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify

members list of pool members to manage.

salt.states.bigip.**manage_profile**(*hostname*, *username*, *password*, *profile_type*, *name*, ***kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exists, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

salt.states.bigip.**manage_virtual**(*hostname*, *username*, *password*, *name*, *destination*, *pool=None*, *address_status=None*, *auto_lasthop=None*, *bwc_policy=None*, *cmp_enabled=None*, *connection_limit=None*, *dhcp_relay=None*, *description=None*, *fallback_persistence=None*, *flow_eviction_policy=None*, *gtm_score=None*, *ip_forward=None*, *ip_protocol=None*, *internal=None*, *twelve_forward=None*, *last_hop_pool=None*, *mask=None*, *mirror=None*, *nat64=None*, *persist=None*, *profiles=None*, *policies=None*, *rate_class=None*, *rate_limit=None*, *rate_limit_mode=None*, *rate_limit_dst=None*, *rate_limit_src=None*, *rules=None*, *related_rules=None*, *reject=None*, *source=None*, *source_address_translation=None*, *source_port=None*, *virtual_state=None*, *traffic_classes=None*, *translate_address=None*, *translate_port=None*, *vlans=None*)

Manage a virtual server. If a virtual does not exists it will be created, otherwise only the parameters specified will be enforced.

slow_ramp_time [integer]

salt.states.bigip.**modify_pool_member**(*hostname*, *username*, *password*, *name*, *member*, *connection_limit=None*, *description=None*, *dynamic_ratio=None*, *inherit_profile=None*, *logging=None*, *monitor=None*, *priority_group=None*, *profiles=None*, *rate_limit=None*, *ratio=None*, *session=None*, *member_state=None*)

A function to connect to a bigip device and modify a member of an existing pool.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
member The member modify

connection_limit [integer]
description [string]
dynamic_ratio [integer]
inherit_profile [enabled | disabled]
logging [enabled | disabled]
monitor [name]
priority_group [integer]
profiles [none | profile_name]
rate_limit [integer]
ratio [integer]
session [user-enabled | user-disabled]
member_state (state) [user-up | user-down]

salt.states.bigip.**modify_profile**(*hostname*, *username*, *password*, *profile_type*, *name*, ***kwargs*)
Modify an existing profile. If it does exists, only the parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

salt.states.bigip.**modify_virtual**(*hostname*, *username*, *password*, *name*, *destination*, *pool=None*, *address_status=None*, *auto_lasthop=None*, *bwc_policy=None*, *cmp_enabled=None*, *connection_limit=None*, *dhcp_relay=None*, *description=None*, *fallback_persistence=None*, *flow_eviction_policy=None*, *gtm_score=None*, *ip_forward=None*, *ip_protocol=None*, *internal=None*, *twelve_forward=None*, *last_hop_pool=None*, *mask=None*, *mirror=None*, *nat64=None*, *persist=None*, *profiles=None*, *policies=None*, *rate_class=None*, *rate_limit=None*, *rate_limit_mode=None*, *rate_limit_dst=None*, *rate_limit_src=None*, *rules=None*, *related_rules=None*, *reject=None*, *source=None*, *source_address_translation=None*, *source_port=None*, *virtual_state=None*, *traffic_classes=None*, *translate_address=None*, *translate_port=None*, *vlans=None*)
Modify an virtual server. modify an existing virtual. Only parameters specified will be enforced.
hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the virtual to create
destination [[virtual_address_name:port] | [ipv4:port] | [ipv6.port]]
pool [[pool_name] | none]
address_status [yes | no]
auto_lasthop [default | enabled | disabled]
bwc_policy [none] | string]
cmp_enabled [yes | no]
dhcp_relay [yes | no}
connection_limit [integer]

vlan_ids [list]
enabled [true | false]

19.19.16 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

salt.states.blockdev.**formatted**(*name*, *fs_type='ext4'*, *force=False*, ***kwargs*)
Manage filesystems of partitions.
name The name of the block device
fs_type The filesystem it should be formatted as

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.`**`tuned`**(*name*, ***kwargs*)

Manage options of block device

name The name of the block device

opts:

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

19.19.17 salt.states.boto3_elasticache module

Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent (``intentionally ignorant'' is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
```

```
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
# Using a profile from pillars
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile
```

```
# Passing in a profile
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto3_elasticache.**cache_cluster_absent**(*name*, *wait=600*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Ensure a given cache cluster is deleted.

name Name of the cache cluster.

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

CacheClusterId The node group (shard) identifier. Note: In general this parameter is not needed, as `name' is used if it's not provided.

FinalSnapshotIdentifier The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.**cache_cluster_present**(*name*, *wait=900*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Ensure a given cache cluster exists.

name Name of the cache cluster (cache cluster id).

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

CacheClusterId The node group (shard) identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as `name' is used if it's not provided.

ReplicationGroupId The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified replication group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

AZMode Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

Note: This parameter is ONLY supported for Memcached cache clusters.

PreferredAvailabilityZone The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

PreferredAvailabilityZones A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

Note: This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

NumCacheNodes The initial (integer) number of cache nodes that the cache cluster has.

Note: For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at https://aws.amazon.com/elasticache/pricing/

Note:

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

Engine The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

EngineVersion The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

CacheSubnetGroupName The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

CacheSecurityGroupNames A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

SecurityGroupIds One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Tags A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotName The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

Note: This parameter is ONLY valid if the Engine parameter is redis.

PreferredMaintenanceWindow Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port The port number on which each of the cache nodes accepts connections.

Default: 6379

NotificationTopicArn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

Note: The Amazon SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade This (boolean) parameter is currently disabled.

SnapshotRetentionLimit The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is ONLY valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server.

Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: `/', `"', or ``@''.

CacheNodeIdsToRemove A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

NewAvailabilityZones The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.**cache_subnet_group_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Ensure a given cache subnet group is deleted.

name Name of the cache subnet group.

CacheSubnetGroupName A name for the cache subnet group. Note: In general this parameter is not needed, as `name' is used if it's not provided.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.**cache_subnet_group_present**(*name*, *subnets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Ensure cache subnet group exists.
name A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.
subnets A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.
CacheSubnetGroupName A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as `name' is used if it's not provided.
CacheSubnetGroupDescription A description for the cache subnet group.
SubnetIds A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with `subnets' above.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.**replication_group_absent**(*name*, *wait=600*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Ensure a given replication group is deleted.
name Name of the replication group.
wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.
ReplicationGroupId The replication group identifier. Note: In general this parameter is not needed, as `name' is used if it's not provided.
RetainPrimaryCluster If set to true, all of the read replicas are deleted, but the primary node is retained.
FinalSnapshotIdentifier The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto3_elasticache.**replication_group_present**(*name*, *wait=900*, *security_groups=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***args*)

Ensure a replication group exists and is in the given state.
name Name of replication group
wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting

for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

ReplicationGroupId The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as `name' is used if it's not provided.

ReplicationGroupDescription A user-created description for the replication group.

PrimaryClusterId The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

AutomaticFailoverEnabled Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false, Multi-AZ is disabled for this replication group.

Default: False

Note: AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
- Redis (cluster mode disabled): T1 and T2 node types.
- Redis (cluster mode enabled): T2 node types.

NumCacheClusters The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled , the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

PreferredCacheClusterAZs A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

Note: If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

NumNodeGroups An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

ReplicasPerNodeGroup An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

NodeGroupConfiguration A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). See https://aws.amazon.com/elasticache/pricing/ for current sizing, prices, and constraints.

Engine The name of the cache engine to be used for the cache clusters in this replication group.

EngineVersion The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

Note: If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use CacheParameterGroupName=default.redis3.2

To create a Redis (cluster mode enabled) replication group, use CacheParameterGroupName=default.redis3.2.cluster.on

---

CacheSubnetGroupName The name of the cache subnet group to be used for the replication group.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a s group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

CacheSecurityGroupNames A list of cache security group names to associate with this replication group.

SecurityGroupIds One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

Tags A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for Elasticache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotName The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

PreferredMaintenanceWindow Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port The port number on which each member of the replication group accepts connections.

NotificationTopicArn The ARN of an SNS topic to which notifications are sent.

> **Note:** The SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade This parameter is currently disabled.

SnapshotRetentionLimit The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

> **Note:** This parameter is only valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

> **Note:** This parameter is only valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: `/', `"', or ``@'.

SnapshottingClusterId The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.18 salt.states.boto3_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
An exciting new AWS Route 53 Hosted Zone:
  boto_route53.hosted_zone_present:
    - Name: example.com.
    - PrivateZone: true
    - VPCs:
      - VPCName: MyLittleVPC
        VPCRegion: us-east-1
      - VPCId: vpc-12345678
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

mycnamerecord:
  boto_route53.rr_present:
    - Name: test.example.com.
    - ResourceRecords:
      - my-elb.us-east-1.elb.amazonaws.com.
    - DomainName: example.com.
    - TTL: 60
    - Type: CNAME
    - region: us-east-1

    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto3_route53.**hosted_zone_absent**(*name*, *Name=None*, *PrivateZone=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

name The name of the state definition.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of name will be used.

PrivateZone Set True if deleting a private hosted zone.

salt.states.boto3_route53.**hosted_zone_present**(*name*, *Name=None*, *PrivateZone=False*, *CallerReference=None*, *Comment=None*, *VPCs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a hosted zone exists with the given attributes.

name The name of the state definition. This will be used as the `CallerReference' param when creating the hosted zone to help ensure idempotency.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of name will be used.

PrivateZone Set True if creating a private hosted zone. If true, then `VPCs' is also required.

Comment Any comments you want to include about the hosted zone.

CallerReference A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with

the same CallerReference. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

VPCs A list of dicts, each dict composed of a VPCRegion, and either a VPCId or a VPCName. Note that this param is ONLY used if PrivateZone == True

VPCId When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCName.

VPCName When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with VPCId.

VPCRegion When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from VPCId or VPCName, if possible. This will fail if a given VPCName exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for VPCRegion.

salt.states.boto3_route53.**rr_absent**(*name*, *HostedZoneId=None*, *DomainName=None*, *PrivateZone=False*, *Name=None*, *Type=None*, *SetIdentifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 record is deleted.

name The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId The ID of the zone to delete the record from. Exclusive with DomainName.

DomainName The domain name of the zone to delete the record from. Exclusive with HostedZoneId.

PrivateZone Set to True if the RR to be removed is in a private zone, False if public.

Name Name of the resource record.

Type The record type (A, NS, MX, TXT, etc.)

SetIdentifier Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

salt.states.boto3_route53.**rr_present**(*name*, *HostedZoneId=None*, *DomainName=None*, *PrivateZone=False*, *Name=None*, *Type=None*, *SetIdentifier=None*, *Weight=None*, *Region=None*, *GeoLocation=None*, *Failover=None*, *TTL=None*, *ResourceRecords=None*, *AliasTarget=None*, *HealthCheckId=None*, *TrafficPolicyInstanceId=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 record is present.

name The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId The ID of a zone to create the record in. Exclusive with DomainName.

DomainName The domain name of a zone to create the record in. Exclusive with HostedZoneId.

PrivateZone Set to True if the resource record should be in a private zone, False if public.

Name Name of the Route 53 resource record being managed.

Type The record type (A, NS, MX, TXT, etc.)

SetIdentifier Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

Weight Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the

weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover in the Amazon Route 53 Developer Guide.

Region Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

GeoLocation Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a Type of A and a ContinentCode of AF.

```
ContinentCode
    The two-letter code for the continent.
    Valid values: AF | AN | AS | EU | OC | NA | SA
    Constraint: Specifying ContinentCode with either CountryCode or
↪SubdivisionCode
                returns an InvalidInput error.
CountryCode
    The two-letter code for the country.
SubdivisionCode
    The code for the subdivision, for example, a state in the United States
↪or a
    province in Canada.
```

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value * in the CountryCode element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of CountryCode is *, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you don't create a * resource record set, Amazon Route 53 returns a ``no answer'' response for

queries from those locations.
- You can't create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

TTL The resource record cache time to live (TTL), in seconds. Note the following:
- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

ResourceRecords A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see Supported DNS Resource Record Types in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass ``magic'' strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

`magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'

This tells salt to lookup an EC2 instance with a tag `some_tag_name' which has the value `some_string' and substitute the `some_instance_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to getattr(instance, `attribute') as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automgically create Route 53 records for them.

AliasTarget The rules governing how to define an AliasTarget for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the Boto 3 Route 53 page and/or the AWS Route 53 docs and suss them for yourself - I sure won't claim to understand them partcularly well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

19.19.19 salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure Apigateway API exists:
  boto_apigateway.present:
    - name: myfunction
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_apigateway.**absent**(*name*, *api_name*, *stage_name*, *nuke_api=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the stage_name associated with the given api_name deployed by boto_apigateway's present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.

name Name of the swagger file in YAML format

api_name Name of the rest api on AWS ApiGateway to ensure is absent.

stage_name Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.

nuke_api If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_apigateway.**present**(*name*, *api_name*, *swagger_file*, *stage_name*, *api_key_required*, *lambda_integration_role*, *lambda_region=None*, *stage_variables=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *lambda_funcname_format='{stage}_{api}_{resource}_{method}'*, *authorization_type='NONE'*, *error_response_template=None*, *response_template=None*)

Ensure the spcified api_name with the corresponding swaggerfile is deployed to the given stage_name in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{
    "api_name": api_name,
    "swagger_file": basename_of_swagger_file
    "swagger_file_md5sum": md5sum_of_swagger_file,
    "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided lambda_funcname_format parameters:

- the default lambda_funcname_format is a string with the following substitutable keys: ``{stage}_{api}_{resource}_{method}''. The user can choose to reorder the known keys.
- the stage key corresponds to the stage_name passed in.
- the api key corresponds to the api_name passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.

For the default lambda_funcname_format, given the following input:

```
api_name = '  Test    Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: `test_service_alpha_a_b_c_post'

The canconicalization of these input parameters is done in the following order:

1. lambda_funcname_format is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with `_'
5. consecutive `_' are replaced with `_'

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in errorMessage field to aid the response mapping from Lambda to the proper error return status codes.

```
Error:
  type: object
  properties:
    stackTrace:
      type: array
      items:
        type: array
        items:
          type: string
      description: call stack
  errorType:
    type: string
    description: error type
  errorMessage:
    type: string
    description: |
      Error message, will be matched based on pattern.
      If no pattern is specified, the default pattern used for response mapping
 ↪will be +*.
```

name The name of the state definition

api_name The name of the rest api that we want to ensure exists in AWS API Gateway

swagger_file Name of the location of the swagger rest api definition file in YAML format.

stage_name Name of the stage we want to be associated with the given api_name and swagger_file definition

api_key_required True or False - whether the API Key is required to call API methods

lambda_integration_role The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

lambda_region The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. lambda_region as passed in (is not None)
2. if lambda_region is None, use the region as if a boto_lambda function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by boto_apigateway functions, a final lookup will be attempted using the boto_apigateway region.

stage_variables A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. {`string': `string'}

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

lambda_funcname_format Please review the earlier example for the usage. The only substituable keys in the funcname format are {stage}, {api}, {resource}, {method}. Any other keys or positional subsitution parameters will be flagged as an invalid input.

authorization_type This field can be either `NONE', or `AWS_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to `NONE'

error_response_template String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html

If set to None, the following default value is used:

```
'#set($inputRoot = $input.path('$'))\n'
'{\n'
'  "errorMessage" : "$inputRoot.errorMessage",\n'
'  "errorType" : "$inputRoot.errorType",\n'
'  "stackTrace" : [\n'
'#foreach($stackTrace in $inputRoot.stackTrace)\n'
'    [\n'
'#foreach($elem in $stackTrace)\n'
'      "$elem"\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'    ]\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'  ]\n'
```

New in version 2017.7.0.

response_template String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({}) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

salt.states.boto_apigateway.**usage_plan_absent**(*name*, *plan_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

name name of the state

plan_name name of the plan to remove

```
usage plan absent:
  boto_apigateway.usage_plan_absent:
    - plan_name: my_usage_plan
    - profile: my_profile
```

salt.states.boto_apigateway.**usage_plan_association_absent**(*name*, *plan_name*, *api_stages*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is removed from provided api_stages If a plan is associated to stages not listed in api_stages parameter, those associations remain intact.

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

- **apiId** apiId of the api to detach usage plan from
- **stage** stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
  boto_apigateway.usage_plan_association_absent:
    - plan_name: my_plan
    - api_stages:
      - apiId: 9kb0404ec0
        stage: my_stage
      - apiId: l9v7o2aj90
        stage: my_stage
    - profile: my_profile
```

salt.states.boto_apigateway.**usage_plan_association_present**(*name*, *plan_name*, *api_stages*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is added to provided api_stages

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

- **apiId** apiId of the api to attach usage plan to
- **stage** stage name of the api to attach usage plan to

```
UsagePlanAssociationPresent:
  boto_apigateway.usage_plan_association_present:
    - plan_name: my_plan
    - api_stages:
      - apiId: 9kb0404ec0
        stage: my_stage
```

```
      - apiId: l9v7o2aj90
        stage: my_stage
    - profile: my_profile
```

salt.states.boto_apigateway.**usage_plan_present**(*name*, *plan_name*, *description=None*, *throttle=None*, *quota=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the spcifieda usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

name name of the state

plan_name [Required] name of the usage plan

throttle [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

rateLimit rate per second at which capacity bucket is populated

burstLimit maximum rate allowed

quota [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

limit [Required] number of calls permitted per quota period

offset [Optional] number of calls to be subtracted from the limit at the beginning of the period

period [Required] period to which quota applies. Must be DAY, WEEK or MONTH

```
UsagePlanPresent:
  boto_apigateway.usage_plan_present:
    - plan_name: my_usage_plan
    - throttle:
        rateLimit: 70
        burstLimit: 100
    - quota:
        limit: 1000
        offset: 0
        period: DAY
    - profile: my_profile
```

19.19.20 salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - suspended_processes:
        - AddToLoadBalancer
        - AlarmNotification
    - scaling_policies
        - adjustment_type: ChangeInCapacity
        - as_name: api-production-iad
        - cooldown: 1800
        - min_adjustment_step: None
        - name: ScaleDown
        - scaling_adjustment: -1
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
```

```
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:
  boto_asg.absent:
    - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True
```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms:
        CPU:
          name: 'ASG CPU **MANAGED BY SALT**'
          attributes:
            metric: CPUUtilization
            namespace: AWS/EC2
            statistic: Average
            comparison: '>='
            threshold: 65.0
            period: 60
            evaluation_periods: 30
            unit: null
            description: 'ASG CPU'
            alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
            insufficient_data_actions: []
            ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_asg_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```
my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
```

```
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
```

Overriding the alarm values on the resource:

```
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile
    - alarms_from_pillar: my_asg_alarm
    # override CPU:attributes:threshold
    - alarms:
        CPU:
          attributes:
            threshold: 50.0
```

salt.states.boto_asg.**absent**(*name*, *force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *remove_lc=False*)

Ensure the named autoscale group is deleted.

name Name of the autoscale group.

force Force deletion of autoscale group.

remove_lc Delete the launch config as well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_asg.**present**(*name*, *launch_config_name*, *availability_zones*, *min_size*, *max_size*, *launch_config=None*, *desired_capacity=None*, *load_balancers=None*, *default_cooldown=None*, *health_check_type=None*, *health_check_period=None*, *placement_group=None*, *vpc_zone_identifier=None*, *subnet_names=None*, *tags=None*, *termination_policies=None*, *termination_policies_from_pillar='boto_asg_termination_policies'*, *suspended_processes=None*, *scaling_policies=None*, *scaling_policies_from_pillar='boto_asg_scaling_policies'*, *scheduled_actions=None*, *scheduled_actions_from_pillar='boto_asg_scheduled_actions'*, *alarms=None*, *alarms_from_pillar='boto_asg_alarms'*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *notification_arn=None*, *notification_arn_from_pillar='boto_asg_notification_arn'*, *notification_types=None*, *notification_types_from_pillar='boto_asg_notification_types'*)

Ensure the autoscale group exists.

name Name of the autoscale group.

launch_config_name Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

launch_config A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```
my_asg:
  boto_asg.present:
  - launch_config:
    - ebs_optimized: false
    - instance_profile_name: my_iam_profile
    - kernel_id: ''
    - ramdisk_id: ''
    - key_name: my_ssh_key
    - image_name: aws2015091-hvm
    - instance_type: c3.xlarge
    - instance_monitoring: false
    - security_groups:
      - my_sec_group_01
      - my_sec_group_02
```

availability_zones List of availability zones for the group.

min_size Minimum size of the group.

max_size Maximum size of the group.

desired_capacity The desired capacity of the group.

load_balancers List of load balancers for the group. Once set this can not be updated (Amazon restriction).

default_cooldown Number of seconds after a Scaling Activity completes before any further scaling activities can start.

health_check_type The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

health_check_period Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

placement_group Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

vpc_zone_identifier A list of the subnet identifiers of the Virtual Private Cloud.

subnet_names For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with vpc_zone_identifier.

tags A list of tags. Example:

```
- key: 'key'
  value: 'value'
  propagate_at_launch: true
```

termination_policies A list of termination policies. Valid values are:

- `OldestInstance`
- `NewestInstance`
- `OldestLaunchConfiguration`
- `ClosestToNextInstanceHour`
- `Default`

If no value is specified, the `Default` value is used.

termination_policies_from_pillar: name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

suspended_processes List of processes to be suspended. see http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html

scaling_policies List of scaling policies. Each policy is a dict of key-values described by https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy

scaling_policies_from_pillar: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

scheduled_actions: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```
- scheduled_actions:
    scale_up_at_10:
        desired_capacity: 4
        min_size: 3
        max_size: 5
        recurrence: "0 9 * * 1-5"
    scale_down_at_7:
        desired_capacity: 1
        min_size: 1
        max_size: 1
        recurrence: "0 19 * * 1-5"
```

scheduled_actions_from_pillar: name of pillar dict that contains scheduled_actions settings. Scheduled actions for this specific state will override those from pillar.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the *`salt.states.boto_cloudwatch_alarm`* state for information about these attributes.

If any alarm actions include ":self:" this will be replaced with the asg name. For example, alarm_actions reading ``['scaling_policy:self:ScaleUp']" will map to the arn for this asg's scaling policy named ``ScaleUp". In addition, any alarms that have only scaling_policy as actions will be ignored if min_size is equal to max_size for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

notification_arn The AWS arn that notifications will be sent to

notification_arn_from_pillar name of the pillar dict that contains `notifcation_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

notification_types A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`

- autoscaling:EC2_INSTANCE_LAUNCH_ERROR
- autoscaling:EC2_INSTANCE_TERMINATE
- autoscaling:EC2_INSTANCE_TERMINATE_ERROR
- autoscaling:TEST_NOTIFICATION

notification_types_from_pillar name of the pillar dict that contains `notifcation_types` settings. `notification_types` defined for this specific state will override those from the pillar.

19.19.21 salt.states.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

depends boto

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
    - disable_rollback: true
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
stack-absent:
  boto_cfn.absent:
    - name: mystack
```

`salt.states.boto_cfn.`**`absent`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cfn.**present**(*name*, *template_body=None*, *template_url=None*, *parameters=None*, *notification_arns=None*, *disable_rollback=None*, *timeout_in_minutes=None*, *capabilities=None*, *tags=None*, *on_failure=None*, *stack_policy_body=None*, *stack_policy_url=None*, *use_previous_template=None*, *stack_policy_during_update_body=None*, *stack_policy_during_update_url=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template_body (string) – Structure containing the template body. Can also be loaded from a file by using salt://.

template_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the SNS_console or your Command Line Interface (CLI).

disable_rollback (bool) – Indicates whether or not to rollback on failure.

timeout_in_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY_IAM'.

tags (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

on_failure (string) – Determines what action will be taken if stack creation fails. This must be one of: DO_NOTHING, ROLLBACK, or DELETE. You can specify either OnFailure or DisableRollback, but not both.

stack_policy_body (string) – Structure containing the stack policy body. Can also be loaded from a file by using salt://.

stack_policy_url (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack.If you pass StackPolicyBody and StackPolicyURL, only StackPolicyBody is used.

use_previous_template (boolean) – Used only when templates are not the same. Set to True to use the previous template instead of uploading a new one via TemplateBody or TemplateURL.

stack_policy_during_update_body (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used. Can also be loaded from a file by using salt://.

stack_policy_during_update_url (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass StackPolicyDuringUpdateBody and StackPolicyDuringUpdateURL, only StackPolicyDuringUpdateBody is used.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.22 salt.states.boto_cloudtrail module

Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure trail exists:
    boto_cloudtrail.present:
        - Name: mytrail
        - S3BucketName: mybucket
        - S3KeyPrefix: prefix
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_cloudtrail.**absent**(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail with passed properties is absent.

name The name of the state definition.

Name Name of the trail.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudtrail.**present**(*name*, *Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=True*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=False*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *LoggingEnabled=True*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

name The name of the state definition

Name Name of the trail.

S3BucketName Specifies the name of the Amazon S3 bucket designated for publishing log files.

S3KeyPrefix Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

SnsTopicName Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

IncludeGlobalServiceEvents Specifies whether the trail is publishing events from global services such as IAM to the log files.

EnableLogFileValidation Specifies whether log file integrity validation is enabled. The default is false.

CloudWatchLogsLogGroupArn Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify CloudWatchLogsRoleArn.

CloudWatchLogsRoleArn Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

KmsKeyId Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be a an alias name prefixed by ``alias/'', a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

LoggingEnabled Whether logging should be enabled for the trail

Tags A dictionary of tags that should be set on the trail

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.23 salt.states.boto_cloudwatch_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
my test alarm:
  boto_cloudwatch_alarm.present:
    - name: my test alarm
    - attributes:
        metric: ApproximateNumberOfMessagesVisible
        namespace: AWS/SQS
        statistic: Average
        comparison: ">="
        threshold: 20000.0
        period: 60
        evaluation_periods: 1
        description: test alarm via salt
        dimensions:
          QueueName:
            - the-sqs-queue-name
        alarm_actions:
          - arn:aws:sns:us-east-1:1111111:myalerting-action
```

salt.states.boto_cloudwatch_alarm.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named cloudwatch alarm is deleted.

name Name of the alarm.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cloudwatch_alarm.**present**(*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cloudwatch alarm exists.

name Name of the alarm

attributes A dict of key/value cloudwatch alarm attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.24 salt.states.boto_cloudwatch_event module

Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure event rule exists:
    boto_cloudwatch_event.present:
        - Name: mytrail
        - ScheduleExpression: 'rate(120 minutes)'
        - State: 'DISABLED'
        - Targets:
          - Id: "target1"
            Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
            Input: '{"arbitrary": "json"}'
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_cloudwatch_event.`**`absent`**(*name*, *Name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure CloudWatch event rule with passed properties is absent.

name The name of the state definition.

Name Name of the event rule. Defaults to the value of the `name' param if not provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_event.`**`present`**(*name*, *Name=None*, *ScheduleExpression=None*, *EventPattern=None*, *Description=None*, *RoleArn=None*, *State=None*, *Targets=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

name The name of the state definition

Name Name of the event rule. Defaults to the value of the `name' param if not provided.

ScheduleExpression The scheduling expression. For example, `cron(0 20 * * ? *)`, ``rate(5 minutes)''

EventPattern The event pattern.

Description A description of the rule

State Indicates whether the rule is ENABLED or DISABLED.

RoleArn The Amazon Resource Name (ARN) of the IAM role associated with the rule.

Targets A list of rresources to be invoked when the rule is triggered.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.25 salt.states.boto_cognitoidentity module

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure function exists:
    boto_cognitoidentity.pool_present:
        - PoolName: my_identity_pool
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_cognitoidentity.`**`pool_absent`**(*name*, *IdentityPoolName*, *RemoveAllMatched=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure cognito identity pool with passed properties is absent.
name The name of the state definition.
IdentityPoolName Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.
RemoveAllMatched If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_cognitoidentity.**pool_present**(*name*, *IdentityPoolName*, *AuthenticatedRole*, *AllowUnauthenticatedIdentities=False*, *UnauthenticatedRole=None*, *SupportedLoginProviders=None*, *DeveloperProviderName=None*, *OpenIdConnectProviderARNs=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure Cognito Identity Pool exists.

name The name of the state definition

IdentityPoolName Name of the Cognito Identity Pool

AuthenticatedRole An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

AllowUnauthenticatedIdentities Whether to allow anonymous user identities

UnauthenticatedRole An IAM role name or ARN that will be associated with anonymous user identities

SupportedLoginProviders A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

DeveloperProviderName A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

OpenIdConnectProviderARNs A list or pillar name that contains a list of OpenID Connect provider ARNs.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.26 salt.states.boto_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure daily data pipeline exists:
  boto_datapipeline.present:
    - name: my-datapipeline
    - pipeline_objects:
        DefaultSchedule:
          name: Every 1 day
          fields:
            period: 1 Day
            type: Schedule
            startAt: FIRST_ACTIVATION_DATE_TIME
    - parameter_values:
        myDDBTableName: my-dynamo-table
```

salt.states.boto_datapipeline.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the service_name does not exist

name Name of the service to ensure a data pipeline does not exist for.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_datapipeline.**present**(*name*, *pipeline_objects=None*, *pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects'*, *parameter_objects=None*, *parameter_objects_from_pillars='boto_datapipeline_parameter_objects'*, *parameter_values=None*, *parameter_values_from_pillars='boto_datapipeline_parameter_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

name Name of the service to ensure a data pipeline exists for.

pipeline_objects Pipeline objects to use. Will override objects read from pillars.

pipeline_objects_from_pillars The pillar key to use for lookup.

parameter_objects Parameter objects to use. Will override objects read from pillars.

parameter_objects_from_pillars The pillar key to use for lookup.

parameter_values Parameter values to use. Will override values read from pillars.

parameter_values_from_pillars The pillar key to use for lookup.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.27 salt.states.boto_dynamodb

Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure DynamoDB table does not exist:
  boto_dynamodb.absent:
    - table_name: new_table
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1

Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - table_name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
    - local_indexes:
        - index:
            - name: "primary_id_end_timestamp_index"
            - hash_key: primary_id
            - hash_key_data_type: N
            - range_key: end_timestamp
            - range_key_data_type: N
    - global_indexes:
        - index:
            - name: "name_end_timestamp_index"
            - hash_key: name
            - hash_key_data_type: S
            - range_key: end_timestamp
            - range_key_data_type: N
            - read_capacity_units: 3
            - write_capacity_units: 4
```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

```
Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - alarms:
        ConsumedWriteCapacityUnits:
           name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
           attributes:
             metric: ConsumedWriteCapacityUnits
             namespace: AWS/DynamoDB
             statistic: Sum
             comparison: '>='
             # threshold_percent is used to calculate the actual threshold
             # based on the provisioned capacity for the table.
             threshold_percent: 0.75
             period: 300
             evaluation_periods: 2
             unit: Count
             description: 'DynamoDB ConsumedWriteCapacityUnits'
             alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
             insufficient_data_actions: []
             ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_dynamodb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

Ensure DynamoDB table exists:
  boto_dynamodb.present:
```

```
    - name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - alarms:
         ConsumedWriteCapacityUnits:
            attributes:
              threshold_percent: 0.90
              period: 900
```

exception salt.states.boto_dynamodb.**GsiNotUpdatableError**

Raised when a global secondary index cannot be updated.

salt.states.boto_dynamodb.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the DynamoDB table does not exist.

name Name of the DynamoDB table.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_dynamodb.**present**(*name=None*, *table_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *read_capacity_units=None*, *write_capacity_units=None*, *alarms=None*, *alarms_from_pillar='boto_dynamodb_alarms'*, *hash_key=None*, *hash_key_data_type=None*, *range_key=None*, *range_key_data_type=None*, *local_indexes=None*, *global_indexes=None*, *backup_configs_from_pillars='boto_dynamodb_backup_configs'*)

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

name Name of the DynamoDB table

table_name Name of the DynamoDB table (deprecated)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

read_capacity_units The read throughput for this table

write_capacity_units The write throughput for this table

hash_key The name of the attribute that will be used as the hash key for this table

hash_key_data_type The DynamoDB datatype of the hash key

range_key The name of the attribute that will be used as the range key for this table

range_key_data_type The DynamoDB datatype of the range key

local_indexes The local indexes you would like to create

global_indexes The global indexes you would like to create

backup_configs_from_pillars Pillars to use to configure DataPipeline backups

19.19.28 salt.states.boto_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - save_private: /root/
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
import-key-pair:
   boto_ec2.key_present:
    - name: mykeypair
    - upload_public: 'ssh-rsa AAAA'
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
   boto_ec2.key_present:
    - name: mykeypair
    - upload_public: salt://mybase/public_key.pub
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

The below code deletes a key pair:

```
delete-key-pair:
  boto_ec2.key_absent:
    - name: mykeypair
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_ec2.**eni_absent**(*name*, *release_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

name Name tag associated with the ENI.

release_eip True/False - release any EIP associated with the ENI

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.**eni_present**(*name*, *subnet_id=None*, *subnet_name=None*, *private_ip_address=None*, *description=None*, *groups=None*, *source_dest_check=True*, *allocate_eip=None*, *arecords=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

name Name tag associated with the ENI.

subnet_id The VPC subnet ID the ENI will exist within.

subnet_name The VPC subnet name the ENI will exist within.

private_ip_address The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

description Description of the key.

groups A list of security groups to apply to the ENI.

source_dest_check Boolean specifying whether source/destination checking is enabled on the ENI.

allocate_eip allocate and associate an EIP to the ENI. Could be `standard' to allocate Elastic IP to EC2 region or `vpc' to get it for a particular VPC

Changed in version 2016.11.0.

arecords A list of arecord dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set `public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.**instance_absent**(*name*, *instance_name=None*, *instance_id=None*, *release_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *filters=None*)

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

name (string) - The name of the state definition.

instance_name (string) - The name of the instance.

instance_id (string) - The ID of the instance.

release_eip (bool) - Release any associated EIPs during termination.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

filters (dict) - A dict of additional filters to use in matching the instance to delete.

YAML example fragment:

```
- filters:
    vpc-id: vpc-abcdef12
```

salt.states.boto_ec2.**instance_present**(*name*, *instance_name=None*, *instance_id=None*, *image_id=None*, *image_name=None*, *tags=None*, *key_name=None*, *security_groups=None*, *user_data=None*, *instance_type=None*, *placement=None*, *kernel_id=None*, *ramdisk_id=None*, *vpc_id=None*, *vpc_name=None*, *monitoring_enabled=None*, *subnet_id=None*, *subnet_name=None*, *private_ip_address=None*, *block_device_map=None*, *disable_api_termination=None*, *instance_initiated_shutdown_behavior=None*, *placement_group=None*, *client_token=None*, *security_group_ids=None*, *security_group_names=None*, *additional_info=None*, *tenancy=None*, *instance_profile_arn=None*, *instance_profile_name=None*, *ebs_optimized=None*, *network_interfaces=None*, *network_interface_name=None*, *network_interface_id=None*, *attributes=None*, *target_state=None*, *public_ip=None*, *allocation_id=None*, *allocate_eip=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an EC2 instance is running with the given attributes and state.

name (string) - The name of the state definition. Recommended that this match the instance_name attribute (generally the FQDN of the instance).

instance_name (string) - The name of the instance, generally its FQDN. Exclusive with `instance_id'.

instance_id (string) - The ID of the instance (if known). Exclusive with `instance_name'.

image_id (string) – The ID of the AMI image to run.

image_name (string) – The name of the AMI image to run.

tags (dict) - Tags to apply to the instance.

key_name (string) – The name of the key pair with which to launch instances.

security_groups (list of strings) – The names of the EC2 classic security groups with which to associate instances

user_data (string) – The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

instance_type (string) – The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

placement (string) – The Availability Zone to launch the instance into.

kernel_id (string) – The ID of the kernel with which to launch the instances.

ramdisk_id (string) – The ID of the RAM disk with which to launch the instances.

vpc_id (string) - The ID of a VPC to attach the instance to.

vpc_name (string) - The name of a VPC to attach the instance to.

monitoring_enabled (bool) – Enable detailed CloudWatch monitoring on the instance.

subnet_id (string) – The ID of the subnet within which to launch the instances for VPC.

subnet_name (string) – The name of the subnet within which to launch the instances for VPC.

private_ip_address (string) – If you're using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).

block_device_map (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.

disable_api_termination (bool) – If True, the instances will be locked and will not be able to be terminated via the API.

instance_initiated_shutdown_behavior (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:

- `stop'

- `terminate'

placement_group (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.

client_token (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.

security_group_ids (list of strings) – The IDs of the VPC security groups with which to associate instances.

security_group_names (list of strings) – The names of the VPC security groups with which to associate instances.

additional_info (string) – Specifies additional information to make available to the instance(s).

tenancy (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are:"default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.

instance_profile_arn (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.

instance_profile_name (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.

ebs_optimized (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types.

network_interfaces (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.

network_interface_name

(string) - The name of Elastic Network Interface to attach

New in version 2016.11.0.

network_interface_id

(string) - The id of Elastic Network Interface to attach

New in version 2016.11.0.

attributes (dict) - Instance attributes and value to be applied to the instance. Available options are:

- instanceType - A valid instance type (m1.small)
- kernel - Kernel ID (None)
- ramdisk - Ramdisk ID (None)
- userData - Base64 encoded String (None)
- disableApiTermination - Boolean (true)
- instanceInitiatedShutdownBehavior - stop|terminate
- blockDeviceMapping - List of strings - ie: ['/dev/sda=false']
- sourceDestCheck - Boolean (true)
- groupSet - Set of Security Groups or IDs
- ebsOptimized - Boolean (false)
- sriovNetSupport - String - ie: 'simple'

target_state (string) - The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

public_ip: (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an allocation_id instead.

allocation_id: (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a public_ip instead.

allocate_eip: (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to releaase this address when terminating the instance, either manually or via the `release_eip' flag to `instance_absent'.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

salt.states.boto_ec2.**key_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Deletes a key pair

salt.states.boto_ec2.**key_present**(*name*, *save_private=None*, *upload_public=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Ensure key pair is present.

salt.states.boto_ec2.**snapshot_created**(*name*, *ami_name*, *instance_name*, *wait_until_available=True*, *wait_timeout_seconds=300*, ***kwargs*)
Create a snapshot from the given instance

New in version 2016.3.0.

salt.states.boto_ec2.**volume_absent**(*name*, *volume_name=None*, *volume_id=None*, *instance_name=None*, *instance_id=None*, *device=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.
name State definition name.
volume_name Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.
volume_id Resource ID of the volume.
instance_name Only remove volume if it is attached to instance with this Name tag. Exclusive with `instance_id'. Requires `device'.
instance_id Only remove volume if it is attached to this instance. Exclusive with `instance_name'. Requires `device'.
device Match by device rather than ID. Requires one of `instance_name' or `instance_id'.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_ec2.**volumes_tagged**(*name*, *tag_maps*, *authoritative=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.
name State definition name.
tag_maps List of dicts of filters and tags, where `filters' is a dict suitable for passing to the `filters' argument of boto_ec2.get_all_volumes(), and `tags' is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of volume_ids or an instance_name (with instance_name being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.
YAML example fragment:

```
- filters:
    attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
    attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
```

```
    BillingGroup: bubba.hotep@aws-foo.com
- filters:
    instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
    volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative Should un-declared tags currently set on matched volumes be deleted? Boolean.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.29 salt.states.boto_elasticache

Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
```

```
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_elasticache.**absent**(*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

name Name of the cache cluster.

wait Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticache.**creategroup**(*name*, *primary_cluster_id*, *replication_group_description*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the a replication group is create.

name Name of replication group

wait Waits for the group to be available

primary_cluster_id Name of the master cache node

replication_group_description Description for the group

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticache.**present**(*name*, *engine=None*, *cache_node_type=None*, *num_cache_nodes=None*, *preferred_availability_zone=None*, *port=None*, *cache_parameter_group_name=None*, *cache_security_group_names=None*, *replication_group_id=None*, *auto_minor_version_upgrade=True*, *security_group_ids=None*, *cache_subnet_group_name=None*, *engine_version=None*, *notification_topic_arn=None*, *preferred_maintenance_window=None*, *wait=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cache cluster exists.

name Name of the cache cluster (cache cluster id).

engine The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

cache_node_type The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster

num_cache_nodes The number of cache nodes that the cache cluster will have.

preferred_availability_zone The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

port The port number on which each of the cache nodes will accept connections.

cache_parameter_group_name The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

cache_security_group_names A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

replication_group_id The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

auto_minor_version_upgrade Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

security_group_ids One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

cache_subnet_group_name The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

engine_version The version number of the cache engine to be used for this cluster.

notification_topic_arn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

wait Boolean. Wait for confirmation from boto that the cluster is in the available state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticache.**subnet_group_present**(*name*, *subnet_ids=None*, *subnet_names=None*, *description=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.
name The name for the ElastiCache subnet group. This value is stored as a lowercase string.
subnet_ids A list of VPC subnet IDs for the cache subnet group. Exclusive with subnet_names.
subnet_names A list of VPC subnet names for the cache subnet group. Exclusive with subnet_ids.
description Subnet group description.
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.30 salt.states.boto_elasticsearch_domain module

Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure domain exists:
    boto_elasticsearch_domain.present:
        - DomainName: mydomain
        - profile='user-credentials'
        - ElasticsearchVersion: "2.3"
        - ElasticsearchClusterConfig:
            InstanceType": "t2.micro.elasticsearch"
            InstanceCount: 1
            DedicatedMasterEnabled: False
            ZoneAwarenessEnabled: False
        - EBSOptions:
            EBSEnabled: True
            VolumeType: "gp2"
            VolumeSize: 10
            Iops: 0
        - AccessPolicies:
            Version: "2012-10-17"
```

```
            Statement:
              - Effect: "Allow"
              - Principal:
                  AWS: "*"
              - Action:
                - "es:*"
              - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
              - Condition:
                  IpAddress:
                    "aws:SourceIp":
                      - "127.0.0.1"
                      - "127.0.0.2"
        - SnapshotOptions:
            AutomatedSnapshotStartHour: 0
        - AdvancedOptions:
            rest.action.multi.allow_explicit_index": "true"
        - Tags:
            a: "b"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_elasticsearch_domain.**absent**(*name*, *DomainName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure domain with passed properties is absent.

name The name of the state definition.

DomainName Name of the domain.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_elasticsearch_domain.**present**(*name*, *DomainName*, *ElasticsearchClusterConfig=None*, *EBSOptions=None*, *AccessPolicies=None*, *SnapshotOptions=None*, *AdvancedOptions=None*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *ElasticsearchVersion=`1.5'*)

Ensure domain exists.

name The name of the state definition

DomainName Name of the domain.

ElasticsearchClusterConfig Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) -- The instance type for an Elasticsearch cluster.

InstanceCount (integer) -- The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) -- A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) -- A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) -- The instance type for a dedicated master node.

DedicatedMasterCount (integer) -- Total number of dedicated master nodes, active and on standby, for

the cluster.

EBSOptions Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) -- Specifies whether EBS-based storage is enabled.

VolumeType (string) -- Specifies the volume type for EBS-based storage.

VolumeSize (integer) -- Integer to specify the size of an EBS volume.

Iops (integer) -- Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

AccessPolicies IAM access policy

SnapshotOptions Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) -- Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

AdvancedOptions Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

ElasticsearchVersion String of format X.Y to specify version for the Elasticsearch domain eg. ``1.5'' or ``2.3''.

19.19.31 salt.states.boto_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - availability_zones:
            - us-east-1a
            - us-east-1c
```

```
            - us-east-1d
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - listeners:
            - elb_port: 443
              instance_port: 80
              elb_protocol: HTTPS
              instance_protocol: HTTP
              certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
              policies:
                  - my-ssl-policy
                  - cookie-policy
            - elb_port: 8210
              instance_port: 8210
              elb_protocol: TCP
        - backends:
            - instance_port: 80
              policies:
                  - enable-proxy-protocol
        - health_check:
            target: 'HTTP:80/'
        - attributes:
            cross_zone_load_balancing:
              enabled: true
            access_log:
              enabled: true
              s3_bucket_name: 'mybucket'
              s3_bucket_prefix: 'my-logs'
              emit_interval: 5
            connecting_settings:
              idle_timeout: 60
        - cnames:
            - name: mycname.example.com.
              zone: example.com.
              ttl: 60
            - name: myothercname.example.com.
              zone: example.com.
        - security_groups:
            - my-security-group
        - policies:
            - policy_name: my-ssl-policy
              policy_type: SSLNegotiationPolicyType
              policy:
                Protocol-TLSv1.2: true
                Protocol-SSLv3: false
                Server-Defined-Cipher-Order: true
                ECDHE-ECDSA-AES128-GCM-SHA256: true
            - policy_name: cookie-policy
              policy_type: LBCookieStickinessPolicyType
              policy: {}  # no policy means this is a session cookie
            - policy_name: enable-proxy-protocol
              policy_type: ProxyProtocolPolicyType
              policy:
                ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
    boto_elb.present:
```

```
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile

# Passing in a profile
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillard by setting the attributes on the resource. The module will use the default pillar key `boto_elb_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```
my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'
    emit_interval: 5
```

Overriding the attribute values on the resource:

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - attributes_from_pillar: my_elb_attributes
        # override cross_zone_load_balancing:enabled
        - attributes:
            cross_zone_load_balancing:
              enabled: false
        - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - alarms:
            UnHealthyHostCount:
              name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
              attributes:
                metric: UnHealthyHostCount
                namespace: AWS/ELB
```

```
                statistic: Average
                comparison: '>='
                threshold: 1.0
                period: 600
                evaluation_periods: 6
                unit: null
                description: ELB UnHealthyHostCount
                alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
                insufficient_data_actions: []
                ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that `boto_elb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
      unit: null
      description: ELB UnHealthyHostCount
      alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
      insufficient_data_actions: []
      ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

Overriding the alarm values on the resource:

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - alarms_from_pillar: my_elb_alarm
        # override UnHealthyHostCount:attributes:threshold
        - alarms:
            UnHealthyHostCount:
              attributes:
                threshold: 2.0
```

Tags can also be set:

New in version 2016.3.0.

```
Ensure myelb ELB exists:
    boto_elb.present:
        - name: myelb
        - region: us-east-1
        - profile: myelbprofile
        - tags:
```

```
            MyTag: 'My Tag Value'
            OtherTag: 'My Other Value'
```

salt.states.boto_elb.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an ELB does not exist

name name of the ELB

salt.states.boto_elb.**present**(*name*, *listeners*, *availability_zones=None*, *subnets=None*, *subnet_names=None*, *security_groups=None*, *scheme='internet-facing'*, *health_check=None*, *attributes=None*, *attributes_from_pillar='boto_elb_attributes'*, *cnames=None*, *alarms=None*, *alarms_from_pillar='boto_elb_alarms'*, *policies=None*, *policies_from_pillar='boto_elb_policies'*, *backends=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *tags=None*, *instance_ids=None*, *instance_names=None*)

Ensure the ELB exists.

name Name of the ELB.

availability_zones A list of availability zones for this ELB.

listeners A list of listener lists; example:

```
[
    ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
    ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/
↪mycert']
]
```

subnets A list of subnet IDs in your VPC to attach to your LoadBalancer.

subnet_names A list of subnet names in your VPC to attach to your LoadBalancer.

security_groups The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

scheme The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

health_check A dict defining the health check for this ELB.

attributes A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the *salt.modules.boto_elb.set_attributes* function for recognized attributes.

attributes_from_pillar name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

cnames A list of cname dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as kwargs.

See the *salt.states.boto_route53* state for information about these attributes.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ELB. All attributes should be specified except for dimension which will be automatically set to this ELB.

See the *salt.states.boto_cloudwatch_alarm* state for information about these attributes.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
wait_for_sync Wait for an INSYNC change status from Route53.
tags dict of tags
instance_ids list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_names.
instance_names list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with instance_ids.

`salt.states.boto_elb.`**`register_instances`**(*name*, *instances*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.
name The name of the Elastic Load Balancer to add EC2 instances to.
instances A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.
New in version 2015.8.0.

```
add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
      - instance-id1
      - instance-id2
```

19.19.32 salt.states.boto_elbv2 module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
elbv2.region: us-west-2
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

salt.states.boto_elbv2.**targets_deregistered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Remove targets to an Application Load Balancer target group.

name The ARN of the Application Load Balancer Target Group to remove targets from.

targets A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```
remove-targets:
  boto_elb.targets_deregistered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

salt.states.boto_elbv2.**targets_registered**(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

name The ARN of the Application Load Balancer Target Group to add targets to.

targets A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
  boto_elb.targets_registered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

19.19.33 salt.states.boto_iam

Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
delete-user:
  boto_iam.user_absent:
    - name: myuser
    - delete_keys: true
```

```
delete-keys:
  boto_iam.keys_absent:
    - access_keys:
      - 'AKIAJHTMIQ2ASDFLASDF'
```

```
      - 'PQIAJHTMIQ2ASRTLASFR'
    - user_name: myuser
```

```
create-user:
  boto_iam.user_present:
    - name: myuser
    - policies:
        mypolicy: |
            {
                "Version": "2012-10-17",
                "Statement": [{
                "Effect": "Allow",
                "Action": "*",
                "Resource": "*"}]
            }
    - password: NewPassword$$1
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADFalkfjasdf'
```

```
create-group:
  boto_iam.group_present:
    - name: mygroup
    - users:
      - myuser
      - myuser1
    - policies:
        mypolicy: |
            {
                "Version": "2012-10-17",

    - key: 'safsdfsal;fdkjsafkljsASSADFalkfj'
```

salt.states.boto_iam.**account_policy**(*name=None*, *allow_users_to_change_password=None*, *hard_expiry=None*, *max_password_age=None*, *minimum_password_length=None*, *password_reuse_prevention=None*, *require_lowercase_characters=None*, *require_numbers=None*, *require_symbols=None*, *require_uppercase_characters=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Change account policy.

New in version 2015.8.0.

name (string) The name of the account policy

allow_users_to_change_password (bool) Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

hard_expiry (bool) Prevents IAM users from setting a new password after their password has expired.

max_password_age (int) The number of days that an IAM user password is valid.

minimum_password_length (int) The minimum number of characters allowed in an IAM user password.

password_reuse_prevention (int) Specifies the number of previous passwords that IAM users are prevented from reusing.

require_lowercase_characters (bool) Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

require_numbers (bool) Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

require_symbols (bool) Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: ! @ # $ % ^ & * ( ) _ + - = [ ] { } | `

require_uppercase_characters (bool) Specifies whether IAM user passwords must contain at least one up-

percase character from the ISO basic Latin alphabet (A to Z).
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string)

salt.states.boto_iam.**group_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
New in version 2015.8.0.

Ensure the IAM group is absent.
name (string) The name of the group.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**group_present**(*name*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *users=None*, *path='/'*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete_policies=True*)
New in version 2015.8.0.

Ensure the IAM group is present
name (string) The name of the new group.
path (string) The path for the group, defaults to `/'
policies (dict) A dict of IAM group policy documents.
policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
manaaged_policies (list) A list of policy names or ARNs that should be attached to this group.
users (list) A list of users to be added to the group.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
delete_policies (boolean) Delete or detach existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

salt.states.boto_iam.**keys_absent**(*access_keys*, *user_name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
New in version 2015.8.0.

Ensure the IAM user access_key_id is absent.
access_key_id (list) A list of access key ids
user_name (string) The username of the user
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**keys_present**(*name*, *number*, *save_dir*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *save_format='{2}\n{0}\n{3}\n{1}\n'*)

New in version 2015.8.0.

Ensure the IAM access keys are present.
name (string) The name of the new user.
number (int) Number of keys that user should have.
save_dir (string) The directory that the key/keys will be saved. Keys are saved to a file named according to the username privided.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
save_format (dict) Save format is repeated for each key. Default format is ``{2}n{0}n{3}n{1}n'', where {0} and {1} are placeholders for new key_id and key respectively, whereas {2} and {3} are ``key_id-{number}'' and `key-{number}' strings kept for compatibility.

salt.states.boto_iam.**policy_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent
name (string) The name of the new policy.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**policy_present**(*name*, *policy_document*, *path=None*, *description=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
New in version 2015.8.0.

Ensure the IAM managed policy is present
name (string) The name of the new policy.
policy_document (dict) The document of the new policy
path (string) The path in which the policy will be created. Default is `/'.
description (string) Description
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**saml_provider_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.
name (string) The name of the SAML provider.
saml_metadata_document (string) The xml document of the SAML provider.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**saml_provider_present**(*name*, *saml_metadata_document*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.
name (string) The name of the SAML provider.
saml_metadata_document (string) The xml document of the SAML provider.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**server_cert_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a server certificate.

New in version 2015.8.0.
name (string) The name for the server certificate. Do not include the path in this value.
region (string) The name of the region to connect to.
key (string) The key to be used in order to connect
keyid (string) The keyid to be used in order to connect
profile (string) The profile that contains a dict of region, key, keyid

salt.states.boto_iam.**server_cert_present**(*name*, *public_key*, *private_key*, *cert_chain=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Crete server certificate.

New in version 2015.8.0.
name (string) The name for the server certificate. Do not include the path in this value.
public_key (string) The contents of the public key certificate in PEM-encoded format.
private_key (string) The contents of the private key in PEM-encoded format.
cert_chain (string) The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.
path (string) The path for the server certificate.
region (string) The name of the region to connect to.
key (string) The key to be used in order to connect
keyid (string) The keyid to be used in order to connect
profile (string) The profile that contains a dict of region, key, keyid

salt.states.boto_iam.**user_absent**(*name*, *delete_keys=True*, *delete_mfa_devices=True*, *delete_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.
name (string) The name of the new user.
delete_keys (bool) Delete all keys from user.
delete_mfa_devices (bool) Delete all mfa devices from user.

New in version 2016.3.0.
delete_profile (bool) Delete profile from user.

New in version 2016.3.0.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.**user_present**(*name*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *password=None*, *path=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

New in version 2015.8.0.

Ensure the IAM user is present

name (string) The name of the new user.

policies (dict) A dict of IAM group policy documents.

policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies (list) A list of managed policy names or ARNs that should be attached to this user.

password (string) The password for the new user. Must comply with account policy.

path (string) The path of the user. Default is `/'.

New in version 2015.8.2.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.34 salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
    boto_iam_role.present:
        - region: us-east-1
        - key: GKTADJGHEIQSXMKKRBJ08H
        - keyid: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - policies_from_pillars:
```

```
            - shared_iam_bootstrap_policy
        - policies:
            MySQSPolicy:
                Statement:
                  - Action:
                        - sqs:*
                    Effect: Allow
                    Resource:
                        - arn:aws:sqs:*:*:*
                    Sid: MyPolicySQS1
            MyS3Policy:
                Statement:
                  - Action:
                        - s3:GetObject
                    Effect: Allow
                    Resource:
                        - arn:aws:s3:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
    boto_iam_role.present:
        - profile: myiamprofile

# Passing in a credentials profile
myrole:
    boto_iam_role.present:
        - profile:
            key: GKTADJGHEIQSXMKKRBJ08H
            keyid: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
            region: us-east-1
```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

Note: When using the `profile` parameter and `region` is set outside of the profile group, region is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_iam_role.`**`absent`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the IAM role is deleted.

name Name of the IAM role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam_role.`**`present`**(*name*, *policy_document=None*, *policy_document_from_pillars=None*, *path=None*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *create_instance_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete_policies=True*)

Ensure the IAM role exists.

name Name of the IAM role.

policy_document The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policy_document_from_pillars A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the policy_document argument.

New in version 2017.7.0.

path The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policies A dict of IAM role policies.

policies_from_pillars A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies A list of (AWS or Customer) managed policies to be attached to the role.

create_instance_profile A boolean of whether or not to create an instance profile and associate it with this role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

delete_policies Deletes existing policies that are not in the given list of policies. Default value is `True`. If `False` is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

19.19.35 salt.states.boto_iot module

Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure policy exists:
    boto_iot.policy_present:
        - policyName: mypolicy
        - policyDocument:
            Version: "2012-10-17"
            Statement:
              Action:
                - iot:Publish
              Resource:
                - "*"
              Effect: "Allow"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

Ensure topic rule exists:
    boto_iot.topic_rule_present:
        - ruleName: myrule
        - sql: "SELECT * FROM 'iot/test'"
        - description: 'test rule'
        - ruleDisabled: false
        - actions:
          - lambda:
              functionArn: "arn:aws:us-east-1:1234:function/functionname"
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_iot.**policy_absent**(*name*, *policyName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy with passed properties is absent.

name The name of the state definition.

policyName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.**policy_attached**(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.**policy_detached**(*name*, *policyName*, *principal*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition.

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.**policy_present**(*name*, *policyName*, *policyDocument*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure policy exists.

name The name of the state definition

policyName Name of the policy.

policyDocument The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.**thing_type_absent**(*name*, *thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

name The name of the state definition.

thingTypeName Name of the thing type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.**thing_type_present**(*name*, *thingTypeName*, *thingTypeDescription*, *searchableAttributesList*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure thing type exists.

New in version 2016.11.0.

name The name of the state definition

thingTypeName Name of the thing type

thingTypeDescription Description of the thing type

searchableAttributesList List of string attributes that are searchable for the thing type

region Region to connect to.

key Secret key to be used.

keyid Access key to be used

profile A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

salt.states.boto_iot.**topic_rule_absent**(*name*, *ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure topic rule with passed properties is absent.

name The name of the state definition.

ruleName Name of the policy.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iot.**topic_rule_present**(*name*, *ruleName*, *sql*, *actions*, *description=''*, *ruleDisabled=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure topic rule exists.
name The name of the state definition
ruleName Name of the rule.
sql The SQL statement used to query the topic.
actions The actions associated with the rule.
description The description of the rule.
ruleDisable Specifies whether the rule is disabled.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.36 salt.states.boto_kinesis module

Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure Kinesis stream does not exist:
  boto_kinesis.absent:
    - name: new_stream
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
```

```
Ensure Kinesis stream exists:
  boto_kinesis.present:
    - name: new_stream
    - retention_hours: 168
    - enhanced_monitoring: ['ALL']
    - num_shards: 2
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - region: us-east-1
```

salt.states.boto_kinesis.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the kinesis stream, if it exists.

name (string) Stream name

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_kinesis.**present**(*name*, *retention_hours=None*, *enhanced_monitoring=None*, *num_shards=None*, *do_reshard=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the kinesis stream is properly configured and scaled.

name (string) Stream name

retention_hours (int) Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

enhanced_monitoring (list of string) Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', `OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

num_shards (int) Reshard stream (if necessary) to this number of shards !!!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^N+1) !!!!!

do_reshard (boolean) If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.37 salt.states.boto_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1

# Using a profile from pillars
Ensure mykey key exists:
  boto_kms.key_present:
    - name: mykey
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
Ensure mykey key exists:
  boto_key.key_present:
    - name: mykey
    - region: us-east-1
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_kms.**key_present**(*name*, *policy*, *description=None*, *key_usage=None*, *grants=None*, *manage_grants=False*, *key_rotation=False*, *enabled=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

name Name of the key.

policy Key usage policy.

description Description of the key.

key_usage Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT_DECRYPT, which is also the only supported option.

grants A list of grants to apply to the key. Not currently implemented.

manage_grants Whether or not to manage grants. False by default, which will not manage any grants.

key_rotation Whether or not key rotation is enabled for the key. False by default.

enabled Whether or not the key is enabled. True by default.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.38 salt.states.boto_lambda module

Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure function exists:
    boto_lambda.function_present:
        - FunctionName: myfunction
        - Runtime: python2.7
        - Role: iam_role_name
        - Handler: entry_function
        - ZipFile: code.zip
        - S3Bucket: bucketname
        - S3Key: keyname
        - S3ObjectVersion: version
        - Description: "My Lambda Function"
        - Timeout: 3
        - MemorySize: 128
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_lambda.**alias_absent**(*name*, *FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

Name Name of the alias.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.**alias_present**(*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description=''*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

name The name of the state definition.

FunctionName Name of the function for which you want to create an alias.

Name The name of the alias to be created.

FunctionVersion Function version for which you are creating the alias.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.**event_source_mapping_absent**(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

name The name of the state definition.

EventSourceArn ARN of the event source.

FunctionName Name of the lambda function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.**event_source_mapping_present**(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

name The name of the state definition.

EventSourceArn The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

FunctionName The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, ``Thumbnail'') or you can specify Amazon Resource Name (ARN) of the function (for example, ``arn:aws:lambda:us-west-2:account-id:function:ThumbNail''). AWS Lambda also allows you to specify only the account ID qualifier (for example, ``account-id:Thumbnail''). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

StartingPosition The position in the stream where AWS Lambda should start reading. (TRIM_HORIZON | LATEST)

Enabled Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

BatchSize The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

region Region to connect to.

key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.**function_absent**(*name*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure function with passed properties is absent.
name The name of the state definition.
FunctionName Name of the function.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lambda.**function_present**(*name*, *FunctionName*, *Runtime*, *Role*, *Handler*, *ZipFile=None*, *S3Bucket=None*, *S3Key=None*, *S3ObjectVersion=None*, *Description=''*, *Timeout=3*, *MemorySize=128*, *Permissions=None*, *RoleRetries=5*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *VpcConfig=None*, *Environment=None*)

Ensure function exists.
name The name of the state definition
FunctionName Name of the Function.
Runtime The Runtime environment for the function. One of `nodejs', `java8', or `python2.7'
Role The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.
Handler The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.*export* value in your function. For Java, it can be package.classname::handler or package.classname.
ZipFile A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.
S3Bucket Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.
S3Key The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.
S3ObjectVersion The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.
Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.
Timeout The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.
MemorySize The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.
VpcConfig If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

```
VpcConfig:
  SecurityGroupNames:
```

```
    - mysecgroup1
    - mysecgroup2
  SecurityGroupIds:
    - sg-abcdef1234
  SubnetNames:
    - mysubnet1
  SubnetIds:
    - subnet-1234abcd
    - subnet-abcd1234
```

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

Permissions A list of permission definitions to be added to the function's policy

RoleRetries IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will atuomatically retry this number of times. The default is 5.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
    'Variables': {
        'VariableName': 'VariableValue'
    }
}
```

New in version 2017.7.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.39 salt.states.boto_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
    - security_groups:
        - mygroup
    - instance_type: m1.small
    - instance_monitoring: true
    - block_device_mappings:
        - '/dev/sda1':
            size: 20
            volume_type: 'io1'
            iops: 220
            delete_on_termination: true
    - cloud_init:
        boothooks:
          'disable-master.sh': |
            #!/bin/bash
            echo "manual" > /etc/init/salt-master.override
        scripts:
          'run_salt.sh': |
            #!/bin/bash

            add-apt-repository -y ppa:saltstack/salt
            apt-get update
            apt-get install -y salt-minion
            salt-call state.highstate
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile: myprofile

# Passing in a profile.
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

```
        region: us-east-1
```

salt.states.boto_lc.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named launch configuration is deleted.

name Name of the launch configuration.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_lc.**present**(*name*, *image_id*, *key_name=None*, *vpc_id=None*, *vpc_name=None*, *security_groups=None*, *user_data=None*, *cloud_init=None*, *instance_type='m1.small'*, *kernel_id=None*, *ramdisk_id=None*, *block_device_mappings=None*, *delete_on_termination=None*, *instance_monitoring=False*, *spot_price=None*, *instance_profile_name=None*, *ebs_optimized=False*, *associate_public_ip_address=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the launch configuration exists.

name Name of the launch configuration.

image_id AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

key_name Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

vpc_id The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_name.

vpc_name Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with vpc_id.

security_groups List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

user_data The user data available to launched EC2 instances.

cloud_init A dict of cloud_init configuration. Currently supported values: scripts, cloud-config. Mutually exclusive with user_data.

instance_type The instance type. ex: m1.small.

kernel_id The kernel id for the instance.

ramdisk_id The RAM disk ID for the instance.

block_device_mappings A dict of block device mappings that contains a dict with volume_type, delete_on_termination, iops, size, encrypted, snapshot_id.

volume_type Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

delete_on_termination Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.

iops For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.

size Desired volume size (in GiB).

encrypted Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

instance_monitoring Whether instances in group are launched with detailed monitoring.

spot_price The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

instance_profile_name The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

ebs_optimized Specifies whether the instance is optimized for EBS I/O (true) or not (false).

associate_public_ip_address Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.40 salt.states.boto_rds

Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit rds credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure myrds RDS exists:
  boto_rds.present:
    - name: myrds
    - allocated_storage: 5
    - storage_type: standard
    - db_instance_class: db.t2.micro
    - engine: MySQL
    - master_username: myuser
    - master_user_password: mypass
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    - tags:
        key: value
```

```
Ensure parameter group exists:
    create-parameter-group:
      boto_rds.parameter_present:
        - name: myparametergroup
        - db_parameter_group_family: mysql5.6
        - description: "parameter group family"
        - parameters:
          - binlog_cache_size: 32768
          - binlog_checksum: CRC32
        - region: eu-west-1
```

depends boto3

salt.states.boto_rds.**absent**(*name*, *skip_final_snapshot=None*, *final_db_snapshot_identifier=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_deletion=True*, *timeout=180*)

Ensure RDS instance is absent.

name Name of the RDS instance.

skip_final_snapshot Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

final_db_snapshot_identifier If a final snapshot is requested, this is the identifier used for that snapshot.

tags A dict of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_deletion (bool) Wait for the RDS instance to be deleted completely before finishing the state.

timeout (in seconds) The amount of time that can pass before raising an Exception.

salt.states.boto_rds.**parameter_present**(*name*, *db_parameter_group_family*, *description*, *parameters=None*, *apply_method='pending-reboot'*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure DB parameter group exists and update parameters.

name The name for the parameter group.

db_parameter_group_family The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

description Parameter group description.

parameters The DB parameters that need to be changed of type dictionary.

apply_method The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

tags A dict of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_rds.**present**(*name*, *allocated_storage*, *db_instance_class*, *engine*, *master_username*, *master_user_password*, *db_name=None*, *storage_type=None*, *db_security_groups=None*, *vpc_security_group_ids=None*, *availability_zone=None*, *db_subnet_group_name=None*, *preferred_maintenance_window=None*, *db_parameter_group_name=None*, *db_cluster_identifier=None*, *tde_credential_arn=None*, *tde_credential_password=None*, *storage_encrypted=None*, *kms_keyid=None*, *backup_retention_period=None*, *preferred_backup_window=None*, *port=None*, *multi_az=None*, *engine_version=None*, *auto_minor_version_upgrade=None*, *license_model=None*, *iops=None*, *option_group_name=None*, *character_set_name=None*, *publicly_accessible=None*, *wait_status=None*, *tags=None*, *copy_tags_to_snapshot=None*, *region=None*, *domain=None*, *key=None*, *keyid=None*, *monitoring_interval=None*, *monitoring_role_arn=None*, *domain_iam_role_name=None*, *promotion_tier=None*, *profile=None*)

Ensure RDS instance exists.

name Name of the RDS state definition.

allocated_storage The amount of storage (in gigabytes) to be initially allocated for the database instance.

db_instance_class The compute and memory capacity of the Amazon RDS DB instance.

engine The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS create_db_instance documentation.

master_username The name of master user for the client DB instance.

master_user_password The password for the master database user. Can be any printable ASCII character except ``/'', `'', or ``@''.

db_name The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance

storage_type Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the Iops parameter.

db_security_groups A list of DB security groups to associate with this DB instance.

vpc_security_group_ids A list of EC2 VPC security groups to associate with this DB instance.

availability_zone The EC2 Availability Zone that the database instance will be created in.

db_subnet_group_name A DB subnet group to associate with this DB instance.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur.

db_parameter_group_name A DB parameter group to associate with this DB instance.

db_cluster_identifier If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

tde_credential_arn The ARN from the Key Store with which the instance is associated for TDE encryption.

tde_credential_password The password to use for TDE encryption if an encryption key is not used.

storage_encrypted Specifies whether the DB instance is encrypted.

kms_keyid If storage_encrypted is true, the KMS key identifier for the encrypted DB instance.

backup_retention_period The number of days for which automated backups are retained.

preferred_backup_window The daily time range during which automated backups are created if automated backups are enabled.

port The port number on which the database accepts connections.

multi_az Specifies if the DB instance is a Multi-AZ deployment. You cannot set the AvailabilityZone parameter if the MultiAZ parameter is set to true.

engine_version The version number of the database engine to use.

auto_minor_version_upgrade Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

license_model License model information for this DB instance.

iops The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

option_group_name Indicates that the DB instance should be associated with the specified option group.

character_set_name For supported engines, indicates that the DB instance should be associated with the specified CharacterSet.

publicly_accessible Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

wait_status Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

tags A dict of tags.

copy_tags_to_snapshot Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

region Region to connect to.

domain The identifier of the Active Directory Domain.

key AWS secret key to be used.

keyid AWS access key to be used.

monitoring_interval The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

monitoring_role_arn The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

domain_iam_role_name Specify the name of the IAM role to be used when making API calls to the Directory Service.

promotion_tier A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_rds.**replica_present**(*name*, *source*, *db_instance_class=None*, *availability_zone=None*, *port=None*, *auto_minor_version_upgrade=None*, *iops=None*, *option_group_name=None*, *publicly_accessible=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *db_parameter_group_name=None*)

Ensure RDS replica exists.

```
Ensure myrds replica RDS exists:
  boto_rds.create_replica:
    - name: myreplica
    - source: mydb
```

salt.states.boto_rds.**subnet_group_present**(*name*, *description*, *subnet_ids=None*, *subnet_names=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure DB subnet group exists.

name The name for the DB subnet group. This value is stored as a lowercase string.

subnet_ids A list of the EC2 Subnet IDs for the DB subnet group. Either subnet_ids or subnet_names must be provided.

subnet_names A list of The EC2 Subnet names for the DB subnet group. Either subnet_ids or subnet_names must be provided.

description Subnet group description.

tags A dict of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.41 salt.states.boto_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
mycnamerecord:
  boto_route53.present:
    - name: test.example.com.
    - value: my-elb.us-east-1.elb.amazonaws.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile: myprofile

# Passing in a profile
myarecord:
```

```
boto_route53.present:
  - name: test.example.com.
  - value: 1.1.1.1
  - zone: example.com.
  - ttl: 60
  - record_type: A
  - region: us-east-1
  - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_route53.**absent**(*name*, *zone*, *record_type*, *identifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*)

Ensure the Route53 record is deleted.

name Name of the record.

zone The zone to delete the record from.

record_type The record type (A, NS, MX, TXT, etc.)

identifier An identifier to match for deletion.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

split_dns Route53 supports a public and private DNS zone with the same names.

private_zone If using split_dns, specify if this is the private zone.

salt.states.boto_route53.**hosted_zone_absent**(*name*, *domain_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the Route53 Hostes Zone described is absent

name The name of the state definition.

domain_name The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

salt.states.boto_route53.**hosted_zone_present**(*name*, *domain_name=None*, *private_zone=False*, *comment=''*, *vpc_id=None*, *vpc_name=None*, *vpc_region=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- private_zone (AWS API limitation).
- comment (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- vpc_id (same story - we really need to rewrite this module with boto3)
- vpc_name (really just a pointer to vpc_id anyway).
- vpc_region (again, supported in boto3 but not boto2).

name The name of the state definition. This will be used as the `caller_ref' param if/when creating the hosted zone.

domain_name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

comment Any comments you want to include about the hosted zone.

private_zone Set True if creating a private hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_name. Ignored if passed for a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpe_id. Ignored if passed for a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, if possible. If this fails, you'll need to provide an explicit value for this option. Ignored if passed for a non-private zone.

`salt.states.boto_route53.`**`present`**(*name*, *value*, *zone*, *record_type*, *ttl=None*, *identifier=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_sync=True*, *split_dns=False*, *private_zone=False*)

Ensure the Route53 record is present.

name Name of the record.

value

Value of the record. **As a special case, you can pass in**: private:<Name tag> to have the function autodetermine the private IP public:<Name tag> to have the function autodetermine the public IP

zone The zone to create the record in.

record_type The record type (A, NS, MX, TXT, etc.)

ttl The time to live for the record.

identifier The unique identifier to use for this record.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

split_dns Route53 supports a public and private DNS zone with the same names.

private_zone If using split_dns, specify if this is the private zone.

19.19.42 salt.states.boto_s3_bucket module

Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure bucket exists:
    boto_s3_bucket.present:
        - Bucket: mybucket
        - LocationConstraint: EU
        - ACL:
          - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"

        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_s3_bucket.**absent**(*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

name The name of the state definition.

Bucket Name of the bucket.

Force Empty the bucket first if necessary - Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_s3_bucket.**present**(*name*, *Bucket*, *LocationConstraint=None*, *ACL=None*, *CORSRules=None*, *LifecycleConfiguration=None*, *Logging=None*, *NotificationConfiguration=None*, *Policy=None*, *Replication=None*, *RequestPayment=None*, *Tagging=None*, *Versioning=None*, *Website=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket exists.

name The name of the state definition

Bucket Name of the bucket.

LocationConstraint `EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

ACL The permissions on a bucket using access control lists (ACL).

CORSRules The cors configuration for a bucket.

LifecycleConfiguration Lifecycle configuration for your bucket

Logging The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

NotificationConfiguration notifications of specified events for a bucket

Policy Policy on the bucket

Replication Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

RequestPayment The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

Tagging A dictionary of tags that should be set on the bucket

Versioning The versioning state of the bucket

Website The website configuration of the bucket

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.43 salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
```

```
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
Ensure mysecgroup exists:
    boto_secgroup.present:
        - name: mysecgroup
        - description: My security group
        - vpc_name: myvpc
        - rules:
            - ip_protocol: tcp
              from_port: 80
              to_port: 80
              cidr_ip:
                - 10.0.0.0/8
                - 192.168.0.0/16
            - ip_protocol: tcp
              from_port: 8080
              to_port: 8090
              cidr_ip:
                - 10.0.0.0/8
                - 192.168.0.0/16
            - ip_protocol: icmp
              from_port: -1
              to_port: -1
              source_group_name: mysecgroup
        - rules_egress:
            - ip_protocol: all
              from_port: -1
              to_port: -1
              cidr_ip:
                - 10.0.0.0/8
                - 192.168.0.0/16
        - tags:
            SomeTag: 'My Tag Value'
            SomeOtherTag: 'Other Tag Value'
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
Ensure mysecgroup exists:
    boto_secgroup.present:
        - name: mysecgroup
        - description: My security group
        - profile: myprofile

# Passing in a profile
Ensure mysecgroup exists:
    boto_secgroup.present:
        - name: mysecgroup
        - description: My security group
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
            region: us-east-1
```

Note: When using the `profile` parameter and `region` is set outside of the profile group, region is ignored and

a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_secgroup.`**`absent`**(*name*, *vpc_id=None*, *vpc_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a security group with the specified name does not exist.

name Name of the security group.

vpc_id The ID of the VPC to remove the security group from, if any. Exclusive with vpc_name.

vpc_name The name of the VPC to remove the security group from, if any. Exclusive with vpc_name.

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_secgroup.`**`present`**(*name*, *description*, *vpc_id=None*, *vpc_name=None*, *rules=None*, *rules_egress=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *tags=None*)

Ensure the security group exists with the specified rules.

name Name of the security group.

description A description of this security group.

vpc_id The ID of the VPC to create the security group in, if any. Exclusive with vpc_name.

vpc_name The name of the VPC to create the security group in, if any. Exclusive with vpc_id.

New in version 2016.3.0.

New in version 2015.8.2.

rules A list of ingress rule dicts. If not specified, `rules=None`, the ingress rules will be unmanaged. If set to an empty list, `[]`, then all ingress rules will be removed.

rules_egress A list of egress rule dicts. If not specified, `rules_egress=None`, the egress rules will be unmanaged. If set to an empty list, `[]`, then all egress rules will be removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.

tags List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

19.19.44 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
mytopic:
    boto_sns.present:
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

# Using a profile from pillars
mytopic:
    boto_sns.present:
        - region: us-east-1
        - profile: mysnsprofile

# Passing in a profile
mytopic:
    boto_sns.present:
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

salt.states.boto_sns.**absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

name Name of the SNS topic.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

unsubscribe If True, unsubscribe all subcriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

salt.states.boto_sns.**present**(*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

name Name of the SNS topic.

subscriptions List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
{'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
{'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

region Region to connect to.

key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.45 salt.states.boto_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
    keyid: GKTADJGHEIQSXMKKRBJ08H
    key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
    region: us-east-1
```

```
myqueue:
    boto_sqs.present:
        - region: us-east-1
        - keyid: GKTADJGHEIQSXMKKRBJ08H
        - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        - attributes:
            ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
    boto_sqs.present:
        - region: us-east-1
        - profile: mysqsprofile

# Passing in a profile
myqueue:
    boto_sqs.present:
        - region: us-east-1
        - profile:
            keyid: GKTADJGHEIQSXMKKRBJ08H
            key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

`salt.states.boto_sqs.`**`absent`**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Ensure the named sqs queue is deleted.
name Name of the SQS queue.
region Region to connect to.

key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_sqs.**present**(*name*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SQS queue exists.
name Name of the SQS queue.
attributes A dict of key/value SQS attributes.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

19.19.46 salt.states.boto_vpc

Manage VPCs

New in version 2015.8.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available here.

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
  region: us-east-1
```

```
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
        region: us-east-1
```

```
Ensure VPC exists:
  boto_vpc.present:
```

```
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
      - subnet_names:
        - subnet1
        - subnet2
      - region: us-east-1
      - profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkghWupUjasdflkdfklgjsdfjajkghs
```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```
accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_name: salt_vpc_peering
    - region: us-west-2
    - require:
      - boto_vpc: request a vpc peering connection

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering
```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```
accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_id: pcx-1873c371
    - region: us-west-2
```

VPC peering connections can be deleted, as shown below.

```
delete a named vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

Delete also accepts a VPC peering connection id.

```
delete a vpc peering connection by id:
  boto_vpc.delete_vpc_peering_connection:
    - conn_id: pcx-1873c371
```

salt.states.boto_vpc.**absent**(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

name Name of the VPC.

tags A list of tags. All tags must match.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**accept_vpc_peering_connection**(*name=None*, *conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

name Name of this state

conn_id The connection ID to accept. Exclusive with conn_name. String type.

conn_name The name of the VPC peering connection to accept. Exclusive with conn_id. String type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
  - conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
  - conn_id: pbx-1873d472
  - region: us-west-2
```

salt.states.boto_vpc.**delete_vpc_peering_connection**(*name*, *conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

name Name of the state
conn_id ID of the peering connection to delete. Exclusive with conn_name.
conn_name The name of the peering connection to delete. Exclusive with conn_id.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn_name and conn_id will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

salt.states.boto_vpc.**dhcp_options_absent**(*name=None*, *dhcp_options_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a set of DHCP options with the given settings exist.
name (string) Name of the DHCP options set.
dhcp_options_id (string) Id of the DHCP options set.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
New in version 2016.3.0.

salt.states.boto_vpc.**dhcp_options_present**(*name*, *dhcp_options_id=None*, *vpc_name=None*, *vpc_id=None*, *domain_name=None*, *domain_name_servers=None*, *ntp_servers=None*, *netbios_name_servers=None*, *netbios_node_type=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp_options_id param.
name (string) Name of the DHCP options.
vpc_name (string) Name of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.
vpc_id (string) Id of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.
domain_name (string) Domain name to be assiciated with this option set.
domain_name_servers (list of strings) The IP address(es) of up to four domain name servers.
ntp_servers (list of strings) The IP address(es) of up to four desired NTP servers.
netbios_name_servers (list of strings) The IP address(es) of up to four NetBIOS name servers.
netbios_node_type (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed

values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

tags (dict of key:value pairs) A set of tags to be added.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

salt.states.boto_vpc.**internet_gateway_absent**(*name*, *detach=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named internet gateway is absent.

name Name of the internet gateway.

detach First detach the internet gateway from a VPC, if attached.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**internet_gateway_present**(*name*, *vpc_name=None*, *vpc_id=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an internet gateway exists.

name Name of the internet gateway.

vpc_name Name of the VPC to which the internet gateway should be attached.

vpc_id Id of the VPC to which the internet_gateway should be attached. Only one of vpc_name or vpc_id may be provided.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**nat_gateway_absent**(*name=None*, *subnet_name=None*, *subnet_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *wait_for_delete_retries=0*)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

name Name of the state.

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

salt.states.boto_vpc.**nat_gateway_present**(*name*, *subnet_name=None*, *subnet_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *allocation_id=None*)

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
  - subnet_name: my-subnet
```

name Name of the state

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.

allocation_id If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new allocation_id is created and used.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**present**(*name*, *cidr_block*, *instance_tenancy=None*, *dns_support=None*, *dns_hostnames=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC exists.

name Name of the VPC.

cidr_block The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

instance_tenancy Instances launched in this VPC will be ingle-tenant or dedicated hardware.

dns_support Indicates whether the DNS resolution is supported for the VPC.

dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**request_vpc_peering_connection**(*name*, *requester_vpc_id=None*, *requester_vpc_name=None*, *peer_vpc_id=None*, *peer_vpc_name=None*, *conn_name=None*, *peer_owner_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name. String type.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id. String type.

peer_vpc_id ID of the VPC tp crete VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name. String type.

peer_vpc_name Name tag of the VPC tp crete VPC peering connection with. This can only be a VPC the

same account. Exclusive with peer_vpc_id. String type.

conn_name The (optional) name to use for this VPC peering connection. String type.

peer_owner_id ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4b3522e
    - peer_vpc_id: vpc-ae83f9ca
    - conn_name: salt_peering_connection
```

salt.states.boto_vpc.**route_table_absent**(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named route table is absent.

name Name of the route table.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**route_table_present**(*name*, *vpc_name=None*, *vpc_id=None*, *routes=None*, *subnet_ids=None*, *subnet_names=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gatewyas are specified.

Example:

```
boto_vpc.route_table_present:
  - name: my_route_table
  - vpc_id: vpc-123456
  - routes:
    - destination_cidr_block: 0.0.0.0/0
      internet_gateway_name: InternetGateway
    - destination_cidr_block: 10.10.11.0/24
      instance_id: i-123456
    - destination_cidr_block: 10.10.12.0/24
      interface_id: eni-123456
    - destination_cidr_block: 10.10.13.0/24
      instance_name: mygatewayserver
    - subnet_names:
      - subnet1
      - subnet2
```

name Name of the route table.

vpc_name Name of the VPC with which the route table should be associated.

vpc_id Id of the VPC with which the route table should be associated. Either vpc_name or vpc_id must be provided.
routes A list of routes. Each route has a cidr and a target.
subnet_ids A list of subnet ids to associate
subnet_names A list of subnet names to associate
tags A list of tags.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**subnet_absent**(*name=None*, *subnet_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure subnet with passed properties is absent.
name Name of the subnet.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**subnet_present**(*name*, *cidr_block*, *vpc_name=None*, *vpc_id=None*, *availability_zone=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *route_table_id=None*, *route_table_name=None*)

Ensure a subnet exists.
name Name of the subnet.
cidr_block The range if IPs for the subnet, in CIDR format. For example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.
vpc_name Name of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.
vpc_id Id of the VPC in which the subnet should be placed. Either vpc_name or vpc_id must be provided.
availability_zone AZ in which the subnet should be placed.
tags A list of tags.
route_table_id A route table ID to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

route_table_name A route table name to explicitly associate the subnet with. If both route_table_id and route_table_name are specified, route_table_id will take precedence.

New in version 2016.11.0.

region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_vpc.**vpc_peering_connection_present**(*name*, *requester_vpc_id=None*, *requester_vpc_name=None*, *peer_vpc_id=None*, *peer_vpc_name=None*, *conn_name=None*, *peer_owner_id=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

name Name of the state
requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.
requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.
peer_vpc_id ID of the VPC tp crete VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.
peer_vpc_name Name tag of the VPC tp crete VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with peer_vpc_id.
conn_name The name to use for this VPC peering connection.
peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
New in version 2016.11.0.

Example:

```
ensure peering twixt local vpc and the other guys:
  boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
    - peer_vpc_name: some_other_guys_vpc
    - conn_name: peering_from_here_to_there
    - peer_owner_id: 012345654321
```

19.19.47 salt.states.bower

Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply `npm` and `git` in most cases), and npm.installed state for the package which provides bower.

Example:

```
npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower
```

`salt.states.bower.`**`bootstrap`**(*name*, *user=None*)
Bootstraps a frontend distribution.

Will execute `bower install' on the specified directory.

user The user to run Bower with

salt.states.bower.**installed**(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)
Verify that the given package is installed and is at the correct version (if specified).

```
underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

jquery#2.0:
  bower.installed:
    - dir: /path/to/project
```

name The package to install
dir The target directory in which to install the package
pkgs A list of packages to install with a single Bower invocation; specifying this argument will ignore the `name` argument
user The user to run Bower with
env A list of environment variables to be set prior to execution. The format is the same as the *cmd.run*. state function.

salt.states.bower.**pruned**(*name*, *user=None*, *env=None*)
New in version 2017.7.0.

Cleans up local bower_components directory.

Will execute `bower prune' on the specified directory (param: name)
user The user to run Bower with

salt.states.bower.**removed**(*name*, *dir*, *user=None*)
Verify that the given package is not installed.
dir The target directory in which to install the package
user The user to run Bower with

19.19.48 salt.states.cabal

Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (`cabal-install` in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

cabal-install: pkg.installed

ShellCheck:

cabal.installed:

- require: - pkg: cabal-install

salt.states.cabal.**installed**(*name*, *pkgs=None*, *user=None*, *install_global=False*, *env=None*)
Verify that the given package is installed and is at the correct version (if specified).

```
ShellCheck-0.3.5:
  cabal:
    - installed:
```

name The package to install
user The user to run cabal install with
install_global Install package globally instead of locally
env A list of environment variables to be set prior to execution. The format is the same as the *cmd.run*. state function.

salt.states.cabal.**removed**(*name*, *user=None*, *env=None*)
Verify that given package is not installed.

19.19.49 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

salt.states.ceph.**quorum**(*name*, ***kwargs*)
Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

19.19.50 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []

my-solo-run:
  chef.solo:
    - environment: dev
```

salt.states.chef.**client**(*name*, ***kwargs*)
name Unique identifier for the state. Does not affect the Chef run.
server The chef server URL
client_key Set the client key file location
config The configuration file to use

config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
localmode Point chef-client at local repository if True
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
pid Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist Permanently replace current run list with specified items
user User to set privilege to
validation_key Set the validation key file location, used for registering new clients

`salt.states.chef.`**`solo`**(*name*, ***kwargs*)

name Unique identifier for the state. Does not affect the Chef run.
config The configuration file to use
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user User to set privilege to

19.19.51 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

`salt.states.chocolatey.`**`installed`**(*name*, *version=None*, *source=None*, *force=False*, *pre_versions=False*, *install_args=None*, *override_args=False*, *force_x86=False*, *package_args=None*, *allow_multiple=False*)

Installs a package if not already installed

Parameters

- **`name`** (*`str`*) -- The name of the package to be installed. Required.
- **`version`** (*`str`*) -- Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **`source`** (*`str`*) -- Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **`force`** (*`bool`*) -- Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **`pre_versions`** (*`bool`*) -- Include pre-release packages. Default is False.
- **`install_args`** (*`str`*) -- Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **`override_args`** (*`bool`*) -- Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False install_args will be appended to the end of the default arguments. Default is False.

- **force_x86** (*bool*) -- Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package_args** (*str*) -- Arguments you want to pass to the package. Default is None.
- **allow_multiple** (*bool*) -- Allow mulitiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

  New in version 2017.7.0.

```
Installsomepackage:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True
```

salt.states.chocolatey.**uninstalled**(*name*, *version=None*, *uninstall_args=None*, *override_args=False*)

Uninstalls a package

name The name of the package to be uninstalled

version Uninstalls a specific version of the package. Defaults to latest version installed.

uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller)in the package and use your own. When this is set to False uninstall_args will be appended to the end of the default arguments

19.19.52 salt.states.chronos_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
        schedule: "R//PT2S"
        command: "echo 'hi'"
        owner: "me@example.com"
```

New in version 2015.8.2.

salt.states.chronos_job.**absent**(*name*)

Ensure that the chronos job with the given name is not present.

Parameters **name** -- The app name

Returns A standard Salt changes dictionary

salt.states.chronos_job.**config**(*name*, *config*)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters

- **name** -- The job name
- **config** -- The configuration to apply (dict)

Returns A standard Salt changes dictionary

19.19.53 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for *salt.proxy.cisconso*.

salt.states.cisconso.**value_present**(*name*, *datastore*, *path*, *config*)

Ensure a specific value exists at a given path

Parameters

- **name** (str) -- The name for this rule
- **datastore** (DatastoreType (str enum).) -- The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list, str OR tuple) -- The device path to set the value at, a list of element names in order, / separated
- **config** (dict) -- The new value at the given path

Examples:

```
enable pap auth:
  cisconso.config_present:
    - name: enable_pap_auth
    - datastore: running
    - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
    - config:
        authentication:
            method: pap
            "list-name": foobar
```

19.19.54 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

salt.states.cloud.**absent**(*name*, *onlyif=None*, *unless=None*)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

name The name of the instance to destroy

onlyif Do run the state only if is unless succeed

unless Do not run the state at least unless succeed

salt.states.cloud.**present**(*name*, *cloud_provider*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).

name The name of the instance to create

cloud_provider The name of the cloud provider to use

onlyif Do run the state only if is unless succeed

unless Do not run the state at least unless succeed

opts Any extra opts that need to be used

salt.states.cloud.**profile**(*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)
Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., cloud.tagged, cloud.untagged, etc).
name The name of the instance to create
profile The name of the cloud profile to use
onlyif Do run the state only if is unless succeed
unless Do not run the state at least unless succeed
kwargs Any profile override or addition
opts Any extra opts that need to be used

salt.states.cloud.**volume_absent**(*name*, *provider=None*, ***kwargs*)
Check that a block volume exists.

salt.states.cloud.**volume_attached**(*name*, *server_name*, *provider=None*, ***kwargs*)
Check if a block volume is attached.

salt.states.cloud.**volume_detached**(*name*, *server_name=None*, *provider=None*, ***kwargs*)
Check if a block volume is attached.

Returns True if server or Volume do not exist.

salt.states.cloud.**volume_present**(*name*, *provider=None*, ***kwargs*)
Check that a block volume exists.

19.19.55 salt.states.cmd

Execution of arbitrary commands

The cmd state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/:
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch /tmp/foo if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```

Note: The `creates` option was added to version 2014.7.0

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the stateful argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

Using the ``Stateful'' Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {}).** If it's key=value pairs then quoting may be used to include spaces. (Python's shlex module is used to parse the key=value string)

   Two special keys or attributes are recognized in the output:

   ```
   changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
   comment: str  (i.e., any string)
   ```

   So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.
3. **If there's a comment then it will be used as the comment of the state.**

   Here's an example of how one might write a shell script for use with a stateful command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo  # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
        - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. **The stateful argument can optionally include a test_name parameter.**

   This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

   New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

Should I use `cmd.run` or `cmd.wait`?

Note: Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

These two states are often confused. The important thing to remember about them is that *`cmd.run`* states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs

after some other state changes, then *cmd.wait* does just that. *cmd.wait* is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the env option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.`**`call`**(*name*, *func*, *args=()*, *kws=None*, *onlyif=None*, *unless=None*, *creates=None*, *output_loglevel='debug'*, *use_vt=False*, ***kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the *salt.renderers.pydsl* renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of *cmd.run*, and all other arguments(`cwd`, `runas`, ...) allowed by *cmd.run* are allowed here, except that their effects apply only to the commands specified in *onlyif* and *unless* rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
    'name': name
    'changes': {'retval': result},
    'result': True if result is None else bool(result),
    'comment': result if isinstance(result, string_types) else ''
}
```

`salt.states.cmd.`**`mod_run_check`**(*cmd_kwargs*, *onlyif*, *unless*, *creates*)

Execute the onlyif and unless logic. Return a result dict if: * onlyif failed (onlyif != 0) * unless succeeded (unless == 0) else return True

`salt.states.cmd.`**`mod_watch`**(*name*, ***kwargs*)

Execute a cmd function based on a watch call

`salt.states.cmd.`**`run`**(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *output_loglevel='debug'*, *quiet=False*, *timeout=None*, *ignore_timeout=False*, *use_vt=False*, ***kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

umask The umask (in octal) to use when running the command.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

quiet The command will be executed quietly, meaning no log entries of the actual command or its return data. This is deprecated as of the **2014.1.0** release, and is being replaced with `output_loglevel: quiet`.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

bg If `True`, run command in background and do not await or deliver it's results.

New in version 2016.3.6.

Note: cmd.run supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your cmd.run does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True
```

`salt.states.cmd.`**`script`**(*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *timeout=None*, *use_vt=False*, *output_loglevel='debug'*, *defaults=None*, *context=None*, ***kwargs*)

Download a script and execute it with specified arguments.

source The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

name Either ``cmd arg1 arg2 arg3...'' (cmd is not used) or a source ``salt://...''.

onlyif Run the named command only if the command passed to the `onlyif` option returns true

unless Run the named command only if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The name of the user to run the command as

shell The shell to use for execution. The default is set in grains['shell']

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

saltenv [`base`] The Salt environment to use

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

args String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: ``arg1 `arg two' arg3''

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

context New in version 2016.3.0.

Overrides default context variables passed to the template.

defaults New in version 2016.3.0.

Default context passed to the template.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

`salt.states.cmd.`**`wait`**(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=()*, *stateful=False*, *umask=None*, *output_loglevel='debug'*, *use_vt=False*, ***kwargs*)

Run the given command only if the watch statement calls it.

Note: Use *`cmd.run`* with `onchange` instead.

---

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The user name to run the command as

shell The shell to use for execution, defaults to /bin/sh

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

`salt.states.cmd.`**`wait_script`**(*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *use_vt=False*, *output_loglevel='debug'*, ***kwargs*)

Download a script from a remote source and execute it only if a watch statement calls it.

source The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

template If this setting is applied then the named templating engine will be used to render the downloaded file, currently jinja, mako, and wempy are supported

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to /root

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.wait_script:
    - env:
      - BATCH: 'yes'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

Variables as values are not evaluated. So $PATH in the following example is a literal `$PATH':

```
salt://scripts/bar.sh:
  cmd.wait_script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing $PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the ``Stateful'' Argument* section.

use_vt

Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

output_loglevel Control the loglevel at which the output from the command is logged. Note that the command being run will still be logged (loglevel: DEBUG) regardless, unless `quiet` is used for this value.

19.19.56 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```
get-composer:
  cmd.run:
    - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
    - unless: test -f /usr/local/bin/composer
    - cwd: /root/

install-composer:
  cmd.wait:
    - name: mv /root/composer.phar /usr/local/bin/composer
    - cwd: /root/
    - watch:
      - cmd: get-composer

/path/to/project:
  composer.installed:
    - no_dev: true
    - require:
      - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
    - composer: /path/to/composer.phar
    - php: /usr/local/bin/php
    - no_dev: true
```

salt.states.composer.**installed**(*name*, *composer=None*, *php=None*, *user=None*, *prefer_source=None*, *prefer_dist=None*, *no_scripts=None*, *no_plugins=None*, *optimize=None*, *no_dev=None*, *quiet=False*, *composer_home='/root'*, *always_check=True*)

Verify that the correct versions of composer dependencies are present.

name Directory location of the `composer.json` file.

composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

user Which system user to run composer as.

New in version 2014.1.4.

prefer_source `--prefer-source` option of composer.

prefer_dist `--prefer-dist` option of composer.

no_scripts `--no-scripts` option of composer.

no_plugins `--no-plugins` option of composer.

optimize `--optimize-autoloader` option of composer. Recommended for production.

no_dev `--no-dev` option for composer. Recommended for production.

quiet `--quiet` option for composer. Whether or not to return output from composer.

composer_home `$COMPOSER_HOME` environment variable

always_check If `True`, *always* run `composer install` in the directory. This is the default behavior. If `False`, only run `composer install` if there is no vendor directory present.

salt.states.composer.**update**(*name*, *composer=None*, *php=None*, *user=None*, *prefer_source=None*, *prefer_dist=None*, *no_scripts=None*, *no_plugins=None*, *optimize=None*, *no_dev=None*, *quiet=False*, *composer_home='/root'*)

Composer update the directory to ensure we have the latest versions of all project dependencies.

name Directory location of the `composer.json` file.

composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is

installed globally. (i.e. /path/to/composer.phar)
php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)
user Which system user to run composer as.

New in version 2014.1.4.
prefer_source `--prefer-source` option of composer.
prefer_dist `--prefer-dist` option of composer.
no_scripts `--no-scripts` option of composer.
no_plugins `--no-plugins` option of composer.
optimize `--optimize-autoloader` option of composer. Recommended for production.
no_dev `--no-dev` option for composer. Recommended for production.
quiet `--quiet` option for composer. Whether or not to return output from composer.
composer_home `$COMPOSER_HOME` environment variable

19.19.57 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- `minute`
- `hour`
- `daymonth`
- `month`
- `dayweek` (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

Warning: Any timing arguments not specified take a value of `*`. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: 7
    - hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
  cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 7
    - hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
  cron.present:
    - identifier: SUPERCRON
    - user: root
    - minute: 3
    - hour: 4
```

New in version 2014.1.2.

The old **date > /tmp/crontest** will be replaced by **superscript > /tmp/crontest**.

Additionally, Salt also supports running a cron every `x minutes` very similarly to the Unix convention of using `*/5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
  cron.present:
    - user: root
    - minute: '*/5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `@reboot` or `@hourly`. Quotes must be used, otherwise PyYAML will strip the `@' sign.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
  cron.absent:
    - user: root
    - special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

salt.states.cron.**absent**(*name*, *user='root'*, *identifier=False*, *special=None*, ***kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

name The command that should be absent in the user crontab.

user The name of the user whose crontab needs to be modified, defaults to the root user

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special The special keyword used in the job (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the `@' sign.

salt.states.cron.**env_absent**(*name*, *user='root'*)

Verifies that the specified environment variable is absent from the crontab for the specified user

name The name of the environment variable to remove from the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

salt.states.cron.**env_present**(*name*, *value=None*, *user='root'*)

Verifies that the specified environment variable is present in the crontab for the specified user.

name The name of the environment variable to set in the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

value The value to set for the given environment variable

salt.states.cron.**file**(*name*, *source_hash=''*, *source_hash_name=None*, *user='root'*, *template=None*, *context=None*, *replace=True*, *defaults=None*, *backup=''*, ***kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

name The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required

source_hash This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

user The user to whom the crontab should be assigned. This defaults to root.

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

context Overrides default context variables passed to the template.

replace If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

defaults Default context passed to the template.

backup Overrides the default backup mode for the user's crontab.

`salt.states.cron.`**`present`**(*name*, *user='root'*, *minute='*'*, *hour='*'*, *daymonth='*'*, *month='*'*, *dayweek='*'*, *comment=None*, *commented=False*, *identifier=False*, *special=None*)

Verifies that the specified cron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

name The command that should be executed by the cron job.

user The name of the user whose crontab needs to be modified, defaults to the root user

minute The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is `*`

hour The information to be set in the hour section. Default is `*`

daymonth The information to be set in the day of month section. Default is `*`

month The information to be set in the month section. Default is `*`

dayweek The information to be set in the day of week section. Default is `*`

comment User comment to be added on line previous the cron job

commented The cron job is set commented (prefixed with `#DISABLED#`). Defaults to False.

New in version 2016.3.0.

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the `@' sign.

New in version 2016.3.0.

19.19.58 salt.states.csf module

`salt.states.csf.`**`nics_skip`**(*name*, *nics*, *ipv6*)

Alias for *csf.nics_skipped*

`salt.states.csf.`**`nics_skipped`**(*name*, *nics*, *ipv6=False*)

name Meaningless arg, but required for state.

nics A list of nics to skip.

ipv6 Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

salt.states.csf.**option_present**(*name*, *value*, *reload=False*)

Ensure the state of a particular option/setting in csf.

name The option name in csf.conf

value The value it should be set to.

reload Boolean. If set to true, csf will be reloaded after.

salt.states.csf.**ports_open**(*name*, *ports*, *proto='tcp'*, *direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - proto='tcp', direction='in' would set the values for TCP_IN in the csf.conf file.

ports A list of ports that should be open.

proto The protocol. May be one of `tcp', `udp', `tcp6', or `udp6'.

direction Choose `in', `out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

salt.states.csf.**rule_absent**(*name*, *method*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='s'*, *ttl=None*, *reload=False*)

Ensure iptable is not present.

name The ip address or CIDR for the rule.

method The type of rule. Either `allow' or `deny'.

port Optional port to be open or closed for the iptables rule.

proto The protocol. Either `tcp', `udp'. Only applicable if port is specified.

direction The diretion of traffic to apply the rule to. Either `in', or `out'. Only applicable if port is specified.

port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either `s', or `d'.

ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either `s', or `d'. Only applicable if port is specified.

ttl How long the rule should exist. If supplied, *csf.tempallow()* or csf.tempdeny()` are used.

reload Reload the csf service after applying this rule. Default false.

salt.states.csf.**rule_present**(*name*, *method*, *port=None*, *proto='tcp'*, *direction='in'*, *port_origin='d'*, *ip_origin='s'*, *ttl=None*, *comment=''*, *reload=False*)

Ensure iptable rule exists.

name The ip address or CIDR for the rule.

method The type of rule. Either `allow' or `deny'.

port Optional port to be open or closed for the iptables rule.

proto The protocol. Either `tcp', or `udp'. Only applicable if port is specified.

direction The diretion of traffic to apply the rule to. Either `in', or `out'. Only applicable if port is specified.

port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either `s', or `d'.

ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either `s', or `d'. Only applicable if port is specified.

ttl How long the rule should exist. If supplied, *csf.tempallow()* or csf.tempdeny()` are used.

comment An optional comment to appear after the rule as a #comment .

reload Reload the csf service after applying this rule. Default false.

salt.states.csf.**testing_off**(*name*, *reload=False*)

Ensure testing mode is enabled in csf.

reload Reload CSF after changing the testing status. Default false.

salt.states.csf.**testing_on**(*name*, *reload=False*)

Ensure testing mode is enabled in csf.

reload Reload CSF after changing the testing status. Default false.

19.19.59 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

class salt.states.cyg.**DictDiffer**(*current_dict*, *past_dict*)

Calculate the difference between two dictionaries.

1.items added
2.items removed
3.keys same in both but changed values
4.keys same in both and unchanged values

added()

Return a set of additions to past_dict.

changed()

Return a set of the keys with changed values.

removed()

Return a set of things removed from past_dict.

same()

True if the two dicts are the same.

unchanged()

Return a set of the keys with unchanged values.

salt.states.cyg.**installed**(*name*, *cyg_arch='x86_64'*, *mirrors=None*)

Make sure that a package is installed.

name The name of the package to install

cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

salt.states.cyg.**removed**(*name*, *cyg_arch='x86_64'*, *mirrors=None*)

Make sure that a package is not installed.

name The name of the package to uninstall

cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

salt.states.cyg.**updated**(*name=None*, *cyg_arch='x86_64'*, *mirrors=None*)

Make sure all packages are up to date.

name [None] No affect, salt fails poorly without the arg available

cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

19.19.60 salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends

- dnspython

Note: The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspy_tsig_key.txt
```

`salt.states.ddns.`**`absent`**(*name*, *zone*, *data=None*, *rdtype=None*, ***kwargs*)

Ensures that the named DNS record is absent.

name The host portion of the DNS record, e.g., `webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check

data Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

rdtype DNS resource type. If omitted, all types will be purged.

****kwargs** Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname). Note that the nsupdate key file can't be reused by this function, the keyfile and other arguments must follow the dnspython spec.

`salt.states.ddns.`**`present`**(*name*, *zone*, *ttl*, *data*, *rdtype='A'*, ***kwargs*)

Ensures that the named DNS record is present with the given ttl.

name The host portion of the DNS record, e.g., `webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check/update

ttl TTL for the record

data Data for the DNS record. E.g., the IP address for an A record.

rdtype DNS resource type. Default `A'.

****kwargs** Additional arguments the ddns.update function may need (e.g. nameserver, keyfile, keyname). Note that the nsupdate key file can't be reused by this function, the keyfile and other arguments must follow the dnspython spec.

19.19.61 salt.states.debconfmod

Management of debconf selections

depends

- debconf-utils package

The debconfmod state module manages the enforcement of debconf selections, this state can set those selections prior to package installation.

Available Functions

The debconfmod state has two functions, the `set` and `set_file` functions

set Set debconf selections from the state itself

set_file Set debconf selections from a file

```
nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
        'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
        'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
  debconf.set:
    - name: ferm
    - data:
        'ferm/enable': {'type': 'boolean', 'value': True}
```

Note: Due to how PyYAML imports nested dicts (see *here*), the values in the `data` dict must be indented four spaces instead of two.

`salt.states.debconfmod.`**`set`**(*name*, *data*, ***kwargs*)

Set debconf selections

```
<state_id>:
  debconf.set:
    - name: <name>
    - data:
        <question>: {'type': <type>, 'value': <value>}
        <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
        <question>: {'type': <type>, 'value': <value>}
        <question>: {'type': <type>, 'value': <value>}
```

name: The package name to set answers for.
data: A set of questions/answers for debconf. Note that everything under this must be indented twice.
question: The question the is being pre-answered
type: The type of question that is being asked (string, boolean, select, etc.)
value: The answer to the question

salt.states.debconfmod.**set_file**(*name*, *source*, *template=None*, *context=None*, *defaults=None*, ***kwargs*)

Set debconf selections from a file or a template

```
<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
        some_value: "false"
```

source: The location of the file containing the package selections

template If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

19.19.62 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - datacenter: dc-1-us
    - location: my-location
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - server-1: my-slot-name
      - server-2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```
proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2
```

```
chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

  servers:
    server-1:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.132
      netmask: 255.255.0.0
      gateway: 172.17.17.1
    server-2:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.2
      netmask: 255.255.0.0
      gateway: 172.17.17.1
    server-3:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.20
      netmask: 255.255.0.0
      gateway: 172.17.17.1
    server-4:
      idrac_password: saltstack1
      ipmi_over_lan: True
      ip: 172.17.17.2
      netmask: 255.255.0.0
      gateway: 172.17.17.1

  switches:
    switch-1:
      ip: 192.168.1.2
      netmask: 255.255.255.0
      gateway: 192.168.1.1
      snmp: nonpublic
      password: saltstack1
    switch-2:
      ip: 192.168.1.3
      netmask: 255.255.255.0
      gateway: 192.168.1.1
      snmp: nonpublic
      password: saltstack1
```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```
{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
```

```
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry details['slot_names'] %}
        - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]]  }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades.  racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
{{ k }}:
  dellchassis.blade_idrac:
    - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
{{ k }}-switch-setup:
  dellchassis.switch:
    - name: {{ k }}
    - ip: {{ v['ip'] }}
    - netmask: {{ v['netmask'] }}
    - gateway: {{ v['gateway'] }}
    - password: {{ v['password'] }}
    - snmp: {{ v['snmp'] }}
{% endfor %}
```

Note: This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chasis-state-name -t 60
```

Note: The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

salt.states.dellchassis.**blade_idrac**(*name*, *idrac_password=None*, *idrac_ipmi=None*, *idrac_ip=None*, *idrac_netmask=None*, *idrac_gateway=None*, *idrac_dnsname=None*, *idrac_dhcp=None*)

Set parameters for iDRAC in a blade.

Parameters

- **idrac_password** -- Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac_ipmi** -- Enable/Disable IPMI over LAN
- **idrac_ip** -- Set IP address for iDRAC
- **idrac_netmask** -- Set netmask for iDRAC
- **idrac_gateway** -- Set gateway for iDRAC
- **idrac_dhcp** -- Turn on DHCP for iDRAC (True turns on, False does nothing becaause setting a static IP will disable DHCP).

Returns A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

salt.states.dellchassis.**chassis**(*name*, *chassis_name=None*, *password=None*, *datacenter=None*, *location=None*, *mode=None*, *idrac_launch=None*, *slot_names=None*, *blade_power_states=None*)

Manage a Dell Chassis.

chassis_name The name of the chassis.

datacenter The datacenter in which the chassis is located

location The location of the chassis.

password Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the blade_idrac function.

mode The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

idrac_launch The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)
- 1: Enabled (launch iDRAC using DNS name)

slot_names The names of the slots, provided as a list identified by their slot numbers.

blade_power_states The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

salt.states.dellchassis.**firmware_update**(*hosts=None*, *directory=''*)

State to update the firmware on host using the `racadm` command

firmwarefile filename (string) starting with `salt://`

host string representing the hostname supplied to the `racadm` command
directory Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares
```

salt.states.dellchassis.**switch**(*name*, *ip=None*, *netmask=None*, *gateway=None*, *dhcp=None*, *password=None*, *snmp=None*)

Manage switches in a Dell Chassis.
name The switch designation (e.g. switch-1, switch-2)
ip The Static IP Address of the switch
netmask The netmask for the static IP
gateway The gateway for the static IP
dhcp True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)
password The access (root) password for the switch
snmp The SNMP community string for the switch
Example:

```
my-dell-chassis:
  dellchassis.switch:
    - switch: switch-1
    - ip: 192.168.1.1
    - netmask: 255.255.255.0
    - gateway: 192.168.1.254
    - dhcp: True
    - password: secret
    - snmp: public
```

19.19.63 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```
used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%
```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```
storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%
```

```
clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold
```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```
used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True
```

`salt.states.disk.`**`status`**(*name*, *maximum=None*, *minimum=None*, *absolute=False*)

Return the current disk usage stats for the named mount point

name Disk mount with which to check used space

maximum The maximum disk utilization

minimum The minimum disk utilization

absolute By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

19.19.64 salt.states.docker

States to manage Docker containers, images, volumes, and networks

Changed in version 2017.7.0: The legacy Docker state and execution module have been removed, and the new modules (formerly called `dockerng` have taken their places).

Important: As of the 2017.7.0 release, the states in this module have been separated into the following four state modules:

- *docker_container* - States to manage Docker containers
- *docker_image* - States to manage Docker images
- *docker_volume* - States to manage Docker volumes
- *docker_network* - States to manage Docker networks

The reason for this change was to make states and requisites more clear. For example, imagine this SLS:

```
myuser/appimage:
  docker.image_present:
    - sls: docker.images.appimage

myapp:
  docker.running:
    - image: myuser/appimage
    - require:
      - docker: myuser/appimage
```

The new syntax would be:

```
myuser/appimage:
  docker_image.present:
    - sls: docker.images.appimage

myapp:
  docker_container.running:
    - image: myuser/appimage
    - require:
      - docker_image: myuser/appimage
```

This is similar to how Salt handles MySQL, MongoDB, Zabbix, and other cases where the same execution module is used to manage several different kinds of objects (users, databases, roles, etc.).

The old syntax will continue to work until the **Fluorine** release of Salt.

---

salt.states.docker.**absent**(*name*, ***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_container.absent*.

salt.states.docker.**image_absent**(***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_image.absent*.

salt.states.docker.**image_present**(*name*, ***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_image.present*.

salt.states.docker.**network_absent**(*name*, ***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_network.absent*.

salt.states.docker.**network_present**(*name*, ***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_network.present*.

salt.states.docker.**running**(*name*, ***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_container.running*.

salt.states.docker.**stopped**(***kwargs*)
Deprecated since version 2017.7.0: This state has been moved to *docker_container.stopped*.

salt.states.docker.**volume_absent**(*name*, *driver=None*)
Deprecated since version 2017.7.0: This state has been moved to *docker_volume.absent*.

salt.states.docker.**volume_present**(*name*, *driver=None*, *driver_opts=None*, *force=False*)
Deprecated since version 2017.7.0: This state has been moved to *docker_volume.present*.

19.19.65 salt.states.docker_container

Management of Docker containers

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the *docker* state module (formerly called **dockerng**) in the 2017.7.0 release. When running the *docker_container.running* state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is None. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

Note: To pull from a Docker registry, authentication must be configured. See *here* for more information on how to configure access to docker registries in *Pillar* data.

salt.states.docker_container.**absent**(*name*, *force=False*)

Ensure that a container is absent

name Name of the container

force [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
  docker_container.absent

multiple_containers:
  docker_container.absent:
    - names:
      - foo
      - bar
      - baz
```

salt.states.docker_container.**running**(*name*, *image=None*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *force=False*, *watch_action='force'*, *start=True*, *shutdown_timeout=10*, *client_timeout=60*, ***kwargs*)

Ensure that a container with a specific configuration is present and running

name Name of the container

image Image to use for the container. Image names can be specified either using repo:tag notation, or just the repo name (in which case a tag of latest is assumed).

Note: This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the docker_image.present state should be used to manage the image.

skip_translate This function translates Salt CLI or SLS input into the format which docker-py expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass True and *all* translation will be skipped.

Skipping tranlsation allows for arguments to be formatted directly in the format which docker-py ex-

pects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings:
      - 10.2.9.10:8080:80
```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format docker-py needs:

```
mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp', 9314}
```

See the following links for more information:

- docker-py Low-level API
- Docker Engine API

ignore_collisions [False] Since many of docker-py`s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the docker-py version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the docker-py version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the docker-py version of the argument.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

force [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

watch_action [force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```
mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file
```

Note: If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

---

start [True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes,

such as the Django `migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

shutdown_timeout [10] If the container needs to be replaced, the container will be stopped using *docker.stop*. The value of this parameter will be passed to *docker.stop* as the `timeout` value, telling Docker how long to wait for a graceful shutdown before killing the container.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

client_timeout [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

CONTAINER CONFIGURATION PARAMETERS

auto_remove (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - auto_remove: True
```

binds Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

`<read_only>` can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

`<selinux_context>` can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

Note: When both `<read_only>` and `<selinux_context>` are specified, there must be a comma before `<selinux_context>`.

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
```

```
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both ro/rw and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

blkio_weight Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100
```

blkio_weight_device Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight_device: /dev/sda:100
```

cap_add List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add: SYS_ADMIN,MKNOD
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_add:
      - SYS_ADMIN
      - MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

cap_drop List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cap_drop:
      - SYS_ADMIN
      - MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

command (or *cmd*) Command to run in the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - command: bash
```

cpuset_cpus (or *cpuset*) CPUs on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of CPUs (e.g. `0,1`).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_cpus: "0,1"
```

cpuset_mems Memory nodes on which which to allow execution, specified as a string containing a range (e.g. `0-3`) or a comma-separated list of MEMs (e.g. `0,1`). Only effective on NUMA systems.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"
```

cpu_group The length of a CPU period in microseconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000
```

cpu_period Microseconds of CPU time that the container can get in a CPU period

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000
```

cpu_shares CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_shares: 512
```

detach [False] If `True`, run the container's command in the background (daemon mode)

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - detach: True
```

devices List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices:
      - /dev/net/tun
      - /dev/xvda1:/dev/xvda1
      - /dev/xvdb1:/dev/xvdb1:r
```

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

device_read_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

dns List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
```

```
    - dns_opt:
      - ndots:9
```

dns_search List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

domainname The domain name to use for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dommainname: domain.tld
```

entrypoint Entrypoint for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

extra_hosts Additional hosts to add to the container's /etc/hosts file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

Note: This option requires Docker 1.3.0 or newer.

group_add List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add: web,network
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add:
      - web
      - network
```

hostname Hostname of the container. If not provided, the value passed as the container's``name`` will be used for the hostname.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
```

Warning: `hostname` cannot be set if `network_mode` is set to `host`. The below example will result in an error:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

interactive (or *stdin_open*) [False] Leave stdin open, even if not attached

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - interactive: True
```

ipc_mode (or *ipc*) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- `container:<container_name_or_id>` reuses another container shared memory, semaphores and message queues
- `host`: use the host's shared memory, semaphores and message queues

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host
```

Warning: Using `host` gives the container full access to local shared memory and is therefore considered insecure.

isolation Specifies the type of isolation technology used by containers

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv
```

Note: The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

labels Add metadata to the container. Labels can be set both with and without values:

WITH VALUES

The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels: label1=value1,label2=value2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
      - label1=value1
      - label2=value2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
      - label1: value1
      - label2: value2
```

The labels can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
        label1: value1
        label2: value2
```

WITHOUT VALUES

The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels: label1,label2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - labels:
        - label1
        - label2
```

links Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

log_driver and log_opt Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The `log_opt` can also be expressed as a comma-separated or YAML list of `key=value` pairs. The below two examples are equivalent to the above one:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address=tcp://192.168.0.42
      - syslog-facility=daemon
```

Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's Configure logging drivers documentation for more information.

lxc_conf Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf: lxc.utsname=docker,lxc.arch=x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64
```

Note: These LXC configuration parameters will only have the desired effect if the container is using the LXC execution driver, which has been deprecated for some time.

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

mem_limit (or *memory*) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. `512M`, `2G`, etc.). A value of `0` (the default) means no memory limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M
```

mem_swappiness Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_swappiness: 60
```

memswap_limit (or *memory_swap*) [-1] Total memory limit (memory plus swap). Set to `-1` to disable swap. A value of `0` means no swap limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G
```

network_disabled [False] If `True`, networking will be disabled within the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_disabled: True
```

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container
- Any name that identifies an existing network that might be created with `docker.network_present`.

> **Warning:** Using `host` mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: "none"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: container:web1
```

oom_kill_disable Whether to disable OOM killer

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_kill_disable: False
```

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_score_adj: 500
```

pid_mode Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host
```

Note: This option requires Docker 1.5.0 or newer.

---

pids_limit Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000
```

port_bindings (or *publish*) Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings:
      - 4505-4506:14505-14506
      - 2123:2123/udp
      - 8080
```

Note: When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

---

ports A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp
```

privileged [False] If `True`, runs the exec process with extended privileges

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - privileged: True
```

publish_all_ports (or *publish_all*) [False] Publish all ports to the host

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True
```

read_only [False] If `True`, mount the container's root filesystem as read only

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True
```

restart_policy (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5

bar:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: always
```

security_opt (or *security_opts*): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined
```

Important: Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for security_opt at https://docs.docker.com/engine/reference/run/#security-configuration

shm_size Size of /dev/shm

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M
```

stop_signal Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3
```

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

New in version 2016.11.0.

stop_timeout Timeout to stop the container, in seconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
```

```
    - stop_timeout: 5
```

Note: In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refer's to the container's configured stop timeout.

storage_opt Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

sysctls (or *sysctl*) Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576,kernel.pid_max=32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768
```

tmpfs A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k
```

tty [False] Attach TTYs

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

ulimits List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60
```

user User under which to run exec process

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

userns_mode (or *user_ns_mode*) Sets the user namsepace mode, when the user namespace remapping option is enabled

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - userns_mode: host
```

volumes (or *volume*) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

volumes_from Container names or IDs from which the container will get volumes. Can be expressed as a

comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

volume_driver sets the container's volume driver

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

working_dir (or *workdir*) Working directory inside the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

salt.states.docker_container.**stopped**(*name=None*, *containers=None*, *shutdown_timeout=10*, *unpause=False*, *error_on_absent=True*)

Ensure that a container (or containers) is stopped

name Name or ID of the container

containers Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  docker_container.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  docker_container.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

shutdown_timeout [10] Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed.

unpause [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

error_on_absent [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

19.19.66 salt.states.docker_image

Management of Docker images

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the *docker* state module (formerly called **dockerng**) in the 2017.7.0 release.

Note: To pull from a Docker registry, authentication must be configured. See *here* for more information on how to configure access to docker registries in *Pillar* data.

---

salt.states.docker_image.**absent**(*name=None*, *images=None*, *force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

images Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  docker_image.absent:
    - images:
      - busybox
      - centos:6
      - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

force [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

Note: This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.`**`present`**(*name*, *build=None*, *load=None*, *force=False*, *insecure_registry=False*, *client_timeout=60*, *dockerfile=None*, *sls=None*, *base='opensuse/python'*, *saltenv='base'*, ***kwargs*)

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, or loaded from a saved image. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed). Repo identifier is mandatory, we don't assume the default repository is docker hub.

If neither of the `build` or `load` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:mytag:
  docker_image.present
```

build Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:mytag:
  docker_image.present:
    - build: /home/myuser/docker/myimage

myuser/myimage:mytag:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - dockerfile: Dockerfile.alternative
```

New in version 2016.11.0.

The image will be built using *docker.build* and the specified image name and tag will be applied to it.

load Loads a tar archive created with *docker.load* (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:mytag:
  docker_image.present:
    - load: salt://path/to/image.tar
```

force [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

client_timeout Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

dockerfile Allows for an alternative Dockerfile to be specified. Path to alternative Dockefile is relative to the build path for the Docker container.

New in version 2016.11.0.

sls Allow for building of image with *docker.sls_build* by specifying the SLS files with which to build. This can be a list or comma-seperated string.

```
myuser/myimage:mytag:
  docker_image.present:
    - sls:
        - webapp1
        - webapp2
```

```
    - base: centos
    - saltenv: base
```

base Base image with which to start *docker.sls_build*
saltenv Environment from which to pull SLS files for *docker.sls_build*

19.19.67 salt.states.docker_network

Management of Docker networks

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the *docker* state module (formerly called **dockerng**) in the 2017.7.0 release.

salt.states.docker_network.**absent**(*name*, *driver=None*)
Ensure that a network is absent.
name Name of the network
Usage Examples:

```
network_foo:
  docker_network.absent
```

salt.states.docker_network.**present**(*name*, *driver=None*, *containers=None*)
Ensure that a network is present.
name Name of the network
driver Type of driver for that network.
containers: List of container names that should be part of this network
Usage Examples:

```
network_foo:
  docker_network.present
```

```
network_bar:
  docker_network.present
    - name: bar
    - containers:
        - cont1
        - cont2
```

19.19.68 salt.states.docker_volume

Management of Docker volumes

New in version 2017.7.0.

depends docker Python module

Note: Older releases of the Python bindings for Docker were called docker-py in PyPI. All releases of docker, and releases of docker-py >= 1.6.0 are supported. These python bindings can easily be installed using *pip.install*:

```
salt myminion pip.install docker
```

To upgrade from docker-py to docker, you must first uninstall docker-py, and then install docker:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the *docker* state module (formerly called **dockerng**) in the 2017.7.0 release.

salt.states.docker_volume.**absent**(*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from **docker.volume_absent** to **docker_volume.absent**

name Name of the volume

Usage Examples:

```
volume_foo:
  docker_volume.absent
```

salt.states.docker_volume.**present**(*name*, *driver=None*, *driver_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from **docker.volume_present** to **docker_volume.present**

name Name of the volume

driver Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

driver_opts Options for the volume driver

force [False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
  docker_volume.present
```

```
volume_bar:
  docker_volume.present
    - name: bar
```

```
    - driver: local
    - driver_opts:
        foo: bar
```

```
volume_bar:
  docker_volume.present
    - name: bar
    - driver: local
    - driver_opts:
        - foo: bar
        - option: value
```

19.19.69 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
  drac.present:
    - name: damian
    - password: secret
    - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
  drac.absent:
    - name: damian
```

Ensure DRAC network is in a consistent state

```
my_network:
  drac.network:
    - ip: 10.225.108.29
    - netmask: 255.255.255.224
    - gateway: 10.225.108.1
```

salt.states.drac.**absent**(*name*)
Ensure a user does not exist on the Dell DRAC
name: The users username

salt.states.drac.**network**(*ip*, *netmask*, *gateway*)
Ensure the DRAC network settings are consistent

salt.states.drac.**present**(*name*, *password*, *permission*)
Ensure the user exists on the Dell DRAC
name: The users username
password The password used to authenticate
permission The permissions that should be assigned to a user

19.19.70 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

salt.states.elasticsearch.**alias_absent**(*name*, *index*)

Ensure that the index alias is absent.

name Name of the index alias to remove

index Name of the index for the alias

salt.states.elasticsearch.**alias_present**(*name*, *index*, *definition=None*)

Ensure that the named index alias is present.

name Name of the alias

index Name of the index

definition Optional dict for filters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html

Example:

```
mytestalias:
  elasticsearch.alias_present:
    - index: testindex
    - definition:
        filter:
          term:
            user: kimchy
```

salt.states.elasticsearch.**index_absent**(*name*)

Ensure that the named index is absent.

name Name of the index to remove

salt.states.elasticsearch.**index_present**(*name*, *definition=None*)

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
        settings:
          index:
            number_of_shards: 10
```

salt.states.elasticsearch.**index_template_absent**(*name*)

Ensure that the named index template is absent.

name Name of the index to remove

salt.states.elasticsearch.**index_template_present**(*name*, *definition*)

Ensure that the named index templat eis present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

Example:

```
mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
        template: logstash-*
        order: 1
        settings:
          number_of_shards: 1
```

salt.states.elasticsearch.**pipeline_absent**(*name*)

Ensure that the named pipeline is absent

name Name of the pipeline to remove

salt.states.elasticsearch.**pipeline_present**(*name*, *definition*)

Ensure that the named pipeline is present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html

Example:

```
test_pipeline:
  elasticsearch_pipeline.present:
    - definition:
        description: example pipeline
        processors:
          - set:
              field: collector_timestamp_millis
              value: '{{ '{{' }}_ingest.timestamp{{ '}}' }}'
```

salt.states.elasticsearch.**search_template_absent**(*name*)

Ensure that the search template is absent

name Name of the search template to remove

salt.states.elasticsearch.**search_template_present**(*name*, *definition*)

Ensure that the named search template is present.

name Name of the search template to add

definition Required dict for creation parameters as per http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html

Example:

```
test_pipeline:
  elasticsearch.search_template_present:
    - definition:
        inline:
          size: 10
```

19.19.71 salt.states.elasticsearch_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

salt.states.elasticsearch_index.**absent**(*name*)

Ensure that the named index is absent.

name Name of the index to remove

salt.states.elasticsearch_index.**present**(*name*, *definition=None*)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked `definition` as optional.

Ensure that the named index is present.

name Name of the index to add

definition Optional dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html

Example:

```
# Default settings
mytestindex:
  elasticsearch_index.present

# Extra settings
mytestindex2:
  elasticsearch_index.present:
    - definition:
        settings:
          index:
            number_of_shards: 10
```

19.19.72 salt.states.elasticsearch_index_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use elasticsearch state instead

salt.states.elasticsearch_index_template.**absent**(*name*)

Ensure that the named index template is absent.

name Name of the index to remove

salt.states.elasticsearch_index_template.**present**(*name*, *definition*)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked `definition` as required.

Ensure that the named index templat eis present.

name Name of the index to add

definition Required dict for creation parameters as per https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html

Example:

```
mytestindex2_template:
  elasticsearch_index_template.present:
    - definition:
        template: logstash-*
        order: 1
        settings:
          number_of_shards: 1
```

19.19.73 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

salt.states.environ.**setenv**(*name*, *value*, *false_unsets=False*, *clear_all=False*, *update_minion=False*, *permanent=False*)

Set the salt process environment variables.

name The environment key to set. Must be a string.

value Either a string or dict. When string, it will be the value set for the environment key of `name' above. When a dict, each key/value pair represents an environment variable to set.

false_unsets If a key's value is False and false_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false_unsets is not True, then the key's value will be set to an empty string. Default: False

clear_all USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

update_minion If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

permanent On Windows minions this will set the environment variable in the registry so that it is always added as a environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in ``HKLM'' for this parameter. On all other minion types this will be ignored. Note: This will only take affect on applications opened after this has been set.

Example:

```
a_string_env:
   environ.setenv:
     - name: foo
     - value: bar
     - update_minion: True

a_dict_env:
   environ.setenv:
     - name: does_not_matter
     - value:
         foo: bar
         baz: quux
```

19.19.74 salt.states.eselect

Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

```
profile:
    eselect.set:
        target: hardened/linux/amd64
```

salt.states.eselect.**set**(*name*, *target*, *module_parameter=None*, *action_parameter=None*)

Verify that the given module is set to the given target

name The name of the module

target The target to be set for this module

module_parameter additional params passed to the defined module

action_parameter additional params passed to the defined action

19.19.75 salt.states.etcd_mod

Manage etcd Keys

New in version 2015.8.0.

depends

- python-etcd

This state module supports setting and removing keys from etcd.

Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

Note: The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the *pillar_opts* must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

Available Functions

- `set`

  This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

  ```
  /foo/bar/baz:
    etcd.set:
      - value: foo
      - profile: my_etcd_config
  ```

- `wait_set`

  Performs the same functionality as `set` but only if a watch requisite is `True`.

  ```
  /some/file.txt:
    file.managed:
      - source: salt://file.txt

  /foo/bar/baz:
    etcd.wait_set:
  ```

```
    - value: foo
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

- `rm`

  This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
  etcd.rm:
    - profile: my_etcd_config
```

- `wait_rm`

  Performs the same functionality as `rm` but only if a watch requisite is `True`.

```
/some/file.txt:
  file.managed:
    - source: salt://file.txt

/foo/bar/baz:
  etcd.wait_rm:
    - profile: my_etcd_config
    - watch:
      - file: /some/file.txt
```

`salt.states.etcd_mod.`**`mod_watch`**(*name*, ***kwargs*)
Execute a etcd function based on a watch call requisite.

`salt.states.etcd_mod.`**`rm`**(*name*, *recurse=False*, *profile=None*)
Deletes a key from etcd. This function is also aliased as `rm`.
name The etcd key name to remove, for example `/foo/bar/baz`.
recurse Optional, defaults to `False`. If `True` performs a recursive delete.
profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.`**`set`**(*name*, *value*, *profile=None*)
Set a key in etcd and can be called as `set`.
name The etcd key name, for example: `/foo/bar/baz`.
value The value the key should contain.
profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.`**`wait_rm`**(*name*, *recurse=False*, *profile=None*)
Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.
name The etcd key name to remove, for example `/foo/bar/baz`.
recurse Optional, defaults to `False`. If `True` performs a recursive delete, see: https://python-etcd.readthedocs.io/en/latest/#delete-a-key.
profile Optional, defaults to `None`. Sets the etcd profile to use which has been defined in the Salt Master config.

`salt.states.etcd_mod.`**`wait_set`**(*name*, *value*, *profile=None*)
Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.
name The etcd key name, for example: `/foo/bar/baz`.
value The value the key should contain.

profile The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

19.19.76 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

codeauthor Krzysztof Pawlowski <msciciel@msciciel.eu>

maturity new

depends python-ethtool

platform linux

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - rx_usecs: 24
    - tx_usecs: 48

eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - tx: 1024

eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

salt.states.ethtool.**coalesce**(*name*, ***kwargs*)

Manage coalescing settings of network device

name Interface name to apply coalescing settings

```
eth0:
  ethtool.coalesce:
    - name: eth0
    - adaptive_rx: on
    - adaptive_tx: on
    - rx_usecs: 24
    - rx_frame: 0
    - rx_usecs_irq: 0
    - rx_frames_irq: 0
    - tx_usecs: 48
    - tx_frames: 0
    - tx_usecs_irq: 0
    - tx_frames_irq: 0
    - stats_block_usecs: 0
    - pkt_rate_low: 0
    - rx_usecs_low: 0
    - rx_frames_low: 0
    - tx_usecs_low: 0
    - tx_frames_low: 0
    - pkt_rate_high: 0
    - rx_usecs_high: 0
```

```
    - rx_frames_high: 0
    - tx_usecs_high: 0
    - tx_frames_high: 0
    - sample_interval: 0
```

salt.states.ethtool.**offload**(*name*, ***kwargs*)

Manage protocol offload and other features of network device

name Interface name to apply coalescing settings

```
eth0:
  ethtool.offload:
    - name: eth0
    - tcp_segmentation_offload: on
```

salt.states.ethtool.**ring**(*name*, ***kwargs*)

Manage rx/tx ring parameters of network device

Use `max' word to set with factory maximum

name Interface name to apply ring parameters

```
eth0:
  ethtool.ring:
    - name: eth0
    - rx: 1024
    - rx_mini: 0
    - rx_jumbo: 0
    - tx: max
```

19.19.77 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See Issue #29537 for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for vSphere 5.5 and vSphere 6.0.

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the vSphere Comparison page for more information.

About

This state module was written to be used in conjunction with Salt's *`ESXi Proxy Minion`*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the *ESXi Proxy Minion Tutorial* for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

`salt.states.esxi.`**`coredump_configured`**(*name*, *enabled*, *dump_ip*, *host_vnic='vmk0'*, *dump_port=6500*)

Ensures a host's core dump configuration.

name Name of the state.

enabled Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many `old` references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system coredemp network configuration command returns data.

dump_ip The IP address of host that will accept the dump.

host_vnic Host VNic port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump. Defaults to `6500`.
Example:

```
configure-host-coredump:
  esxi.coredump_configured:
    - enabled: True
    - dump_ip: 'my-coredump-ip.example.com'
```

salt.states.esxi.**ntp_configured**(*name*, *service_running*, *ntp_servers=None*, *service_policy=None*, *service_restart=False*, *update_datetime=False*)

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

name Name of the state.

service_running Ensures the running state of the ntp daemon for the host. Boolean value where `True` indicates that ntpd should be running and `False` indicates that it should be stopped.

ntp_servers A list of servers that should be added to the ESXi host's NTP configuration.

service_policy The policy to set for the NTP service.

> **Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

service_restart If set to `True`, the ntp daemon will be restarted, regardless of its previous running state. Default is `False`.

update_datetime If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
  esxi.ntp_configured:
    - service_running: True
    - ntp_servers:
      - 192.174.1.100
      - 192.174.1.200
    - service_policy: 'on'
    - service_restart: True
```

salt.states.esxi.**password_present**(*name*, *password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using test=True functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

name Name of the state.

password The new password to change on the host.

Example:

```
configure-host-password:
  esxi.password_present:
    - password: 'new-bad-password'
```

salt.states.esxi.**ssh_configured**(*name*, *service_running*, *ssh_key=None*, *ssh_key_file=None*, *service_policy=None*, *service_restart=False*, *certificate_verify=False*)

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

name Name of the state.

service_running Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should stopped.

In order to update SSH keys, the SSH service must be running.

ssh_key Public SSH key to added to the authorized_keys file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

ssh_key_file File containing the public SSH key to be added to the authorized_keys file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

service_policy The policy to set for the NTP service.

Note: When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

service_restart If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

certificate_verify If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```
configure-host-ssh:
  esxi.ssh_configured:
    - service_running: True
    - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
    - service_policy: 'on'
    - service_restart: True
    - certificate_verify: True
```

salt.states.esxi.**syslog_configured**(*name*, *syslog_configs*, *firewall=True*, *reset_service=True*, *reset_syslog_config=False*, *reset_configs=None*)

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

name Name of the state.

syslog_configs Name of parameter to set (corresponds to the command line switch for esxcli without the double dashes (--))

Valid syslog_config values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each syslog_config option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html)

firewall Enable the firewall rule set for syslog. Defaults to `True`.

reset_service After a successful parameter set, reset the service. Defaults to `True`.

reset_syslog_config Resets the syslog service to it's default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running

any other syslog settings.

reset_configs A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```
configure-host-syslog:
  esxi.syslog_configured:
    - syslog_configs:
        loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
        default-timeout: 120
    - firewall: True
    - reset_service: True
    - reset_syslog_config: True
    - reset_configs: loghost,default-timeout
```

`salt.states.esxi.`**`vmotion_configured`**(*name*, *enabled*, *device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

name Name of the state.

enabled Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

device The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```
configure-vmotion:
  esxi.vmotion_configured:
    - enabled: True
    - device: sample-device
```

`salt.states.esxi.`**`vsan_configured`**(*name*, *enabled*, *add_disks_to_vsan=False*)

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

name Name of the state.

enabled Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

add_disks_to_vsan If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```
configure-host-vsan:
  esxi.vsan_configured:
    - enabled: True
    - add_disks_to_vsan: True
```

19.19.78 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.`**`send`**(*name*, *data=None*, *preload=None*, *with_env=False*, *with_grains=False*, *with_pillar=False*, ***kwargs*)

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the *event.send* execution module of the same name.

Example:

```
# ...snip bunch of states above

mycompany/mystaterun/status/update:
  event.send:
    - data:
        status: "Half-way through the state run!"

# ...snip bunch of states below
```

salt.states.event.**wait**(*name*, *sfun=None*)

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```
# Stand up a new web server.
apache:
  pkg:
    - installed
    - name: httpd
  service:
    - running
    - enable: True
    - name: httpd

# Notify the load balancer to update the pool once Apache is running.
refresh_pool:
  event:
    - wait
    - name: mycompany/loadbalancer/pool/update
    - data:
        new_web_server_ip: {{ grains['ipv4'] | first() }}
    - watch:
      - pkg: apache
```

19.19.79 salt.states.file

Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```
/etc/http/conf/http.conf:
  file.managed:
    - source: salt://apache/http.conf
    - user: root
    - group: root
```

```
    - mode: 644
    - template: jinja
    - defaults:
        custom_var: "default value"
        other_var: 123
{% if grains['os'] == 'Ubuntu' %}
    - context:
        custom_var: "override"
{% endif %}
```

It is also possible to use the *py renderer* as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```
def run():
    lines = ['foo', 'bar', 'baz']
    lines.extend([source, name, user, context])  # Arguments as globals
    return '\n\n'.join(lines)
```

Note: The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information*.

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
  file.managed:
    - source:
      - salt://foo.conf.{{ grains['fqdn'] }}
      - salt://foo.conf.fallback
    - user: foo
    - group: users
    - mode: 644
    - backup: minion
```

Note: Salt supports backing up managed files via the backup option. For more details on this functionality please review the *backup_mode documentation*.

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
  file.managed:
    - source:
      - 'salt://foo.conf?saltenv=dev'
```

```
    - user: foo
    - group: users
    - mode: '0644'
```

Warning: When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state `name` and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

There is more documentation about this feature in the *Names declaration* section of the *Highstate docs*.

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
  file.mknod:
    - ntype: c
    - major: 1
    - minor: 8
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
  file.mknod:
    - ntype: b
    - major: 7
    - minor: 0
    - user: named
    - group: named
    - mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
  file.mknod:
    - ntype: p
    - user: named
    - group: named
    - mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
  file.directory:
```

```
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

As a default, `mode` will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```
/srv/stuff/substuf:
  file.directory:
    - user: fred
    - group: users
    - file_mode: 744
    - dir_mode: 755
    - makedirs: True
    - recurse:
      - user
      - group
      - mode
```

Symlinks can be easily created; the symlink function is very simple and only takes a few arguments:

```
/etc/grub.conf:
  file.symlink:
    - target: /boot/grub/grub.conf
```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```
/opt/code/flask:
  file.recurse:
    - source: salt://code/flask
    - include_empty: True
```

A more complex `recurse` example:

```
{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
```

```
  file.recurse:
    - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
    - user: {{ site_user }}
    - dir_mode: 2775
    - file_mode: '0644'
    - template: jinja
    - source: salt://project/templates_dir
    - include_empty: True
```

Retention scheduling can be applied to manage contents of backup directories. For example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 14
        first_of_week: 6
        first_of_month: 6
        first_of_year: all
```

salt.states.file.**absent**(*name*)

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

name The path which should be deleted

salt.states.file.**accumulated**(*name*, *filename*, *text*, ***kwargs*)

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

name Accumulator name

filename Filename which would receive this accumulator (see file.managed state documentation about name)

text String or list for adding in accumulator

require_in / watch_in One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
  file.accumulated:
    - filename: /tmp/animal_file.txt
    - text: ' jumps over the lazy dog.'
    - require_in:
      - file: animal_file

animal_file:
  file.managed:
    - name: /tmp/animal_file.txt
    - source: salt://animal_file.txt
    - template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
 ↪animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be ``chained'' together.

Note: The `accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

---

salt.states.file.**append**(*name*, *text=None*, *makedirs=False*, *source=None*, *source_hash=None*, *template='jinja'*, *sources=None*, *source_hashes=None*, *defaults=None*, *context=None*, *ignore_whitespace=True*)

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

name The location of the file to append to.

text The text to be appended, which can be a single string or a list of strings.

makedirs If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

source A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*

- *wempy*

sources A list of source files to append. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

source_hashes A list of source_hashes corresponding to the sources list specified in the sources argument.

defaults Default context passed to the template.

context Overrides default context variables passed to the template.

ignore_whitespace New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
  file.append:
    - text: |
        Thou hadst better eat salt with the Philosophers of Greece,
        than sugar with the Courtiers of Italy.
        - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.append:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - append
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 0.9.5.

`salt.states.file.`**`blockreplace`**(*name*, *marker_start='#-- start managed zone --`*, *marker_end='#-- end managed zone --`*, *source=None*, *source_hash=None*, *template='jinja'*, *sources=None*, *source_hashes=None*, *defaults=None*, *context=None*, *content='`*, *append_if_not_found=False*, *prepend_if_not_found=False*, *backup='.bak'*, *show_changes=True*, *append_newline=None*)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits. Note: this

function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

name Filesystem path to the file to be edited

marker_start The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

marker_end The line content identifying a line as the end of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output. Note: you can use file.accumulated and target this state. All accumulated data dictionaries content will be added as new lines in the content

content The content to be used between the two lines identified by `marker_start` and `marker_end`

source The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
  file.blockreplace:
    - name: /etc/example.conf
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template [jinja] Templating engine to be used to render the downloaded file. The following engines are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*

- *py*
- *wempy*

context Overrides default context variables passed to the template

defaults Default context passed to the template

append_if_not_found [False] If markers are not found and this option is set to `True`, the content block will be appended to the file.

prepend_if_not_found [False] If markers are not found and this option is set to `True`, the content block will be prepended to the file.

backup The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

dry_run [False] If `True`, do not make any edits to the file and simply return the changes that *would* be made.

show_changes [True] Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If False, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

append_newline Controls whether or not a newline is appended to the content block. If the value of this argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
  file.blockreplace:
    - name: /etc/hosts
    - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
    - marker_end: "# END managed zone {{ myvar }} --"
    - content: 'First line of content'
    - append_if_not_found: True
    - backup: '.bak'
    - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: "text 2"
    - require_in:
      - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
  file.accumulated:
    - filename: /etc/hosts
    - name: my-accumulator-{{ myvar }}
    - text: |
        text 3
        text 4
    - require_in:
      - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in `/etc/hosts`:

```
# START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
```

```
text 3
text 4
# END managed zone 42 --
```

salt.states.file.**cached**(*name*, *source_hash=''*, *source_hash_name=None*, *skip_verify=False*, *saltenv='base'*)

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than `base`, either use the `saltenv` argument or include the saltenv in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the state will obviously not try to download anything, but it will compare a hash if one is specified.

---

source_hash See the documentation for this same argument in the *file.managed* state.

Note: For remote files not originating from the `salt://` fileserver, such as http(s) or ftp servers, this state will not re-download the file if the locally-cached copy matches this hash. This is done to prevent unnecessary downloading on repeated runs of this state. To update the cached copy of a file, it is necessary to update this hash.

---

source_hash_name See the documentation for this same argument in the *file.managed* state.

skip_verify See the documentation for this same argument in the *file.managed* state.

Note: Setting this to `True` will result in a copy of the file being downloaded from a remote (http(s), ftp, etc.) source each time the state is run.

---

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

This state will in most cases not be useful in SLS files, but it is useful when writing a state or remote-execution module that needs to make sure that a file at a given URL has been downloaded to the cachedir. One example of this is in the `archive.extracted` state:

```
result = __states__['file.cached'](source_match,
                                   source_hash=source_hash,
                                   source_hash_name=source_hash_name,
                                   skip_verify=skip_verify,
                                   saltenv=__env__)
```

This will return a dictionary containing the state's return data, including a `result` key which will state whether or not the state was successful. Note that this will not catch exceptions, so it is best used within a try/except.

Once this state has been run from within another state or remote-execution module, the actual location of the cached file can be obtained using *cp.is_cached*:

```
cached = __salt__['cp.is_cached'](source_match, saltenv=__env__)
```

This function will return the cached path of the file, or an empty string if the file is not present in the minion cache.

salt.states.file.**comment**(*name*, *regex*, *char='#'*, *backup='.bak'*)

Comment out specified lines in a file.

name The full path to the file to be edited

regex A regular expression used to find the lines that are to be commented; this pattern will be wrapped in parenthesis and will move any preceding/trailing ^ or $ characters outside the parenthesis (e.g., the pattern ^foo$ will be rewritten as ^(foo)$) Note that you _need_ the leading ^, otherwise each time you run highstate, another comment char will be inserted.

char [#] The character to be inserted at the beginning of a line in order to comment it out

backup [.bak] The file will be backed up before edit with this file extension

> **Warning:** This backup will be overwritten each time sed / comment / uncomment is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/fstab:
  file.comment:
    - regex: ^bind 127.0.0.1
```

New in version 0.9.5.

salt.states.file.**copy**(*name*, *source*, *force=False*, *makedirs=False*, *preserve=False*, *user=None*, *group=None*, *mode=None*, *subdir=False*, ***kwargs*)

If the file defined by the source option exists on the minion, copy it to the named path. The file will not be overwritten if it already exists, unless the force option is set to True.

Note: This state only copies files from one location on a minion to another location on the same minion. For copying files from the master, use a *file.managed* state.

---

name The location of the file to copy to

source The location of the file to copy to the location specified with name

force If the target location is present then the file will not be moved, specify ``force: True'' to overwrite the target file

makedirs If the target subdirectories don't exist create them

preserve New in version 2015.5.0.

Set preserve: True to preserve user/group ownership and mode after copying. Default is False. If preserve is set to True, then user/group/mode attributes will be ignored.

user New in version 2015.5.0.

The user to own the copied file, this defaults to the user salt is running as on the minion. If preserve is set to True, then this will be ignored

group New in version 2015.5.0.

The group to own the copied file, this defaults to the group salt is running as on the minion. If preserve is set to True or on Windows this will be ignored

mode New in version 2015.5.0.

The permissions to set on the copied file, aka 644, `0775', `4664'. If preserve is set to True, then this will be ignored. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

subdir New in version 2015.5.0.

If the name is a directory then place the file inside the named directory

---

Note: The copy function accepts paths that are local to the Salt minion. This function does not support salt://, http://, or the other additional file paths that are supported by *states.file.managed* and *states.file.recurse*.

---

salt.states.file.**decode**(*name*, *encoded_data=None*, *contents_pillar=None*, *encoding_type='base64'*, *checksum='md5'*)

Decode an encoded file and write it to disk

New in version 2016.3.0.

name Path of the file to be written.

encoded_data The encoded file. Either this option or `contents_pillar` must be specified.

contents_pillar A Pillar path to the encoded file. Uses the same path syntax as *pillar.get*. The *hashutil.base64_encodefile* function can load encoded content into Pillar. Either this option or `encoded_data` must be specified.

encoding_type [`base64`] The type of encoding.

checksum [`md5`] The hashing algorithm to use to generate checksums. Wraps the *hashutil.digest* execution function.

Usage:

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - contents_pillar: mypillar:thefile

# or

write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
        Z2V0IHNhbHRlZAo=
```

Be careful with multi-line strings that the YAML indentation is correct. E.g.,

```
write_base64_encoded_string_to_a_file:
  file.decode:
    - name: /tmp/new_file
    - encoding_type: base64
    - encoded_data: |
        {{ salt.pillar.get('path:to:data') | indent(8) }}
```

salt.states.file.**directory**(*name*, *user=None*, *group=None*, *recurse=None*, *max_depth=None*, *dir_mode=None*, *file_mode=None*, *makedirs=False*, *clean=False*, *require=None*, *exclude_pat=None*, *follow_symlinks=False*, *force=False*, *backupname=None*, *allow_symlink=True*, *children_only=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, ***kwargs*)

Ensure that a named directory is present and has the right perms

name The location to create or manage a directory, as an absolute path

user The user to own the directory; this defaults to the user salt is running as on the minion

group The group ownership set for the directory; this defaults to the group salt is running as on the minion. On Windows, this is ignored

recurse Enforce user/group ownership and mode of directory recursively. Accepts a list of strings representing what you would like to recurse. If `mode` is defined, will recurse on both `file_mode` and `dir_mode` if they are defined. If `ignore_files` or `ignore_dirs` is included, files or directories will be left unchanged respectively. Example:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
```

Leave files or directories unchanged:

```
/var/log/httpd:
  file.directory:
    - user: root
    - group: root
    - dir_mode: 755
    - file_mode: 644
    - recurse:
      - user
      - group
      - mode
      - ignore_dirs
```

New in version 2015.5.0.

max_depth Limit the recursion depth. The default is no limit=None. `max_depth' and `clean' are mutually exclusive.

New in version 2016.11.0.

dir_mode / mode The permissions mode to set any directories created. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

file_mode The permissions mode to set any files created if `mode' is run in `recurse'. This defaults to dir_mode. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

makedirs If the directory is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file.

clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required. `clean' and `max_depth' are mutually exclusive.

require Require other resources such as packages or files

exclude_pat When `clean' is set to True, exclude this pattern from removal list and preserve in the destination.

follow_symlinks [False] If the desired path is a symlink (or `recurse` is defined and a symlink is encountered while recursing), follow it and check the permissions of the directory/file to which the symlink points.

New in version 2014.1.4.

force If the name of the directory exists and is not a directory and force is set to False, the state will fail. If force is set to True, the file in the way of the directory will be deleted to make room for the directory, unless backupname is set, then it will be renamed.

New in version 2014.7.0.

backupname If the name of the directory exists and is not a directory, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

New in version 2014.7.0.

allow_symlink [True] If allow_symlink is True and the specified path is a symlink, it will be allowed to remain if it points to a directory. If allow_symlink is False then the state will fail, unless force is also set to True, in which case it will be removed or renamed, depending on the value of the backupname argument.

New in version 2014.7.0.

children_only [False] If children_only is True the base of a path is excluded when performing a recursive operation. In case of /path/to/base, base will be ignored while all of /path/to/base/* are still operated on.

win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control','applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` is optional and defaults to `this_folder_subfoler_files`.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control','applies_to': 'this_folder_only'}}` Can be a single basic perm or a list of advanced perms.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

Here's an example using the above `win_*` parameters:

```
create_config_dir:
  file.directory:
    - name: 'C:\config\'
    - win_owner: Administrators
    - win_perms:
        # Basic Permissions
        dev_ops:
          perms: full_control
        # List of advanced permissions
        appuser:
          perms:
            - read_attributes
            - read_ea
            - create_folders
            - read_permissions
          applies_to: this_folder_only
        joe_snuffy:
          perms: read
          applies_to: this_folder_files
    - win_deny_perms:
        fred_snuffy:
```

```
        perms: full_control
    - win_inheritance: False
```

salt.states.file.**exists**(*name*)

Verify that the named file or directory is present or exists. Ensures pre-requisites outside of Salt's purview (e.g., keytabs, private keys, etc.) have been previously satisfied before deployment.

name Absolute path which must exist

salt.states.file.**line**(*name*, *content=None*, *match=None*, *mode=None*, *location=None*, *before=None*, *after=None*, *show_changes=True*, *backup=False*, *quiet=False*, *indent=True*, *create=False*, *user=None*, *group=None*, *file_mode=None*)

Line-based editing of a file.

New in version 2015.8.0.

name Filesystem path to the file to be edited.

content Content of the line. Allowed to be empty if mode=delete.

match Match the target line for an action by a fragment of a string or regular expression.

If neither `before` nor `after` are provided, and `match` is also `None`, match becomes the `content` value.

mode Defines how to edit a line. One of the following options is required:

- **ensure** If line does not exist, it will be added.
- **replace** If line already exists, it will be replaced.
- **delete** Delete the line, once found.
- **insert** Insert a line.

Note: If `mode=insert` is used, at least one of the following options must also be defined: `location`, `before`, or `after`. If `location` is used, it takes precedence over the other two options.

---

location Defines where to place content in the line. Note this option is only used when `mode=insert` is specified. If a location is passed in, it takes precedence over both the `before` and `after` kwargs. Valid locations are:

- **start** Place the content at the beginning of the file.
- **end** Place the content at the end of the file.

before Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

after Regular expression or an exact case-sensitive fragment of the string. This option is only used when either the `ensure` or `insert` mode is defined.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Default is `True`

Note: Using this option will store two copies of the file in-memory (the original version and the edited version) in order to generate the diff.

---

backup Create a backup of the original file with the extension: ``Year-Month-Day-Hour-Minutes-Seconds''.

quiet Do not raise any exceptions. E.g. ignore the fact that the file that is tried to be edited does not exist and nothing really happened.

indent Keep indentation with the previous line. This option is not considered when the `delete` mode is specified.

Parameters

- **create** -- Create an empty file if doesn't exists.

  New in version 2016.11.0.
- **user** -- The user to own the file, this defaults to the user salt is running as on the minion.

New in version 2016.11.0.

- **group** -- The group ownership set for the file, this defaults to the group salt is running as on the minion On Windows, this is ignored.

  New in version 2016.11.0.
- **file_mode** -- The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

  New in version 2016.11.0.

If an equal sign (=) appears in an argument to a Salt command, it is interpreted as a keyword argument in the format of `key=val`. That processing can be bypassed in order to pass an equal sign through to the remote shell command by manually specifying the kwarg:

```
update_config:
  file.line:
    - name: /etc/myconfig.conf
    - mode: ensure
    - content: my key = my value
    - before: somekey.*?
```

salt.states.file.**managed**(*name*, *source=None*, *source_hash=''*, *source_hash_name=None*, *keep_source=True*, *user=None*, *group=None*, *mode=None*, *template=None*, *makedirs=False*, *dir_mode=None*, *context=None*, *replace=True*, *defaults=None*, *backup=''*, *show_changes=True*, *create=True*, *contents=None*, *tmp_ext=''*, *contents_pillar=None*, *contents_grains=None*, *contents_newline=True*, *contents_delimiter=':'*, *encoding=None*, *encoding_errors='strict'*, *allow_empty=True*, *follow_symlinks=True*, *check_cmd=None*, *skip_verify=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, ***kwargs*)

Manage a given file, this function allows for a file to be downloaded from the salt master and potentially run through a templating system.

name The location of the file to manage, as an absolute path.

source The source file to download to the minion, this source file can be hosted on either the salt master server (`salt://`), the salt minion local file system (`/`), or on an HTTP or FTP server (`http(s)://`, `ftp://`).

Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see s3.get state documentation) File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs, see swift.get documentation. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs. If source is left blank or None (use ~ in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the source_hash argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored. Source list functionality only supports local files and remote files hosted on the salt master server or retrievable via HTTP, HTTPS, or FTP.

```
file_override_example:
  file.managed:
    - source:
      - salt://file_that_does_not_exist
      - salt://file_that_exists
```

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

Using a Source Hash File The file can contain several checksums for several files. Each line must contain both the file name and the hash. If no file name is matched, the first hash encountered will be used, otherwise the most secure hash with the correct source file name will be used.

When using a source hash file the source_hash argument needs to be a url, the standard download urls are supported, ftp, http, salt etc:

Example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
 ↪tomdroid-src-0.7.3.hash
```

The following lines are all supported formats:

```
/etc/rc.conf ef6e82e4006dee563d98ada2a2a80a27
sha254c8525aee419eb649f0233be91c151178b30f0dff8ebbdcc8de71b1d5c8bcc06a  /
 ↪etc/resolv.conf
ead48423703509d37c4a90e6a0d53e143b6fc268
```

Debian file type `*.dsc` files are also supported.

Inserting the Source Hash in the SLS Data

The source_hash can be specified as a simple checksum, like so:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
 ↪src-0.7.3.tar.gz
    - source_hash: 79eef25f9b0b2c642c62b7f737d4f53f
```

Note: Releases prior to 2016.11.0 must also include the hash type, like in the below example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
```

```
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/tomdroid-
↪src-0.7.3.tar.gz
    - source_hash: md5=79eef25f9b0b2c642c62b7f737d4f53f
```

Known issues: If the remote server URL has the hash file as an apparent sub-directory of the source file, the module will discover that it has already cached a directory where a file should be cached. For example:

```
tomdroid-src-0.7.3.tar.gz:
  file.managed:
    - name: /tmp/tomdroid-src-0.7.3.tar.gz
    - source: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz
    - source_hash: https://launchpad.net/tomdroid/beta/0.7.3/+download/
↪tomdroid-src-0.7.3.tar.gz/+md5
```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/tmp/foo.txt:
  file.managed:
    - source: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

keep_source [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds to the umask of the salt process. The mode of existing files and directories will only be changed if `mode` is specified.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

Note: keep does not work with salt-ssh.

As a consequence of how the files are transferred to the minion, and the inability to connect back to the master with salt-ssh, salt is unable to stat the file as it exists on the fileserver and thus cannot mirror the mode on the salt-ssh minion

---

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

makedirs [False] If set to `True`, then the parent directories will be created to facilitate the creation of the named file. If `False`, and the parent directory of the destination file doesn't exist, the state will fail.

dir_mode If directories are to be created, passing this option specifies the permissions for those directories. If this is not set, directories will be assigned permissions by adding the execute bit to the mode of the files.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

replace [True] If set to `False` and the file already exists, the file will not be modified even if changes would otherwise be made. Permissions and ownership will still be enforced, however.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

backup Overrides the default backup mode for this specific file. See *backup_mode documentation* for more details.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create [True] If set to `False`, then the file will only be managed if the file already exists on the system.

contents Specify the contents of the file. Cannot be used in combination with `source`. Ignores hashes and does not use a templating engine.

This value can be either a single string, a multiline YAML string or a list of strings. If a list of strings, then the strings will be joined together with newlines in the resulting file. For example, the below two example states would result in identical file contents:

```
/path/to/file1:
  file.managed:
    - contents:
      - This is line 1
      - This is line 2
```

```
/path/to/file2:
  file.managed:
    - contents: |
        This is line 1
        This is line 2
```

contents_pillar New in version 0.17.0.

Operates like `contents`, but draws from a value stored in pillar, using the pillar path syntax used in *pillar.get*. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

For example, the following could be used to deploy an SSH private key:

```
/home/deployer/.ssh/id_rsa:
  file.managed:
    - user: deployer
    - group: deployer
    - mode: 600
    - contents_pillar: userdata:deployer:id_rsa
```

This would populate `/home/deployer/.ssh/id_rsa` with the contents of `pillar['userdata']['deployer']['id_rsa']`. An example of this pillar setup would be like so:

```
userdata:
  deployer:
    id_rsa: |
        -----BEGIN RSA PRIVATE KEY-----
        MIIEowIBAAKCAQEAoQiwO3JhBquPAalQF9qP1lLZNXVjYMIswrMe2HcWUVBgh+vY
        U7sCwx/dH6+VvNwmCoqmNnP+8gTPKGl1vgAObJAnMT623dMXjVKwnEagZPRJIxDy
        B/HaAre9euNiY3LvIzBTWRSeMfT+rWvIKVBpvwlgGrfgz70m0pqxu+UyFbAGLin+
        GpxzZAMaFpZw4sSbIlRuissXZj/sHpQb8p9M5IeO4Z3rjkCP1cxI
        -----END RSA PRIVATE KEY-----
```

Note: The private key above is shortened to keep the example brief, but shows how to do multiline string in YAML. The key is followed by a pipe character, and the mutliline string is indented two more spaces.

To avoid the hassle of creating an indented multiline YAML string, the *file_tree external pillar* can be used instead. However, this will not work for binary files in Salt releases before 2015.8.4.

---

contents_grains New in version 2014.7.0.

Operates like `contents`, but draws from a value stored in grains, using the grains path syntax used in *grains.get*. This functionality works similarly to `contents_pillar`, but with grains.

For example, the following could be used to deploy a ``message of the day'' file:

```
write_motd:
  file.managed:
    - name: /etc/motd
    - contents_grains: motd
```

This would populate `/etc/motd` file with the contents of the `motd` grain. The `motd` grain is not a default grain, and would need to be set prior to running the state:

```
salt '*' grains.set motd 'Welcome! This system is managed by Salt.'
```

contents_newline [True] New in version 2014.7.0.

Changed in version 2015.8.4: This option is now ignored if the contents being deployed contain binary data.

If `True`, files managed using `contents`, `contents_pillar`, or `contents_grains` will have a newline added to the end of the file if one is not present. Setting this option to `False` will omit this final newline.

contents_delimiter New in version 2015.8.4.

Can be used to specify an alternate delimiter for `contents_pillar` or `contents_grains`. This delimiter will be passed through to *`pillar.get`* or *`grains.get`* when retrieving the contents.

encoding Encoding used for the file, e.g. `` `UTF-8` ``, `` `base64` ``. Default is None, which means str() will be applied to contents to ensure an ascii encoded file and backwards compatibility. See https://docs.python.org/3/library/codecs.html#standard-encodings for available encodings.

New in version 2017.7.0.

encoding_errors [`strict'] Error encoding scheme. Default is `` `'strict'` ``. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

allow_empty [True] New in version 2015.8.4.

If set to `False`, then the state will fail if the contents specified by `contents_pillar` or `contents_grains` are empty.

follow_symlinks [True] New in version 2014.7.0.

If the desired path is a symlink follow it and make changes to the file to which the symlink points.

check_cmd New in version 2014.7.0.

The specified command will be run with an appended argument of a *temporary* file containing the new managed contents. If the command exits with a zero status the new managed contents will be written to the managed destination. If the command exits with a nonzero exit code, the state will fail and no changes will be made to the file.

For example, the following could be used to verify sudoers before making changes:

```
/etc/sudoers:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - source: salt://sudoers/files/sudoers.jinja
    - template: jinja
    - check_cmd: /usr/sbin/visudo -c -f
```

NOTE: This `check_cmd` functions differently than the requisite `check_cmd`.

tmp_ext Suffix for temp file created by `check_cmd`. Useful for checkers dependent on config file extension (e.g. the init-checkconf upstart config checker).

```
/etc/init/test.conf:
  file.managed:
    - user: root
    - group: root
    - mode: 0440
    - tmp_ext: '.conf'
    - contents:
      - 'description "Salt Minion"'
```

```
      - 'start on started mountall'
      - 'stop on shutdown'
      - 'respawn'
      - 'exec salt-minion'
    - check_cmd: init-checkconf -f
```

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.0.

win_owner [None] The owner of the directory. If this is not passed, user will be used. If user is not passed, the account under which Salt is running will be used.

New in version 2017.7.0.

win_perms [None] A dictionary containing permissions to grant and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_deny_perms [None] A dictionary containing permissions to deny and their propagation. For example: `{'Administrators': {'perms': 'full_control'}}` Can be a single basic perm or a list of advanced perms. `perms` must be specified. `applies_to` does not apply to file objects.

New in version 2017.7.0.

win_inheritance [True] True to inherit permissions from the parent directory, False not to inherit permission.

New in version 2017.7.0.

Here's an example using the above `win_*` parameters:

```
create_config_file:
  file.managed:
    - name: C:\config\settings.cfg
    - source: salt://settings.cfg
    - win_owner: Administrators
    - win_perms:
        # Basic Permissions
        dev_ops:
          perms: full_control
        # List of advanced permissions
        appuser:
          perms:
            - read_attributes
            - read_ea
            - create_folders
            - read_permissions
        joe_snuffy:
          perms: read
    - win_deny_perms:
        fred_snuffy:
          perms: full_control
    - win_inheritance: False
```

`salt.states.file.`**`missing`**(*name*)

Verify that the named file or directory is missing, this returns True only if the named file is missing but does not remove the file if it is present.

name Absolute path which must NOT exist

`salt.states.file.`**`mknod`**(*name*, *ntype*, *major=0*, *minor=0*, *user=None*, *group=None*, *mode='0600'*)

Create a special file similar to the `nix mknod command. The supported device types are `p` (fifo pipe), `c`

(character device), and b (block device). Provide the major and minor numbers when specifying a character device or block device. A fifo pipe does not require this information. The command will create the necessary dirs if needed. If a file of the same name not of the same type/major/minor exists, it will not be overwritten or unlinked (deleted). This is logically in place as a safety measure because you can really shoot yourself in the foot here and it is the behavior of `nix mknod. It is also important to note that not just anyone can create special devices. Usually this is only done as root. If the state is executed as none other than root on a minion, you may receive a permission error.

name name of the file

ntype node type `p' (fifo pipe), `c' (character device), or `b' (block device)

major major number of the device does not apply to a fifo pipe

minor minor number of the device does not apply to a fifo pipe

user owning user of the device/pipe

group owning group of the device/pipe

mode permissions on the device/pipe

Usage:

```
/dev/chr:
  file.mknod:
    - ntype: c
    - major: 180
    - minor: 31
    - user: root
    - group: root
    - mode: 660

/dev/blk:
  file.mknod:
    - ntype: b
    - major: 8
    - minor: 999
    - user: root
    - group: root
    - mode: 660

/dev/fifo:
  file.mknod:
    - ntype: p
    - user: root
    - group: root
    - mode: 660
```

New in version 0.17.0.

salt.states.file.**mod_run_check_cmd**(*cmd*, *filename*, ***check_cmd_opts*)

Execute the check_cmd logic.

Return a result dict if check_cmd succeeds (check_cmd == 0) otherwise return True

salt.states.file.**not_cached**(*name*, *saltenv='base'*)

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

name The URL of the file to be cached. To cache a file from an environment other than base, either use the saltenv argument or include the saltenv in the URL (e.g. salt://path/to/file.conf?saltenv=dev).

Note: A list of URLs is not supported, this must be a single URL. If a local file is passed here, the state

will take no action.

saltenv Used to specify the environment from which to download a file from the Salt fileserver (i.e. those with `salt://` URL).

`salt.states.file.`**`patch`**(*name*, *source=None*, *options=''*, *dry_run_first=True*, ***kwargs*)

Ensure that a patch has been applied to the specified file

Note: A suitable `patch` executable must be available on the minion

name The file to which the patch should be applied

source The source patch to download to the minion, this source file must be hosted on the salt master server. If the file is located in the directory named spam, and is called eggs, the source string is salt://spam/eggs. A source is required.

hash The hash of the patched file. If the hash of the target file matches this value then the patch is assumed to have been applied. For versions 2016.11.4 and newer, the hash can be specified without an accompanying hash type (e.g. `e138491e9d5b97023cea823fe17bac22`), but for earlier releases it is necessary to also specify the hash type in the format `<hash_type>:<hash_value>` (e.g. `md5:e138491e9d5b97023cea823fe17bac22`).

options Extra options to pass to patch.

dry_run_first [`True`] Run patch with `--dry-run` first to check if it will apply cleanly.

saltenv Specify the environment from which to retrieve the patch file indicated by the `source` parameter. If not provided, this defaults to the environment from which the state is being executed.

Usage:

```
# Equivalent to ``patch --forward /opt/file.txt file.patch``
/opt/file.txt:
  file.patch:
    - source: salt://file.patch
    - hash: e138491e9d5b97023cea823fe17bac22
```

Note: For minions running version 2016.11.3 or older, the hash in the example above would need to be specified with the hash type (i.e. `md5:e138491e9d5b97023cea823fe17bac22`).

`salt.states.file.`**`prepend`**(*name*, *text=None*, *makedirs=False*, *source=None*, *source_hash=None*, *template='jinja'*, *sources=None*, *source_hashes=None*, *defaults=None*, *context=None*, *header=None*)

Ensure that some text appears at the beginning of a file

The text will not be prepended again if it already exists in the file. You may specify a single line of text or a list of lines to append.

name The location of the file to append to.

text The text to be appended, which can be a single string or a list of strings.

makedirs If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

source A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see s3.get state documentation). File retrieval from Openstack Swift object storage is supported via swift://container/object_path URLs (see swift.get documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named spam,

and is called eggs, the source string is salt://spam/eggs.

If the file is hosted on an HTTP or FTP server, the source_hash argument is also required.

source_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

```
Type    Length
======  ======
sha512     128
sha384      96
sha256      64
sha224      56
sha1        40
md5         32
```

See the `source_hash` parameter description for *`file.managed`* function for more details and examples.

template The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- *`cheetah`*
- *`genshi`*
- *`jinja`*
- *`mako`*
- *`py`*
- *`wempy`*

sources A list of source files to append. If the files are hosted on an HTTP or FTP server, the source_hashes argument is also required.

source_hashes A list of source_hashes corresponding to the sources list specified in the sources argument.

defaults Default context passed to the template.

context Overrides default context variables passed to the template.

ignore_whitespace New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
  file.prepend:
    - text: |
        Thou hadst better eat salt with the Philosophers of Greece,
        than sugar with the Courtiers of Italy.
        - Benjamin Franklin
```

Multiple lines of text:

```
/etc/motd:
  file.prepend:
    - text:
      - Trust no one unless you have eaten much salt with him.
      - "Salt is born of the purest of parents: the sun and the sea."
```

Optionally, require the text to appear exactly as specified (order and position). Combine with multi-line or multiple lines of input.

```
/etc/motd:
  file.prepend:
    - header: True
    - text:
      - This will be the very first line in the file.
      - The 2nd line, regardless of duplicates elsewhere in the file.
      - These will be written anew if they do not appear verbatim.
```

Gather text from multiple template files:

```
/etc/motd:
  file:
    - prepend
    - template: jinja
    - sources:
      - salt://motd/devops-messages.tmpl
      - salt://motd/hr-messages.tmpl
      - salt://motd/general-messages.tmpl
```

New in version 2014.7.0.

salt.states.file.**recurse**(*name*, *source*, *keep_source=True*, *clean=False*, *require=None*, *user=None*, *group=None*, *dir_mode=None*, *file_mode=None*, *sym_mode=None*, *template=None*, *context=None*, *defaults=None*, *include_empty=False*, *backup=''*, *include_pat=None*, *exclude_pat=None*, *maxdepth=None*, *keep_symlinks=False*, *force_symlinks=False*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=True*, ***kwargs*)

Recurse through a subdirectory on the master and copy said subdirectory over to the specified path.

name The directory to set the recursion in

source The source directory, this directory is located on the salt master file server and is specified with the salt:// protocol. If the directory is located on the master in the directory named spam, and is called eggs, the source string is salt://spam/eggs

keep_source [True] Set to `False` to discard the cached copy of the source file once the state completes. This can be useful for larger files to keep them from taking up space in minion cache. However, keep in mind that discarding the source file will result in the state needing to re-download the source file if the state is run again.

New in version 2017.7.3.

clean Make sure that only files that are set up by salt and required by this function are kept. If this option is set then everything in this directory will be deleted unless it is required.

require Require other resources such as packages or files

user The user to own the directory. This defaults to the user salt is running as on the minion

group The group ownership set for the directory. This defaults to the group salt is running as on the minion. On Windows, this is ignored

dir_mode The permissions mode to set on any directories created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

---

file_mode The permissions mode to set on any files created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

Changed in version 2016.11.0: This option can be set to `keep`, and Salt will keep the mode from the Salt fileserver. This is only supported when the `source` URL begins with `salt://`, or for files local to the minion. Because the `source` option cannot be used with any of the `contents` options, setting the `mode` to `keep` is also incompatible with the `contents` options.

sym_mode The permissions mode to set on any symlink created.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

Note: This option is **not** supported on Windows.

template If this setting is applied, the named templating engine will be used to render the downloaded file. The following templates are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

Note: The template option is required when recursively applying templates.

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

include_empty Set this to True if empty directories should also be created (default is False)

backup Overrides the default backup mode for all replaced files. See *backup_mode documentation* for more details.

include_pat When copying, include only this pattern from the source. Default is glob match; if prefixed with `E@', then regexp match. Example:

```
- include_pat: hello*       :: glob matches 'hello01', 'hello02'
                               ... but not 'otherhello'
- include_pat: E@hello      :: regexp matches 'otherhello',
                               'hello01' ...
```

exclude_pat Exclude this pattern from the source when copying. If both *include_pat* and *exclude_pat* are supplied, then it will apply conditions cumulatively. i.e. first select based on include_pat, and then within that result apply exclude_pat.

Also, when `clean=True', exclude this pattern from the removal list and preserve in the destination. Example:

```
- exclude_pat: APPDATA*               :: glob matches APPDATA.01,
                                         APPDATA.02,.. for exclusion
- exclude_pat: E@(APPDATA)|(TEMPDATA) :: regexp matches APPDATA
                                         or TEMPDATA for exclusion
```

maxdepth When copying, only copy paths which are of depth *maxdepth* from the source path. Example:

```
- maxdepth: 0      :: Only include files located in the source
                      directory
- maxdepth: 1      :: Only include files located in the source
                      or immediate subdirectories
```

keep_symlinks Keep symlinks when copying from the source. This option will cause the copy operation to terminate at the symlink. If desire behavior similar to rsync, then set this to True.

force_symlinks Force symlink creation. This option will force the symlink creation. If a file or directory is obstructing symlink creation it will be recursively removed so that symlink creation can proceed. This option is usually not needed except in special circumstances.

win_owner [None] The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

`salt.states.file.`**`rename`**(*name*, *source*, *force=False*, *makedirs=False*)

If the source file exists on the system, rename it to the named file. The named file will not be overwritten if it already exists unless the force option is set to True.

name The location of the file to rename to

source The location of the file to move to the location specified with name

force If the target location is present then the file will not be moved, specify ``force: True'' to overwrite the target file

makedirs If the target subdirectories don't exist create them

`salt.states.file.`**`replace`**(*name*, *pattern*, *repl*, *count=0*, *flags=8*, *bufsize=1*, *append_if_not_found=False*, *prepend_if_not_found=False*, *not_found_content=None*, *backup='.bak'*, *show_changes=True*, *ignore_if_missing=False*, *backslash_literal=False*)

Maintain an edit in a file.

New in version 0.17.0.

name Filesystem path to the file to be edited. If a symlink is specified, it will be resolved to its target.

pattern A regular expression, to be matched using Python's `search()`.

Note: If you need to match a literal string that contains regex special characters, you may want to use salt's custom Jinja filter, `regex_escape`.

```
{{ 'http://example.com?foo=bar%20baz' | regex_escape }}
```

---

repl The replacement text

count Maximum number of pattern occurrences to be replaced. Defaults to 0. If count is a positive integer n, no more than n occurrences will be replaced, otherwise all occurrences will be replaced.

flags A list of flags defined in the `re` module documentation from the Python standard library. Each list item should be a string that will correlate to the human-friendly flag name. E.g., `['IGNORECASE','MULTILINE']`. Optionally, `flags` may be an int, with a value corresponding to the XOR (`|`) of all the desired flags. Defaults to 8 (which equates to `['MULTILINE']`).

Note: `file.replace` reads the entire file as a string to support multiline regex patterns. Therefore, when using anchors such as ^ or $ in the pattern, those anchors may be relative to the line OR relative to the file. The default for `file.replace` is to treat anchors as relative to the line, which is implemented by setting the default value of `flags` to `['MULTILINE']`. When overriding the default value for

`flags`, if `'MULTILINE'` is not present then anchors will be relative to the file. If the desired behavior is for anchors to be relative to the line, then simply add `'MULTILINE'` to the list of flags.

bufsize How much of the file to buffer into memory at once. The default value `1` processes one line at a time. The special value `file` may be specified which will read the entire file into memory before processing.

append_if_not_found [False] If set to `True`, and pattern is not found, then the content will be appended to the file.

New in version 2014.7.0.

prepend_if_not_found [False] If set to `True` and pattern is not found, then the content will be prepended to the file.

New in version 2014.7.0.

not_found_content Content to use for append/prepend if not found. If `None` (default), uses `repl`. Useful when `repl` uses references to group in pattern.

New in version 2014.7.0.

backup The file extension to use for a backup of the file before editing. Set to `False` to skip making a backup.

show_changes [True] Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made. Returns a boolean or a string.

ignore_if_missing [False] New in version 2016.3.4.

Controls what to do if the file is missing. If set to `False`, the state will display an error raised by the execution module. If set to `True`, the state will simply report no changes.

backslash_literal [False] New in version 2016.11.7.

Interpret backslashes as literal backslashes for the repl and not escape characters. This will help when using append/prepend so that the backslashes are not interpreted for the repl on the second run of the state.

For complex regex patterns, it can be useful to avoid the need for complex quoting and escape sequences by making use of YAML's multiline string syntax.

```
complex_search_and_replace:
  file.replace:
    # <...snip...>
    - pattern: |
        CentOS \(2.6.32[^\\n]+\\n\s+root[^\\n]+\\n\)+
```

Note: When using YAML multiline string syntax in `pattern:`, make sure to also use that syntax in the `repl:` part, or you might loose line feeds.

`salt.states.file.`**`retention_schedule`**(*name*, *retain*, *strptime_format=None*, *timezone=None*)

Apply retention scheduling to backup storage directory.

New in version 2016.11.0.

Parameters

- **`name`** -- The filesystem path to the directory containing backups to be managed.
- **`retain`** -- Delete the backups, except for the ones we want to keep. The N below should be an integer but may also be the special value of `all`, which keeps all files matching the criteria. All of the retain options default to None, which means to not keep files based on this criteria.
  - **most_recent N** Keep the most recent N files.
  - **first_of_hour N** For the last N hours from now, keep the first file after the hour.
  - **first_of_day N** For the last N days from now, keep the first file after midnight. See also `timezone`.

first_of_week N For the last N weeks from now, keep the first file after Sunday midnight.

first_of_month N For the last N months from now, keep the first file after the start of the month.

first_of_year N For the last N years from now, keep the first file after the start of the year.

- **strptime_format** -- A python strptime format string used to first match the filenames of backups and then parse the filename to determine the datetime of the file. https://docs.python.org/2/library/datetime.html#datetime.datetime.strptime Defaults to None, which considers all files in the directory to be backups eligible for deletion and uses `os.path.getmtime()` to determine the datetime.
- **timezone** -- The timezone to use when determining midnight. This is only used when datetime is pulled from `os.path.getmtime()`. Defaults to `None` which uses the timezone from the locale.

Usage example:

```
/var/backups/example_directory:
  file.retention_schedule:
    - retain:
        most_recent: 5
        first_of_hour: 4
        first_of_day: 7
        first_of_week: 6    # NotImplemented yet.
        first_of_month: 6
        first_of_year: all
    - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
    - timezone: None
```

`salt.states.file.`**`serialize`**(*name*, *dataset=None*, *dataset_pillar=None*, *user=None*, *group=None*, *mode=None*, *backup=''*, *makedirs=False*, *show_diff=None*, *show_changes=True*, *create=True*, *merge_if_exists=False*, *encoding=None*, *encoding_errors='strict'*, ***kwargs*)

Serializes dataset and store it into managed file. Useful for sharing simple configuration files.

name The location of the file to create

dataset The dataset that will be serialized

dataset_pillar Operates like `dataset`, but draws from a value stored in pillar, using the pillar path syntax used in *`pillar.get`*. This is useful when the pillar value contains newlines, as referencing a pillar variable using a jinja/mako template can result in YAML formatting issues due to the newlines causing indentation mismatches.

New in version 2015.8.0.

formatter Write the data as this format. See the list of `serializer modules` for supported output formats.

encoding Encoding used for the file, e.g. `` `UTF-8` ``, `` `base64` ``. Default is None, which means str() will be applied to contents to ensure an ascii encoded file. See https://docs.python.org/3/library/codecs.html#standard-encodings for available encodings.

New in version 2017.7.0.

encoding_errors [`strict'] Error encoding scheme. Default is `` `'strict'` ``. See https://docs.python.org/2/library/codecs.html#codec-base-classes for the list of available schemes.

New in version 2017.7.0.

user The user to own the directory, this defaults to the user salt is running as on the minion

group The group ownership set for the directory, this defaults to the group salt is running as on the minion

mode The permissions to set on this file, e.g. `644`, `0775`, or `4664`.

The default mode for new files and directories corresponds umask of salt process. For existing files and

directories it's not enforced.

Note: This option is **not** supported on Windows.

backup Overrides the default backup mode for this specific file.
makedirs Create parent directories for destination file.

New in version 2014.1.3.

show_diff DEPRECATED: Please use show_changes.

If set to `False`, the diff will not be shown in the return data if changes are made.

show_changes Output a unified diff of the old file and the new file. If `False` return a boolean if any changes were made.

create Default is True, if create is set to False then the file will only be managed if the file already exists on the system.

merge_if_exists Default is False, if merge_if_exists is True then the existing file will be parsed and the dataset passed in will be merged with the existing content

New in version 2014.7.0.

For example, this state:

```
/etc/dummy/package.json:
  file.serialize:
    - dataset:
        name: naive
        description: A package using naive versioning
        author: A confused individual <iam@confused.com>
        dependencies:
          express: '>= 1.2.0'
          optimist: '>= 0.1.0'
        engine: node 0.4.1
    - formatter: json
```

will manage the file `/etc/dummy/package.json`:

```
{
  "author": "A confused individual <iam@confused.com>",
  "dependencies": {
    "express": ">= 1.2.0",
    "optimist": ">= 0.1.0"
  },
  "description": "A package using naive versioning",
  "engine": "node 0.4.1",
  "name": "naive"
}
```

`salt.states.file.`**`shortcut`**(*name*, *target*, *arguments=None*, *working_dir=None*, *description=None*, *icon_location=None*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, ***kwargs*)

Create a Windows shortcut

If the file already exists and is a shortcut pointing to any location other than the specified target, the shortcut will be replaced. If it is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a shortcut pass force: True, if it is to be renamed, pass a backupname.

name The location of the shortcut to create. Must end with either ".lnk" or ".url"
target The location that the shortcut points to
arguments Any arguments to pass in the shortcut
working_dir Working directory in which to execute target

description Description to set on shortcut

icon_location Location of shortcut's icon

force If the name of the shortcut exists and is not a file and force is set to False, the state will fail. If force is set to True, the link or directory in the way of the shortcut file will be deleted to make room for the shortcut, unless backupname is set, when it will be renamed

backupname If the name of the shortcut exists and is not a file, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

makedirs If the location of the shortcut does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory. Setting this to True will also create the parent for backupname if necessary.

user The user to own the file, this defaults to the user salt is running as on the minion

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

salt.states.file.**symlink**(*name*, *target*, *force=False*, *backupname=None*, *makedirs=False*, *user=None*, *group=None*, *mode=None*, *win_owner=None*, *win_perms=None*, *win_deny_perms=None*, *win_inheritance=None*, ***kwargs*)

Create a symbolic link (symlink, soft link)

If the file already exists and is a symlink pointing to any location other than the specified target, the symlink will be replaced. If the symlink is a regular file or directory then the state will return False. If the regular file or directory is desired to be replaced with a symlink pass force: True, if it is to be renamed, pass a backupname.

name The location of the symlink to create

target The location that the symlink points to

force If the name of the symlink exists and is not a symlink and force is set to False, the state will fail. If force is set to True, the file or directory in the way of the symlink file will be deleted to make room for the symlink, unless backupname is set, when it will be renamed

backupname If the name of the symlink exists and is not a symlink, it will be renamed to the backupname. If the backupname already exists and force is False, the state will fail. Otherwise, the backupname will be removed first.

makedirs If the location of the symlink does not already have a parent directory then the state will fail, setting makedirs to True will allow Salt to create the parent directory

user The user to own the file, this defaults to the user salt is running as on the minion

group The group ownership set for the file, this defaults to the group salt is running as on the minion. On Windows, this is ignored

mode The permissions to set on this file, aka 644, 0775, 4664. Not supported on Windows.

The default mode for new files and directories corresponds umask of salt process. For existing files and directories it's not enforced.

win_owner [None] The owner of the symlink and directories if `makedirs` is True. If this is not passed, `user` will be used. If `user` is not passed, the account under which Salt is running will be used.

New in version 2017.7.7.

win_perms [None] A dictionary containing permissions to grant

New in version 2017.7.7.

win_deny_perms [None] A dictionary containing permissions to deny

New in version 2017.7.7.

win_inheritance [None] True to inherit permissions from parent, otherwise False

New in version 2017.7.7.

salt.states.file.**touch**(*name*, *atime=None*, *mtime=None*, *makedirs=False*)

Replicate the `nix ``touch'' command to create a new empty file or update the atime and mtime of an existing file.

Note that if you just want to create a file and don't care about atime or mtime, you should use `file.managed` instead, as it is more feature-complete. (Just leave out the `source`/`template`/`contents` arguments, and it will just create the file and/or check its permissions, without messing with contents)

name name of the file

atime atime of the file

mtime mtime of the file

makedirs whether we should create the parent directory/directories in order to touch the file

Usage:

```
/var/log/httpd/logrotate.empty:
  file.touch
```

New in version 0.9.5.

`salt.states.file.`**`uncomment`**(*name*, *regex*, *char='#'*, *backup='.bak'*)

Uncomment specified commented lines in a file

name The full path to the file to be edited

regex A regular expression used to find the lines that are to be uncommented. This regex should not include the comment character. A leading `^` character will be stripped for convenience (for easily switching between comment() and uncomment()). The regex will be searched for from the beginning of the line, ignoring leading spaces (we prepend `'^[ t]*'`)

char [#] The character to remove in order to uncomment a line

backup [`.bak`] The file will be backed up before edit with this file extension;

> **Warning:** This backup will be overwritten each time `sed` / `comment` / `uncomment` is called. Meaning the backup will only be useful after the first invocation.

Set to False/None to not keep a backup.

Usage:

```
/etc/adduser.conf:
  file.uncomment:
    - regex: EXTRA_GROUPS
```

New in version 0.9.5.

19.19.80 salt.states.firewall module

State to check firewall configurations .. versionadded:: 2016.3.0

`salt.states.firewall.`**`check`**(*name*, *port=None*, ***kwargs*)

Checks if there is an open connection from the minion to the defined host on a specific port.

name host name or ip address to test connection to

port The port to test the connection on

kwargs

Additional parameters, parameters allowed are: proto (tcp or udp) family (ipv4 or ipv6) timeout

```
testgoogle:
  firewall.check:
    - name: 'google.com'
    - port: 80
    - proto: 'tcp'
```

19.19.81 salt.states.firewalld

Management of firewalld

New in version 2015.8.0.

The following example applies changes to the public zone, blocks echo-reply and echo-request packets, does not set the zone to be the default, enables masquerading, and allows ports 22/tcp and 25/tcp. It will be applied permanently and directly before restart/reload.

```
public:
  firewalld.present:
    - name: public
    - block_icmp:
      - echo-reply
      - echo-request
    - default: False
    - masquerade: True
    - ports:
      - 22/tcp
      - 25/tcp
```

The following example applies changes to the public zone, enables masquerading and configures port forwarding TCP traffic from port 22 to 2222, and forwards TCP traffic from port 80 to 443 at 192.168.0.1.

```
my_zone:
  firewalld.present:
    - name: public
    - masquerade: True
    - port_fwd:
      - 22:2222:tcp
      - 80:443:tcp:192.168.0.1
```

The following example binds the public zone to interface eth0 and to all packets coming from the 192.168.1.0/24 subnet. It also removes the zone from all other interfaces or sources.

```
public:
  firewalld.present:
    - name: public
    - interfaces:
      - eth0
    - sources:
      - 192.168.1.0/24
```

Here, we define a new service that encompasses TCP ports 4505 4506:

```
saltmaster:
  firewalld.service:
    - name: saltmaster
    - ports:
      - 4505/tcp
      - 4506/tcp
```

To make this new service available in a zone, the following can be used, which would allow access to the salt master from the 10.0.0.0/8 subnet:

```
saltzone:
  firewalld.present:
    - name: saltzone
```

```
    - services:
      - saltmaster
    - sources:
      - 10.0.0.0/8
```

class salt.states.firewalld.**ForwardingMapping**(*srcport*, *destport*, *protocol*, *destaddr*)

Represents a port forwarding statement mapping a local port to a remote port for a specific protocol (TCP or UDP)

todict()

Returns a pretty dictionary meant for command line output.

salt.states.firewalld.**present**(*name*, *block_icmp=None*, *default=None*, *masquerade=False*, *ports=None*, *port_fwd=None*, *services=None*, *prune_services=True*, *interfaces=None*, *sources=None*, *rich_rules=None*)

Ensure a zone has specific attributes.

salt.states.firewalld.**service**(*name*, *ports=None*, *protocols=None*)

Ensure the service exists and encompasses the specified ports and protocols.

New in version 2016.11.0.

19.19.82 salt.states.gem

Installation of Ruby modules packaged as gems

A state module to manage rubygems. Gems can be set up to be installed or removed. This module will use RVM or rbenv if they are installed. In that case, you can specify what ruby version and gemset to target.

```
addressable:
  gem.installed:
    - user: rvm
    - ruby: jruby@jgemset
```

salt.states.gem.**installed**(*name*, *ruby=None*, *gem_bin=None*, *user=None*, *version=None*, *rdoc=False*, *ri=False*, *pre_releases=False*, *proxy=None*, *source=None*)

Make sure that a gem is installed.

name The name of the gem to install

ruby: **None** Only for RVM or rbenv installations: the ruby version and gemset to target.

gem_bin: **None** Custom `gem` command to run instead of the default. Use this to install gems to a non-default ruby install. If you are using rvm or rbenv use the ruby argument instead.

user: **None** The user under which to run the `gem` command

New in version 0.17.0.

version [None] Specify the version to install for the gem. Doesn't play nice with multiple gems at once

rdoc [False] Generate RDoc documentation for the gem(s).

ri [False] Generate RI documentation for the gem(s).

pre_releases [False] Install pre-release version of gem(s) if available.

proxy [None] Use the specified HTTP proxy server for all outgoing traffic. Format: http://hostname{[}:port]

source [None] Use the specified HTTP gem source server to download gem. Format: http://hostname{[}:port]

salt.states.gem.**removed**(*name*, *ruby=None*, *user=None*, *gem_bin=None*)

Make sure that a gem is not installed.

name The name of the gem to uninstall

gem_bin [None] Full path to `gem` binary to use.

ruby [None] If RVM or rbenv are installed, the ruby version and gemset to use. Ignored if `gem_bin` is specified.

user: **None** The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.`**`sources_add`**(*name*, *ruby=None*, *user=None*)

Make sure that a gem source is added.
name The URL of the gem source to be added
ruby: **None** For RVM or rbenv installations: the ruby version and gemset to target.
user: **None** The user under which to run the `gem` command

New in version 0.17.0.

`salt.states.gem.`**`sources_remove`**(*name*, *ruby=None*, *user=None*)

Make sure that a gem source is removed.
name The URL of the gem source to be removed
ruby: **None** For RVM or rbenv installations: the ruby version and gemset to target.
user: **None** The user under which to run the `gem` command

New in version 0.17.0.

19.19.83 salt.states.git

States to manage git repositories and git configuration

Important: Before using git over ssh, make sure your remote host fingerprint exists in your `~/.ssh/known_hosts` file.

Changed in version 2015.8.8: This state module now requires git 1.6.5 (released 10 October 2009) or newer.

`salt.states.git.`**`config_set`**(*name*, *value=None*, *multivar=None*, *repo=None*, *user=None*, *password=None*, ***kwargs*)

New in version 2014.7.0.

Changed in version 2015.8.0: Renamed from `git.config` to `git.config_set`. For earlier versions, use `git.config`.

Ensure that a config value is set to the desired value(s)
name Name of the git config value to set
value Set a single value for the config item
multivar Set multiple values for the config item

Note: The order matters here, if the same parameters are set but in a different order, they will be removed and replaced in the order specified.

New in version 2015.8.0.
repo Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.
user User under which to run git commands. By default, the commands are run by the user under which the minion is running.
password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.
global [False] If `True`, this will set a global git config option
Local Config Example:

```
# Single value
mylocalrepo:
  git.config_set:
    - name: user.email
    - value: foo@bar.net
    - repo: /path/to/repo

# Multiple values
mylocalrepo:
  git.config_set:
    - name: mysection.myattribute
    - multivar:
      - foo
      - bar
      - baz
    - repo: /path/to/repo
```

Global Config Example (User ``foo``):

```
mylocalrepo:
  git.config_set:
    - name: user.name
    - value: Foo Bar
    - user: foo
    - global: True
```

salt.states.git.**config_unset**(*name*, *value_regex=None*, *repo=None*, *user=None*, *password=None*, ***kwargs*)

New in version 2015.8.0.

Ensure that the named config key is not present

name The name of the configuration key to unset. This value can be a regex, but the regex must match the entire key name. For example, `foo\.` would not match all keys in the `foo` section, it would be necessary to use `foo\..+` to do so.

value_regex Regex indicating the values to unset for the matching key(s)

> **Note:** This option behaves differently depending on whether or not `all` is set to `True`. If it is, then all values matching the regex will be deleted (this is the only way to delete multiple values from a multivar). If `all` is set to `False`, then this state will fail if the regex matches more than one value in a multivar.

all [False] If `True`, unset all matches

repo Location of the git repository for which the config value should be set. Required unless `global` is set to `True`.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

global [False] If `True`, this will set a global git config option

Examples:

```
# Value matching 'baz'
mylocalrepo:
  git.config_unset:
    - name: foo.bar
```

```
    - value_regex: 'baz'
    - repo: /path/to/repo

# Ensure entire multivar is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - all: True

# Ensure all variables in 'foo' section are unset, including multivars
mylocalrepo:
  git.config_unset:
    - name: 'foo\..+'
    - all: True

# Ensure that global config value is unset
mylocalrepo:
  git.config_unset:
    - name: foo.bar
    - global: True
```

salt.states.git.**detached**(*name*, *rev*, *target=None*, *remote='origin'*, *user=None*, *password=None*, *force_clone=False*, *force_checkout=False*, *fetch_remote=True*, *hard_reset=False*, *submodules=False*, *identity=None*, *https_user=None*, *https_pass=None*, *onlyif=False*, *unless=False*, ***kwargs*)

New in version 2016.3.0.

Make sure a repository is cloned to the given target directory and is a detached HEAD checkout of the commit ID resolved from `rev`.

name Address of the remote repository.

rev The branch, tag, or commit ID to checkout after clone. If a branch or tag is specified it will be resolved to a commit ID and checked out.

ref Deprecated since version 2017.7.0: Use `rev` instead.

target Name of the target directory where repository is about to be cloned.

remote [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

force_clone [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_checkout [False] When checking out the revision ID, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

fetch_remote [True] If `False` a fetch will not be performed and only local refs will be reachable.

hard_reset [False] If `True` a hard reset will be performed before the checkout and any uncommitted modifications to the working directory will be discarded. Untracked files will remain in place.

Note: Changes resulting from a hard reset will not trigger requisites.

---

submodules [False] Update submodules

identity A path on the minion (or a SaltStack fileserver URL, e.g. `salt://path/to/identity_file`)

to a private key to use for SSH authentication.

https_user HTTP Basic Auth username for HTTPS (only) clones

https_pass HTTP Basic Auth password for HTTPS (only) clones

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

`salt.states.git.`**`latest`**(*name*, *rev='HEAD'*, *target=None*, *branch=None*, *user=None*, *password=None*, *update_head=True*, *force_checkout=False*, *force_clone=False*, *force_fetch=False*, *force_reset=False*, *submodules=False*, *bare=False*, *mirror=False*, *remote='origin'*, *fetch_tags=True*, *depth=None*, *identity=None*, *https_user=None*, *https_pass=None*, *onlyif=False*, *unless=False*, *refspec_branch='*'*, *refspec_tag='*'*, ***kwargs*)

Make sure the repository is cloned to the given directory and is up-to-date.

name Address of the remote repository, as passed to `git clone`

Note: From the Git documentation, there are two URL formats supported for SSH authentication. The below two examples are equivalent:

```
# ssh:// URL
ssh://user@server/project.git

# SCP-like syntax
user@server:project.git
```

A common mistake is to use an `ssh://` URL, but with a colon after the domain instead of a slash. This is invalid syntax in Git, and will therefore not work in Salt. When in doubt, confirm that a `git clone` works for the URL before using it in Salt.

It has been reported by some users that SCP-like syntax is incompatible with git repos hosted on Atlassian Stash/BitBucket Server. In these cases, it may be necessary to use `ssh://` URLs for SSH authentication.

---

rev [HEAD] The remote branch, tag, or revision ID to checkout after clone / before update. If specified, then Salt will also ensure that the tracking branch is set to `<remote>/<rev>`, unless `rev` refers to a tag or SHA1, in which case Salt will ensure that the tracking branch is unset.

If `rev` is not specified, it will be assumed to be HEAD, and Salt will not manage the tracking branch at all.

Changed in version 2015.8.0: If not specified, `rev` now defaults to the remote repository's HEAD.

target Name of the target directory where repository is about to be cloned

branch Name of the local branch into which to checkout the specified rev. If not specified, then Salt will not care what branch is being used locally and will just use whatever branch is currently there.

New in version 2015.8.0.

Note: If this argument is not specified, this means that Salt will not change the local branch if the repository is reset to another branch/tag/SHA1. For example, assume that the following state was run initially:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
```

This would have cloned the HEAD of that repo (since a `rev` wasn't specified), and because `branch` is not specified, the branch in the local clone at `/var/www/foo` would be whatever the default branch is on the remote repository (usually `master`, but not always). Now, assume that it becomes necessary to switch this checkout to the `dev` branch. This would require `rev` to be set, and probably would also require `force_reset` to be enabled:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - force_reset: True
```

The result of this state would be to perform a hard-reset to `origin/dev`. Since `branch` was not specified though, while `/var/www/foo` would reflect the contents of the remote repo's `dev` branch, the local branch would still remain whatever it was when it was cloned. To make the local branch match the remote one, set `branch` as well, like so:

```
foo_app:
  git.latest:
    - name: https://mydomain.tld/apps/foo.git
    - target: /var/www/foo
    - user: www
    - rev: dev
    - branch: dev
    - force_reset: True
```

This may seem redundant, but Salt tries to support a wide variety of use cases, and doing it this way allows for the use case where the local branch doesn't need to be strictly managed.

---

user Local system user under which to run git commands. By default, commands are run by the user under which the minion is running.

Note: This is not to be confused with the username for http(s)/SSH authentication.

New in version 0.17.0.

password Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

update_head [True] If set to `False`, then the remote repository will be fetched (if necessary) to ensure that the commit to which `rev` points exists in the local checkout, but no changes will be made to the local HEAD.

New in version 2015.8.3.

force_checkout [False] When checking out the local branch, the state will fail if there are unwritten changes. Set this argument to `True` to discard unwritten changes when checking out.

force_clone [False] If the `target` directory exists and is not a git repository, then this state will fail. Set this argument to `True` to remove the contents of the target directory and clone the repo into it.

force_fetch [False] If a fetch needs to be performed, non-fast-forward fetches will cause this state to fail. Set this argument to `True` to force the fetch even if it is a non-fast-forward update.

New in version 2015.8.0.

force_reset [False] If the update is not a fast-forward, this state will fail. Set this argument to `True` to force a hard-reset to the remote revision in these cases.

submodules [False] Update submodules on clone or branch change

bare [False] Set to `True` if the repository is to be a bare clone of the remote repository.

mirror Set to `True` if the repository is to be a mirror of the remote repository. This implies that `bare` set to `True`, and thus is incompatible with `rev`.

remote [origin] Git remote to use. If this state needs to clone the repo, it will clone it using this value as the initial remote name. If the repository already exists, and a remote by this name is not present, one will be added.

fetch_tags [True] If `True`, then when a fetch is performed all tags will be fetched, even those which are not reachable by any branch on the remote.

depth Defines depth in history when git a clone is needed in order to ensure latest. E.g. `depth: 1` is useful when deploying from a repository with a long history. Use rev to specify branch. This is not compatible with tags or revision IDs.

identity Path to a private key to use for ssh URLs. This can be either a single string, or a list of strings. For example:

```
# Single key
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity: /home/deployer/.ssh/id_rsa

# Two keys
git@github.com:user/repo.git:
  git.latest:
    - user: deployer
    - identity:
      - /home/deployer/.ssh/id_rsa
      - /home/deployer/.ssh/id_rsa_alternate
```

If multiple keys are specified, they will be tried one-by-one in order for each git command which needs to authenticate.

> **Warning:** Unless Salt is invoked from the minion using `salt-call`, the key(s) must be passphraseless. For greater security with passphraseless private keys, see the sshd(8) manpage for information on securing the keypair from the remote side in the `authorized_keys` file.

Changed in version 2015.8.7: Salt will no longer attempt to use passphrase-protected keys unless invoked from the minion using `salt-call`, to prevent blocking waiting for user input.

Changed in version 2016.3.0: Key can now be specified as a SaltStack fileserver URL (e.g. `salt://path/to/identity_file`).

https_user HTTP Basic Auth username for HTTPS (only) clones

New in version 2015.5.0.

https_pass HTTP Basic Auth password for HTTPS (only) clones

New in version 2015.5.0.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

refspec_branch [*] A glob expression defining which branches to retrieve when fetching. See git-fetch(1) for more information on how refspecs work.

New in version 2017.7.0.

refspec_tag [*] A glob expression defining which tags to retrieve when fetching. See git-fetch(1) for more information on how refspecs work.

New in version 2017.7.0.

Note: Clashing ID declarations can be avoided when including different branches from the same git repository in the same SLS file by using the `name` argument. The example below checks out the `gh-pages` and `gh-pages-prod` branches from the same repository into separate directories. The example also sets up the `ssh_known_hosts` ssh key required to perform the git checkout.

Also, it has been reported that the SCP-like syntax for

```
gitlab.example.com:
  ssh_known_hosts:
    - present
    - user: root
    - enc: ecdsa
    - fingerprint: 4e:94:b0:54:c1:5b:29:a2:70:0e:e1:a3:51:ee:ee:e3

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-staging:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages
    - target: /usr/share/nginx/staging
    - identity: salt://website/id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com

git-website-prod:
  git.latest:
    - name: git@gitlab.example.com:user/website.git
    - rev: gh-pages-prod
    - target: /usr/share/nginx/prod
    - identity: /root/.ssh/website_id_rsa
    - require:
      - pkg: git
      - ssh_known_hosts: gitlab.example.com
```

`salt.states.git.`**`mod_run_check`**(*cmd_kwargs*, *onlyif*, *unless*)

Execute the onlyif and unless logic. Return a result dict if:

- onlyif failed (onlyif != 0)
- unless succeeded (unless == 0)

Otherwise, returns `True`

`salt.states.git.`**`present`**(*name*, *force=False*, *bare=True*, *template=None*, *separate_git_dir=None*, *shared=None*, *user=None*, *password=None*)

Ensure that a repository exists in the given directory

> **Warning:** If the minion has Git 2.5 or later installed, `name` points to a worktree, and `force` is set to `True`, then the worktree will be deleted. This has been corrected in Salt 2015.8.0.

name Path to the directory

Changed in version 2015.8.0: This path must now be absolute

force [False] If `True`, and if `name` points to an existing directory which does not contain a git repository, then the contents of that directory will be recursively removed and a new repository will be initialized in its place.

bare [True] If `True`, and a repository must be initialized, then the repository will be a bare repository.

> **Note:** This differs from the default behavior of *`git.init`*, make sure to set this value to `False` if a bare repo is not desired.

template If a new repository is initialized, this argument will specify an alternate template directory.

New in version 2015.8.0.

separate_git_dir If a new repository is initialized, this argument will specify an alternate `$GIT_DIR`

New in version 2015.8.0.

shared Set sharing permissions on git repo. See git-init(1) for more details.

New in version 2015.5.0.

user User under which to run git commands. By default, commands are run by the user under which the minion is running.

New in version 0.17.0.

password

Windows only. Required when specifying `user`. This parameter will be ignored on non-Windows platforms.

New in version 2016.3.4.

19.19.84 salt.states.github module

Github User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in the Organization.

```
ensure user test is present in github:
    github.present:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

`salt.states.github.`**`absent`**(*name*, *profile='github'*, ***kwargs*)

Ensure a github user is absent

```
ensure user test is absent in github:
    github.absent:
        - name: 'Example TestUser1'
        - email: example@domain.com
        - username: 'gitexample'
```

The following parameters are required:
name Github handle of the user in organization

salt.states.github.**present**(*name*, *profile='github'*, ***kwargs*)
Ensure a user is present

```
ensure user test is present in github:
    github.present:
        - name: 'gitexample'
```

The following parameters are required:
name This is the github handle of the user in the organization

salt.states.github.**repo_absent**(*name*, *profile='github'*, ***kwargs*)
Ensure a repo is absent.

Example:

```
ensure repo test is absent in github:
    github.repo_absent:
        - name: 'test'
```

The following parameters are required:
name This is the name of the repository in the organization.
New in version 2016.11.0.

salt.states.github.**repo_present**(*name*, *description=None*, *homepage=None*, *private=None*, *has_issues=None*, *has_wiki=None*, *has_downloads=None*, *auto_init=False*, *gitignore_template=None*, *license_template=None*, *teams=None*, *profile='github'*, ***kwargs*)
Ensure a repository is present
name This is the name of the repository.
description The description of the repository.
homepage The URL with more information about the repository.
private The visiblity of the repository. Note that private repositories require a paid GitHub account.
has_issues Whether to enable issues for this repository.
has_wiki Whether to enable the wiki for this repository.
has_downloads Whether to enable downloads for this repository.
auto_init Whether to create an initial commit with an empty README.
gitignore_template The desired language or platform for a .gitignore, e.g ``Haskell''.
license_template The desired LICENSE template to apply, e.g ``mit'' or ``mozilla''.
teams The teams for which this repo should belong to, specified as a dict of team name to permission (`pull', `push' or `admin').

New in version 2017.7.0.

Example:

```
Ensure repo my-repo is present in github:
    github.repo_present:
        - name: 'my-repo'
        - description: 'My very important repository'
```

New in version 2016.11.0.

salt.states.github.**team_absent**(*name*, *profile='github'*, ***kwargs*)
Ensure a team is absent.

Example:

```
ensure team test is present in github:
    github.team_absent:
        - name: 'test'
```

The following parameters are required:

name This is the name of the team in the organization.

New in version 2016.11.0.

salt.states.github.**team_present**(*name*, *description=None*, *repo_names=None*, *privacy='secret'*, *permission='pull'*, *members=None*, *enforce_mfa=False*, *no_mfa_grace_seconds=0*, *profile='github'*, ***kwargs*)

Ensure a team is present

name This is the name of the team in the organization.

description The description of the team.

repo_names The names of repositories to add the team to.

privacy The level of privacy for the team, can be `secret' or `closed'. Defaults to secret.

permission The default permission for new repositories added to the team, can be `pull', `push' or `admin'. Defaults to pull.

members The members belonging to the team, specified as a dict of member name to optional configuration. Options include `enforce_mfa_from' and `mfa_exempt'.

enforce_mfa Whether to enforce MFA requirements on members of the team. If True then all members without *mfa_exempt: True* configured will be removed from the team. Note that *no_mfa_grace_seconds* may be set to allow members a grace period.

no_mfa_grace_seconds The number of seconds of grace time that a member will have to enable MFA before being removed from the team. The grace period will begin from *enforce_mfa_from* on the member configuration, which defaults to 1970/01/01.

Example:

```
Ensure team test is present in github:
    github.team_present:
        - name: 'test'
        - members:
            user1: {}
            user2: {}

Ensure team test_mfa is present in github:
    github.team_present:
        - name: 'test_mfa'
        - members:
            user1:
                enforce_mfa_from: 2016/06/15
        - enforce_mfa: True
```

New in version 2016.11.0.

19.19.85 salt.states.glance

Managing Images in OpenStack Glance

salt.states.glance.**image_present**(*name*, *visibility='public'*, *protected=None*, *checksum=None*, *location=None*, *disk_format='raw'*, *wait_for=None*, *timeout=30*)

Checks if given image is present with properties set as specified.

An image should got through the stages `queued', `saving' before becoming `active'. The attribute `checksum' can only be checked once the image is active. If you don't specify `wait_for' but `checksum' the function will

wait for the image to become active before comparing checksums. If you don't specify checksum either the function will return when the image reached `saving'. The default timeout for both is 30 seconds.
Supported properties:

- visibility (`public' or `private')
- protected (bool)
- checksum (string, md5sum)
- location (URL, to copy from)
- disk_format (`raw' (default), `vhd', `vhdx', `vmdk', `vdi', `iso', `qcow2', `aki', `ari' or `ami')

19.19.86 salt.states.glusterfs

Manage GlusterFS pool.

salt.states.glusterfs.**add_volume_bricks**(*name*, *bricks*)

Add brick(s) to an existing volume
name Volume name
bricks List of bricks to add to the volume

```
myvolume:
  glusterfs.add_volume_bricks:
    - bricks:
        - host1:/srv/gluster/drive1
        - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.add_volume_bricks:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
```

salt.states.glusterfs.**peered**(*name*)

Check if node is peered.
name The remote host with which to peer.

```
peer-cluster:
  glusterfs.peered:
    - name: two

peer-clusters:
  glusterfs.peered:
    - names:
      - one
      - two
      - three
      - four
```

salt.states.glusterfs.**started**(*name*)

Check if volume has been started
name name of the volume

```
mycluster:
  glusterfs.started: []
```

salt.states.glusterfs.**volume_present**(*name*, *bricks*, *stripe=False*, *replica=False*, *device_vg=False*, *transport='tcp'*, *start=False*, *force=False*)

Ensure that the volume exists

name name of the volume
bricks list of brick paths
start ensure that the volume is also started

```
myvolume:
  glusterfs.volume_present:
    - bricks:
        - host1:/srv/gluster/drive1
        - host2:/srv/gluster/drive2

Replicated Volume:
  glusterfs.volume_present:
    - name: volume2
    - bricks:
      - host1:/srv/gluster/drive2
      - host2:/srv/gluster/drive3
    - replica: 2
    - start: True
```

19.19.87 salt.states.gnomedesktop

Configuration of the GNOME desktop

Control the GNOME settings

```
localdesktop_wm_prefs:
    gnomedesktop.wm_preferences:
        - user: username
        - audible_bell: false
        - action_double_click_titlebar: 'toggle-maximize'
        - visual_bell: true
        - num_workspaces: 6
localdesktop_lockdown:
    gnomedesktop.desktop_lockdown:
        - user: username
        - disable_user_switching: true
localdesktop_interface:
    gnomedesktop.desktop_interface:
        - user: username
        - clock_show_date: true
        - clock_format: 12h
```

19.19.88 salt.states.gpg module

Management of the GPG keychains

New in version 2016.3.0.

salt.states.gpg.**absent**(*name*, *keys=None*, *user=None*, *gnupghome=None*, ***kwargs*)

Ensure GPG public key is absent in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Add GPG keys to the user's keychain

gnupghome Override GNUPG Home directory

salt.states.gpg.**present**(*name*, *keys=None*, *user=None*, *keyserver=None*, *gnupghome=None*, *trust=None*, ***kwargs*)

Ensure GPG public key is present in keychain

name The unique name or keyid for the GPG public key.

keys The keyId or keyIds to add to the GPG keychain.

user Add GPG keys to the user's keychain

keyserver The keyserver to retrieve the keys from.

gnupghome Override GNUPG Home directory

trust Trust level for the key in the keychain, ignored by default. Valid trust levels: expired, unknown, not_trusted, marginally, fully, ultimately

19.19.89 salt.states.grafana

Manage Grafana Dashboards

This module uses `elasticsearch`, which can be installed via package, or pip.

You can specify elasticsearch hosts directly to the module, or you can use an elasticsearch profile via pillars:

```
mygrafanaprofile:
  hosts:
    - es1.example.com:9200
    - es2.example.com:9200
  index: grafana-dash
```

```
# Basic usage (uses default pillar profile key 'grafana')
Ensure myservice dashboard is managed:
  grafana.dashboard_present:
    - name: myservice
    - dashboard_from_pillar: default
    - rows_from_pillar:
        - systemhealth
        - requests

# Passing hosts in
Ensure myservice dashboard is managed:
  grafana.dashboard_present:
    - name: myservice
    - dashboard_from_pillar: default
    - rows:
        - collapse: false
          editable: true
          height: 150px
          title: System Health
          panels:
            - aliasColors: {}
              id: 200000
              annotate:
                enable: false
              bars: false
              datasource: null
              editable: true
              error: false
              fill: 7
              grid:
                leftMax: 100
                leftMin: null
                rightMax: null
                rightMin: null
                threshold1: 60
                threshold1Color: rgb(216, 27, 27)
                threshold2: null
                threshold2Color: rgba(234, 112, 112, 0.22)
              leftYAxisLabel: ''
              legend:

        templating:
          enable: true
          list: []
        time:
          from: now-2h
          to: now
        timezone: browser
    - rows_from_pillars:
      - systemhealth
      - requests
    - profile: mygrafanaprofile
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana.**dashboard_absent**(*name*, *hosts=None*, *profile='grafana'*)

Ensure the named grafana dashboard is deleted.

name Name of the grafana dashboard.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

salt.states.grafana.**dashboard_present**(*name*, *dashboard=None*, *dashboard_from_pillar=None*, *rows=None*, *rows_from_pillar=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

dashboard A dict that defines a dashboard that should be managed.

dashboard_from_pillar A pillar key that contains a grafana dashboard dict. Mutually exclusive with dashboard.

rows A list of grafana rows.

rows_from_pillar A list of pillar keys that contain lists of grafana dashboard rows. Rows defined in the pillars will be appended to the rows defined in the state.

profile A pillar key or dict that contains a list of hosts and an elasticsearch index to use.

19.19.90 salt.states.grafana4_dashboard module

Manage Grafana v4.0 Dashboards

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the `grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

```
Ensure minimum dashboard is managed:
  grafana4_dashboard.present:
    - name: insightful-dashboard
    - base_dashboards_from_pillar:
      - default_dashboard
    - base_rows_from_pillar:
      - default_row
    - base_panels_from_pillar:
      - default_panel
    - dashboard:
        rows:
          - title: Usage
            panels:
              - targets:
                  - target: alias(constantLine(50), 'max')
                title: Imaginary
                type: graph
```

salt.states.grafana4_dashboard.**absent**(*name*, *orgname=None*, *profile='grafana'*)

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

orgname Name of the organization in which the dashboard should be present.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

salt.states.grafana4_dashboard.**present**(*name*, *base_dashboards_from_pillar=None*, *base_panels_from_pillar=None*, *base_rows_from_pillar=None*, *dashboard=None*, *orgname=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from

base_rows_from_pillar A pillar key that contains a list of rows to inherit from

dashboard A dict that defines a dashboard that should be managed.

orgname Name of the organization in which the dashboard should be present.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

19.19.91 salt.states.grafana4_datasource module

Manage Grafana v4.0 data sources

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the `grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

The behavior of this module is to create data sources if the do not exists, and to update data sources if the already exists.

```
Ensure influxdb data source is present:
  grafana4_datasource.present:
    - name: influxdb
    - type: influxdb
    - url: http://localhost:8086
    - access: proxy
    - basic_auth: true
    - basic_auth_user: myuser
    - basic_auth_password: mypass
    - is_default: true
```

salt.states.grafana4_datasource.**absent**(*name*, *orgname=None*, *profile='grafana'*)

Ensure that a data source is present.

name Name of the data source to remove.

orgname Name of the organization from which the data source should be absent.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

salt.states.grafana4_datasource.**present**(*name*, *type*, *url*, *access=None*, *user=None*, *password=None*, *database=None*, *basic_auth=None*, *basic_auth_user=None*, *basic_auth_password=None*, *tls_auth=None*, *json_data=None*, *is_default=None*, *with_credentials=None*, *type_logo_url=None*, *orgname=None*, *profile='grafana'*)

Ensure that a data source is present.

name Name of the data source.

type Type of the datasource (`graphite', `influxdb' etc.).

access Use proxy or direct. Default: proxy

url The URL to the data source API.

user Optional - user to authenticate with the data source.

password Optional - password to authenticate with the data source.

database Optional - database to use with the data source.

basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
json_data Optional - additional json data to post (eg. ``timeInterval'').
is_default Optional - set data source as default.
with_credentials Optional - Whether credentials such as cookies or auth headers should be sent with cross-site requests.
type_logo_url Optional - Logo to use for this datasource.
orgname Name of the organization in which the data source should be present.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

19.19.92 salt.states.grafana4_org module

Manage Grafana v4.0 orgs

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the `grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

```
Ensure foobar org is present:
  grafana4_org.present:
    - name: foobar
    - theme:  ""
    - home_dashboard_id: 0
    - timezone: "utc"
    - address1: ""
    - address2: ""
    - city: ""
    - zip_code: ""
    - state: ""
    - country: ""
```

salt.states.grafana4_org.**absent**(*name*, *profile='grafana'*)
Ensure that a org is present.
name Name of the org to remove.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

salt.states.grafana4_org.**present**(*name*, *users=None*, *theme=None*, *home_dashboard_id=None*, *timezone=None*, *address1=None*, *address2=None*, *city=None*, *zip_code=None*, *address_state=None*, *country=None*, *profile='grafana'*)

Ensure that an organization is present.
name Name of the org.
users Optional - Dict of user/role associated with the org. Example:

```
users:
  foo: Viewer
  bar: Editor
```

theme Optional - Selected theme for the org.
home_dashboard_id Optional - Home dashboard for the org.
timezone Optional - Timezone for the org (one of: ``browser'', ``utc'', or ``'').
address1 Optional - address1 of the org.
address2 Optional - address2 of the org.
city Optional - city of the org.
zip_code Optional - zip_code of the org.
address_state Optional - state of the org.
country Optional - country of the org.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

19.19.93 salt.states.grafana4_user module

Manage Grafana v4.0 users

New in version 2017.7.0.

configuration This state requires a configuration profile to be configured in the minion config, minion pillar, or master config. The module will use the `grafana' key by default, if defined.

Example configuration using basic authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_user: admin
  grafana_password: admin
  grafana_timeout: 3
```

Example configuration using token based authentication:

```
grafana:
  grafana_url: http://grafana.localhost
  grafana_token: token
  grafana_timeout: 3
```

```
Ensure foobar user is present:
  grafana4_user.present:
    - name: foobar
    - password: mypass
    - email: "foobar@localhost"
    - fullname: Foo Bar
    - is_admin: true
```

salt.states.grafana4_user.**absent**(*name*, *profile='grafana'*)
Ensure that a user is present.
name Name of the user to remove.
profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

salt.states.grafana4_user.**present**(*name*, *password*, *email*, *is_admin=False*, *fullname=None*, *theme=None*, *profile='grafana'*)

Ensure that a user is present.

name Name of the user.

password Password of the user.

email Email of the user.

is_admin Optional - Set user as admin user. Default: False

fullname Optional - Full name of the user.

theme Optional - Selected theme of the user.

profile Configuration profile used to connect to the Grafana instance. Default is `grafana'.

19.19.94 salt.states.grafana_dashboard module

Manage Grafana v2.0 Dashboards

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure minimum dashboard is managed:
  grafana_dashboard.present:
    - name: insightful-dashboard
    - base_dashboards_from_pillar:
      - default_dashboard
    - base_rows_from_pillar:
      - default_row
    - base_panels_from_pillar:
      - default_panel
    - dashboard:
        rows:
          - title: Usage
            panels:
              - targets:
                  - target: alias(constantLine(50), 'max')
                title: Imaginary
                type: graph
```

The behavior of this module is to create dashboards if they do not exist, to add rows if they do not exist in existing dashboards, and to update rows if they exist in dashboards. The module will not manage rows that are not defined, allowing users to manage their own custom rows.

salt.states.grafana_dashboard.**absent**(*name*, *profile='grafana'*)

Ensure the named grafana dashboard is absent.

name Name of the grafana dashboard.

profile A pillar key or dict that contains grafana information

salt.states.grafana_dashboard.**present**(*name*, *base_dashboards_from_pillar=None*, *base_panels_from_pillar=None*, *base_rows_from_pillar=None*, *dashboard=None*, *profile='grafana'*)

Ensure the grafana dashboard exists and is managed.

name Name of the grafana dashboard.

base_dashboards_from_pillar A pillar key that contains a list of dashboards to inherit from

base_panels_from_pillar A pillar key that contains a list of panels to inherit from

base_rows_from_pillar A pillar key that contains a list of rows to inherit from
dashboard A dict that defines a dashboard that should be managed.
profile A pillar key or dict that contains grafana information

19.19.95 salt.states.grafana_datasource module

Manage Grafana v2.0 data sources

New in version 2016.3.0.

```
grafana:
  grafana_timeout: 3
  grafana_token: qwertyuiop
  grafana_url: 'https://url.com'
```

```
Ensure influxdb data source is present:
  grafana_datasource.present:
    - name: influxdb
    - type: influxdb
    - url: http://localhost:8086
    - access: proxy
    - basic_auth: true
    - basic_auth_user: myuser
    - basic_auth_password: mypass
    - is_default: true
```

salt.states.grafana_datasource.**absent**(*name*, *profile='grafana'*)
Ensure that a data source is present.
name Name of the data source to remove.

salt.states.grafana_datasource.**present**(*name*, *type*, *url*, *access='proxy'*, *user=''*, *password=''*, *database=''*, *basic_auth=False*, *basic_auth_user=''*, *basic_auth_password=''*, *is_default=False*, *json_data=None*, *profile='grafana'*)
Ensure that a data source is present.
name Name of the data source.
type Which type of data source it is (`graphite', `influxdb' etc.).
url The URL to the data source API.
user Optional - user to authenticate with the data source
password Optional - password to authenticate with the data source
basic_auth Optional - set to True to use HTTP basic auth to authenticate with the data source.
basic_auth_user Optional - HTTP basic auth username.
basic_auth_password Optional - HTTP basic auth password.
is_default Default: False

19.19.96 salt.states.grains

Manage grains on the minion

This state allows for grains to be set.

Grains set or altered with this module are stored in the `grains' file on the minions, By default, this file is located at: `/etc/salt/grains`

Note: This does **NOT** override any grains set in the minion config file.

salt.states.grains.**absent**(*name*, *destructive=False*, *delimiter=':'*, *force=False*)

New in version 2014.7.0.

Delete a grain from the grains config file

name The grain name

destructive If destructive is True, delete the entire grain. If destructive is False, set the grain's value to None. Defaults to False.

force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

Changed in version v2015.8.2.

This state now support nested grains and complex values. It is also more conservative: if a grain has a value that is a list or a dict, it will not be removed unless the *force* parameter is True.

```
grain_name:
  grains.absent
```

salt.states.grains.**append**(*name*, *value*, *convert=False*, *delimiter=':'*)

New in version 2014.7.0.

Append a value to a list in the grains config file. The grain that is being appended to (name) must exist before the new value can be added.

name The grain name

value The value to append

convert If convert is True, convert non-list contents into a list. If convert is False and the grain contains non-list contents, an error is given. Defaults to False.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

```
grain_name:
  grains.append:
    - value: to_be_appended
```

salt.states.grains.**exists**(*name*, *delimiter=':'*)

Ensure that a grain is set

name The grain name

delimiter A delimiter different from the default can be provided.

Check whether a grain exists. Does not attempt to check or set the value.

salt.states.grains.**list_absent**(*name*, *value*, *delimiter=':'*)

Delete a value from a grain formed as a list.

New in version 2014.1.0.

name The grain name.

value The value to delete from the grain list.

delimiter A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be list type

```
roles:
  grains.list_absent:
    - value: db
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_absent:
    - value:
      - web
      - dev
```

salt.states.grains.**list_present**(*name*, *value*, *delimiter=':'*)

New in version 2014.1.0.

Ensure the value is present in the list-type grain. Note: If the grain that is provided in `name` is not present on the system, this new grain will be created with the corresponding provided value.

name The grain name.

value The value is present in the list type grain.

delimiter A delimiter different from the default `:` can be provided.

New in version v2015.8.2.

The grain should be list type

```
roles:
  grains.list_present:
    - value: web
```

For multiple grains, the syntax looks like:

```
roles:
  grains.list_present:
    - value:
      - web
      - dev
```

salt.states.grains.**present**(*name*, *value*, *delimiter=':'*, *force=False*)

Ensure that a grain is set

Changed in version v2015.8.2.

name The grain name

value The value to set on the grain

force If force is True, the existing grain will be overwritten regardless of its existing or provided value type. Defaults to False

New in version v2015.8.2.

delimiter A delimiter different from the default can be provided.

New in version v2015.8.2.

It is now capable to set a grain to a complex value (ie. lists and dicts) and supports nested grains as well.

If the grain does not yet exist, a new grain is set to the given value. For a nested grain, the necessary keys are created if they don't exist. If a given key is an existing value, it will be converted, but an existing value different from the given key will fail the state.

If the grain with the given name exists, its value is updated to the new value unless its existing or provided value is complex (list or dict). Use *force: True* to overwrite.

```
cheese:
  grains.present:
    - value: edam

nested_grain_with_complex_value:
  grains.present:
    - name: icinga:Apache SSL
    - value:
      - command: check_https
      - params: -H localhost -p 443 -S

with,a,custom,delimiter:
  grains.present:
    - value: yay
    - delimiter: ','
```

19.19.97 salt.states.group

Management of user groups

The group module is used to create and manage group settings, groups can be either present or absent. User/Group names can be passed to the `adduser`, `deluser`, and `members` parameters. `adduser` and `deluser` can be used together but not with `members`.

In Windows, if no domain is specified in the user or group name (ie: *DOMAINusername*`) the module will assume a local user or group.

```
cheese:
  group.present:
    - gid: 7648
    - system: True
    - addusers:
      - user1
      - users2
    - delusers:
      - foo

cheese:
  group.present:
    - gid: 7648
    - system: True
    - members:
      - foo
      - bar
      - user1
      - user2
```

`salt.states.group.`**`absent`**(*name*)

Ensure that the named group is absent

Parameters **`name`** (*str*) -- The name of the group to remove

Example:

```
# Removes the local group `db_admin`
db_admin:
  group.absent
```

salt.states.group.**present**(*name*, *gid=None*, *system=False*, *addusers=None*, *delusers=None*, *members=None*)

Ensure that a group is present

Parameters

- **name** (*str*) -- The name of the group to manage
- **gid** (*str*) -- The group id to assign to the named group; if left empty, then the next available group id will be assigned. Ignored on Windows
- **system** (*bool*) -- Whether or not the named group is a system group. This is essentially the `-r' option of `groupadd'. Ignored on Windows
- **addusers** (*list*) -- List of additional users to be added as a group members. Cannot conflict with names in delusers. Cannot be used in conjunction with members.
- **delusers** (*list*) -- Ensure these user are removed from the group membership. Cannot conflict with names in addusers. Cannot be used in conjunction with members.
- **members** (*list*) -- Replace existing group members with a list of new members. Cannot be used in conjunction with addusers or delusers.

Example:

```
# Adds DOMAIN\db_admins and Administrators to the local db_admin group
# Removes Users
db_admin:
  group.present:
    - addusers:
      - DOMAIN\db_admins
      - Administrators
    - delusers:
      - Users

# Ensures only DOMAIN\domain_admins and the local Administrator are
# members of the local Administrators group. All other users are
# removed
Administrators:
  group.present:
    - members:
      - DOMAIN\domain_admins
      - Administrator
```

19.19.98 salt.states.heat module

Management of Heat

New in version 2017.7.0.

depends

- heat Python module

configuration See *salt.modules.heat* for setup instructions.

The heat module is used to create, show, list and delete Heat staks. Stack can be set as either absent or deploy.

```
heat.deployed:
  - name:
  - template: #Required
  - environment:
  - params: {}
  - poll: 5
```

```
  - rollback: False
  - timeout: 60

heat.absent:
  - name:
  - poll: 5
```

mysql:

heat.deployed:

- template: salt://templates/mysql.heat.yaml
- params: image: Debian 7
- rollback: True

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

`salt.states.heat.`**`absent`**(*name*, *poll=5*, *timeout=60*, *profile=None*)

Ensure that the named stack is absent

name The name of the stack to remove

poll Poll(in sec.) and report events until stack complete

timeout Stack creation timeout in minutes

profile Profile to use

`salt.states.heat.`**`deployed`**(*name*, *template=None*, *environment=None*, *params=None*, *poll=5*, *rollback=False*, *timeout=60*, *update=False*, *profile=None*, ***connection_args*)

Deploy stack with the specified properties

name The name of the stack

template File of template

environment File of environment

params Parameter dict used to create the stack

poll Poll (in sec.) and report events until stack complete

rollback Enable rollback on create failure

timeout Stack creation timeout in minutes

profile Profile to use

New in version 2017.7.5,2018.3.1: The spelling mistake in parameter *enviroment* was corrected to *environment*. The misspelled version is still supported for backward compatibility, but will be removed in Salt Neon.

19.19.99 salt.states.hg

Interaction with Mercurial repositories

Before using hg over ssh, make sure the remote host fingerprint already exists in ~/.ssh/known_hosts, and the remote host has this host's public key.

```
https://bitbucket.org/example_user/example_repo:
    hg.latest:
      - rev: tip
      - target: /tmp/example_repo
```

`salt.states.hg.`**`latest`**(*name*, *rev=None*, *target=None*, *clean=False*, *user=None*, *identity=None*, *force=False*, *opts=False*, *update_head=True*)

Make sure the repository is cloned to the given directory and is up to date

name Address of the remote repository as passed to ``hg clone''

rev The remote branch, tag, or revision hash to clone/pull
target Target destination directory path on minion to clone into
clean Force a clean update with -C (Default: False)
user Name of the user performing repository management operations

New in version 0.17.0.

identity Private SSH key on the minion server for authentication (ssh://)

New in version 2015.5.0.

force Force hg to clone into pre-existing directories (deletes contents)
opts Include additional arguments and options to the hg command line
update_head Should we update the head if new changes are found? Defaults to True

New in version 2017.7.0.

19.19.100 salt.states.hipchat

Send a message to Hipchat

This state is useful for sending messages to Hipchat during state runs.

The property api_url is optional. By defaul will use the public HipChat API at https://api.hipchat.com

New in version 2015.5.0.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
```

The api key can be specified in the master or minion configuration like below:

```
hipchat:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_version: v1
```

salt.states.hipchat.**send_message**(*name*, *room_id*, *from_name*, *message*, *api_url=None*, *api_key=None*, *api_version=None*, *message_color='yellow'*, *notify=False*)

Send a message to a Hipchat room.

```
hipchat-message:
  hipchat.send_message:
    - room_id: 123456
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_url: https://hipchat.myteam.com
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
    - api_version: v1
    - message_color: green
    - notify: True
```

The following parameters are required:
name The unique name for this event.

room_id The room to send the message to. Can either be the ID or the name.
from_name The name of that is to be shown in the ``from'' field. If not specified, defaults to.
message The message that is to be sent to the Hipchat room.
The following parameters are optional:
api_url The API URl to be used. If not specified here or in the configuration options of master or minion, will use the public HipChat API: https://api.hipchat.com
api_key The api key for Hipchat to use for authentication, if not specified in the configuration options of master or minion.
api_version The api version for Hipchat to use, if not specified in the configuration options of master or minion.
message_color The color the Hipchat message should be displayed in. One of the following, default: yellow ``yellow'', ``red'', ``green'', ``purple'', ``gray'', or ``random''.
notify Should a notification in the room be raised.

19.19.101 salt.states.host

Management of addresses and names in hosts file

The `/etc/hosts` file can be managed to contain definitions for specific hosts:

```
salt-master:
  host.present:
    - ip: 192.168.0.42
```

Or using the `names` directive, you can put several names for the same IP. (Do not try one name with space-separated values).

```
server1:
  host.present:
    - ip: 192.168.0.42
    - names:
      - server1
      - florida
```

Note: Changing the `names` in `host.present` does not cause an update to remove the old entry.

```
server1:
  host.present:
    - ip:
      - 192.168.0.42
      - 192.168.0.43
      - 192.168.0.44
    - names:
      - server1
```

You can replace all existing names for a particular IP address:

```
127.0.1.1:
  host.only:
    - hostnames:
      - foo.example.com
      - foo
```

Or delete all existing names for an address:

```
203.0.113.25:
    host.only:
      - hostnames: []
```

salt.states.host.**absent**(*name*, *ip*)

Ensure that the named host is absent

name The host to remove

ip The ip addr(s) of the host to remove

salt.states.host.**only**(*name*, *hostnames*)

Ensure that only the given hostnames are associated with the given IP address.

New in version 2016.3.0.

name The IP address to associate with the given hostnames.

hostnames Either a single hostname or a list of hostnames to associate with the given IP address in the given order. Any other hostname associated with the IP address is removed. If no hostnames are specified, all hostnames associated with the given IP address are removed.

salt.states.host.**present**(*name*, *ip*)

Ensures that the named host is present with the given ip

name The host to assign an ip to

ip The ip addr(s) to apply to the host

19.19.102 salt.states.htpasswd

Support for htpasswd module. Requires the apache2-utils package for Debian-based distros.

New in version 2014.7.0.

```
username:
  webutil.user_exists:
    - password: secr3t
    - htpasswd_file: /etc/nginx/htpasswd
    - options: d
    - force: true
```

salt.states.htpasswd.**user_absent**(*name*, *htpasswd_file=None*, *runas=None*)

Make sure the user is not in the specified htpasswd file

name User name

htpasswd_file Path to the htpasswd file

runas The system user to run htpasswd command with

salt.states.htpasswd.**user_exists**(*name*, *password=None*, *htpasswd_file=None*, *options='`*, *force=False*, *runas=None*, *update=False*)

Make sure the user is inside the specified htpasswd file

name User name

password User password

htpasswd_file Path to the htpasswd file

options See *salt.modules.htpasswd.useradd*

force Touch the file even if user already created

runas The system user to run htpasswd command with

update Update an existing user's password if it's different from what's in the htpasswd file (unlike force, which updates regardless)

19.19.103 salt.states.http

HTTP monitoring states

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

`salt.states.http.`**`query`**(*name*, *match=None*, *match_type='string'*, *status=None*, *wait_for=None*, ***kwargs*)

Perform an HTTP query and statefully return the result

New in version 2015.5.0.

name The name of the query.

match Specifies a pattern to look for in the return text. By default, this will perform a string comparison of looking for the value of match in the return text.

match_type Specifies the type of pattern matching to use. Default is `string`, but can also be set to `pcre` to use regular expression matching if a more complex pattern matching is required.

Note: Despite the name of `match_type` for this argument, this setting actually uses Python's `re.search()` function rather than Python's `re.match()` function.

---

status The status code for a URL for which to be checked. Can be used instead of or in addition to the `match` setting.

If both `match` and `status` options are set, both settings will be checked. However, note that if only one option is `True` and the other is `False`, then `False` will be returned. If this case is reached, the comments in the return data will contain troubleshooting information.

For more information about the `http.query` state, refer to the *HTTP Tutorial*.

```
query_example:
  http.query:
    - name: 'http://example.com/'
    - status: 200
```

`salt.states.http.`**`wait_for_successful_query`**(*name*, *wait_for=300*, ***kwargs*)

Like query but, repeat and wait until match/match_type or status is fulfilled. State returns result from last query state in case of success or if no successful query was made within wait_for timeout.

name The name of the query.

wait_for Total time to wait for requests that succeed.

request_interval Optional interval to delay requests by N seconds to reduce the number of requests sent.

Note: All other arguments are passed to the http.query state.

19.19.104 salt.states.icinga2 module

Icinga2 state

New in version 2017.7.0.

depends

- Icinga2 Python module

configuration See *salt.modules.icinga2* for setup instructions.

The icinga2 module is used to execute commands. Its output may be stored in a file or in a grain.

```
command_id:
  icinga2.generate_ticket
    - name: domain.tld
    - output:  "/tmp/query_id.txt"
```

salt.states.icinga2.**generate_cert**(*name*)

Generate an icinga2 certificate and key on the client.

name The domain name for which this certificate and key will be generated

salt.states.icinga2.**generate_ticket**(*name*, *output=None*, *grain=None*, *key=None*, *overwrite=True*)

Generate an icinga2 ticket on the master.

name The domain name for which this ticket will be generated

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

salt.states.icinga2.**node_setup**(*name*, *master*, *ticket*)

Setup the icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

ticket Authentication ticket generated on icinga2 master

salt.states.icinga2.**request_cert**(*name*, *master*, *ticket*, *port=`5665'*)

Request CA certificate from master icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

ticket Authentication ticket generated on icinga2 master

port Icinga2 port, defaults to 5665

salt.states.icinga2.**save_cert**(*name*, *master*)

Save the certificate on master icinga2 node.

name The domain name for which this certificate will be saved

master Icinga2 master node for which this certificate will be saved

19.19.105 salt.states.ifttt

Trigger an event in IFTTT

This state is useful for trigging events in IFTTT.

New in version 2015.8.0.

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'This state was executed successfully.'
    - value2: 'Another value we can send.'
    - value3: 'A third value we can send.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

ifttt: secret_key: bzMRb-KKIAaNOwKEEw792J7Eb-B3z7muhdhYblJn4V6

salt.states.ifttt.**trigger_event**(*name*, *event*, *value1=None*, *value2=None*, *value3=None*)

Trigger an event in IFTTT

```
ifttt-event:
  ifttt.trigger_event:
    - event: TestEvent
    - value1: 'A value that we want to send.'
    - value2: 'A second value that we want to send.'
    - value3: 'A third value that we want to send.'
```

The following parameters are required:

name The unique name for this event.

event The name of the event to trigger in IFTTT.

The following parameters are optional:

value1 One of the values that we can send to IFTT.

value2 One of the values that we can send to IFTT.

value3 One of the values that we can send to IFTT.

19.19.106 salt.states.incron

Management of incron, the inotify cron

The incron state module allows for user incrontabs to be cleanly managed.

Incron declarations require a number of parameters. The parameters needed to be declared: `path`, `mask`, and `cmd`. The `user` whose incrontab is to be edited also needs to be defined.

When making changes to an existing incron job, the `path` declaration is the unique factor, so if an existing cron that looks like this:

```
Watch for modifications in /home/user:
    incron.present:
        - user: root
        - path: /home/user
        - mask:
            - IN_MODIFY
        - cmd: 'echo "$$ $@"'
```

Is changed to this:

```
Watch for modifications and access in /home/user:
    incron.present:
        - user: root
        - path: /home/user
        - mask:
            - IN_MODIFY
            - IN_ACCESS
        - cmd: 'echo "$$ $@"'
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

New in version 0.17.0.

salt.states.incron.**absent**(*name*, *path*, *mask*, *cmd*, *user='root'*)

Verifies that the specified incron job is absent for the specified user; only the name is matched when removing a incron job.

name Unique comment describing the entry
path The path that should be watched
user The name of the user who's crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for
cmd The cmd that should be executed

`salt.states.incron.`**`present`**(*name*, *path*, *mask*, *cmd*, *user='root'*)
Verifies that the specified incron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your incron system's documentation. Most Unix-like systems' incron documentation can be found via the incrontab man page: `man 5 incrontab`.
name Unique comment describing the entry
path The path that should be watched
user The name of the user who's crontab needs to be modified, defaults to the root user
mask The mask of events that should be monitored for
cmd The cmd that should be executed

19.19.107 salt.states.influxdb08_database module

Management of Influxdb 0.8 databases

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_database.`**`absent`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*)
Ensure that the named database is absent
name The name of the database to remove
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

`salt.states.influxdb08_database.`**`present`**(*name*, *user=None*, *password=None*, *host=None*, *port=None*)
Ensure that the named database is present
name The name of the database to create
user The user to connect as (must be able to remove the database)
password The password of the user
host The host to connect to
port The port to connect to

19.19.108 salt.states.influxdb08_user module

Management of InfluxDB 0.8 users

(compatible with InfluxDB version 0.5-0.8)

New in version 2014.7.0.

`salt.states.influxdb08_user.`**`absent`**(*name*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)
Ensure that the named cluster admin or database user is absent.
name The name of the user to remove
database The database to remove the user from

user The user to connect as (must be able to remove the user)
password The password of the user
host The host to connect to
port The port to connect to

salt.states.influxdb08_user.**present**(*name*, *passwd*, *database=None*, *user=None*, *password=None*, *host=None*, *port=None*)
Ensure that the cluster admin or database user is present.
name The name of the user to manage
passwd The password of the user
database The database to create the user in
user The user to connect as (must be able to create the user)
password The password of the user
host The host to connect to
port The port to connect to

19.19.109 salt.states.influxdb_continuous_query module

Management of Influxdb continuous queries

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_continuous_query.**absent**(*name*, *database*, ***client_args*)
Ensure that given continuous query is absent.
name Name of the continuous query to remove.
database Name of the database that the continuous query was defined on.

salt.states.influxdb_continuous_query.**present**(*name*, *database*, *query*, *resample_time=None*, *coverage_period=None*, ***client_args*)
Ensure that given continuous query is present.
name Name of the continuous query to create.
database Database to create continuous query on.
query The query content
resample_time [None] Duration between continuous query resampling.
coverage_period [None] Duration specifying time period per sample.

19.19.110 salt.states.influxdb_database

Management of Influxdb databases

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_database.**absent**(*name*, ***client_args*)
Ensure that given database is absent.
name Name of the database to remove.

salt.states.influxdb_database.**present**(*name*, ***client_args*)
Ensure that given database is present.
name Name of the database to create.

19.19.111 salt.states.influxdb_retention_policy module

Management of Influxdb retention policies

New in version 2017.7.0.

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_retention_policy.**absent**(*name*, *database*, ***client_args*)

Ensure that given retention policy is absent.

name Name of the retention policy to remove.

database Name of the database that the retention policy was defined on.

salt.states.influxdb_retention_policy.**present**(*name*, *database*, *duration='7d'*, *replication=1*, *default=False*, ***client_args*)

Ensure that given retention policy is present.

name Name of the retention policy to create.

database Database to create retention policy on.

19.19.112 salt.states.influxdb_user

Management of InfluxDB users

(compatible with InfluxDB version 0.9+)

salt.states.influxdb_user.**absent**(*name*, ***client_args*)

Ensure that given user is absent.

name The name of the user to manage

salt.states.influxdb_user.**present**(*name*, *password*, *admin=False*, *grants=None*, ***client_args*)

Ensure that given user is present.

name Name of the user to manage

password Password of the user

admin [False] Whether the user should have cluster administration privileges or not.

grants Optional - Dict of database:privilege items associated with the user. Example:

grants: foo_db: read bar_db: all

Example:

```
example user present in influxdb:
  influxdb_user.present:
    - name: example
    - password: somepassword
    - admin: False
    - grants:
        foo_db: read
        bar_db: all
```

19.19.113 salt.states.infoblox module

states for infoblox stuff

ensures a record is either present or absent in an Infoblox DNS system

New in version 2016.3.0.

salt.states.infoblox.**absent**(*name*, *record_type*, *dns_view*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

Ensure a record does not exists

name Name of the record

record_type record type (host, a, cname, etc)

dns_view DNS View

infoblox_server infoblox server to connect to (will try pillar if not specified)

infoblox_user username to use to connect to infoblox (will try pillar if not specified)

infoblox_password password to use to connect to infoblox (will try pillar if not specified)

verify_ssl verify SSL certificates

Example:

```
some-state:
    infoblox.absent:
      - name: some.dns.record
      - record_type: host
      - dns_view: MyView
      - sslVerify: False
```

salt.states.infoblox.**present**(*name*, *value*, *record_type*, *dns_view*, *infoblox_server=None*, *infoblox_user=None*, *infoblox_password=None*, *infoblox_api_version='v1.4.2'*, *sslVerify=True*)

Ensure a record exists

name Name of the record

value Value of the record

record_type record type (host, a, cname, etc)

dns_view DNS View

infoblox_server infoblox server to connect to (will try pillar if not specified)

infoblox_user username to use to connect to infoblox (will try pillar if not specified)

infoblox_password password to use to connect to infoblox (will try pillar if not specified)

verify_ssl verify SSL certificates

Example:

```
some-state:
    infoblox.present:
      - name: some.dns.record
      - value: 10.1.1.3
      - record_type: host
      - sslVerify: False
```

19.19.114 salt.states.ini_manage

Manage ini files

maintainer <akilesh1597@gmail.com>

maturity new

depends re

platform all

salt.states.ini_manage.**options_absent**(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.options_absent:
    - separator: '='
    - sections:
        test:
          - testkey
          - secondoption
        test1:
          - testkey1
```

options present in file and not specified in sections dict will be untouched

changes dict will contain the list of changes made

salt.states.ini_manage.**options_present**(*name*, *sections=None*, *separator='='*, *strict=False*)

```
/home/saltminion/api-paste.ini:
  ini.options_present:
    - separator: '='
    - strict: True
    - sections:
        test:
          testkey: 'testval'
          secondoption: 'secondvalue'
        test1:
          testkey1: 'testval121'
```

options present in file and not specified in sections dict will be untouched, unless *strict: True* flag is used

changes dict will contain the list of changes made

salt.states.ini_manage.**sections_absent**(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.sections_absent:
    - separator: '='
    - sections:
        - test
        - test1
```

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

salt.states.ini_manage.**sections_present**(*name*, *sections=None*, *separator='='*)

```
/home/saltminion/api-paste.ini:
  ini.sections_present:
    - separator: '='
    - sections:
        - section_one
        - section_two
```

This will only create empty sections. To also create options, use options_present state

options present in file and not specified in sections will be deleted changes dict will contain the sections that changed

19.19.115 salt.states.ipmi

Manage IPMI devices over LAN

The following configuration defaults can be defined in the minion, master config or pillar:

```
ipmi.config:
    api_host: 127.0.0.1
    api_user: admin
    api_pass: apassword
    api_port: 623
    api_kg: None
```

Every call can override the config defaults:

```
ensure myipmi system is set to network boot:
    ipmi.boot_device:
        - name: network
        - api_host: myipmi.hostname.com
        - api_user: root
        - api_pass: apassword
        - api_kg: None

ensure myipmi system is powered on:
    ipmi.power:
        - name: boot
        - api_host: myipmi.hostname.com
        - api_user: root
        - api_pass: apassword
```

salt.states.ipmi.**boot_device**(*name='default'*, ***kwargs*)

Request power state change

name = **default**

- network -- Request network boot
- hd -- Boot from hard drive
- safe -- Boot from hard drive, requesting `safe mode'
- optical -- boot from CD/DVD/BD drive
- setup -- Boot into setup utility
- default -- remove any IPMI directed boot device request

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.**power**(*name='power_on'*, *wait=300*, ***kwargs*)

Request power state change

name

Ensure power state one of:

- power_on -- system turn on
- power_off -- system turn off (without waiting for OS)
- shutdown -- request OS proper shutdown
- reset -- reset (without waiting for OS)
- boot -- If system is off, then `on', else `reset'

wait wait X seconds for the job to complete before forcing. (defaults to 300 seconds)

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.**user_absent**(*name*, *channel=14*, ***kwargs*)

Remove user Delete all user (uid) records having the matching name.

name string name of user to delete

channel channel to remove user access from defaults to 14 for auto.

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

salt.states.ipmi.**user_present**(*name*, *uid*, *password*, *channel=14*, *callback=False*, *link_auth=True*, *ipmi_msg=True*, *privilege_level='administrator'*, ***kwargs*)

Ensure IPMI user and user privileges.

name name of user (limit 16 bytes)

uid user id number (1 to 7)

password user password (limit 16 bytes)

channel ipmi channel defaults to 14 for auto

callback User Restricted to Callback

False = User Privilege Limit is determined by the User Privilege Limit parameter privilege_level, for both callback and non-callback connections.

True = User Privilege Limit is determined by the privilege_level parameter for callback connections, but is restricted to Callback level for non-callback connections. Thus, a user can only initiate a Callback when they `call in' to the BMC, but once the callback connection has been made, the user could potentially establish a session as an Operator.

link_auth User Link authentication True/False user name and password information will be used for link authentication, e.g. PPP CHAP) for the given channel. Link authentication itself is a global setting for the channel and is enabled/disabled via the serial/modem configuration parameters.

ipmi_msg User IPMI Messaging True/False user name and password information will be used for IPMI Messaging. In this case, `IPMI Messaging' refers to the ability to execute generic IPMI commands that are not associated with a particular payload type. For example, if IPMI Messaging is disabled for a user, but that user is enabled for activating the SOL payload type, then IPMI commands associated with SOL and session management, such as Get SOL Configuration Parameters and Close Session are available, but generic IPMI commands such as Get SEL Time are unavailable.) ipmi_msg

privilege_level

- callback
- user
- operator
- administrator
- proprietary
- no_access

kwargs

- api_host=localhost
- api_user=admin
- api_pass=
- api_port=623
- api_kg=None

19.19.116 salt.states.ipset

Management of ipsets

This is an ipset-specific module designed to manage IPSets for use in IPTables Firewalls.

```
setname:
  ipset.set_present:
    - set_type: bitmap:ip
    - range: 192.168.0.0/16
    - comment: True

setname:
  ipset.set_absent:
    - set_type: bitmap:ip

setname:
  ipset.flush:
```

salt.states.ipset.**absent**(*name*, *entry=None*, *entries=None*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Remove a entry or entries from a chain

name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.

family Network family, ipv4 or ipv6.

salt.states.ipset.**flush**(*name*, *family='ipv4'*, ***kwargs*)

New in version 2014.7.0.

Flush current ipset set
family Networking family, either ipv4 or ipv6

salt.states.ipset.**present**(*name*, *entry=None*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Append a entry to a set
name A user-defined name to call this entry by in another part of a state or formula. This should not be an actual entry.
entry A single entry to add to a set or a list of entries to add to a set
family Network family, ipv4 or ipv6.

salt.states.ipset.**set_absent**(*name*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Verify the set is absent.
family Networking family, either ipv4 or ipv6

salt.states.ipset.**set_present**(*name*, *set_type*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Verify the set exists.
name A user-defined set name.
set_type The type for the set.
family Networking family, either ipv4 or ipv6

19.19.117 salt.states.iptables

Management of iptables

This is an iptables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic `firewall` state.

```
httpd:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80

    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.insert:
    - position: 1
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
```

```
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

httpd:
  iptables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - protocol: tcp
    - sport: 1025:65535
    - save: True

default to accept:
  iptables.set_policy:
    - chain: INPUT
    - policy: ACCEPT
```

Note: Whereas iptables will accept `-p`, `--proto[c[o[l]]]` as synonyms of `--protocol`, if `--proto` appears in an iptables command after the appearance of `-m policy`, it is interpreted as the `--proto` option of the policy extension (see the iptables-extensions(8) man page).

Example rules for IPSec policy:

```
accept_esp_in:
  iptables.append:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - source: 10.20.0.0/24
    - destination: 10.10.0.0/24
    - in-interface: eth0
    - match: policy
    - dir: in
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_in:
  iptables.append:
```

```
    - use:
      - iptables: accept_esp_in
    - chain: FORWARD

accept_esp_out:
  iptables.append:
    - table: filter
    - chain: OUTPUT
    - jump: ACCEPT
    - source: 10.10.0.0/24
    - destination: 10.20.0.0/24
    - out-interface: eth0
    - match: policy
    - dir: out
    - pol: ipsec
    - reqid: 1
    - proto: esp
accept_esp_forward_out:
  iptables.append:
    - use:
      - iptables: accept_esp_out
    - chain: FORWARD
```

Note: Various functions of the `iptables` module use the `--check` option. If the version of `iptables` on the target system does not include this option, an alternate version of this check will be performed using the output of iptables-save. This may have unintended consequences on legacy releases of `iptables`.

`salt.states.iptables.`**`append`**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 0.17.0.

Add a rule to the end of the specified chain.

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain which should be modified

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

`salt.states.iptables.`**`chain_absent`**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is absent.

table The table to remove the chain from

family Networking family, either ipv4 or ipv6

`salt.states.iptables.`**`chain_present`**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.1.0.

Verify the chain is exist.

name A user-defined chain name.

table The table to own the chain.

family Networking family, either ipv4 or ipv6

salt.states.iptables.**delete**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Delete a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

salt.states.iptables.**flush**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Flush current iptables state

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

salt.states.iptables.**insert**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Insert a rule into a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

position The numerical representation of where the rule should be inserted into the chain. Note that `-1` is not a supported position value.

All other arguments are passed in with the same name as the long option that would normally be used for iptables, with one exception: `--state` is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

Jump options that doesn't take arguments should be passed in with an empty string.

salt.states.iptables.**mod_aggregate**(*low*, *chunks*, *running*)

The mod_aggregate function which looks up all rules in the available low chunks and merges them into a single rules ref in the present low data

salt.states.iptables.**set_policy**(*name*, *table='filter'*, *family='ipv4'*, ***kwargs*)

New in version 2014.1.0.

Sets the default policy for iptables firewall tables

table The table that owns the chain that should be modified

family Networking family, either ipv4 or ipv6

policy The requested table policy

19.19.118 salt.states.jboss7

Manage JBoss 7 Application Server via CLI interface

New in version 2015.5.0.

This state uses the jboss-cli.sh script from a JBoss or Wildfly installation and parses its output to determine the execution result.

In order to run each state, a jboss_config dictionary with the following properties must be passed:

```
jboss:
   cli_path: '/opt/jboss/jboss-7.0/bin/jboss-cli.sh'
   controller: 10.11.12.13:9999
   cli_user: 'jbossadm'
   cli_password: 'jbossadm'
```

If the controller doesn't require a password, then the cli_user and cli_password parameters are optional.

Since same dictionary with configuration will be used in all the states, it may be more convenient to move JBoss configuration and other properties to the pillar.

Example of application deployment from local filesystem:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

For the sake of brevity, examples for each state assume that jboss_config is contained in the pillar.

`salt.states.jboss7.`**`bindings_exist`**(*name*, *jboss_config*, *bindings*, *profile=None*)

Ensures that given JNDI binding are present on the server. If a binding doesn't exist on the server it will be created. If it already exists its value will be changed.
jboss_config: Dict with connection properties (see state description)
bindings: Dict with bindings to set.
profile: The profile name (domain mode only)
Example:

```
jndi_entries_created:
  jboss7.bindings_exist:
    - bindings:
        'java:global/sampleapp/environment': 'DEV'
        'java:global/sampleapp/configurationFile': '/var/opt/sampleapp/config.
↪properties'
    - jboss_config: {{ pillar['jboss'] }}
```

`salt.states.jboss7.`**`datasource_exists`**(*name*, *jboss_config*, *datasource_properties*, *recreate=False*, *profile=None*)

Ensures that a datasource with given properties exist on the jboss instance. If datasource doesn't exist, it is created, otherwise only the properties that are different will be updated.
name Datasource property name
jboss_config Dict with connection properties (see state description)
datasource_properties Dict with datasource properties
recreate [False] If set to True and datasource exists it will be removed and created again. However, if there are deployments that depend on the datasource, it will not me possible to remove it.
profile [None] The profile name for this datasource (domain mode only)
Example:

```
sampleDS:
  jboss7.datasource_exists:
    - recreate: False
    - datasource_properties:
        driver-name: mysql
        connection-url: 'jdbc:mysql://localhost:3306/sampleDatabase'
        jndi-name: 'java:jboss/datasources/sampleDS'
        user-name: sampleuser
        password: secret
```

```
      min-pool-size: 3
      use-java-context: True
  - jboss_config: {{ pillar['jboss'] }}
  - profile: full-ha
```

salt.states.jboss7.**deployed**(*name*, *jboss_config*, *salt_source=None*)

Ensures that the given application is deployed on server.

jboss_config: Dict with connection properties (see state description)

salt_source:

How to find the artifact to be deployed.

target_file: Where to look in the minion's file system for the artifact to be deployed (e.g. `/tmp/application-web-0.39.war'). When source is specified, also specifies where to save the retrieved file.

source: (optional) File on salt master (e.g. salt://application-web-0.39.war). If absent, no files will be retrieved and the artifact in target_file will be used for the deployment.

undeploy: (optional) Regular expression to match against existing deployments. When present, if there is a deployment that matches the regular expression, it will be undeployed before the new artifact is deployed.

Examples:

Deployment of a file from minion's local file system:

```
application_deployed:
  jboss7.deployed:
    - salt_source:
        target_file: '/tmp/webapp.war'
    - jboss_config: {{ pillar['jboss'] }}
```

It is assumed that /tmp/webapp.war was made available by some other means. No applications will be undeployed; if an existing deployment that shares that name exists, then it will be replaced with the updated version.

Deployment of a file from the Salt master's file system:

```
application_deployed:
  jboss7.deployed:
   - salt_source:
        source: salt://application-web-0.39.war
        target_file: '/tmp/application-web-0.39.war'
        undeploy: 'application-web-.*'
   - jboss_config: {{ pillar['jboss'] }}
```

Here, application-web-0.39.war file is downloaded from Salt file system to /tmp/application-web-0.39.war file on minion. Existing deployments are checked if any of them matches `application-web-.*' regular expression, and if so then it is undeployed before deploying the application. This is useful to automate deployment of new application versions.

If the source parameter of salt_source is specified, it can use any protocol that the file states use. This includes not only downloading from the master but also HTTP, HTTPS, FTP, Amazon S3, and OpenStack Swift.

salt.states.jboss7.**reloaded**(*name*, *jboss_config*, *timeout=60*, *interval=5*)

Reloads configuration of jboss server.

jboss_config: Dict with connection properties (see state description)

timeout: Time to wait until jboss is back in running state. Default timeout is 60s.

interval: Interval between state checks. Default interval is 5s. Decreasing the interval may slightly decrease waiting time but be aware that every status check is a call to jboss-cli which is a java process. If interval is smaller than process cleanup time it may easily lead to excessive resource consumption.

This step performs the following operations:

- Ensures that server is in running or reload-required state (by reading server-state attribute)
- Reloads configuration
- Waits for server to reload and be in running state

Example:

```
configuration_reloaded:
   jboss7.reloaded:
    - jboss_config: {{ pillar['jboss'] }}
```

19.19.119 salt.states.jenkins module

Management of Jenkins

New in version 2016.3.0.

`salt.states.jenkins.`**`absent`**(*name*, ***kwargs*)

Ensure the job is absent from the Jenkins configured jobs

name The name of the Jenkins job to remove

`salt.states.jenkins.`**`present`**(*name*, *config=None*, ***kwargs*)

Ensure the job is present in the Jenkins configured jobs

name The unique name for the Jenkins job

config The Salt URL for the file to use for configuring the job

19.19.120 salt.states.junos module

State modules to interact with Junos devices.

maturity new

dependencies junos-eznc, jxmlease

Note: Those who wish to use junos-eznc (PyEZ) version >= 2.1.0, must use the latest salt code from github until the next release.

Refer to *junos* for information on connecting to junos proxy.

`salt.states.junos.`**`cli`**(*name*, *format='text'*, ***kwargs*)

Executes the CLI commands and reuturns the text output.

```
show version:
  junos:
    - cli
    - format: xml
```

Parameters

- **Required** --
  - command: The command that need to be executed on Junos CLI. (default = None)
- **Optional** --
  - format: Format in which to get the CLI output. (text or xml, default = `text')
  - **kwargs: Keyworded arguments which can be provided like-**

* timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
* dest: The destination file where the CLI output can be stored. (default = None)

salt.states.junos.**commit**(*name*, ***kwargs*)

Commits the changes loaded into the candidate configuration.

```
commit the changes:
  junos:
    - commit
    - confirm: 10
```

Parameters **Optional** --

- **kwargs: Keyworded arguments which can be provided like-**
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - sync: On dual control plane systems, requests that the candidate configuration on one control plane be copied to the other control plane,checked for correct syntax, and committed on both Routing Engines. (default = False)
  - force_sync: On dual control plane systems, force the candidate configuration on one control plane to be copied to the other control plane.
  - full: When set to True requires all the daemons to check and evaluate the new configuration.
  - detail: When true return commit detail.

salt.states.junos.**commit_check**(*name*)

Perform a commit check on the configuration.

```
perform commit check:
  junos.commit_check
```

salt.states.junos.**diff**(*name*, *d_id*)

Gets the difference between the candidate and the current configuration.

```
get the diff:
  junos:
    - diff
    - id: 10
```

Parameters **Optional** --

- id: The rollback id value [0-49]. (default = 0)

salt.states.junos.**file_copy**(*name*, *dest=None*, ***kwargs*)

Copies the file from the local device to the junos device.

```
/home/m2/info.txt:
  junos:
    - file_copy
    - dest: info_copy.txt
```

Parameters **Required** --

- src: The sorce path where the file is kept.
- dest: The destination path where the file will be copied.

salt.states.junos.**install_config**(*name*, ***kwargs*)

Loads and commits the configuration provided.

```
Install the mentioned config:
  junos:
    - install_config
    - path: salt//configs/interface.set
    - timeout: 100
    - diffs_file: 'var/log/diff'
```

```
Install the mentioned config:
  junos:
    - install_config
    - template_path: salt//configs/interface.set
    - timeout: 100
    - template_vars:
        interface_name: lo0
        description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands

template_vars The dictionary of data for the jinja variables present in the jinja template

timeout [30] Set NETCONF RPC timeout. Can be used for commands which take a while to execute.

overwrite [False]

Set to **`True`** if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses ``replace:'' statements. Only those statements under the `replace' tag will be changed.

comment Provide a comment to the commit. (default = None)

confirm Provide time in minutes for commit confirmation. If this option is specified, the commit will be rolled back in the given time unless the commit is confirmed.

diffs_file Path to the file where the diff (difference in old configuration and the committed configuration) will be stored.

Note: The file will be stored on the proxy minion. To push the files to the master use *cp.push*.

---

salt.states.junos.**install_os**(*name*, ***kwargs*)

Installs the given image on the device. After the installation is complete the device is rebooted, if reboot=True is given as a keyworded argument.

```
salt://images/junos_image.tgz:
  junos:
    - install_os
    - timeout: 100
    - reboot: True
```

Parameters

- **`Required`** --
  - path: Path where the image file is present on the pro xy minion.
- **`Optional`** --
  - **kwargs: keyworded arguments to be given such as timeout, reboot etc**

* timeout: Set NETCONF RPC timeout. Can be used to RPCs which take a while to execute. (default = 30 seconds)
* reboot: Whether to reboot after installation (default = False)
* no_copy: When True the software package will not be SCP'd to the device. (default = False)

salt.states.junos.**load**(*name*, ***kwargs*)

Loads the configuration provided onto the junos device.

```
Install the mentioned config:
  junos:
    - load
    - path: salt//configs/interface.set
```

```
Install the mentioned config:
  junos:
    - load
    - template_path: salt//configs/interface.set
    - template_vars:
        interface_name: lo0
        description: Creating interface via SaltStack.
```

name Path where the configuration/template file is present. If the file has a `*.conf` extension, the content is treated as text format. If the file has a `*.xml` extension, the content is treated as XML format. If the file has a `*.set` extension, the content is treated as Junos OS `set` commands.

overwrite [False] Set to `True` if you want this file is to completely replace the configuration file.

replace [False] Specify whether the configuration file uses ``replace:'' statements. Only those statements under the `replace' tag will be changed.

format: Determines the format of the contents.

update [False] Compare a complete loaded configuration against the candidate configuration. For each hierarchy level or configuration object that is different in the two configurations, the version in the loaded configuration replaces the version in the candidate configuration. When the configuration is later committed, only system processes that are affected by the changed configuration elements parse the new configuration. This action is supported from PyEZ 2.1 (default = False)

template_vars Variables to be passed into the template processing engine in addition to those present in __pillar__, __opts__, __grains__, etc. You may reference these variables in your template like so: {{ template_vars["var_name"] }}

salt.states.junos.**lock**(*name*)

Attempts an exclusive lock on the candidate configuration. This is a non-blocking call.

Note: Any user who wishes to use lock, must necessarily unlock the configuration too. Ensure *unlock* is called in the same orchestration run in which the lock is called.

```
lock the config:
  junos.lock
```

salt.states.junos.**rollback**(*name*, *id*, ***kwargs*)

Rollbacks the committed changes.

```
rollback the changes:
  junos:
    - rollback
    - id: 5
```

Parameters **Optional** --

- id: The rollback id value [0-49]. (default = 0)
- **kwargs**: **Keyworded arguments which can be provided like-**
  - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
  - comment: Provide a comment to the commit. (default = None)
  - confirm: Provide time in minutes for commit confirmation. If this option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.
  - diffs_file: Path to the file where any diffs will be written. (default = None)

salt.states.junos.**rpc**(*name*, *dest=None*, *format='xml'*, *args=None*, ***kwargs*)

Executes the given rpc. The returned data can be stored in a file by specifying the destination path with dest as an argument

```
get-interface-information:
    junos:
      - rpc
      - dest: /home/user/rpc.log
      - interface_name: lo0
```

Parameters

- **Required** --
  - cmd: The rpc to be executed. (default = None)
- **Optional** --
  - dest: Destination file where the rpc output is stored. (default = None) Note that the file will be stored on the proxy minion. To push the files to the master use the salt's following execution module: *cp.push*
  - format: The format in which the rpc reply must be stored in file specified in the dest (used only when dest is specified) (default = xml)
  - **kwargs**: **keyworded arguments taken by rpc call like-**
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default= 30 seconds)
    - filter: Only to be used with `get-config' rpc to get specific configuration.
    - terse: Amount of information you want.
    - interface_name: Name of the interface whose information you want.

salt.states.junos.**set_hostname**(*name*, ***kwargs*)

Changes the hostname of the device.

```
device_name:
  junos:
    - set_hostname
    - comment: "Host-name set via saltstack."
```

Parameters

- **Required** --
  - hostname: The name to be set. (default = None)
- **Optional** --
  - **kwargs**: **Keyworded arguments which can be provided like-**
    - timeout: Set NETCONF RPC timeout. Can be used for commands which take a while to execute. (default = 30 seconds)
    - comment: Provide a comment to the commit. (default = None)
    - confirm: Provide time in minutes for commit confirmation. If this

option is specified, the commit will be rollbacked in the given time unless the commit is confirmed.

salt.states.junos.**shutdown**(*name*, ***kwargs*)

Shuts down the device.

```
shut the device:
  junos:
    - shutdown
    - in_min: 10
```

Parameters **Optional** --

- **kwargs**:
  - reboot: Whether to reboot instead of shutdown. (default=False)
  - at: Specify time for reboot. (To be used only if reboot=yes)
  - in_min: Specify delay in minutes for shutdown

salt.states.junos.**unlock**(*name*)

Unlocks the candidate configuration.

```
unlock the config:
  junos.unlock
```

salt.states.junos.**zeroize**(*name*)

Resets the device to default factory settings.

```
reset my device:
  junos.zeroize
```

name: can be anything

19.19.121 salt.states.k8s

Manage Kubernetes

New in version 2016.3.0.

```
kube_label_1:
  k8s.label_present:
    - name: mylabel
    - value: myvalue
    - node: myothernodename
    - apiserver: http://mykubeapiserer:8080

kube_label_2:
  k8s.label_absent:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserer:8080

kube_label_3:
  k8s.label_folder_present:
    - name: mylabel
    - node: myothernodename
    - apiserver: http://mykubeapiserer:8080
```

salt.states.k8s.**label_absent**(*name*, *node=None*, *apiserver=None*)
Deprecated since version 2017.7.0: This state has been moved to kubernetes.node_label_absent <salt.states.kubernetes.node_label_absent().

Ensure the label doesn't exist on the kube node.
name Name of the label.
node Override node ID.
apiserver K8S apiserver URL.

salt.states.k8s.**label_folder_absent**(*name*, *node=None*, *apiserver=None*)
Deprecated since version 2017.7.0: This state has been moved to kubernetes.node_label_folder_absent <salt.states.kubernetes.node_label_folder_absent().

Ensure the label folder doesn't exist on the kube node.
name Name of the label folder.
node Override node ID.
apiserver K8S apiserver URL.

salt.states.k8s.**label_present**(*name*, *value*, *node=None*, *apiserver=None*)
Deprecated since version 2017.7.0: This state has been moved to kubernetes.node_label_present <salt.states.kubernetes.node_label_present().

Ensure the label exists on the kube node.
name Name of the label.
value Value of the label.
node Override node ID.
apiserver K8S apiserver URL.

19.19.122 salt.states.kapacitor module

Kapacitor state module.

configuration This module accepts connection configuration details either as parameters or as configuration settings in /etc/salt/minion on the relevant minions:

```
kapacitor.host: 'localhost'
kapacitor.port: 9092
```

This data can also be passed into pillar. Options passed into opts will overwrite options passed into pillar.

New in version 2016.11.0.

salt.states.kapacitor.**task_absent**(*name*)
Ensure that a task is absent from Kapacitor.
name Name of the task.

salt.states.kapacitor.**task_present**(*name*, *tick_script*, *task_type='stream'*, *database=None*, *retention_policy='default'*, *enable=True*)
Ensure that a task is present and up-to-date in Kapacitor.
name Name of the task.
tick_script Path to the TICK script for the task. Can be a salt:// source.
task_type Task type. Defaults to `stream'
database Which database to fetch data from. Defaults to None, which will use the default database in InfluxDB.
retention_policy Which retention policy to fetch data from. Defaults to `default'.
enable Whether to enable the task or not. Defaults to True.

19.19.123 salt.states.keyboard

Management of keyboard layouts

The keyboard layout can be managed for the system:

```
us:
  keyboard.system
```

Or it can be managed for XOrg:

```
us:
  keyboard.xorg
```

salt.states.keyboard.**system**(*name*)
Set the keyboard layout for the system
name The keyboard layout to use

salt.states.keyboard.**xorg**(*name*)
Set the keyboard layout for XOrg
layout The keyboard layout to use

19.19.124 salt.states.keystone

Management of Keystone users

depends

- keystoneclient Python module

configuration See *salt.modules.keystone* for setup instructions.

```
Keystone tenants:
  keystone.tenant_present:
    - names:
      - admin
      - demo
      - service

Keystone roles:
  keystone.role_present:
    - names:
      - admin
      - Member

admin:
  keystone.user_present:
    - password: R00T_4CC3SS
    - email: admin@domain.com
    - roles:
        admin:   # tenants
          - admin  # roles
        service:
          - admin
          - Member
    - require:
      - keystone: Keystone tenants
```

```
      - keystone: Keystone roles

nova:
  keystone.user_present:
    - password: '$up3rn0v4'
    - email: nova@domain.com
    - tenant: service
    - roles:
        service:
          - admin
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

demo:
  keystone.user_present:
    - password: 'd3m0n$trati0n'
    - email: demo@domain.com
    - tenant: demo
    - roles:
        demo:
          - Member
    - require:
      - keystone: Keystone tenants
      - keystone: Keystone roles

nova service:
  keystone.service_present:
    - name: nova
    - service_type: compute
    - description: OpenStack Compute Service
```

salt.states.keystone.**endpoint_absent**(*name*, *region=None*, *profile=None*, *interface=None*, ***connection_args*)

Ensure that the endpoint for a service doesn't exist in Keystone catalog

name The name of the service whose endpoints should not exist

region (optional) The region of the endpoint. Defaults to RegionOne.

interface The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.**endpoint_present**(*name*, *publicurl=None*, *internalurl=None*, *adminurl=None*, *region=None*, *profile=None*, *url=None*, *interface=None*, ***connection_args*)

Ensure the specified endpoints exists for service

name The Service name

publicurl The public url of service endpoint (for V2 API)

internalurl The internal url of service endpoint (for V2 API)

adminurl The admin url of the service endpoint (for V2 API)

region The region of the endpoint

url The endpoint URL (for V3 API)

interface The interface type, which describes the visibility of the endpoint. (for V3 API)

salt.states.keystone.**project_absent**(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone project is absent. Alias for tenant_absent from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

name The name of the project that should not exist

```
delete_nova:
    keystone.project_absent:
        - name: nova
```

salt.states.keystone.**project_present**(*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Ensures that the keystone project exists Alias for tenant_present from V2 API to fulfill V3 API naming convention.

New in version 2016.11.0.

name The name of the project to manage

description The description to use for this project

enabled Availability state for this project

```
nova:
    keystone.project_present:
        - enabled: True
        - description: 'Nova Compute Service'
```

salt.states.keystone.**role_absent**(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone role is absent.

name The name of the role that should not exist

salt.states.keystone.**role_present**(*name*, *profile=None*, ***connection_args*)

` Ensures that the keystone role exists

name The name of the role that should be present

salt.states.keystone.**service_absent**(*name*, *profile=None*, ***connection_args*)

Ensure that the service doesn't exist in Keystone catalog

name The name of the service that should not exist

salt.states.keystone.**service_present**(*name*, *service_type*, *description=None*, *profile=None*, ***connection_args*)

Ensure service present in Keystone catalog

name The name of the service

service_type The type of Openstack Service

description (optional) Description of the service

salt.states.keystone.**tenant_absent**(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone tenant is absent.

name The name of the tenant that should not exist

salt.states.keystone.**tenant_present**(*name*, *description=None*, *enabled=True*, *profile=None*, ***connection_args*)

Ensures that the keystone tenant exists

name The name of the tenant to manage

description The description to use for this tenant

enabled Availability state for this tenant

salt.states.keystone.**user_absent**(*name*, *profile=None*, ***connection_args*)

Ensure that the keystone user is absent.

name The name of the user that should not exist

salt.states.keystone.**user_present**(*name*, *password*, *email*, *tenant=None*, *enabled=True*, *roles=None*, *profile=None*, *password_reset=True*, *project=None*, ***connection_args*)

Ensure that the keystone user is present with the specified properties.

name The name of the user to manage

password The password to use for this user.

> **Note:** If the user already exists and a different password was set for the user than the one specified here, the password for the user will be updated. Please set the `password_reset` option to `False` if this is not the desired behavior.

password_reset Whether or not to reset password after initial set. Defaults to `True`.
email The email address for this user
tenant The tenant (name) for this user
project The project (name) for this user (overrides tenant in api v3)
enabled Availability state for this user
roles The roles the user should have under given tenants. Passed as a dictionary mapping tenant names to a list of roles in this tenant, i.e.:

```
roles:
    admin:   # tenant
      - admin  # role
    service:
      - admin
      - Member
```

19.19.125 salt.states.kmod

Loading and unloading of kernel modules

The Kernel modules on a system can be managed cleanly with the kmod state module:

```
add_kvm:
  kmod.present:
    - name: kvm_amd
remove_beep:
  kmod.absent:
    - name: pcspkr
```

Multiple modules can be specified for both kmod.present and kmod.absent.

```
add_sound:
  kmod.present:
    - mods:
      - snd_hda_codec_hdmi
      - snd_hda_codec
      - snd_hwdep
      - snd_hda_core
      - snd_pcm
      - snd_timer
      - snd
```

`salt.states.kmod.`**`absent`**(*name*, *persist=False*, *comment=True*, *mods=None*)
Verify that the named kernel module is not loaded
name The name of the kernel module to verify is not loaded
persist Remove module from `/etc/modules`
comment Comment out module in `/etc/modules` rather than remove it
mods A list of modules to verify are unloaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

salt.states.kmod.**present**(*name*, *persist=False*, *mods=None*)

Ensure that the specified kernel module is loaded

name The name of the kernel module to verify is loaded

persist Also add module to `/etc/modules`

mods A list of modules to verify are loaded. If this argument is used, the `name` argument, although still required, is not used, and becomes a placeholder

New in version 2016.3.0.

19.19.126 salt.states.kubernetes

Manage kubernetes resources as salt states

NOTE: This module requires the proper pillar values set. See salt.modules.kubernetes for more information.

Warning: Configuration options will change in Flourine.

The kubernetes module is used to manage different kubernetes resources.

```
my-nginx:
  kubernetes.deployment_present:
    - namespace: default
      metadata:
        app: frontend
      spec:
        replicas: 1
        template:
          metadata:
            labels:
              run: my-nginx
          spec:
            containers:
            - name: my-nginx
              image: nginx
              ports:
              - containerPort: 80

my-mariadb:
  kubernetes.deployment_absent:
    - namespace: default

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
redis-master-deployment:
  kubernetes.deployment_present:
    - name: redis-master
    - source: salt://k8s/redis-master-deployment.yml
  require:
    - pip: kubernetes-python-module

# kubernetes service as specified inside of
# a file containing the definition of the the
```

```
# service using the official kubernetes format
redis-master-service:
  kubernetes.service_present:
    - name: redis-master
    - source: salt://k8s/redis-master-service.yml
  require:
    - kubernetes.deployment_present: redis-master

# kubernetes deployment as specified inside of
# a file containing the definition of the the
# deployment using the official kubernetes format
# plus some jinja directives
 nginx-source-template:
  kubernetes.deployment_present:
    - source: salt://k8s/nginx.yml.jinja
    - template: jinja
  require:
    - pip: kubernetes-python-module

# Kubernetes secret
k8s-secret:
  kubernetes.secret_present:
    - name: top-secret
      data:
        key1: value1
        key2: value2
        key3: value3
```

salt.states.kubernetes.**configmap_absent**(*name*, *namespace='default'*, ***kwargs*)

Ensures that the named configmap is absent from the given namespace.

name The name of the configmap

namespace The name of the namespace

salt.states.kubernetes.**configmap_present**(*name*, *namespace='default'*, *data=None*, *source=''*, *template=''*, ***kwargs*)

Ensures that the named configmap is present inside of the specified namespace with the given data. If the configmap exists it will be replaced.

name The name of the configmap.

namespace The namespace holding the configmap. The `default' one is going to be used unless a different one is specified.

data The dictionary holding the configmaps.

source A file containing the data of the configmap in plain format.

template Template engine to be used to render the source file.

salt.states.kubernetes.**deployment_absent**(*name*, *namespace='default'*, ***kwargs*)

Ensures that the named deployment is absent from the given namespace.

name The name of the deployment

namespace The name of the namespace

salt.states.kubernetes.**deployment_present**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, ***kwargs*)

Ensures that the named deployment is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.

name The name of the deployment.

namespace The namespace holding the deployment. The `default' one is going to be used unless a different one is specified.

metadata The metadata of the deployment object.
spec The spec of the deployment object.
source A file containing the definition of the deployment (metadata and spec) in the official kubernetes format.
template Template engine to be used to render the source file.

salt.states.kubernetes.**namespace_absent**(*name*, ***kwargs*)
Ensures that the named namespace is absent.
name The name of the namespace

salt.states.kubernetes.**namespace_present**(*name*, ***kwargs*)
Ensures that the named namespace is present.
name The name of the deployment.

salt.states.kubernetes.**node_label_absent**(*name*, *node*, ***kwargs*)
Ensures that the named label is absent from the node.
name The name of the label
node The name of the node

salt.states.kubernetes.**node_label_folder_absent**(*name*, *node*, ***kwargs*)
Ensures the label folder doesn't exist on the specified node.
name The name of label folder
node The name of the node

salt.states.kubernetes.**node_label_present**(*name*, *node*, *value*, ***kwargs*)
Ensures that the named label is set on the named node with the given value. If the label exists it will be replaced.
name The name of the label.
value Value of the label.
node Node to change.

salt.states.kubernetes.**pod_absent**(*name*, *namespace='default'*, ***kwargs*)
Ensures that the named pod is absent from the given namespace.
name The name of the pod
namespace The name of the namespace

salt.states.kubernetes.**pod_present**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, ***kwargs*)
Ensures that the named pod is present inside of the specified namespace with the given metadata and spec. If the pod exists it will be replaced.
name The name of the pod.
namespace The namespace holding the pod. The `default' one is going to be used unless a different one is specified.
metadata The metadata of the pod object.
spec The spec of the pod object.
source A file containing the definition of the pod (metadata and spec) in the official kubernetes format.
template Template engine to be used to render the source file.

salt.states.kubernetes.**secret_absent**(*name*, *namespace='default'*, ***kwargs*)
Ensures that the named secret is absent from the given namespace.
name The name of the secret
namespace The name of the namespace

salt.states.kubernetes.**secret_present**(*name*, *namespace='default'*, *data=None*, *source=''*, *template=''*, ***kwargs*)
Ensures that the named secret is present inside of the specified namespace with the given data. If the secret exists it will be replaced.
name The name of the secret.

namespace The namespace holding the secret. The `default' one is going to be used unless a different one is specified.
data The dictionary holding the secrets.
source A file containing the data of the secret in plain format.
template Template engine to be used to render the source file.

`salt.states.kubernetes.`**`service_absent`**(*name*, *namespace='default'*, ***kwargs*)
Ensures that the named service is absent from the given namespace.
name The name of the service
namespace The name of the namespace

`salt.states.kubernetes.`**`service_present`**(*name*, *namespace='default'*, *metadata=None*, *spec=None*, *source=''*, *template=''*, ***kwargs*)
Ensures that the named service is present inside of the specified namespace with the given metadata and spec. If the deployment exists it will be replaced.
name The name of the service.
namespace The namespace holding the service. The `default' one is going to be used unless a different one is specified.
metadata The metadata of the service object.
spec The spec of the service object.
source A file containing the definition of the service (metadata and spec) in the official kubernetes format.
template Template engine to be used to render the source file.

19.19.127 salt.states.layman

Management of Gentoo Overlays using layman

A state module to manage Gentoo package overlays via layman

```
sunrise:
    layman.present
```

`salt.states.layman.`**`absent`**(*name*)
Verify that the overlay is absent
name The name of the overlay to delete

`salt.states.layman.`**`present`**(*name*)
Verify that the overlay is present
name The name of the overlay to add

19.19.128 salt.states.ldap

Manage entries in an LDAP database

New in version 2016.3.0.

The `states.ldap` state module allows you to manage LDAP entries and their attributes.

`salt.states.ldap.`**`managed`**(*name*, *entries*, *connect_spec=None*)
Ensure the existence (or not) of LDAP entries and their attributes

Example:

```
ldapi:///:
  ldap.managed:
    - connect_spec:
```

```
      bind:
        method: sasl

  - entries:

    # make sure the entry doesn't exist
    - cn=foo,ou=users,dc=example,dc=com:
      - delete_others: True

    # make sure the entry exists with only the specified
    # attribute values
    - cn=admin,dc=example,dc=com:
      - delete_others: True
      - replace:
          cn:
            - admin
          description:
            - LDAP administrator
          objectClass:
            - simpleSecurityObject
            - organizationalRole
          userPassword:
            - {{pillar.ldap_admin_password}}

    # make sure the entry exists, its olcRootDN attribute
    # has only the specified value, the olcRootDN attribute
    # doesn't exist, and all other attributes are ignored
    - 'olcDatabase={1}hdb,cn=config':
      - replace:
          olcRootDN:
            - cn=admin,dc=example,dc=com
          # the admin entry has its own password attribute
          olcRootPW: []

    # note the use of 'default'.  also note how you don't
    # have to use list syntax if there is only one attribute
    # value
    - cn=foo,ou=users,dc=example,dc=com:
      - delete_others: True
      - default:
          userPassword: changeme
          shadowLastChange: 0
          # keep sshPublicKey if present, but don't create
          # the attribute if it is missing
          sshPublicKey: []
      - replace:
          cn: foo
          uid: foo
          uidNumber: 1000
          gidNumber: 1000
          gecos: Foo Bar
          givenName: Foo
          sn: Bar
          homeDirectory: /home/foo
          loginShell: /bin/bash
          objectClass:
            - inetOrgPerson
            - posixAccount
```

```
            - top
            - ldapPublicKey
            - shadowAccount
```

Parameters

- **name** -- The URL of the LDAP server. This is ignored if `connect_spec` is either a connection object or a dict with a `'url'` entry.
- **entries** -- A description of the desired state of zero or more LDAP entries.

  `entries` is an iterable of dicts. Each of these dict's keys are the distinguished names (DNs) of LDAP entries to manage. Each of these dicts is processed in order. A later dict can reference an LDAP entry that was already mentioned in an earlier dict, which makes it possible for later dicts to enhance or alter the desired state of an LDAP entry.

  The DNs are mapped to a description of the LDAP entry's desired state. These LDAP entry descriptions are themselves iterables of dicts. Each dict in the iterable is processed in order. They contain directives controlling the entry's state. The key names the directive type and the value is state information for the directive. The specific structure of the state information depends on the directive type.

  The structure of `entries` looks like this:

```
[{dn1: [{directive1: directive1_state,
         directive2: directive2_state},
        {directive3: directive3_state}],
  dn2: [{directive4: directive4_state,
         directive5: directive5_state}]},
 {dn3: [{directive6: directive6_state}]}]
```

  These are the directives:

  - **'delete_others'** Boolean indicating whether to delete attributes not mentioned in this dict or any of the other directive dicts for this DN. Defaults to `False`.

    If you don't want to delete an attribute if present, but you also don't want to add it if it is missing or modify it if it is present, you can use either the `'default'` directive or the `'add'` directive with an empty value list.
  - **'default'** A dict mapping an attribute name to an iterable of default values for that attribute. If the attribute already exists, it is left alone. If not, it is created using the given list of values.

    An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.
  - **'add'** Attribute values to add to the entry. This is a dict mapping an attribute name to an iterable of values to add.

    An empty value list is useful when you don't want to create an attribute if it is missing but you do want to preserve it if the `'delete_others'` key is `True`.
  - **'delete'** Attribute values to remove from the entry. This is a dict mapping an attribute name to an iterable of values to delete from the attribute. If the iterable is empty, all of the attribute's values are deleted.
  - **'replace'** Attributes to replace. This is a dict mapping an attribute name to an iterable of values. Any existing values for the attribute are deleted, then the given values are added. The iterable may be empty.

In the above directives, the iterables of attribute values may instead be None, in which case an empty list is used, or a scalar such as a string or number, in which case a new list containing the scalar is used.

Note that if all attribute values are removed from an entry, the entire entry is deleted.

- **connect_spec** -- See the description of the connect_spec parameter of the *ldap3.connect* function in the *ldap3* execution module. If this is a dict and the 'url' entry is not specified, the 'url' entry is set to the value of the name parameter.

Returns

A dict with the following keys:

- **'name'** This is the same object passed to the name parameter.
- **'changes'** This is a dict describing the changes made (or, in test mode, the changes that would have been attempted). If no changes were made (or no changes would have been attempted), then this dict is empty. Only successful changes are included.

  Each key is a DN of an entry that was changed (or would have been changed). Entries that were not changed (or would not have been changed) are not included. The value is a dict with two keys:

  - **'old'** The state of the entry before modification. If the entry did not previously exist, this key maps to None. Otherwise, the value is a dict mapping each of the old entry's attributes to a list of its values before any modifications were made. Unchanged attributes are excluded from this dict.
  - **'new'** The state of the entry after modification. If the entry was deleted, this key maps to None. Otherwise, the value is a dict mapping each of the entry's attributes to a list of its values after the modifications were made. Unchanged attributes are excluded from this dict.

  Example 'changes' dict where a new entry was created with a single attribute containing two values:

  ```
  {'dn1': {'old': None,
           'new': {'attr1': ['val1', 'val2']}}}
  ```

  Example 'changes' dict where a new attribute was added to an existing entry:

  ```
  {'dn1': {'old': {},
           'new': {'attr2': ['val3']}}}
  ```

- **'result'** One of the following values:
  - True if no changes were necessary or if all changes were applied successfully.
  - False if at least one change was unable to be applied.
  - None if changes would be applied but it is in test mode.

19.19.129 salt.states.libcloud_dns module

Manage DNS records and zones using libcloud

codeauthor Anthony Shaw <anthonyshaw@apache.org>

New in version 2016.11.0.

Create and delete DNS records or zones through Libcloud. Libcloud's DNS system supports over 20 DNS providers including Amazon, Google, GoDaddy, Softlayer

This module uses `libcloud`, which can be installed via package, or pip.

configuration This module uses a configuration profile for one or multiple DNS providers

```
libcloud_dns:
  profile1:
    driver: godaddy
    key: 2orgk34kgk34g
  profile2:
    driver: route53
    key: blah
    secret: blah
```

Example:

```
webserver:
  libcloud_dns.zone_present:
    name: mywebsite.com
    profile: profile1
  libcloud_dns.record_present:
    name: www
    zone: mywebsite.com
    type: A
    data: 12.34.32.3
    profile: profile1
```

depends apache-libcloud

`salt.states.libcloud_dns.`**`record_absent`**(*name*, *zone*, *type*, *data*, *profile*)

Ensures a record is absent.

Parameters

- **`name`** (`str`) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (`') for this argument.
- **`zone`** (`str`) -- Zone where the requested record is created, the domain name
- **`type`** (`str`) -- DNS record type (A, AAAA, ...).
- **`data`** (`str`) -- Data for the record (depends on the record type).
- **`profile`** (`str`) -- The profile key

`salt.states.libcloud_dns.`**`record_present`**(*name*, *zone*, *type*, *data*, *profile*)

Ensures a record is present.

Parameters

- **`name`** (`str`) -- Record name without the domain name (e.g. www). Note: If you want to create a record for a base domain name, you should specify empty string (`') for this argument.
- **`zone`** (`str`) -- Zone where the requested record is created, the domain name
- **`type`** (`str`) -- DNS record type (A, AAAA, ...).
- **`data`** (`str`) -- Data for the record (depends on the record type).
- **`profile`** (`str`) -- The profile key

`salt.states.libcloud_dns.`**`state_result`**(*name*, *result*, *message*)

`salt.states.libcloud_dns.`**`zone_absent`**(*domain*, *profile*)

Ensures a record is absent.

Parameters

- **`domain`** (`str`) -- Zone name, i.e. the domain name

- **profile** (str) -- The profile key

salt.states.libcloud_dns.**zone_present**(*domain*, *type*, *profile*)

Ensures a record is present.

Parameters

- **domain** (str) -- Zone name, i.e. the domain name
- **type** (str) -- Zone type (master / slave), defaults to master
- **profile** (str) -- The profile key

19.19.130 salt.states.linux_acl

Linux File Access Control Lists

The Linux ACL state module requires the *getfacl* and *setfacl* binaries.

Ensure a Linux ACL is present

```
root:
  acl.present:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

Ensure a Linux ACL does not exist

```
root:
  acl.absent:
    - name: /root
    - acl_type: user
    - acl_name: damian
    - perms: rwx
```

salt.states.linux_acl.**absent**(*name*, *acl_type*, *acl_name=''*, *perms=''*, *recurse=False*)

Ensure a Linux ACL does not exist

salt.states.linux_acl.**present**(*name*, *acl_type*, *acl_name=''*, *perms=''*, *recurse=False*)

Ensure a Linux ACL is present

19.19.131 salt.states.locale

Management of languages/locales

Manage the available locales and the system default:

```
us_locale:
  locale.present:
    - name: en_US.UTF-8

default_locale:
  locale.system:
    - name: en_US.UTF-8
    - require:
      - locale: us_locale
```

salt.states.locale.**present**(*name*)
Generate a locale if it is not present

New in version 2014.7.0.

name The name of the locale to be present. Some distributions require the charmap to be specified as part of the locale at this point.

salt.states.locale.**system**(*name*)
Set the locale for the system

name The name of the locale to use

19.19.132 salt.states.logrotate module

Module for managing logrotate.

New in version 2017.7.0.

salt.states.logrotate.**set**(*name*, *key*, *value*, *setting=None*, *conf_file='/etc/logrotate.conf'*)
Set a new value for a specific configuration line.

Parameters

- **key** (*str*) -- The command or block to configure.
- **value** (*str*) -- The command value or command of the block specified by the key parameter.
- **setting** (*str*) -- The command value for the command specified by the value parameter.
- **conf_file** (*str*) -- The logrotate configuration file.

Example of usage with only the required arguments:

```
logrotate-rotate:
    logrotate.set:
        - key: rotate
        - value: 2
```

Example of usage specifying all available arguments:

```
logrotate-wtmp-rotate:
    logrotate.set:
        - key: /var/log/wtmp
        - value: rotate
        - setting: 2
        - conf_file: /etc/logrotate.conf
```

19.19.133 salt.states.loop module

Loop state

Allows for looping over execution modules.

New in version 2017.7.0.

```
wait_for_service_to_be_healthy:
  loop.until:
    - name: boto_elb.get_instance_health
    - condition: m_ret[0]['state'] == 'InService'
    - period: 5
    - timeout: 20
```

```
    - m_args:
      - {{ elb }}
    - m_kwargs:
        keyid: {{ access_key }}
        key: {{ secret_key }}
        instances: "{{ instance }}"
```

Warning: This state allows arbitrary python code to be executed through the condition parameter which is literally evaluated within the state. Please use caution.

salt.states.loop.**until**(*name*, *m_args=None*, *m_kwargs=None*, *condition=None*, *period=0*, *timeout=604800*)

Loop over an execution module until a condition is met.

name The name of the execution module

m_args The execution module's positional arguments

m_kwargs The execution module's keyword arguments

condition The condition which must be met for the loop to break. This should contain `m_ret` which is the return from the execution module.

period The number of seconds to wait between executions

timeout The timeout in seconds

19.19.134 salt.states.lvm

Management of Linux logical volumes

A state module to manage LVMs

```
/dev/sda:
  lvm.pv_present

my_vg:
  lvm.vg_present:
    - devices: /dev/sda

lvroot:
  lvm.lv_present:
    - vgname: my_vg
    - size: 10G
    - stripes: 5
    - stripesize: 8K
```

salt.states.lvm.**lv_absent**(*name*, *vgname=None*)

Remove a given existing logical volume from a named existing volume group

name The logical volume to remove

vgname The volume group name

salt.states.lvm.**lv_present**(*name*, *vgname=None*, *size=None*, *extents=None*, *snapshot=None*, *pv='`*, *thinvolume=False*, *thinpool=False*, ***kwargs*)

Create a new logical volume

name The name of the logical volume

vgname The volume group name for this logical volume

size The initial size of the logical volume

extents The number of logical extents to allocate

snapshot The name of the snapshot
pv The physical volume to use
kwargs Any supported options to lvcreate. See *linux_lvm* for more details.
New in version to_complete.
thinvolume Logical volume is thinly provisioned
thinpool Logical volume is a thin pool

salt.states.lvm.**pv_absent**(*name*)
Ensure that a Physical Device is not being used by lvm
name The device name to initialize.

salt.states.lvm.**pv_present**(*name*, ***kwargs*)
Set a physical device to be used as an LVM physical volume
name The device name to initialize.
kwargs Any supported options to pvcreate. See *linux_lvm* for more details.

salt.states.lvm.**vg_absent**(*name*)
Remove an LVM volume group
name The volume group to remove

salt.states.lvm.**vg_present**(*name*, *devices=None*, ***kwargs*)
Create an LVM volume group
name The volume group name to create
devices A list of devices that will be added to the volume group
kwargs Any supported options to vgcreate. See *linux_lvm* for more details.

19.19.135 salt.states.lvs_server

Management of LVS (Linux Virtual Server) Real Server

salt.states.lvs_server.**absent**(*name*, *protocol=None*, *service_address=None*, *server_address=None*)
Ensure the LVS Real Server in specified service is absent.
name The name of the LVS server.
protocol The service protocol(only support `tcp`, `udp` and `fwmark` service).
service_address The LVS service address.
server_address The LVS real server address.

salt.states.lvs_server.**present**(*name*, *protocol=None*, *service_address=None*, *server_address=None*, *packet_forward_method='dr'*, *weight=1*)
Ensure that the named service is present.
name The LVS server name
protocol The service protocol
service_address The LVS service address
server_address The real server address.
packet_forward_method The LVS packet forwarding method(`dr` for direct routing, `tunnel` for tunneling, `nat` for network access translation).
weight The capacity of a server relative to the others in the pool.

```
lvsrs:
  lvs_server.present:
    - protocol: tcp
    - service_address: 1.1.1.1:80
    - server_address: 192.168.0.11:8080
    - packet_forward_method: dr
    - weight: 10
```

19.19.136 salt.states.lvs_service

Management of LVS (Linux Virtual Server) Service

salt.states.lvs_service.**absent**(*name*, *protocol=None*, *service_address=None*)

Ensure the LVS service is absent.

name The name of the LVS service

protocol The service protocol

service_address The LVS service address

salt.states.lvs_service.**present**(*name*, *protocol=None*, *service_address=None*, *scheduler='wlc'*)

Ensure that the named service is present.

name The LVS service name

protocol The service protocol

service_address The LVS service address

scheduler Algorithm for allocating TCP connections and UDP datagrams to real servers.

```
lvstest:
  lvs_service.present:
    - service_address: 1.1.1.1:80
    - protocol: tcp
    - scheduler: rr
```

19.19.137 salt.states.lxc

Manage Linux Containers

salt.states.lxc.**absent**(*name*, *stop=False*, *path=None*)

Ensure a container is not present, destroying it if present

name Name of the container to destroy

stop stop before destroying default: false

New in version 2015.5.2.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
web01:
  lxc.absent
```

salt.states.lxc.**edited_conf**(*name*, *lxc_conf=None*, *lxc_conf_unset=None*)

Warning: This state is unsuitable for setting parameters that appear more than once in an LXC config file, or parameters which must appear in a certain order (such as when configuring more than one network interface). It is slated to be replaced, and as of version 2015.5.0 it is deprecated.

Edit LXC configuration options

Deprecated since version 2015.5.0.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
setconf:
  lxc.edited_conf:
    - name: ubuntu
    - lxc_conf:
        - network.ipv4.ip: 10.0.3.6
    - lxc_conf_unset:
        - lxc.utsname
```

salt.states.lxc.**frozen**(*name*, *start=True*, *path=None*)

New in version 2015.5.0.

Ensure that a container is frozen

Note: This state does not enforce the existence of the named container, it just freezes the container if it is running. To ensure that the named container exists, use *lxc.present*.

---

name The name of the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

start [True] Start container first, if necessary. If `False`, then this state will fail if the container is not running.

```
web01:
  lxc.frozen

web02:
  lxc.frozen:
    - start: False
```

salt.states.lxc.**present**(*name*, *running=None*, *clone_from=None*, *snapshot=False*, *profile=None*, *network_profile=None*, *template=None*, *options=None*, *image=None*, *config=None*, *fstype=None*, *size=None*, *backing=None*, *vgname=None*, *lvname=None*, *thinpool=None*, *path=None*)

Changed in version 2015.8.0: The `lxc.created` state has been renamed to `lxc.present`, and the `lxc.cloned` state has been merged into this state.

Create the named container if it does not exist

name The name of the container to be created

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

running [False]

- If `True`, ensure that the container is running
- If `False`, ensure that the container is stopped
- If `None`, do nothing with regards to the running state of the container

New in version 2015.8.0.

clone_from Create named container as a clone of the specified container

snapshot [False] Use Copy On Write snapshots (LVM). Only supported with `clone_from`.

profile Profile to use in container creation (see the *LXC Tutorial* for more information). Values in a profile will be overridden by the parameters listed below.

network_profile Network Profile to use in container creation (see the *LXC Tutorial* for more information). Values in a profile will be overridden by the parameters listed below.

New in version 2015.5.2.

Container Creation Arguments

template The template to use. For example, `ubuntu` or `fedora`. For a full list of available templates, check out the *`lxc.templates`* function.

Conflicts with the `image` argument.

Note: The `download` template requires the following three parameters to be defined in `options`:

- **dist** - The name of the distribution
- **release** - Release name/version
- **arch** - Architecture of the container

The available images can be listed using the *`lxc.images`* function.

---

options

New in version 2015.5.0.

Template-specific options to pass to the lxc-create command. These correspond to the long options (ones beginning with two dashes) that the template script accepts. For example:

```
web01:
  lxc.present:
    - template: download
    - options:
        dist: centos
        release: 6
        arch: amd64
```

Remember to double-indent the options, due to *how PyYAML works*.

For available template options, refer to the lxc template scripts which are ususally located under `/usr/share/lxc/templates`, or run `lxc-create -t <template> -h`.

image A tar archive to use as the rootfs for the container. Conflicts with the `template` argument.
backing The type of storage to use. Set to `lvm` to use an LVM group. Defaults to filesystem within /var/lib/lxc.
fstype Filesystem type to use on LVM logical volume
size Size of the volume to create. Only applicable if `backing` is set to `lvm`.
vgname [lxc] Name of the LVM volume group in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.
lvname Name of the LVM logical volume in which to create the volume for this container. Only applicable if `backing` is set to `lvm`.
thinpool Name of a pool volume that will be used for thin-provisioning this container. Only applicable if `backing` is set to `lvm`.

`salt.states.lxc.`**`running`**(*name*, *restart=False*, *path=None*)

Changed in version 2015.5.0: The `lxc.started` state has been renamed to `lxc.running`

Ensure that a container is running

Note: This state does not enforce the existence of the named container, it just starts the container if it is not running. To ensure that the named container exists, use *`lxc.present`*.

---

name The name of the container
path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

restart [False] Restart container if it is already running

```
web01:
  lxc.running
```

```
web02:
  lxc.running:
    - restart: True
```

salt.states.lxc.**set_pass**(*name*, ***kwargs*)

Deprecated since version 2015.5.0.

This state function has been disabled, as it did not conform to design guidelines. Specifically, due to the fact that *lxc.set_password* uses `chpasswd(8)` to set the password, there was no method to make this action idempotent (in other words, the password would be changed every time). This makes this state redundant, since the following state will do the same thing:

```
setpass:
  module.run:
    - name: set_pass
    - m_name: root
    - password: secret
```

salt.states.lxc.**stopped**(*name*, *kill=False*, *path=None*)

Ensure that a container is stopped

Note: This state does not enforce the existence of the named container, it just stops the container if it running or frozen. To ensure that the named container exists, use *lxc.present*, or use the *lxc.absent* state to ensure that the container does not exist.

---

name The name of the container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

kill [False] Do not wait for the container to stop, kill all tasks in the container. Older LXC versions will stop containers like this irrespective of this argument.

New in version 2015.5.0.

```
web01:
  lxc.stopped
```

19.19.138 salt.states.mac_assistive module

Allows you to manage assistive access on macOS minions with 10.9+

Install, enable and disable assistive access on macOS minions

```
/usr/bin/osacript:
  assistive.installed:
    - enabled: True
```

salt.states.mac_assistive.**installed**(*name*, *enabled=True*)

Make sure that we have the given bundle ID or path to command installed in the assistive access panel.

name The bundle ID or path to command

enable Should assistive access be enabled on this application?

19.19.139 salt.states.mac_defaults module

Writing/reading defaults from a macOS minion

salt.states.mac_defaults.**absent**(*name*, *domain*, *user=None*)

Make sure the defaults value is absent

name The key of the given domain to remove

domain The name of the domain to remove from

user The user to write the defaults to

salt.states.mac_defaults.**write**(*name*, *domain*, *value*, *vtype='string'*, *user=None*)

Write a default to the system

name The key of the given domain to write to

domain The name of the domain to write to

value The value to write to the given key

vtype The type of value to be written, valid types are string, data, int[eger], float, bool[ean], date, array, array-add, dict, dict-add

user The user to write the defaults to

19.19.140 salt.states.mac_keychain module

Installing of certificates to the keychain

Install certificats to the macOS keychain

```
/mnt/test.p12:
  keychain.installed:
    - password: test123
```

salt.states.mac_keychain.**default_keychain**(*name*, *domain='user'*, *user=None*)

Set the default keychain to use

name The chain in which to use as the default

domain The domain to use valid values are user|system|common|dynamic, the default is user

user The user to run as

salt.states.mac_keychain.**installed**(*name*, *password*, *keychain='/Library/Keychains/System.keychain'*, ***kwargs*)

Install a p12 certificate file into the macOS keychain

name The certificate to install

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

keychain The keychain to install the certificate to, this defaults to /Library/Keychains/System.keychain

allow_any Allow any application to access the imported certificate without warning

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

salt.states.mac_keychain.**uninstalled**(*name*, *password*, *keychain='/Library/Keychains/System.keychain'*, *keychain_password=None*)

Uninstall a p12 certificate file from the macOS keychain

name The certificate to uninstall, this can be a path for a .p12 or the friendly name

password The password for the certificate being installed formatted in the way described for openssl command in the PASS PHRASE ARGUMENTS section

cert_name The friendly name of the certificate, this can be used instead of giving a certificate

keychain The keychain to remove the certificate from, this defaults to /Library/Keychains/System.keychain

keychain_password If your keychain is likely to be locked pass the password and it will be unlocked before running the import

19.19.141 salt.states.mac_package module

Installing of mac pkg files

Install any kind of pkg, dmg or app file on macOS:

```
/mnt/test.pkg:
  macpackage.installed:
    - store: True

/mnt/test.dmg:
  macpackage.installed:
    - dmg: True

/mnt/xcode.dmg:
  macpackage.installed:
    - dmg: True
    - app: True
    - target: /Applications/Xcode.app
    - version_check: xcodebuild -version=Xcode 7.1\n.*7B91b
```

salt.states.mac_package.**installed**(*name*, *target='LocalSystem'*, *dmg=False*, *store=False*, *app=False*, *mpkg=False*, *user=None*, *onlyif=None*, *unless=None*, *force=False*, *allow_untrusted=False*, *version_check=None*)

Install a Mac OS Package from a pkg or dmg file, if given a dmg file it will first be mounted in a temporary location

name The pkg or dmg file to install

target The location in which to install the package. This can be a path or LocalSystem

dmg Is the given file a dmg file?

store Should the pkg be installed as if it was from the Mac OS Store?

app Is the file a .app? If so then we'll just copy that to /Applications/ or the given target

mpkg Is the file a .mpkg? If so then we'll check all of the .pkg files found are installed

user Name of the user performing the unless or onlyif checks

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

force Force the package to be installed even if its already been found installed

allow_untrusted Allow the installation of untrusted packages

version_check The command and version that we want to check against, the version number can use regex.

```
version_check: python --version_check=2.7.[0-9]
```

19.19.142 salt.states.mac_xattr module

Allows you to manage extended attributes on files or directories

Install, enable and disable assistive access on macOS minions

```
/path/to/file:
  xattr.exists:
    - attributes:
        - com.file.attr=test
        - com.apple.quarantine=0x00001111
```

salt.states.mac_xattr.**delete**(*name*, *attributes*)

Make sure the given attributes are deleted from the file/directory

name The path to the file/directory

attributes The attributes that should be removed from the file/directory, this is accepted as an array.

salt.states.mac_xattr.**exists**(*name*, *attributes*)

Make sure the given attributes exist on the file/directory

name The path to the file/directory

attributes The attributes that should exist on the file/directory, this is accepted as an array, with key and value split with an equals sign, if you want to specify a hex value then add 0x to the beginning of the value.

19.19.143 salt.states.makeconf

Management of Gentoo make.conf

A state module to manage Gentoo's `make.conf` file

```
makeopts:
  makeconf.present:
    - value: '-j3'
```

salt.states.makeconf.**absent**(*name*)

Verify that the variable is not in the `make.conf`.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

salt.states.makeconf.**present**(*name*, *value=None*, *contains=None*, *excludes=None*)

Verify that the variable is in the `make.conf` and has the provided settings. If value is set, contains and excludes will be ignored.

name The variable name. This will automatically be converted to upper case since variables in `make.conf` are in upper case

value Enforce that the value of the variable is set to the provided value

contains Enforce that the value of the variable contains the provided value

excludes Enforce that the value of the variable does not contain the provided value.

19.19.144 salt.states.marathon_app module

Configure Marathon apps via a salt proxy.

```
my_app:
  marathon_app.config:
    - config:
        cmd: "while [ true ] ; do echo 'Hello Marathon' ; sleep 5 ; done"
        cpus: 0.1
        mem: 10
        instances: 3
```

New in version 2015.8.2.

salt.states.marathon_app.**absent**(*name*)

Ensure that the marathon app with the given id is not present.

Parameters **name** -- The app name/id

Returns A standard Salt changes dictionary

salt.states.marathon_app.**config**(*name*, *config*)

Ensure that the marathon app with the given id is present and is configured to match the given config values.

Parameters

- **name** -- The app name/id
- **config** -- The configuration to apply (dict)

Returns A standard Salt changes dictionary

salt.states.marathon_app.**running**(*name*, *restart=False*, *force=True*)

Ensure that the marathon app with the given id is present and restart if set.

Parameters

- **name** -- The app name/id
- **restart** -- Restart the app
- **force** -- Override the current deployment

Returns A standard Salt changes dictionary

19.19.145 salt.states.mdadm

Managing software RAID with mdadm

A state module for creating or destroying software RAID devices.

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

salt.states.mdadm.**absent**(*name*)

Verify that the raid is absent

name The name of raid device to be destroyed

```
/dev/md0:
  raid:
    - absent
```

salt.states.mdadm.**present**(*name*, *level*, *devices*, ***kwargs*)

Verify that the raid is present

Changed in version 2014.7.0.

name The name of raid device to be created

level The RAID level to use when creating the raid.

devices A list of devices used to build the array.

kwargs Optional arguments to be passed to mdadm.

Example:

```
/dev/md0:
  raid.present:
    - level: 5
    - devices:
      - /dev/xvdd
      - /dev/xvde
      - /dev/xvdf
    - chunk: 256
    - run: True
```

19.19.146 salt.states.memcached

States for Management of Memcached Keys

New in version 2014.1.0.

salt.states.memcached.**absent**(*name*, *value=None*, *host=`127.0.0.1'*, *port=11211*, *time=0*)

Ensure that a memcached key is not present.

name The key

value [None] If specified, only ensure that the key is absent if it matches the specified value.

host The memcached server IP address

port The memcached server port

```
foo:
  memcached.absent

bar:
  memcached.absent:
    - host: 10.0.0.1
```

salt.states.memcached.**managed**(*name*, *value=None*, *host=`127.0.0.1'*, *port=11211*, *time=0*, *min_compress_len=0*)

Manage a memcached key.

name The key to manage

value The value to set for that key

host The memcached server IP address

port The memcached server port

```
foo:
  memcached.managed:
    - value: bar
```

19.19.147 salt.states.modjk

State to control Apache modjk

salt.states.modjk.**worker_activated**(*name*, *workers=None*, *profile='default'*)

Activate all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_activated:
    - workers:
```

```
      - app1
      - app2
```

salt.states.modjk.**worker_disabled**(*name*, *workers=None*, *profile='default'*)
Disable all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_disabled:
    - workers:
      - app1
      - app2
```

salt.states.modjk.**worker_recover**(*name*, *workers=None*, *profile='default'*)
Recover all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_recover:
    - workers:
      - app1
      - app2
```

salt.states.modjk.**worker_stopped**(*name*, *workers=None*, *profile='default'*)
Stop all the workers in the modjk load balancer

Example:

```
loadbalancer:
  modjk.worker_stopped:
    - workers:
      - app1
      - app2
```

19.19.148 salt.states.modjk_worker

Manage modjk workers

Send commands to a **modjk** load balancer via the peer system.

This module can be used with the *prereq* requisite to remove/add the worker from the load balancer before deploying/restarting service.

Mandatory Settings:

- The minion needs to have permission to publish the **modjk.*** functions (see *here* for information on configuring peer publishing permissions)
- The modjk load balancer must be configured as stated in the **modjk** execution module *documentation*

salt.states.modjk_worker.**activate**(*name*, *lbn*, *target*, *profile='default'*, *tgt_type='glob'*, *expr_form=None*)
Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Activate the named worker from the lbn load balancers at the targeted minions

Example:

```
disable-before-deploy:
  modjk_worker.activate:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

salt.states.modjk_worker.**disable**(*name*, *lbn*, *target*, *profile='default'*, *tgt_type='glob'*, *expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Disable the named worker from the lbn load balancers at the targeted minions. The worker will get traffic only for current sessions and won't get new ones.

Example:

```
disable-before-deploy:
  modjk_worker.disable:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

salt.states.modjk_worker.**stop**(*name*, *lbn*, *target*, *profile='default'*, *tgt_type='glob'*, *expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Stop the named worker from the lbn load balancers at the targeted minions The worker won't get any traffic from the lbn

Example:

```
disable-before-deploy:
  modjk_worker.stop:
    - name: {{ grains['id'] }}
    - lbn: application
    - target: 'roles:balancer'
    - tgt_type: grain
```

19.19.149 salt.states.module

Execution of Salt modules from within states

With *module.run* these states allow individual execution module calls to be made via states. To call a single module function use a `module.run` state:

```
mine.send:
  module.run:
    - network.interfaces
```

Note that this example is probably unnecessary to use in practice, since the `mine_functions` and `mine_interval` config parameters can be used to schedule updates for the mine (see *here* for more info).

It is sometimes desirable to trigger a function call after a state is executed, for this the *module.wait* state can be used:

```
fetch_out_of_band:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

Another example:

```
mine.send:
  module.run:
    - network.ip_addrs:
      - interface: eth0
```

And more complex example:

```
eventsviewer:
  module.run:
    - task.create_task:
      - name: events-viewer
      - user_name: System
      - action_type: Execute
      - cmd: 'c:\netops\scripts\events_viewer.bat'
      - trigger_type: 'Daily'
      - start_date: '2017-1-20'
      - start_time: '11:59PM'
```

Please note, this is a new behaviour of *module.run* function.

With the previous *module.run* there are several differences:

- The need of *name* keyword
- The need of *m_* prefix
- No way to call more than one function at once

For example:

```
mine.send:
  module.wait:
    - name: network.interfaces
    - watch:
      - file: /etc/network/interfaces
```

All arguments that the `module` state does not consume are passed through to the execution module function being executed:

```
fetch_out_of_band:
  module.run:
    - name: git.fetch
    - cwd: /path/to/my/repo
    - user: myuser
    - opts: '--all'
```

Due to how the state system works, if a module function accepts an argument called, `name`, then `m_name` must be used to specify that argument, to avoid a collision with the `name` argument.

Here is a list of keywords hidden by the state system, which must be prefixed with `m_`:

- fun
- name
- names
- state
- saltenv

For example:

```
disable_nfs:
  module.run:
    - name: service.disable
    - m_name: nfs
```

Note that some modules read all or some of the arguments from a list of keyword arguments. For example:

```
mine.send:
  module.run:
    - func: network.ip_addrs
    - kwargs:
        interface: eth0
```

```
cloud.create:
  module.run:
    - func: cloud.create
    - provider: test-provider
    - m_names:
      - test-vlad
    - kwargs: {
          ssh_username: 'ubuntu',
          image: 'ami-8d6d9daa',
          securitygroup: 'default',
          size: 'c3.large',
          location: 'ap-northeast-1',
          delvol_on_destroy: 'True'
      }
```

Another example that creates a recurring task that runs a batch file on a Windows system:

```
eventsviewer:
  module.run:
    - name: task.create_task
    - m_name: 'events-viewer'
    - user_name: System
    - kwargs: {
          action_type: 'Execute',
          cmd: 'c:\netops\scripts\events_viewer.bat',
          trigger_type: 'Daily',
          start_date: '2017-1-20',
          start_time: '11:59PM'
    }
```

Another option is to use the new version of *module.run*. With which you can call one (or more!) functions at once the following way:

```
call_something:
  module.run:
    - git.fetch:
      - cwd: /path/to/my/repo
      - user: myuser
      - opts: '--all'
```

By default this behaviour is not turned on. In order to do so, please add the following configuration to the minion:

```
use_superseded:
  - module.run
```

salt.states.module.**wait**(*name*, ***kwargs*)

Run a single module function only if the watch statement calls it

name The module function to execute

****kwargs** Pass any arguments needed to execute the function

---

Note: Like the *cmd.run* state, this state will return `True` but not actually execute, unless one of the following two things happens:

1. The state has a *watch requisite*, and the state which it is watching changes.
2. Another state has a *watch_in requisite* which references this state, and the state wth the `watch_in` changes.

19.19.150 salt.states.mongodb_database

Management of Mongodb databases

Only deletion is supported, creation doesn't make sense and can be done using mongodb_user.present

salt.states.mongodb_database.**absent**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *authdb=None*)

Ensure that the named database is absent

name The name of the database to remove

user The user to connect as (must be able to create the user)

password The password of the user

host The host to connect to

port The port to connect to

authdb The database in which to authenticate

19.19.151 salt.states.mongodb_user

Management of Mongodb users

Note: This module requires PyMongo to be installed.

---

salt.states.mongodb_user.**absent**(*name*, *user=None*, *password=None*, *host=None*, *port=None*, *database='admin'*, *authdb=None*)

Ensure that the named user is absent

name The name of the user to remove

user MongoDB user with sufficient privilege to create the user

password Password for the admin user specified by the `user` parameter

host The hostname/IP address of the MongoDB server
port The port on which MongoDB is listening
database The database from which to remove the user specified by the `name` parameter
authdb The database in which to authenticate

`salt.states.mongodb_user.`**`present`**(*name*, *passwd*, *database='admin'*, *user=None*, *password=None*, *host='localhost'*, *port=27017*, *authdb=None*, *roles=None*)

Ensure that the user is present with the specified properties
name The name of the user to manage
passwd The password of the user to manage
user MongoDB user with sufficient privilege to create the user
password Password for the admin user specified with the `user` parameter
host The hostname/IP address of the MongoDB server
port The port on which MongoDB is listening
database The database in which to create the user

> **Note:** If the database doesn't exist, it will be created.

authdb The database in which to authenticate
roles The roles assigned to user specified with the `name` parameter
Example:

```
mongouser-myapp:
  mongodb_user.present:
  - name: myapp
  - passwd: password-of-myapp
  - database: admin
  # Connect as admin:sekrit
  - user: admin
  - password: sekrit
  - roles:
      - readWrite
      - userAdmin
      - dbOwner
```

19.19.152 salt.states.monit

Monit state

Manage monit states

```
```

monit_enable_service_monitoring:

monit.monitor:

- name: service

monit_disable_service_monitoring:

monit.unmonitor:

- name: service

Note: Use of these states require that the *monit* execution module is available.

salt.states.monit.**monitor**(*name*)
Get the summary from module monit and try to see if service is being monitored. If not then monitor the service.

salt.states.monit.**unmonitor**(*name*)
Get the summary from module monit and try to see if service is being monitored. If it is then stop monitoring the service.

19.19.153 salt.states.mount

Mounting of filesystems

Mount any type of mountable filesystem with the mounted function:

```
/mnt/sdb:
  mount.mounted:
    - device: /dev/sdb1
    - fstype: ext4
    - mkmnt: True
    - opts:
      - defaults

/srv/bigdata:
  mount.mounted:
    - device: UUID=066e0200-2867-4ebe-b9e6-f30026ca2314
    - fstype: xfs
    - opts: nobootwait,noatime,nodiratime,nobarrier,logbufs=8
    - dump: 0
    - pass_num: 2
    - persist: True
    - mkmnt: True
```

salt.states.mount.**mod_watch**(*name*, *user=None*, ***kwargs*)
The mounted watcher, called to invoke the watch command.
name The name of the mount point

salt.states.mount.**mounted**(*name*, *device*, *fstype*, *mkmnt=False*, *opts='defaults'*, *dump=0*, *pass_num=0*, *config='/etc/fstab'*, *persist=True*, *mount=True*, *user=None*, *match_on='auto'*, *device_name_regex=None*, *extra_mount_invisible_options=None*, *extra_mount_invisible_keys=None*, *extra_mount_ignore_fs_keys=None*, *extra_mount_translate_options=None*, *hidden_opts=None*)
Verify that a device is mounted
name The path to the location where the device is to be mounted
device The device name, typically the device node, such as `/dev/sdb1` or `UUID=066e0200-2867-4ebe-b9e6-f30026ca2314` or `LABEL=DATA`
fstype The filesystem type, this will be `xfs`, `ext2/3/4` in the case of classic filesystems, `fuse` in the case of fuse mounts, and `nfs` in the case of nfs mounts
mkmnt If the mount point is not present then the state will fail, set `mkmnt: True` to create the mount point if it is otherwise not present
opts A list object of options or a comma delimited list
dump The dump value to be passed into the fstab, Default is `0`

pass_num The pass value to be passed into the fstab, Default is `0`
config Set an alternative location for the fstab, Default is `/etc/fstab`
persist Set if the mount should be saved in the fstab, Default is `True`
mount Set if the mount should be mounted immediately, Default is `True`
user The account used to execute the mount; this defaults to the user salt is running as on the minion
match_on A name or list of fstab properties on which this state should be applied. Default is `auto`, a special value indicating to guess based on fstype. In general, `auto` matches on name for recognized special devices and device otherwise.
device_name_regex A list of device exact names or regular expressions which should not force a remount. For example, glusterfs may be mounted with a comma-separated list of servers in fstab, but the /proc/self/mountinfo will show only the first available server.

```
{% set glusterfs_ip_list = ['10.0.0.1', '10.0.0.2', '10.0.0.3'] %}

mount glusterfs volume:
  mount.mounted:
    - name: /mnt/glusterfs_mount_point
    - device: {{ glusterfs_ip_list|join(',') }}:/volume_name
    - fstype: glusterfs
    - opts: _netdev,rw,defaults,direct-io-mode=disable
    - mkmnt: True
    - persist: True
    - dump: 0
    - pass_num: 0
    - device_name_regex:
      - ({{ glusterfs_ip_list|join('|') }}):/volume_name
```

New in version 2016.11.0.
extra_mount_invisible_options A list of extra options that are not visible through the `/proc/self/mountinfo` interface.

If a option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_options` list.
extra_mount_invisible_keys A list of extra key options that are not visible through the `/proc/self/mountinfo` interface.

If a key option is not visible through this interface it will always remount the device. This option extends the builtin `mount_invisible_keys` list.

A good example for a key option is the password option:

```
password=badsecret
```

extra_mount_ignore_fs_keys A dict of filesystem options which should not force a remount. This will update the internal dictionary. The dict should look like this:

```
{
    'ramfs': ['size']
}
```

extra_mount_translate_options A dict of mount options that gets translated when mounted. To prevent a remount add additional options to the default dictionary. This will update the internal dictionary. The dictionary should look like this:

```
{
    'tcp': 'proto=tcp',
    'udp': 'proto=udp'
}
```

hidden_opts A list of mount options that will be ignored when considering a remount as part of the state application

New in version 2015.8.2.

salt.states.mount.**swap**(*name*, *persist=True*, *config='/etc/fstab'*)

Activates a swap device

```
/root/swapfile:
  mount.swap
```

Note: swap does not currently support LABEL

salt.states.mount.**unmounted**(*name*, *device=None*, *config='/etc/fstab'*, *persist=False*, *user=None*)

New in version 0.17.0.

Verify that a device is not mounted

name The path to the location where the device is to be unmounted from

device The device to be unmounted. This is optional because the device could be mounted in multiple places.

New in version 2015.5.0.

config Set an alternative location for the fstab, Default is `/etc/fstab`

persist Set if the mount should be purged from the fstab, Default is `False`

user The user to own the mount; this defaults to the user salt is running as on the minion

19.19.154 salt.states.msteams module

Send a message card to Microsoft Teams

This state is useful for sending messages to Teams during state runs.

New in version 2017.7.0.

```
teams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url:  https://outlook.office.com/webhook/837
```

The hook_url can be specified in the master or minion configuration like below:

```
msteams:
  hook_url: https://outlook.office.com/webhook/837
```

salt.states.msteams.**post_card**(*name*, *message*, *hook_url=None*, *title=None*, *theme_color=None*)

Send a message to a Microsft Teams channel

```
send-msteams-message:
  msteams.post_card:
    - message: 'This state was executed successfully.'
    - hook_url: https://outlook.office.com/webhook/837
```

The following parameters are required:

message The message that is to be sent to the MS Teams channel.

The following parameters are optional:

hook_url The webhook URL given configured in Teams interface, if not specified in the configuration options of master or minion.

title The title for the card posted to the channel
theme_color A hex code for the desired highlight color

19.19.155 salt.states.mysql_database

Management of MySQL databases (schemas)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The mysql_database module is used to create and manage MySQL databases. Databases can be set as either absent or present.

```
frank:
  mysql_database.present
```

`salt.states.mysql_database.`**`absent`**(*name*, ***connection_args*)
Ensure that the named database is absent
name The name of the database to remove

`salt.states.mysql_database.`**`present`**(*name*, *character_set=None*, *collate=None*, ***connection_args*)
Ensure that the named database is present with the specified properties
name The name of the database to manage

19.19.156 salt.states.mysql_grants

Management of MySQL grants (user permissions)

depends

- MySQLdb Python module

configuration See `salt.modules.mysql` for setup instructions.

The mysql_grants module is used to grant and revoke MySQL permissions.

The `name` you pass in purely symbolic and does not have anything to do with the grant itself.

The `database` parameter needs to specify a `priv_level' in the same specification as defined in the MySQL documentation:

- *
- *.*
- db_name.*
- db_name.tbl_name
- etc...

This state is not able to set password for the permission from the specified host. See `salt.states.mysql_user` for further instructions.

```
frank_exampledb:
   mysql_grants.present:
    - grant: select,insert,update
    - database: exampledb.*
    - user: frank
    - host: localhost

frank_otherdb:
  mysql_grants.present:
    - grant: all privileges
    - database: otherdb.*
    - user: frank

restricted_singletable:
  mysql_grants.present:
    - grant: select
    - database: somedb.sometable
    - user: joe
```

salt.states.mysql_grants.**absent**(*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant_option=False*, *escape=True*, ***connection_args*)

Ensure that the grant is absent

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)

database The database priv_level (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

salt.states.mysql_grants.**present**(*name*, *grant=None*, *database=None*, *user=None*, *host='localhost'*, *grant_option=False*, *escape=True*, *revoke_first=False*, *ssl_option=False*, ***connection_args*)

Ensure that the grant is present with the specified properties

name The name (key) of the grant to add

grant The grant priv_type (i.e. select,insert,update OR all privileges)

database The database priv_level (i.e. db.tbl OR db.*)

user The user to apply the grant to

host The network/host that the grant should apply to

grant_option Adds the WITH GRANT OPTION to the defined grant. Default is `False`

escape Defines if the database value gets escaped or not. Default is `True`

revoke_first By default, MySQL will not do anything if you issue a command to grant privileges that are more restrictive than what's already in place. This effectively means that you cannot downgrade permissions without first revoking permissions applied to a db.table/user pair first.

To have Salt forcibly revoke perms before applying a new grant, enable the `revoke_first options.

WARNING: This will *remove* permissions for a database before attempting to apply new permissions. There is no guarantee that new permissions will be applied correctly which can leave your database security in an unknown and potentially dangerous state. Use with caution!

Default is `False`

ssl_option Adds the specified ssl options for the connecting user as requirements for this grant. Value is a list of single-element dicts corresponding to the list of ssl options to use.

Possible key/value pairings for the dicts in the value:

```
- SSL: True
- X509: True
- SUBJECT: <subject>
```

```
- ISSUER: <issuer>
- CIPHER: <cipher>
```

The non-boolean ssl options take a string as their values, which should be an appropriate value as specified by the MySQL documentation for these options.

Default is `False` (no ssl options will be used)

19.19.157 salt.states.mysql_query

Execution of MySQL queries

New in version 2014.7.0.

depends

- MySQLdb Python module

configuration See *salt.modules.mysql* for setup instructions.

The mysql_query module is used to execute queries on MySQL databases. Its output may be stored in a file or in a grain.

```
query_id:
  mysql_query.run
    - database: my_database
    - query:    "SELECT * FROM table;"
    - output:   "/tmp/query_id.txt"
```

salt.states.mysql_query.**run**(*name*, *database*, *query*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, ***connection_args*)

Execute an arbitrary query on the specified database

name Used only as an ID

database The name of the database to execute the query on

query The query to execute

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

salt.states.mysql_query.**run_file**(*name*, *database*, *query_file=None*, *output=None*, *grain=None*, *key=None*, *overwrite=True*, *saltenv=None*, ***connection_args*)

Execute an arbitrary query on the specified database

New in version 2017.7.0.

name Used only as an ID

database The name of the database to execute the query_file on

query_file The file of mysql commands to run

output grain: output in a grain other: the file to store results None: output to the result comment (default)

grain: grain to store the output (need output=grain)

key: the specified grain will be treated as a dictionary, the result of this state will be stored under the specified key.

overwrite: The file or grain will be overwritten if it already exists (default)

saltenv: The saltenv to pull the query_file from

19.19.158 salt.states.mysql_user

Management of MySQL users

depends

- MySQLdb Python module

configuration See *salt.modules.mysql* for setup instructions.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: bobcat
```

New in version 0.16.2: Authentication overrides have been added.

The MySQL authentication information specified in the minion config file can be overridden in states using the following arguments: `connection_host`, `connection_port`, `connection_user`, `connection_pass`, `connection_db`, `connection_unix_socket`, `connection_default_file` and `connection_charset`.

```
frank:
  mysql_user.present:
    - host: localhost
    - password: "bob@cat"
    - connection_user: someuser
    - connection_pass: somepass
    - connection_charset: utf8
    - saltenv:
      - LC_ALL: "en_US.utf8"
```

This state is not able to grant permissions for the user. See *salt.states.mysql_grants* for further instructions.

`salt.states.mysql_user.`**`absent`**(*name*, *host='localhost'*, ***connection_args*)

Ensure that the named user is absent

name The name of the user to remove

`salt.states.mysql_user.`**`present`**(*name*, *host='localhost'*, *password=None*, *password_hash=None*, *allow_passwordless=False*, *unix_socket=False*, *password_column=None*, ***connection_args*)

Ensure that the named user is present with the specified properties. A passwordless user can be configured by omitting `password` and `password_hash`, and setting `allow_passwordless` to `True`.

name The name of the user to manage

host Host for which this user/password combo applies

password The password to use for this user. Will take precedence over the `password_hash` option if both are specified.

password_hash The password in hashed form. Be sure to quote the password because YAML doesn't like the `*`. A password hash can be obtained from the mysql command-line client like so:

```
mysql> SELECT PASSWORD('mypass');
+-------------------------------------------+
| PASSWORD('mypass')                        |
+-------------------------------------------+
| *6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4 |
+-------------------------------------------+
1 row in set (0.00 sec)
```

allow_passwordless If `True`, then `password` and `password_hash` can be omitted to permit a passwordless login.

New in version 0.16.2.

unix_socket If `True` and allow_passwordless is `True`, the unix_socket auth plugin will be used.

19.19.159 salt.states.netacl

Network ACL

Manage the firewall configuration on the network device namaged through NAPALM. The firewall configuration is generated by Capirca.

New in version 2017.7.0.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends capirca, napalm

platform unix

Dependencies

Capirca: `pip install -e git+git@github.com:google/capirca.git#egg=aclgen`

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.states.netacl.`**`filter`**(*name*, *filter_name*, *filter_options=None*, *terms=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=False*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*)

Generate and load the configuration of a policy filter.

filter_name The name of the policy filter.

filter_options Additional filter options. These options are platform-specific. See the complete list of options.

terms Dictionary of terms for this policy filter. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`** When `merge_pillar` is set as `True`, the final list of terms generated by merging the terms from `terms` with those defined in the pillar (if any): new terms are prepended at the beginning, while existing ones will preserve the position. To add the new terms at the end of the list, set this argument to `False`.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`False`** Merge `terms` with the corresponding value from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The terms specified through the `terms` argument have higher priority than the pillar.

---

only_lower_merge: **`False`** Specify if it should merge only the terms fields. Otherwise it will try to merge also filters fields. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.
revision_id Add a comment in the filter config having the description for the changes applied.
revision_no The revision count.
revision_date: **`True`** Boolean flag: display the date when the filter configuration was generated. Default: `True`.
revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).
test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
commit: **`True`** Commit? Default: `True`.
debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.
CLI Example:

```
salt 'edge01.flw01' state.sls router.acl test=True
```

Output Example:

```
edge01.flw01:
----------
          ID: my-filter
    Function: netacl.filter
      Result: None
     Comment: Testing mode: Configuration discarded.

                  exit

Summary for edge01.flw01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
```

```
Total states run:     1
Total run time:   2.437 s
```

Pillar example:

```
acl:
  - my-filter:
      options:
        - inet6
      terms:
        - my-term:
            source_port: [1234, 1235]
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
```

State SLS Example:

```
{%- set filter_name = 'my-filter' -%}
{%- set my_filter_cfg = salt.netacl.get_filter_pillar(filter_name, pillar_key=
↪'firewall') -%}
my_first_filter_state:
  netacl.filter:
    - filter_name: {{ filter_name }}
    - options: {{ my_filter_cfg['options'] | json }}
    - terms: {{ my_filter_cfg['terms'] | json }}
    - revision_date: false
    - revision_no: 5
    - debug: true
```

Or:

```
my_first_filter_state:
  netacl.filter:
    - filter_name: my-filter
    - merge_pillar: true
    - pillar_key: firewall
    - revision_date: false
    - revision_no: 5
    - debug: true
```

In the example above, as `inet6` has been specified in the `filter_options`, the configuration chunk referring to `my-term` has been ignored as it referred to IPv4 only (from `source_address` field).

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

salt.states.netacl.**managed**(*name*, *filters=None*, *prepend=True*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=False*, *only_lower_merge=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*)

Manage the whole firewall configuration.

filters Dictionary of filters for this policy. If not specified or empty, will try to load the configuration from the pillar, unless `merge_pillar` is set as `False`.

prepend: **`True`** When `merge_pillar` is set as `True`, the final list of filters generated by merging the filters from `filters` with those defined in the pillar (if any): new filters are prepended at the beginning, while existing ones will preserve the position. To add the new filters at the end of the list, set this argument to `False`.

pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.

pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.

saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.

merge_pillar: **`False`** Merge the `filters` will the corresponding values from the pillar. Default: `False`.

Note: By default this state does not merge, to avoid any unexpected behaviours.

The merge logic depends on the `prepend` argument.

The filters specified through the `filters` argument have higher priority than the pillar.

only_lower_merge: **`False`** Specify if it should merge only the filters and terms fields. Otherwise it will try to merge everything at the policy level. Default: `False`. This option requires `merge_pillar`, otherwise it is ignored.

test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

revision_id Add a comment in the policy config having the description for the changes applied.

revision_no The revision count.

revision_date: **`True`** Boolean flag: display the date when the policy configuration was generated. Default: `True`.

revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: %Y/%m/%d (<year>/<month>/<day>).

commit: **`True`** Commit? Default: `True`.

debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl test=True
```

Output Example:

```
edge01.bjm01:
----------
              ID: netacl_example
        Function: netacl.managed
          Result: None
         Comment: Testing mode: Configuration discarded.
         Started: 12:03:24.807023
        Duration: 5569.453 ms
```

```
        Changes:
                 ----------
                 diff:
                     [edit firewall]
                     +    family inet {
                     +        /*
                     +         ** $Id: netacl_example $

                            filter block-icmp {
                                interface-specific;
                                term first-term {
                                    from {
                                        protocol icmp;
                                    }
                                    then {
                                        reject;
                                    }
                                }
                            }
                        }
                    }

Summary for edge01.bjm01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   5.569 s
```

The policy configuration has been loaded from the pillar, having the following structure:

```
firewall:
  - my-filter:
      terms:
        - my-term:
            source_port: [1234, 1235]
            protocol:
              - tcp
              - udp
            source_address: 1.2.3.4
            action: reject
        - my-other-term:
            source_port:
              - [5678, 5680]
            protocol: tcp
            action: accept
  - block-icmp:
      terms:
        - first-term:
            protocol:
              - icmp
            action: reject
```

Example SLS file:

```
{%- set fw_filters = pillar.get('firewall', {}) -%}
netacl_example:
  netacl.managed:
    - filters: {{ fw_filters | json }}
    - revision_no: 2
    - debug: true
```

Or:

```
netacl_example:
  netacl.managed:
    - pillar_key: firewall
    - merge_pillar: true
    - revision_no: 2
    - debug: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

salt.states.netacl.**term**(*name*, *filter_name*, *term_name*, *filter_options=None*, *pillar_key='acl'*, *pillarenv=None*, *saltenv=None*, *merge_pillar=False*, *revision_id=None*, *revision_no=None*, *revision_date=True*, *revision_date_format='%Y/%m/%d'*, *test=False*, *commit=True*, *debug=False*, *source_service=None*, *destination_service=None*, ***term_fields*)

Manage the configuration of a specific policy term.

filter_name The name of the policy filter.
term_name The name of the term.
filter_options Additional filter options. These options are platform-specific. See the complete list of options.
pillar_key: **`acl`** The key in the pillar containing the default attributes values. Default: `acl`.
pillarenv Query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment.
saltenv Included only for compatibility with *`pillarenv_from_saltenv`*, and is otherwise ignored.
merge_pillar: **`False`** Merge the CLI variables with the pillar. Default: `False`.

The properties specified through the state arguments have higher priority than the pillar.
revision_id Add a comment in the term config having the description for the changes applied.
revision_no The revision count.
revision_date: **`True`** Boolean flag: display the date when the term configuration was generated. Default: `True`.
revision_date_format: **`%Y/%m/%d`** The date format to be used when generating the perforce data. Default: `%Y/%m/%d` (<year>/<month>/<day>).
test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
commit: **`True`** Commit? Default: `True`.
debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.
source_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a source_port and protocol.

As this module is available on Unix platforms only, it reads the IANA port assignment from /etc/services.

If the user requires additional shortcuts to be referenced, they can add entries under /etc/services, which can be managed using the *`file state`*.
destination_service A special service to choose from. This is a helper so the user is able to select a source just using the name, instead of specifying a destination_port and protocol. Allows the same options as `source_service`.
term_fields Term attributes. To see what fields are supported, please consult the list of supported keywords. Some platforms have few other optional keywords.

Note: The following fields are accepted:

- action
- address
- address_exclude
- comment
- counter
- expiration
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- log_name
- loss_priority
- option
- policer
- port
- precedence
- principals

- protocol
- protocol_except
- qos
- pan_application
- routing_instance
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- packet_length
- fragment_offset
- hop_limit
- icmp_type
- ether_type
- traffic_class_count
- traffic_type
- translated
- dscp_set
- dscp_match
- dscp_except
- next_ip
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- vpn
- source_tag
- destination_tag
- source_interface
- destination_interface
- flattened
- flattened_addr
- flattened_saddr
- flattened_daddr
- priority

Note: The following fields can be also a single value and a list of values:

- action
- address
- address_exclude
- comment
- destination_address
- destination_address_exclude
- destination_port
- destination_prefix
- forwarding_class
- forwarding_class_except
- logging
- option
- port
- precedence
- principals

- protocol
- protocol_except
- pan_application
- source_address
- source_address_exclude
- source_port
- source_prefix
- verbatim
- icmp_type
- ether_type
- traffic_type
- dscp_match
- dscp_except
- flexible_match_range
- source_prefix_except
- destination_prefix_except
- source_tag
- destination_tag
- source_service
- destination_service

Example: `destination_address` can be either defined as:

```
destination_address: 172.17.17.1/24
```

or as a list of destination IP addresses:

```
destination_address:
    - 172.17.17.1/24
    - 172.17.19.1/24
```

or a list of services to be matched:

```
source_service:
    - ntp
    - snmp
    - ldap
    - bgpd
```

Note: The port fields `source_port` and `destination_port` can be used as above to select either a single value, either a list of values, but also they can select port ranges. Example:

```
source_port:
    - [1000, 2000]
    - [3000, 4000]
```

With the configuration above, the user is able to select the 1000-2000 and 3000-4000 source port ranges.

CLI Example:

```
salt 'edge01.bjm01' state.sls router.acl
```

Output Example:

```
edge01.bjm01:
----------
          ID: update_icmp_first_term
    Function: netacl.term
      Result: None
     Comment: Testing mode: Configuration discarded.
     Started: 12:49:09.174179
    Duration: 5751.882 ms
     Changes:
              ----------
              diff:
                  [edit firewall]
                  +    family inet {
                  +        /*
                  +         ** $Id: update_icmp_first_term $
                  +         ** $Date: 2017/02/30 $
                  +         **
                  +         */
                  +        filter block-icmp {
                  +            term first-term {
                  +                from {
                  +                    protocol icmp;
                  +                }
                  +                then {
                  +                    reject;
                  +                }
                  +            }
                  +        }
                  +    }

Summary for edge01.bjm01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time:   5.752 s
```

Pillar example:

```
firewall:
  - block-icmp:
      terms:
        - first-term:
            protocol:
              - icmp
            action: reject
```

State SLS example:

```
{%- set filter_name = 'block-icmp' -%}
{%- set term_name = 'first-term' -%}
{%- set my_term_cfg = salt.netacl.get_term_pillar(filter_name, term_name) -%}

update_icmp_first_term:
  netacl.term:
    - filter_name: {{ filter_name }}
    - filter_options:
```

```
        - not-interface-specific
    - term_name: {{ term_name }}
    - {{ my_term_cfg | json }}
```

Or directly referencing the pillar keys:

```
update_icmp_first_term:
  netacl.term:
    - filter_name: block-icmp
    - filter_options:
        - not-interface-specific
    - term_name: first-term
    - merge_pillar: true
```

Note: The first method allows the user to eventually apply complex manipulation and / or retrieve the data from external services before passing the data to the state. The second one is more straightforward, for less complex cases when loading the data directly from the pillar is sufficient.

Note: When passing retrieved pillar data into the state file, it is strongly recommended to use the json serializer explicitly (`` | json``), instead of relying on the default Python serializer.

19.19.160 salt.states.netconfig

Network Config

Manage the configuration on a network device given a specific static config or template.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *Network-related basic features execution module*

New in version 2017.7.0.

salt.states.netconfig.**managed**(*name*, *template_name*, *template_source=None*, *template_path=None*, *template_hash=None*, *template_hash_name=None*, *template_user='root'*, *template_group='root'*, *template_mode=`755'*, *saltenv=None*, *template_engine='jinja'*, *skip_verify=False*, *defaults=None*, *test=False*, *commit=True*, *debug=False*, *replace=False*, ***template_vars*)

Manages the configuration on network devices.

By default this state will commit the changes on the device. If there are no changes required, it does not commit and the field `already_configured` from the output dictionary will be set as `True` to notify that.

To avoid committing the configuration, set the argument `test` to `True` (or via the CLI argument `test=True`) and will discard (dry run).

To preserve the changes, set `commit` to `False` (either as CLI argument, either as state parameter). However, this is recommended to be used only in exceptional cases when there are applied few consecutive states and/or configuration changes. Otherwise the user might forget that the config DB is locked and the candidate config buffer is not cleared/merged in the running config.

To replace the config, set `replace` to `True`. This option is recommended to be used with caution!

Warning: The support for NAPALM native templates will be dropped beginning with Salt Fluorine. Implicitly, the `template_path` argument will be deprecated and removed.

template_name Identifies path to the template source. The template can be either stored on the local machine, either remotely. The recommended location is under the `file_roots` as specified in the master config file. For example, let's suppose the `file_roots` is configured as:

```
file_roots:
    base:
        - /etc/salt/states
```

Placing the template under `/etc/salt/states/templates/example.jinja`, it can be used as `salt://templates/example.jinja`. Alternatively, for local files, the user can specify the absolute path. If remotely, the source can be retrieved via `http`, `https` or `ftp`.

Examples:

- `salt://my_template.jinja`
- `/absolute/path/to/my_template.jinja`
- `http://example.com/template.cheetah`
- `https:/example.com/template.mako`
- `ftp://example.com/template.py`

template_source: **None** Inline config template to be rendered and loaded on the device.

template_path: **None** Required only in case the argument `template_name` provides only the file basename. E.g.: if `template_name` is specified as `my_template.jinja`, in order to find the template, this argument must be provided: `template_path: /absolute/path/to/`.

template_hash: **None** Hash of the template file. Format: `{hash_type: 'md5','hsum': <md5sum>}`

template_hash_name: **None** When `template_hash` refers to a remote file, this specifies the filename to look for in that file.

template_group: **root** Owner of file.

template_user: **root** Group owner of file.

template_user: 755 Permissions of file

saltenv: **base** Specifies the template environment. This will influence the relative imports inside the templates.

template_engine: **jinja** The following templates engines are supported:

- *cheetah*
- *genshi*
- *jinja*
- *mako*
- *py*
- *wempy*

skip_verify: **False** If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

Changed in version 2017.7.1.

test: False Dry run? If set to `True`, will apply the config, discard and return the changes. Default: `False` (will commit the changes on the device).

commit: True Commit? Default: `True`.

debug: False Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw result after the template was rendered.

Note: This argument cannot be used directly on the command line. Instead, it can be passed through the `pillar` variable when executing either of the *`state.sls`* or *`state.apply`* (see below for an example).

---

replace: False Load and replace the configuration. Default: `False` (will apply load merge).

defaults: None Default variables/context passed to the template.

template_vars Dictionary with the arguments/context to be used when the template is rendered. Do not explicitly specify this argument. This represents any other variable that will be sent to the template rendering system. Please see an example below! In both `ntp_peers_example_using_pillar` and `ntp_peers_example`, `peers` is sent as template variable.

SLS Example (e.g.: under salt://router/config.sls) :

```
whole_config_example:
    netconfig.managed:
        - template_name: salt://path/to/complete_config.jinja
        - debug: True
        - replace: True
bgp_config_example:
    netconfig.managed:
        - template_name: /absolute/path/to/bgp_neighbors.mako
        - template_engine: mako
prefix_lists_example:
    netconfig.managed:
        - template_name: prefix_lists.cheetah
        - template_path: /absolute/path/to/
        - debug: True
        - template_engine: cheetah
ntp_peers_example:
    netconfig.managed:
        - template_name: http://bit.ly/2gKOj20
        - skip_verify: False
        - debug: True
        - peers:
            - 192.168.0.1
            - 192.168.0.1
ntp_peers_example_using_pillar:
    netconfig.managed:
        - template_name: http://bit.ly/2gKOj20
        - peers: {{ pillar.get('ntp.peers', []) }}
```

Usage examples:

```
$ sudo salt 'juniper.device' state.sls router.config test=True

$ sudo salt -N all-routers state.sls router.config pillar="{'debug': True}"
```

`router.config` depends on the location of the SLS file (see above). Running this command, will be executed all five steps from above. These examples above are not meant to be used in a production environment, their sole purpose is to provide usage examples.

Output example:

```
$ sudo salt 'juniper.device' state.sls router.config test=True
juniper.device:
----------
          ID: ntp_peers_example_using_pillar
    Function: netconfig.managed

19.19.161 salt.states.netntp

Network NTP

Manage the configuration of NTP peers and servers on the network devices through the NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- Requires netaddr to be installed: *pip install netaddr* to check if IP Addresses are correctly specified
- Requires dnspython to be installed: *pip install dnspython* to resolve the nameserver entities (in case the user does not configure the peers/servers using their IP addresses)
- *NAPALM proxy minion*
- *NTP operational and configuration management module*

salt.states.netntp.**managed**(*name*, *peers=None*, *servers=None*)

Manages the configuration of NTP peers and servers on the device, as specified in the state SLS file. NTP entities not specified in these lists will be removed whilst entities not configured on the device will be set.

SLS Example:

```
netntp_example:
    netntp.managed:
         - peers:
           - 192.168.0.1
           - 172.17.17.1
         - servers:
           - 24.124.0.251
           - 138.236.128.36
```

Output example:

```
{
    'edge01.nrt04': {
        'netntp_|-netntp_example_|-netntp_example_|-managed': {
            'comment': 'NTP servers already configured as needed.',
            'name': 'netntp_example',
            'start_time': '12:45:24.056659',
            'duration': 2938.857,
            'changes': {
                'peers': {
                    'removed': [
                        '192.168.0.2',
                        '192.168.0.3'
                    ],
                    'added': [
                        '192.168.0.1',
                        '172.17.17.1'
                    ]
                }
```

```
            },
            'result': None
        }
    }
}
```

19.19.162 salt.states.netsnmp

Network SNMP

Manage the SNMP configuration on network devices.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm snmp management module (salt.modules.napalm_snmp)*

salt.states.netsnmp.**managed**(*name*, *config=None*, *defaults=None*)

Configures the SNMP on the device as specified in the SLS file.

SLS Example:

```
snmp_example:
    netsnmp.managed:
         - config:
            location: Honolulu, HI, US
         - defaults:
            contact: noc@cloudflare.com
```

Output example (for the SLS above, e.g. called snmp.sls under /router/):

```
$ sudo salt edge01.hnl01 state.sls router.snmp test=True
edge01.hnl01:
----------
          ID: snmp_example
    Function: snmp.managed
      Result: None
     Comment: Testing mode: configuration was not changed!
     Started: 13:29:06.872363
    Duration: 920.466 ms
     Changes:
              ----------
              added:
                  ----------
                  chassis_id:
                      None
                  contact:
                      noc@cloudflare.com
                  location:
```

```
                      Honolulu, HI, US

Summary for edge01.hnl01
------------
Succeeded: 1 (unchanged=1, changed=1)
Failed:    0
------------
Total states run:     1
Total run time: 920.466 ms
```

19.19.163 salt.states.netusers

Network Users

Manage the users configuration on network devices via the NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *NAPALM proxy minion*
- *Users configuration management module*

New in version 2016.11.0.

salt.states.netusers.**managed**(*name*, *users=None*, *defaults=None*)

Manages the configuration of the users on the device, as specified in the state SLS file. Users not defined in that file will be remove whilst users not configured on the device, will be added.

SLS Example:

```
netusers_example:
    netusers.managed:
         - users:
            admin:
                level: 15
                password: $1$knmhgPPv$g8745biu4rb.Zf.IT.F/U1
                sshkeys: []
            restricted:
                level: 1
                password: $1$j34j5k4b$4d5SVjTiz1l.Zf.IT.F/K7
            martin:
                level: 15
                password: ''
                sshkeys:

19.19.164 salt.states.network

Configuration of network interfaces

The network module is used to create and manage network settings, interfaces can be set as either managed or ignored. By default all interfaces are ignored unless specified.

Note: Prior to version 2014.1.0, only RedHat-based systems (RHEL, CentOS, Scientific Linux, etc.) are supported. Support for Debian/Ubuntu is new in 2014.1.0 and should be considered experimental.

Other platforms are not yet supported.

```

      - 10.1.0.4/32
      - 10.1.0.12/32
    - ipv6addrs:
      - fc00::1/128
      - fc00::100/128

.. note::
    Apply changes to hostname immediately.

.. versionadded:: 2015.5.0

system:
  network.system:
    - hostname: server2.example.com
    - apply_hostname: True
    - retain_settings: True

.. note::
    Use `retain_settings` to retain current network settings that are not
    otherwise specified in the state. Particularly useful if only setting
    the hostname. Default behavior is to delete unspecified network
    settings.

.. versionadded:: 2016.11.0
```

Note: When managing bridged interfaces on a Debian or Ubuntu based system, the ports argument is required. Red Hat systems will ignore the argument.

salt.states.network.**managed**(*name*, *type*, *enabled=True*, ***kwargs*)

Ensure that the named interface is configured properly.
name The name of the interface to manage
type Type of interface and configuration.
enabled Designates the state of this interface.
kwargs The IP parameters for this interface.

`salt.states.network.routes`(*name*, ***kwargs*)
Manage network interface static routes.
name Interface name to apply the route to.
kwargs Named routes

`salt.states.network.system`(*name*, ***kwargs*)
Ensure that global network settings are configured properly.
name Custom name to represent this configuration change.
kwargs The global parameters for the system.

19.19.165 salt.states.netyang

NAPALM YANG state

Manage the configuration of network devices according to the YANG models (OpenConfig/IETF).

New in version 2017.7.0.

Dependencies

- napalm-yang
- pyangbing > 0.5.11

To be able to load configuration on network devices, it requires NAPALM library to be installed: `pip install napalm`. Please check Installation for complete details.

`salt.states.netyang.configured`(*name*, *data*, *models*, ***kwargs*)
Configure the network device, given the input data strucuted according to the YANG models.

Note: The main difference between this function and `managed` is that the later generates and loads the configuration only when there are differences between the existing configuration on the device and the expected configuration. Depending on the platform and hardware capabilities, one could be more optimal than the other. Additionally, the output of the `managed` is different, in such a way that the `pchange` field in the output contains structured data, rather than text.

---

data YANG structured data.
models A list of models to be used when generating the config.
profiles: **`None`** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).
test: **`False`** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.
commit: **`True`** Commit? Default: `True`.
debug: **`False`** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.
replace: **`False`** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config =  pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.configured:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
          mtu: 9000
      Et2:
        config:
          description: "description example"
```

salt.states.netyang.**managed**(*name*, *data*, *models*, ***kwargs*)

Manage the device configuration given the input data strucuted according to the YANG models.

data YANG structured data.

models A list of models to be used when generating the config.

profiles: **None** Use certain profiles to generate the config. If not specified, will use the platform default profile(s).

compliance_report: **False** Return the compliance report in the comment. The compliance report structured object can be found however in the `pchanges` field of the output (not displayed on the CLI).

New in version 2017.7.3.

test: **False** Dry run? If set as `True`, will apply the config, discard and return the changes. Default: `False` and will commit the changes on the device.

commit: **True** Commit? Default: `True`.

debug: **False** Debug mode. Will insert a new key under the output dictionary, as `loaded_config` containing the raw configuration loaded on the device.

replace: **False** Should replace the config with the new generate one?

State SLS example:

```
{%- set expected_config =  pillar.get('openconfig_interfaces_cfg') -%}
interfaces_config:
  napalm_yang.managed:
    - data: {{ expected_config | json }}
    - models:
      - models.openconfig_interfaces
    - debug: true
```

Pillar example:

```
openconfig_interfaces_cfg:
  _kwargs:
    filter: true
  interfaces:
    interface:
      Et1:
        config:
```

```
        mtu: 9000
    Et2:
      config:
        description: "description example"
```

19.19.166 salt.states.nftables

Management of nftables

This is an nftables-specific module designed to manage Linux firewalls. It is expected that this state module, and other system-specific firewall states, may at some point be deprecated in favor of a more generic *firewall* state.

```
httpd:
  nftables.append:
    - table: filter
    - chain: input
    - jump: accept
    - match: state
    - connstate: new
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.append:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.insert:
    - position: 1
    - table: filter
    - family: ipv6
    - chain: INPUT
```

```
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.delete:
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.delete:
    - position: 1
    - table: filter
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True

httpd:
  nftables.delete:
    - table: filter
    - family: ipv6
    - chain: INPUT
    - jump: ACCEPT
    - match: state
    - connstate: NEW
    - dport: 80
    - proto: tcp
    - sport: 1025:65535
    - save: True
```

salt.states.nftables.**append**(*name*, *family='ipv4'*, ***kwargs*)

New in version 0.17.0.

Append a rule to a chain

name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.

family Network family, ipv4 or ipv6.

All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.**chain_absent**(*name*, *table='filter'*, *family='ipv4'*)

New in version 2014.7.0.

Verify the chain is absent.
family Networking family, either ipv4 or ipv6

salt.states.nftables.**chain_present**(*name*, *table='filter'*, *table_type=None*, *hook=None*, *priority=None*, *family='ipv4'*)
New in version 2014.7.0.

Verify the chain is exist.
name A user-defined chain name.
table The table to own the chain.
family Networking family, either ipv4 or ipv6

salt.states.nftables.**delete**(*name*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Delete a rule to a chain
name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
family Networking family, either ipv4 or ipv6
All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

salt.states.nftables.**flush**(*name*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Flush current nftables state
family Networking family, either ipv4 or ipv6

salt.states.nftables.**insert**(*name*, *family='ipv4'*, ***kwargs*)
New in version 2014.7.0.

Insert a rule into a chain
name A user-defined name to call this rule by in another part of a state or formula. This should not be an actual rule.
family Networking family, either ipv4 or ipv6
All other arguments are passed in with the same name as the long option that would normally be used for nftables, with one exception: *--state* is specified as *connstate* instead of *state* (not to be confused with *ctstate*).

19.19.167 salt.states.npm

Installation of NPM Packages

These states manage the installed packages for node.js using the Node Package Manager (npm). Note that npm must be installed for these states to be available, so npm states should include a requisite to a pkg.installed state for the package which provides npm (simply `npm` in most cases). Example:

```
npm:
  pkg.installed

yaml:
  npm.installed:
    - require:
      - pkg: npm
```

salt.states.npm.**bootstrap**(*name*, *user=None*, *silent=True*)
Bootstraps a node.js application.

Will execute `npm install --json' on the specified directory.

user The user to run NPM with

New in version 0.17.0.

salt.states.npm.**cache_cleaned**(*name=None*, *user=None*, *force=False*)

Ensure that the given package is not cached.

If no package is specified, this ensures the entire cache is cleared.

name The name of the package to remove from the cache, or None for all packages

user The user to run NPM with

force Force cleaning of cache. Required for npm@5 and greater

New in version 2016.11.6.

salt.states.npm.**installed**(*name*, *pkgs=None*, *dir=None*, *user=None*, *force_reinstall=False*, *registry=None*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

```
coffee-script:
  npm.installed:
    - user: someuser

coffee-script@1.0.1:
  npm.installed: []
```

name The package to install

Changed in version 2014.7.2: This parameter is no longer lowercased by salt so that case-sensitive NPM package names will work.

pkgs A list of packages to install with a single npm invocation; specifying this argument will ignore the `name` argument

New in version 2014.7.0.

dir The target directory in which to install the package, or None for global installation

user The user to run NPM with

New in version 0.17.0.

registry The NPM registry from which to install the package

New in version 2014.7.0.

env A list of environment variables to be set prior to execution. The format is the same as the *cmd.run*. state function.

New in version 2014.7.0.

force_reinstall Install the package even if it is already installed

salt.states.npm.**removed**(*name*, *dir=None*, *user=None*)

Verify that the given package is not installed.

dir The target directory in which to install the package, or None for global installation

user The user to run NPM with

New in version 0.17.0.

19.19.168 salt.states.ntp

Management of NTP servers

New in version 2014.1.0.

This state is used to manage NTP servers. Currently only Windows is supported.

```
win_ntp:
  ntp.managed:
    - servers:
      - pool.ntp.org
      - us.pool.ntp.org
```

salt.states.ntp.**managed**(*name*, *servers=None*)

Manage NTP servers

servers A list of NTP servers

19.19.169 salt.states.nxos module

State module for Cisco NX OS Switches Proxy minions

For documentation on setting up the nxos proxy minion look in the documentation for *salt.proxy.nxos*.

salt.states.nxos.**config_absent**(*name*)

Ensure a specific configuration line does not exist in the running config

name config line to remove

Examples:

```
add snmp group:
  nxos.config_absent:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPSTring group network-admin
```

Note: For certain cases extra lines could be removed based on dependencies. In this example, included after the example for config_present, the ACLs would be removed because they depend on the existence of the group.

---

salt.states.nxos.**config_present**(*name*)

Ensure a specific configuration line exists in the running config

name config line to set

Examples:

```
add snmp group:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE group network-operator
      - snmp-server community AnotherRandomSNMPSTring group network-admin

add snmp acl:
  nxos.config_present:
    - names:
      - snmp-server community randoSNMPstringHERE use-acl snmp-acl-ro
      - snmp-server community AnotherRandomSNMPSTring use-acl snmp-acl-rw
```

salt.states.nxos.**replace**(*name*, *repl*, *full_match=False*)

Replace all instances of a string or full line in the running config

name String to replace

repl The replacement text

full_match Whether *name* will match the full line or only a subset of the line. Defaults to False. When False, *.** is added around *name* for matching in the *show run* config.

Examples:

```
replace snmp string:
  nxos.replace:
    - name: randoSNMPstringHERE
    - repl: NEWrandoSNMPstringHERE

replace full snmp string:
  nxos.replace:
    - name: ^snmp-server community randoSNMPstringHERE group network-operator$
    - repl: snmp-server community NEWrandoSNMPstringHERE group network-operator
    - full_match: True
```

Note: The first example will replace the SNMP string on both the group and the ACL, so you will not lose the ACL setting. Because the second is an exact match of the line, when the group is removed, the ACL is removed, but not readded, because it was not matched.

salt.states.nxos.**user_absent**(*name*)

Ensure a user is not present

name username to remove if it exists

Examples:

```
delete:
  nxos.user_absent:
    - name: daniel
```

salt.states.nxos.**user_present**(*name*, *password=None*, *roles=None*, *encrypted=False*, *crypt_salt=None*, *algorithm='sha256'*)

Ensure a user is present with the specified groups

name Name of user

password Encrypted or Plain Text password for user

roles List of roles the user should be assigned. Any roles not in this list will be removed

encrypted Whether the password is encrypted already or not. Defaults to False

crypt_salt Salt to use when encrypting the password. Default is None (salt is randomly generated for unhashed passwords)

algorithm Algorithm to use for hashing password. Defaults to sha256. Accepts md5, blowfish, sha256, sha512

Examples:

```
create:
  nxos.user_present:
    - name: daniel
    - roles:
      - vdc-admin

set_password:
  nxos.user_present:
    - name: daniel
    - password: admin
    - roles:
      - network-admin

update:
  nxos.user_present:
    - name: daniel
    - password: AiN9jaoP
    - roles:
```

```
    - network-admin
    - vdc-admin
```

19.19.170 salt.states.openstack_config

Manage OpenStack configuration file settings.

maintainer Jeffrey C. Ollie <jeff@ocjtech.us>

maturity new

depends

platform linux

salt.states.openstack_config.**absent**(*name*, *filename*, *section*, *parameter=None*)

Ensure a value is not set in an OpenStack configuration file.

filename The full path to the configuration file

section The section in which the parameter will be set

parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

salt.states.openstack_config.**present**(*name*, *filename*, *section*, *value*, *parameter=None*)

Ensure a value is set in an OpenStack configuration file.

filename The full path to the configuration file

section The section in which the parameter will be set

parameter (optional) The parameter to change. If the parameter is not supplied, the name will be used as the parameter.

value The value to set

19.19.171 salt.states.openvswitch_bridge module

Management of Open vSwitch bridges.

salt.states.openvswitch_bridge.**absent**(*name*)

Ensures that the named bridge does not exist, eventually deletes it.

Parameters **name** -- The name of the bridge.

salt.states.openvswitch_bridge.**present**(*name*)

Ensures that the named bridge exists, eventually creates it.

Parameters **name** -- The name of the bridge.

19.19.172 salt.states.openvswitch_port module

Management of Open vSwitch ports.

salt.states.openvswitch_port.**absent**(*name*, *bridge=None*)

Ensures that the named port exists on bridge, eventually deletes it. If bridge is not set, port is removed from whatever bridge contains it.

Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.

salt.states.openvswitch_port.**present**(*name*, *bridge*, *tunnel_type=None*, *id=None*, *remote=None*, *dst_port=None*, *internal=False*)

Ensures that the named port exists on bridge, eventually creates it.

Parameters

- **name** -- The name of the port.
- **bridge** -- The name of the bridge.
- **tunnel_type** -- Optional type of interface to create, currently supports: vlan, vxlan and gre.
- **id** -- Optional tunnel's key.
- **remote** -- Remote endpoint's IP address.
- **dst_port** -- Port to use when creating tunnelport in the switch.
- **internal** -- Create an internal port if one does not exist

19.19.173 salt.states.pagerduty

Create an Event in PagerDuty

New in version 2014.1.0.

This state is useful for creating events on the PagerDuty service during state runs.

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

salt.states.pagerduty.**create_event**(*name*, *details*, *service_key*, *profile*)

Create an event on the PagerDuty service

```
server-warning-message:
  pagerduty.create_event:
    - name: 'This is a server warning message'
    - details: 'This is a much more detailed message'
    - service_key: 9abcd123456789efabcde362783cdbaf
    - profile: my-pagerduty-account
```

The following parameters are required:

name This is a short description of the event.

details This can be a more detailed description of the event.

service_key This key can be found by using pagerduty.list_services.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

19.19.174 salt.states.pagerduty_escalation_policy

Manage PagerDuty escalation policies.

Schedules and users can be referenced by pagerduty ID, or by name, or by email address.

For example:

```
ensure test escalation policy:
    pagerduty_escalation_policy.present:
        - name: bruce test escalation policy
        - escalation_rules:
            - targets:
                - type: schedule
```

```
                id: 'bruce test schedule level1'
              - type: user
                id: 'Bruce Sherrod'
            escalation_delay_in_minutes: 15
          - targets:
              - type: schedule
                id: 'bruce test schedule level2'
            escalation_delay_in_minutes: 15
          - targets:
              - type: user
                id: 'Bruce TestUser1'
              - type: user
                id: 'Bruce TestUser2'
              - type: user
                id: 'Bruce TestUser3'
              - type: user
                id:  'bruce+test4@lyft.com'
            escalation_delay_in_minutes: 15
```

salt.states.pagerduty_escalation_policy.**absent**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure that a PagerDuty escalation policy does not exist. Accepts all the arguments that pagerduty_escalation_policy.present accepts; but ignores all arguments except the name.

Name can be the escalation policy id or the escalation policy name.

salt.states.pagerduty_escalation_policy.**present**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure that a pagerduty escalation policy exists. Will create or update as needed.

This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/escalation_policies/create. In addition, user and schedule id's will be translated from name (or email address) into PagerDuty unique ids. For example:

```

```

pagerduty_escalation_policy.present:

- name: bruce test escalation policy
- **escalation_rules**:
  - **targets**:
    - type: schedule id: `bruce test schedule level1'
    - type: user id: `Bruce Sherrod'

In this example, `Bruce Sherrod' will be looked up and replaced with the PagerDuty id (usually a 7 digit all-caps string, e.g. PX6GQL7)

19.19.175 salt.states.pagerduty_schedule

Manage PagerDuty schedules.

Example:

```
ensure test schedule:
    pagerduty_schedule.present:
        - name: 'bruce test schedule level1'
        - schedule:
            name: 'bruce test schedule level1'
            time_zone: 'Pacific Time (US & Canada)'
```

```
            schedule_layers:
                - name: 'Schedule Layer 1'
                  start: '2015-01-01T00:00:00'
                  users:
                    - user:
                        'id': 'Bruce TestUser1'
                      member_order: 1
                    - user:
                        'id': 'Bruce TestUser2'
                      member_order: 2
                    - user:
                        'id': 'bruce+test3@lyft.com'
                      member_order: 3
                    - user:
                        'id': 'bruce+test4@lyft.com'
                      member_order: 4
                  rotation_virtual_start: '2015-01-01T00:00:00'
                  priority: 1
                  rotation_turn_length_seconds: 604800
```

salt.states.pagerduty_schedule.**absent**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure that a pagerduty schedule does not exist. Name can be pagerduty schedule id or pagerduty schedule name.

salt.states.pagerduty_schedule.**present**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure that a pagerduty schedule exists. This method accepts as args everything defined in https://developer.pagerduty.com/documentation/rest/schedules/create. This means that most arguments are in a dict called ``schedule''.

User id's can be pagerduty id, or name, or email address.

19.19.176 salt.states.pagerduty_service

Manage PagerDuty services

Escalation policies can be referenced by pagerduty ID or by namea.

For example:

```
ensure test service
    pagerduty_service.present:
        - name: 'my service'
        - escalation_policy_id: 'my escalation policy'
        - type: nagios
```

salt.states.pagerduty_service.**absent**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure a pagerduty service does not exist. Name can be the service name or pagerduty service id.

salt.states.pagerduty_service.**present**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure pagerduty service exists. This method accepts as arguments everything defined in https://developer.pagerduty.com/documentation/rest/services/create

Note that many arguments are mutually exclusive, depending on the ``type'' argument.

Examples:

```
# create a PagerDuty email service at test-email@DOMAIN.pagerduty.com
ensure generic email service exists:
    pagerduty_service.present:
        - name: my email service
        - service:
            description: "email service controlled by salt"
            escalation_policy_id: "my escalation policy"
            type: "generic_email"
            service_key: "test-email"
```

```
# create a pagerduty service using cloudwatch integration
ensure my cloudwatch service exists:
    pagerduty_service.present:
        - name: my cloudwatch service
        - service:
            escalation_policy_id: "my escalation policy"
            type: aws_cloudwatch
            description: "my cloudwatch service controlled by salt"
```

19.19.177 salt.states.pagerduty_user

Manage PagerDuty users.

Example

```
```

ensure bruce test user 1:

pagerduty.user_present:

- name: `Bruce TestUser1'
- email: bruce+test1@lyft.com
- requester_id: P1GV5NT

salt.states.pagerduty_user.**absent**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure pagerduty user does not exist. Name can be pagerduty id, email address, or user name.

salt.states.pagerduty_user.**present**(*profile='pagerduty'*, *subdomain=None*, *api_key=None*, ***kwargs*)

Ensure pagerduty user exists. Arguments match those supported by https://developer.pagerduty.com/documentation/rest/users/create.

19.19.178 salt.states.pcs module

Management of Pacemaker/Corosync clusters with PCS

A state module to manage Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

New in version 2016.110.

depends pcs

Walkthrough of a complete PCS cluster setup: http://clusterlabs.org/doc/en-US/Pacemaker/1.1/html/Clusters_from_Scratch/

Requirements: PCS is installed, pcs service is started and the password for the hacluster user is set and known.

Remark on the cibname variable used in the examples: The use of the cibname variable is optional. Use it only if you want to deploy your changes into a cibfile first and then push it. This makes only sense if you want to deploy multiple changes (which require each other) at once to the cluster.

At first the cibfile must be created:

```
mysql_pcs__cib_present_cib_for_galera:
    pcs.cib_present:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

Then the cibfile can be modified by creating resources (creating only 1 resource for demonstration, see also 7.):

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.org,node3.
↪example.org'
            - '--master'
        - cibname: cib_for_galera
```

After modifying the cibfile, it can be pushed to the live CIB in the cluster:

```
mysql_pcs__cib_pushed_cib_for_galera:
    pcs.cib_pushed:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

Create a cluster from scratch:

1. Authorize nodes to each other:

   ```
   pcs_auth__auth:
       pcs.auth:
           - nodes:
               - node1.example.com
               - node2.example.com
           - pcsuser: hacluster
           - pcspasswd: hoonetorg
           - extra_args: []
   ```

2. Do the initial cluster setup:

   ```
   pcs_setup__setup:
       pcs.cluster_setup:
           - nodes:
               - node1.example.com
               - node2.example.com
           - pcsclustername: pcscluster
           - extra_args:
   ```

```
            - '--start'
            - '--enable'
```

3. Optional: Set cluster properties:

```
pcs_properties__prop_has_value_no-quorum-policy:
    pcs.prop_has_value:
        - prop: no-quorum-policy
        - value: ignore
        - cibname: cib_for_cluster_settings
```

4. Optional: Set resource defaults:

```
pcs_properties__resource_defaults_to_resource-stickiness:
    pcs.resource_defaults_to:
        - default: resource-stickiness
        - value: 100
        - cibname: cib_for_cluster_settings
```

5. Optional: Set resource op defaults:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
    pcs.resource_op_defaults_to:
        - op_default: monitor-interval
        - value: 60s
        - cibname: cib_for_cluster_settings
```

6. Configure Fencing (!is often not optional on production ready cluster!):

```
pcs_stonith__created_eps_fence:
    pcs.stonith_present:
        - stonith_id: eps_fence
        - stonith_device_type: fence_eps
        - stonith_device_options:
            - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
            - 'ipaddr=myepsdevice.example.org'
            - 'power_wait=5'
            - 'verbose=1'
            - 'debug=/var/log/pcsd/eps_fence.log'
            - 'login=hidden'
            - 'passwd=hoonetorg'
        - cibname: cib_for_stonith
```

7. Add resources to your cluster:

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↪org,node3.example.org'
            - '--master'
        - cibname: cib_for_galera
```

8. Optional: Add constraints (locations, colocations, orders):

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
    pcs.constraint_present:
        - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
        - constraint_type: colocation
        - constraint_options:
            - 'add'
            - 'vip_galera'
            - 'with'
            - 'haproxy-clone'
        - cibname: cib_for_haproxy
```

New in version 2016.3.0.

salt.states.pcs.**auth**(*name*, *nodes*, *pcsuser='hacluster'*, *pcspasswd='hacluster'*, *extra_args=None*)

Ensure all nodes are authorized to the cluster

name Irrelevant, not used (recommended: pcs_auth__auth)

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communication with pcs (default: hacluster)

pcspasswd password for pcsuser (default: hacluster)

extra_args list of extra args for the `pcs cluster auth' command

Example:

```
pcs_auth__auth:
    pcs.auth:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsuser: hacluster
        - pcspasswd: hoonetorg
        - extra_args: []
```

salt.states.pcs.**cib_present**(*name*, *cibname*, *scope=None*, *extra_args=None*)

Ensure that a CIB-file with the content of the current live CIB is created

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: {{formulaname}}__cib_present_{{cibname}})

cibname name/path of the file containing the CIB

scope specific section of the CIB (default:

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_present_cib_for_galera:
    pcs.cib_present:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

salt.states.pcs.**cib_pushed**(*name*, *cibname*, *scope=None*, *extra_args=None*)

Ensure that a CIB-file is pushed if it is changed since the creation of it with pcs.cib_present

Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: {{formulaname}}__cib_pushed_{{cibname}})

cibname name/path of the file containing the CIB

scope specific section of the CIB

extra_args additional options for creating the CIB-file

Example:

```
mysql_pcs__cib_pushed_cib_for_galera:
    pcs.cib_pushed:
        - cibname: cib_for_galera
        - scope: None
        - extra_args: None
```

salt.states.pcs.**cluster_node_present**(*name*, *node*, *extra_args=None*)

Add a node to the Pacemaker cluster via PCS Should be run on one cluster node only (there may be races) Can only be run on a already setup/added node

name Irrelevant, not used (recommended: pcs_setup__node_add_{{node}})

node node that should be added

extra_args list of extra args for the `pcs cluster node add' command

Example:

```
pcs_setup__node_add_node1.example.com:
    pcs.cluster_node_present:
        - node: node1.example.com
        - extra_args:
            - '--start'
            - '--enable'
```

salt.states.pcs.**cluster_setup**(*name*, *nodes*, *pcsclustername='pcscluster'*, *extra_args=None*)

Setup Pacemaker cluster on nodes. Should be run on one cluster node only (there may be races)

name Irrelevant, not used (recommended: pcs_setup__setup)

nodes a list of nodes which should be set up

pcsclustername Name of the Pacemaker cluster

extra_args list of extra args for the `pcs cluster setup' command

Example:

```
pcs_setup__setup:
    pcs.cluster_setup:
        - nodes:
            - node1.example.com
            - node2.example.com
        - pcsclustername: pcscluster
        - extra_args:
            - '--start'
            - '--enable'
```

salt.states.pcs.**constraint_present**(*name*, *constraint_id*, *constraint_type*, *constraint_options=None*, *cibname=None*)

Ensure that a constraint is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: {{formulaname}}__constraint_present_{{constraint_id}})

constraint_id name for the constraint (try first to create manually to find out the autocreated name)

constraint_type constraint type (location, colocation, order)

constraint_options options for creating the constraint

cibname use a cached CIB-file named like cibname instead of the live CIB

Example:

```
haproxy_pcs__constraint_present_colocation-vip_galera-haproxy-clone-INFINITY:
    pcs.constraint_present:
        - constraint_id: colocation-vip_galera-haproxy-clone-INFINITY
        - constraint_type: colocation
        - constraint_options:
```

```
            - 'add'
            - 'vip_galera'
            - 'with'
            - 'haproxy-clone'
        - cibname: cib_for_haproxy
```

salt.states.pcs.**prop_has_value**(*name*, *prop*, *value*, *extra_args=None*, *cibname=None*)

Ensure that a property in the cluster is set to a given value

Should be run on one cluster node only (there may be races)
name Irrelevant, not used (recommended: pcs_properties__prop_has_value_{{prop}})
prop name of the property
value value of the property
extra_args additional options for the pcs property command
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
pcs_properties__prop_has_value_no-quorum-policy:
    pcs.prop_has_value:
        - prop: no-quorum-policy
        - value: ignore
        - cibname: cib_for_cluster_settings
```

salt.states.pcs.**resource_defaults_to**(*name*, *default*, *value*, *extra_args=None*, *cibname=None*)

Ensure a resource default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync
name Irrelevant, not used (recommended: pcs_properties__resource_defaults_to_{{default}})
default name of the default resource property
value value of the default resource property
extra_args additional options for the pcs command
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
pcs_properties__resource_defaults_to_resource-stickiness:
    pcs.resource_defaults_to:
        - default: resource-stickiness
        - value: 100
        - cibname: cib_for_cluster_settings
```

salt.states.pcs.**resource_op_defaults_to**(*name*, *op_default*, *value*, *extra_args=None*, *cibname=None*)

Ensure a resource operation default in the cluster is set to a given value

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync
name Irrelevant, not used (recommended: pcs_properties__resource_op_defaults_to_{{op_default}})
op_default name of the operation default resource property
value value of the operation default resource property
extra_args additional options for the pcs command
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
pcs_properties__resource_op_defaults_to_monitor-interval:
    pcs.resource_op_defaults_to:
        - op_default: monitor-interval
```

```
        - value: 60s
        - cibname: cib_for_cluster_settings
```

salt.states.pcs.**resource_present**(*name*, *resource_id*, *resource_type*, *resource_options=None*, *cibname=None*)

Ensure that a resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: {{formulaname}}__resource_present_{{resource_id}})
resource_id name for the resource
resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)
resource_options additional options for creating the resource
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
mysql_pcs__resource_present_galera:
    pcs.resource_present:
        - resource_id: galera
        - resource_type: "ocf:heartbeat:galera"
        - resource_options:
            - 'wsrep_cluster_address=gcomm://node1.example.org,node2.example.
↪org,node3.example.org'
            - '--master'
        - cibname: cib_for_galera
```

salt.states.pcs.**stonith_present**(*name*, *stonith_id*, *stonith_device_type*, *stonith_device_options=None*, *cibname=None*)

Ensure that a fencing resource is created

Should be run on one cluster node only (there may be races) Can only be run on a node with a functional pacemaker/corosync

name Irrelevant, not used (recommended: pcs_stonith__created_{{stonith_id}})
stonith_id name for the stonith resource
stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.
stonith_device_options additional options for creating the stonith resource
cibname use a cached CIB-file named like cibname instead of the live CIB
Example:

```
pcs_stonith__created_eps_fence:
    pcs.stonith_present:
        - stonith_id: eps_fence
        - stonith_device_type: fence_eps
        - stonith_device_options:
            - 'pcmk_host_map=node1.example.org:01;node2.example.org:02'
            - 'ipaddr=myepsdevice.example.org'
            - 'power_wait=5'
            - 'verbose=1'
            - 'debug=/var/log/pcsd/eps_fence.log'
            - 'login=hidden'
            - 'passwd=hoonetorg'
        - cibname: cib_for_stonith
```

19.19.179 salt.states.pecl

Installation of PHP Extensions Using pecl

These states manage the installed pecl extensions. Note that php-pear must be installed for these states to be available, so pecl states should include a requisite to a pkg.installed state for the package which provides pecl (`php-pear` in most cases). Example:

```
php-pear:
  pkg.installed

mongo:
  pecl.installed:
    - require:
      - pkg: php-pear
```

`salt.states.pecl.`**`installed`**(*name*, *version=None*, *defaults=False*, *force=False*, *preferred_state='stable'*)

New in version 0.17.0.

Make sure that a pecl extension is installed.

name The pecl extension name to install

version The pecl extension version to install. This option may be ignored to install the latest stable version.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

preferred_state The pecl extension state to install

`salt.states.pecl.`**`removed`**(*name*)

Make sure that a pecl extension is not installed.

name The pecl extension name to uninstall

19.19.180 salt.states.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends pdbedit

platform posix

New in version 2017.7.0.

```
wash:

account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid
user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties

> **Note:** Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

salt.states.pdbedit.**present**(*name*, ***kwargs*)

Alias for pdbedit.managed

19.19.181 salt.states.pip_state

Installation of Python Packages Using pip

These states manage system installed python packages. Note that pip must be installed for these states to be available, so pip states should include a requisite to a pkg.installed state for the package which provides pip (`python-pip` in most cases). Example:

```
python-pip:
  pkg.installed

virtualenvwrapper:
  pip.installed:
    - require:
      - pkg: python-pip
```

salt.states.pip_state.**installed**(*name*, *pkgs=None*, *pip_bin=None*, *requirements=None*, *bin_env=None*, *use_wheel=False*, *no_use_wheel=False*, *log=None*, *proxy=None*, *timeout=None*, *repo=None*, *editable=None*, *find_links=None*, *index_url=None*, *extra_index_url=None*, *no_index=False*, *mirrors=None*, *build=None*, *target=None*, *download=None*, *download_cache=None*, *source=None*, *upgrade=False*, *force_reinstall=False*, *ignore_installed=False*, *exists_action=None*, *no_deps=False*, *no_install=False*, *no_download=False*, *install_options=None*, *global_options=None*, *user=None*, *cwd=None*, *pre_releases=False*, *cert=None*, *allow_all_external=False*, *allow_external=None*, *allow_unverified=None*, *process_dependency_links=False*, *env_vars=None*, *use_vt=False*, *trusted_host=None*, *no_cache_dir=False*, *cache_dir=None*, *no_binary=None*, ***kwargs*)

Make sure the package is installed

name The name of the python package to install. You can also specify version numbers here using the standard operators `==,>=,<=`. If `requirements` is given, this parameter will be ignored.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - require:
      - pkg: python-pip
```

This will install the latest Django version greater than 1.6 but less than 1.7.

requirements Path to a pip requirements file. If the path begins with salt:// the file will be transferred from the master file server.

user The user under which to run pip

use_wheel [False] Prefer wheel archives (requires pip>=1.4)

no_use_wheel [False] Force to not use wheel archives (requires pip>=1.4)

no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either :all: to disable all binary packages, :none: to empty the set, or a list of one or more packages

Example:

```
django:
  pip.installed:
    - no_binary: ':all:'

flask:
  pip.installed:
    - no_binary:
      - itsdangerous
      - click
```

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form user:passwd@proxy.server:port. Note that the user:password@ is optional and required only if you are behind an authenticated proxy. If you provide user@proxy.server:port then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

editable install something editable (i.e. git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed)

find_links URL to look for packages at

index_url Base URL of Python Package Index

extra_index_url Extra URLs of package indexes to use in addition to `index_url`

no_index Ignore package index
mirrors Specific mirror URL(s) to query (automatically adds --use-mirrors)
build Unpack packages into `build` dir
target Install packages into `target` dir
download Download packages into `download` instead of installing them
download_cache Cache downloaded packages in `download_cache` dir
source Check out `editable` packages into `source` dir
upgrade Upgrade all packages to the newest available version
force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed Ignore the installed packages (reinstalling instead)
exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps Ignore package dependencies
no_install Download and unpack all packages, but don't actually install them
no_cache_dir: Disable the cache.
cwd Current working directory to run pip from
pre_releases Include pre-releases in the available versions
cert Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
bin_env [None] Absolute path to a virtual environment directory or absolute path to a pip executable. The example below assumes a virtual environment has been created at `/foo/.virtualenvs/bar`.
env_vars Add or modify environment variables. Useful for tweaking build steps, such as specifying INCLUDE or LIBRARY paths in Makefiles, build scripts or compiler calls. This must be in the form of a dictionary or a mapping.

Example:

```
django:
  pip.installed:
    - name: django_app
    - env_vars:
        CUSTOM_PATH: /opt/django_app
        VERBOSE: True
```

use_vt Use VT terminal emulation (see output while installing)
trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar
    - require:
      - pkg: python-pip
```

Or

Example:

```
django:
  pip.installed:
    - name: django >= 1.6, <= 1.7
    - bin_env: /foo/.virtualenvs/bar/bin/pip
    - require:
      - pkg: python-pip
```

Attention

The following arguments are deprecated, do not use.

pip_bin [None] Deprecated, use `bin_env`

Changed in version 0.17.0: `use_wheel` option added.

install_options
: Extra arguments to be supplied to the setup.py install command. If you are using an option with a directory path, be sure to use absolute path.

  Example:

```
django:
  pip.installed:
    - name: django
    - install_options:
      - --prefix=/blah
    - require:
      - pkg: python-pip
```

global_options Extra global options to be supplied to the setup.py call before the install command.

New in version 2014.1.3.

Attention

As of Salt 0.17.0 the pip state **needs** an importable pip module. This usually means having the system's pip package installed or running Salt from an active virtualenv.

The reason for this requirement is because `pip` already does a pretty good job parsing its own requirements. It makes no sense for Salt to do `pip` requirements parsing and validation before passing them to the `pip` library. It's functionality duplication and it's more error prone.

Attention

Please set `reload_modules: True` to have the salt minion import this module after installation.

Example:

```
pyopenssl:
    pip.installed:
        - name: pyOpenSSL
        - reload_modules: True
        - exists_action: i
```

salt.states.pip_state.**removed**(*name*, *requirements=None*, *bin_env=None*, *log=None*, *proxy=None*, *timeout=None*, *user=None*, *cwd=None*, *use_vt=False*)

Make sure that a package is not installed.

name The name of the package to uninstall

user The user under which to run pip

bin_env [None] the pip executable or virtualenenv to use

use_vt Use VT terminal emulation (see output while installing)

salt.states.pip_state.**uptodate**(*name*, *bin_env=None*, *user=None*, *cwd=None*, *use_vt=False*)

New in version 2015.5.0.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

user The user under which to run pip

bin_env the pip executable or virtualenenv to use

use_vt Use VT terminal emulation (see output while installing)

19.19.182 salt.states.pkg

Installation of packages using OS package managers such as yum or apt-get

Note: On minions running systemd>=205, as of version 2015.8.12, 2016.3.3, and 2016.11.0, systemd-run(1) is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing the package manager commands spawned by Salt, when Salt updates itself (see `KillMode` in the systemd.kill(5) manpage for more information). If desired, usage of systemd-run(1) can be suppressed by setting a *config option* called `systemd.use_scope`, with a value of `False` (no quotes).

Salt can manage software packages via the pkg state module, packages can be set up to be installed, latest, removed and purged. Package management declarations are typically rather simple:

```
vim:
  pkg.installed
```

A more involved example involves pulling from a custom repository.

```
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: ppa:wolfnet/logstash
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com

logstash:
  pkg.installed:
    - fromrepo: ppa:wolfnet/logstash
```

Multiple packages can also be installed with the use of the pkgs state module

```
dotdeb.repo:
  pkgrepo.managed:
    - humanname: Dotdeb
    - name: deb http://packages.dotdeb.org wheezy-php55 all
    - dist: wheezy-php55
    - file: /etc/apt/sources.list.d/dotbeb.list
    - keyid: 89DF5277
    - keyserver: keys.gnupg.net
    - refresh_db: true

php.packages:
  pkg.installed:
    - fromrepo: wheezy-php55
```

```
  - pkgs:
    - php5-fpm
    - php5-cli
    - php5-curl
```

Warning: Package names are currently case-sensitive. If the minion is using a package manager which is not case-sensitive (such as *pkgng*), then this state will fail if the proper case is not used. This will be addressed in a future release of Salt.

salt.states.pkg.**downloaded**(*name*, *version=None*, *pkgs=None*, *fromrepo=None*, *ignore_epoch=None*, ***kwargs*)

New in version 2017.7.0.

Ensure that the package is downloaded, and that it is the correct version (if specified).

Currently supported for the following pkg providers: *yumpkg* and *zypper*

Parameters

- **name** (*str*) -- The name of the package to be downloaded. This parameter is ignored if either ``pkgs" is used. Additionally, please note that this option can only be used to download packages from a software repository.
- **version** (*str*) -- Download a specific version of a package.

  Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon must have the epoch included when specifying the version number. For example:

  ```
  vim-enhanced:
    pkg.downloaded:
      - version: 2:7.4.160-1.el7
  ```

  An **ignore_epoch** argument has been added to which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

  You can install a specific version when using the pkgs argument by including the version after the package:

  ```
  common_packages:
    pkg.downloaded:
      - pkgs:
        - unzip
        - dos2unix
        - salt-minion: 2015.8.5-1.el6
  ```

CLI Example:

```
zsh:
  pkg.downloaded:
    - version: 5.0.5-4.63
    - fromrepo: "myrepository"
```

salt.states.pkg.**group_installed**(*name*, *skip=None*, *include=None*, ***kwargs*)

New in version 2015.8.0.

Changed in version 2016.11.0: Added support in *pacman*

Ensure that an entire package group is installed. This state is currently only supported for the *yum* and *pacman* package managers.

skip Packages that would normally be installed by the package group (``default'' packages), which should not be installed.

```
Load Balancer:
  pkg.group_installed:
    - skip:
      - piranha
```

include Packages which are included in a group, which would not normally be installed by a `yum groupinstall` (``optional'' packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed.

```
Load Balancer:
  pkg.group_installed:
    - include:
      - haproxy
```

Changed in version 2016.3.0: This option can no longer be passed as a comma-separated list, it must now be passed as a list (as shown in the above example).

Note: Because this is essentially a wrapper around *pkg.install*, any argument which can be passed to pkg.install may also be included here, and it will be passed on to the call to *pkg.install*.

`salt.states.pkg.`**`installed`**(*name*, *version=None*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *skip_suggestions=False*, *pkgs=None*, *sources=None*, *allow_updates=False*, *pkg_verify=False*, *normalize=True*, *ignore_epoch=False*, *reinstall=False*, *update_holds=False*, ***kwargs*)

Ensure that the package is installed, and that it is the correct version (if specified).

param str name The name of the package to be installed. This parameter is ignored if either ``pkgs'' or ``sources'' is used. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the ``sources'' option detailed below.

param str version Install a specific version of a package. This option is ignored if ``sources'' is used. Currently, this option is supported for the following pkg providers: *apt*, *ebuild*, *pacman*, *win_pkg*, *yumpkg*, and *zypper*. The version number includes the release designation where applicable, to allow Salt to target a specific release of a given version. When in doubt, using the `pkg.latest_version` function for an uninstalled package will tell you the version available.

```
# salt myminion pkg.latest_version vim-enhanced
myminion:
    2:7.4.160-1.el7
```

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the `pkg.latest_version` output above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *pkg.installed*, *pkg.removed*, and *pkg.purged* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed.

Also, while this function is not yet implemented for all pkg frontends, *pkg.list_repo_pkgs* will show all versions available in the various repositories for a given package, irrespective of whether or not it is installed.

```
# salt myminion pkg.list_repo_pkgs bash
myminion:
----------
    bash:
        - 4.2.46-21.el7_3
        - 4.2.46-20.el7_2
```

This function was first added for *pkg.list_repo_pkgs* in 2014.1.0, and was expanded to *Debian/Ubuntu* and *Arch Linux*-based distros in the 2017.7.0 release.

The version strings returned by either of these functions can be used as version specifiers in pkg states.

You can install a specific version when using the `pkgs` argument by including the version after the package:

```
common_packages:
  pkg.installed:
    - pkgs:
      - unzip
      - dos2unix
      - salt-minion: 2015.8.5-1.el6
```

If the version given is the string `latest`, the latest available package version will be installed à la `pkg.latest`.

WILDCARD VERSIONS

As of the 2017.7.0 release, this state now supports wildcards in package versions for SUSE SLES/Leap/Tumbleweed, Debian/Ubuntu, RHEL/CentOS, Arch Linux, and their derivatives. Using wildcards can be useful for packages where the release name is built into the version in some way, such as for RHEL/CentOS which typically has version numbers like `1.2.34-5.el7`. An example of the usage for this would be:

```
mypkg:
  pkg.installed:
    - version: '1.2.34*'
```

Keep in mind that using wildcard versions will result in a slower state run since Salt must gather the available versions of the specified packages and figure out which of them match the specified wildcard expression.

param bool refresh This parameter controls whether or not the package repo database is updated prior to installing the requested package(s).

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before installing.

If `False`, the package database will *not* be refreshed before installing.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - cache_valid_time: 300
    - allow_updates: True
    - hold: False
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

---

param str fromrepo Specify a repository from which to install

---

Note: Distros which use APT (Debian, Ubuntu, etc.) do not have a concept of repositories, in the same way as YUM-based distros do. When a source is added, it is assigned to a given release. Consider the following source configuration:

```
deb http://ppa.launchpad.net/saltstack/salt/ubuntu precise
 ↪main
```

The packages provided by this source would be made available via the `precise` release, therefore `fromrepo` would need to be set to `precise` for Salt to install the package from this source.

Having multiple sources in the same release may result in the default install candidate being newer than what is desired. If this is the case, the desired version must be specified using the `version` parameter.

If the `pkgs` parameter is being used to install multiple packages in the same state, then instead of using `version`, use the method of version specification described in the **Multiple Package Installation Options** section below.

Running the shell command `apt-cache policy pkgname` on a minion can help elucidate the APT configuration and aid in properly configuring states:

```
root@saltmaster:~# salt ubuntu01 cmd.run 'apt-cache policy
 ↪ffmpeg'
ubuntu01:
    ffmpeg:
    Installed: (none)
    Candidate: 7:0.10.11-1~precise1
    Version table:
        7:0.10.11-1~precise1 0
            500 http://ppa.launchpad.net/jon-severinsson/
 ↪ffmpeg/ubuntu/ precise/main amd64 Packages
        4:0.8.10-0ubuntu0.12.04.1 0
            500 http://us.archive.ubuntu.com/ubuntu/
 ↪precise-updates/main amd64 Packages
            500 http://security.ubuntu.com/ubuntu/ precise-
 ↪security/main amd64 Packages
        4:0.8.1-0ubuntu1 0
            500 http://us.archive.ubuntu.com/ubuntu/
 ↪precise/main amd64 Packages
```

The release is located directly after the source's URL. The actual release name is the part before the slash, so to install version **4:0.8.10-0ubuntu0.12.04.1** either `precise-updates` or `precise-security` could be used for the `fromrepo` value.

---

param bool skip_verify Skip the GPG verification check for the package to be installed

param bool skip_suggestions Force strict package naming. Disables lookup of package alternatives.

New in version 2014.1.1.

param bool allow_updates Allow the package to be updated outside Salt's control (e.g. auto updates on Windows). This means a package on the Minion can have a newer version than the latest available in the repository without enforcing a re-installation of the package.

New in version 2014.7.0.

Example:

```
httpd:
  pkg.installed:
    - fromrepo: mycustomrepo
    - skip_verify: True
    - skip_suggestions: True
    - version: 2.0.6~ubuntu3
    - refresh: True
    - allow_updates: True
    - hold: False
```

param bool pkg_verify New in version 2014.7.0.

For requested packages that are already installed and would not be targeted for upgrade or downgrade, use pkg.verify to determine if any of the files installed by the package have been altered. If files have been altered, the reinstall option of pkg.install is used to force a reinstall. Types to ignore can be passed to pkg.verify. Additionally, `verify_options` can be used to modify further the behavior of pkg.verify. See examples below. Currently, this option is supported for the following pkg providers: *yumpkg*.

Examples:

```
httpd:
  pkg.installed:
    - version: 2.2.15-30.el6.centos
    - pkg_verify: True
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
```

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
    - pkg_verify:
      - ignore_types:
        - config
        - doc
      - verify_options:
        - nodeps
        - nofiledigest
```

param list ignore_types List of types to ignore when verifying the package

New in version 2014.7.0.

param list verify_options List of additional options to pass when verifying the package. These options will be added to the `rpm -V` command, prepended with `--` (for example, when `nodeps` is passed in this option, `rpm -V` will be run with `--nodeps`).

New in version 2016.11.0.

param bool normalize Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2014.7.0.

Example:

```
gpfs.gplbin-2.6.32-279.31.1.el6.x86_64:
  pkg.installed:
    - normalize: False
```

param bool ignore_epoch When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.installed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the package would be installed, but the state would report as failed because the actual installed version would be `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

MULTIPLE PACKAGE INSTALLATION OPTIONS: (not supported in pkgng)

param list pkgs A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar
      - baz
    - hold: True
```

`NOTE:` For *apt*, *ebuild*, *pacman*, *winrepo*, *yumpkg*, and *zypper*, version numbers can be specified in the `pkgs` argument. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

Additionally, *ebuild*, *pacman* and *zypper* support the <, <=, >=, and > operators for more control over what versions will be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: '>=1.2.3-4'
      - baz
```

`NOTE:` When using comparison operators, the expression must be enclosed in quotes to avoid a YAML render error.

With *ebuild* is also possible to specify a use flag list and/or if the given packages should be in package.accept_keywords file and/or the overlay from which you want the package to be installed. For example:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo: '~'
      - bar: '~>=1.2:slot::overlay[use,-otheruse]'
      - baz
```

param list sources A list of packages to install, along with the source URI or local path from which to install each package. In the example below, `foo`, `bar`, `baz`, etc. refer to the name of the package, as it would appear in the output of the `pkg.version` or `pkg.list_pkgs` salt CLI commands.

```
mypkgs:
  pkg.installed:
    - sources:
      - foo: salt://rpms/foo.rpm
      - bar: http://somesite.org/bar.rpm
      - baz: ftp://someothersite.org/baz.rpm
      - qux: /minion/path/to/qux.rpm
```

PLATFORM-SPECIFIC ARGUMENTS

These are specific to each OS. If it does not apply to the execution module for your OS, it is ignored.

param bool hold Force the package to be held at the current installed version. Currently works with YUM/DNF & APT based systems.

New in version 2014.7.0.

param bool update_holds If `True`, and this function would update the package version, any packages which are being held will be temporarily unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and the state will fail. By default, this parameter is set to `False`.

Currently works with YUM/DNF & APT based systems.

New in version 2016.11.0.

param list names A list of packages to install from a software repository. Each package will be installed individually by the package manager.

> **Warning:** Unlike `pkgs`, the `names` parameter cannot specify a version. In addition, it makes a separate call to the package management frontend to install each package, whereas `pkgs` makes just a single call. It is therefore recommended to use `pkgs` instead of `names` to install multiple packages, both for the additional features and the performance improvement that it brings.

param bool install_recommends Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
```

```
    - install_recommends: False
```

param bool only_upgrade Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.installed:
    - only_upgrade: True
```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

Parameters **`report_reboot_exit_codes`** (*bool*) --
If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.installed:
    - name: ms-vcpp
    - version: 10.0.40219
    - report_reboot_exit_codes: False
```

return A dictionary containing the state of the software installation
rtype dict

Note: The `pkg.installed` state supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. In many cases, Salt is clever enough to transparently reload the modules. For example, if you install a package, Salt reloads modules because some other module or state might require the package which was installed. However, there are some edge cases where this may not be the case, which is what `reload_modules` is meant to resolve.

You should only use `reload_modules` if your `pkg.installed` does some sort of installation where if you do not reload the modules future items in your state which rely on the software being installed will fail. Please see the *Reloading Modules* documentation for more information.

`salt.states.pkg.`**`latest`**(*name*, *refresh=None*, *fromrepo=None*, *skip_verify=False*, *pkgs=None*, *watch_flags=True*, ***kwargs*)

Ensure that the named package is installed and the latest available package. If the package can be updated, this state function will update the package. Generally it is better for the *`installed`* function to be used, as *`latest`* will update the package whenever a new package is available.

name The name of the package to maintain at the latest available version. This parameter is ignored if ``pkgs'' is used.

fromrepo Specify a repository from which to install

skip_verify Skip the GPG verification check for the package to be installed

refresh This parameter controls whether or not the package repo database is updated prior to checking for the latest available version of the requested packages.

If `True`, the package database will be refreshed (`apt-get update` or equivalent, depending on platform) before checking for the latest available version of the requested packages.

If `False`, the package database will *not* be refreshed before checking.

If unset, then Salt treats package database refreshes differently depending on whether or not a `pkg` state has been executed already during the current Salt run. Once a refresh has been performed in a `pkg` state, for the remainder of that Salt run no other refreshes will be performed for `pkg` states which do not explicitly set `refresh` to `True`. This prevents needless additional refreshes from slowing down the Salt run.

param str cache_valid_time New in version 2016.11.0.

This parameter sets the value in seconds after which the cache is marked as invalid, and a cache update is necessary. This overwrites the `refresh` parameter's default behavior.

Example:

```
httpd:
  pkg.latest:
    - refresh: True
    - cache_valid_time: 300
```

In this case, a refresh will not take place for 5 minutes since the last `apt-get update` was executed on the system.

Note: This parameter is available only on Debian based distributions and has no effect on the rest.

Multiple Package Installation Options:

(Not yet supported for: FreeBSD, OpenBSD, MacOS, and Solaris pkgutil)

pkgs A list of packages to maintain at the latest available version.

```
mypkgs:
  pkg.latest:
    - pkgs:
      - foo
      - bar
      - baz
```

install_recommends Whether to install the packages marked as recommended. Default is `True`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - install_recommends: False
```

only_upgrade Only upgrade the packages, if they are already installed. Default is `False`. Currently only works with APT-based systems.

New in version 2015.5.0.

```
httpd:
  pkg.latest:
    - only_upgrade: True
```

Note: If this parameter is set to True and the package is not already installed, the state will fail.

report_reboot_exit_codes If the installer exits with a recognized exit code indicating that a reboot is required, the module function

win_system.set_reboot_required_witnessed

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, `3010` is the only recognized exit code, but this is subject to future refinement. The value of this param defaults to `True`. This parameter has no effect on non-Windows systems.

New in version 2016.11.0.

```
ms vcpp installed:
  pkg.latest:
    - name: ms-vcpp
    - report_reboot_exit_codes: False
```

salt.states.pkg.**mod_aggregate**(*low*, *chunks*, *running*)

The mod_aggregate function which looks up all packages in the available low chunks and merges them into a single pkgs ref in the present low data

salt.states.pkg.**mod_init**(*low*)

Set a flag to tell the install functions to refresh the package database. This ensures that the package database is refreshed only once during a state run significantly improving the speed of package management during a state run.

It sets a flag for a number of reasons, primarily due to timeline logic. When originally setting up the mod_init for pkg a number of corner cases arose with different package managers and how they refresh package data.

It also runs the ``ex_mod_init'' from the package manager module that is currently loaded. The ``ex_mod_init'' is expected to work as a normal ``mod_init'' function.

See also:

salt.modules.ebuild.ex_mod_init()

salt.states.pkg.**mod_watch**(*name*, ***kwargs*)

Install/reinstall a package based on a watch requisite

salt.states.pkg.**patch_downloaded**(*name*, *advisory_ids=None*, ***kwargs*)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are downloaded.

Currently supported for the following pkg providers: *yumpkg* and *zypper*

CLI Example:

```
preparing-to-fix-issues:
  pkg.patch_downloaded:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

salt.states.pkg.**patch_installed**(*name*, *advisory_ids=None*, *downloadonly=None*, ***kwargs*)

New in version 2017.7.0.

Ensure that packages related to certain advisory ids are installed.

Currently supported for the following pkg providers: *yumpkg* and *zypper*

CLI Example:

```
issue-foo-fixed:
  pkg.patch_installed:
    - advisory_ids:
      - SUSE-SLE-SERVER-12-SP2-2017-185
      - SUSE-SLE-SERVER-12-SP2-2017-150
      - SUSE-SLE-SERVER-12-SP2-2017-120
```

salt.states.pkg.**purged**(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*)

Verify that a package is not installed, calling `pkg.purge` if necessary to purge the package. All configuration files are also removed.

name The name of the package to be purged.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *pkg.installed*, *pkg.removed*, and *pkg.purged* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.purged:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.purged:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to purge. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.`**`removed`**(*name*, *version=None*, *pkgs=None*, *normalize=True*, *ignore_epoch=False*, ***kwargs*)

Verify that a package is not installed, calling `pkg.remove` if necessary to remove the package.

name The name of the package to be removed.

version The version of the package that should be removed. Don't do anything if the package is installed with an unmatching version.

Important: As of version 2015.8.7, for distros which use yum/dnf, packages which have a version with a nonzero epoch (that is, versions which start with a number followed by a colon like in the example above) must have the epoch included when specifying the version number. For example:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

In version 2015.8.9, an **ignore_epoch** argument has been added to *pkg.installed*, *pkg.removed*, and *pkg.purged* states, which causes the epoch to be disregarded when the state checks to see if the desired version was installed. If **ignore_epoch** was not set to `True`, and instead of `2:7.4.160-1.el7` a version of `7.4.160-1.el7` were used, this state would report success since the actual installed version includes the epoch, and the specified version would not match.

---

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

ignore_epoch [False] When a package version contains an non-zero epoch (e.g. `1:3.14.159-2.el7`, and a specific version of a package is desired, set this option to `True` to ignore the epoch when comparing versions. This allows for the following SLS to be used:

```
# Actual vim-enhanced version: 2:7.4.160-1.el7
vim-enhanced:
  pkg.removed:
    - version: 7.4.160-1.el7
    - ignore_epoch: True
```

Without this option set to `True` in the above example, the state would falsely report success since the actual installed version is `2:7.4.160-1.el7`. Alternatively, this option can be left as `False` and the full version string (with epoch) can be specified in the SLS file:

```
vim-enhanced:
  pkg.removed:
    - version: 2:7.4.160-1.el7
```

New in version 2015.8.9.

Multiple Package Options:

pkgs A list of packages to remove. Must be passed as a python list. The `name` parameter will be ignored if this option is passed. It accepts version numbers as well.

New in version 0.16.0.

`salt.states.pkg.`**`uptodate`**(*name*, *refresh=False*, *pkgs=None*, ***kwargs*)

New in version 2014.7.0.

Verify that the system is completely up to date.

name The name has no functional value and is only used as a tracking reference

refresh refresh the package database before checking for new upgrades

pkgs list of packages to upgrade

Parameters **`cache_valid_time`** (*str*) -- This parameter sets the value in seconds after which cache marked as invalid, and cache update is necessary. This overwrite `refresh` parameter default behavior.

In this case cache_valid_time is set, refresh will not take place for amount in seconds since last `apt-get update` executed on the system.

Note: This parameter available only on Debian based distributions, and have no effect on the rest.

---

kwargs Any keyword arguments to pass through to `pkg.upgrade`.

New in version 2015.5.0.

19.19.183 salt.states.pkgbuild

The pkgbuild state is the front of Salt package building backend. It automatically builds DEB and RPM packages from specified sources

New in version 2015.8.0.

```
salt_2015.5.2:
  pkgbuild.built:
    - runas: thatch
    - results:
      - salt-2015.5.2-2.el7.centos.noarch.rpm
      - salt-api-2015.5.2-2.el7.centos.noarch.rpm
      - salt-cloud-2015.5.2-2.el7.centos.noarch.rpm
      - salt-master-2015.5.2-2.el7.centos.noarch.rpm
      - salt-minion-2015.5.2-2.el7.centos.noarch.rpm
      - salt-ssh-2015.5.2-2.el7.centos.noarch.rpm
      - salt-syndic-2015.5.2-2.el7.centos.noarch.rpm
    - dest_dir: /tmp/pkg
    - spec: salt://pkg/salt/spec/salt.spec
    - template: jinja
    - deps:
      - salt://pkg/salt/sources/required_dependency.rpm
    - tgt: epel-7-x86_64
    - sources:
      - salt://pkg/salt/sources/logrotate.salt
      - salt://pkg/salt/sources/README.fedora
      - salt://pkg/salt/sources/salt-2015.5.2.tar.gz
      - salt://pkg/salt/sources/salt-2015.5.2-tests.patch
```

```
      - salt://pkg/salt/sources/salt-api
      - salt://pkg/salt/sources/salt-api.service
      - salt://pkg/salt/sources/salt-master
      - salt://pkg/salt/sources/salt-master.service
      - salt://pkg/salt/sources/salt-minion
      - salt://pkg/salt/sources/salt-minion.service
      - salt://pkg/salt/sources/saltpkg.sls
      - salt://pkg/salt/sources/salt-syndic
      - salt://pkg/salt/sources/salt-syndic.service
      - salt://pkg/salt/sources/SaltTesting-2015.5.8.tar.gz
/tmp/pkg:
  pkgbuild.repo
```

salt.states.pkgbuild.**built**(*name*, *runas*, *dest_dir*, *spec*, *sources*, *tgt*, *template=None*, *deps=None*, *env=None*, *results=None*, *force=False*, *saltenv='base'*, *log_dir='/var/log/salt/pkgbuild'*)

Ensure that the named package is built and exists in the named directory

name The name to track the build, the name value is otherwise unused

runas The user to run the build process as

dest_dir The directory on the minion to place the built package(s)

spec The location of the spec file (used for rpms)

sources The list of package sources

tgt The target platform to run the build on

template Run the spec file through a templating engine

> Changed in version 2015.8.2: This argument is now optional, allowing for no templating engine to be used if none is desired.

deps Packages required to ensure that the named package is built can be hosted on either the salt master server or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials

env A dictionary of environment variables to be set prior to execution. Example:

```
- env:
    DEB_BUILD_OPTIONS: 'nocheck'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.

results The names of the expected rpms that will be built

force [False] If `True`, packages will be built even if they already exist in the `dest_dir`. This is useful when building a package for continuous or nightly package builds.

> New in version 2015.8.2.

saltenv The saltenv to use for files downloaded from the salt filesever

log_dir [/var/log/salt/rpmbuild] Root directory for log files created from the build. Logs will be organized by package name, version, OS release, and CPU architecture under this directory.

> New in version 2015.8.2.

salt.states.pkgbuild.**repo**(*name*, *keyid=None*, *env=None*, *use_passphrase=False*, *gnupghome='/etc/salt/gpgkeys'*, *runas='builder'*, *timeout=15.0*)

Make a package repository and optionally sign it and packages present

The name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

name The directory to find packages that will be in the repository

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```
gpg_pkg_priv_key: |
  -----BEGIN PGP PRIVATE KEY BLOCK-----
  Version: GnuPG v1

  lQO+BFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  Ebe+8JCQTwqSXPRTzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn

  =JvW8
  -----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
  -----BEGIN PGP PUBLIC KEY BLOCK-----
  Version: GnuPG v1

  mQENBFciIfQBCADAPCtzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
  w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6VO4ysvVz28UbnhPxsIkOlf2cq8qc
  .
  .
  bYP7t5iwJmQzRMyFInYRt77wkJBPCpJc9FPNebL9vlZcN4zv0KQta+4alcWivvoP
  4QIxE+/+trC6QRw2m2dHk6aAeq/J0Sc7ilZufwnNA71hf9SzRIwcFXMsLx4iLlki
  inNqW9c=
  =s1CX
  -----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub
```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository. Example:

```
- env:
    OPTIONS: 'ask-passphrase'
```

> **Warning:** The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found *here*.
>
> Use of `OPTIONS` on some platforms, for example: `ask-passphrase`, will require `gpg-agent` or similar to cache passphrases.

Note: This parameter is not used for making `yum` repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid'

runas [builder] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

---

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

19.19.184 salt.states.pkgng

Manage package remote repo using FreeBSD pkgng

Salt can manage the URL pkgng pulls packages from. ATM the state and module are small so use cases are typically rather simple:

```
pkgng_clients:
  pkgng.update_packaging_site:
    - name: "http://192.168.0.2"
```

19.19.185 salt.states.pkgrepo

Management of APT/DNF/YUM/Zypper package repos

States for managing software package repositories on Linux distros. Supported package managers are APT, DNF, YUM and Zypper. Here is some example SLS:

```
base:
  pkgrepo.managed:
    - humanname: CentOS-$releasever - Base
    - mirrorlist: http://mirrorlist.centos.org/?release=$releasever&arch=$basearch&
 ↪repo=os
    - comments:
        - 'http://mirror.centos.org/centos/$releasever/os/$basearch/'
    - gpgcheck: 1
    - gpgkey: file:///etc/pki/rpm-gpg/RPM-GPG-KEY-CentOS-6
```

```
base:
  pkgrepo.managed:
    - humanname: Logstash PPA
    - name: deb http://ppa.launchpad.net/wolfnet/logstash/ubuntu precise main
    - dist: precise
    - file: /etc/apt/sources.list.d/logstash.list
    - keyid: 28B04E4A
    - keyserver: keyserver.ubuntu.com
    - require_in:
```

```
      - pkg: logstash

  pkg.latest:
    - name: logstash
    - refresh: True
```

```
base:
  pkgrepo.managed:
    - humanname: deb-multimedia
    - name: deb http://www.deb-multimedia.org stable main
    - file: /etc/apt/sources.list.d/deb-multimedia.list
    - key_url: salt://deb-multimedia/files/marillat.pub
```

```
base:
  pkgrepo.managed:
    - humanname: Google Chrome
    - name: deb http://dl.google.com/linux/chrome/deb/ stable main
    - dist: stable
    - file: /etc/apt/sources.list.d/chrome-browser.list
    - require_in:
      - pkg: google-chrome-stable
    - gpgcheck: 1
    - key_url: https://dl-ssl.google.com/linux/linux_signing_key.pub
```

```
base:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
  pkg.latest:
    - name: logstash
    - refresh: True
```

Note: On Ubuntu systems, the `python-software-properties` package should be installed for better support of PPA repositories. To check if this package is installed, run `dpkg -l python-software-properties`.

Also, some Ubuntu releases have a bug in their `python-software-properties` package, a missing dependency on pycurl, so `python-pycurl` will need to be manually installed if it is not present once `python-software-properties` is installed.

On Ubuntu & Debian systems, the `` `python-apt `` package is required to be installed. To check if this package is installed, run `dpkg -l python-software-properties`. `python-apt` will need to be manually installed if it is not present.

`salt.states.pkgrepo.`**`absent`**(*name*, ***kwargs*)

This function deletes the specified repo on the system, if it exists. It is essentially a wrapper around pkg.del_repo.

name The name of the package repo, as it would be referred to when running the regular package manager commands.

UBUNTU-SPECIFIC OPTIONS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name.

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be specified. This is required for matching if the name format uses the `ppa:` specifier and is private (requires username/password to access, which is encoded in the URI).

```
logstash-ppa:
  pkgrepo.absent:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

keyid If passed, then the GPG key corresponding to the passed KeyID will also be removed.

keyid_ppa [False] If set to `True`, the GPG key's ID will be looked up from ppa.launchpad.net and removed, and the `keyid` argument will be ignored.

Note: This option will be disregarded unless the `ppa` argument is present.

`salt.states.pkgrepo.`**`managed`**(*name*, *ppa=None*, ***kwargs*)

This state manages software package repositories. Currently, *yum*, *apt*, and *zypper* repositories are supported.

YUM/DNF/ZYPPER-BASED SYSTEMS

Note: One of `baseurl` or `mirrorlist` below is required. Additionally, note that this state is not presently capable of managing more than one repo in a single repo file, so each instance of this state will manage a single repo file containing the configuration for a single repo.

---

name This value will be used in two ways: Firstly, it will be the repo ID, as seen in the entry in square brackets (e.g. `[foo]`) for a given repo. Secondly, it will be the name of the file as stored in /etc/yum.repos.d (e.g. `/etc/yum.repos.d/foo.conf`).

enabled [True] Whether or not the repo is enabled. Can be specified as True/False or 1/0.

disabled [False] Included to reduce confusion due to APT's use of the `disabled` argument. If this is passed for a YUM/DNF/Zypper-based distro, then the reverse will be passed as `enabled`. For example passing `disabled=True` will assume `enabled=False`.

humanname This is used as the ``name'' value in the repo file in `/etc/yum.repos.d/` (or `/etc/zypp/repos.d` for SUSE distros).

baseurl The URL to a yum repository

mirrorlist A URL which points to a file containing a collection of baseurls

comments Sometimes you want to supply additional information, but not as enabled configuration. Anything supplied for this list will be saved in the repo configuration with a comment marker (#) in front.

gpgautoimport Only valid for Zypper package manager. If set to True, automatically trust and import public GPG key for the repository. The key should be specified with `gpgkey` parameter. See details below.

Additional configuration values seen in YUM/DNF/Zypper repo files, such as `gpgkey` or `gpgcheck`, will be used directly as key-value pairs. For example:

```
foo:
  pkgrepo.managed:
    - humanname: Personal repo for foo
    - baseurl: https://mydomain.tld/repo/foo/$releasever/$basearch
    - gpgkey: file:///etc/pki/rpm-gpg/foo-signing-key
    - gpgcheck: 1
```

APT-BASED SYSTEMS

ppa On Ubuntu, you can take advantage of Personal Package Archives on Launchpad simply by specifying the user and archive name. The keyid will be queried from launchpad and everything else is set automatically. You can override any of the below settings by simply setting them as you would normally.

For example:

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
```

ppa_auth For Ubuntu PPAs there can be private PPAs that require authentication to access. For these PPAs the username/password can be passed as an HTTP Basic style username/password combination.

```
logstash-ppa:
  pkgrepo.managed:
    - ppa: wolfnet/logstash
    - ppa_auth: username:password
```

name On apt-based systems this must be the complete entry as it would be seen in the sources.list file. This can have a limited subset of components (i.e. `main') which can be added/modified with the `comps` option.

```
precise-repo:
  pkgrepo.managed:
    - name: deb http://us.archive.ubuntu.com/ubuntu precise main
```

Note: The above example is intended as a more readable way of configuring the SLS, it is equivalent to the following:

```
'deb http://us.archive.ubuntu.com/ubuntu precise main':
  pkgrepo.managed
```

---

disabled [False] Toggles whether or not the repo is used for resolving dependencies and/or installing packages.

enabled [True] Included to reduce confusion due to YUM/DNF/Zypper's use of the `enabled` argument. If this is passed for an APT-based distro, then the reverse will be passed as `disabled`. For example, passing `enabled=False` will assume `disabled=False`.

architectures On apt-based systems, architectures can restrict the available architectures that the repository provides (e.g. only amd64). architectures should be a comma-separated list.

comps On apt-based systems, comps dictate the types of packages to be installed from the repository (e.g. main, nonfree, ...). For purposes of this, comps should be a comma-separated list.

file The filename for the .list that the repository is configured in. It is important to include the full-path AND make sure it is in a directory that APT will look in when handling packages

dist This dictates the release of the distro the packages should be built for. (e.g. unstable). This option is rarely needed.

keyid The KeyID of the GPG key to install. This option also requires the `keyserver` option to be set.

keyserver This is the name of the keyserver to retrieve gpg keys from. The `keyid` option must also be set for this option to work.

key_url URL to retrieve a GPG key from. Allows the usage of `http://`, `https://` as well as `salt://`.

Note: Use either `keyid`/`keyserver` or `key_url`, but not both.

---

consolidate If set to true, this will consolidate all sources definitions to the sources.list file, cleanup the now unused files, consolidate components (e.g. main) for the same URI, type, and architecture to a single line, and finally remove comments from the sources.list file. The consolidate will run every time the state is processed. The option only needs to be set on one repo managed by salt to take effect.

clean_file If set to true, empty file before config repo, dangerous if use multiple sources in one file.

New in version 2015.8.0.

refresh_db If set to false this will skip refreshing the apt package database on debian based systems.
require_in Set this to a list of pkg.installed or pkg.latest to trigger the running of apt-get update prior to attempting to install these packages. Setting a require in the pkg will not work for this.

19.19.186 salt.states.portage_config

Management of Portage package configuration on Gentoo

A state module to manage Portage configuration on Gentoo

```
salt:
    portage_config.flags:
        - use:
            - openssl
```

`salt.states.portage_config.`**`flags`**(*name*, *use=None*, *accept_keywords=None*, *env=None*, *license=None*, *properties=None*, *unmask=False*, *mask=False*)

Enforce the given flags on the given package or DEPEND atom.

> **Warning:** In most cases, the affected package(s) need to be rebuilt in order to apply the changes.

name The name of the package or its DEPEND atom
use A list of USE flags
accept_keywords A list of keywords to accept. ~ARCH means current host arch, and will be translated into a line without keywords
env A list of environment files
license A list of accepted licenses
properties A list of additional properties
unmask A boolean to unmask the package
mask A boolean to mask the package

`salt.states.portage_config.`**`mod_init`**(*low*)

Enforce a nice structure on the configuration files.

19.19.187 salt.states.ports

Manage software from FreeBSD ports

New in version 2014.1.0.

Note: It may be helpful to use a higher timeout when running a *`ports.installed`* state, since compiling the port may exceed Salt's timeout.

```
salt -t 1200 '*' state.highstate
```

`salt.states.ports.`**`installed`**(*name*, *options=None*)

Verify that the desired port is installed, and that it was compiled with the desired options.
options Make sure that the desired non-default options are set

> **Warning:** Any build options not passed here assume the default values for the port, and are not just differences from the existing cached options from a previous `make config`.

Example usage:

```
security/nmap:
  ports.installed:
    - options:
      - IPV6: off
```

19.19.188 salt.states.postgres_cluster module

Management of PostgreSQL clusters

The postgres_cluster state module is used to manage PostgreSQL clusters. Clusters can be set as either absent or present

```
create cluster 9.3 main:
  postgres_cluster.present:
      - name: 'main'
      - version: '9.3'
```

`salt.states.postgres_cluster.`**`absent`**(*version*, *name*)

Ensure that the named cluster is absent

version Version of the postgresql server of the cluster to remove

name The name of the cluster to remove

New in version 2015.XX.

`salt.states.postgres_cluster.`**`present`**(*version*, *name*, *port=None*, *encoding=None*, *locale=None*, *datadir=None*)

Ensure that the named cluster is present with the specified properties. For more information about all of these options see man pg_createcluster(1)

version Version of the postgresql cluster

name The name of the cluster

port Cluster port

encoding The character encoding scheme to be used in this database

locale Locale with which to create cluster

datadir Where the cluster is stored

New in version 2015.XX.

19.19.189 salt.states.postgres_database

Management of PostgreSQL databases

The postgres_database module is used to create and manage Postgres databases. Databases can be set as either absent or present

```
frank:
  postgres_database.present
```

salt.states.postgres_database.**absent**(*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named database is absent

name The name of the database to remove

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

user System user all operations should be performed on behalf of

New in version 0.17.0.

salt.states.postgres_database.**present**(*name*, *tablespace=None*, *encoding=None*, *lc_collate=None*, *lc_ctype=None*, *owner=None*, *owner_recurse=False*, *template=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named database is present with the specified properties. For more information about all of these options see man createdb(1)

name The name of the database to manage

tablespace Default tablespace for the database

encoding The character encoding scheme to be used in this database

lc_collate The LC_COLLATE setting to be used in this database

lc_ctype The LC_CTYPE setting to be used in this database

owner The username of the database owner

owner_recurse Recurse owner change to all relations in the database

template The template database from which to build this database

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

New in version 0.17.0.

19.19.190 salt.states.postgres_extension

Management of PostgreSQL extensions

A module used to install and manage PostgreSQL extensions.

```
adminpack:
  postgres_extension.present
```

New in version 2014.7.0.

salt.states.postgres_extension.**absent**(*name*, *if_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *maintenance_db=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named extension is absent.

name Extension name of the extension to remove

if_exists Add if exist slug

restrict Add restrict slug

cascade Drop on cascade

user System user all operations should be performed on behalf of

maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_extension.**present**(*name*, *if_not_exists=None*, *schema=None*, *ext_version=None*, *from_version=None*, *user=None*, *maintenance_db=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named extension is present.

Note: Before you can use the state to load an extension into a database, the extension's supporting files must be already installed.

For more information about all of these options see `CREATE EXTENSION` SQL command reference in the PostgreSQL documentation.
name The name of the extension to be installed
if_not_exists Add an `IF NOT EXISTS` parameter to the DDL statement
schema Schema to install the extension into
ext_version Version to install
from_version Old extension version if already installed
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

19.19.191 salt.states.postgres_group

Management of PostgreSQL groups (roles)

The postgres_group module is used to create and manage Postgres groups.

```
frank:
  postgres_group.present
```

salt.states.postgres_group.**absent**(*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named group is absent
name The groupname of the group to remove
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or defaul
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_group.**present**(*name*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *superuser=None*, *inherit=None*, *login=None*, *replication=None*, *password=None*, *refresh_password=None*, *groups=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named group is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seen as roles with the LOGIN privilege and groups the others.

name The name of the group to manage

createdb Is the group allowed to create databases?

createroles Is the group allowed to create other roles/users

createuser Alias to create roles, and history problem, in pgsql normally createuser == superuser

encrypted Should the password be encrypted in the system catalog?

login Should the group have login perm

inherit Should the group inherit permissions

superuser Should the new group be a ``superuser''

replication Should the new group be allowed to initiate streaming replication

password The group's password It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is True, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups A string of comma separated groups the group should be in

user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

19.19.192 salt.states.postgres_initdb

Initialization of PostgreSQL data directory

The postgres_initdb module is used to initialize the postgresql data directory.

New in version 2016.3.0.

```
pgsql-data-dir:
  postgres_initdb.present:
    - name: /var/lib/pgsql/data
    - auth: password
    - user: postgres
    - password: strong_password
```

```
    - encoding: UTF8
    - locale: C
    - runas: postgres
```

salt.states.postgres_initdb.**present**(*name*, *user=None*, *password=None*, *auth='password'*, *encoding='UTF8'*, *locale=None*, *runas=None*)

Initialize the PostgreSQL data directory
name The name of the directory to initialize
user The database superuser name
password The password to set for the postgres user
auth The default authentication method for local connections
encoding The default encoding for new databases
locale The default locale for new databases
runas The system user the operation should be performed on behalf of

19.19.193 salt.states.postgres_language

Management of PostgreSQL languages

The postgres_language module is used to create and manage Postgres languages. Languages can be set as either absent or present

New in version 2016.3.0.

```
plpgsql:
  postgres_language.present:
    - maintenance_db: testdb
```

```
plpgsql:
  postgres_language.absent:
    - maintenance_db: testdb
```

salt.states.postgres_language.**absent**(*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that a named language is absent in the specified database.
name The name of the language to remove
maintenance_db The name of the database in which the language is to be installed
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_language.**present**(*name*, *maintenance_db*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that a named language is present in the specified database.
name The name of the language to install
maintenance_db The name of the database in which the language is to be installed
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

19.19.194 salt.states.postgres_privileges

Management of PostgreSQL Privileges

The postgres_privileges module is used to manage Postgres privileges. Privileges can be set as either absent or present.

Privileges can be set on the following database object types:

- database
- schema
- tablespace
- table
- sequence
- language
- group

Setting the grant option is supported as well.

New in version 2016.3.0.

```
baruwa:
  postgres_privileges.present:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - grant_option: False
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.present:
    - object_name: admins
    - object_type: group
    - grant_option: False
    - maintenance_db: testdb
```

```
baruwa:
  postgres_privileges.absent:
    - object_name: awl
    - object_type: table
    - privileges:
      - SELECT
      - INSERT
      - DELETE
    - prepend: public
    - maintenance_db: testdb
```

```
andrew:
  postgres_privileges.absent:
    - object_name: admins
```

```
    - object_type: group
    - maintenance_db: testdb
```

salt.states.postgres_privileges.**absent**(*name*, *object_name*, *object_type*, *privileges=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Revoke the requested privilege(s) on the specificed object(s)

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when revoking group membership

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

salt.states.postgres_privileges.**present**(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Grant the requested privilege(s) on the specified object to a role

name Name of the role to which privileges should be granted

object_name Name of the object on which the grant is to be performed. `ALL' may be used for objects of type `table' or `sequence'.

object_type The object type, which can be one of the following:

- table
- sequence

- schema
- tablespace
- language
- database
- group
- function

privileges List of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

note privileges should not be set when granting group membership

grant_option If grant_option is set to True, the recipient of the privilege can in turn grant it to others

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The name of the database in which the language is to be installed

user System user all operations should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

19.19.195 salt.states.postgres_schema

Management of PostgreSQL schemas

The postgres_schemas module is used to create and manage Postgres schemas.

```
public:
  postgres_schema.present 'dbname' 'name'
```

salt.states.postgres_schema.**absent**(*dbname*, *name*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named schema is absent.

dbname The database's name will work on

name The name of the schema to remove

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

salt.states.postgres_schema.**present**(*dbname*, *name*, *owner=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named schema is present in the database.

dbname The database's name will work on

name The name of the schema to manage
owner The database user that will be the owner of the schema
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

19.19.196 salt.states.postgres_tablespace

Management of PostgreSQL tablespace

A module used to create and manage PostgreSQL tablespaces.

```
ssd-tablespace:
  postgres_tablespace.present:
    - name: indexes
    - directory: /mnt/ssd-data
```

New in version 2015.8.0.

salt.states.postgres_tablespace.**absent**(*name*, *user=None*, *maintenance_db=None*, *db_user=None*, *db_password=None*, *db_host=None*, *db_port=None*)

Ensure that the named tablespace is absent.
name The name of the tablespace to remove
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or defaul
db_password User password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_tablespace.**present**(*name*, *directory*, *options=None*, *owner=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named tablespace is present with the specified properties. For more information about all of these options run `man 7 create_tablespace`.
name The name of the tablespace to create/manage.
directory The directory where the tablespace will be located, must already exist
options A dictionary of options to specify for the tablespace. Currently, the only tablespace options supported are `seq_page_cost` and `random_page_cost`. Default values are shown in the example below:

```
my_space:
  postgres_tablespace.present:
    - directory: /srv/my_tablespace
    - options:
        seq_page_cost: 1.0
        random_page_cost: 4.0
```

owner The database user that will be the owner of the tablespace. Defaults to the user executing the command (i.e. the *user* option)
user System user all operations should be performed on behalf of
maintenance_db Database to act on
db_user Database username if different from config or default
db_password User password if any password for a specified user

db_host Database host if different from config or default
db_port Database port if different from config or default

19.19.197 salt.states.postgres_user

Management of PostgreSQL users (roles)

The postgres_users module is used to create and manage Postgres users.

```
frank:
  postgres_user.present
```

salt.states.postgres_user.**absent**(*name*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named user is absent
name The username of the user to remove
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

salt.states.postgres_user.**present**(*name*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *superuser=None*, *replication=None*, *inherit=None*, *login=None*, *password=None*, *default_password=None*, *refresh_password=None*, *groups=None*, *user=None*, *maintenance_db=None*, *db_password=None*, *db_host=None*, *db_port=None*, *db_user=None*)

Ensure that the named user is present with the specified privileges Please note that the user/group notion in postgresql is just abstract, we have roles, where users can be seens as roles with the LOGIN privilege and groups the others.
name The name of the system user to manage.
createdb Is the user allowed to create databases?
createroles Is the user allowed to create other users?
createuser Alias to create roles
encrypted Should the password be encrypted in the system catalog?
login Should the group have login perm
inherit Should the group inherit permissions
superuser Should the new user be a ``superuser''
replication Should the new user be allowed to initiate streaming replication
password The system user's password. It can be either a plain string or a md5 postgresql hashed password:

```
'md5{MD5OF({password}{role}}'
```

If encrypted is None or True, the password will be automatically encrypted to the previous format if it is not already done.
default_password The password used only when creating the user, unless password is set.

New in version 2016.3.0.

refresh_password Password refresh flag

Boolean attribute to specify whether to password comparison check should be performed.

If refresh_password is `True`, the password will be automatically updated without extra password change check.

This behaviour makes it possible to execute in environments without superuser access available, e.g. Amazon RDS for PostgreSQL

groups A string of comma separated groups the user should be in
user System user all operations should be performed on behalf of

New in version 0.17.0.

db_user Postgres database username, if different from config or default.
db_password Postgres user's password, if any password, for a specified db_user.
db_host Postgres database host, if different from config or default.
db_port Postgres database port, if different from config or default.

19.19.198 salt.states.powerpath

Powerpath configuration support

Allows configuration of EMC Powerpath. Currently only addition/deletion of licenses is supported.

```
key:
  powerpath.license_present: []
```

`salt.states.powerpath.`**`license_absent`**(*name*)
Ensures that the specified PowerPath license key is absent on the host.
name The license key to ensure is absent

`salt.states.powerpath.`**`license_present`**(*name*)
Ensures that the specified PowerPath license key is present on the host.
name The license key to ensure is present

19.19.199 salt.states.probes

Network Probes

Configure RPM (JunOS)/SLA (Cisco) probes on the device via NAPALM proxy.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

- *napalm probes management module*

`salt.states.probes.`**`managed`**(*name*, *probes*, *defaults=None*)
Ensure the networks device is configured as specified in the state SLS file. Probes not specified will be removed, while probes not confiured as expected will trigger config updates.
Parameters

- **probes** -- Defines the probes as expected to be configured on the device. In order to ease the configuration and avoid repeating the same parameters for each probe, the next parameter (defaults) can be used, providing common characteristics.
- **defaults** -- Specifies common parameters for the probes.

SLS Example:

```
rpmprobes:
    probes.managed:
        - probes:
            probe_name1:
                probe1_test1:
                    source: 192.168.0.2
                    target: 192.168.0.1
                probe1_test2:
                    target: 172.17.17.1
                probe1_test3:
                    target: 8.8.8.8
                    probe_type: http-ping
            probe_name2:
                probe2_test1:
                    test_interval: 100
        - defaults:
            target: 10.10.10.10
            probe_count: 15
            test_interval: 3
            probe_type: icmp-ping
```

In the probes configuration, the only mandatory attribute is *target* (specified either in probes configuration, either in the defaults dictionary). All the other parameters will use the operating system defaults, if not provided:

- `source` - Specifies the source IP Address to be used during the tests. If not specified will use the IP Address of the logical interface loopback0.
- `target` - Destination IP Address.
- `probe_count` - Total number of probes per test (1..15). System defaults: 1 on both JunOS & Cisco.
- `probe_interval` - Delay between tests (0..86400 seconds). System defaults: 3 on JunOS, 5 on Cisco.
- `probe_type` - Probe request type. Available options:
  - icmp-ping
  - tcp-ping
  - udp-ping

Using the example configuration above, after running the state, on the device will be configured 4 probes, with the following properties:

```
probe_name1:
    probe1_test1:
        source: 192.168.0.2
        target: 192.168.0.1
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
    probe1_test2:
        target: 172.17.17.1
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
    probe1_test3:
        target: 8.8.8.8
        probe_count: 15
```

```
        test_interval: 3
        probe_type: http-ping
probe_name2:
    probe2_test1:
        target: 10.10.10.10
        probe_count: 15
        test_interval: 3
        probe_type: icmp-ping
```

19.19.200 salt.states.process

Process Management

Ensure a process matching a given pattern is absent.

```
httpd-absent:
  process.absent:
    - name: apache2
```

salt.states.process.**absent**(*name*, *user=None*, *signal=None*)

Ensures that the named command is not running.

name The pattern to match.

user The user process belongs

signal Signal to send to the process(es).

19.19.201 salt.states.proxy module

Allows you to manage proxy settings on minions

Setup proxy settings on minions

```
192.168.1.4:
  proxy.managed:
    - port: 3128
    - bypass_domains:
        - localhost
        - 127.0.0.1
```

salt.states.proxy.**managed**(*name*, *port*, *services=None*, *user=None*, *password=None*, *bypass_domains=None*, *network_service='Ethernet'*)

Manages proxy settings for this mininon

name The proxy server to use

port The port used by the proxy server

services A list of the services that should use the given proxy settings, valid services include http, https and ftp. If no service is given all of the valid services will be used.

user The username to use for the proxy server if required

password The password to use if required by the server

bypass_domains An array of the domains that should bypass the proxy

network_service The network service to apply the changes to, this only necessary on macOS

19.19.202 salt.states.pushover

Send a message to PushOver

This state is useful for sending messages to PushOver during state runs.

New in version 2015.5.0.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
    - message: 'This state was executed successfully.'
```

The api key can be specified in the master or minion configuration like below: .. code-block:: yaml

pushover: token: peWcBiMOS9HrZG15peWcBiMOS9HrZG15

`salt.states.pushover.`**`post_message`**(*name*, *user=None*, *device=None*, *message=None*, *title=None*, *priority=None*, *expire=None*, *retry=None*, *sound=None*, *api_version=1*, *token=None*)

Send a message to a PushOver channel.

```
pushover-message:
  pushover.post_message:
    - user: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - token: xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
    - title: Salt Returner
    - device: phone
    - priority: -1
    - expire: 3600
    - retry: 5
```

The following parameters are required:
name The unique name for this event.
user The user or group of users to send the message to. Must be ID of user, not name or email address.
message The message that is to be sent to the PushOver channel.
The following parameters are optional:
title The title to use for the message.
device The device for the user to send the message to.
priority The priority for the message.
expire The message should expire after specified amount of seconds.
retry The message should be resent this many times.
token The token for PushOver to use for authentication, if not specified in the configuration options of master or minion.

19.19.203 salt.states.pyenv

Managing python installations with pyenv

This module is used to install and manage python installations with pyenv. Different versions of python can be installed, and uninstalled. pyenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which pyenv will need to compile the versions of python.

If pyenv is run as the root user then it will be installed to /usr/local/pyenv, otherwise it will be installed to the users ~/.pyenv directory. To make pyenv available in the shell you may need to add the pyenv/shims and pyenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access pyenv then you will need to add pyenv_ROOT to their environment.

This is how a state configuration could look like:

```
pyenv-deps:
  pkg.installed:
    - pkgs:
      - make
      - build-essential
      - libssl-dev
      - zlib1g-dev
      - libbz2-dev
      - libreadline-dev
      - libsqlite3-dev
      - wget
      - curl
      - llvm
python-2.6:
  pyenv.absent:
    - require:
      - pkg: pyenv-deps

python-2.7.6:
  pyenv.installed:
    - default: True
    - require:
      - pkg: pyenv-deps
```

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

salt.states.pyenv.**absent**(*name*, *user=None*)

Verify that the specified python is not installed with pyenv. pyenv is installed if necessary.

name The version of python to uninstall

user: **None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

salt.states.pyenv.**install_pyenv**(*name*, *user=None*)

Install pyenv if not installed. Allows you to require pyenv be installed prior to installing the plugins. Useful if you want to install pyenv plugins via the git or file modules and need them installed before installing any rubies.

Use the pyenv.root configuration option to set the path for pyenv if you want a system wide install that is not in a user home dir.

user: **None** The user to run pyenv as.

salt.states.pyenv.**installed**(*name*, *default=False*, *user=None*)
Verify that the specified python is installed with pyenv. pyenv is installed if necessary.
name The version of python to install
default [False] Whether to make this python the default.
user: **None** The user to run pyenv as.

New in version 0.17.0.

New in version 0.16.0.

19.19.204 salt.states.pyrax_queues

Manage Rackspace Queues

New in version 2015.5.0.

Create and destroy Rackspace queues. Be aware that this interacts with Rackspace's services, and so may incur charges.

This module uses `pyrax`, which can be installed via package, or pip. This module is greatly inspired by boto_* modules from SaltStack code source.

```
myqueue:
    pyrax_queues.present:
        - provider: my-pyrax

myqueue:
    pyrax_queues.absent:
        - provider: my-pyrax
```

salt.states.pyrax_queues.**absent**(*name*, *provider*)
Ensure the named Rackspace queue is deleted.
name Name of the Rackspace queue.
provider Salt Cloud provider

salt.states.pyrax_queues.**present**(*name*, *provider*)
Ensure the RackSpace queue exists.
name Name of the Rackspace queue.
provider Salt Cloud Provider

19.19.205 salt.states.quota

Management of POSIX Quotas

The quota can be managed for the system:

```
/:
  quota.mode:
    mode: off
    quotatype: user
```

salt.states.quota.**mode**(*name*, *mode*, *quotatype*)
Set the quota for the system
name The filesystem to set the quota mode on
mode Whether the quota system is on or off
quotatype Must be `user` or `group`

19.19.206 salt.states.rabbitmq_cluster

Manage RabbitMQ Clusters

Example:

```
rabbit@rabbit.example.com:
  rabbitmq_cluster.join:
    - user: rabbit
    - host: rabbit.example.com
```

salt.states.rabbitmq_cluster.**join**(*name*, *host*, *user='rabbit'*, *ram_node=None*, *runas='root'*)

This function is an alias of `joined`.

Ensure the current node joined to a cluster with node user@host

name Irrelevant, not used (recommended: user@host)

user The user of node to join to (default: rabbit)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the rabbitmq command as

salt.states.rabbitmq_cluster.**joined**(*name*, *host*, *user='rabbit'*, *ram_node=None*, *runas='root'*)

Ensure the current node joined to a cluster with node user@host

name Irrelevant, not used (recommended: user@host)

user The user of node to join to (default: rabbit)

host The host of node to join to

ram_node Join node as a RAM node

runas The user to run the rabbitmq command as

19.19.207 salt.states.rabbitmq_plugin

Manage RabbitMQ Plugins

New in version 2014.1.0.

Example:

```
some_plugin:
  rabbitmq_plugin.enabled: []
```

salt.states.rabbitmq_plugin.**disabled**(*name*, *runas=None*)

Ensure the RabbitMQ plugin is disabled.

name The name of the plugin

runas The user to run the rabbitmq-plugin command as

salt.states.rabbitmq_plugin.**enabled**(*name*, *runas=None*)

Ensure the RabbitMQ plugin is enabled.

name The name of the plugin

runas The user to run the rabbitmq-plugin command as

19.19.208 salt.states.rabbitmq_policy

Manage RabbitMQ Policies

maintainer Benn Eichhorn <benn@getlocalmeasure.com>

maturity new

platform all

Example:

```
rabbit_policy:
  rabbitmq_policy.present:
    - name: HA
    - pattern: '.*'
    - definition: '{"ha-mode": "all"}'
```

salt.states.rabbitmq_policy.**absent**(*name*, *vhost='/'*, *runas=None*)

Ensure the named policy is absent

Reference: http://www.rabbitmq.com/ha.html

name The name of the policy to remove

runas Name of the user to run the command as

salt.states.rabbitmq_policy.**present**(*name*, *pattern*, *definition*, *priority=0*, *vhost='/'*, *runas=None*)

Ensure the RabbitMQ policy exists.

Reference: http://www.rabbitmq.com/ha.html

name Policy name

pattern A regex of queues to apply the policy to

definition A json dict describing the policy

priority Priority (defaults to 0)

vhost Virtual host to apply to (defaults to `/')

runas Name of the user to run the command as

19.19.209 salt.states.rabbitmq_user

Manage RabbitMQ Users

Example:

```
rabbit_user:
  rabbitmq_user.present:
    - password: password
    - force: True
    - tags:
      - monitoring
      - user
    - perms:
      - '/':
        - '.*'
        - '.*'
        - '.*'
    - runas: rabbitmq
```

salt.states.rabbitmq_user.**absent**(*name*, *runas=None*)

Ensure the named user is absent

name The name of the user to remove

runas User to run the command

salt.states.rabbitmq_user.**present**(*name*, *password=None*, *force=False*, *tags=None*, *perms=()*, *runas=None*)

Ensure the RabbitMQ user exists.

name User name

password User's password, if one needs to be set

force If user exists, forcibly change the password

tags Optional list of tags for the user

perms A list of dicts with vhost keys and 3-tuple values

runas Name of the user to run the command

19.19.210 salt.states.rabbitmq_vhost

Manage RabbitMQ Virtual Hosts

Example:

```
virtual_host:
  rabbitmq_vhost.present:
    - user: rabbit_user
    - conf: .*
    - write: .*
    - read: .*
```

salt.states.rabbitmq_vhost.**absent**(*name*)

Ensure the RabbitMQ Virtual Host is absent

name Name of the Virtual Host to remove

runas User to run the command

Deprecated since version 2015.8.0.

salt.states.rabbitmq_vhost.**present**(*name*)

Ensure the RabbitMQ VHost exists.

name VHost name

user Initial user permission to set on the VHost, if present

Deprecated since version 2015.8.0.

owner Initial owner permission to set on the VHost, if present

Deprecated since version 2015.8.0.

conf Initial conf string to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

write Initial write permissions to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

read Initial read permissions to apply to the VHost and user. Defaults to .*

Deprecated since version 2015.8.0.

runas Name of the user to run the command

Deprecated since version 2015.8.0.

19.19.211 salt.states.rbac_solaris

Management of Solaris RBAC

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends rbac_solaris,solaris_user

platform solaris,illumos

New in version 2016.11.0.

```
sjorge:
  rbac.managed:
    - roles:
        - netcfg
    - profiles:
        - System Power
    - authorizations:
        - solaris.audit.*
```

salt.states.rbac_solaris.**managed**(*name*, *roles=None*, *profiles=None*, *authorizations=None*)

Manage RBAC properties for user

name [string] username

roles [list] list of roles for user

profiles [list] list of profiles for user

authorizations [list] list of authorizations for user

> **Warning:** All existing roles, profiles and authorizations will be replaced! An empty list will remove everything.
>
> Set the property to *None* to not manage it.

19.19.212 salt.states.rbenv

Managing Ruby installations with rbenv

This module is used to install and manage ruby installations with rbenv and the ruby-build plugin. Different versions of ruby can be installed, and uninstalled. Rbenv will be installed automatically the first time it is needed and can be updated later. This module will *not* automatically install packages which rbenv will need to compile the versions of ruby. If your version of ruby fails to install, refer to the ruby-build documentation to verify you are not missing any dependencies: https://github.com/sstephenson/ruby-build/wiki

If rbenv is run as the root user then it will be installed to /usr/local/rbenv, otherwise it will be installed to the users ~/.rbenv directory. To make rbenv available in the shell you may need to add the rbenv/shims and rbenv/bin directories to the users PATH. If you are installing as root and want other users to be able to access rbenv then you will need to add RBENV_ROOT to their environment.

The following state configuration demonstrates how to install Ruby 1.9.x and 2.x using rbenv on Ubuntu/Debian:

```
rbenv-deps:
  pkg.installed:
    - names:
      - bash
      - git
      - openssl
      - libssl-dev
      - make
      - curl
      - autoconf
      - bison
```

```
      - build-essential
      - libffi-dev
      - libyaml-dev
      - libreadline6-dev
      - zlib1g-dev
      - libncurses5-dev

ruby-1.9.3-p429:
  rbenv.absent:
    - require:
      - pkg: rbenv-deps

ruby-2.0.0-p598:
  rbenv.installed:
    - default: True
    - require:
      - pkg: rbenv-deps
```

salt.states.rbenv.**absent**(*name*, *user=None*)

Verify that the specified ruby is not installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to uninstall

user: **None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

salt.states.rbenv.**install_rbenv**(*name*, *user=None*)

Install rbenv if not installed. Allows you to require rbenv be installed prior to installing the plugins. Useful if you want to install rbenv plugins via the git or file modules and need them installed before installing any rubies.

Use the rbenv.root configuration option to set the path for rbenv if you want a system wide install that is not in a user home dir.

user: **None** The user to run rbenv as.

salt.states.rbenv.**installed**(*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with rbenv. Rbenv is installed if necessary.

name The version of ruby to install

default [False] Whether to make this ruby the default.

user: **None** The user to run rbenv as.

New in version 0.17.0.

New in version 0.16.0.

19.19.213 salt.states.rdp

Manage RDP Service on Windows servers

salt.states.rdp.**disabled**(*name*)

Disable the RDP service

salt.states.rdp.**enabled**(*name*)

Enable the RDP service and make sure access to the RDP port is allowed in the firewall configuration

19.19.214 salt.states.redismod

Management of Redis server

New in version 2014.7.0.

depends

- redis Python module

configuration See `salt.modules.redis` for setup instructions.

```
key_in_redis:
  redis.string:
    - value: string data
```

The redis server information specified in the minion config file can be overridden in states using the following arguments: `host`, `post`, `db`, `password`.

```
key_in_redis:
  redis.string:
    - value: string data
    - host: localhost
    - port: 6379
    - db: 0
    - password: somuchkittycat
```

`salt.states.redismod.`**`absent`**(*name*, *keys=None*, ***connection_args*)

Ensure key absent from redis

name Key to ensure absent from redis

keys list of keys to ensure absent, name will be ignored if this is used

`salt.states.redismod.`**`slaveof`**(*name*, *sentinel_host=None*, *sentinel_port=None*, *sentinel_password=None*, ***connection_args*)

Set this redis instance as a slave.

name Master to make this a slave of

sentinel_host Ip of the sentinel to check for the master

sentinel_port Port of the sentinel to check for the master

`salt.states.redismod.`**`string`**(*name*, *value*, *expire=None*, *expireat=None*, ***connection_args*)

Ensure that the key exists in redis with the value specified

name Redis key to manage

value Data to persist in key

expire Sets time to live for key in seconds

expireat Sets expiration time for key via UNIX timestamp, overrides *expire*

19.19.215 salt.states.reg

Manage the Windows registry

Many python developers think of registry keys as if they were python keys in a dictionary which is not the case. The windows registry is broken down into the following components:

Hives

This is the top level of the registry. They all begin with HKEY. - HKEY_CLASSES_ROOT (HKCR) - HKEY_CURRENT_USER(HKCU) - HKEY_LOCAL MACHINE (HKLM) - HKEY_USER (HKU) - HKEY_CURRENT_CONFIG

Keys

Hives contain keys. These are basically the folders beneath the hives. They can contain any number of subkeys.

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. It is usually ``(Default)"="(value not set)". The actual value for the name and the date is Null. The registry editor will display ``(Default)" and ``(value not set)".

Example

The following example is taken from the windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\"C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe\" -s"
"NvBackend"="\"C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.exe\
 ↪""
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.
 ↪dll\",TrayApp"
```

In this example these are the values for each:

Hive: *HKEY_LOCAL_MACHINE*

Key and subkeys: *SOFTWAREMicrosoftWindowsCurrentVersionRun*

Value:

- There are 3 value names: *RTHDVCPL*, *NvBackend*, and *BTMTrayAgent*
- Each value name has a corresponding value

`salt.states.reg.`**`absent`**(*name*, *vname=None*, *use_32bit_registry=False*)

Ensure a registry value is removed. To remove a key use key_absent.

Parameters **`name`** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
`HKEY_LOCAL_MACHINE\SOFTWARE\Salt`

Valid hive values include:
•HKEY_CURRENT_USER or HKCU
•HKEY_LOCAL_MACHINE or HKLM
•HKEY_USERS or HKU

Parameters

- **`vname`** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- **`use_32bit_registry`** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns Returns a dictionary showing the results of the registry operation.
Return type dict

CLI Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.absent
    - vname: version
```

In the above example the value named `version` will be removed from the SOFTWARESalt key in the HKEY_CURRENT_USER hive. If `vname` was not passed, the (Default) value would be deleted.

`salt.states.reg.`**`key_absent`**(*name*, *use_32bit_registry=False*)

New in version 2015.5.4.

Ensure a registry key is removed. This will remove a key and all value entries it contains. It will fail if the key contains subkeys.

Parameters **`name`** (*str*) -- A string representing the full path to the key to be removed to include the hive and the keypath. The hive can be any of the following:

- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU

Parameters **`use_32bit_registry`** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.
Returns Returns a dictionary showing the results of the registry operation.
Return type dict

The following example will delete the `SOFTWARE\Salt` key and all subkeys under the `HKEY_CURRENT_USER` hive.

Example:

```
'HKEY_CURRENT_USER\SOFTWARE\Salt':
  reg.key_absent:
    - force: True
```

In the above example the path is interpreted as follows:

- `HKEY_CURRENT_USER` is the hive
- `SOFTWARE\Salt` is the key

`salt.states.reg.`**`present`**(*name*, *vname=None*, *vdata=None*, *vtype='REG_SZ'*, *use_32bit_registry=False*)

Ensure a registry key or value is present.

Parameters **`name`** (*str*) -- A string value representing the full path of the key to include the HIVE, Key, and all Subkeys. For example:
`HKEY_LOCAL_MACHINE\SOFTWARE\Salt`

Valid hive values include:

- HKEY_CURRENT_USER or HKCU
- HKEY_LOCAL_MACHINE or HKLM
- HKEY_USERS or HKU

Parameters

- **`vname`** (*str*) -- The name of the value you'd like to create beneath the Key. If this parameter is not passed it will assume you want to set the (Default) value
- **`vdata`** (*str*) -- The value you'd like to set. If a value name (vname) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type for the (Default) value is always REG_SZ and cannot be changed. This parameter is optional. If not passed, the Key will be created with no associated item/value pairs.

Parameters **vtype** (*str*) -- The value type for the data you wish to store in the registry. Valid values are:

- REG_BINARY
- REG_DWORD
- REG_EXPAND_SZ
- REG_MULTI_SZ
- REG_SZ (Default)

Parameters **use_32bit_registry** (*bool*) -- Use the 32bit portion of the registry. Applies only to 64bit windows. 32bit Windows will ignore this parameter. Default is False.

Returns Returns a dictionary showing the results of the registry operation.

Return type dict

The following example will set the `(Default)` value for the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vdata: 2016.3.1
```

The following example will set the value for the `version` entry under the `SOFTWARE\Salt` key in the `HKEY_CURRENT_USER` hive to `2016.3.1`. The value will be reflected in `Wow6432Node`:

Example:

```
HKEY_CURRENT_USER\SOFTWARE\Salt:
  reg.present:
    - vname: version
    - vdata: 2016.3.1
```

In the above example the path is interpreted as follows: - `HKEY_CURRENT_USER` is the hive - `SOFTWARE\Salt` is the key - `vname` is the value name (`version') that will be created under the key - `vdata` is the data that will be assigned to `version'

19.19.216 salt.states.rsync

State to synchronize files and directories with rsync.

New in version 2016.3.0.

```
/opt/user-backups:
  rsync.synchronized:
    - source: /home
    - force: True
```

salt.states.rsync.**synchronized**(*name*, *source*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*, *exclude=None*, *excludefrom=None*, *prepare=False*, *dryrun=False*)

Guarantees that the source directory is always copied to the target.

name Name of the target directory.

source Source directory.

prepare Create destination directory if it does not exists.

delete Delete extraneous files from the destination dirs (True or False)

force Force deletion of dirs even if not empty
update Skip files that are newer on the receiver (True or False)
passwordfile Read daemon-access password from the file (path)
exclude Exclude files, that matches pattern.
excludefrom Read exclude patterns from the file (path)
dryrun Perform a trial run with no changes made. Is the same as doing test=True

New in version 2016.3.1.

19.19.217 salt.states.rvm

Managing Ruby installations and gemsets with Ruby Version Manager (RVM)

This module is used to install and manage ruby installations and gemsets with RVM, the Ruby Version Manager. Different versions of ruby can be installed and gemsets created. RVM itself will be installed automatically if it's not present. This module will not automatically install packages that RVM depends on or ones that are needed to build ruby. If you want to run RVM as an unprivileged user (recommended) you will have to create this user yourself. This is how a state configuration could look like:

```
rvm:
  group.present: []
  user.present:
    - gid: rvm
    - home: /home/rvm
    - require:
      - group: rvm

rvm-deps:
  pkg.installed:
    - pkgs:
      - bash
      - coreutils
      - gzip
      - bzip2
      - gawk
      - sed
      - curl
      - git-core
      - subversion

mri-deps:
  pkg.installed:
    - pkgs:
      - build-essential
      - openssl
      - libreadline6
      - libreadline6-dev
      - curl
      - git-core
      - zlib1g
      - zlib1g-dev
      - libssl-dev
      - libyaml-dev
      - libsqlite3-0
      - libsqlite3-dev
      - sqlite3
      - libxml2-dev
```

```
      - libxslt1-dev
      - autoconf
      - libc6-dev
      - libncurses5-dev
      - automake
      - libtool
      - bison
      - subversion
      - ruby

jruby-deps:
  pkg.installed:
    - pkgs:
      - curl
      - g++
      - openjdk-6-jre-headless

ruby-1.9.2:
  rvm.installed:
    - default: True
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: mri-deps
      - user: rvm

jruby:
  rvm.installed:
    - user: rvm
    - require:
      - pkg: rvm-deps
      - pkg: jruby-deps
      - user: rvm

jgemset:
  rvm.gemset_present:
    - ruby: jruby
    - user: rvm
    - require:
      - rvm: jruby

mygemset:
  rvm.gemset_present:
    - ruby: ruby-1.9.2
    - user: rvm
    - require:
      - rvm: ruby-1.9.2
```

salt.states.rvm.**gemset_present**(*name*, *ruby='default'*, *user=None*)

Verify that the gemset is present.

name The name of the gemset.

ruby: **default** The ruby version this gemset belongs to.

user: **None** The user to run rvm as.

New in version 0.17.0.

salt.states.rvm.**installed**(*name*, *default=False*, *user=None*)

Verify that the specified ruby is installed with RVM. RVM is installed when necessary.

name The version of ruby to install
default [False] Whether to make this ruby the default.
user: **None** The user to run rvm as.

New in version 0.17.0.

19.19.218 salt.states.salt_proxy module

Salt proxy state

New in version 2015.8.2.

State to deploy and run salt-proxy processes on a minion.

Set up pillar data for your proxies per the documentation.

Run the state as below

..code-block:: yaml

salt-proxy-configure:

salt_proxy.configure_proxy:

- proxyname: p8000
- start: True

This state will configure the salt proxy settings within /etc/salt/proxy (if /etc/salt/proxy doesn't exists) and start the salt-proxy process (default true), if it isn't already running.

`salt.states.salt_proxy.`**`configure_proxy`**(*name*, *proxyname='p8000'*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **`name`** -- The name of this state
- **`proxyname`** -- Name to be used for this proxy (should match entries in pillar)
- **`start`** -- Boolean indicating if the process should be started

Example:

..code-block:: yaml

salt-proxy-configure:
salt_proxy.configure_proxy:
- proxyname: p8000
- start: True

19.19.219 salt.states.saltmod

Control the Salt command interface

This state is intended for use from the Salt Master. It provides access to sending commands down to minions as well as access to executing master-side modules. These state functions wrap Salt's *Python API*.

Support for masterless minions was added to the `salt.state` function, so they can run orchestration sls files. This is particularly useful when the rendering of a state is dependent on the execution of another state. Orchestration will render and execute each orchestration block independently, while honoring requisites to ensure the states are applied in the correct order.

See also:

More Orchestrate documentation

- *Full Orchestrate Tutorial*
- *The Orchestrate runner*

salt.states.saltmod.**function**(*name*, *tgt*, *ssh=False*, *tgt_type='glob'*, *expr_form=None*, *ret=''*, *expect_minions=False*, *fail_minions=None*, *fail_function=None*, *arg=None*, *kwarg=None*, *timeout=None*, *batch=None*, *subset=None*)

Execute a single module function on a remote minion via salt or salt-ssh

name The name of the function to run, aka cmd.run or pkg.install

tgt The target specification, aka `*' for all minions

tgt_type The target type, defaults to `glob`

expr_form Deprecated since version 2017.7.0: Use tgt_type instead

arg The list of arguments to pass into the function

kwarg The dict (not a list) of keyword arguments to pass into the function

ret Optionally set a single or a list of returners to use

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

fail_function An optional string that points to a salt module that returns True or False based on the returned data dict for individual minions

ssh Set to *True* to use the ssh client instead of the standard salt client

batch Execute the command *in batches*. E.g.: `10%`.

subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

salt.states.saltmod.**runner**(*name*, ***kwargs*)

Execute a runner module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

```
run-manage-up:
 salt.runner:
   - name: manage.up
```

salt.states.saltmod.**state**(*name*, *tgt*, *ssh=False*, *tgt_type='glob'*, *expr_form=None*, *ret=''*, *highstate=None*, *sls=None*, *top=None*, *saltenv=None*, *test=False*, *pillar=None*, *pillarenv=None*, *expect_minions=True*, *fail_minions=None*, *allow_fail=0*, *concurrent=False*, *timeout=None*, *batch=None*, *queue=False*, *subset=None*, *orchestration_jid=None*)

Invoke a state run on a given target

name An arbitrary name used to track the state execution

tgt The target specification for the state run.

Masterless support: When running on a masterless minion, the `tgt` is ignored and will always be the local minion.

tgt_type The target type to resolve, defaults to `glob`

expr_form Deprecated since version 2017.7.0: Use tgt_type instead

ret Optionally set a single or a list of returners to use

highstate Defaults to None, if set to True the target systems will ignore any sls references specified in the sls option and call state.highstate on the targeted minions

top Should be the name of a top file. If set state.top is called with this top file instead of state.sls.

sls A group of sls files to execute. This can be defined as a single string containing a single sls file, or a list of sls files

test Pass `test=true` through to the state function

pillar Pass the `pillar` kwarg through to the state function

pillarenv The pillar environment to grab pillars from

New in version 2017.7.0.

saltenv The default salt environment to pull sls files from

ssh Set to *True* to use the ssh client instead of the standard salt client

roster In the event of using salt-ssh, a roster system can be set

expect_minions An optional boolean for failing if some minions do not respond

fail_minions An optional list of targeted minions where failure is an option

allow_fail Pass in the number of minions to allow for failure before setting the result of the execution to False

concurrent Allow multiple state runs to occur at once.

WARNING: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same Do not use this flag for performance optimization.

queue Pass `queue=true` through to the state function

batch Execute the command *in batches*. E.g.: `10%`.

New in version 2016.3.0.

subset Number of minions from the targeted set to randomly use

New in version 2017.7.0.

Examples:

Run a list of sls files via `state.sls` on target minions:

```
webservers:
  salt.state:
    - tgt: 'web*'
    - sls:
      - apache
      - django
      - core
    - saltenv: prod
```

Run a full `state.highstate` on target mininons.

```
databases:
  salt.state:
    - tgt: role:database
    - tgt_type: grain
    - highstate: True
```

`salt.states.saltmod.`**`wait_for_event`**(*name*, *id_list*, *event_id='id'*, *timeout=300*, *node='master'*)

Watch Salt's event bus and block until a condition is met

New in version 2014.7.0.

name An event tag to watch for; supports Reactor-style globbing.

id_list A list of event identifiers to watch for -- usually the minion ID. Each time an event tag is matched the event data is inspected for `event_id`, if found it is removed from `id_list`. When `id_list` is empty this function returns success.

event_id [id] The name of a key in the event data. Default is `id` for the minion ID, another common value is `name` for use with orchestrating salt-cloud events.

timeout [300] The maximum time in seconds to wait before failing.

The following example blocks until all the listed minions complete a restart and reconnect to the Salt master:

```
reboot_all_minions:
  salt.function:
    - name: system.reboot
    - tgt: '*'

wait_for_reboots:
```

```
  salt.wait_for_event:
    - name: salt/minion/*/start
    - id_list:
      - jerry
      - stuart
      - dave
      - phil
      - kevin
      - mike
    - require:
      - salt: reboot_all_minions
```

salt.states.saltmod.**wheel**(*name*, ***kwargs*)

Execute a wheel module on the master

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the wheel function

```
accept_minion_key:
  salt.wheel:
    - name: key.accept
    - match: frank
```

19.19.220 salt.states.schedule

Management of the Salt scheduler

```
job3:
  schedule.present:
    - function: test.ping
    - seconds: 3600
    - splay: 10

This will schedule the command: test.ping every 3600 seconds
(every hour) splaying the time between 0 and 10 seconds

job2:
  schedule.present:
    - function: test.ping
    - seconds: 15
    - splay:
        start: 10
        end: 20

This will schedule the command: test.ping every 15 seconds
splaying the time between 10 and 20 seconds

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - when:
```

```
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm

This will schedule the command: state.sls httpd test=True at 5pm on Monday,
Wednesday and Friday, and 3pm on Tuesday and Thursday.  Requires that
python-dateutil is installed on the minion.

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - cron: '*/5 * * * *'

Scheduled jobs can also be specified using the format used by cron.  This will
schedule the command: state.sls httpd test=True to run every 5 minutes.  Requires
that python-croniter is installed on the minion.

job1:
  schedule.present:
    - function: state.sls
    - job_args:
      - httpd
    - job_kwargs:
        test: True
    - when:
        - Monday 5:00pm
        - Tuesday 3:00pm
        - Wednesday 5:00pm
        - Thursday 3:00pm
        - Friday 5:00pm
    - returner: xmpp
    - return_config: xmpp_state_run
    - return_kwargs:
        recipient: user@domain.com

This will schedule the command: state.sls httpd test=True at 5pm on Monday,
Wednesday and Friday, and 3pm on Tuesday and Thursday.  Using the xmpp returner
to return the results of the scheduled job, with the alternative configuration
options found in the xmpp_state_run section.
```

salt.states.schedule.**absent**(*name*, ***kwargs*)

Ensure a job is absent from the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.**disabled**(*name*, ***kwargs*)

Ensure a job is disabled in the schedule

name The unique name that is given to the scheduled job.

persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.**enabled**(*name*, ***kwargs*)

Ensure a job is enabled in the schedule

name The unique name that is given to the scheduled job.
persist Whether the job should persist between minion restarts, defaults to True.

salt.states.schedule.**present**(*name*, ***kwargs*)
Ensure a job is present in the schedule
name The unique name that is given to the scheduled job.
seconds The scheduled job will be executed after the specified number of seconds have passed.
minutes The scheduled job will be executed after the specified number of minutes have passed.
hours The scheduled job will be executed after the specified number of hours have passed.
days The scheduled job will be executed after the specified number of days have passed.
when This will schedule the job at the specified time(s). The when parameter must be a single value or a dictionary with the date string(s) using the dateutil format. Requires python-dateutil.
cron This will schedule the job at the specified time(s) using the crontab format. Requires python-croniter.
run_on_start Whether the job will run when Salt minion start. Value should be a boolean.
function The function that should be executed by the scheduled job.
job_args The arguments that will be used by the scheduled job.
job_kwargs The keyword arguments that will be used by the scheduled job.
maxrunning Ensure that there are no more than N copies of a particular job running.
jid_include Include the job into the job cache.
splay The amount of time in seconds to splay a scheduled job. Can be specified as a single value in seconds or as a dictionary range with `start' and `end' values.
range This will schedule the command within the range specified. The range parameter must be a dictionary with the date strings using the dateutil format. Requires python-dateutil.
once This will schedule a job to run once on the specified date.
once_fmt The default date format is ISO 8601 but can be overridden by also specifying the `once_fmt` option.
enabled Whether the job should be enabled or disabled. Value should be a boolean.
return_job Whether to return information to the Salt master upon job completion.
metadata Using the metadata parameter special values can be associated with a scheduled job. These values are not used in the execution of the job, but can be used to search for specific jobs later if combined with the return_job parameter. The metadata parameter must be specified as a dictionary, othewise it will be ignored.
returner The returner to use to return the results of the scheduled job.
return_config The alternative configuration to use for returner configuration options.
return_kwargs Any individual returner configuration items to override. Should be passed as a dictionary.
persist Whether the job should persist between minion restarts, defaults to True.

19.19.221 salt.states.selinux

Management of SELinux rules

If SELinux is available for the running system, the mode can be managed and booleans can be set.

```
enforcing:
    selinux.mode

samba_create_home_dirs:
    selinux.boolean:
      - value: True
      - persist: True

nginx:
    selinux.module:
      - enabled: False
```

Note: Use of these states require that the `selinux` execution module is available.

salt.states.selinux.**boolean**(*name*, *value*, *persist=False*)
Set up an SELinux boolean
name The name of the boolean to set
value The value to set on the boolean
persist Defaults to False, set persist to true to make the boolean apply on a reboot

salt.states.selinux.**fcontext_policy_absent**(*name*, *filetype='a'*, *sel_type=None*, *sel_user=None*, *sel_level=None*)
New in version 2017.7.0.

Makes sure an SELinux file context policy for a given filespec (name), filetype and SELinux context type is absent.
name filespec of the file or directory. Regex syntax is allowed.
filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to `a' (all files).
sel_type The SELinux context type. There are many.
sel_user The SELinux user.
sel_level The SELinux MLS range.

salt.states.selinux.**fcontext_policy_applied**(*name*, *recursive=False*)
New in version 2017.7.0.

Checks and makes sure the SELinux policies for a given filespec are applied.

salt.states.selinux.**fcontext_policy_present**(*name*, *sel_type*, *filetype='a'*, *sel_user=None*, *sel_level=None*)
New in version 2017.7.0.

Makes sure a SELinux policy for a given filespec (name), filetype and SELinux context type is present.
name filespec of the file or directory. Regex syntax is allowed.
sel_type SELinux context type. There are many.
filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to `a' (all files).
sel_user The SELinux user.
sel_level The SELinux MLS range.

salt.states.selinux.**mode**(*name*)
Verifies the mode SELinux is running in, can be set to enforcing, permissive, or disabled

Note: A change to or from disabled mode requires a system reboot. You will need to perform this yourself.

name The mode to run SELinux in, permissive, enforcing, or disabled.

salt.states.selinux.**module**(*name*, *module_state='Enabled'*, *version='any'*, ***opts*)
Enable/Disable and optionally force a specific version for an SELinux module
name The name of the module to control
module_state Should the module be enabled or disabled?
version Defaults to no preference, set to a specified value if required. Currently can only alert if the version is incorrect.
install Setting to True installs module
source Points to module source file, used only when install is True
remove Setting to True removes module
New in version 2016.3.0.

salt.states.selinux.**module_install**(*name*)
Installs custom SELinux module from given file
name Path to file with module to install
New in version 2016.11.6.

salt.states.selinux.**module_remove**(*name*)
Removes SELinux module
name The name of the module to remove
New in version 2016.11.6.

19.19.222 salt.states.serverdensity_device

Monitor Server with Server Density

New in version 2014.7.0.

Server Density Is a hosted monitoring service.

Warning: This state module is beta. It might be changed later to include more or less automation.

Note: This state module requires a pillar for authentication with Server Density To install a v1 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_url: "https://your-account.serverdensity.io"
```

To install a v2 agent:

```
serverdensity:
  api_token: "b97da80a41c4f61bff05975ee51eb1aa"
  account_name: "your-account"
```

Note: Although Server Density allows duplicate device names in its database, this module will raise an exception if you try monitoring devices with the same name.

Example:

```
'server_name':
  serverdensity_device.monitored
```

salt.states.serverdensity_device.**monitored**(*name*, *group=None*, *salt_name=True*, *salt_params=True*, *agent_version=1*, ***params*)
Device is monitored with Server Density.
name Device name in Server Density.
salt_name If `True` (default), takes the name from the `id` grain. If `False`, the provided name is used.
group Group name under with device will appear in Server Density dashboard. Default - *None*.
agent_version The agent version you want to use. Valid values are 1 or 2. Default - 1.
salt_params If `True` (default), needed config parameters will be sourced from grains and from *status.all_status*.

params Add parameters that you want to appear in the Server Density dashboard. Will overwrite the *salt_params* parameters. For more info, see the API docs.

Usage example:

```
'server_name':
  serverdensity_device.monitored
```

```
'server_name':
  serverdensity_device.monitored:
    - group: web-servers
```

```
'my_special_server':
  serverdensity_device.monitored:
    - salt_name: False
    - group: web-servers
    - cpuCores: 2
    - os: '{"code": "linux", "name": "Linux"}'
```

19.19.223 salt.states.service

Starting or restarting of services and daemons

Services are defined as system daemons typically started with system init or rc scripts. The service state uses whichever service module that is loaded on the minion with the virtualname of `service`. Services can be defined as running or dead.

If you need to know if your init system is supported, see the list of supported `service modules` for your desired init system (systemd, sysvinit, launchctl, etc.).

Note that Salt's service execution module, and therefore this service state, uses OS grains to ascertain which service module should be loaded and used to execute service functions. As existing distributions change init systems or new distributions are created, OS detection can sometimes be incomplete. If your service states are running into trouble with init system detection, please see the *Overriding Virtual Module Providers* section of Salt's module documentation to work around possible errors.

Note: The current status of a service is determined by the return code of the init/rc script status command. A status return code of 0 it is considered running. Any other return code is considered dead.

```
httpd:
  service.running: []
```

The service can also be set to be started at runtime via the enable option:

```
openvpn:
  service.running:
    - enable: True
```

By default if a service is triggered to refresh due to a watch statement the service is by default restarted. If the desired behavior is to reload the service, then set the reload value to True:

```
redis:
  service.running:
    - enable: True
    - reload: True
```

```
    - watch:
      - pkg: redis
```

Note: More details regarding `watch` can be found in the *Requisites* documentation.

`salt.states.service.`**`dead`**(*name*, *enable=None*, *sig=None*, *init_delay=None*, ***kwargs*)

Ensure that the named service is dead by stopping the service if it is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig The string to search for when looking for the service process with ps

init_delay Add a sleep command (in seconds) before the check to make sure service is killed.

New in version 2017.7.0.

no_block [False] **For systemd minions only.** Stops the service using `--no-block`.

New in version 2017.7.0.

`salt.states.service.`**`disabled`**(*name*, ***kwargs*)

Ensure that the service is disabled on boot, only use this state if you don't want to manage the running process, remember that if you want to disable a service to use the enable: False option for the running or dead function.

name The name of the init or rc script used to manage the service

`salt.states.service.`**`enabled`**(*name*, ***kwargs*)

Ensure that the service is enabled on boot, only use this state if you don't want to manage the running process, remember that if you want to enable a running service to use the enable: True option for the running or dead function.

name The name of the init or rc script used to manage the service

`salt.states.service.`**`masked`**(*name*, *runtime=False*)

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is masked (i.e. prevented from being started).

name Name of the service to mask

runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to runtime mask the service.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is already indefinitely masked, running this state with `runtime` set to `True` will _not_ remove the indefinite mask before setting a runtime mask. In these cases, if it is desirable to ensure that the service is runtime masked and not indefinitely masked, pair this state with a *`service.unmasked`* state, like so:

```
mask_runtime_foo:
  service.masked:
    - name: foo
    - runtime: True

unmask_indefinite_foo:
  service.unmasked:
```

```
    - name: foo
    - runtime: False
```

salt.states.service.**mod_watch**(*name*, *sfun=None*, *sig=None*, *reload=False*, *full_restart=False*, *init_delay=None*, *force=False*, ***kwargs*)

The service watcher, called to invoke the watch command.

name The name of the init or rc script used to manage the service

sfun The original function which triggered the mod_watch call (*service.running*, for example).

sig The string to search for when looking for the service process with ps

reload Use reload instead of the default restart (exclusive option with full_restart, defaults to reload if both are used)

full_restart Use service.full_restart instead of restart (exclusive option with reload)

force Use service.force_reload instead of reload (needs reload to be set to True)

init_delay Add a sleep command (in seconds) before the service is restarted/reloaded

salt.states.service.**running**(*name*, *enable=None*, *sig=None*, *init_delay=None*, *no_block=False*, *unmask=False*, *unmask_runtime=False*, ***kwargs*)

Ensure that the service is running

name The name of the init or rc script used to manage the service

enable Set the service to be enabled at boot time, `True` sets the service to be enabled, `False` sets the named service to be disabled. The default is `None`, which does not enable or disable anything.

sig The string to search for when looking for the service process with ps

init_delay Some services may not be truly available for a short period after their startup script indicates to the system that they are. Provide an `init_delay' to specify that this state should wait an additional given number of seconds after a service has started before returning. Useful for requisite states wherein a dependent state might assume a service has started but is not yet fully initialized.

no_block [False] **For systemd minions only.** Starts the service using `--no-block`.

New in version 2017.7.0.

unmask [False] **For systemd minions only.** Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

unmask_runtime [False] **For systemd minions only.** Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before making any changes. This behavior is no longer the default.

Note:

`watch` can be used with service.running to restart a service when another state changes (example: a file.managed state that creates the service's config file). More details regarding `watch` can be found in the *Requisites* documentation.

salt.states.service.**unmasked**(*name*, *runtime=False*)

New in version 2017.7.0.

Note: This state is only available on minions which use systemd.

Ensures that the named service is unmasked

name Name of the service to unmask

runtime [False] By default, this state will manage an indefinite mask for the named service. Set this argument to `True` to ensure that the service is runtime masked.

Note: It is possible for a service to have both indefinite and runtime masks set for it. Therefore, this state will manage a runtime or indefinite mask independently of each other. This means that if the service is indefinitely masked, running this state with `runtime` set to `True` will _not_ remove the indefinite mask.

19.19.224 salt.states.slack

Send a message to Slack

This state is useful for sending messages to Slack during state runs.

New in version 2015.5.0.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The api key can be specified in the master or minion configuration like below:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.states.slack.`**`post_message`**(*name*, *channel*, *from_name*, *message*, *api_key=None*, *icon=None*)

Send a message to a Slack channel.

```
slack-message:
  slack.post_message:
    - channel: '#general'
    - from_name: SuperAdmin
    - message: 'This state was executed successfully.'
    - api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

The following parameters are required:

name The unique name for this event.

channel The channel to send the message to. Can either be the ID or the name.

from_name The name of that is to be shown in the ``from'' field.

message The message that is to be sent to the Slack channel.

The following parameters are optional:

api_key The api key for Slack to use for authentication, if not specified in the configuration options of master or minion.

icon URL to an image to use as the icon for this message

19.19.225 salt.states.smartos

Management of SmartOS Standalone Compute Nodes

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends vmadm, imgadm

platform smartos

New in version 2016.3.0.

```

            size: 2048
            model: virtio
            compression: lz4
            boot: true
        nics:
```

```
          "82:1b:8e:49:e9:15"
            nic_tag: trunk
            mtu: 1500
            ips:
              - dhcp
            vlan_id: 30

cleanup_images:
  smartos.image_vacuum
```

Note: Keep in mind that when removing properties from vmconfig they will not get removed from the vm's current configuration, except for nics, disk, tags, ... they get removed via add_*, set_*, update_*, and remove_*. Properties must be manually reset to their default value. The same behavior as when using `vmadm update'.

salt.states.smartos.**config_absent**(*name*)
Ensure configuration property is absent in /usbkey/config
name [string] name of property

salt.states.smartos.**config_present**(*name*, *value*)
Ensure configuration property is set to value in /usbkey/config
name [string] name of property
value [string] value of property

salt.states.smartos.**image_absent**(*name*)
Ensure image is absent on the computenode
name [string] uuid of image

Note: computenode.image_absent will only remove the image if it is not used by a vm.

salt.states.smartos.**image_present**(*name*)
Ensure image is present on the computenode
name [string] uuid of image

salt.states.smartos.**image_vacuum**(*name*)
Delete images not in use or installed via image_present

salt.states.smartos.**vm_absent**(*name*, *archive=False*)
Ensure vm is absent on the computenode
name [string] hostname of vm
archive [boolean] toggle archiving of vm on removal

Note: State ID is used as hostname. Hostnames must be unique.

salt.states.smartos.**vm_present**(*name*, *vmconfig*, *config=None*)
Ensure vm is present on the computenode
name [string] hostname of vm
vmconfig [dict] options to set for the vm
config [dict] fine grain control over vm_present

Note:
The following configuration properties can be toggled in the config parameter.

- kvm_reboot (true) - reboots of kvm zones if needed for a config update
- auto_import (false) - automatic importing of missing images
- reprovision (false) - reprovision on image_uuid changes

- enforce_customer_metadata (true) - false = add metadata only, true = add, update, and remove metadata
- enforce_tags (true) - false = add tags only, true = add, update, and remove tags

---

Note: State ID is used as hostname. Hostnames must be unique.

Note: If hostname is provided in vmconfig this will take president over the State ID. This allows multiple states to be applied to the same vm.

Note:
The following instances should have a unique ID.
- nic : mac
- filesystem: target
- disk : path or diskN for zvols

e.g. disk0 will be the first disk added, disk1 the 2nd,...

`salt.states.smartos.`**`vm_running`**(*name*)

Ensure vm is in the running state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

`salt.states.smartos.`**`vm_stopped`**(*name*)

Ensure vm is in the stopped state on the computenode

name [string] hostname of vm

Note: State ID is used as hostname. Hostnames must be unique.

19.19.226 salt.states.smtp

Sending Messages via SMTP

New in version 2014.7.0.

This state is useful for firing messages during state runs, using the SMTP protocol

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
    - profile: my-smtp-account
    - recipient: admins@example.com
```

`salt.states.smtp.`**`send_msg`**(*name*, *recipient*, *subject*, *sender=None*, *profile=None*, *use_ssl='True'*)

Send a message via SMTP

```
server-warning-message:
  smtp.send_msg:
    - name: 'This is a server warning message'
```

```
    - profile: my-smtp-account
    - subject: 'Message from Salt'
    - recipient: admin@example.com
    - sender: admin@example.com
    - use_ssl: True
```

name The message to send via SMTP

19.19.227 salt.states.snapper module

Managing implicit state and baselines using snapshots

New in version 2016.11.0.

Salt can manage state against explicitly defined state, for example if your minion state is defined by:

```
/etc/config_file:
  file.managed:
    - source: salt://configs/myconfig
```

If someone modifies this file, the next application of the highstate will allow the admin to correct this deviation and the file will be corrected.

Now, what happens if somebody creates a file `/etc/new_config_file` and deletes `/etc/important_config_file`? Unless you have a explicit rule, this change will go unnoticed.

The snapper state module allows you to manage state implicitly, in addition to explicit rules, in order to define a baseline and iterate with explicit rules as they show that they work in production.

The workflow is: once you have a working and audited system, you would create your baseline snapshot (eg. with `salt tgt snapper.create_snapshot`) and define in your state this baseline using the identifier of the snapshot (in this case: 20):

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - include_diff: False
    - ignore:
      - /var/log
      - /var/cache
```

Baseline snapshots can be also referenced by tag. Most recent baseline snapshot is used in case of multiple snapshots with the same tag:

my_baseline_external_storage:

snapper.baseline_snapshot:

- tag: my_custom_baseline_tag
- config: external
- ignore: - /mnt/tmp_files/

If you have this state, and you haven't done changes to the system since the snapshot, and you add a user, the state will show you the changes (including full diffs) to `/etc/passwd`, `/etc/shadow`, etc if you call it with `test=True` and will undo all changes if you call it without.

This allows you to add more explicit state knowing that you are starting from a very well defined state, and that you can audit any change that is not part of your explicit configuration.

So after you made this your state, you decided to introduce a change in your configuration:

```
my_baseline:
  snapper.baseline_snapshot:
    - number: 20
    - ignore:
      - /var/log
      - /var/cache

hosts_entry:
  file.blockreplace:
    - name: /etc/hosts
    - content: 'First line of content'
    - append_if_not_found: True
```

The change in `/etc/hosts` will be done after any other change that deviates from the specified snapshot are reverted. This could be for example, modifications to the `/etc/passwd` file or changes in the `/etc/hosts` that could render your the `hosts_entry` rule void or dangerous.

Once you take a new snapshot and you update the baseline snapshot number to include the change in `/etc/hosts` the `hosts_entry` rule will basically do nothing. You are free to leave it there for documentation, to ensure that the change is made in case the snapshot is wrong, but if you remove anything that comes after the `snapper.baseline_snapshot` as it will have no effect; by the moment the state is evaluated, the baseline state was already applied and include this change.

Warning: Make sure you specify the baseline state before other rules, otherwise the baseline state will revert all changes if they are not present in the snapshot.

Warning: Do not specify more than one baseline rule as only the last one will affect the result.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>

maturity new

platform Linux

`salt.states.snapper.`**`baseline_snapshot`**(*name*, *number=None*, *tag=None*, *include_diff=True*, *config='root'*, *ignore=None*)

Enforces that no file is modified comparing against a previously defined snapshot identified by number.

number Number of selected baseline snapshot.

tag Tag of the selected baseline snapshot. Most recent baseline baseline snapshot is used in case of multiple snapshots with the same tag. (*tag* and *number* cannot be used at the same time)

include_diff Include a diff in the response (Default: True)

config Snapper config name (Default: root)

ignore List of files to ignore. (Default: None)

19.19.228 salt.states.solrcloud module

States for solrcloud alias and collection configuration

New in version 2017.7.0.

salt.states.solrcloud.**alias**(*name*, *collections*, ***kwargs*)
Create alias and enforce collection list.

Use the solrcloud module to get alias members and set them.

You can pass additional arguments that will be forwarded to http.query
name The collection name
collections list of collections to include in the alias

salt.states.solrcloud.**collection**(*name*, *options=None*, ***kwargs*)
Create collection and enforce options.

Use the solrcloud module to get collection parameters.

You can pass additional arguments that will be forwarded to http.query
name The collection name
options [{}] options to ensure

19.19.229 salt.states.splunk

Splunk User State Module

New in version 2016.3.0..

This state is used to ensure presence of users in splunk.

```
ensure example test user 1:
    splunk.present:
