`salt.modules.parted.mklabel` (*device*, *label_type*)

Create a new disklabel (partition table) of *label_type*.

Type should be one of "aix", "amiga", "bsd", "dvh", "gpt", "loop", "mac", "msdos", "pc98", or "sun".

CLI Example:

```
salt '*' partition.mklabel /dev/sda msdos
```

`salt.modules.parted.mkpart` (*device*, *part_type*, *fs_type=None*, *start=None*, *end=None*)

Make a *part_type* partition for filesystem *fs_type*, beginning at *start* and ending at *end* (by default in megabytes). *part_type* should be one of "primary", "logical", or "extended".

CLI Examples:

```
salt '*' partition.mkpart /dev/sda primary fs_type=fat32 start=0 end=639
salt '*' partition.mkpart /dev/sda primary start=0 end=639
```

`salt.modules.parted.mkpartfs` (*device*, *part_type*, *fs_type*, *start*, *end*)

Make a *<part_type>* partition with a new filesystem of *<fs_type>*, beginning at *<start>* and ending at *<end>* (by default in megabytes).

<part_type> should be one of "primary", "logical", or "extended". *<fs_type>* must be one of "ext2", "fat32", "fat16", "linux-swap" or "reiserfs" (if libreiserfs is installed)

CLI Example:

```
salt '*' partition.mkpartfs /dev/sda logical ext2 440 670
```

`salt.modules.parted.name` (*device*, *partition*, *name*)

Set the name of partition to *name*. This option works only on Mac, PC98, and GPT disklabels. The name can be placed in quotes, if necessary.

CLI Example:

```
salt '*' partition.name /dev/sda 1 'My Documents'
```

`salt.modules.parted.probe` (**devices*)

Ask the kernel to update its local partition data. When no args are specified all block devices are tried.

Caution: Generally only works on devices with no mounted partitions and may take a long time to return if specified devices are in use.

CLI Examples:

```
salt '*' partition.probe
salt '*' partition.probe /dev/sda
salt '*' partition.probe /dev/sda /dev/sdb
```

`salt.modules.parted.rescue` (*device*, *start*, *end*)

Rescue a lost partition that was located somewhere between *start* and *end*. If a partition is found, parted will ask if you want to create an entry for it in the partition table.

CLI Example:

```
salt '*' partition.rescue /dev/sda 0 8056
```

`salt.modules.parted.resize(device, minor, start, end)`

Resizes the partition with number <minor>.

The partition will start <start> from the beginning of the disk, and end <end> from the beginning of the disk. `resize` never changes the minor number. Extended partitions can be resized, so long as the new extended partition completely contains all logical partitions.

CLI Example:

```
salt '*' partition.resize /dev/sda 3 200 850
```

`salt.modules.parted.rm(device, minor)`

Removes the partition with number <minor>.

CLI Example:

```
salt '*' partition.rm /dev/sda 5
```

`salt.modules.parted.set_(device, minor, flag, state)`

Changes a flag on the partition with number <minor>.

A flag can be either "on" or "off" (make sure to use proper quoting, see [YAML Idiosyncrasies](#)). Some or all of these flags will be available, depending on what disk label you are using.

Valid flags are: `bios_grub`, `legacy_boot`, `boot`, `lba`, `root`, `swap`, `hidden`, `raid`, LVM, PALO, PREP, DIAG

CLI Example:

```
salt '*' partition.set /dev/sda 1 boot "on"
```

`salt.modules.parted.set_id(device, minor, system_id)`

Sets the system ID for the partition. Some typical values are:

```
b: FAT32 (vfat)
7: HPFS/NTFS
82: Linux Swap
83: Linux
8e: Linux LVM
fd: Linux RAID Auto
```

CLI Example:

```
salt '*' partition.set_id /dev/sda 1 83
```

`salt.modules.parted.system_types()`

List the system types that are supported by the installed version of `sfdisk`

CLI Example:

```
salt '*' partition.system_types
```

`salt.modules.parted.toggle(device, partition, flag)`

Toggle the state of <flag> on <partition>. Valid flags are the same as the `set` command.

CLI Example:

```
salt '*' partition.toggle /dev/sda 1 boot
```

20.9.298 salt.modules.pcs module

Configure a Pacemaker/Corosync cluster with PCS

Configure Pacemaker/Corosync clusters with the Pacemaker/Corosync configuration system (PCS)

depends pcs

New in version 2016.3.0.

`salt.modules.pcs.auth(nodes, pcsuser='hacluster', pcspasswd='hacluster', extra_args=None)`

Authorize nodes to the cluster

nodes a list of nodes which should be authorized to the cluster

pcsuser user for communication with PCS (default: hacluster)

pcspasswd password for pcsuser (default: hacluster)

extra_args list of extra option for the 'pcs cluster auth' command

CLI Example:

```
salt '*' pcs.auth nodes='[ node1.example.org node2.example.org ]'
↳pcsuser=hacluster pcspasswd=hoonetorg extra_args="[ '--force' ]"
```

`salt.modules.pcs.cib_create(cibfile, scope='configuration', extra_args=None)`

Create a CIB-file from the current CIB of the cluster

cibfile name/path of the file containing the CIB

scope specific section of the CIB (default: configuration)

extra_args additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_create cibfile='/tmp/VIP_apache_1.cib' scope=False
```

`salt.modules.pcs.cib_push(cibfile, scope='configuration', extra_args=None)`

Push a CIB-file as the new CIB to the cluster

cibfile name/path of the file containing the CIB

scope specific section of the CIB (default: configuration)

extra_args additional options for creating the CIB-file

CLI Example:

```
salt '*' pcs.cib_push cibfile='/tmp/VIP_apache_1.cib' scope=False
```

`salt.modules.pcs.cluster_node_add(node, extra_args=None)`

Add a node to the pacemaker cluster via pcs command

node node that should be added

extra_args list of extra option for the 'pcs cluster node add' command

CLI Example:

```
salt '*' pcs.cluster_node_add node=node2.example.org
```

`salt.modules.pcs.cluster_setup(nodes, pcsclustername='pcscluster', extra_args=None)`

Setup pacemaker cluster via pcs command

nodes a list of nodes which should be set up

pcsclustername Name of the Pacemaker cluster (default: pcscluster)

extra_args list of extra option for the 'pcs cluster setup' command

CLI Example:

```
salt '*' pcs.cluster_setup nodes='[ node1.example.org node2.example.org ]'
↳pcsclustername=pcscluster
```

`salt.modules.pcs.config_show(cibfile=None)`

Show config of cluster

cibfile name/path of the file containing the CIB

CLI Example:

```
salt '*' pcs.config_show cibfile='/tmp/cib_for_galera'
```

salt.modules.pcs.is_auth(nodes)

Check if nodes are already authorized

nodes a list of nodes to be checked for authorization to the cluster

CLI Example:

```
salt '*' pcs.is_auth nodes='[node1.example.org node2.example.org]'
```

salt.modules.pcs.item_create(item, item_id, item_type, create='create', extra_args=None, cibfile=None)

Create an item via pcs command (mainly for use with the pcs state module)

item config, property, resource, constraint etc.

item_id id of the item

item_type item type

create create command (create or set f.e., default: create)

extra_args additional options for the pcs command

cibfile use cibfile instead of the live CIB

salt.modules.pcs.item_show(item, item_id=None, item_type=None, show='show', extra_args=None, cibfile=None)

Show an item via pcs command (mainly for use with the pcs state module)

item config, property, resource, constraint etc.

item_id id of the item

item_type item type

show show command (probably None, default: show)

extra_args additional options for the pcs command

cibfile use cibfile instead of the live CIB

salt.modules.pcs.prop_set(prop, value, extra_args=None, cibfile=None)

Set the value of a cluster property

prop name of the property

value value of the property prop

extra_args additional options for the pcs property command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_set prop='no-quorum-policy' value='ignore' cibfile='/tmp/2_node_
↳cluster.cib'
```

salt.modules.pcs.prop_show(prop, extra_args=None, cibfile=None)

Show the value of a cluster property

prop name of the property

extra_args additional options for the pcs property command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.prop_show cibfile='/tmp/2_node_cluster.cib' prop='no-quorum-policy'
↳cibfile='/tmp/2_node_cluster.cib'
```

salt.modules.pcs.resource_create(resource_id, resource_type, resource_options=None, cibfile=None)

Create a resource via pcs command

resource_id name for the resource

resource_type resource type (f.e. ocf:heartbeat:IPaddr2 or VirtualIP)

resource_options additional options for creating the resource

cibfile use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.resource_create resource_id='galera' resource_type=
↳'ocf:heartbeat:galera' resource_options="['wsrep_cluster_address=gcomm://node1.
↳example.org,node2.example.org,node3.example.org', '--master']" cibfile='/tmp/
↳cib_for_galera.cib'
```

salt.modules.pcs.resource_show(*resource_id*, *extra_args=None*, *cibfile=None*)

Show a resource via pcs command

resource_id name of the resource

extra_args additional options for the pcs command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.resource_show resource_id='galera' cibfile='/tmp/cib_for_galera.cib'
```

salt.modules.pcs.stonith_create(*stonith_id*, *stonith_device_type*, *stonith_device_options=None*, *cibfile=None*)

Create a stonith resource via pcs command

stonith_id name for the stonith resource

stonith_device_type name of the stonith agent fence_eps, fence_xvm f.e.

stonith_device_options additional options for creating the stonith resource

cibfile use cibfile instead of the live CIB for manipulation

CLI Example:

```
salt '*' pcs.stonith_create stonith_id='eps_fence' stonith_device_type='fence_eps'
stonith_device_options="['pcmk_host_map=node1.example.
↳org:01;node2.example.org:02', 'ipaddr=myepsdevice.example.org', 'action=reboot',
↳'power_wait=5', 'verbose=1', 'debug=/var/log/pcsd/eps_fence.log', 'login=hidden
↳', 'passwd=hoonetorg']" cibfile='/tmp/cib_for_stonith.cib'
```

salt.modules.pcs.stonith_show(*stonith_id*, *extra_args=None*, *cibfile=None*)

Show the value of a cluster stonith

stonith_id name for the stonith resource

extra_args additional options for the pcs stonith command

cibfile use cibfile instead of the live CIB

CLI Example:

```
salt '*' pcs.stonith_show stonith_id='eps_fence' cibfile='/tmp/2_node_cluster.cib'
```

20.9.299 salt.modules.pdbedit

Manage accounts in Samba's passdb using pdbedit

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform posix

New in version 2017.7.0.

salt.modules.pdbedit.create(*login*, *password*, *password_hashed=False*, *machine_account=False*)

Create user account

login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
machine_account [boolean] set to create a machine trust account instead
 CLI Example:

```
salt '*' pdbedit.create zoe 9764951149F84E770889011E1DC4A927 ntlhash
salt '*' pdbedit.create river 1sw4ll0w3d4bug
```

salt.modules.pdbedit.delete(*login*)

Delete user account
login [string] login name
 CLI Example:

```
salt '*' pdbedit.delete wash
```

salt.modules.pdbedit.generate_nt_hash(*password*)

Generate a NT HASH
 CLI Example:

```
salt '*' pdbedit.generate_nt_hash my_passwd
```

salt.modules.pdbedit.get_user(*login*, *hashes=False*)

Get user account details
login [string] login name
hashes [boolean] include NTHASH and LMHASH in verbose output
 CLI Example:

```
salt '*' pdbedit.get kaylee
```

salt.modules.pdbedit.list_users(*verbose=True*, *hashes=False*)

List user accounts
verbose [boolean] return all information
hashes [boolean] include NT HASH and LM HASH in verbose output
 CLI Example:

```
salt '*' pdbedit.list
```

salt.modules.pdbedit.modify(*login*, *password=None*, *password_hashed=False*, *domain=None*, *profile=None*, *script=None*, *drive=None*, *homedir=None*, *fullname=None*, *account_desc=None*, *account_control=None*, *machine_sid=None*, *user_sid=None*, *reset_login_hours=False*, *reset_bad_password_count=False*)

Modify user account
login [string] login name
password [string] password
password_hashed [boolean] set if password is a nt hash instead of plain text
domain [string] users domain
profile [string] profile path
script [string] logon script
drive [string] home drive
homedir [string] home directory
fullname [string] full name
account_desc [string] account description
machine_sid [string] specify the machines new primary group SID or rid

user_sid [string] specify the users new primary group SID or rid
account_control [string] specify user account control properties

Note: Only the following can be set: - N: No password required - D: Account disabled - H: Home directory required - L: Automatic Locking - X: Password does not expire

reset_login_hours [boolean] reset the users allowed logon hours
reset_bad_password_count [boolean] reset the stored bad login counter

Note: if user is absent and password is provided, the user will be created

CLI Example:

```
salt '*' pdbedit.modify inara fullname='Inara Serra'  
salt '*' pdbedit.modify simon password=r1v3r  
salt '*' pdbedit.modify jane drive='V:' homedir='\\serenity\jane\profile'  
salt '*' pdbedit.modify mal account_control=NX
```

20.9.300 salt.modules.pecl

Manage PHP pecl extensions.

salt.modules.pecl.install(*pecls*, *defaults=False*, *force=False*, *preferred_state='stable'*)

New in version 0.17.0.

Installs one or several pecl extensions.

pecls The pecl extensions to install.

defaults Use default answers for extensions such as pecl_http which ask questions before installation. Without this option, the pecl.installed state will hang indefinitely when trying to install these extensions.

force Whether to force the installed version or not

CLI Example:

```
salt '*' pecl.install fuse
```

salt.modules.pecl.list_(*channel=None*)

List installed pecl extensions.

CLI Example:

```
salt '*' pecl.list
```

salt.modules.pecl.uninstall(*pecls*)

Uninstall one or several pecl extensions.

pecls The pecl extensions to uninstall.

CLI Example:

```
salt '*' pecl.uninstall fuse
```

salt.modules.pecl.update(*pecls*)

Update one or several pecl extensions.

pecls The pecl extensions to update.

CLI Example:

```
salt '*' pecl.update fuse
```

20.9.301 salt.modules.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

20.9.302 salt.modules.pillar

Extract the pillar data for this minion

`salt.modules.pillar.ext` (*external*, *pillar=None*)

Changed in version 2016.3.6,2016.11.3,2017.7.0: The supported `ext_pillar` types are now tunable using the `on_demand_ext_pillar` config option. Earlier releases used a hard-coded default.

Generate the pillar and apply an explicit external pillar

external A single `ext_pillar` to add to the `ext_pillar` configuration. This must be passed as a single section from the `ext_pillar` configuration (see CLI examples below). For more complicated `ext_pillar` configurations, it can be helpful to use the Python shell to load YAML configuration into a dictionary, and figure out

```
>>> import salt.utils.yaml
>>> ext_pillar = salt.utils.yaml.safe_load("""
... ext_pillar:
...   - git:
...     - issue38440 https://github.com/terminalmage/git_pillar:
...       - env: base
... """)
>>> ext_pillar
{'ext_pillar': [{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}]}
>>> ext_pillar['ext_pillar'][0]
{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}
```

In the above example, the value to pass would be `{'git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}`. Note that this would need to be quoted when passing on the CLI (as in the CLI examples below).

pillar [None] If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. These pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

CLI Examples:

```
salt '*' pillar.ext '{libvirt: _}'
salt '*' pillar.ext '{"git': ['master https://github.com/myuser/myrepo']}"
salt '*' pillar.ext '{"git': [{'mybranch https://github.com/myuser/myrepo': [{'env': 'base'}]}]}"
```

`salt.modules.pillar.fetch` (*key*, *default=<class 'KeyError'>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the `merge` parameter is set to `True`, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

key The pillar key to get value from

default The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless `pillar_raise_on_missing` is set to `True`, in which case an error will be raised.

merge [`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

Note: This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.file_exists`(*path*, *saltenv=None*)

New in version 2016.3.0.

This is a master-only function. Calling from the minion is not supported.

Use the given path and search relative to the pillar environments to see if a file exists at that path.

If the `saltenv` argument is given, restrict search to that environment only.

Will only work with `pillar_roots`, not external pillars.

Returns True if the file is found, and False otherwise.

path The path to the file in question. Will be treated as a relative path

saltenv Optional argument to restrict the search to a specific saltenv

CLI Example:

```
salt '*' pillar.file_exists foo/bar.sls
```

`salt.modules.pillar.filter_by`(*lookup_dict*, *pillar*, *merge=None*, *default='default'*, *base=None*)

New in version 2017.7.0.

Look up the given pillar in a given dictionary and return the result

Parameters

- **lookup_dict** – A dictionary, keyed by a pillar, containing a value or values relevant to systems matching that pillar. For example, a key could be a pillar for a role and the value could be the name of a package on that particular OS.

The dictionary key can be a globbing pattern. The function will return the corresponding `lookup_dict` value where the pillar value matches the pattern. For example:

```
# this will render 'got some salt' if `role` begins with
↳ 'salt'
salt '*' pillar.filter_by '{salt*: got some salt, default: x}' role
↳ salt is not here}
```

- **pillar** – The name of a pillar to match with the system's pillar. For example, the value of the "role" pillar could be used to pull values from the `lookup_dict` dictionary.

The pillar value can be a list. The function will return the `lookup_dict` value for a first found item in the list matching one of the `lookup_dict` keys.

- **merge** – A dictionary to merge with the results of the pillar selection from `lookup_dict`. This allows another dictionary to override the values in the `lookup_dict`.
- **default** – default `lookup_dict`'s key used if the pillar does not exist or if the pillar value has no match on `lookup_dict`. If unspecified the value is "default".
- **base** – A `lookup_dict` key to use for a base dictionary. The pillar-selected `lookup_dict` is merged over this and then finally the `merge` dictionary is merged. This allows common values for each case to be collected in the base and overridden by the pillar selection dictionary and the merge dictionary. Default is unset.

CLI Example:

```
salt '*' pillar.filter_by '{web: Serve it up, db: I query, default: x_x}' role
```

`salt.modules.pillar.get`(*key*, *default=<class 'KeyError'>*, *merge=False*, *merge_nested_lists=None*, *delimiter=':'*, *pillarenv=None*, *saltenv=None*)

New in version 0.14.

Attempt to retrieve the named value from *in-memory pillar data*. If the pillar key is not present in the in-memory pillar, then the value specified in the `default` option (described below) will be returned.

If the merge parameter is set to True, the default will be recursively merged into the returned pillar data.

The value can also represent a value in a nested dict using a ":" delimiter for the dict. This means that if a dict in pillar looks like this:

```
{'pkg': {'apache': 'httpd'}}
```

To retrieve the value associated with the `apache` key in the `pkg` dict this key can be passed as:

```
pkg:apache
```

key The pillar key to get value from

default The value specified by this option will be returned if the desired pillar key does not exist.

If a default value is specified, then it will be an empty string, unless *pillar_raise_on_missing* is set to `True`, in which case an error will be raised.

merge [`False`] If `True`, the retrieved values will be merged into the passed default. When the default and the retrieved value are both dictionaries, the dictionaries will be recursively merged.

New in version 2014.7.0.

Changed in version 2016.3.7,2016.11.4,2017.7.0: If the default and the retrieved value are not of the same type, then merging will be skipped and the retrieved value will be returned. Earlier releases raised an error in these cases.

merge_nested_lists If set to `False`, lists nested within the retrieved pillar dictionary will *overwrite* lists in `default`. If set to `True`, nested lists will be *merged* into lists in `default`. If unspecified (the default), this option is inherited from the `pillar_merge_lists` minion config option.

Note: This option is ignored when `merge` is set to `False`.

New in version 2016.11.6.

delimiter Specify an alternate delimiter to use when traversing a nested dict. This is useful for when the desired key contains a colon. See CLI example below for usage.

New in version 2014.7.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.0.

saltenv Included only for compatibility with *pillarenv_from_saltenv*, and is otherwise ignored.

New in version 2017.7.0.

CLI Example:

```
salt '*' pillar.get pkg:apache
salt '*' pillar.get abc::def|ghi delimiter='|'
```

`salt.modules.pillar.item(*args, **kwargs)`

New in version 0.16.2.

Return one or more pillar entries from the *in-memory pillar data*.

delimiter Delimiter used to traverse nested dictionaries.

Note: This is different from *pillar.get* in that no default value can be specified. *pillar.get* should probably still be used in most cases to retrieve nested pillar values, as it is a bit more flexible. One reason to use this function instead of *pillar.get* however is when it is desirable to retrieve the values of more than one key, since *pillar.get* can only retrieve one key at a time.

New in version 2015.8.0.

pillarenv If specified, this function will query the master to generate fresh pillar data on the fly, specifically from the requested pillar environment. Note that this can produce different pillar data than executing this function without an environment, as its normal behavior is just to return a value from minion's pillar data in memory (which can be sourced from more than one pillar environment).

Using this argument will not affect the pillar data in memory. It will however be slightly slower and use more resources on the master due to the need for the master to generate and send the minion fresh pillar data. This tradeoff in performance however allows for the use case where pillar data is desired only from a single environment.

New in version 2017.7.6,2018.3.1.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

New in version 2017.7.6,2018.3.1.

CLI Examples:

```
salt '*' pillar.item foo
salt '*' pillar.item foo:bar
salt '*' pillar.item foo bar baz
```

`salt.modules.pillar.items(*args, **kwargs)`

Calls the master for a fresh pillar and generates the pillar data on the fly

Contrast with `raw()` which returns the pillar data that is currently loaded into the minion.

pillar If specified, allows for a dictionary of pillar data to be made available to pillar and `ext_pillar` rendering. these pillar variables will also override any variables of the same name in pillar or `ext_pillar`.

New in version 2015.5.0.

pillar_enc If specified, the data passed in the `pillar` argument will be passed through this renderer to decrypt it.

Note: This will decrypt on the minion side, so the specified renderer must be set up on the minion for this to work. Alternatively, pillar data can be decrypted master-side. For more information, see the [Pillar Encryption](#) documentation. Pillar data that is decrypted master-side, is not decrypted until the end of pillar compilation though, so minion-side decryption will be necessary if the encrypted pillar data must be made available in an decrypted state pillar/`ext_pillar` rendering.

New in version 2017.7.0.

pillarenv Pass a specific pillar environment from which to compile pillar data. If not specified, then the minion's `pillarenv` option is not used, and if that also is not specified then all configured pillar environments will be merged into a single pillar dictionary and returned.

New in version 2016.11.2.

saltenv Included only for compatibility with `pillarenv_from_saltenv`, and is otherwise ignored.

CLI Example:

```
salt '*' pillar.items
```

`salt.modules.pillar.keys(key, delimiter=':')`

New in version 2015.8.0.

Attempt to retrieve a list of keys from the named value from the pillar.

The value can also represent a value in a nested dict using a ":" delimiter for the dict, similar to how `pillar.get` works.

delimiter Specify an alternate delimiter to use when traversing a nested dict

CLI Example:

```
salt '*' pillar.keys web:sites
```

`salt.modules.pillar.ls(*args)`

New in version 2015.8.0.

Calls the master for a fresh pillar, generates the pillar data on the fly (same as `items()`), but only shows the available main keys.

CLI Examples:

```
salt '*' pillar.ls
```

`salt.modules.pillar.obfuscate(*args)`

New in version 2015.8.0.

Same as `items()`, but replace pillar values with a simple type indication.

This is useful to avoid displaying sensitive information on console or flooding the console with long output, such as certificates. For many debug or control purposes, the stakes lie more in dispatching than in actual values.

In case the value is itself a collection type, obfuscation occurs within the value. For mapping types, keys are not obfuscated. Here are some examples:

- 'secret password' becomes '<str>'
- ['secret', 1] becomes ['<str>', '<int>']
- {'login': 'some login', 'pwd': 'secret'} becomes {'login': '<str>', 'pwd': '<str>'}

CLI Examples:

```
salt '*' pillar.obfuscate
```

`salt.modules.pillar.raw(key=None)`

Return the raw pillar data that is currently loaded into the minion.

Contrast with `items()` which calls the master to fetch the most up-to-date Pillar.

CLI Example:

```
salt '*' pillar.raw
```

With the optional key argument, you can select a subtree of the pillar raw data.:

```
salt '*' pillar.raw key='roles'
```

20.9.303 salt.modules.pip

Install Python packages with pip to either the system or a virtualenv

Windows Support

New in version 2014.7.4.

Salt now uses a portable python. As a result the entire pip module is now functional on the salt installation itself. You can pip install dependencies for your custom modules. You can even upgrade salt itself using pip. For this to work properly, you must specify the Current Working Directory (`cwd`) and the Pip Binary (`bin_env`) salt should use. The variable `pip_bin` can be either a virtualenv path or the path to the pip binary itself.

For example, the following command will list all software installed using pip to your current salt environment:

```
salt <minion> pip.list cwd='C:\salt\bin\Scripts' bin_env='C:\salt\bin\Scripts\pip.exe'
```

Specifying the `cwd` and `bin_env` options ensures you're modifying the salt environment. If these are omitted, it will default to the local installation of python. If python is not installed locally it will fail saying it couldn't find pip.

State File Support

This functionality works in states as well. If you need to pip install colorama with a state, for example, the following will work:

```
install_colorama:
  pip.installed:
    - name: colorama
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - upgrade: True
```

Upgrading Salt using Pip

You can now update salt using pip to any version from the 2014.7 branch forward. Previous version require recompiling some of the dependencies which is painful in windows.

To do this you just use pip with git to update to the version you want and then restart the service. Here is a sample state file that upgrades salt to the head of the 2015.5 branch:

```
install_salt:
  pip.installed:
    - cwd: 'C:\salt\bin\scripts'
    - bin_env: 'C:\salt\bin\scripts\pip.exe'
    - editable: git+https://github.com/saltstack/salt@2015.5#egg=salt
    - upgrade: True

restart_service:
  service.running:
    - name: salt-minion
    - enable: True
    - watch:
      - pip: install_salt
```

Note: If you're having problems, you might try doubling the back slashes. For example, `cwd: 'C:\salt\bin\scripts'`. Sometimes python thinks the single back slash is an escape character.

```
salt.modules.pip.freeze(bin_env=None, user=None, cwd=None, use_vt=False, env_vars=None,
                        **kwargs)
```

Return a list of installed packages either globally or in the specified virtualenv

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

user The user under which to run pip

cwd Directory from which to run pip

Note: If the version of pip available is older than 8.0.3, the list will not include the packages `pip`, `wheel`, `setuptools`, or `distribute` even if they are installed.

CLI Example:

```
salt '*' pip.freeze bin_env=/home/code/path/to/virtualenv
```

```
salt.modules.pip.install(pkgs=None, requirements=None, bin_env=None, use_wheel=False,
no_use_wheel=False, log=None, proxy=None, timeout=None, editable=None, find_links=None, index_url=None, extra_index_url=None,
no_index=False, mirrors=None, build=None, target=None, download=None, download_cache=None, source=None, upgrade=False, force_reinstall=False,
ignore_installed=False, exists_action=None, no_deps=False, no_install=False, no_download=False, global_options=None, install_options=None, user=None, cwd=None, pre_releases=False, cert=None,
allow_all_external=False, allow_external=None, allow_unverified=None, process_dependency_links=False, saltenv='base', env_vars=None, use_vt=False, trusted_host=None, no_cache_dir=False, cache_dir=None,
no_binary=None, **kwargs)
```

Install packages with pip

Install packages individually or from a pip requirements file. Install packages globally or to a virtualenv.

pkgs Comma separated list of packages to install

requirements Path to requirements

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. `/usr/bin/pip-2.7` or `/usr/bin/pip-2.6`). If a directory path is specified, it is assumed to be a virtualenv.

Note: For Windows, if the pip module is being used to upgrade the pip package, `bin_env` should be the path to the virtualenv or to the python binary that should be used. The pip command is unable to upgrade itself in Windows.

use_wheel Prefer wheel archives (requires pip>=1.4)

no_use_wheel Force to not use wheel archives (requires pip>=1.4,<10.0.0)

no_binary Force to not use binary packages (requires pip >= 7.0.0) Accepts either `:all:` to disable all binary packages, `:none:` to empty the set, or one or more package names with commas between them

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the form `user:passwd@proxy.server:port`. Note that the `user:password@` is optional and required only if you are behind an authenticated proxy. If you provide `user@proxy.server:port` then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

editable install something editable (e.g. `git+https://github.com/worldcompany/djangoembed.git#egg=djangoembed`)

find_links URL to search for packages

index_url Base URL of Python Package Index

extra_index_url Extra URLs of package indexes to use in addition to `index_url`

no_index Ignore package index

mirrors Specific mirror URL(s) to query (automatically adds `-use-mirrors`)

Warning: This option has been deprecated and removed in pip version 7.0.0. Please use `index_url` and/or `extra_index_url` instead.

build Unpack packages into `build` dir
target Install packages into `target` dir
download Download packages into `download` instead of installing them
download_cache | **cache_dir** Cache downloaded packages in `download_cache` or `cache_dir` dir
source Check out `editable` packages into `source` dir
upgrade Upgrade all packages to the newest available version
force_reinstall When upgrading, reinstall all packages even if they are already up-to-date.
ignore_installed Ignore the installed packages (reinstalling instead)
exists_action Default action when a path already exists: (s)witch, (i)gnore, (w)ipe, (b)ackup
no_deps Ignore package dependencies
no_install Download and unpack all packages, but don't actually install them
no_download Don't download any packages, just install the ones already downloaded (completes an install run with `--no-install`)
install_options Extra arguments to be supplied to the `setup.py` install command (e.g. like `--install-option='--install-scripts=/usr/local/bin'`). Use multiple `-install-option` options to pass multiple options to `setup.py` install. If you are using an option with a directory path, be sure to use absolute path.
global_options Extra global options to be supplied to the `setup.py` call before the install command.
user The user under which to run pip
cwd Directory from which to run pip
pre_releases Include pre-releases in the available versions
cert Provide a path to an alternate CA bundle
allow_all_external Allow the installation of all externally hosted files
allow_external Allow the installation of externally hosted files (comma separated list)
allow_unverified Allow the installation of insecure and unverifiable files (comma separated list)
process_dependency_links Enable the processing of dependency links
env_vars Set environment variables that some builds will depend on. For example, a Python C-module may have a Makefile that needs `INCLUDE_PATH` set to pick up a header file while compiling. This must be in the form of a dictionary or a mapping.

Example:

```
salt '*' pip.install django_app env_vars="{ 'CUSTOM_PATH': '/opt/django_app' }"
```

trusted_host Mark this host as trusted, even though it does not have valid or any HTTPS.
use_vt Use VT terminal emulation (see output while installing)
no_cache_dir Disable the cache.
 CLI Example:

```

salt '*' pip.install <package name>,<package2 name>
salt '*' pip.install requirements=/path/to/requirements.txt
salt '*' pip.install <package name> bin_env=/path/to/virtualenv
salt '*' pip.install <package name> bin_env=/path/to/pip_bin
  
```

Complicated CLI example:

```

salt '*' pip.install markdown,django                               editable=git+https://github.
↪com/worldcompany/djangoembed.git#egg=djangoembed upgrade=True no_deps=True
  
```

`salt.modules.pip.is_installed`(*pkgname=None, bin_env=None, user=None, cwd=None*)

New in version 2018.3.0.

Filter list of installed apps from `freeze` and return True or False if `pkgname` exists in the list of packages installed.

Note: If the version of pip available is older than 8.0.3, the packages `wheel`, `setuptools`, and `distribute` will not

be reported by this function even if they are installed. Unlike *pip.freeze*, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.is_installed salt
```

```
salt.modules.pip.list_(prefix=None, bin_env=None, user=None, cwd=None, env_vars=None,
                      **kwargs)
```

Filter list of installed apps from *freeze* and check to see if *prefix* exists in the list of packages installed.

Note: If the version of pip available is older than 8.0.3, the packages *wheel*, *setuptools*, and *distribute* will not be reported by this function even if they are installed. Unlike *pip.freeze*, this function always reports the version of pip which is installed.

CLI Example:

```
salt '*' pip.list salt
```

```
salt.modules.pip.list_all_versions(pkg, bin_env=None, include_alpha=False,
                                   include_beta=False, include_rc=False, user=None, cwd=None)
```

New in version 2017.7.3.

List all available versions of a pip package

pkg The package to check

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. */usr/bin/pip-2.7* or */usr/bin/pip-2.6*. If a directory path is specified, it is assumed to be a virtualenv.

include_alpha Include alpha versions in the list

include_beta Include beta versions in the list

include_rc Include release candidates versions in the list

user The user under which to run pip

cwd Directory from which to run pip

CLI Example:

```
salt '*' pip.list_all_versions <package name>
```

```
salt.modules.pip.list_upgrades(bin_env=None, user=None, cwd=None)
```

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pip.list_upgrades
```

```
salt.modules.pip.uninstall(pkgs=None, requirements=None, bin_env=None, log=None, proxy=None,
                           timeout=None, user=None, cwd=None, saltenv='base', use_vt=False)
```

Uninstall packages individually or from a pip requirements file

pkgs comma separated list of packages to install

requirements Path to requirements file

bin_env Path to pip (or to a virtualenv). This can be used to specify the path to the pip to use when more than one Python release is installed (e.g. */usr/bin/pip-2.7* or */usr/bin/pip-2.6*. If a directory path is specified, it is assumed to be a virtualenv.

log Log file where a complete (maximum verbosity) record will be kept

proxy Specify a proxy in the format *user:passwd@proxy.server:port*. Note that the *user:password@* is optional and required only if you are behind an authenticated proxy. If you

provide `user@proxy.server:port` then you will be prompted for a password.

timeout Set the socket timeout (default 15 seconds)

user The user under which to run pip

cwd Directory from which to run pip

use_vt Use VT terminal emulation (see output while installing)

CLI Example:

```
salt '*' pip.uninstall <package name>,<package2 name>
salt '*' pip.uninstall requirements=/path/to/requirements.txt
salt '*' pip.uninstall <package name> bin_env=/path/to/virtualenv
salt '*' pip.uninstall <package name> bin_env=/path/to/pip_bin
```

`salt.modules.pip.upgrade` (*bin_env=None, user=None, cwd=None, use_vt=False*)

New in version 2015.5.0.

Upgrades outdated pip packages.

Note: On Windows you can't update salt from pip using salt, so salt will be skipped

Returns a dict containing the changes.

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pip.upgrade
```

`salt.modules.pip.upgrade_available` (*pkg, bin_env=None, user=None, cwd=None*)

New in version 2015.5.0.

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pip.upgrade_available <package name>
```

`salt.modules.pip.version` (*bin_env=None*)

New in version 0.17.0.

Returns the version of pip. Use `bin_env` to specify the path to a virtualenv and get the version of pip in that virtualenv.

If unable to detect the pip version, returns None.

CLI Example:

```
salt '*' pip.version
```

20.9.304 salt.modules.pkg_resource

Resources needed by pkg providers

`salt.modules.pkg_resource.add_pkg` (*pkgs, name, pkgver*)

Add a package to a dict of installed packages.

CLI Example:

```
salt '*' pkg_resource.add_pkg '{} bind 9
```

`salt.modules.pkg_resource.check_extra_requirements(pkgname, pkgver)`

Check if the installed package already has the given requirements. This function will return the result of `pkg.check_extra_requirements` if this function exists for the minion, otherwise it will return True.

CLI Example:

```
salt '*' pkg_resource.check_extra_requirements <pkgname> <extra_requirements>
```

`salt.modules.pkg_resource.format_pkg_list(packages, versions_as_list, attr)`

Formats packages according to parameters for `list_pkgs`.

`salt.modules.pkg_resource.format_version(epoch, version, release)`

Formats a version string for `list_pkgs`.

`salt.modules.pkg_resource.pack_sources(sources, normalize=True)`

Accepts list of dicts (or a string representing a list of dicts) and packs the key/value pairs into a single dict.

'[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.rpm}]' would become {"foo": "salt://foo.rpm", "bar": "salt://bar.rpm"}

normalize [True] Normalize the package name by removing the architecture, if the architecture of the package is different from the architecture of the operating system. The ability to disable this behavior is useful for poorly-created packages which include the architecture as an actual part of the name, such as kernel modules which match a specific kernel version.

New in version 2015.8.0.

CLI Example:

```
salt '*' pkg_resource.pack_sources '[{"foo": "salt://foo.rpm"}, {"bar": "salt://  
→bar.rpm}]'
```

`salt.modules.pkg_resource.parse_targets(name=None, pkgs=None, sources=None, saltenv='base', normalize=True, **kwargs)`

Parses the input to `pkg.install` and returns back the package(s) to be installed. Returns a list of packages, as well as a string noting whether the packages are to come from a repository or a binary package.

CLI Example:

```
salt '*' pkg_resource.parse_targets
```

`salt.modules.pkg_resource.sort_pkglist(pkgs)`

Accepts a dict obtained from `pkg.list_pkgs()` and sorts in place the list of versions for any packages that have multiple versions installed, so that two package lists can be compared to one another.

CLI Example:

```
salt '*' pkg_resource.sort_pkglist '["3.45", "2.13"]'
```

`salt.modules.pkg_resource.stringify(pkgs)`

Takes a dict of package name/version information and joins each list of installed versions into a string.

CLI Example:

```
salt '*' pkg_resource.stringify 'vim: 7.127'
```

`salt.modules.pkg_resource.version(*names, **kwargs)`

Common interface for obtaining the version of installed packages.

CLI Example:

```
salt '*' pkg_resource.version vim
salt '*' pkg_resource.version foo bar baz
salt '*' pkg_resource.version 'python*'
```

`salt.modules.pkg_resource.version_clean(verstr)`

Clean the version string removing extra data. This function will simply try to call `pkg.version_clean`.

CLI Example:

```
salt '*' pkg_resource.version_clean <version_string>
```

20.9.305 salt.modules.pkgin

Package support for pkgin based systems, inspired from freebsd/pkg module

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.pkgin.available_version(*names, **kwargs)`

This function is an alias of `latest_version`.

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.file_dict(*packages)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_dict nginx
salt '*' pkg.file_dict nginx varnish
```

`salt.modules.pkgin.file_list(package)`

List the files that belong to a package.

CLI Examples:

```
salt '*' pkg.file_list nginx
```

`salt.modules.pkgin.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo Specify a package repository to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳deb"}]'
```

Return a dict containing the new package names and versions:

```
{ '<package>': {'old': '<old-version>',
                'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.pkgin.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> ...
```

`salt.modules.pkgin.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{ '<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.pkgin.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades.

New in version 2018.3.0.

refresh Whether or not to refresh the package database before installing.

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.pkgin.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.refresh_db` (*force=False*)

Use pkg update to get latest pkg_summary
force Pass -f so that the cache is always refreshed.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.pkgin.remove` (*name=None, pkgs=None, **kwargs*)

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.pkgin.search` (*pkg_name*)

Searches for an exact match using pkgin ^package\$

CLI Example:

```
salt '*' pkg.search 'mysql-server'
```

`salt.modules.pkgin.upgrade` (*refresh=True, pkgs=None, **kwargs*)

Run pkg upgrade, if pkgin used. Otherwise do nothing

refresh Whether or not to refresh the package database before installing.

Multiple Package Upgrade Options:

pkgs A list of packages to upgrade from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.upgrade pkgs='["foo", "bar"]'
```

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.pkgin.versioin` (**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

20.9.306 salt.modules.pkgng

Support for pkgng, the new package manager for FreeBSD

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

Warning: This module has been completely rewritten. Up to and including version 0.17.x, it was available as the `pkgng` module, (`pkgng.install`, `pkgng.delete`, etc.), but moving forward this module will no longer be available as `pkgng`, as it will behave like a normal Salt `pkg` provider. The documentation below should not be considered to apply to this module in versions `<= 0.17.x`. If your minion is running a 0.17.x release or older, then the documentation for this module can be viewed using the `sys.doc` function:

```
salt bsdminion sys.doc pkgng
```

This module provides an interface to `pkg(8)`. It acts as the default package provider for FreeBSD 10 and newer. For FreeBSD hosts which have been upgraded to use `pkgng`, you will need to override the `pkg` provider by setting the `providers` parameter in your Minion config file, in order to use this module to manage packages, like so:

```
providers:
  pkg: pkgng
```

salt.modules.pkgng.audit (*jail=None, chroot=None, root=None*)

Audits installed packages against known vulnerabilities

CLI Example:

```
salt '*' pkg.audit
```

jail Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.audit jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if `jail` is specified)

root Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.audit chroot=/path/to/chroot
```

salt.modules.pkgng.autoremove (*jail=None, chroot=None, root=None, dryrun=False*)

Delete packages which were automatically installed as dependencies and are not required anymore.

dryrun Dry-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.autoremove
salt '*' pkg.autoremove jail=<jail name or id>
```

(continues on next page)

(continued from previous page)

```
salt '*' pkg.autoremove dryrun=True
salt '*' pkg.autoremove jail=<jail name or id> dryrun=True
```

`salt.modules.pkgng.backup` (*file_name*, *jail=None*, *chroot=None*, *root=None*)

Export installed packages into yaml+mtree file

CLI Example:

```
salt '*' pkg.backup /tmp/pkg
```

jail Backup packages from the specified jail. Note that this will run the command within the jail, and so the path to the backup file will be relative to the root of the jail

CLI Example:

```
salt '*' pkg.backup /tmp/pkg jail=<jail name or id>
```

chroot Backup packages from the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the backup file will be relative to the root of the chroot.

root Backup packages from the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the backup file will be relative to the root of the root.

CLI Example:

```
salt '*' pkg.backup /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.check` (*jail=None*, *chroot=None*, *root=None*, *depends=False*, *recompute=False*, *checksum=False*)

Sanity checks installed packages

jail Perform the sanity check in the specified jail

CLI Example:

```
salt '*' pkg.check jail=<jail name or id>
```

chroot Perform the sanity check in the specified chroot (ignored if `jail` is specified)

root Perform the sanity check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.check chroot=/path/to/chroot
```

Of the below, at least one must be set to `True`.

depends Check for and install missing dependencies.

CLI Example:

```
salt '*' pkg.check recompute=True
```

recompute Recompute sizes and checksums of installed packages.

CLI Example:

```
salt '*' pkg.check depends=True
```

checksum Find invalid checksums for installed packages.

CLI Example:

```
salt '*' pkg.check checksum=True
```

`salt.modules.pkgng.clean` (*jail=None, chroot=None, root=None*)

Cleans the local cache of fetched remote packages

CLI Example:

```
salt '*' pkg.clean
salt '*' pkg.clean jail=<jail name or id>
salt '*' pkg.clean chroot=/path/to/chroot
```

`salt.modules.pkgng.fetch` (*name, jail=None, chroot=None, root=None, fetch_all=False, quiet=False, fromrepo=None, glob=True, regex=False, pcre=False, local=False, depends=False*)

Fetches remote packages

CLI Example:

```
salt '*' pkg.fetch <package name>
```

jail Fetch package in the specified jail

CLI Example:

```
salt '*' pkg.fetch <package name> jail=<jail name or id>
```

chroot Fetch package in the specified chroot (ignored if `jail` is specified)

root Fetch package in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.fetch <package name> chroot=/path/to/chroot
```

fetch_all Fetch all packages.

CLI Example:

```
salt '*' pkg.fetch <package name> fetch_all=True
```

quiet Quiet mode. Show less output.

CLI Example:

```
salt '*' pkg.fetch <package name> quiet=True
```

fromrepo Fetches packages from the given repo if multiple repo support is enabled. See `pkg.conf(5)`.

CLI Example:

```
salt '*' pkg.fetch <package name> fromrepo=repo
```

glob Treat `pkg_name` as a shell glob pattern.

CLI Example:

```
salt '*' pkg.fetch <package name> glob=True
```

regex Treat `pkg_name` as a regular expression.

CLI Example:

```
salt '*' pkg.fetch <regular expression> regex=True
```

pcre Treat `pkg_name` is an extended regular expression.

CLI Example:

```
salt '*' pkg.fetch <extended regular expression> pcre=True
```

local Skip updating the repository catalogs with pkg-update(8). Use the local cache only.

CLI Example:

```
salt '*' pkg.fetch <package name> local=True
```

depends Fetch the package and its dependencies as well.

CLI Example:

```
salt '*' pkg.fetch <package name> depends=True
```

salt.modules.pkgng.install (*name=None, fromrepo=None, pkgs=None, sources=None, jail=None, chroot=None, root=None, orphan=False, force=False, glob=False, local=False, dryrun=False, quiet=False, reinstall_requires=False, regex=False, pcre=False, batch=False, **kwargs*)

Install package(s) from a repository

name The name of the package to install

CLI Example:

```
salt '*' pkg.install <package name>
```

jail Install the package into the specified jail

chroot Install the package into the specified chroot (ignored if jail is specified)

root Install the package into the specified root (ignored if jail is specified)

orphan Mark the installed package as orphan. Will be automatically removed if no other packages depend on them. For more information please refer to pkg-autoremove(8).

CLI Example:

```
salt '*' pkg.install <package name> orphan=True
```

force Force the reinstallation of the package if already installed.

CLI Example:

```
salt '*' pkg.install <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.install <package name> glob=True
```

local Do not update the repository catalogs with pkg-update(8). A value of True here is equivalent to using the -U flag with pkg install.

CLI Example:

```
salt '*' pkg.install <package name> local=True
```

dryrun Dru-run mode. The list of changes to packages is always printed, but no changes are actually made.

CLI Example:

```
salt '*' pkg.install <package name> dryrun=True
```

quiet Force quiet output, except when dryrun is used, where pkg install will always show packages to be installed, upgraded or deleted.

CLI Example:

```
salt '*' pkg.install <package name> quiet=True
```

reinstall_requires When used with force, reinstalls any packages that require the given package.

CLI Example:

```
salt '*' pkg.install <package name> reinstall_requires=True force=True
```

Changed in version 2014.7.0: `require` kwarg renamed to `reinstall_requires`

fromrepo In multi-repo mode, override the `pkg.conf` ordering and only attempt to download packages from the named repository.

CLI Example:

```
salt '*' pkg.install <package name> fromrepo=repo
```

regex Treat the package names as a regular expression

CLI Example:

```
salt '*' pkg.install <regular expression> regex=True
```

pcre Treat the package names as extended regular expressions.

CLI Example:

batch Use `BATCH=true` for `pkg install`, skipping all questions. Be careful when using in production.

CLI Example:

```
salt '*' pkg.install <package name> batch=True
```

`salt.modules.pkgng.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> jail=<jail name or id>
salt '*' pkg.latest_version <package name> chroot=/path/to/chroot
```

`salt.modules.pkgng.list_pkgs(versions_as_list=False, jail=None, chroot=None, root=None, with_origin=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

jail List the packages in the specified jail

chroot List the packages in the specified chroot (ignored if `jail` is specified)

root List the packages in the specified root (ignored if `jail` is specified)

with_origin [False] Return a nested dictionary containing both the origin name and version for each installed package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs jail=<jail name or id>
salt '*' pkg.list_pkgs chroot=/path/to/chroot
```

`salt.modules.pkgng.parse_config`(*file_name*='usr/local/etc/pkg.conf')

Return dict of uncommented global variables.

CLI Example:

```
salt '*' pkg.parse_config
```

NOTE: not working properly right now

`salt.modules.pkgng.refresh_db`(*jail*=None, *chroot*=None, *root*=None, *force*=False)

Refresh PACKAGESITE contents

Note: This function can accessed using `pkg.update` in addition to `pkg.refresh_db`, to more closely match the CLI usage of `pkg(8)`.

CLI Example:

```
salt '*' pkg.refresh_db
```

jail Refresh the pkg database within the specified jail

chroot Refresh the pkg database within the specified chroot (ignored if `jail` is specified)

root Refresh the pkg database within the specified root (ignored if `jail` is specified)

force Force a full download of the repository catalog without regard to the respective ages of the local and remote copies of the catalog.

CLI Example:

```
salt '*' pkg.refresh_db force=True
```

`salt.modules.pkgng.remove`(*name*=None, *pkgs*=None, *jail*=None, *chroot*=None, *root*=None, *all_installed*=False, *force*=False, *glob*=False, *dryrun*=False, *recurse*=False, *regex*=False, *pcre*=False, ***kwargs*)

Remove a package from the database and system

Note: This function can accessed using `pkg.delete` in addition to `pkg.remove`, to more closely match the CLI usage of `pkg(8)`.

name The package to remove

CLI Example:

```
salt '*' pkg.remove <package name>
```

jail Delete the package from the specified jail

chroot Delete the package from the specified chroot (ignored if `jail` is specified)

root Delete the package from the specified root (ignored if `jail` is specified)

all_installed Deletes all installed packages from the system and empties the database. USE WITH CAUTION!

CLI Example:

```
salt '*' pkg.remove all all_installed=True force=True
```

force Forces packages to be removed despite leaving unresolved dependencies.

CLI Example:

```
salt '*' pkg.remove <package name> force=True
```

glob Treat the package names as shell glob patterns.

CLI Example:

```
salt '*' pkg.remove <package name> glob=True
```

dryrun Dry run mode. The list of packages to delete is always printed, but no packages are actually deleted.

CLI Example:

```
salt '*' pkg.remove <package name> dryrun=True
```

recurse Delete all packages that require the listed package as well.

CLI Example:

```
salt '*' pkg.remove <package name> recurse=True
```

regex Treat the package names as regular expressions.

CLI Example:

```
salt '*' pkg.remove <regular expression> regex=True
```

pcre Treat the package names as extended regular expressions.

CLI Example:

```
salt '*' pkg.remove <extended regular expression> pcre=True
```

`salt.modules.pkgng.restore` (*file_name*, *jail=None*, *chroot=None*, *root=None*)

Reads archive created by pkg backup -d and recreates the database.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg
```

jail Restore database to the specified jail. Note that this will run the command within the jail, and so the path to the file from which the pkg database will be restored is relative to the root of the jail.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg jail=<jail name or id>
```

chroot Restore database to the specified chroot (ignored if `jail` is specified). Note that this will run the command within the chroot, and so the path to the file from which the pkg database will be restored is relative to the root of the chroot.

root Restore database to the specified root (ignored if `jail` is specified). Note that this will run the command within the root, and so the path to the file from which the pkg database will be restored is relative to the root of the root.

CLI Example:

```
salt '*' pkg.restore /tmp/pkg chroot=/path/to/chroot
```

`salt.modules.pkgng.search` (*name*, *jail=None*, *chroot=None*, *root=None*, *exact=False*, *glob=False*, *regex=False*, *pcre=False*, *comment=False*, *desc=False*, *full=False*, *depends=False*, *size=False*, *quiet=False*, *origin=False*, *prefix=False*)

Searches in remote package repositories

CLI Example:

```
salt '*' pkg.search pattern
```

jail Perform the search using the `pkg.conf(5)` from the specified jail

CLI Example:

```
salt '*' pkg.search pattern jail=<jail name or id>
```

chroot Perform the search using the `pkg.conf(5)` from the specified chroot (ignored if `jail` is specified)

root Perform the search using the `pkg.conf(5)` from the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.search pattern chroot=/path/to/chroot
```

exact Treat pattern as exact pattern.

CLI Example:

```
salt '*' pkg.search pattern exact=True
```

glob Treat pattern as a shell glob pattern.

CLI Example:

```
salt '*' pkg.search pattern glob=True
```

regex Treat pattern as a regular expression.

CLI Example:

```
salt '*' pkg.search pattern regex=True
```

pcre Treat pattern as an extended regular expression.

CLI Example:

```
salt '*' pkg.search pattern pcre=True
```

comment Search for pattern in the package comment one-line description.

CLI Example:

```
salt '*' pkg.search pattern comment=True
```

desc Search for pattern in the package description.

CLI Example:

```
salt '*' pkg.search pattern desc=True
```

full Displays full information about the matching packages.

CLI Example:

```
salt '*' pkg.search pattern full=True
```

depends Displays the dependencies of pattern.

CLI Example:

```
salt '*' pkg.search pattern depends=True
```

size Displays the size of the package

CLI Example:

```
salt '*' pkg.search pattern size=True
```

quiet Be quiet. Prints only the requested information without displaying many hints.

CLI Example:

```
salt '*' pkg.search pattern quiet=True
```

origin Displays pattern origin.

CLI Example:

```
salt '*' pkg.search pattern origin=True
```

prefix Displays the installation prefix for each package matching pattern.

CLI Example:

```
salt '*' pkg.search pattern prefix=True
```

salt.modules.pkgng.stats (*local=False, remote=False, jail=None, chroot=None, root=None*)

Return pkgng stats.

CLI Example:

```
salt '*' pkg.stats
```

local Display stats only for the local package database.

CLI Example:

```
salt '*' pkg.stats local=True
```

remote Display stats only for the remote package database(s).

CLI Example:

```
salt '*' pkg.stats remote=True
```

jail Retrieve stats from the specified jail.

CLI Example:

```
salt '*' pkg.stats jail=<jail name or id>
salt '*' pkg.stats jail=<jail name or id> local=True
salt '*' pkg.stats jail=<jail name or id> remote=True
```

chroot Retrieve stats from the specified chroot (ignored if `jail` is specified).

root Retrieve stats from the specified root (ignored if `jail` is specified).

CLI Example:

```
salt '*' pkg.stats chroot=/path/to/chroot
salt '*' pkg.stats chroot=/path/to/chroot local=True
salt '*' pkg.stats chroot=/path/to/chroot remote=True
```

salt.modules.pkgng.update_package_site (*new_url*)

Updates remote package repo URL, PACKAGESITE var to be exact.

Must use `http://`, `ftp://`, or `https://` protocol

CLI Example:

```
salt '*' pkg.update_package_site http://127.0.0.1/
```

`salt.modules.pkgng.updating`(*name*, *jail=None*, *chroot=None*, *root=None*, *filedate=None*, *filename=None*)

' Displays UPDATING entries of software packages

CLI Example:

```
salt '*' pkg.updating foo
```

jail Perform the action in the specified jail

CLI Example:

```
salt '*' pkg.updating foo jail=<jail name or id>
```

chroot Perform the action in the specified chroot (ignored if `jail` is specified)

root Perform the action in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.updating foo chroot=/path/to/chroot
```

filedate Only entries newer than date are shown. Use a YYYYMMDD date format.

CLI Example:

```
salt '*' pkg.updating foo filedate=20130101
```

filename Defines an alternative location of the UPDATING file.

CLI Example:

```
salt '*' pkg.updating foo filename=/tmp/UPDATING
```

`salt.modules.pkgng.upgrade`(**names*, ***kwargs*)

Upgrade named or all packages (run a `pkg upgrade`). If `<package name>` is omitted, the operation is executed on all packages.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade <package name>
```

jail Audit packages within the specified jail

CLI Example:

```
salt '*' pkg.upgrade <package name> jail=<jail name or id>
```

chroot Audit packages within the specified chroot (ignored if `jail` is specified)

root Audit packages within the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.upgrade <package name> chroot=/path/to/chroot
```

Any of the below options can also be used with `jail` or `chroot`.

force Force reinstalling/upgrading the whole set of packages.

CLI Example:

```
salt '*' pkg.upgrade <package name> force=True
```

local Do not update the repository catalogs with `pkg-update(8)`. A value of `True` here is equivalent to using the `-U` flag with `pkg upgrade`.

CLI Example:

```
salt '*' pkg.upgrade <package name> local=True
```

dryrun Dry-run mode: show what packages have updates available, but do not perform any upgrades. Repository catalogs will be updated as usual unless the `local` option is also given.

CLI Example:

```
salt '*' pkg.upgrade <package name> dryrun=True
```

`salt.modules.pkgng.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Note: This function can be accessed using `pkg.info` in addition to `pkg.version`, to more closely match the CLI usage of `pkg(8)`.

jail Get package version information for the specified jail

chroot Get package version information for the specified chroot (ignored if `jail` is specified)

root Get package version information for the specified root (ignored if `jail` is specified)

with_origin [False] Return a nested dictionary containing both the origin name and version for each specified package.

New in version 2014.1.0.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name> jail=<jail name or id>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.pkgng.version_cmp(pkg1, pkg2, ignore_epoch=False)`

Do a `cmp`-style comparison on two packages. Return `-1` if `pkg1 < pkg2`, `0` if `pkg1 == pkg2`, and `1` if `pkg1 > pkg2`. Return `None` if there was a problem making the comparison.

CLI Example:

```
salt '*' pkg.version_cmp '2.1.11' '2.1.12'
```

`salt.modules.pkgng.which(path, jail=None, chroot=None, root=None, origin=False, quiet=False)`

Displays which package installed a specific file

CLI Example:

```
salt '*' pkg.which <file name>
```

jail Perform the check in the specified jail

CLI Example:

```
salt '*' pkg.which <file name> jail=<jail name or id>
```

chroot Perform the check in the specified chroot (ignored if `jail` is specified)

root Perform the check in the specified root (ignored if `jail` is specified)

CLI Example:

```
salt '*' pkg.which <file name> chroot=/path/to/chroot
```

origin Shows the origin of the package instead of name-version.

CLI Example:

```
salt '*' pkg.which <file name> origin=True
```

quiet Quiet output.

CLI Example:

```
salt '*' pkg.which <file name> quiet=True
```

20.9.307 salt.modules.pkgutil

Pkgutil support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.pkgutil.install`(*name=None, refresh=False, version=None, pkgs=None, **kwargs*)

Install packages using the pkgutil tool.

CLI Example:

```
salt '*' pkg.install <package_name>
salt '*' pkg.install SMClgcc346
```

Multiple Package Installation Options:

pkgs A list of packages to install from OpenCSW. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3'}]
```

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

`salt.modules.pkgutil.latest_version`(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkgutil.latest_version CSWpython
salt '*' pkgutil.latest_version <package1> <package2> <package3> ...
```

`salt.modules.pkgutil.list_pkgs` (*versions_as_list=False, **kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.pkgutil.list_upgrades` (*refresh=True, **kwargs*)

List all available package upgrades on this system

CLI Example:

```
salt '*' pkgutil.list_upgrades
```

`salt.modules.pkgutil.purge` (*name=None, pkgs=None, **kwargs*)

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs=['"foo"', '"bar"']
```

`salt.modules.pkgutil.refresh_db` ()

Updates the pkgutil repo database (pkgutil -U)

CLI Example:

```
salt '*' pkgutil.refresh_db
```

`salt.modules.pkgutil.remove` (*name=None, pkgs=None, **kwargs*)

Remove a package and all its dependencies which are not in use by other packages.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['"foo"', '"bar"']
```

`salt.modules.pkgutil.upgrade` (*refresh=True*)

Upgrade all of the packages to the latest available version.

Returns a dict containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkgutil.upgrade
```

salt.modules.pkgutil.upgrade_available(*name*)
Check if there is an upgrade available for a certain package

CLI Example:

```
salt '*' pkgutil.upgrade_available CSWpython
```

salt.modules.pkgutil.version(**names*, ***kwargs*)
Returns a version if the package is installed, else returns an empty string

CLI Example:

```
salt '*' pkgutil.version CSWpython
```

20.9.308 salt.modules.portage_config

Configure portage(5)

salt.modules.portage_config.append_to_package_conf(*conf*, *atom*=", *flags*=None, *string*=",
overwrite=False)
Append a string or a list of flags for a given package or DEPEND atom to a given configuration file.

CLI Example:

```
salt '*' portage_config.append_to_package_conf use string="app-admin/salt ldap -
↳ libvirt"
salt '*' portage_config.append_to_package_conf use atom="> = app-admin/salt-0.14.1
↳ flags="['ldap', '-libvirt']"
```

salt.modules.portage_config.append_use_flags(*atom*, *uses*=None, *overwrite*=False)
Append a list of use flags for a given package or DEPEND atom

CLI Example:

```
salt '*' portage_config.append_use_flags "app-admin/salt[ldap, -libvirt]"
salt '*' portage_config.append_use_flags ">=app-admin/salt-0.14.1" "['ldap', '-
↳ libvirt']"
```

salt.modules.portage_config.enforce_nice_config()
Enforce a nice tree structure for /etc/portage/package.* configuration files.

See also:

salt.modules.ebuild.ex_mod_init() for information on automatically running this when pkg is used.

CLI Example:

```
salt '*' portage_config.enforce_nice_config
```

`salt.modules.portage_config.filter_flags`(*use, use_expand_hidden, usemasked, useforced*)

New in version 2015.8.0.

Filter function to remove hidden or otherwise not normally visible USE flags from a list.

@type use: list @param use: the USE flag list to be filtered. @type use_expand_hidden: list @param use_expand_hidden: list of flags hidden. @type usemasked: list @param usemasked: list of masked USE flags. @type useforced: list @param useforced: the forced USE flags. @rtype: list @return the filtered USE flags.

`salt.modules.portage_config.get_all_cpv_use`(*cp*)

New in version 2015.8.0.

Uses portage to determine final USE flags and settings for an emerge.

@type cp: string @param cp: eg cat/pkg @rtype: lists @return use, use_expand_hidden, usemask, useforce

`salt.modules.portage_config.get_cleared_flags`(*cp*)

New in version 2015.8.0.

Uses portage for compare use flags which is used for installing package and use flags which now exist in /etc/portage/package.use/

@type cp: string @param cp: eg cat/pkg @rtype: tuple @rparam: tuple with two lists - list of used flags and list of flags which will be used

`salt.modules.portage_config.get_flags_from_package_conf`(*conf, atom*)

Get flags for a given package or DEPEND atom. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.get_flags_from_package_conf license salt
```

`salt.modules.portage_config.get_installed_use`(*cp, use='USE'*)

New in version 2015.8.0.

Gets the installed USE flags from the VARDB.

@type cp: string @param cp: cat/pkg @type use: string @param use: 1 of ["USE", "PKGUSE"] @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_iuse`(*cp*)

New in version 2015.8.0.

Gets the current IUSE flags from the tree.

@type cpv: string @param cpv: cat/pkg @rtype list @returns [] or the list of IUSE flags

`salt.modules.portage_config.get_missing_flags`(*conf, atom, flags*)

Find out which of the given flags are currently not set. CLI Example:

```
salt '*' portage_config.get_missing_flags use salt "['ldap', '-libvirt', 'openssl', '-]'"
```

`salt.modules.portage_config.has_flag`(*conf, atom, flag*)

Verify if the given package or DEPEND atom has the given flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_flag license salt Apache-2.0
```

`salt.modules.portage_config.has_use(atom, use)`

Verify if the given package or DEPEND atom has the given use flag. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.has_use salt libvirt
```

`salt.modules.portage_config.is_changed_uses(cp)`

New in version 2015.8.0.

Uses portage for determine if the use flags of installed package is compatible with use flags in portage configs.

@type cp: string @param cp: eg cat/pkg

`salt.modules.portage_config.is_present(conf, atom)`

Tell if a given package or DEPEND atom is present in the configuration files tree. Warning: This only works if the configuration files tree is in the correct format (the one enforced by `enforce_nice_config`)

CLI Example:

```
salt '*' portage_config.is_present unmask salt
```

20.9.309 salt.modules.postfix

Support for Postfix

This module is currently little more than a config file viewer and editor. It is able to read the `master.cf` file (which is one style) and files in the style of `main.cf` (which is a different style, that is used in multiple postfix configuration files).

The design of this module is such that when files are edited, a minimum of changes are made to them. Each file should look as if it has been edited by hand; order, comments and whitespace are all preserved.

`salt.modules.postfix.delete(queue_id)`

Delete message(s) from the mail queue

CLI Example:

```
salt '*' postfix.delete 5C33CA0DEA
salt '*' postfix.delete ALL
```

`salt.modules.postfix.hold(queue_id)`

Put message(s) on hold from the mail queue

CLI Example:

```
salt '*' postfix.hold 5C33CA0DEA
salt '*' postfix.hold ALL
```

`salt.modules.postfix.requeue(queue_id)`

Requeue message(s) in the mail queue

CLI Example:

```
salt '*' postfix.requeue 5C33CA0DEA
salt '*' postfix.requeue ALL
```

`salt.modules.postfix.set_main(key, value, path='/etc/postfix/main.cf')`

Set a single config value in the main.cf file. If the value does not already exist, it will be appended to the end.

CLI Example:

```
salt <minion> postfix.set_main mailq_path /usr/bin/mailq
```

`salt.modules.postfix.set_master(service, conn_type, private='y', unpriv='y', chroot='y', wakeup='n', maxproc='100', command="", write_conf=True, path='/etc/postfix/master.cf')`

Set a single config value in the master.cf file. If the value does not already exist, it will be appended to the end.

Because of shell parsing issues, '-' cannot be set as a value, as is normal in the master.cf file; either 'y', 'n' or a number should be used when calling this function from the command line. If the value used matches the default, it will internally be converted to a '-'. Calling this function from the Python API is not affected by this limitation

The settings and their default values, in order, are: service (required), conn_type (required), private (y), unpriv (y), chroot (y), wakeup (n), maxproc (100), command (required).

By default, this function will write out the changes to the master.cf file, and then returns the full contents of the file. By setting the `write_conf` option to `False`, it will skip writing the file.

CLI Example:

```
salt <minion> postfix.set_master smtp inet n y n n 100 smtpd
```

`salt.modules.postfix.show_main(path='/etc/postfix/main.cf')`

Return a dict of active config values. This does not include comments, spacing or order. Bear in mind that order is functionally important in the main.cf file, since keys can be referred to as variables. This means that the data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_main salt <minion> postfix.show_main path=/path/to/main.cf
```

`salt.modules.postfix.show_master(path='/etc/postfix/master.cf')`

Return a dict of active config values. This does not include comments, spacing or order.

The data returned from this function should not be used for direct modification of the main.cf file; other functions are available for that.

CLI Examples:

```
salt <minion> postfix.show_master salt <minion> postfix.show_master path=/path/to/master.cf
```

`salt.modules.postfix.show_queue()`

Show contents of the mail queue

CLI Example:

```
salt '*' postfix.show_queue
```

`salt.modules.postfix.unhold(queue_id)`

Set held message(s) in the mail queue to unheld

CLI Example:

```
salt '*' postfix.unhold 5C33CA0DEA
```

```
salt '*' postfix.unhold ALL
```

20.9.310 salt.modules.postgres

Module to provide Postgres compatibility to salt.

configuration In order to connect to Postgres, certain configuration is required in `/etc/salt/minion` on the relevant minions. Some sample configs might look like:

```
postgres.host: 'localhost'
postgres.port: '5432'
postgres.user: 'postgres' -> db user
postgres.pass: ''
postgres.maintenance_db: 'postgres'
```

The default for the `maintenance_db` is `'postgres'` and in most cases it can be left at the default setting. This data can also be passed into pillar. Options passed into `opts` will overwrite options passed into pillar

note This module uses MD5 hashing which may not be compliant with certain security audits.

note When installing postgres from the official postgres repos, on certain linux distributions, either the `psql` or the `initdb` binary is *not* automatically placed on the path. Add a configuration to the location of the postgres bin's path to the relevant minion for this module:

```
postgres.bins_dir: '/usr/pgsql-9.5/bin/'
```

`salt.modules.postgres.available_extensions` (*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

List available postgresql extensions

CLI Example:

```
salt '*' postgres.available_extensions
```

`salt.modules.postgres.create_extension` (*name, if_not_exists=None, schema=None, ext_version=None, from_version=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Install a postgresql extension

CLI Example:

```
salt '*' postgres.create_extension 'adminpack'
```

`salt.modules.postgres.create_metadata` (*name, ext_version=None, schema=None, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Get lifecycle information about an extension

CLI Example:

```
salt '*' postgres.create_metadata adminpack
```

`salt.modules.postgres.datadir_exists` (*name*)

New in version 2016.3.0.

Checks if postgres data directory has been initialized

CLI Example:

```
salt '*' postgres.datadir_exists '/var/lib/pgsql/data'
```

name Name of the directory to check

`salt.modules.postgres.datadir_init`(*name*, *auth*='password', *user*=None, *password*=None, *encoding*='UTF8', *locale*=None, *runas*=None)

New in version 2016.3.0.

Initializes a postgres data directory

CLI Example:

```
salt '*' postgres.datadir_init '/var/lib/pgsql/data'
```

name The name of the directory to initialize

auth The default authentication method for local connections

password The password to set for the postgres user

user The database superuser name

encoding The default encoding for new databases

locale The default locale for new databases

runas The system user the operation should be performed on behalf of

`salt.modules.postgres.db_alter`(*name*, *user*=None, *host*=None, *port*=None, *maintenance_db*=None, *password*=None, *tablespace*=None, *owner*=None, *owner_recurse*=False, *runas*=None)

Change tablespace or/and owner of database.

CLI Example:

```
salt '*' postgres.db_alter dbname owner=otheruser
```

`salt.modules.postgres.db_create`(*name*, *user*=None, *host*=None, *port*=None, *maintenance_db*=None, *password*=None, *tablespace*=None, *encoding*=None, *lc_collate*=None, *lc_ctype*=None, *owner*=None, *template*=None, *runas*=None)

Adds a databases to the Postgres server.

CLI Example:

```
salt '*' postgres.db_create 'dbname'
```

```
salt '*' postgres.db_create 'dbname' template=template_postgis
```

`salt.modules.postgres.db_exists`(*name*, *user*=None, *host*=None, *port*=None, *maintenance_db*=None, *password*=None, *runas*=None)

Checks if a database exists on the Postgres server.

CLI Example:

```
salt '*' postgres.db_exists 'dbname'
```

`salt.modules.postgres.db_list`(*user*=None, *host*=None, *port*=None, *maintenance_db*=None, *password*=None, *runas*=None)

Return dictionary with information about databases of a Postgres server.

CLI Example:

```
salt '*' postgres.db_list
```

`salt.modules.postgres.db_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a databases from the Postgres server.

CLI Example:

```
salt '*' postgres.db_remove 'dbname'
```

`salt.modules.postgres.drop_extension`(*name*, *if_exists=None*, *restrict=None*, *cascade=None*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Drop an installed postgresql extension

CLI Example:

```
salt '*' postgres.drop_extension 'adminpack'
```

`salt.modules.postgres.get_available_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an available postgresql extension

CLI Example:

```
salt '*' postgres.get_available_extension plpgsql
```

`salt.modules.postgres.get_installed_extension`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Get info about an installed postgresql extension

CLI Example:

```
salt '*' postgres.get_installed_extension plpgsql
```

`salt.modules.postgres.group_create`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *encrypted=None*, *login=None*, *inherit=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Creates a Postgres group. A group is postgres is similar to a user, but cannot login.

CLI Example:

```
salt '*' postgres.group_create 'groupname' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.group_remove`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a group from the Postgres server.

CLI Example:

```
salt '*' postgres.group_remove 'groupname'
```

`salt.modules.postgres.group_update`(*groupname*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createroles=None*, *createuser=None*, *encrypted=None*, *inherit=None*, *login=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *groups=None*, *runas=None*)

Updates a postgres group

CLI Examples:

```
salt '*' postgres.group_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword'
```

`salt.modules.postgres.has_privileges`(*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Check if a role has the specified privileges on an object

CLI Example:

```
salt '*' postgres.has_privileges user_name table_name table \
SELECT,INSERT maintenance_db=db_name
```

name Name of the role whose privileges should be checked on *object_type*

object_name Name of the object on which the check is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to check, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If *grant_option* is set to True, the grant option check is performed

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

```
salt.modules.postgres.installed_extensions(user=None, host=None, port=None,
                                             maintenance_db=None, password=None,
                                             runas=None)
```

List installed postgresql extensions

CLI Example:

```
salt '*' postgres.installed_extensions
```

```
salt.modules.postgres.is_available_extension(name, user=None, host=None, port=None,
                                              maintenance_db=None, password=None,
                                              runas=None)
```

Test if a specific extension is available

CLI Example:

```
salt '*' postgres.is_available_extension
```

```
salt.modules.postgres.is_installed_extension(name, user=None, host=None, port=None,
                                              maintenance_db=None, password=None,
                                              runas=None)
```

Test if a specific extension is installed

CLI Example:

```
salt '*' postgres.is_installed_extension
```

```
salt.modules.postgres.language_create(name, maintenance_db, user=None, host=None,
                                         port=None, password=None, runas=None)
```

New in version 2016.3.0.

Installs a language into a database

CLI Example:

```
salt '*' postgres.language_create plpgsql dbname
```

name Language to install
maintenance_db The database to install the language in
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

```
salt.modules.postgres.language_exists(name, maintenance_db, user=None, host=None,
                                         port=None, password=None, runas=None)
```

New in version 2016.3.0.

Checks if language exists in a database.

CLI Example:

```
salt '*' postgres.language_exists plpgsql dbname
```

name Language to check for
maintenance_db The database to check in

user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

`salt.modules.postgres.language_list` (*maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Return a list of languages in a database.

CLI Example:

```
salt '*' postgres.language_list dbname
```

maintenance_db The database to check
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

`salt.modules.postgres.language_remove` (*name*, *maintenance_db*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Removes a language from a database

CLI Example:

```
salt '*' postgres.language_remove plpgsql dbname
```

name Language to remove
maintenance_db The database to install the language in
user database username if different from config or default
password user password if any password for a specified user
host Database host if different from config or default
port Database port if different from config or default
runas System user all operations should be performed on behalf of

`salt.modules.postgres.owner_to` (*dbname*, *ownername*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

Set the owner of all schemas, functions, tables, views and sequences to the given username.

CLI Example:

```
salt '*' postgres.owner_to 'dbname' 'username'
```

`salt.modules.postgres.privileges_grant` (*name*, *object_name*, *object_type*, *privileges=None*, *grant_option=None*, *prepend='public'*, *maintenance_db=None*, *user=None*, *host=None*, *port=None*, *password=None*, *runas=None*)

New in version 2016.3.0.

Grant privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_grant user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name Name of the role to which privileges should be granted
object_name Name of the object on which the grant is to be performed
object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to grant, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

grant_option If `grant_option` is set to `True`, the recipient of the privilege can in turn grant it to others

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_list(name, object_type, prepend='public', maintenance_db=None, user=None, host=None, port=None, password=None, runas=None)
```

New in version 2016.3.0.

Return a list of privileges for the specified object.

CLI Example:

```
salt '*' postgres.privileges_list table_name table maintenance_db=db_name
```

name Name of the object for which the permissions should be returned

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

prepend Table and Sequence object types live under a schema so this should be provided if the object is not under the default *public* schema

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.privileges_revoke(name, object_name, object_type, privileges=None,
                                           prepend='public', maintenance_db=None,
                                           user=None, host=None, port=None, password=None,
                                           runas=None)
```

New in version 2016.3.0.

Revoke privileges on a postgres object

CLI Example:

```
salt '*' postgres.privileges_revoke user_name table_name table \
SELECT,UPDATE maintenance_db=db_name
```

name Name of the role whose privileges should be revoked

object_name Name of the object on which the revoke is to be performed

object_type The object type, which can be one of the following:

- table
- sequence
- schema
- tablespace
- language
- database
- group
- function

privileges Comma separated list of privileges to revoke, from the list below:

- INSERT
- CREATE
- TRUNCATE
- CONNECT
- TRIGGER
- SELECT
- USAGE
- TEMPORARY
- UPDATE
- EXECUTE
- REFERENCES
- DELETE
- ALL

maintenance_db The database to connect to

user database username if different from config or default

password user password if any password for a specified user

host Database host if different from config or default

port Database port if different from config or default

runas System user all operations should be performed on behalf of

```
salt.modules.postgres.psql_query(query, user=None, host=None, port=None, mainte-
                                   nance_db=None, password=None, runas=None, write=False)
```

Run an SQL-Query and return the results as a list. This command only supports SELECT statements. This

limitation can be worked around with a query like this:

```
WITH updated AS (UPDATE pg_authid SET rolconnlimit = 2000 WHERE rolname = 'rolename' RETURNING
rolconnlimit) SELECT * FROM updated;
```

query The query string.

user Database username, if different from config or default.

host Database host, if different from config or default.

port Database port, if different from the config or default.

maintenance_db The database to run the query against.

password User password, if different from the config or default.

runas User to run the command as.

write Mark query as READ WRITE transaction.

CLI Example:

```
salt '*' postgres.psycopg_query 'select * from pg_stat_activity'
```

```
salt.modules.postgres.role_get(name, user=None, host=None, port=None, maintenance_db=None,
password=None, runas=None, return_password=False)
```

Return a dict with information about users of a Postgres server.

Set return_password to True to get password hash in the result.

CLI Example:

```
salt '*' postgres.role_get postgres
```

```
salt.modules.postgres.schema_create(dbname, name, owner=None, user=None, db_user=None,
db_password=None, db_host=None, db_port=None)
```

Creates a Postgres schema.

CLI Example:

```
salt '*' postgres.schema_create dbname name owner='owner' \
user='user' \
db_user='user' db_password='password'
db_host='hostname' db_port='port'
```

```
salt.modules.postgres.schema_exists(dbname, name, user=None, db_user=None,
db_password=None, db_host=None, db_port=None)
```

Checks if a schema exists on the Postgres server.

CLI Example:

```
salt '*' postgres.schema_exists dbname schemaname
```

dbname Database name we query on

name Schema name we look for

user The system user the operation should be performed on behalf of

db_user database username if different from config or default

db_password user password if any password for a specified user

db_host Database host if different from config or default

db_port Database port if different from config or default

```
salt.modules.postgres.schema_get(dbname, name, user=None, db_user=None, db_password=None,
db_host=None, db_port=None)
```

Return a dict with information about schemas in a database.

CLI Example:

```
salt '*' postgres.schema_get dbname name
```

dbname Database name we query on
name Schema name we look for
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

```
salt.modules.postgres.schema_list(dbname, user=None, db_user=None, db_password=None,
                                     db_host=None, db_port=None)
```

Return a dict with information about schemas in a Postgres database.

CLI Example:

```
salt '*' postgres.schema_list dbname
```

dbname Database name we query on
user The system user the operation should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

```
salt.modules.postgres.schema_remove(dbname, name, user=None, db_user=None,
                                       db_password=None, db_host=None, db_port=None)
```

Removes a schema from the Postgres server.

CLI Example:

```
salt '*' postgres.schema_remove dbname schemaname
```

dbname Database name we work on
schemaname The schema's name we'll remove
user System user all operations should be performed on behalf of
db_user database username if different from config or default
db_password user password if any password for a specified user
db_host Database host if different from config or default
db_port Database port if different from config or default

```
salt.modules.postgres.tablespace_alter(name, user=None, host=None, port=None, mainte-
                                         nance_db=None, password=None, new_name=None,
                                         new_owner=None, set_option=None, re-
                                         set_option=None, runas=None)
```

Change tablespace name, owner, or options.

CLI Example:

```
salt '*' postgres.tablespace_alter tsname new_owner=otheruser
salt '*' postgres.tablespace_alter index_space new_name=fast_raid
salt '*' postgres.tablespace_alter test set_option="{ 'seq_page_cost': '1.1' }"
salt '*' postgres.tablespace_alter tsname reset_option=seq_page_cost
```

New in version 2015.8.0.

```
salt.modules.postgres.tablespace_create(name, location, options=None, owner=None,
                                          user=None, host=None, port=None, mainte-
                                          nance_db=None, password=None, runas=None)
```

Adds a tablespace to the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_create tablespacename '/path/datadir'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a tablespace exists on the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_exists 'dbname'
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_list`(*user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Return dictionary with information about tablespaces of a Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_list
```

New in version 2015.8.0.

`salt.modules.postgres.tablespace_remove`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Removes a tablespace from the Postgres server.

CLI Example:

```
salt '*' postgres.tablespace_remove tsname
```

New in version 2015.8.0.

`salt.modules.postgres.user_create`(*username*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *createdb=None*, *createuser=None*, *createroles=None*, *inherit=None*, *login=None*, *conlimit=None*, *encrypted=None*, *superuser=None*, *replication=None*, *rolepassword=None*, *valid_until=None*, *groups=None*, *runas=None*)

Creates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_create 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

`salt.modules.postgres.user_exists`(*name*, *user=None*, *host=None*, *port=None*, *maintenance_db=None*, *password=None*, *runas=None*)

Checks if a user exists on the Postgres server.

CLI Example:

```
salt '*' postgres.user_exists 'username'
```

`salt.modules.postgres.user_list` (*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None, return_password=False*)

Return a dict with information about users of a Postgres server.

Set `return_password` to `True` to get password hash in the result.

CLI Example:

```
salt '*' postgres.user_list
```

`salt.modules.postgres.user_remove` (*username, user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Removes a user from the Postgres server.

CLI Example:

```
salt '*' postgres.user_remove 'username'
```

`salt.modules.postgres.user_update` (*username, user=None, host=None, port=None, maintenance_db=None, password=None, createdb=None, createuser=None, createroles=None, encrypted=None, superuser=None, inherit=None, login=None, connlimit=None, replication=None, rolepassword=None, valid_until=None, groups=None, runas=None*)

Updates a Postgres user.

CLI Examples:

```
salt '*' postgres.user_update 'username' user='user' \
    host='hostname' port='port' password='password' \
    rolepassword='rolepassword' valid_until='valid_until'
```

`salt.modules.postgres.version` (*user=None, host=None, port=None, maintenance_db=None, password=None, runas=None*)

Return the version of a Postgres server.

CLI Example:

```
salt '*' postgres.version
```

20.9.311 salt.modules.poudriere

Support for poudriere

`salt.modules.poudriere.bulk_build` (*jail, pkg_file, keep=False*)

Run bulk build on poudriere server.

Return number of pkg builds, failures, and errors, on error dump to CLI

CLI Example:

```
salt -N buildbox_group poudriere.bulk_build 90amd64 /root/pkg_list
```

`salt.modules.poudriere.create_jail` (*name, arch, version='9.0-RELEASE'*)

Creates a new poudriere jail if one does not exist

NOTE creating a new jail will take some time the master is not hanging

CLI Example:

```
salt '*' poudriere.create_jail 90amd64 amd64
```

`salt.modules.poudriere.create_ports_tree()`

Not working need to run portfetch non interactive

`salt.modules.poudriere.delete_jail(name)`

Deletes poudriere jail with *name*

CLI Example:

```
salt '*' poudriere.delete_jail 90amd64
```

`salt.modules.poudriere.is_jail(name)`

Return True if jail exists False if not

CLI Example:

```
salt '*' poudriere.is_jail <jail name>
```

`salt.modules.poudriere.list_jails()`

Return a list of current jails managed by poudriere

CLI Example:

```
salt '*' poudriere.list_jails
```

`salt.modules.poudriere.list_ports()`

Return a list of current port trees managed by poudriere

CLI Example:

```
salt '*' poudriere.list_ports
```

`salt.modules.poudriere.make_pkgng_aware(jname)`

Make jail *jname* pkgng aware

CLI Example:

```
salt '*' poudriere.make_pkgng_aware <jail name>
```

`salt.modules.poudriere.parse_config(config_file=None)`

Returns a dict of poudriere main configuration definitions

CLI Example:

```
salt '*' poudriere.parse_config
```

`salt.modules.poudriere.update_jail(name)`

Run freebsd-update on *name* poudriere jail

CLI Example:

```
salt '*' poudriere.update_jail freebsd:10:x86:64
```

`salt.modules.poudriere.update_ports_tree(ports_tree)`

Updates the ports tree, either the default or the *ports_tree* specified

CLI Example:

```
salt '*' poudriere.update_ports_tree staging
```

`salt.modules.poudriere.version()`

Return poudriere version

CLI Example:

```
salt '*' poudriere.version
```

20.9.312 salt.modules.powerpath

powerpath support.

Assumes RedHat

`salt.modules.powerpath.add_license(key)`

Add a license

`salt.modules.powerpath.has_powerpath()`

`salt.modules.powerpath.list_licenses()`

returns a list of applied powerpath license keys

`salt.modules.powerpath.remove_license(key)`

Remove a license

20.9.313 salt.modules.proxy module

This module allows you to manage proxy settings

```
salt '*' network.get_http_proxy
```

`salt.modules.proxy.get_ftp_proxy(network_service='Ethernet')`

Returns the current ftp proxy settings

network_service The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_ftp_proxy Ethernet
```

`salt.modules.proxy.get_http_proxy(network_service='Ethernet')`

Returns the current http proxy settings

network_service The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_http_proxy Ethernet
```

`salt.modules.proxy.get_https_proxy(network_service='Ethernet')`

Returns the current https proxy settings

network_service The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.get_https_proxy Ethernet
```

`salt.modules.proxy.get_proxy_bypass(network_service='Ethernet')`

Returns the current domains that can bypass the proxy

network_service The network service to get the bypass domains from, this is only necessary on macOS

CLI Example:

```
salt '*' proxy.get_proxy_bypass
```

`salt.modules.proxy.get_proxy_win()`

Gets all of the proxy settings in one call, only available on Windows

CLI Example:

```
salt '*' proxy.get_proxy_win
```

`salt.modules.proxy.set_ftp_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the ftp proxy settings

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on macOS

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_ftp_proxy example.com 1080 user=proxy_user password=proxy_pass
↳network_service=Ethernet
```

`salt.modules.proxy.set_http_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the http proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on macOS

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_https_proxy(server, port, user=None, password=None, network_service='Ethernet', bypass_hosts=None)`

Sets the https proxy settings. Note: On Windows this will override any other proxy settings you have, the preferred method of updating proxies on windows is using `set_proxy`.

server The proxy server to use

port The port used by the proxy server

user The username to use for the proxy server if required

password The password to use if required by the server

network_service The network service to apply the changes to, this only necessary on macOS

bypass_hosts The hosts that are allowed to by pass the proxy. Only used on Windows for other OS's use `set_proxy_bypass` to edit the bypass hosts.

CLI Example:

```
salt '*' proxy.set_https_proxy example.com 1080 user=proxy_user password=proxy_
↳pass network_service=Ethernet
```

`salt.modules.proxy.set_proxy_bypass` (*domains*, *network_service*='Ethernet')

Sets the domains that can bypass the proxy

domains An array of domains allowed to bypass the proxy

network_service The network service to apply the changes to, this only necessary on macOS

CLI Example:

```
salt '*' proxy.set_proxy_bypass "['127.0.0.1', 'localhost']"
```

`salt.modules.proxy.set_proxy_win` (*server*, *port*, *types*=None, *bypass_hosts*=None)

Sets the http proxy settings, only works with Windows.

server The proxy server to use

password The password to use if required by the server

types The types of proxy connections should be setup with this server. Valid types are:

- http
- https
- ftp

bypass_hosts The hosts that are allowed to by pass the proxy.

CLI Example:

```
salt '*' proxy.set_http_proxy example.com 1080 types="['http', 'https']"
```

20.9.314 salt.modules.ps

A salt interface to psutil, a system and process library. See <http://code.google.com/p/psutil>.

depends

- psutil Python module, version 0.3.0 or later
- python-utmp package (optional)

`salt.modules.ps.boot_time` (*time_format*=None)

Return the boot time in number of seconds since the epoch began.

CLI Example:

time_format Optionally specify a `strftime` format string. Use `time_format='%c'` to get a nicely-formatted locale specific date and time (i.e. Fri May 2 19:08:32 2014).

New in version 2014.1.4.

```
salt '*' ps.boot_time
```

`salt.modules.ps.cpu_percent` (*interval*=0.1, *per_cpu*=False)

Return the percent of time the CPU is busy.

interval the number of seconds to sample CPU usage over

per_cpu if True return an array of CPU percent busy for each CPU, otherwise aggregate all percents into one number

CLI Example:

```
salt '*' ps.cpu_percent
```

`salt.modules.ps.cpu_times` (*per_cpu*=False)

Return the percent of time the CPU spends in each state, e.g. user, system, idle, nice, iowait, irq, softirq.

per_cpu if True return an array of percents for each CPU, otherwise aggregate all percents into one number
CLI Example:

```
salt '*' ps.cpu_times
```

salt.modules.ps.disk_io_counters (*device=None*)

Return disk I/O statistics.

CLI Example:

```
salt '*' ps.disk_io_counters
```

```
salt '*' ps.disk_io_counters device=sda1
```

salt.modules.ps.disk_partition_usage (*all=False*)

Return a list of disk partitions plus the mount point, filesystem and usage statistics.

CLI Example:

```
salt '*' ps.disk_partition_usage
```

salt.modules.ps.disk_partitions (*all=False*)

Return a list of disk partitions and their device, mount point, and filesystem type.

all if set to False, only return local, physical partitions (hard disk, USB, CD/DVD partitions). If True, return all filesystems.

CLI Example:

```
salt '*' ps.disk_partitions
```

salt.modules.ps.disk_usage (*path*)

Given a path, return a dict listing the total available space as well as the free space, and used space.

CLI Example:

```
salt '*' ps.disk_usage /home
```

salt.modules.ps.get_pid_list ()

Return a list of process ids (PIDs) for all running processes.

CLI Example:

```
salt '*' ps.get_pid_list
```

salt.modules.ps.get_users ()

Return logged-in users.

CLI Example:

```
salt '*' ps.get_users
```

salt.modules.ps.kill_pid (*pid, signal=15*)

Kill a process by PID.

```
salt 'minion' ps.kill_pid pid [signal=signal_number]
```

pid PID of process to kill.

signal Signal to send to the process. See manpage entry for kill for possible values. Default: 15 (SIGTERM).

Example:

Send SIGKILL to process with PID 2000:

```
salt 'minion' ps.kill_pid 2000 signal=9
```

salt.modules.ps.lsof(*name*)

Retrieve the lsof information of the given process name.

CLI Example:

```
salt '*' ps.lsof apache2
```

salt.modules.ps.netstat(*name*)

Retrieve the netstat information of the given process name.

CLI Example:

```
salt '*' ps.netstat apache2
```

salt.modules.ps.network_io_counters(*interface=None*)

Return network I/O statistics.

CLI Example:

```
salt '*' ps.network_io_counters
salt '*' ps.network_io_counters interface=eth0
```

salt.modules.ps.num_cpus()

Return the number of CPUs.

CLI Example:

```
salt '*' ps.num_cpus
```

salt.modules.ps.pgrep(*pattern, user=None, full=False*)

Return the pids for processes matching a pattern.

If full is true, the full command line is searched for a match, otherwise only the name of the command is searched.

```
salt '*' ps.pgrep pattern [user=username] [full=(true|false)]
```

pattern Pattern to search for in the process list.

user Limit matches to the given username. Default: All users.

full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Find all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pgrep httpd
```

Find all bash processes owned by user 'tom':

```
salt '*' ps.pgrep bash user=tom
```

salt.modules.ps.pkill(*pattern, user=None, signal=15, full=False*)

Kill processes matching a pattern.

```
salt '*' ps.pkill pattern [user=username] [signal=signal_number] \
    [full=(true|false)]
```

pattern Pattern to search for in the process list.

user Limit matches to the given username. Default: All users.

signal Signal to send to the process(es). See manpage entry for kill for possible values. Default: 15 (SIGTERM).

full A boolean value indicating whether only the name of the command or the full command line should be matched against the pattern.

Examples:

Send SIGHUP to all httpd processes on all 'www' minions:

```
salt 'www.*' ps.pkill httpd signal=1
```

Send SIGKILL to all bash processes owned by user 'tom':

```
salt '*' ps.pkill bash signal=9 user=tom
```

`salt.modules.ps.proc_info`(*pid*, *attrs=None*)

Return a dictionary of information for a process id (PID).

CLI Example:

```
salt '*' ps.proc_info 2322
salt '*' ps.proc_info 2322 attrs='["pid", "name"]'
```

pid PID of process to query.

attrs Optional list of desired process attributes. The list of possible attributes can be found here: <http://pythonhosted.org/psutil/#psutil.Process>

`salt.modules.ps.psaux`(*name*)

Retrieve information corresponding to a "ps aux" filtered with the given pattern. It could be just a name or a regular expression (using python search from "re" module).

CLI Example:

```
salt '*' ps.psaux www-data.+apache2
```

`salt.modules.ps.ss`(*name*)

Retrieve the ss information of the given process name.

CLI Example:

```
salt '*' ps.ss apache2
```

New in version 2016.11.6.

`salt.modules.ps.swap_memory`()

New in version 2014.7.0.

Return a dict that describes swap memory statistics.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.swap_memory
```

`salt.modules.ps.top`(*num_processes=5, interval=3*)

Return a list of top CPU consuming processes during the interval. *num_processes* = return the top N CPU consuming processes *interval* = the number of seconds to sample CPU usage over

CLI Examples:

```
salt '*' ps.top
salt '*' ps.top 5 10
```

`salt.modules.ps.total_physical_memory`()

Return the total number of bytes of physical memory.

CLI Example:

```
salt '*' ps.total_physical_memory
```

`salt.modules.ps.virtual_memory`()

New in version 2014.7.0.

Return a dict that describes statistics about system memory usage.

Note: This function is only available in psutil version 0.6.0 and above.

CLI Example:

```
salt '*' ps.virtual_memory
```

20.9.315 salt.modules.publish

Publish a command from a minion to a target

`salt.modules.publish.full_data`(*tgt, fun, arg=None, tgt_type='glob', returner="", timeout=5, expr_form=None*)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

`salt.modules.publish.publish`(*tgt, fun, arg=None, tgt_type='glob', returner="", timeout=5, via_master=None, expr_form=None*)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Note that for pillar matches must be exact, both in the pillar matcher and the compound matcher. No globbing is supported.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

Multiple keyword arguments should be passed as a list.

```
salt '*' publish.publish test.kwarg arg="['cheese=spam', 'spam=cheese']"
```

When running via `salt-call`, the `via_master` flag may be set to specific which master the publication should be sent to. Only one master may be specified. If unset, the publication will be sent only to the first master in minion configuration.

`salt.modules.publish.runner` (*fun*, *arg=None*, *timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

20.9.316 salt.modules.puppet

Execute puppet routines

`salt.modules.puppet.disable` (*message=None*)

New in version 2014.7.0.

Disable the puppet agent

message New in version 2015.5.2.

Disable message to send to puppet

CLI Example:

```
salt '*' puppet.disable
salt '*' puppet.disable 'Disabled, contact XYZ before enabling'
```

`salt.modules.puppet.enable` ()

New in version 2014.7.0.

Enable the puppet agent

CLI Example:

```
salt '*' puppet.enable
```

`salt.modules.puppet.fact` (*name, puppet=False*)

Run facter for a specific fact

CLI Example:

```
salt '*' puppet.fact kernel
```

`salt.modules.puppet.facts` (*puppet=False*)

Run facter and return the results

CLI Example:

```
salt '*' puppet.facts
```

`salt.modules.puppet.noop` (**args, **kwargs*)

Execute a puppet noop run and return a dict with the stderr, stdout, return code, etc. Usage is the same as for `puppet.run`.

CLI Example:

```
salt '*' puppet.noop
salt '*' puppet.noop tags=basefiles::edit,apache::server
salt '*' puppet.noop debug
salt '*' puppet.noop apply /a/b/manifest.pp modulepath=/a/b/modules
↳ tags=basefiles::edit,apache::server
```

`salt.modules.puppet.plugin_sync` ()

Runs a plugin sync between the puppet master and agent

CLI Example:

```
salt '*' puppet.plugin_sync
```

`salt.modules.puppet.run` (**args, **kwargs*)

Execute a puppet run and return a dict with the stderr, stdout, return code, etc. The first positional argument

given is checked as a subcommand. Following positional arguments should be ordered with arguments required by the subcommand first, followed by non-keyword arguments. Tags are specified by a tag keyword and comma separated list of values. – http://docs.puppetlabs.com/puppet/latest/reference/lang_tags.html

CLI Examples:

```
salt '*' puppet.run
salt '*' puppet.run tags=basefiles::edit,apache::server
salt '*' puppet.run agent onetime no-daemonize no-usecacheonfailure no-splay
↳ ignorecache
salt '*' puppet.run debug
salt '*' puppet.run apply /a/b/manifest.pp modulepath=/a/b/modules
↳ tags=basefiles::edit,apache::server
```

`salt.modules.puppet.status()`

New in version 2014.7.0.

Display puppet agent status

CLI Example:

```
salt '*' puppet.status
```

`salt.modules.puppet.summary()`

New in version 2014.7.0.

Show a summary of the last puppet agent run

CLI Example:

```
salt '*' puppet.summary
```

20.9.317 salt.modules.purefa

Management of Pure Storage FlashArray

Installation Prerequisites

- You will need the `purestorage` python package in your python installation path that is running salt.

```
pip install purestorage
```

- Configure Pure Storage FlashArray authentication. Use one of the following three methods.

- From the minion config

```
pure_tags:
fa:
  san_ip: management vip or hostname for the FlashArray
  api_token: A valid api token for the FlashArray being managed
```

- From environment (`PUREFA_IP` and `PUREFA_API`)

- From the pillar (`PUREFA_IP` and `PUREFA_API`)

maintainer Simon Dodsley (simon@purestorage.com)

maturity new

requires purestorage

platform all

New in version 2018.3.0.

salt.modules.purefa.hg_create(*name*, *host=None*, *volume=None*)

Create a hostgroup on a Pure Storage FlashArray.

Will return False if hostgroup already exists, or if named host or volume do not exist.

New in version 2018.3.0.

name [string] name of hostgroup (truncated to 63 characters)

host [string] name of host to add to hostgroup

volume [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_create foo host=bar volume=vol
```

salt.modules.purefa.hg_delete(*name*)

Delete a hostgroup on a Pure Storage FlashArray (removes all volumes and hosts).

Will return False is hostgroup is already in a deleted state.

New in version 2018.3.0.

name [string] name of hostgroup

CLI Example:

```
salt '*' purefa.hg_delete foo
```

salt.modules.purefa.hg_remove(*name*, *volume=None*, *host=None*)

Remove a host and/or volume from a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup does not exist, or named host or volume are not in the hostgroup.

New in version 2018.3.0.

name [string] name of hostgroup

volume [string] name of volume to remove from hostgroup

host [string] name of host to remove from hostgroup

CLI Example:

```
salt '*' purefa.hg_remove foo volume=test host=bar
```

salt.modules.purefa.hg_update(*name*, *host=None*, *volume=None*)

Adds entries to a hostgroup on a Pure Storage FlashArray.

Will return False is hostgroup doesn't exist, or host or volume do not exist.

New in version 2018.3.0.

name [string] name of hostgroup

host [string] name of host to add to hostgroup

volume [string] name of volume to add to hostgroup

CLI Example:

```
salt '*' purefa.hg_update foo host=bar volume=vol
```

salt.modules.purefa.host_create(*name*, *iqn=None*, *wwn=None*)

Add a host on a Pure Storage FlashArray.

Will return False if host already exists, or the iSCSI or Fibre Channel parameters are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name [string] name of host (truncated to 63 characters)

iqn [string] iSCSI IQN of host

wwn [string] Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_create foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

salt.modules.purefa.host_delete(*name*)

Delete a host on a Pure Storage FlashArray (detaches all volumes).

Will return False if the host doesn't exist.

New in version 2018.3.0.

name [string] name of host

CLI Example:

```
salt '*' purefa.host_delete foo
```

salt.modules.purefa.host_update(*name, iqn=None, wwn=None*)

Update a hosts port definitions on a Pure Storage FlashArray.

Will return False if new port definitions are already in use by another host, or are not in a valid format. See Pure Storage FlashArray documentation.

New in version 2018.3.0.

name [string] name of host

iqn [string] Additional iSCSI IQN of host

wwn [string] Additional Fibre Channel WWN of host

CLI Example:

```
salt '*' purefa.host_update foo iqn='<Valid iSCSI IQN>' wwn='<Valid WWN>'
```

salt.modules.purefa.pg_create(*name, hostgroup=None, host=None, volume=None, enabled=True*)

Create a protection group on a Pure Storage FlashArray.

Will return False is the following cases:

- Protection Grop already exists
- Protection Group in a deleted state
- More than one type is specified - protection groups are for only hostgroups, hosts or volumes
- Named type for protection group does not exist

New in version 2018.3.0.

name [string] name of protection group

hostgroup [string] name of hostgroup to add to protection group

host [string] name of host to add to protection group

volume [string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_create foo [hostgroup=foo | host=bar | volume=vol]
→enabled=[true | false]
```

salt.modules.purefa.pg_delete(*name, eradicate=False*)

Delete a protecton group on a Pure Storage FlashArray.

Will return False if protection group is already in a deleted state.

New in version 2018.3.0.

name [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_delete foo
```

`salt.modules.purefa.pg_eradicate` (*name*)

Eradicate a deleted protection group on a Pure Storage FlashArray.

Will return False if protection group is not in a deleted state.

New in version 2018.3.0.

name [string] name of protection group

CLI Example:

```
salt '*' purefa.pg_eradicate foo
```

`salt.modules.purefa.pg_remove` (*name, hostgroup=None, host=None, volume=None*)

Remove a hostgroup, host or volume from a protection group on a Pure Storage FlashArray.

Will return False in the following cases:

- Protection group does not exist
- Specified type is not currently associated with the protection group

New in version 2018.3.0.

name [string] name of hostgroup

hostgroup [string] name of hostgroup to remove from protection group

host [string] name of host to remove from hostgroup

volume [string] name of volume to remove from hostgroup

CLI Example:

```
salt '*' purefa.pg_remove foo [hostgroup=bar | host=test | volume=bar]
```

`salt.modules.purefa.pg_update` (*name, hostgroup=None, host=None, volume=None*)

Update a protection group on a Pure Storage FlashArray.

Will return False in the following cases:

- Protection group does not exist
- Incorrect type selected for current protection group type
- Specified type does not exist

New in version 2018.3.0.

name [string] name of protection group

hostgroup [string] name of hostgroup to add to protection group

host [string] name of host to add to protection group

volume [string] name of volume to add to protection group

CLI Example:

```
salt '*' purefa.pg_update foo [hostgroup=foo | host=bar | volume=vol]
```

`salt.modules.purefa.snap_create` (*name, suffix=None*)

Create a volume snapshot on a Pure Storage FlashArray.

Will return False is volume selected to snap does not exist.

New in version 2018.3.0.

name [string] name of volume to snapshot

suffix [string] if specified forces snapshot name suffix. If not specified defaults to timestamp.

CLI Example:

```
salt '*' purefa.snap_create foo
salt '*' purefa.snap_create foo suffix=bar
```

`salt.modules.purefa.snap_delete` (*name, suffix=None, eradicate=False*)

Delete a volume snapshot on a Pure Storage FlashArray.

Will return False if selected snapshot does not exist.

New in version 2018.3.0.

name [string] name of volume

suffix [string] name of snapshot

eradicate [boolean] Eradicate snapshot after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.snap_delete foo suffix=snap eradicate=True
```

salt.modules.purefa.snap_eradicate(*name, suffix=None*)

Eradicate a deleted volume snapshot on a Pure Storage FlashArray.

Will return False if snapshot is not in a deleted state.

New in version 2018.3.0.

name [string] name of volume

suffix [string] name of snapshot

CLI Example:

```
salt '*' purefa.snap_eradicate foo suffix=snap
```

salt.modules.purefa.snap_volume_create(*name, target, overwrite=False*)

Create R/W volume from snapshot on a Pure Storage FlashArray.

Will return False if target volume already exists and overwrite is not specified, or selected snapshot doesn't exist.

New in version 2018.3.0.

name [string] name of volume snapshot

target [string] name of clone volume

overwrite [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.snap_volume_create foo.bar clone overwrite=True
```

salt.modules.purefa.volume_attach(*name, host*)

Attach a volume to a host on a Pure Storage FlashArray.

Host and volume must exist or else will return False.

New in version 2018.3.0.

name [string] name of volume

host [string] name of host

CLI Example:

```
salt '*' purefa.volume_attach foo bar
```

salt.modules.purefa.volume_clone(*name, target, overwrite=False*)

Clone an existing volume on a Pure Storage FlashArray.

Will return False if source volume doesn't exist, or target volume already exists and overwrite not specified.

New in version 2018.3.0.

name [string] name of volume

target [string] name of clone volume

overwrite [boolean] overwrite clone if already exists (default: False)

CLI Example:

```
salt '*' purefa.volume_clone foo bar overwrite=True
```

`salt.modules.purefa.volume_create`(*name*, *size=None*)

Create a volume on a Pure Storage FlashArray.

Will return False if volume already exists.

New in version 2018.3.0.

name [string] name of volume (truncated to 63 characters)

size [string] if specified capacity of volume. If not specified default to 1G. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_create foo
salt '*' purefa.volume_create foo size=10T
```

`salt.modules.purefa.volume_delete`(*name*, *eradicate=False*)

Delete a volume on a Pure Storage FlashArray.

Will return False if volume doesn't exist is already in a deleted state.

New in version 2018.3.0.

name [string] name of volume

eradicate [boolean] Eradicate volume after deletion if True. Default is False

CLI Example:

```
salt '*' purefa.volume_delete foo eradicate=True
```

`salt.modules.purefa.volume_detach`(*name*, *host*)

Detach a volume from a host on a Pure Storage FlashArray.

Will return False if either host or volume do not exist, or if selected volume isn't already connected to the host.

New in version 2018.3.0.

name [string] name of volume

host [string] name of host

CLI Example:

```
salt '*' purefa.volume_detach foo bar
```

`salt.modules.purefa.volume_eradicate`(*name*)

Eradicate a deleted volume on a Pure Storage FlashArray.

Will return False is volume is not in a deleted state.

New in version 2018.3.0.

name [string] name of volume

CLI Example:

```
salt '*' purefa.volume_eradicate foo
```

`salt.modules.purefa.volume_extend`(*name*, *size*)

Extend an existing volume on a Pure Storage FlashArray.

Will return False if new size is less than or equal to existing size.

New in version 2018.3.0.

name [string] name of volume

size [string] New capacity of volume. Refer to Pure Storage documentation for formatting rules.

CLI Example:

```
salt '*' purefa.volume_extend foo 10T
```

20.9.318 salt.modules.pushbullet module

Module for sending messages to Pushbullet (<https://www.pushbullet.com>)

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

For example:

```
pushbullet:
  device: "Chrome"
  title: "Example push message"
  body: "Message body."
```

`salt.modules.pushbullet.push_note` (*device=None, title=None, body=None*)

Pushing a text note.

Parameters

- **device** – Pushbullet target device
- **title** – Note title
- **body** – Note body

Returns Boolean if message was sent successfully.

CLI Example:

```
salt "*" pushbullet.push_note device="Chrome" title="Example title" body="Example
↳body."
```

20.9.319 salt.modules.pushover_notify

Module for sending messages to Pushover (<https://www.pushover.net>)

New in version 2016.3.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
pushover:
  token: abAHuZyCLtdH8P4zhmFZmgUHUsv1ei8
```

`salt.modules.pushover_notify.post_message` (*user=None, device=None, message=None, title=None, priority=None, expire=None, retry=None, sound=None, api_version=1, token=None*)

Send a message to a Pushover user or group.

Parameters

- **user** – The user or group to send to, must be key of user or group not email address.
- **message** – The message to send to the PushOver user or group.
- **title** – Specify who the message is from.
- **priority** – The priority of the message, defaults to 0.
- **expire** – The message should expire after N number of seconds.
- **retry** – The number of times the message should be retried.

- **sound** – The sound to associate with the message.
- **api_version** – The PushOver API version, if not specified in the configuration.
- **token** – The PushOver token, if not specified in the configuration.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳ 'Message from Salt' message='Build is done'

salt '*' pushover.post_message user='xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx' title=
↳ 'Message from Salt' message='Build is done' priority='2' expire='720' retry='5'
```

20.9.320 salt.modules.pw_group

Manage groups on FreeBSD

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.pw_group.add`(*name*, *gid=None*, ***kwargs*)

Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.pw_group.adduser`(*name*, *username*)

Add a user in the group.

CLI Example:

```
salt '*' group.adduser foo bar
```

Verifies if a valid username 'bar' as a member of an existing group 'foo', if not then adds it.

`salt.modules.pw_group.chgid`(*name*, *gid*)

Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.pw_group.delete`(*name*)

Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.pw_group.deluser`(*name*, *username*)

Remove a user from the group.

CLI Example:

```
salt '*' group.deluser foo bar
```

Removes a member user 'bar' from a group 'foo'. If group is not present then returns True.

`salt.modules.pw_group.getent` (*refresh=False*)
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.pw_group.info` (*name*)
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.pw_group.members` (*name, members_list*)
Replaces members of the group with a provided list.

New in version 2015.5.4.

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3,...'
```

Replaces a membership list for a local group 'foo'. foo:x:1234:user1,user2,user3,...

20.9.321 salt.modules.pw_user

Manage users with the pw command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

`salt.modules.pw_user.add` (*name, uid=None, gid=None, groups=None, home=None, shell=None, unique=True, fullname="", roomnumber="", workphone="", homephone="", createhome=True, loginclass=None, **kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.pw_user.chfullname` (*name, fullname*)
Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.pw_user.chgid` (*name, gid*)
Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.pw_user.chgroups` (*name, groups, append=False*)

Change the groups to which a user belongs

name Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

salt.modules.pw_user.chhome (*name, home, persist=False*)

Set a new home directory for an existing user

name Username to modify

home New home directory to set

persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

salt.modules.pw_user.chhomephone (*name, homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

salt.modules.pw_user.chloginclass (*name, loginclass, root=None*)

Change the default login class of the user

New in version 2016.3.5.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

salt.modules.pw_user.chroomnumber (*name, roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

salt.modules.pw_user.chshell (*name, shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

salt.modules.pw_user.chuid (*name, uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

salt.modules.pw_user.chworkphone (*name, workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.pw_user.delete`(*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.pw_user.get_loginclass`(*name*)

Get the login class of the user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.pw_user.getent`(*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.pw_user.info`(*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.pw_user.list_groups`(*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.pw_user.list_users`()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.pw_user.rename`(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

20.9.322 salt.modules.pyenv

Manage python installations with pyenv.

Note: Git needs to be installed and available via PATH if pyenv is to be installed automatically by the module.

New in version v2014.04.

`salt.modules.pyenv.default` (*python=None, runas=None*)

Returns or sets the currently defined default python.

python=None The version to set as the default. Should match one of the versions listed by `pyenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' pyenv.default
salt '*' pyenv.default 2.0.0-p0
```

`salt.modules.pyenv.do` (*cmdline=None, runas=None*)

Execute a python command with pyenv's shims from the user or the system.

CLI Example:

```
salt '*' pyenv.do 'gem list bundler'
salt '*' pyenv.do 'gem list bundler' deploy
```

`salt.modules.pyenv.do_with_python` (*python, cmdline, runas=None*)

Execute a python command with pyenv's shims using a specific python version.

CLI Example:

```
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler'
salt '*' pyenv.do_with_python 2.0.0-p0 'gem list bundler' deploy
```

`salt.modules.pyenv.install` (*runas=None, path=None*)

Install pyenv systemwide

CLI Example:

```
salt '*' pyenv.install
```

`salt.modules.pyenv.install_python` (*python, runas=None*)

Install a python implementation.

python The version of python to install, should match one of the versions listed by `pyenv.list`

CLI Example:

```
salt '*' pyenv.install_python 2.0.0-p0
```

`salt.modules.pyenv.is_installed` (*runas=None*)

Check if pyenv is installed.

CLI Example:

```
salt '*' pyenv.is_installed
```

`salt.modules.pyenv.list_` (*runas=None*)

List the installable versions of python.

CLI Example:

```
salt '*' pyenv.list
```

`salt.modules.pyenv.rehash`(*runas=None*)
Run pyenv rehash to update the installed shims.

CLI Example:

```
salt '*' pyenv.rehash
```

`salt.modules.pyenv.uninstall_python`(*python, runas=None*)
Uninstall a python implementation.

python The version of python to uninstall. Should match one of the versions listed by `pyenv.versions`

CLI Example:

```
salt '*' pyenv.uninstall_python 2.0.0-p0
```

`salt.modules.pyenv.update`(*runas=None, path=None*)
Updates the current versions of pyenv and python-Build

CLI Example:

```
salt '*' pyenv.update
```

`salt.modules.pyenv.versions`(*runas=None*)
List the installed versions of python.

CLI Example:

```
salt '*' pyenv.versions
```

20.9.323 salt.modules.qemu_img

Qemu-img Command Wrapper

The qemu img command is wrapped for specific functions

depends qemu-img

`salt.modules.qemu_img.convert`(*orig, dest, fmt*)
Convert an existing disk image to another format using qemu-img

CLI Example:

```
salt '*' qemu_img.convert /path/to/original.img /path/to/new.img qcow2
```

`salt.modules.qemu_img.make_image`(*location, size, fmt*)
Create a blank virtual machine image file of the specified size in megabytes. The image can be created in any format supported by qemu

CLI Example:

```
salt '*' qemu_img.make_image /tmp/image.qcow 2048 qcow2
salt '*' qemu_img.make_image /tmp/image.raw 10240 raw
```

20.9.324 salt.modules.qemu_nbd

Qemu Command Wrapper

The qemu system comes with powerful tools, such as qemu-img and qemu-nbd which are used here to build up kvm images.

`salt.modules.qemu_nbd.clear`(*mnt*)

Pass in the mnt dict returned from `nbd_mount` to unmount and disconnect the image from nbd. If all of the partitions are unmounted return an empty dict, otherwise return a dict containing the still mounted partitions

CLI Example:

```
salt '*' qemu_nbd.clear '{"mnt/foo": "/dev/nbd0p1"}'
```

`salt.modules.qemu_nbd.connect`(*image*)

Activate nbd for an image file.

CLI Example:

```
salt '*' qemu_nbd.connect /tmp/image.raw
```

`salt.modules.qemu_nbd.init`(*image*, *root=None*)

Mount the named image via qemu-nbd and return the mounted roots

CLI Example:

```
salt '*' qemu_nbd.init /srv/image.qcow2
```

`salt.modules.qemu_nbd.mount`(*nbd*, *root=None*)

Pass in the nbd connection device location, mount all partitions and return a dict of mount points

CLI Example:

```
salt '*' qemu_nbd.mount /dev/nbd0
```

20.9.325 salt.modules.quota

Module for managing quotas on POSIX-like systems.

`salt.modules.quota.get_mode`(*device*)

Report whether the quota system for this device is on or off

CLI Example:

```
salt '*' quota.get_mode
```

`salt.modules.quota.off`(*device*)

Turns off the quota system

CLI Example:

```
salt '*' quota.off
```

`salt.modules.quota.on`(*device*)

Turns on the quota system

CLI Example:

```
salt '*' quota.on
```

`salt.modules.quota.report`(*mount*)

Report on quotas for a specific volume

CLI Example:

```
salt '*' quota.report /media/data
```

`salt.modules.quota.set_`(*device, **kwargs*)

Calls out to setquota, for a specific user or group

CLI Example:

```
salt '*' quota.set /media/data user=larry block-soft-limit=1048576
salt '*' quota.set /media/data group=painters file-hard-limit=1000
```

`salt.modules.quota.stats`()

Runs the quotastats command, and returns the parsed output

CLI Example:

```
salt '*' quota.stats
```

`salt.modules.quota.warn`()

Runs the warnquota command, to send warning emails to users who are over their quota limit.

CLI Example:

```
salt '*' quota.warn
```

20.9.326 salt.modules.rabbitmq

Module to provide RabbitMQ compatibility to Salt. Todo: A lot, need to add cluster support, logging, and minion configuration data.

`salt.modules.rabbitmq.add_user`(*name, password=None, runas=None*)

Add a rabbitMQ user via rabbitmqctl user_add <user> <password>

CLI Example:

```
salt '*' rabbitmq.add_user rabbit_user password
```

`salt.modules.rabbitmq.add_vhost`(*vhost, runas=None*)

Adds a vhost via rabbitmqctl add_vhost.

CLI Example:

```
salt '*' rabbitmq.add_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.change_password`(*name, password, runas=None*)

Changes a user's password.

CLI Example:

```
salt '*' rabbitmq.change_password rabbit_user password
```

`salt.modules.rabbitmq.check_password`(*name, password, runas=None*)

New in version 2016.3.0.

Checks if a user's password is valid.

CLI Example:

```
salt '*' rabbitmq.check_password rabbit_user password
```

`salt.modules.rabbitmq.clear_password`(*name*, *runas=None*)
Removes a user's password.

CLI Example:

```
salt '*' rabbitmq.clear_password rabbit_user
```

`salt.modules.rabbitmq.cluster_status`(*runas=None*)
return rabbitmq cluster_status

CLI Example:

```
salt '*' rabbitmq.cluster_status
```

`salt.modules.rabbitmq.delete_policy`(*vhost*, *name*, *runas=None*)
Delete a policy based on rabbitmqctl clear_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.delete_policy / HA
```

`salt.modules.rabbitmq.delete_user`(*name*, *runas=None*)
Deletes a user via rabbitmqctl delete_user.

CLI Example:

```
salt '*' rabbitmq.delete_user rabbit_user
```

`salt.modules.rabbitmq.delete_vhost`(*vhost*, *runas=None*)
Deletes a vhost rabbitmqctl delete_vhost.

CLI Example:

```
salt '*' rabbitmq.delete_vhost '<vhost_name>'
```

`salt.modules.rabbitmq.disable_plugin`(*name*, *runas=None*)
Disable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.disable_plugin foo
```

`salt.modules.rabbitmq.enable_plugin`(*name*, *runas=None*)
Enable a RabbitMQ plugin via the rabbitmq-plugins command.

CLI Example:

```
salt '*' rabbitmq.enable_plugin foo
```

`salt.modules.rabbitmq.force_reset`(*runas=None*)
Forcefully Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.force_reset
```

`salt.modules.rabbitmq.join_cluster`(*host*, *user*='rabbit', *ram_node*=None, *runas*=None)

Join a rabbit cluster

CLI Example:

```
salt '*' rabbitmq.join_cluster rabbit.example.com rabbit
```

`salt.modules.rabbitmq.list_available_plugins`(*runas*=None)

Returns a list of the names of all available plugins (enabled and disabled).

CLI Example:

```
salt '*' rabbitmq.list_available_plugins
```

`salt.modules.rabbitmq.list_enabled_plugins`(*runas*=None)

Returns a list of the names of the enabled plugins.

CLI Example:

```
salt '*' rabbitmq.list_enabled_plugins
```

`salt.modules.rabbitmq.list_permissions`(*vhost*, *runas*=None)

Lists permissions for vhost via rabbitmqctl list_permissions

CLI Example:

```
salt '*' rabbitmq.list_permissions /myvhost
```

`salt.modules.rabbitmq.list_policies`(*vhost*='/', *runas*=None)

Return a dictionary of policies nested by vhost and name based on the data returned from rabbitmqctl list_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.list_policies
```

`salt.modules.rabbitmq.list_queues`(*runas*=None, **args*)

Returns queue details of the / virtual host

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_queues_vhost`(*vhost*, *runas*=None, **args*)

Returns queue details of specified virtual host. This command will consider first parameter as the vhost name and rest will be treated as queueinfoitem. For getting details on vhost /, use `list_queues` instead).

CLI Example:

```
salt '*' rabbitmq.list_queues messages consumers
```

`salt.modules.rabbitmq.list_user_permissions`(*name*, *runas*=None)

List permissions for a user via rabbitmqctl list_user_permissions

CLI Example:

```
salt '*' rabbitmq.list_user_permissions user
```

`salt.modules.rabbitmq.list_users` (*runas=None*)

Return a list of users based off of rabbitmqctl user_list.

CLI Example:

```
salt '*' rabbitmq.list_users
```

`salt.modules.rabbitmq.list_vhosts` (*runas=None*)

Return a list of vhost based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.list_vhosts
```

`salt.modules.rabbitmq.plugin_is_enabled` (*name, runas=None*)

Return whether the plugin is enabled.

CLI Example:

```
salt '*' rabbitmq.plugin_is_enabled rabbitmq_plugin_name
```

`salt.modules.rabbitmq.policy_exists` (*vhost, name, runas=None*)

Return whether the policy exists based on rabbitmqctl list_policies.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.policy_exists / HA
```

`salt.modules.rabbitmq.reset` (*runas=None*)

Return a RabbitMQ node to its virgin state

CLI Example:

```
salt '*' rabbitmq.reset
```

`salt.modules.rabbitmq.set_permissions` (*vhost, user, conf='**', write='**', read='**', runas=None*)

Sets permissions for vhost via rabbitmqctl set_permissions

CLI Example:

```
salt '*' rabbitmq.set_permissions myvhost myuser
```

`salt.modules.rabbitmq.set_policy` (*vhost, name, pattern, definition, priority=None, runas=None, apply_to=None*)

Set a policy based on rabbitmqctl set_policy.

Reference: <http://www.rabbitmq.com/ha.html>

CLI Example:

```
salt '*' rabbitmq.set_policy / HA '.*' '{"ha-mode":"all"}'
```

`salt.modules.rabbitmq.set_user_tags` (*name, tags, runas=None*)

Add user tags via rabbitmqctl set_user_tags

CLI Example:

```
salt '*' rabbitmq.set_user_tags myadmin administrator
```

`salt.modules.rabbitmq.start_app` (*runas=None*)

Start the RabbitMQ application.

CLI Example:

```
salt '*' rabbitmq.start_app
```

`salt.modules.rabbitmq.status` (*runas=None*)

return rabbitmq status

CLI Example:

```
salt '*' rabbitmq.status
```

`salt.modules.rabbitmq.stop_app` (*runas=None*)

Stops the RabbitMQ application, leaving the Erlang node running.

CLI Example:

```
salt '*' rabbitmq.stop_app
```

`salt.modules.rabbitmq.user_exists` (*name, runas=None*)

Return whether the user exists based on rabbitmqctl list_users.

CLI Example:

```
salt '*' rabbitmq.user_exists rabbit_user
```

`salt.modules.rabbitmq.vhost_exists` (*name, runas=None*)

Return whether the vhost exists based on rabbitmqctl list_vhosts.

CLI Example:

```
salt '*' rabbitmq.vhost_exists rabbit_host
```

20.9.327 salt.modules.raet_publish

Publish a command from a minion to a target

`salt.modules.raet_publish.full_data` (*tgt, fun, arg=None, tgt_type='glob', returner=', timeout=5, expr_form=None*)

Return the full data about the publication, this is invoked in the same way as the publish function

CLI Example:

```
salt system.example.com publish.full_data '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.full_data test.kwarg arg='cheese=spam'
```

`salt.modules.raet_publish.publish`(*tgt*, *fun*, *arg=None*, *tgt_type='glob'*, *returner=""*, *timeout=5*,
expr_form=None)

Publish a command from the minion out to other minions.

Publications need to be enabled on the Salt master and the minion needs to have permission to publish the command. The Salt master will also prevent a recursive publication loop, this means that a minion cannot command another minion to command another minion as that would create an infinite command loop.

The `tgt_type` argument is used to pass a target other than a glob into the execution, the available options are:

- glob
- pcre
- grain
- grain_pcre
- pillar
- pillar_pcre
- ipcidr
- range
- compound

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

The arguments sent to the minion publish function are separated with commas. This means that for a minion executing a command with multiple args it will look like this:

```
salt system.example.com publish.publish '*' user.add 'foo,1020,1020'  
salt system.example.com publish.publish 'os:Fedora' network.interfaces '' grain
```

CLI Example:

```
salt system.example.com publish.publish '*' cmd.run 'ls -la /tmp'
```

Attention

If you need to pass a value to a function argument and that value contains an equal sign, you **must** include the argument name. For example:

```
salt '*' publish.publish test.kwarg arg='cheese=spam'
```

`salt.modules.raet_publish.runner`(*fun*, *arg=None*, *timeout=5*)

Execute a runner on the master and return the data from the runner function

CLI Example:

```
salt publish.runner manage.down
```

20.9.328 salt.modules.rallydev

Support for RallyDev

New in version 2015.8.0.

Requires a username and a password in `/etc/salt/minion`:

`salt.modules.rallydev.list_items`(*name*)

List items of a particular type

CLI Examples:

```
salt myminion rallydev.list_<item name>s
salt myminion rallydev.list_users
salt myminion rallydev.list_artifacts
```

`salt.modules.rallydev.list_users()`

List the users

CLI Example:

```
salt myminion rallydev.list_users
```

`salt.modules.rallydev.query_item(name, query_string, order='Rank')`

Query a type of record for one or more items. Requires a valid query string. See <https://rally1.rallydev.com/slm/doc/webservice/introduction.jsp> for information on query syntax.

CLI Example:

```
salt myminion rallydev.query_<item name> <query string> [<order>]
salt myminion rallydev.query_task '(Name contains github)'
salt myminion rallydev.query_task '(Name contains reactor)' Rank
```

`salt.modules.rallydev.query_user(query_string, order='UserName')`

Update a user

CLI Example:

```
salt myminion rallydev.query_user '(Name contains Jo)'
```

`salt.modules.rallydev.show_artifact(id_)`

Show an artifact

CLI Example:

```
salt myminion rallydev.show_artifact <artifact id>
```

`salt.modules.rallydev.show_item(name, id_)`

Show an item

CLI Example:

```
salt myminion rallydev.show_<item name> <item id>
```

`salt.modules.rallydev.show_user(id_)`

Show a user

CLI Example:

```
salt myminion rallydev.show_user <user id>
```

`salt.modules.rallydev.update_item(name, id_, field=None, value=None, postdata=None)`

Update an item. Either a field and a value, or a chunk of POST data, may be used, but not both.

CLI Example:

```
salt myminion rallydev.update_<item name> <item id> field=<field> value=<value>
salt myminion rallydev.update_<item name> <item id> postdata=<post data>
```

`salt.modules.rallydev.update_user(id_, field, value)`

Update a user

CLI Example:

```
salt myminion rallydev.update_user <user id> <field> <new value>
```

20.9.329 salt.modules.random_org

Module for retrieving random information from Random.org

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
random_org:
  api_key: 7be1402d-5719-5bd3-a306-3def9f135da5
  api_version: 1
```

`salt.modules.random_org.generateBlobs(api_key=None, api_version=None, **kwargs)`

List all Slack users.

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **format** – Specifies the format in which the blobs will be returned. Values allowed are base64 and hex.

Returns The user list.

CLI Example:

```
salt '*' get_integers number=5 min=1 max=6
salt '*' get_integers number=5 min=1 max=6
```

`salt.modules.random_org.generateDecimalFractions(api_key=None, api_version=None, **kwargs)`

Generates true random decimal fractions

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – How many random decimal fractions you need. Must be within the [1,1e4] range.
- **decimalPlaces** – The number of decimal places to use. Must be within the [1,20] range.
- **replacement** – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of decimal fraction

CLI Example:

```

salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4

salt '*' random_org.generateDecimalFractions number=10 decimalPlaces=4
↳replacement=True

```

`salt.modules.random_org.generateGaussians` (*api_key=None, api_version=None, **kwargs*)

This method generates true random numbers from a Gaussian distribution (also known as a normal distribution).

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – How many random numbers you need. Must be within the [1,1e4] range.
- **mean** – The distribution's mean. Must be within the [-1e6,1e6] range.
- **standardDeviation** – The distribution's standard deviation. Must be within the [-1e6,1e6] range.
- **significantDigits** – The number of significant digits to use. Must be within the [2,20] range.

Returns The user list.

CLI Example:

```

salt '*' random_org.generateGaussians number=10 mean=0.0 standardDeviation=1.0
↳significantDigits=8

```

`salt.modules.random_org.generateIntegers` (*api_key=None, api_version=None, **kwargs*)

Generate random integers

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – The number of integers to generate
- **minimum** – The lower boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **maximum** – The upper boundary for the range from which the random numbers will be picked. Must be within the [-1e9,1e9] range.
- **replacement** – Specifies whether the random numbers should be picked with replacement. The default (true) will cause the numbers to be picked with replacement, i.e., the resulting numbers may contain duplicate values (like a series of dice rolls). If you want the numbers picked to be unique (like raffle tickets drawn from a container), set this value to false.
- **base** – Specifies the base that will be used to display the numbers. Values allowed are 2, 8, 10 and 16. This affects the JSON types and formatting of the resulting data as discussed below.

Returns A list of integers.

CLI Example:

```

salt '*' random_org.generateIntegers number=5 minimum=1 maximum=6

salt '*' random_org.generateIntegers number=5 minimum=2 maximum=255 base=2

```

`salt.modules.random_org.generateStrings` (*api_key=None, api_version=None, **kwargs*)

Generate random strings.

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – The number of strings to generate.

- **length** – The length of each string. Must be within the [1,20] range. All strings will be of the same length
- **characters** – A string that contains the set of characters that are allowed to occur in the random strings. The maximum number of characters is 80.
- **replacement** – Specifies whether the random strings should be picked with replacement. The default (true) will cause the strings to be picked with replacement, i.e., the resulting list of strings may contain duplicates (like a series of dice rolls). If you want the strings to be unique (like raffle tickets drawn from a container), set this value to false.

Returns A list of strings.

CLI Example:

```
salt '*' random_org.generateStrings number=5 length=8 characters=
↳ 'abcdefghijklmnopqrstuvxyz'

salt '*' random_org.generateStrings number=10 length=16 characters
↳ 'abcdefghijklmnopqrstuvxyz'
```

`salt.modules.random_org.generateUUIDs` (*api_key=None, api_version=None, **kwargs*)

Generate a list of random UUIDs

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.
- **number** – How many random UUIDs you need. Must be within the [1,1e3] range.

Returns A list of UUIDs

CLI Example:

```
salt '*' random_org.generateUUIDs number=5
```

`salt.modules.random_org.getUsage` (*api_key=None, api_version=None*)

Show current usages statistics

Parameters

- **api_key** – The Random.org api key.
- **api_version** – The Random.org api version.

Returns The current usage statistics.

CLI Example:

```
salt '*' random_org.getUsage

salt '*' random_org.getUsage api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15 api_
↳ version=1
```

20.9.330 salt.modules.rbac_solaris

Module for Solaris' Role-Based Access Control

`salt.modules.rbac_solaris.auth_add` (*user, auth*)

Add authorization to user

user [string] username

auth [string] authorization name

CLI Example:

```
salt '*' rbac.auth_add martine solaris.zone.manage
salt '*' rbac.auth_add martine solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.auth_get(user, computed=True)`

List authorization for user

user [string] username

computed [boolean] merge results from *auths* command into data from *user_attr*

CLI Example:

```
salt '*' rbac.auth_get leo
```

`salt.modules.rbac_solaris.auth_list()`

List all available authorization

CLI Example:

```
salt '*' rbac.auth_list
```

`salt.modules.rbac_solaris.auth_rm(user, auth)`

Remove authorization from user

user [string] username

auth [string] authorization name

CLI Example:

```
salt '*' rbac.auth_rm jorge solaris.zone.manage
salt '*' rbac.auth_rm jorge solaris.zone.manage,solaris.mail.mailq
```

`salt.modules.rbac_solaris.profile_add(user, profile)`

Add profile to user

user [string] username

profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_add martine 'Primary Administrator'
salt '*' rbac.profile_add martine 'User Management,User Security'
```

`salt.modules.rbac_solaris.profile_get(user, default_hidden=True)`

List profiles for user

user [string] username

default_hidden [boolean] hide default profiles

CLI Example:

```
salt '*' rbac.profile_get leo
salt '*' rbac.profile_get leo default_hidden=False
```

`salt.modules.rbac_solaris.profile_list(default_only=False)`

List all available profiles

default_only [boolean] return only default profile

CLI Example:

```
salt '*' rbac.profile_list
```

`salt.modules.rbac_solaris.profile_rm(user, profile)`

Remove profile from user

user [string] username

profile [string] profile name

CLI Example:

```
salt '*' rbac.profile_rm jorge 'Primary Administrator'  
salt '*' rbac.profile_rm jorge 'User Management,User Security'
```

`salt.modules.rbac_solaris.role_add(user, role)`

Add role to user

user [string] username

role [string] role name

CLI Example:

```
salt '*' rbac.role_add martine netcfg  
salt '*' rbac.role_add martine netcfg,zfssnap
```

`salt.modules.rbac_solaris.role_get(user)`

List roles for user

user [string] username

CLI Example:

```
salt '*' rbac.role_get leo
```

`salt.modules.rbac_solaris.role_list()`

List all available roles

CLI Example:

```
salt '*' rbac.role_list
```

`salt.modules.rbac_solaris.role_rm(user, role)`

Remove role from user

user [string] username

role [string] role name

CLI Example:

```
salt '*' rbac.role_rm jorge netcfg  
salt '*' rbac.role_rm jorge netcfg,zfssnap
```

20.9.331 salt.modules.rbenv

Manage ruby installations with rbenv. rbenv is supported on Linux and macOS. rbenv doesn't work on Windows (and isn't really necessary on Windows as there is no system Ruby on Windows). On Windows, the RubyInstaller and/or Pik are both good alternatives to work with multiple versions of Ruby on the same box.

<http://misheska.com/blog/2013/06/15/using-rbenv-to-manage-multiple-versions-of-ruby/>

New in version 0.16.0.

`salt.modules.rbenv.default(ruby=None, runas=None)`

Returns or sets the currently defined default ruby

ruby The version to set as the default. Should match one of the versions listed by `rbenv.versions`. Leave blank to return the current default.

CLI Example:

```
salt '*' rbenv.default  
salt '*' rbenv.default 2.0.0-p0
```

`salt.modules.rbenv.do(cmdline, runas=None, env=None)`

Execute a ruby command with rbenv's shims from the user or the system

CLI Example:

```
salt '*' rbenv.do 'gem list bundler'
salt '*' rbenv.do 'gem list bundler' deploy
```

`salt.modules.rbenv.do_with_ruby` (*ruby*, *cmdline*, *runas=None*)

Execute a ruby command with rbenv's shims using a specific ruby version

CLI Example:

```
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler'
salt '*' rbenv.do_with_ruby 2.0.0-p0 'gem list bundler' runas=deploy
```

`salt.modules.rbenv.install` (*runas=None*, *path=None*)

Install rbenv systemwide

CLI Example:

```
salt '*' rbenv.install
```

`salt.modules.rbenv.install_ruby` (*ruby*, *runas=None*)

Install a ruby implementation.

ruby The version of Ruby to install, should match one of the versions listed by `rbenv.list`

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

Additional environment variables can be configured in pillar / grains / master:

```
rbenv:
  build_env: 'CONFIGURE_OPTS="--no-tcmalloc" CFLAGS="-fno-tree-dce"'
```

CLI Example:

```
salt '*' rbenv.install_ruby 2.0.0-p0
```

`salt.modules.rbenv.is_installed` (*runas=None*)

Check if rbenv is installed

CLI Example:

```
salt '*' rbenv.is_installed
```

`salt.modules.rbenv.list_` (*runas=None*)

List the installable versions of ruby

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.list
```

`salt.modules.rbenv.rehash` (*runas=None*)

Run rbenv rehash to update the installed shims

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.rehash
```

`salt.modules.rbenv.uninstall_ruby` (*ruby*, *runas=None*)

Uninstall a ruby implementation.

ruby The version of ruby to uninstall. Should match one of the versions listed by `rbenv.versions`.

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.uninstall_ruby 2.0.0-p0
```

`salt.modules.rbenv.update` (*runas=None*, *path=None*)

Updates the current versions of rbenv and ruby-build

runas The user under which to run rbenv. If not specified, then rbenv will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rbenv.update
```

`salt.modules.rbenv.versions` (*runas=None*)

List the installed versions of ruby

CLI Example:

```
salt '*' rbenv.versions
```

20.9.332 salt.modules.rdp

Manage RDP Service on Windows servers

`salt.modules.rdp.disable` ()

Disable RDP the service on the server

CLI Example:

```
salt '*' rdp.disable
```

`salt.modules.rdp.disconnect_session` (*session_id*)

Disconnect a session.

New in version 2016.11.0.

Parameters **session_id** – The numeric Id of the session.

Returns A boolean representing whether the disconnect succeeded.

CLI Example:

```
salt '*' rdp.disconnect_session session_id
salt '*' rdp.disconnect_session 99
```

`salt.modules.rdp.enable` ()

Enable RDP the service on the server

CLI Example:

```
salt '*' rdp.enable
```

`salt.modules.rdp.get_session` (*session_id*)

Get information about a session.

New in version 2016.11.0.

Parameters **session_id** – The numeric Id of the session.

Returns A dictionary of session information.

CLI Example:

```
salt '*' rdp.get_session session_id
salt '*' rdp.get_session 99
```

salt.modules.rdp.list_sessions(*logged_in_users_only=False*)

List information about the sessions.

New in version 2016.11.0.

Parameters **logged_in_users_only** – If True, only return sessions with users logged in.

Returns A list containing dictionaries of session information.

CLI Example:

```
salt '*' rdp.list_sessions
```

salt.modules.rdp.logoff_session(*session_id*)

Initiate the logoff of a session.

New in version 2016.11.0.

Parameters **session_id** – The numeric Id of the session.

Returns A boolean representing whether the logoff succeeded.

CLI Example:

```
salt '*' rdp.logoff_session session_id
salt '*' rdp.logoff_session 99
```

salt.modules.rdp.status()

Show if rdp is enabled on the server

CLI Example:

```
salt '*' rdp.status
```

20.9.333 salt.modules.redis

Module to provide redis functionality to Salt

New in version 2014.7.0.

configuration This module requires the redis python module and uses the following defaults which may be overridden in the minion configuration:

```
redis.host: 'salt'
redis.port: 6379
redis.db: 0
redis.password: None
```

salt.modules.redismod.bgrewriteaof(*host=None, port=None, db=None, password=None*)

Asynchronously rewrite the append-only file

CLI Example:

```
salt '*' redis.bgrewriteaof
```

`salt.modules.redismod.bgsave` (*host=None, port=None, db=None, password=None*)

Asynchronously save the dataset to disk

CLI Example:

```
salt '*' redis.bgsave
```

`salt.modules.redismod.config_get` (*pattern='*', host=None, port=None, db=None, password=None*)

Get redis server configuration values

CLI Example:

```
salt '*' redis.config_get
salt '*' redis.config_get port
```

`salt.modules.redismod.config_set` (*name, value, host=None, port=None, db=None, password=None*)

Set redis server configuration values

CLI Example:

```
salt '*' redis.config_set masterauth luv_kittens
```

`salt.modules.redismod.dbsize` (*host=None, port=None, db=None, password=None*)

Return the number of keys in the selected database

CLI Example:

```
salt '*' redis.dbsize
```

`salt.modules.redismod.delete` (**keys, **connection_args*)

Deletes the keys from redis, returns number of keys deleted

CLI Example:

```
salt '*' redis.delete foo
```

`salt.modules.redismod.exists` (*key, host=None, port=None, db=None, password=None*)

Return true if the key exists in redis

CLI Example:

```
salt '*' redis.exists foo
```

`salt.modules.redismod.expire` (*key, seconds, host=None, port=None, db=None, password=None*)

Set a keys time to live in seconds

CLI Example:

```
salt '*' redis.expire foo 300
```

`salt.modules.redismod.expireat` (*key, timestamp, host=None, port=None, db=None, password=None*)

Set a keys expire at given UNIX time

CLI Example:

```
salt '*' redis.expireat foo 1400000000
```

`salt.modules.redismod.flushall` (*host=None, port=None, db=None, password=None*)

Remove all keys from all databases

CLI Example:

```
salt '*' redis.flushall
```

`salt.modules.redismod.flushdb` (*host=None, port=None, db=None, password=None*)

Remove all keys from the selected database

CLI Example:

```
salt '*' redis.flushdb
```

`salt.modules.redismod.get_key` (*key, host=None, port=None, db=None, password=None*)

Get redis key value

CLI Example:

```
salt '*' redis.get_key foo
```

`salt.modules.redismod.get_master_ip` (*host=None, port=None, password=None*)

Get host information about slave

CLI Example:

```
salt '*' redis.get_master_ip
```

`salt.modules.redismod.hdel` (*key, *fields, **options*)

Delete one or more hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hdel foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hexists` (*key, field, host=None, port=None, db=None, password=None*)

Determine if a hash field exists.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hexists foo_hash bar_field
```

`salt.modules.redismod.hget` (*key, field, host=None, port=None, db=None, password=None*)

Get specific field value from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hget foo_hash bar_field
```

`salt.modules.redismod.hgetall` (*key, host=None, port=None, db=None, password=None*)

Get all fields and values from a redis hash, returns dict

CLI Example:

```
salt '*' redis.hgetall foo_hash
```

`salt.modules.redismod.hincrby`(*key, field, increment=1, host=None, port=None, db=None, password=None*)

Increment the integer value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrby foo_hash bar_field 5
```

`salt.modules.redismod.hincrbyfloat`(*key, field, increment=1.0, host=None, port=None, db=None, password=None*)

Increment the float value of a hash field by the given number.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hincrbyfloat foo_hash bar_field 5.17
```

`salt.modules.redismod.hlen`(*key, host=None, port=None, db=None, password=None*)

Returns number of fields of a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hlen foo_hash
```

`salt.modules.redismod.hmget`(*key, *fields, **options*)

Returns the values of all the given hash fields.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmget foo_hash bar_field1 bar_field2
```

`salt.modules.redismod.hmset`(*key, **fieldsvals*)

Sets multiple hash fields to multiple values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hmset foo_hash bar_field1=bar_value1 bar_field2=bar_value2
```

`salt.modules.redismod.hscan`(*key, cursor=0, match=None, count=None, host=None, port=None, db=None, password=None*)

Incrementally iterate hash fields and associated values.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hscan foo_hash match='field_prefix_*' count=1
```

`salt.modules.redismod.hset`(*key, field, value, host=None, port=None, db=None, password=None*)

Set the value of a hash field.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hset foo_hash bar_field bar_value
```

`salt.modules.redismod.hsetnx` (*key, field, value, host=None, port=None, db=None, password=None*)

Set the value of a hash field only if the field does not exist.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hsetnx foo_hash bar_field bar_value
```

`salt.modules.redismod.hvals` (*key, host=None, port=None, db=None, password=None*)

Return all the values in a hash.

New in version 2017.7.0.

CLI Example:

```
salt '*' redis.hvals foo_hash bar_field1 bar_value1
```

`salt.modules.redismod.info` (*host=None, port=None, db=None, password=None*)

Get information and statistics about the server

CLI Example:

```
salt '*' redis.info
```

`salt.modules.redismod.key_type` (*key, host=None, port=None, db=None, password=None*)

Get redis key type

CLI Example:

```
salt '*' redis.type foo
```

`salt.modules.redismod.keys` (*pattern='**', host=None, port=None, db=None, password=None*)

Get redis keys, supports glob style patterns

CLI Example:

```
salt '*' redis.keys
salt '*' redis.keys test*
```

`salt.modules.redismod.lastsave` (*host=None, port=None, db=None, password=None*)

Get the UNIX time in seconds of the last successful save to disk

CLI Example:

```
salt '*' redis.lastsave
```

`salt.modules.redismod.llen` (*key, host=None, port=None, db=None, password=None*)

Get the length of a list in Redis

CLI Example:

```
salt '*' redis.llen foo_list
```

`salt.modules.redismod.lrange` (*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a list in Redis

CLI Example:

```
salt '*' redis.lrange foo_list 0 10
```

`salt.modules.redismod.ping`(*host=None, port=None, db=None, password=None*)

Ping the server, returns False on connection errors

CLI Example:

```
salt '*' redis.ping
```

`salt.modules.redismod.save`(*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk

CLI Example:

```
salt '*' redis.save
```

`salt.modules.redismod.sentinel_get_master_ip`(*master, host=None, port=None, password=None*)

Get ip for sentinel master

CLI Example:

```
salt '*' redis.sentinel_get_master_ip 'mymaster'
```

`salt.modules.redismod.set_key`(*key, value, host=None, port=None, db=None, password=None*)

Set redis key value

CLI Example:

```
salt '*' redis.set_key foo bar
```

`salt.modules.redismod.shutdown`(*host=None, port=None, db=None, password=None*)

Synchronously save the dataset to disk and then shut down the server

CLI Example:

```
salt '*' redis.shutdown
```

`salt.modules.redismod.slaveof`(*master_host=None, master_port=None, host=None, port=None, db=None, password=None*)

Make the server a slave of another instance, or promote it as master

CLI Example:

```
# Become slave of redis-n01.example.com:6379
salt '*' redis.slaveof redis-n01.example.com 6379
salt '*' redis.slaveof redis-n01.example.com
# Become master
salt '*' redis.slaveof
```

`salt.modules.redismod.smembers`(*key, host=None, port=None, db=None, password=None*)

Get members in a Redis set

CLI Example:

```
salt '*' redis.smembers foo_set
```

`salt.modules.redismod.time`(*host=None, port=None, db=None, password=None*)

Return the current server UNIX time in seconds

CLI Example:

```
salt '*' redis.time
```

`salt.modules.redismod.zcard` (*key, host=None, port=None, db=None, password=None*)

Get the length of a sorted set in Redis

CLI Example:

```
salt '*' redis.zcard foo_sorted
```

`salt.modules.redismod.zrange` (*key, start, stop, host=None, port=None, db=None, password=None*)

Get a range of values from a sorted set in Redis by index

CLI Example:

```
salt '*' redis.zrange foo_sorted 0 10
```

20.9.334 salt.modules.reg

Manage the Windows registry

Hives

Hives are the main sections of the registry and all begin with the word HKEY.

- HKEY_LOCAL_MACHINE
- HKEY_CURRENT_USER
- HKEY_USER

Keys

Keys are the folders in the registry. Keys can have many nested subkeys. Keys can have a value assigned to them under the (Default)

When passing a key on the CLI it must be quoted correctly depending on the backslashes being used (\ vs \\). The following are valid methods of passing the the key on the CLI:

Using **single backslashes**: "SOFTWARE\Python" 'SOFTWARE\Python' (will not work on a Windows Master)

Using **double backslashes**: SOFTWARE\\Python

Values or Entries

Values or Entries are the name/data pairs beneath the keys and subkeys. All keys have a default name/data pair. The name is (Default) with a displayed value of (value not set). The actual value is Null.

Example

The following example is an export from the Windows startup portion of the registry:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Run]
"RTHDVCPL"="\C:\\Program Files\\Realtek\\Audio\\HDA\\RtkNGUI64.exe" -s"
"NvBackend"="\C:\\Program Files (x86)\\NVIDIA Corporation\\Update Core\\NvBackend.
↪exe\"
"BTMTrayAgent"="rundll32.exe \"C:\\Program Files (x86)\\Intel\\Bluetooth\\btmshellex.
↪dll\",TrayApp"
```

In this example these are the values for each:

Hive: HKEY_LOCAL_MACHINE

Key and subkeys: SOFTWARE\\Microsoft\\Windows\\CurrentVersion\\Run

Value:

- There are 3 value names:
 - *RTHDVCPL*
 - *NvBackend*
 - *BTMTrayAgent*
- Each value name has a corresponding value

depends

- salt.utils.win_reg

salt.modules.reg.broadcast_change()

Refresh the windows environment.

Note: This will only effect new processes and windows. Services will not see the change until the system restarts.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' reg.broadcast_change
```

salt.modules.reg.delete_key_recursive(hive, key, use_32bit_registry=False)

New in version 2015.5.4.

Delete a registry key to include all subkeys and value/data pairs.

Parameters **hive** (*str*) – The name of the hive. Can be one of the following

- HKEY_LOCAL_MACHINE or HKLM
- HKEY_CURRENT_USER or HKCU
- HKEY_USER or HKU
- HKEY_CLASSES_ROOT or HKCR
- HKEY_CURRENT_CONFIG or HKCC

key (*str*): The key to remove (looks like a path)

use_32bit_registry (*bool*): Deletes the 32bit portion of the registry on 64bit installations.

On 32bit machines this is ignored.

Returns

A dictionary listing the keys that deleted successfully as well as those that failed to delete.

Return type dict

CLI Example:

The following example will remove `delete_me` and all its subkeys from the `SOFTWARE` key in `HKEY_LOCAL_MACHINE`:

```
salt '*' reg.delete_key_recursive HKLM SOFTWARE\\delete_me
```

`salt.modules.reg.delete_value` (*hive, key, vname=None, use_32bit_registry=False*)

Delete a registry value entry or the default value for a key.

Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following
 - `HKEY_LOCAL_MACHINE` or `HKLM`
 - `HKEY_CURRENT_USER` or `HKCU`
 - `HKEY_USER` or `HKU`
 - `HKEY_CLASSES_ROOT` or `HKCR`
 - `HKEY_CURRENT_CONFIG` or `HKCC`
- **key** (*str*) – The key (looks like a path) to the value name.
- **vname** (*str*) – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be deleted.
- **use_32bit_registry** (*bool*) – Deletes the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' reg.delete_value HKEY_CURRENT_USER 'SOFTWARE\\Salt' 'version'
```

`salt.modules.reg.import_file` (*source, use_32bit_registry=False*)

Import registry settings from a Windows REG file by invoking `REG.EXE`.

New in version 2018.3.0.

Parameters

- **source** (*str*) – The full path of the REG file. This can be either a local file path or a URL type supported by salt (e.g. `salt://salt_master_path`)
- **use_32bit_registry** (*bool*) – If the value of this parameter is True then the REG file will be imported into the Windows 32 bit registry. Otherwise the Windows 64 bit registry will be used.

Returns True if successful, otherwise an error is raised

Return type `bool`

Raises

- **ValueError** – If the value of `source` is an invalid path or otherwise causes `cp.cache_file` to return False
- **CommandExecutionError** – If `reg.exe` exits with a non-0 exit code

CLI Example:

```
salt machine1 reg.import_file salt://win/printer_config/110_Canon/
↳postinstall_config.reg
```

`salt.modules.reg.key_exists` (*hive, key, use_32bit_registry=False*)

Check that the key is found in the registry. This refers to keys and not value/data pairs.

Parameters

- **hive** (*str*) – The hive to connect to
- **key** (*str*) – The key to check
- **use_32bit_registry** (*bool*) – Look in the 32bit portion of the registry

Returns True if exists, otherwise False

Return type `bool`

CLI Example:

```
salt '*' reg.key_exists HKLM SOFTWARE\Microsoft
```

`salt.modules.reg.list_keys` (*hive*, *key=None*, *use_32bit_registry=False*)

Enumerates the subkeys in a registry key or hive.

Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following:
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
 - HKEY_CLASSES_ROOT or HKCR
 - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name. If a key is not passed, the keys under the hive will be returned.
- **use_32bit_registry** (*bool*) – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.

Returns A list of keys/subkeys under the hive or key.

Return type `list`

CLI Example:

```
salt '*' reg.list_keys HKLM 'SOFTWARE'
```

`salt.modules.reg.list_values` (*hive*, *key=None*, *use_32bit_registry=False*, *include_default=True*)

Enumerates the values in a registry key or hive.

Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following:
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
 - HKEY_CLASSES_ROOT or HKCR
 - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name. If a key is not passed, the values under the hive will be returned.
- **use_32bit_registry** (*bool*) – Accesses the 32bit portion of the registry on 64 bit installations. On 32bit machines this is ignored.
- **include_default** (*bool*) – Toggle whether to include the '(Default)' value.

Returns A list of values under the hive or key.

Return type `list`

CLI Example:

```
salt '*' reg.list_values HKLM 'SYSTEM\CurrentControlSet\Services\Tcpip'
↪'
```

`salt.modules.reg.read_value` (*hive*, *key*, *vname=None*, *use_32bit_registry=False*)

Reads a registry value entry or the default value for a key. To read the default value, don't pass *vname*

Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following:
 - HKEY_LOCAL_MACHINE or HKLM
 - HKEY_CURRENT_USER or HKCU
 - HKEY_USER or HKU
 - HKEY_CLASSES_ROOT or HKCR
 - HKEY_CURRENT_CONFIG or HKCC
- **key** (*str*) – The key (looks like a path) to the value name.
- **vname** (*str*) – The value name. These are the individual name/data pairs under the

key. If not passed, the key (Default) value will be returned.

- **use_32bit_registry** (*bool*) – Accesses the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.

Returns

A dictionary containing the passed settings as well as the `value_data` if successful. If unsuccessful, sets `success` to `False`.

`bool`: Returns `False` if the key is not found

If `vname` is not passed:

- Returns the first unnamed value (Default) as a string.
- Returns `None` if first unnamed value is empty.

Return type `dict`

CLI Example:

The following will get the value of the `version` value name in the `HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt` key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
```

CLI Example:

The following will get the default value of the `HKEY_LOCAL_MACHINE\\SOFTWARE\\Salt` key

```
salt '*' reg.read_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt'
```

```
salt.modules.reg.set_value(hive, key, vname=None, vdata=None, vtype='REG_SZ',
                           use_32bit_registry=False, volatile=False)
```

Sets a value in the registry. If `vname` is passed, it will be the value for that value name, otherwise it will be the default value for the specified key

Parameters

- **hive** (*str*) – The name of the hive. Can be one of the following
 - `HKEY_LOCAL_MACHINE` or `HKLM`
 - `HKEY_CURRENT_USER` or `HKCU`
 - `HKEY_USER` or `HKU`
 - `HKEY_CLASSES_ROOT` or `HKCR`
 - `HKEY_CURRENT_CONFIG` or `HKCC`
- **key** (*str*) – The key (looks like a path) to the value name.
- **vname** (*str*) – The value name. These are the individual name/data pairs under the key. If not passed, the key (Default) value will be set.
- **vdata** (*str, int, list, bytes*) – The value you'd like to set. If a value name (`vname`) is passed, this will be the data for that value name. If not, this will be the (Default) value for the key.

The type of data this parameter expects is determined by the value type specified in `vtype`. The correspondence is as follows:

- `REG_BINARY`: Binary data (str in Py2, bytes in Py3)
- `REG_DWORD`: int
- `REG_EXPAND_SZ`: str
- `REG_MULTI_SZ`: list of str
- `REG_QWORD`: int
- `REG_SZ`: str

Note: When setting `REG_BINARY`, string data will be converted to binary.

Note: The type for the (Default) value is always REG_SZ and cannot be changed.

Note: This parameter is optional. If `vdata` is not passed, the Key will be created with no associated item/value pairs.

- **vtype** (*str*) – The value type. The possible values of the `vtype` parameter are indicated above in the description of the `vdata` parameter.
- **use_32bit_registry** (*bool*) – Sets the 32bit portion of the registry on 64bit installations. On 32bit machines this is ignored.
- **volatile** (*bool*) – When this parameter has a value of True, the registry key will be made volatile (i.e. it will not persist beyond a system reset or shutdown). This parameter only has an effect when a key is being created and at no other time.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

This will set the version value to 2015.5.2 in the SOFTWARE\Salt key in the HKEY_LOCAL_MACHINE hive

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'version'
↳ '2015.5.2'
```

CLI Example:

This function is strict about the type of `vdata`. For instance this example will fail because `vtype` has a value of REG_SZ and `vdata` has a type of int (as opposed to str as expected).

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data' 1.2
```

CLI Example:

In this next example `vdata` is properly quoted and should succeed.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'str_data'
↳ vtype=REG_SZ vdata="'1.2'"
```

CLI Example:

This is an example of using `vtype` REG_BINARY.

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'bin_data'
↳ vtype=REG_BINARY vdata='Salty Data'
```

CLI Example:

An example of using `vtype` REG_MULTI_SZ is as follows:

```
salt '*' reg.set_value HKEY_LOCAL_MACHINE 'SOFTWARE\Salt' 'list_data'
↳ vtype=REG_MULTI_SZ vdata='["Salt", "is", "great"]'
```

20.9.335 salt.modules.rest_package

Package support for the REST example

`salt.modules.rest_package.install`(*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*)

`salt.modules.rest_package.installed`(*name, version=None, refresh=False, fromrepo=None, skip_verify=False, pkgs=None, sources=None, **kwargs*)

`salt.modules.rest_package.list_pkgs`(*versions_as_list=False, **kwargs*)

`salt.modules.rest_package.remove`(*name=None, pkgs=None, **kwargs*)

`salt.modules.rest_package.upgrade`(*refresh=True, skip_verify=True, **kwargs*)

`salt.modules.rest_package.version`(**names, **kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

20.9.336 salt.modules.rest_sample_utils module

Utility functions for the `rest_sample`

`salt.modules.rest_sample_utils.fix_outage`()

"Fix" the outage

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.fix_outage
```

`salt.modules.rest_sample_utils.get_test_string`()

Helper function to test cross-calling to the `__proxy__` dunder.

CLI Example:

```
salt 'rest-sample-proxy' rest_sample.get_test_string
```

20.9.337 salt.modules.rest_service

Provide the service module for the proxy-minion REST sample

`salt.modules.rest_service.enabled`(*name, sig=None*)

Only the 'redbull' service is 'enabled' in the test

New in version 2015.8.1.

`salt.modules.rest_service.get_all`()

Return a list of all available services

New in version 2015.8.0.

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.rest_service.list`()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.rest_service.restart`(*name, sig=None*)

Restart the specified service with `rest_sample`

New in version 2015.8.0.

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rest_service.running`(*name*, *sig=None*)

Return whether this service is running.

New in version 2015.8.0.

`salt.modules.rest_service.start`(*name*, *sig=None*)

Start the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rest_service.status`(*name*, *sig=None*)

Return the status for a service via rest_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

New in version 2015.8.0.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.rest_service.stop`(*name*, *sig=None*)

Stop the specified service on the rest_sample

New in version 2015.8.0.

CLI Example:

```
salt '*' service.stop <service name>
```

20.9.338 salt.modules.restartcheck module

checkrestart functionality for Debian and Red Hat Based systems

Identifies services (processes) that are linked against deleted files (for example after downloading an updated binary of a shared library).

Based on checkrestart script from debian-goodies (written by Matt Zimmerman for the Debian GNU/Linux distribution, <https://packages.debian.org/debian-goodies>) and psdel by Sam Morris.

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.restartcheck.restartcheck`(*ignorelist=None*, *blacklist=None*, *excludepid=None*, *verbose=True*)

Analyzes files opened by running processes and seeks for packages which need to be restarted.

Parameters

- **ignorelist** – string or list of packages to be ignored
- **blacklist** – string or list of file paths to be ignored
- **excludepid** – string or list of process IDs to be ignored
- **verbose** – boolean, enables extensive output

Returns True if no packages for restart found. False on failure. String with checkrestart output if some package seems to need to be restarted.

New in version 2015.8.3.

CLI Example: .. code-block:: bash

```
salt '*' restartcheck.restartcheck
```

20.9.339 salt.modules.ret

Module to integrate with the returner system and retrieve data sent to a salt returner

`salt.modules.ret.get_fun`(*returner, fun*)

Return info about last time fun was called on each minion

CLI Example:

```
salt '*' ret.get_fun mysql network.interfaces
```

`salt.modules.ret.get_jid`(*returner, jid*)

Return the information for a specified job id

CLI Example:

```
salt '*' ret.get_jid redis 20421104181954700505
```

`salt.modules.ret.get_jids`(*returner*)

Return a list of all job ids

CLI Example:

```
salt '*' ret.get_jids mysql
```

`salt.modules.ret.get_minions`(*returner*)

Return a list of all minions

CLI Example:

```
salt '*' ret.get_minions mysql
```

20.9.340 salt.modules.rh_ip

The networking module for RHEL/Fedora based distros

`salt.modules.rh_ip.apply_network_settings`(***settings*)

Apply global network configuration.

CLI Example:

```
salt '*' ip.apply_network_settings
```

`salt.modules.rh_ip.build_bond`(*iface*, ***settings*)

Create a bond script in /etc/modprobe.d with the passed settings and load the bonding kernel module.

CLI Example:

```
salt '*' ip.build_bond bond0 mode=balance-alb
```

`salt.modules.rh_ip.build_interface`(*iface*, *iface_type*, *enabled*, ***settings*)

Build an interface script for a network interface.

CLI Example:

```
salt '*' ip.build_interface eth0 eth <settings>
```

`salt.modules.rh_ip.build_network_settings`(***settings*)

Build the global network script.

CLI Example:

```
salt '*' ip.build_network_settings <settings>
```

`salt.modules.rh_ip.build_routes`(*iface*, ***settings*)

Build a route script for a network interface.

CLI Example:

```
salt '*' ip.build_routes eth0 <settings>
```

`salt.modules.rh_ip.down`(*iface*, *iface_type*)

Shutdown a network interface

CLI Example:

```
salt '*' ip.down eth0
```

`salt.modules.rh_ip.get_bond`(*iface*)

Return the content of a bond script

CLI Example:

```
salt '*' ip.get_bond bond0
```

`salt.modules.rh_ip.get_interface`(*iface*)

Return the contents of an interface script

CLI Example:

```
salt '*' ip.get_interface eth0
```

`salt.modules.rh_ip.get_network_settings`()

Return the contents of the global network script.

CLI Example:

```
salt '*' ip.get_network_settings
```

`salt.modules.rh_ip.get_routes`(*iface*)

Return the contents of the interface routes script.

CLI Example:

```
salt '*' ip.get_routes eth0
```

`salt.modules.rh_ip.up`(*iface, iface_type*)

Start up a network interface

CLI Example:

```
salt '*' ip.up eth0
```

20.9.341 salt.modules.rh_service

Service support for RHEL-based systems, including support for both upstart and sysvinit

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

`salt.modules.rh_service.available`(*name, limit=""*)

Return True if the named service is available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.available sshd
salt '*' service.available sshd limit=upstart
salt '*' service.available sshd limit=sysvinit
```

`salt.modules.rh_service.delete`(*name, **kwargs*)

Delete the named service

New in version 2016.3.

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.rh_service.disable`(*name, **kwargs*)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.rh_service.disabled`(*name*)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.rh_service.enable`(*name, **kwargs*)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.rh_service.enabled(name, **kwargs)`
Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.rh_service.get_all(limit=)`
Return all installed services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_all
salt '*' service.get_all limit=upstart
salt '*' service.get_all limit=sysvinit
```

`salt.modules.rh_service.get_disabled(limit=)`
Return the disabled services. Use the `limit` param to restrict results to services of that type.

CLI Example:

```
salt '*' service.get_disabled
salt '*' service.get_disabled limit=upstart
salt '*' service.get_disabled limit=sysvinit
```

`salt.modules.rh_service.get_enabled(limit=)`
Return the enabled services. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.get_enabled
salt '*' service.get_enabled limit=upstart
salt '*' service.get_enabled limit=sysvinit
```

`salt.modules.rh_service.missing(name, limit=)`
The inverse of `service.available`. Return True if the named service is not available. Use the `limit` param to restrict results to services of that type.

CLI Examples:

```
salt '*' service.missing sshd
salt '*' service.missing sshd limit=upstart
salt '*' service.missing sshd limit=sysvinit
```

`salt.modules.rh_service.reload_(name)`
Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.rh_service.restart(name)`
Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.rh_service.start(name)`
Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.rh_service.status`(*name*, *sig=None*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

`salt.modules.rh_service.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

20.9.342 salt.modules.riak

Riak Salt Module

`salt.modules.riak.cluster_commit`()

Commit Cluster Changes

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_commit
```

`salt.modules.riak.cluster_join`(*username*, *hostname*)

Join a Riak cluster

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_join <user> <host>
```

username - The riak username to join the cluster *hostname* - The riak hostname you are connecting to

`salt.modules.riak.cluster_leave`(*username*, *hostname*)

Leave a Riak cluster

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_leave <username> <host>
```

username - The riak username to join the cluster hostname - The riak hostname you are connecting to

`salt.modules.riak.cluster_plan()`

Review Cluster Plan

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.cluster_plan
```

`salt.modules.riak.member_status()`

Get cluster member status

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.member_status
```

`salt.modules.riak.services()`

List available services on a node

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.services
```

`salt.modules.riak.start()`

Start Riak

CLI Example:

```
salt '*' riak.start
```

`salt.modules.riak.status()`

Current node status

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.status
```

`salt.modules.riak.stop()`

Stop Riak

Changed in version 2015.8.0.

CLI Example:

```
salt '*' riak.stop
```

`salt.modules.riak.test()`

Runs a test of a few standard Riak operations

New in version 2015.8.0.

CLI Example:

```
salt '*' riak.test
```

20.9.343 salt.modules.rpm

Support for rpm

`salt.modules.rpm.bin_pkg_info`(*path*, *saltenv*='base')

New in version 2015.8.0.

Parses RPM metadata and returns a dictionary of information about the package (name, version, etc.).

path Path to the file. Can either be an absolute path to a file on the minion, or a salt fileserver URL (e.g. `salt://path/to/file.rpm`). If a salt fileserver URL is passed, the file will be cached to the minion so that it can be examined.

saltenv [base] Salt fileserver environment from which to retrieve the package. Ignored if `path` is a local file path on the minion.

CLI Example:

```
salt '*' lowpkg.bin_pkg_info /root/salt-2015.5.1-2.el7.noarch.rpm
salt '*' lowpkg.bin_pkg_info salt://salt-2015.5.1-2.el7.noarch.rpm
```

`salt.modules.rpm.checksum`(**paths*)

Return if the signature of a RPM file is valid.

CLI Example:

```
salt '*' lowpkg.checksum /path/to/package1.rpm
salt '*' lowpkg.checksum /path/to/package1.rpm /path/to/package2.rpm
```

`salt.modules.rpm.diff`(*package*, *path*)

Return a formatted diff between current file and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters

- **package** – The name of the package
- **path** – Full path to the installed file

Returns Difference or empty string. For binary files only a notification.

CLI example:

```
salt '*' lowpkg.diff apache2 /etc/apache2/httpd.conf
```

`salt.modules.rpm.file_dict`(**packages*)

List the files that belong to a package, sorted by group. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_dict httpd
salt '*' lowpkg.file_dict httpd postfix
salt '*' lowpkg.file_dict
```

`salt.modules.rpm.file_list`(**packages*)

List the files that belong to a package. Not specifying any packages will return a list of `_every_` file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' lowpkg.file_list httpd
salt '*' lowpkg.file_list httpd postfix
salt '*' lowpkg.file_list
```

`salt.modules.rpm.info`(**packages*, ***attr*)

Return a detailed package(s) summary information. If no packages specified, all packages will be returned.

Parameters

- **packages** –
- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.
Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.

Returns

CLI example:

```
salt '*' lowpkg.info apache2 bash
salt '*' lowpkg.info apache2 bash attr=version
salt '*' lowpkg.info apache2 bash attr=version,build_date_iso,size
```

salt.modules.rpm.list_pkgs(*packages)

List the packages currently installed in a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' lowpkg.list_pkgs
```

salt.modules.rpm.modified(*packages, **flags)List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

CLI examples:

```
salt '*' lowpkg.modified httpd
salt '*' lowpkg.modified httpd postfix
salt '*' lowpkg.modified
```

salt.modules.rpm.owner(*paths)

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' lowpkg.owner /usr/bin/apachectl
salt '*' lowpkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

salt.modules.rpm.verify(*packages, **kwargs)Runs an `rpm -Va` on a system, and returns the results in a dictFiles with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' lowpkg.verify
salt '*' lowpkg.verify httpd
```

(continues on next page)

(continued from previous page)

```
salt '*' lowpkg.verify httpd postfix
salt '*' lowpkg.verify httpd postfix ignore_types=['config','doc']
```

`salt.modules.rpm.version_cmp`(*ver1*, *ver2*, *ignore_epoch=False*)
New in version 2015.8.9.

Do a cmp-style comparison on two packages. Return -1 if *ver1* < *ver2*, 0 if *ver1* == *ver2*, and 1 if *ver1* > *ver2*. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

20.9.344 salt.modules.rpmbuild

RPM Package builder system

New in version 2015.8.0.

This system allows for all of the components to build rpms safely in chrooted environments. This also provides a function to generate yum repositories

This module implements the pkgbuild interface

`salt.modules.rpmbuild.build`(*runas*, *tgt*, *dest_dir*, *spec*, *sources*, *deps*, *env*, *template*, *saltenv='base'*,
log_dir='/var/log/salt/pkgbuild')

Given the package destination directory, the spec file source and package sources, use mock to safely build the rpm defined in the spec file

CLI Example:

```
salt '*' pkgbuild.build mock epel-7-x86_64 /var/www/html
https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/
python-libnacl.spec
https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl package for rhel 7 using user mock and place it in /var/www/html/ on the minion

`salt.modules.rpmbuild.make_repo`(*repor_dir*, *keyid=None*, *env=None*, *use_passphrase=False*,
gnupghome='/etc/salt/gpgkeys', *runas='root'*, *timeout=15.0*)

Make a package repository and optionally sign packages present

Given the repodir, create a yum repository out of the rpms therein and optionally sign it and packages present, the name is directory to turn into a repo. This state is best used with onchanges linked to your package building states.

repor_dir The directory to find packages that will be in the repository.

keyid Changed in version 2016.3.0.

Optional Key ID to use in signing packages and repository. Utilizes Public and Private keys associated with keyid which have been loaded into the minion's Pillar data.

For example, contents from a Pillar data file with named Public and Private keys as follows:

```

gpg_pkg_priv_key: |
-----BEGIN PGP PRIVATE KEY BLOCK-----
Version: GnuPG v1

lQ0+BFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.
.
Ebe+8JCQTqwSXPRtzXmy/b5WXDeM79CkLWvuGpXFor76D+ECMRPv/rawukEcNptn
R50mgHqvydEn04pWbn8JzQ09YX/Us0SMHBVzLC8eIi5ZiopzalvX
=JvW8
-----END PGP PRIVATE KEY BLOCK-----

gpg_pkg_priv_keyname: gpg_pkg_key.pem

gpg_pkg_pub_key: |
-----BEGIN PGP PUBLIC KEY BLOCK-----
Version: GnuPG v1

mQENBFciIfQBCADAPctzx7I5Rl32escCMZsPzaEKWe7bIX1em4KCKkBoX47IG54b
w82PCE8Y1jF/9Uk2m3RKVWp3YcLlc7Ap3gj6V04ysvVz28UbnhPxsIk0lf2cq8qc
.

inNqW9c=
=s1CX
-----END PGP PUBLIC KEY BLOCK-----

gpg_pkg_pub_keyname: gpg_pkg_key.pub

```

env Changed in version 2016.3.0.

A dictionary of environment variables to be utilized in creating the repository.

Note: This parameter is not used for making yum repositories.

use_passphrase [False] New in version 2016.3.0.

Use a passphrase with the signing key presented in `keyid`. Passphrase is received from Pillar data which could be passed on the command line with `pillar` parameter. For example:

```
pillar='{ "gpg_passphrase" : "my_passphrase" }'
```

gnupghome [/etc/salt/gpgkeys] New in version 2016.3.0.

Location where GPG related files are stored, used with `keyid`.

runas [root] New in version 2016.3.0.

User to create the repository as, and optionally sign packages.

Note: Ensure the user has correct permissions to any files and directories which are to be utilized.

timeout [15.0] New in version 2016.3.4.

Timeout in seconds to wait for the prompt for inputting the passphrase.

CLI Example:

```
salt '*' pkgbuild.make_repo /var/www/html/
```

`salt.modules.rpmbuild.make_src_pkg`(*dest_dir*, *spec*, *sources*, *env=None*, *template=None*,
saltenv='base', *runas='root'*)

Create a source rpm from the given spec file and sources

CLI Example:

```
salt '*' pkgbuild.make_src_pkg /var/www/html/  
    https://raw.githubusercontent.com/saltstack/libnacl/master/pkg/rpm/python-  
→libnacl.spec  
    https://pypi.python.org/packages/source/l/libnacl/libnacl-1.3.5.tar.gz
```

This example command should build the libnacl SOURCE package and place it in /var/www/html/ on the minion

Changed in version 2017.7.0.

dest_dir The directory on the minion to place the built package(s)

spec The location of the spec file (used for rpms)

sources The list of package sources

env A dictionary of environment variables to be set prior to execution.

template Run the spec file through a templating engine Optional argument, allows for no templating engine used to be if none is desired.

saltenv The saltenv to use for files downloaded from the salt fileserver

runas The user to run the build process as

New in version 2018.3.3.

Note: using SHA256 as digest and minimum level dist el6

20.9.345 salt.modules.rsync

Wrapper for rsync

New in version 2014.1.0.

This data can also be passed into *pillar*. Options passed into *opts* will overwrite options passed into *pillar*.

`salt.modules.rsync.config`(*conf_path='/etc/rsyncd.conf'*)

Changed in version 2016.3.0: Return data now contains just the contents of the rsyncd.conf as a string, instead of a dictionary as returned from `cmd.run_all`.

Returns the contents of the rsync config file

conf_path [/etc/rsyncd.conf] Path to the config file

CLI Example:

```
salt '*' rsync.config
```

`salt.modules.rsync.rsync`(*src*, *dst*, *delete=False*, *force=False*, *update=False*, *passwordfile=None*,
exclude=None, *excludefrom=None*, *dryrun=False*, *rsh=None*, *addi-*
tional_opts=None, *saltenv='base'*)

Changed in version 2016.3.0: Return data now contains just the output of the rsync command, instead of a dictionary as returned from `cmd.run_all`.

Rsync files from *src* to *dst*

src The source location where files will be rsynced from.

dst The destination location where files will be rsynced to.

delete [False] Whether to enable the rsync *-delete* flag, which will delete extraneous files from dest dirs

force [False] Whether to enable the rsync *-force* flag, which will force deletion of dirs even if not empty.

update [False] Whether to enable the rsync *-update* flag, which forces rsync to skip any files which exist on the destination and have a modified time that is newer than the source file.

passwordfile A file that contains a password for accessing an rsync daemon. The file should contain just the password.

exclude Whether to enable the rsync *-exclude* flag, which will exclude files matching a PATTERN.

excludefrom Whether to enable the rsync *-excludefrom* flag, which will read exclude patterns from a file.

dryrun [False] Whether to enable the rsync *-dry-run* flag, which will perform a trial run with no changes made.

rsh Whether to enable the rsync *-rsh* flag, to specify the remote shell to use.

additional_opts Any additional rsync options, should be specified as a list.

saltenv

Specify a salt fileserver environment to be used.

CLI Example:

```
salt '*' rsync.rsync {src} {dst} {delete=True} {update=True} {passwordfile=/
→etc/pass.crt} {exclude=xx} {rsh}
salt '*' rsync.rsync {src} {dst} {delete=True} {excludefrom=/xx.ini} {rsh}

salt '*' rsync.rsync {src} {dst} {delete=True} {excludefrom=/xx.ini}
→additional_opts='["--partial", "--bwlimit=5000"]'
```

salt.modules.rsync.version()

Changed in version 2016.3.0: Return data now contains just the version number as a string, instead of a dictionary as returned from *cmd.run_all*.

Returns rsync version

CLI Example:

```
salt '*' rsync.version
```

20.9.346 salt.modules.runit

runit service module (<http://smarden.org/runit>)

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: runit
```

Provides virtual *service* module on systems using runit as init.

Service management rules (*sv* command):

service \$n is ENABLED if file SERVICE_DIR/\$n/run exists service \$n is AVAILABLE if ENABLED or if file AVAIL_SVR_DIR/\$n/run exists service \$n is DISABLED if AVAILABLE but not ENABLED

SERVICE_DIR/\$n is normally a symlink to a AVAIL_SVR_DIR/\$n folder

Service auto-start/stop mechanism:

`sv` (auto)starts/stops service as soon as `SERVICE_DIR/<service>` is created/deleted, both on service creation or a boot time.

autostart feature is disabled if file `SERVICE_DIR/<n>/down` exists. This does not affect the current's service status (if already running) nor manual service management.

Service's alias:

Service `sva` is an alias of service `svc` when `AVAIL_SVR_DIR/sva` symlinks to folder `AVAIL_SVR_DIR/svc`. `svc` can't be enabled if it is already enabled through an alias already enabled, since `sv` files are stored in folder `SERVICE_DIR/svc/`.

XBPS package management uses a service's alias to provides service alternative(s), such as `chrony` and `openntpd` both aliased to `ntpd`.

`salt.modules.runit.add_svc_avail_path(path)`

Add a path that may contain available services. Return `True` if added (or already present), `False` on error.
path directory to add to `AVAIL_SVR_DIRS`

`salt.modules.runit.available(name)`

Returns `True` if the specified service is available, otherwise returns `False`.

name the service's name

CLI Example:

```
salt '*' runit.available <service name>
```

`salt.modules.runit.disable(name, stop=False, **kwargs)`

Don't start service name at boot Returns `True` if operation is successful

name the service's name

stop if `True`, also stops the service

CLI Example:

```
salt '*' service.disable <name> [stop=True]
```

`salt.modules.runit.disabled(name)`

Return `True` if the named service is disabled, `False` otherwise

name the service's name

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.runit.enable(name, start=False, **kwargs)`

Start service name at boot. Returns `True` if operation is successful

name the service's name

start [`False`] If `True`, start the service once enabled.

CLI Example:

```
salt '*' service.enable <name> [start=True]
```

`salt.modules.runit.enabled(name)`

Return `True` if the named service is enabled, `False` otherwise

name the service's name

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.runit.full_restart(name)`

Calls `runit.restart()`

name the service's name

CLI Example:

```
salt '*' runit.full_restart <service name>
```

`salt.modules.runit.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' runit.get_all
```

`salt.modules.runit.get_disabled()`

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.runit.get_enabled()`

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.runit.get_svc_alias()`

Returns the list of service's name that are aliased and their alias path(s)

`salt.modules.runit.get_svc_avail_path()`

Return list of paths that may contain available services

`salt.modules.runit.get_svc_broken_path(name='*')`

Return list of broken path(s) in `SERVICE_DIR` that match name

A path is broken if it is a broken symlink or can not be a runit service

name a glob for service name. default is `*`

CLI Example:

```
salt '*' runit.get_svc_broken_path <service name>
```

`salt.modules.runit.missing(name)`

The inverse of `runit.available`. Returns `True` if the specified service is not available, otherwise returns `False`.

name the service's name

CLI Example:

```
salt '*' runit.missing <service name>
```

`salt.modules.runit.reload_(name)`

Reload service

name the service's name

CLI Example:

```
salt '*' runit.reload <service name>
```

salt.modules.runit.remove(*name*)

Remove the service <name> from system. Returns True if operation is successful. The service will be also stopped.

name the service's name

CLI Example:

```
salt '*' service.remove <name>
```

salt.modules.runit.restart(*name*)

Restart service

name the service's name

CLI Example:

```
salt '*' runit.restart <service name>
```

salt.modules.runit.show(*name*)

Show properties of one or more units/jobs or the manager

name the service's name

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.runit.start(*name*)

Start service

name the service's name

CLI Example:

```
salt '*' runit.start <service name>
```

salt.modules.runit.status(*name, sig=None*)

Return True if service is running

name the service's name

sig signature to identify with ps

CLI Example:

```
salt '*' runit.status <service name>
```

salt.modules.runit.status_autostart(*name*)

Return True if service <name> is autostarted by sv (file \$service_folder/down does not exist) NB: return False if the service is not enabled.

name the service's name

CLI Example:

```
salt '*' runit.status_autostart <service name>
```

salt.modules.runit.stop(*name*)

Stop service

name the service's name

CLI Example:

```
salt '*' runit.stop <service name>
```

20.9.347 salt.modules.rvm

Manage ruby installations and gemsets with RVM, the Ruby Version Manager.

`salt.modules.rvm.do`(*ruby, command, runas=None, cwd=None, env=None*)

Execute a command in an RVM controlled environment.

ruby Which ruby to use

command The rvm command to execute

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

cwd The directory from which to run the rvm command. Defaults to the user's home directory.

CLI Example:

```
salt '*' rvm.do 2.0.0 <command>
```

`salt.modules.rvm.gemset_copy`(*source, destination, runas=None*)

Copy all gems from one gemset to another.

source The name of the gemset to copy, complete with ruby version

destination The destination gemset

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_copy foobar bazquo
```

`salt.modules.rvm.gemset_create`(*ruby, gemset, runas=None*)

Creates a gemset.

ruby The ruby version for which to create the gemset

gemset The name of the gemset to create

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_create 2.0.0 foobar
```

`salt.modules.rvm.gemset_delete`(*ruby, gemset, runas=None*)

Delete a gemset

ruby The ruby version to which the gemset belongs

gemset The gemset to delete

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_delete 2.0.0 foobar
```

`salt.modules.rvm.gemset_empty`(*ruby, gemset, runas=None*)

Remove all gems from a gemset.

ruby The ruby version to which the gemset belongs

gemset The gemset to empty

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_empty 2.0.0 foobar
```

`salt.modules.rvm.gemset_list`(*ruby='default', runas=None*)

List all gemsets for the given ruby.

ruby [default] The ruby version for which to list the gemsets

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list
```

`salt.modules.rvm.gemset_list_all`(*runas=None*)

List all gemsets for all installed rubies.

Note that you must have set a default ruby before this can work.

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.gemset_list_all
```

`salt.modules.rvm.get`(*version='stable', runas=None*)

Update RVM

version [stable] Which version of RVM to install, (e.g. stable or head)

CLI Example:

```
salt '*' rvm.get
```

`salt.modules.rvm.install`(*runas=None*)

Install RVM system-wide

runas The user under which to run the rvm installer script. If not specified, then it be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.install
```

`salt.modules.rvm.install_ruby`(*ruby, runas=None, opts=None, env=None*)

Install a ruby implementation.

ruby The version of ruby to install

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

env Environment to set for the install command. Useful for exporting compilation flags such as RUBY_CONFIGURE_OPTS

opts List of options to pass to the RVM installer (ie -C, -patch, etc)

CLI Example:

```
salt '*' rvm.install_ruby 1.9.3-p385
```

`salt.modules.rvm.is_installed`(*runas=None*)

Check if RVM is installed.

CLI Example:

```
salt '*' rvm.is_installed
```

`salt.modules.rvm.list_`(*runas=None*)

List all rvm-installed rubies

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.list
```

`salt.modules.rvm.reinstall_ruby` (*ruby*, *runas=None*, *env=None*)

Reinstall a ruby implementation

ruby The version of ruby to reinstall

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.reinstall_ruby 1.9.3-p385
```

`salt.modules.rvm.rubygems` (*ruby*, *version*, *runas=None*)

Installs a specific rubygems version in the given ruby

ruby The ruby for which to install rubygems

version The version of rubygems to install, or 'remove' to use the version that ships with 1.9

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.rubygems 2.0.0 1.8.24
```

`salt.modules.rvm.set_default` (*ruby*, *runas=None*)

Set the default ruby

ruby The version of ruby to make the default

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

CLI Example:

```
salt '*' rvm.set_default 2.0.0
```

`salt.modules.rvm.wrapper` (*ruby_string*, *wrapper_prefix*, *runas=None*, **binaries*)

Install RVM wrapper scripts

ruby_string Ruby/gemset to install wrappers for

wrapper_prefix What to prepend to the name of the generated wrapper binaries

runas The user under which to run rvm. If not specified, then rvm will be run as the user under which Salt is running.

binaries [None] The names of the binaries to create wrappers for. When nothing is given, wrappers for ruby, gem, rake, irb, rdoc, ri and testrb are generated.

CLI Example:

```
salt '*' rvm.wrapper <ruby_string> <wrapper_prefix>
```

20.9.348 salt.modules.s3

Connection module for Amazon S3

configuration This module accepts explicit s3 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

```
http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html
```

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
s3.keyid: GKTADJGHEIQSXMKKRBJ08H
s3.key: askdjghsdfjkgHwupUjasdfkldfklgjsdfjajkghs
```

(Note: this is literally the pillar key 's3.keyid' or the config option 's3.keyid', not "s3:n keyid: blah".)

A `service_url` may also be specified in the configuration:

```
s3.service_url: s3.amazonaws.com
```

A `role_arn` may also be specified in the configuration:

```
s3.role_arn: arn:aws:iam::111111111111:role/my-role-to-assume
```

If a `service_url` is not specified, the default is `s3.amazonaws.com`. This may appear in various documentation as an "endpoint". A comprehensive list for Amazon S3 may be found at:

```
http://docs.aws.amazon.com/general/latest/gr/rande.html#s3_region
```

The `service_url` will form the basis for the final endpoint that is used to query the service.

Path style can be enabled:

```
s3.path_style: True
```

This can be useful if you need to use salt with a proxy for an s3 compatible storage

You can use either https protocol or http protocol:

```
s3.https_enable: True
```

SSL verification may also be turned off in the configuration:

```
s3.verify_ssl: False
```

This is required if using S3 bucket names that contain a period, as these will not match Amazon's S3 wildcard certificates. Certificate verification is enabled by default.

AWS region may be specified in the configuration:

```
s3.location: eu-central-1
```

Default is `us-east-1`.

This module should be usable to query other S3-like services, such as Eucalyptus.

depends requests

```
salt.modules.s3.delete(bucket, path=None, action=None, key=None, keyid=None, service_url=None,
                       verify_ssl=None, kms_keyid=None, location=None, role_arn=None,
                       path_style=None, https_enable=None)
```

Delete a bucket, or delete an object from a bucket.

CLI Example to delete a bucket:

```
salt myminion s3.delete mybucket
```

CLI Example to delete an object from a bucket:

```
salt myminion s3.delete mybucket remoteobject
```

```
salt.modules.s3.get(bucket="", path="", return_bin=False, action=None, local_file=None, key=None,
                   keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
                   role_arn=None, path_style=None, https_enable=None)
```

List the contents of a bucket, or return an object from a bucket. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list buckets:

```
salt myminion s3.get
```

CLI Example to list the contents of a bucket:

```
salt myminion s3.get mybucket
```

CLI Example to return the binary contents of an object:

```
salt myminion s3.get mybucket myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion s3.get mybucket myfile.png local_file=/tmp/myfile.png
```

It is also possible to perform an action on a bucket. Currently, S3 supports the following actions:

```
acl
cors
lifecycle
policy
location
logging
notification
tagging
versions
requestPayment
versioning
website
```

To perform an action on a bucket:

```
salt myminion s3.get mybucket myfile.png action=acl
```

```
salt.modules.s3.head(bucket, path="", key=None, keyid=None, service_url=None, verify_ssl=None,
                    kms_keyid=None, location=None, role_arn=None, path_style=None,
                    https_enable=None)
```

Return the metadata for a bucket, or an object in a bucket.

CLI Examples:

```
salt myminion s3.head mybucket
salt myminion s3.head mybucket myfile.png
```

```
salt.modules.s3.put(bucket, path=None, return_bin=False, action=None, local_file=None, key=None,
                   keyid=None, service_url=None, verify_ssl=None, kms_keyid=None, location=None,
                   role_arn=None, path_style=None, https_enable=None)
```

Create a new bucket, or upload an object to a bucket.

CLI Example to create a bucket:

```
salt myminion s3.put mybucket
```

CLI Example to upload an object to a bucket:

```
salt myminion s3.put mybucket remotepath local_file=/path/to/file
```

20.9.349 salt.modules.s6 module

s6 service module

This module is compatible with the *service* states, so it can be used to maintain services using the provider argument:

```
myservice:
  service:
    - running
    - provider: s6
```

Note that the enabled argument is not available with this provider.

codeauthor Marek Skrobacki <skrobul@skrobul.com>

salt.modules.s6.available(*name*)

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' s6.available foo
```

salt.modules.s6.full_restart(*name*)

Calls s6.restart() function

CLI Example:

```
salt '*' s6.full_restart <service name>
```

salt.modules.s6.get_all()

Return a list of all available services

CLI Example:

```
salt '*' s6.get_all
```

salt.modules.s6.missing(*name*)

The inverse of s6.available. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' s6.missing foo
```

salt.modules.s6.reload_(*name*)

Send a HUP to service via s6

CLI Example:

```
salt '*' s6.reload <service name>
```

salt.modules.s6.restart(*name*)

Restart service via s6. This will stop/start service

CLI Example:

```
salt '*' s6.restart <service name>
```

salt.modules.s6.start(*name*)

Starts service via s6

CLI Example:

```
salt '*' s6.start <service name>
```

`salt.modules.s6.status`(*name*, *sig=None*)

Return the status for a service via s6, return pid if running

CLI Example:

```
salt '*' s6.status <service name>
```

`salt.modules.s6.stop`(*name*)

Stops service via s6

CLI Example:

```
salt '*' s6.stop <service name>
```

`salt.modules.s6.term`(*name*)

Send a TERM to service via s6

CLI Example:

```
salt '*' s6.term <service name>
```

20.9.350 salt.modules.salt_proxy module

Salt proxy module

New in version 2015.8.3.

Module to deploy and manage salt-proxy processes on a minion.

`salt.modules.salt_proxy.configure_proxy`(*proxyname*, *start=True*)

Create the salt proxy file and start the proxy process if required

Parameters

- **proxyname** – Name to be used for this proxy (should match entries in pillar)
- **start** – Boolean indicating if the process should be started default = True

CLI Example:

```
salt deviceminion salt_proxy.configure_proxy p8000
```

`salt.modules.salt_proxy.is_running`(*proxyname*)

Check if the salt-proxy process associated with this proxy (name) is running.

Returns True if the process is running False otherwise

Parameters **proxyname** – String name of the proxy (p8000 for example)

CLI Example:

```
salt deviceminion salt_proxy.is_running p8000
```

20.9.351 salt.modules.saltcheck

A module for testing the logic of states and highstates

codeauthor William Cannon <william.cannon@gmail.com>

maturity new

Saltcheck provides unittest like functionality requiring only the knowledge of salt module execution and yaml.

In order to run state and highstate saltcheck tests a sub-folder of a state must be created and named `saltcheck-tests`.

Tests for a state should be created in files ending in `*.tst` and placed in the `saltcheck-tests` folder.

Multiple tests can be created in a file. Multiple `*.tst` files can be created in the `saltcheck-tests` folder. Salt rendering is supported in test files (e.g. `yaml + jinja`). The `id` of a test works in the same manner as in salt state files. They should be unique and descriptive.

Example file system layout:

Example:

```
echo-test-hello:
  module_and_function: test.echo
  args:
    - "hello"
  kwargs:
  assertion: assertEquals
  expected-return: 'hello'
```

class `salt.modules.saltcheck.SaltCheck`

This class implements the saltcheck

call_salt_command(*fun, args, kwargs*)

Generic call of salt Caller command

static cast_expected_to_returned_type(*expected, returned*)

Determine the type of variable returned Cast the expected to the type of variable returned

static get_state_search_path_list()

For the state file system, return a list of paths to search for states

run_test(*test_dict*)

Run a single saltcheck test

class `salt.modules.saltcheck.StateTestLoader`(*search_paths*)

Class loads in test files for a state e.g. `state_dir/saltcheck-tests/[1.tst, 2.tst, 3.tst]`

add_test_files_for_sls(*sls_path*)

Adding test files

static convert_sls_to_path(*sls*)

Converting sls to paths

static convert_sls_to_paths(*sls_list*)

Converting sls to paths

gather_files(*filepath*)

Gather files for a test suite

load_file(*filepath*)

loads in one test file

load_file_salt_rendered(*filepath*)

loads in one test file

load_test_suite()

Load tests either from one file, or a set of files

`salt.modules.saltcheck.run_highstate_tests()`

Execute all tests for a salt highstate and return results

CLI Example:

```
salt '*' saltcheck.run_highstate_tests
```

`salt.modules.saltcheck.run_state_tests(state)`

Execute all tests for a salt state and return results Nested states will also be tested

Parameters `state` (*str*) – the name of a user defined state

CLI Example:

```
salt '*' saltcheck.run_state_tests postfix
```

`salt.modules.saltcheck.run_test(**kwargs)`

Execute one saltcheck test and return result

Parameters `arg test` (*keyword*) –

CLI Example:

```
salt '*' saltcheck.run_test
  test={'module_and_function': "test.echo",
        "assertion": "assertEqual",
        "expected-return": "This works!",
        "args":["This works!"] }
```

`salt.modules.saltcheck.update_master_cache()`

Updates the master cache onto the minion - transfers all salt-check-tests Should be done one time before running tests, and if tests are updated Can be automated by setting "auto_update_master_cache: True" in minion config

CLI Example:

```
salt '*' saltcheck.update_master_cache
```

20.9.352 salt.modules.saltcloudmod

Control a salt cloud system

`salt.modules.saltcloudmod.create(name, profile)`

Create the named vm

CLI Example:

```
salt <minion-id> saltcloud.create webserver rackspace_centos_512
```

20.9.353 salt.modules.saltutil

The Saltutil module is used to manage the state of the salt minion itself. It is used to manage minion modules as well as automate updates to the salt minion.

depends

- esky Python module for update functionality

`salt.modules.saltutil.clear_cache()`

Forcibly removes all caches on a minion.

New in version 2014.7.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_cache
```

`salt.modules.saltutil.clear_job_cache` (*hours=24*)

Forcibly removes job cache folders and files on a minion.

New in version 2018.3.0.

WARNING: The safest way to clear a minion cache is by first stopping the minion and then deleting the cache files before restarting it.

CLI Example:

```
salt '*' saltutil.clear_job_cache hours=12
```

`salt.modules.saltutil.cmd` (*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret=", kwarg=None, ssh=False, **kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd
```

`salt.modules.saltutil.cmd_iter` (*tgt, fun, arg=(), timeout=None, tgt_type='glob', ret=", kwarg=None, ssh=False, **kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Assuming this minion is a master, execute a salt command

CLI Example:

```
salt '*' saltutil.cmd_iter
```

`salt.modules.saltutil.find_cached_job` (*jid*)

Return the data for a specific cached job id. Note this only works if `cache_jobs` has previously been set to `True` on the minion.

CLI Example:

```
salt '*' saltutil.find_cached_job <job id>
```

`salt.modules.saltutil.find_job` (*jid*)

Return the data for a specific job id that is currently running.

jid The job id to search for and return data.

CLI Example:

```
salt '*' saltutil.find_job <job id>
```

Note that the `find_job` function only returns job information when the job is still running. If the job is currently running, the output looks something like this:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
  arg:
    - 30
  fun:
    test.sleep
  jid:
    20160503150049487736
  pid:
    9601
  ret:
  tgt:
    my-minion
  tgt_type:
    glob
  user:
    root
```

If the job has already completed, the job cannot be found and therefore the function returns an empty dictionary, which looks like this on the CLI:

```
# salt my-minion saltutil.find_job 20160503150049487736
my-minion:
-----
```

`salt.modules.saltutil.is_running(fun)`

If the named function is running return the data associated with it/them. The argument can be a glob

CLI Example:

```
salt '*' saltutil.is_running state.highstate
```

`salt.modules.saltutil.kill_all_jobs()`

Sends a kill signal (SIGKILL 9) to all currently running jobs

CLI Example:

```
salt '*' saltutil.kill_all_jobs
```

`salt.modules.saltutil.kill_job(jid)`

Sends a kill signal (SIGKILL 9) to the named salt job's process

CLI Example:

```
salt '*' saltutil.kill_job <job id>
```

`salt.modules.saltutil.list_extmods()`

New in version 2017.7.0.

List Salt modules which have been synced externally

CLI Examples:

```
salt '*' saltutil.list_extmods
```

`salt.modules.saltutil.mmodule(saltenv, fun, *args, **kwargs)`

Loads minion modules from an environment so that they can be used in pillars for that environment

CLI Example:

```
salt '*' saltutil.mmodule base test.ping
```

`salt.modules.saltutil.refresh_beacons()`

Signal the minion to refresh the beacons.

CLI Example:

```
salt '*' saltutil.refresh_beacons
```

`salt.modules.saltutil.refresh_grains(**kwargs)`

New in version 2016.3.6,2016.11.4,2017.7.0.

Refresh the minion's grains without syncing custom grains modules from `salt://_grains`.

Note: The available execution modules will be reloaded as part of this process, as grains can affect which modules are available.

refresh_pillar [True] Set to `False` to keep pillar data from being refreshed.

CLI Examples:

```
salt '*' saltutil.refresh_grains
```

`salt.modules.saltutil.refresh_modules(**kwargs)`

Signal the minion to refresh the module and grain data

The default is to refresh module asynchronously. To block until the module refresh is complete, set the 'async' flag to `False`.

CLI Example:

```
salt '*' saltutil.refresh_modules
```

`salt.modules.saltutil.refresh_pillar()`

Signal the minion to refresh the pillar data.

CLI Example:

```
salt '*' saltutil.refresh_pillar
```

`salt.modules.saltutil.regen_keys()`

Used to regenerate the minion keys.

CLI Example:

```
salt '*' saltutil.regen_keys
```

`salt.modules.saltutil.revoke_auth(preserve_minion_cache=False)`

The minion sends a request to the master to revoke its own key. Note that the minion session will be revoked and the minion may not be able to return the result of this command back to the master.

If the 'preserve_minion_cache' flag is set to `True`, the master cache for this minion will not be removed.

CLI Example:

```
salt '*' saltutil.revoke_auth
```

`salt.modules.saltutil.runner`(*name*, *arg=None*, *kwarg=None*, *full_return=False*, *saltenv='base'*, *jid=None*, ***kwargs*)

Execute a runner function. This function must be run on the master, either by targeting a minion running on a master or by using salt-call on a master.

New in version 2014.7.0.

name The name of the function to run

kwargs Any keyword arguments to pass to the runner function

CLI Example:

In this example, assume that *master_minion* is a minion running on a master.

```
salt master_minion saltutil.runner jobs.list_jobs
salt master_minion saltutil.runner test.arg arg="['baz']" kwarg="{ 'foo': 'bar' }"
```

`salt.modules.saltutil.running`()

Return the data on all running salt processes on the minion

CLI Example:

```
salt '*' saltutil.running
```

`salt.modules.saltutil.signal_job`(*jid*, *sig*)

Sends a signal to the named salt job's process

CLI Example:

```
salt '*' saltutil.signal_job <job id> 15
```

`salt.modules.saltutil.sync_all`(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Changed in version 2015.8.11,2016.3.2: On masterless minions, pillar modules are now synced, and refreshed when *refresh* is set to *True*.

Sync down all of the dynamic modules from the file server for a specific environment. This function synchronizes custom modules, states, beacons, grains, returners, output modules, renderers, and utils.

refresh [True] Also refresh the execution modules and recompile pillar data available to the minion. This refresh will be performed even if no new dynamic modules are synced. Set to *False* to prevent this refresh.

Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a *refresh* argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_all
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_all
salt '*' saltutil.sync_all saltenv=dev
```

(continues on next page)

(continued from previous page)

```
salt '*' saltutil.sync_all saltenv=base,dev
salt '*' saltutil.sync_all extmod_whitelist={'modules': ['custom_module']}
```

`salt.modules.saltutil.sync_beacons` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.5.1.

Sync beacons from `salt://_beacons` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for beacons to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available beacons on the minion. This refresh will be performed even if no new beacons are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_beacons
salt '*' saltutil.sync_beacons saltenv=dev
salt '*' saltutil.sync_beacons saltenv=base,dev
```

`salt.modules.saltutil.sync_clouds` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_cloud` to the minion

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_clouds
salt '*' saltutil.sync_clouds saltenv=dev
salt '*' saltutil.sync_clouds saltenv=base,dev
```

`salt.modules.saltutil.sync_engines` (*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2016.3.0.

Sync engine modules from `salt://_engines` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new engine modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_engines
salt '*' saltutil.sync_engines saltenv=base,dev

```

`salt.modules.saltutil.sync_grains` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync grains modules from `salt://_grains` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for grains modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules and recompile pillar data for the minion. This refresh will be performed even if no new grains modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_grains
salt '*' saltutil.sync_grains saltenv=dev
salt '*' saltutil.sync_grains saltenv=base,dev

```

`salt.modules.saltutil.sync_log_handlers` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2015.8.0.

Sync log handlers from `salt://_log_handlers` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for log handlers to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new log handlers are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_log_handlers
salt '*' saltutil.sync_log_handlers saltenv=dev
salt '*' saltutil.sync_log_handlers saltenv=base,dev

```

`salt.modules.saltutil.sync_modules` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 0.10.0.

Sync execution modules from `salt://_modules` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for execution modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new execution modules are synced. Set to False to prevent this refresh.

Important: If this function is executed using a `module.run` state, the SLS file will not have access to newly synced execution modules unless a `refresh` argument is added to the state, like so:

```
load_my_custom_module:
  module.run:
    - name: saltutil.sync_modules
    - refresh: True
```

See [here](#) for a more detailed explanation of why this is necessary.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt '*' saltutil.sync_modules
salt '*' saltutil.sync_modules saltenv=dev
salt '*' saltutil.sync_modules saltenv=base,dev
```

salt.modules.saltutil.sync_output (*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

Sync outputters from `salt://_output` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

salt.modules.saltutil.sync_outputters (*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

This function is an alias of `sync_output`.

Sync outputters from `salt://_output` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for outputters to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new outputters are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_output
salt '*' saltutil.sync_output saltenv=dev
salt '*' saltutil.sync_output saltenv=base,dev
```

`salt.modules.saltutil.sync_pillar` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*,
extmod_blacklist=None)

New in version 2015.8.11,2016.3.2.

Sync pillar modules from the `salt://_pillar` directory on the Salt fileserver. This function is environment-aware, pass the desired environment to grab the contents of the `_pillar` directory from that environment. The default environment, if none is specified, is `base`.

refresh [True] Also refresh the execution modules available to the minion, and refresh pillar data.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

Note: This function will raise an error if executed on a traditional (i.e. not masterless) minion

CLI Examples:

```
salt '*' saltutil.sync_pillar
salt '*' saltutil.sync_pillar saltenv=dev
```

`salt.modules.saltutil.sync_proxymodules` (*saltenv=None*, *refresh=False*,
extmod_whitelist=None, *extmod_blacklist=None*)

New in version 2015.8.2.

Sync proxy modules from `salt://_proxy` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for proxy modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new proxy modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```
salt '*' saltutil.sync_proxymodules
salt '*' saltutil.sync_proxymodules saltenv=dev
salt '*' saltutil.sync_proxymodules saltenv=base,dev
```

`salt.modules.saltutil.sync_renderers` (*saltenv=None*, *refresh=True*, *extmod_whitelist=None*,
extmod_blacklist=None)

New in version 0.10.0.

Sync renderers from `salt://_renderers` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for renderers to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new renderers are synced. Set to False to prevent this refresh. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_renderers
salt '*' saltutil.sync_renderers saltenv=dev
salt '*' saltutil.sync_renderers saltenv=base,dev

```

`salt.modules.saltutil.sync_returners` (*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 0.10.0.

Sync returners from `salt://_returners` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for returners to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available execution modules on the minion. This refresh will be performed even if no new returners are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_returners
salt '*' saltutil.sync_returners saltenv=dev

```

`salt.modules.saltutil.sync_sdb` (*saltenv=None, extmod_whitelist=None, extmod_blacklist=None*)

New in version 2015.5.8,2015.8.3.

Sync sdb modules from `salt://_sdb` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for sdb modules to sync.

If no top files are found, then the `base` environment will be synced.

refresh [False] This argument has no affect and is included for consistency with the other sync functions.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```

salt '*' saltutil.sync_sdb
salt '*' saltutil.sync_sdb saltenv=dev
salt '*' saltutil.sync_sdb saltenv=base,dev

```

`salt.modules.saltutil.sync_states` (*saltenv=None, refresh=True, extmod_whitelist=None, extmod_blacklist=None*)

New in version 0.10.0.

Sync state modules from `salt://_states` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for state modules to sync.

If no top files are found, then the `base` environment will be synced.

refresh [True] If True, refresh the available states on the minion. This refresh will be performed even if no new state modules are synced. Set to False to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_states
salt '*' saltutil.sync_states saltenv=dev
salt '*' saltutil.sync_states saltenv=base,dev

```

`salt.modules.saltutil.sync_thorium`(*saltenv=None*, *refresh=False*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2018.3.0.

Sync Thorium modules from `salt://_thorium` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for engines to sync. If no top files are found, then the `base` environment will be synced.

refresh: True If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new Thorium modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist comma-separated list of modules to sync

extmod_blacklist comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_thorium
salt '*' saltutil.sync_thorium saltenv=base,dev

```

`salt.modules.saltutil.sync_utils`(*saltenv=None*, *refresh=True*, *extmod_whitelist=None*, *extmod_blacklist=None*)

New in version 2014.7.0.

Sync utility modules from `salt://_utils` to the minion

saltenv The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

If not passed, then all environments configured in the *top files* will be checked for utility modules to sync. If no top files are found, then the `base` environment will be synced.

refresh [True] If `True`, refresh the available execution modules on the minion. This refresh will be performed even if no new utility modules are synced. Set to `False` to prevent this refresh.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Examples:

```

salt '*' saltutil.sync_utils
salt '*' saltutil.sync_utils saltenv=dev
salt '*' saltutil.sync_utils saltenv=base,dev

```

`salt.modules.saltutil.term_all_jobs`()

Sends a termination signal (SIGTERM 15) to all currently running jobs

CLI Example:

```

salt '*' saltutil.term_all_jobs

```

`salt.modules.saltutil.term_job`(*jid*)

Sends a termination signal (SIGTERM 15) to the named salt job's process

CLI Example:

```

salt '*' saltutil.term_job <job id>

```

`salt.modules.saltutil.update` (*version=None*)

Update the salt minion from the URL defined in `opts['update_url']` SaltStack, Inc provides the latest builds here: `update_url: https://repo.saltstack.com/windows/`

Be aware that as of 2014-8-11 there's a bug in esky such that only the latest version available in the `update_url` can be downloaded and installed.

This feature requires the minion to be running a `bdist_esky` build.

The version number is optional and will default to the most recent version available at `opts['update_url']`.

Returns details about the transaction upon completion.

CLI Examples:

```
salt '*' saltutil.update
salt '*' saltutil.update 0.10.3
```

`salt.modules.saltutil.wheel` (*name, *args, **kwargs*)

Execute a wheel module and function. This function must be run against a minion that is local to the master.

New in version 2014.7.0.

name The name of the function to run

args Any positional arguments to pass to the wheel function. A common example of this would be the `match` arg needed for key functions.

New in version v2015.8.11.

kwargs Any keyword arguments to pass to the wheel function

CLI Example:

```
salt my-local-minion saltutil.wheel key.accept jerry
salt my-local-minion saltutil.wheel minions.connected
```

Note: Since this function must be run against a minion that is running locally on the master in order to get accurate returns, if this function is run against minions that are not local to the master, "empty" returns are expected. The remote minion does not have access to wheel functions and their return data.

20.9.354 salt.modules.schedule

Module for managing the Salt schedule on a minion

New in version 2014.7.0.

`salt.modules.schedule.add` (*name, **kwargs*)

Add a job to the schedule

CLI Example:

```
salt '*' schedule.add job1 function='test.ping' seconds=3600
# If function have some arguments, use job_args
salt '*' schedule.add job2 function='cmd.run' job_args="['date >> /tmp/date.log']
↪" seconds=60
```

`salt.modules.schedule.build_schedule_item` (*name, **kwargs*)

Build a schedule job

CLI Example:

```
salt '*' schedule.build_schedule_item job1 function='test.ping' seconds=3600
```

`salt.modules.schedule.copy`(*name*, *target*, ***kwargs*)

Copy scheduled job to another minion or minions.

CLI Example:

```
salt '*' schedule.copy jobname target
```

`salt.modules.schedule.delete`(*name*, ***kwargs*)

Delete a job from the minion's schedule

CLI Example:

```
salt '*' schedule.delete job1
```

`salt.modules.schedule.disable`(***kwargs*)

Disable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.disable
```

`salt.modules.schedule.disable_job`(*name*, ***kwargs*)

Disable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.disable_job job1
```

`salt.modules.schedule.enable`(***kwargs*)

Enable all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.enable
```

`salt.modules.schedule.enable_job`(*name*, ***kwargs*)

Enable a job in the minion's schedule

CLI Example:

```
salt '*' schedule.enable_job job1
```

`salt.modules.schedule.is_enabled`(*name*)

List a Job only if its enabled

New in version 2015.5.3.

CLI Example:

```
salt '*' schedule.is_enabled name=job_name
```

`salt.modules.schedule.list_`(*show_all=False*, *show_disabled=True*, *where=None*, *re-
turn_yaml=True*)

List the jobs currently scheduled on the minion

CLI Example:

```

salt '*' schedule.list

# Show all jobs including hidden internal jobs
salt '*' schedule.list show_all=True

# Hide disabled jobs from list of jobs
salt '*' schedule.list show_disabled=False

```

`salt.modules.schedule.modify`(*name*, ***kwargs*)
 Modify an existing job in the schedule

CLI Example:

```

salt '*' schedule.modify job1 function='test.ping' seconds=3600

```

`salt.modules.schedule.move`(*name*, *target*, ***kwargs*)
 Move scheduled job to another minion or minions.

CLI Example:

```

salt '*' schedule.move jobname target

```

`salt.modules.schedule.postpone_job`(*name*, *current_time*, *new_time*, ***kwargs*)
 Postpone a job in the minion's schedule

Current time and new time should be in date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```

salt '*' schedule.postpone_job job current_time new_time

salt '*' schedule.postpone_job job current_time new_time time_fmt='%Y-%m-%dT%H:%M:
↪%S'

```

`salt.modules.schedule.purge`(***kwargs*)
 Purge all the jobs currently scheduled on the minion

CLI Example:

```

salt '*' schedule.purge

```

`salt.modules.schedule.reload`(*kwargs*)
 Reload saved scheduled jobs on the minion

CLI Example:

```

salt '*' schedule.reload

```

`salt.modules.schedule.run_job`(*name*, *force=False*)
 Run a scheduled job on the minion immediately

CLI Example:

```

salt '*' schedule.run_job job1

salt '*' schedule.run_job job1 force=True
Force the job to run even if it is disabled.

```

`salt.modules.schedule.save(**kwargs)`
Save all scheduled jobs on the minion

CLI Example:

```
salt '*' schedule.save
```

`salt.modules.schedule.show_next_fire_time(name, **kwargs)`
Show the next fire time for scheduled job

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.show_next_fire_time job_name
```

`salt.modules.schedule.skip_job(name, current_time, **kwargs)`
Skip a job in the minion's schedule at specified time.

Time to skip should be specified as date string format, default value is %Y-%m-%dT%H:%M:%S.

New in version 2018.3.0.

CLI Example:

```
salt '*' schedule.skip_job job time
```

20.9.355 salt.modules.scsi

SCSI administration module

`salt.modules.scsi.ls_(get_size=True)`
List SCSI devices, with details

CLI Examples:

```
salt '*' scsi.ls
salt '*' scsi.ls get_size=False
```

`get_size` [True] Get the size information for scsi devices. This option should be set to False for older OS distributions (RHEL6 and older) due to lack of support for the '-s' option in lsscsi.

New in version 2015.5.10.

`salt.modules.scsi.rescan_all(host)`
List scsi devices

CLI Example:

```
salt '*' scsi.rescan_all 0
```

20.9.356 salt.modules.sdb

Module for Manipulating Data via the Salt DB API

`salt.modules.sdb.delete(uri)`

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return False.

CLI Example:

```
salt '*' sdb.delete sdb://mymemcached/foo
```

`salt.modules.sdb.get(uri)`

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt '*' sdb.get sdb://mymemcached/foo
```

`salt.modules.sdb.get_or_set_hash(uri, length=8, chars='abcdefghijklmnopqrstuvwxyz0123456789!@#%$%^&*(-_+=)')`

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

State Example:

```
some_mysql_user:
  mysql_user:
    - present
    - host: localhost
    - password: '{{ salt["sdb.get_or_set_hash"]('some_mysql_user_pass') }}'
```

CLI Example:

```
salt '*' sdb.get_or_set_hash 'SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.modules.sdb.set_(uri, value)`

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt '*' sdb.set sdb://mymemcached/foo bar
```

20.9.357 salt.modules.seed

Virtual machine image management tools

`salt.modules.seed.apply_(path, id_=None, config=None, approve_key=True, install=True, prep_install=False, pub_key=None, priv_key=None, mount_point=None)`

Seed a location (disk image, directory, or block device) with the minion config, approve the minion's key, and/or install salt-minion.

CLI Example:

```
salt 'minion' seed.apply path id [config=config_data] \
    [gen_key=(true|false)] [approve_key=(true|false)] \
    [install=(true|false)]
```

path Full path to the directory, device, or disk image on the target minion's file system.

id Minion id with which to seed the path.

config Minion configuration options. By default, the 'master' option is set to the target host's 'master'.

approve_key Request a pre-approval of the generated minion key. Requires that the salt-master be configured to either auto-accept all keys or expect a signing request from the target host. Default: true.

install Install salt-minion, if absent. Default: true.

prep_install Prepare the bootstrap script, but don't run it. Default: false

```
salt.modules.seed.mkconfig(config=None, tmp=None, id_=None, approve_key=True, pub_key=None,
                           priv_key=None)
```

Generate keys and config and put them in a tmp directory.

pub_key absolute path or file content of an optional preseeded salt key

priv_key absolute path or file content of an optional preseeded salt key

CLI Example:

```
salt 'minion' seed.mkconfig [config=config_data] [tmp=tmp_dir] \
    [id_=minion_id] [approve_key=(true|false)]
```

```
salt.modules.seed.prep_bootstrap(mpt)
```

Update and get the random script to a random place

CLI Example:

```
salt '*' seed.prep_bootstrap /tmp
```

20.9.358 salt.modules.selinux

Execute calls on selinux

Note: This module requires the `semanage`, `setsebool`, and `semodule` commands to be available on the minion. On RHEL-based distributions, ensure that the `policycoreutils` and `policycoreutils-python` packages are installed. If not on a Fedora or RHEL-based distribution, consult the selinux documentation for your distribution to ensure that the proper packages are installed.

```
salt.modules.selinux.fcontext_add_or_delete_policy(action, name, filetype=None,
                                                    sel_type=None, sel_user=None,
                                                    sel_level=None)
```

New in version 2017.7.0.

Sets or deletes the SELinux policy for a given filespec and other optional parameters.

Returns the result of the call to `semanage`.

Note that you don't have to remove an entry before setting a new one for a given filespec and filetype, as adding one with `semanage` automatically overwrites a previously configured SELinux context.

name filespec of the file or directory. Regex syntax is allowed.

file_type The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also `man semanage-fcontext`. Defaults to 'a' (all files).

sel_type SELinux context type. There are many.

sel_user SELinux user. Use `semanage login -l` to determine which ones are available to you.

sel_level The MLS range of the SELinux context.

CLI Example:

```
salt '*' selinux.fcontext_add_or_delete_policy add my-policy
```

`salt.modules.selinux.fcontext_apply_policy` (*name*, *recursive=False*)

New in version 2017.7.0.

Applies SELinux policies to filespec using *restorecon [-R] filespec*. Returns dict with changes if successful, the output of the *restorecon* command otherwise.

name filespec of the file or directory. Regex syntax is allowed.

recursive Recursively apply SELinux policies.

CLI Example:

```
salt '*' selinux.fcontext_apply_policy my-policy
```

`salt.modules.selinux.fcontext_get_policy` (*name*, *filetype=None*, *sel_type=None*, *sel_user=None*, *sel_level=None*)

New in version 2017.7.0.

Returns the current entry in the SELinux policy list as a dictionary. Returns None if no exact match was found.

Returned keys are:

- filespec (the name supplied and matched)
- filetype (the descriptive name of the filetype supplied)
- sel_user, sel_role, sel_type, sel_level (the selinux context)

For a more in-depth explanation of the selinux context, go to https://access.redhat.com/documentation/en-US/Red_Hat_Enterprise_Linux/6/html/Security-Enhanced_Linux/chap-Security-Enhanced_Linux-SELinux_Contexts.html

name filespec of the file or directory. Regex syntax is allowed.

filetype The SELinux filetype specification. Use one of [a, f, d, c, b, s, l, p]. See also *man semanage-fcontext*. Defaults to 'a' (all files).

CLI Example:

```
salt '*' selinux.fcontext_get_policy my-policy
```

`salt.modules.selinux.fcontext_policy_is_applied` (*name*, *recursive=False*)

New in version 2017.7.0.

Returns an empty string if the SELinux policy for a given filespec is applied, returns string with differences in policy and actual situation otherwise.

name filespec of the file or directory. Regex syntax is allowed.

CLI Example:

```
salt '*' selinux.fcontext_policy_is_applied my-policy
```

`salt.modules.selinux.filetype_id_to_string` (*filetype='a'*)

New in version 2017.7.0.

Translates SELinux filetype single-letter representation to a more human-readable version (which is also used in *semanage fcontext -l*).

`salt.modules.selinux.getconfig` ()

Return the selinux mode from the config file

CLI Example:

```
salt '*' selinux.getconfig
```

`salt.modules.selinux.getenforce()`

Return the mode selinux is running in

CLI Example:

```
salt '*' selinux.getenforce
```

`salt.modules.selinux.getsebool(boolean)`

Return the information on a specific selinux boolean

CLI Example:

```
salt '*' selinux.getsebool virt_use_usb
```

`salt.modules.selinux.getsemod(module)`

Return the information on a specific selinux module

CLI Example:

```
salt '*' selinux.getsemod mysql
```

New in version 2016.3.0.

`salt.modules.selinux.install_semod(module_path)`

Install custom SELinux module from file

CLI Example:

```
salt '*' selinux.install_semod [salt://]path/to/module.pp
```

New in version 2016.11.6.

`salt.modules.selinux.list_sebool()`

Return a structure listing all of the selinux booleans on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_sebool
```

`salt.modules.selinux.list_semod()`

Return a structure listing all of the selinux modules on the system and what state they are in

CLI Example:

```
salt '*' selinux.list_semod
```

New in version 2016.3.0.

`salt.modules.selinux.remove_semod(module)`

Remove SELinux module

CLI Example:

```
salt '*' selinux.remove_semod module_name
```

New in version 2016.11.6.

`salt.modules.selinux.selinux_fs_path()`

Return the location of the SELinux VFS directory

CLI Example:

```
salt '*' selinux.selinux_fs_path
```

`salt.modules.selinux.setenforce(mode)`

Set the SELinux enforcing mode

CLI Example:

```
salt '*' selinux.setenforce enforcing
```

`salt.modules.selinux.setsebool(boolean, value, persist=False)`

Set the value for a boolean

CLI Example:

```
salt '*' selinux.setsebool virt_use_usb off
```

`salt.modules.selinux.setsebools(pairs, persist=False)`

Set the value of multiple booleans

CLI Example:

```
salt '*' selinux.setsebools '{virt_use_usb: on, squid_use_tproxy: off}'
```

`salt.modules.selinux.setsemod(module, state)`

Enable or disable an SELinux module.

CLI Example:

```
salt '*' selinux.setsemod nagios Enabled
```

New in version 2016.3.0.

20.9.359 salt.modules.sensehat

Module for controlling the LED matrix or reading environment data on the SenseHat of a Raspberry Pi.

New in version 2017.7.0.

maintainer Benedikt Werner <1benediktwerner@gmail.com>, Joachim Werner <joe@suse.com>

maturity new

depends sense_hat Python module

The rotation of the Pi can be specified in a pillar. This is useful if the Pi is used upside down or sideways to correct the orientation of the image being shown.

Example:

```
sensehat:
  rotation: 90
```

`salt.modules.sensehat.clear(color=None)`

Sets the LED matrix to a single color or turns all LEDs off.

CLI Example:

```
salt 'raspberrypi' sensehat.clear
salt 'raspberrypi' sensehat.clear '[255, 0, 0]'
```

`salt.modules.sensehat.get_humidity()`

Get the percentage of relative humidity from the humidity sensor.

`salt.modules.sensehat.get_pixel(x, y)`

Returns the color of a single pixel on the LED matrix.

x The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

y The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

Note: Please read the note for `get_pixels`

`salt.modules.sensehat.get_pixels()`

Returns a list of 64 smaller lists of [R, G, B] pixels representing the the currently displayed image on the LED matrix.

Note: When using `set_pixels` the pixel values can sometimes change when you read them again using `get_pixels`. This is because we specify each pixel element as 8 bit numbers (0 to 255) but when they're passed into the Linux frame buffer for the LED matrix the numbers are bit shifted down to fit into RGB 565. 5 bits for red, 6 bits for green and 5 bits for blue. The loss of binary precision when performing this conversion (3 bits lost for red, 2 for green and 3 for blue) accounts for the discrepancies you see.

The `get_pixels` method provides an accurate representation of how the pixels end up in frame buffer memory after you have called `set_pixels`.

`salt.modules.sensehat.get_pressure()`

Gets the current pressure in Millibars from the pressure sensor.

`salt.modules.sensehat.get_temperature()`

Gets the temperature in degrees Celsius from the humidity sensor. Equivalent to calling `get_temperature_from_humidity`.

If you get strange results try using `get_temperature_from_pressure`.

`salt.modules.sensehat.get_temperature_from_humidity()`

Gets the temperature in degrees Celsius from the humidity sensor.

`salt.modules.sensehat.get_temperature_from_pressure()`

Gets the temperature in degrees Celsius from the pressure sensor.

`salt.modules.sensehat.low_light(low_light=True)`

Sets the LED matrix to low light mode. Useful in a dark environment.

CLI Example:

```
salt 'raspberrypi' sensehat.low_light
salt 'raspberrypi' sensehat.low_light False
```

`salt.modules.sensehat.set_pixel(x, y, color)`

Sets a single pixel on the LED matrix to a specified color.

x The x coordinate of the pixel. Ranges from 0 on the left to 7 on the right.

y The y coordinate of the pixel. Ranges from 0 at the top to 7 at the bottom.

color The new color of the pixel as a list of [R, G, B] values.

CLI Example:

```
salt 'raspberrypi' sensehat.set_pixel 0 0 '[255, 0, 0]'
```

`salt.modules.sensehat.set_pixels(pixels)`

Sets the entire LED matrix based on a list of 64 pixel values

pixels A list of 64 [R, G, B] color values.

`salt.modules.sensehat.show_image`(*image*)

Displays an 8 x 8 image on the LED matrix.

image The path to the image to display. The image must be 8 x 8 pixels in size.

CLI Example:

```
salt 'raspberrry' sensehat.show_image /tmp/my_image.png
```

`salt.modules.sensehat.show_letter`(*letter*, *text_color=None*, *back_color=None*)

Displays a single letter on the LED matrix.

letter The letter to display

text_color The color in which the letter is shown. Defaults to '[255, 255, 255]' (white).

back_color The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_letter O
salt 'raspberrry' sensehat.show_letter X '[255, 0, 0]'
salt 'raspberrry' sensehat.show_letter B '[0, 0, 255]' '[255, 255, 0]'
```

`salt.modules.sensehat.show_message`(*message*, *msg_type=None*, *text_color=None*, *back_color=None*, *scroll_speed=0.1*)

Displays a message on the LED matrix.

message The message to display

msg_type The type of the message. Changes the appearance of the message.

Available types are:

```
error:      red text
warning:    orange text
success:    green text
info:       blue text
```

scroll_speed The speed at which the message moves over the LED matrix. This value represents the time paused for between shifting the text to the left by one column of pixels. Defaults to '0.1'.

text_color The color in which the message is shown. Defaults to '[255, 255, 255]' (white).

back_color The background color of the display. Defaults to '[0, 0, 0]' (black).

CLI Example:

```
salt 'raspberrry' sensehat.show_message 'Status ok'
salt 'raspberrry' sensehat.show_message 'Something went wrong' error
salt 'raspberrry' sensehat.show_message 'Red' text_color='[255, 0, 0]'
salt 'raspberrry' sensehat.show_message 'Hello world' None '[0, 0, 255]' '[255,
↪255, 0]' 0.2
```

20.9.360 salt.modules.sensors

Read lm-sensors

New in version 2014.1.3.

`salt.modules.sensors.sense`(*chip*, *fahrenheit=False*)

Gather lm-sensors data from a given chip

To determine the chip to query, use the 'sensors' command and see the leading line in the block.

Example:

```
/usr/bin/sensors
```

coretemp-isa-0000 Adapter: ISA adapter Physical id 0: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 0: +52.0°C (high = +87.0°C, crit = +105.0°C) Core 1: +50.0°C (high = +87.0°C, crit = +105.0°C) Core 2: +56.0°C (high = +87.0°C, crit = +105.0°C) Core 3: +53.0°C (high = +87.0°C, crit = +105.0°C)

Given the above, the chip is 'coretemp-isa-0000'.

20.9.361 salt.modules.serverdensity_device

Wrapper around Server Density API

New in version 2014.7.0.

`salt.modules.serverdensity_device.create(name, **params)`
Function to create device in Server Density. For more info, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.create lama
salt '*' serverdensity_device.create rich_lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.delete(device_id)`
Delete a device from Server Density. For more information, see the [API docs](#).

CLI Example:

```
salt '*' serverdensity_device.delete 51f7eafcdba4bb235e000ae4
```

`salt.modules.serverdensity_device.get_sd_auth(val, sd_auth_pillar_name='serverdensity')`
Returns requested Server Density authentication value from pillar.

CLI Example:

```
salt '*' serverdensity_device.get_sd_auth <val>
```

`salt.modules.serverdensity_device.install_agent(agent_key, agent_version=1)`
Function downloads Server Density installation agent, and installs sd-agent with agent_key. Optionally the agent_version would select the series to use (defaults on the v1 one).

CLI Example:

```
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498
salt '*' serverdensity_device.install_agent c2bbdd6689ff46282bdaa07555641498 2
```

`salt.modules.serverdensity_device.ls(**params)`

List devices in Server Density

Results will be filtered by any params passed to this function. For more information, see the [API docs](#) on [listing](#) and [searching](#).

CLI Example:

```
salt '*' serverdensity_device.ls
salt '*' serverdensity_device.ls name=lama
salt '*' serverdensity_device.ls name=lama group=lama_band installedRAM=32768
```

`salt.modules.serverdensity_device.update(device_id, **params)`
Updates device information in Server Density. For more information see the [API docs](#).

CLI Example:

```

salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=lama
↳group=lama_band
salt '*' serverdensity_device.update 51f7eafcdba4bb235e000ae4 name=better_lama
↳group=rock_lamas swapSpace=512

```

20.9.362 salt.modules.servicenow module

Module for execution of ServiceNow CI (configuration items)

New in version 2016.11.0.

depends servicenow_rest python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'servicenow' key by default, if defined.

For example:

```

servicenow:
  instance_name: ''
  username: ''
  password: ''

```

`salt.modules.servicenow.delete_record(table, sys_id)`

Delete an existing record

Parameters

- **table** (str) – The table name, e.g. sys_user
- **sys_id** (str) – The unique ID of the record

CLI Example:

```

salt myminion servicenow.delete_record sys_computer 2134566

```

`salt.modules.servicenow.non_structured_query(table, query=None, **kwargs)`

Run a non-structured (not a dict) query on a servicenow table. See http://wiki.servicenow.com/index.php?title=Encoded_Query_Strings#gsc.tab=0 for help on constructing a non-structured query string.

Parameters

- **table** (str) – The table name, e.g. sys_user
- **query** (str) – The query to run (or use keyword arguments to filter data)

CLI Example:

```

salt myminion servicenow.non_structured_query sys_computer 'role=web'
salt myminion servicenow.non_structured_query sys_computer role=web type=computer

```

`salt.modules.servicenow.set_change_request_state(change_id, state='approved')`

Set the approval state of a change request/record

Parameters

- **change_id** (str) – The ID of the change request, e.g. CHG123545
- **state** (str) – The target state, e.g. approved

CLI Example:

```

salt myminion servicenow.set_change_request_state CHG000123 declined
salt myminion servicenow.set_change_request_state CHG000123 approved

```

`salt.modules.servicenow.update_record_field(table, sys_id, field, value)`

Update the value of a record's field in a servicenow table

Parameters

- **table** (str) – The table name, e.g. sys_user
- **sys_id** (str) – The unique ID of the record
- **field** (str) – The new value
- **value** (str) – The new value

CLI Example:

```
salt myminion servicenow.update_record_field sys_user 2348234 first_name jimmy
```

20.9.363 salt.modules.slack_notify

Module for sending messages to Slack

New in version 2015.5.0.

configuration This module can be used by either passing an api key and version directly or by specifying both in a configuration profile in the salt master/minion config.

For example:

```
slack:
  api_key: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.call_hook` (*message*, *attachment=None*, *color='good'*, *short=False*, *identifier=None*, *channel=None*, *username=None*, *icon_emoji=None*)

Send message to Slack incoming webhook.

Parameters

- **message** – The topic of message.
- **attachment** – The message to send to the Slack WebHook.
- **color** – The color of border of left side
- **short** – An optional flag indicating whether the value is short enough to be displayed side-by-side with other values.
- **identifier** – The identifier of WebHook.
- **channel** – The channel to use instead of the WebHook default.
- **username** – Username to use instead of WebHook default.
- **icon_emoji** – Icon to use instead of WebHook default.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.call_hook message='Hello, from SaltStack'
```

`salt.modules.slack_notify.find_room` (*name*, *api_key=None*)

Find a room by name and return it.

Parameters

- **name** – The room name.
- **api_key** – The Slack admin api key.

Returns The room object.

CLI Example:

```
salt '*' slack.find_room name="random"
salt '*' slack.find_room name="random" api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.find_user` (*name*, *api_key=None*)

Find a user by name and return it.

Parameters

- **name** – The user name.
- **api_key** – The Slack admin api key.

Returns The user object.

CLI Example:

```
salt '*' slack.find_user name="ThomasHatch"

salt '*' slack.find_user name="ThomasHatch" api_
↳key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_rooms(api_key=None)`

List all Slack rooms.

Parameters **api_key** – The Slack admin api key.

Returns The room list.

CLI Example:

```
salt '*' slack.list_rooms

salt '*' slack.list_rooms api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.list_users(api_key=None)`

List all Slack users.

Parameters **api_key** – The Slack admin api key.

Returns The user list.

CLI Example:

```
salt '*' slack.list_users

salt '*' slack.list_users api_key=peWcBiMOS9HrZG15peWcBiMOS9HrZG15
```

`salt.modules.slack_notify.post_message(channel, message, from_name, api_key=None, icon=None)`

Send a message to a Slack channel.

Parameters

- **channel** – The channel name, either will work.
- **message** – The message to send to the Slack channel.
- **from_name** – Specify who the message is from.
- **api_key** – The Slack api key, if not specified in the configuration.
- **icon** – URL to an image to use as the icon for this message

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' slack.post_message channel="Development Room" message="Build is done"
↳from_name="Build Server"
```

20.9.364 salt.modules.slsutil

Utility functions for use with or in SLS files

`salt.modules.slsutil.deserialize(serializer, stream_or_string, **mod_kwargs)`

Deserialize a Python object using a `serializer` module

CLI Example:

```
salt '*' slsutil.deserialize 'json' '{"foo": "Foo!"}'
salt '*' --no-parse=stream_or_string slsutil.deserialize 'json' \
    stream_or_string='{"foo": "Foo!"}'
```

Jinja Example:

```
{% set python_object = salt.slsutil.deserialize('json',
    '{"foo": "Foo!"}') %}
```

`salt.modules.slsutil.merge(obj_a, obj_b, strategy='smart', renderer='yaml', merge_lists=False)`
Merge a data structure into another by choosing a merge strategy

Strategies:

- aggregate
- list
- overwrite
- recurse
- smart

CLI Example:

```
salt '*' slsutil.merge '{foo: Foo}' '{bar: Bar}'
```

`salt.modules.slsutil.renderer(path=None, string=None, default_renderer='jinja|yaml', **kwargs)`
Parse a string or file through Salt's renderer system

Changed in version 2018.3.0: Add support for Salt fileserver URIs.

This is an open-ended function and can be used for a variety of tasks. It makes use of Salt's "renderer pipes" system to run a string or file through a pipe of any of the loaded renderer modules.

Parameters

- **path** – The path to a file on Salt's fileserver (any URIs supported by `cp.get_url`) or on the local file system.
- **string** – An inline string to be used as the file to send through the renderer system. Note, not all renderer modules can work with strings; the 'py' renderer requires a file, for example.
- **default_renderer** – The renderer pipe to send the file through; this is overridden by a "she-bang" at the top of the file.
- **kwargs** – Keyword args to pass to Salt's `compile_template()` function.

Keep in mind the goal of each renderer when choosing a render-pipe; for example, the Jinja renderer processes a text file and produces a string, however the YAML renderer processes a text file and produces a data structure.

One possible use is to allow writing "map files", as are commonly seen in Salt formulas, but without tying the renderer of the map file to the renderer used in the other sls files. In other words, a map file could use the Python renderer and still be included and used by an sls file that uses the default 'jinja|yaml' renderer.

For example, the two following map files produce identical results but one is written using the normal 'jinja|yaml' and the other is using 'py':

```
#!jinja|yaml
{% set apache = salt.grains.filter_by({
    ...normal jinja map file here...
}), merge=salt.pillar.get('apache:lookup')) %}
{{ apache | yaml() }}
```

```
#!py
def run():
```

(continues on next page)

(continued from previous page)

```

apache = __salt__.grains.filter_by({
    ...normal map here but as a python dict...
}), merge=__salt__.pillar.get('apache:lookup'))
return apache

```

Regardless of which of the above map files is used, it can be accessed from any other sls file by calling this function. The following is a usage example in Jinja:

```
{% set apache = salt.slsutil.renderer('map.sls') %}
```

CLI Example:

```

salt '*' slsutil.renderer salt://path/to/file
salt '*' slsutil.renderer /path/to/file
salt '*' slsutil.renderer /path/to/file.jinja 'jinja'
salt '*' slsutil.renderer /path/to/file.sls 'jinja|yaml'
salt '*' slsutil.renderer string='Inline template! {{ saltenv }}'
salt '*' slsutil.renderer string='Hello, {{ name }}.' name='world'

```

`salt.modules.slsutil.serialize(serializer, obj, **mod_kwargs)`

Serialize a Python object using a `serializer` module

CLI Example:

```
salt '*' --no-parse=obj slsutil.serialize 'json' obj="{ 'foo': 'Foo!' }
```

Jinja Example:

```
{% set json_string = salt.slsutil.serialize('json',
    { 'foo': 'Foo!' }) %}
```

`salt.modules.slsutil.update(dest, upd, recursive_update=True, merge_lists=False)`

Merge `upd` recursively into `dest`

If `merge_lists=True`, will aggregate list object types instead of replacing. This behavior is only activated when `recursive_update=True`.

CLI Example:

```
salt '*' slsutil.update '{foo: Foo}' '{bar: Bar}'
```

20.9.365 salt.modules.smartos_imgadm

Module for running `imgadm` command on SmartOS

`salt.modules.smartos_imgadm.avail(search=None, verbose=False)`

Return a list of available images

`search` [string] search keyword

`verbose` [boolean (False)] toggle verbose output

CLI Example:

```

salt '*' imgadm.avail [percona]
salt '*' imgadm.avail verbose=True

```

`salt.modules.smartos_imgadm.delete(uid)`

Remove an installed image

uuid [string] Specifies uuid to import
CLI Example:

```
salt '*' imgadm.delete e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.get(uuid)

Return info on an installed image

uuid [string] uuid of image

CLI Example:

```
salt '*' imgadm.get e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.import_image(uuid, verbose=False)

Import an image from the repository

uuid [string] uuid to import

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.import e42f8c84-bbea-11e2-b920-078fab2aab1f [verbose=True]
```

salt.modules.smartos_imgadm.list_installed(verbose=False)

Return a list of installed images

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.list [verbose=True]
```

salt.modules.smartos_imgadm.show(uuid)

Show manifest of a given image

uuid [string] uuid of image

CLI Example:

```
salt '*' imgadm.show e42f8c84-bbea-11e2-b920-078fab2aab1f
```

salt.modules.smartos_imgadm.update_installed(uuid="")

Gather info on unknown image(s) (locally installed)

uuid [string] optional uuid of image

CLI Example:

```
salt '*' imgadm.update [uuid]
```

salt.modules.smartos_imgadm.vacuum(verbose=False)

Remove unused images

verbose [boolean (False)] toggle verbose output

CLI Example:

```
salt '*' imgadm.vacuum [verbose=True]
```

salt.modules.smartos_imgadm.version()

Return imgadm version

CLI Example:

```
salt '*' imgadm.version
```

20.9.366 salt.modules.smartos_nictagadm module

Module for running nictagadm command on SmartOS :maintainer: Jorge Schrauwen <sjorge@blackdot.be> :maturity: new :depends: nictagadm binary, dladm binary :platform: smartos

..versionadded:: 2016.11.0

salt.modules.smartos_nictagadm.add(*name, mac, mtu=1500*)

Add a new nictag

name [string] name of new nictag

mac [string] mac of parent interface or 'etherstub' to create a ether stub

mtu [int] MTU (ignored for etherstubs)

CLI Example:

```
salt '*' nictagadm.add storage0 etherstub
salt '*' nictagadm.add trunk0 'DE:AD:00:00:BE:EF' 9000
```

salt.modules.smartos_nictagadm.delete(*name, force=False*)

Delete nictag

name [string] nictag to delete

force [boolean] force delete even if vms attached

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.exists(**nictag, **kwargs*)

Check if nictags exists

nictag [string] one or more nictags to check

verbose [boolean] return list of nictags

CLI Example:

```
salt '*' nictagadm.exists admin
```

salt.modules.smartos_nictagadm.list_nictags(*include_etherstubs=True*)

List all nictags

include_etherstubs [boolean] toggle include of etherstubs

CLI Example:

```
salt '*' nictagadm.list
```

salt.modules.smartos_nictagadm.update(*name, mac=None, mtu=None*)

Update a nictag

name [string] name of nictag

mac [string] optional new mac for nictag

mtu [int] optional new MTU for nictag

CLI Example:

```
salt '*' nictagadm.update trunk mtu=9000
```

salt.modules.smartos_nictagadm.vms(*nictag*)

List all vms connect to nictag

nictag [string] name of nictag

CLI Example:

```
salt '*' nictagadm.vms admin
```

20.9.367 salt.modules.smartos_virt

virt compatibility module for managing VMs on SmartOS

`salt.modules.smartos_virt.get_macs(domain)`
Return a list off MAC addresses from the named VM

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.smartos_virt.init(**kwargs)`
Initialize a new VM

CLI Example:

```
salt '*' virt.init image_uuid='...' alias='...' [...]
```

`salt.modules.smartos_virt.list_active_vms()`
Return a list of uuids for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

`salt.modules.smartos_virt.list_domains()`
Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.smartos_virt.list_inactive_vms()`
Return a list of uuids for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

`salt.modules.smartos_virt.reboot(domain)`
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.smartos_virt.setmem(domain, memory)`
Change the amount of memory allocated to VM. <memory> is to be specified in MB.

Note for KVM : this would require a restart of the VM.

CLI Example:

```
salt '*' virt.setmem <domain> 512
```

`salt.modules.smartos_virt.shutdown(domain)`
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.smartos_virt.start(domain)`

Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.smartos_virt.stop(domain)`

Hard power down the virtual machine, this is equivalent to powering off the hardware.

CLI Example:

```
salt '*' virt.destroy <domain>
```

`salt.modules.smartos_virt.vm_info(domain)`

Return a dict with information about the specified VM on this CN

CLI Example:

```
salt '*' virt.vm_info <domain>
```

`salt.modules.smartos_virt.vm_virt_type(domain)`

Return VM virtualization type : OS or KVM

CLI Example:

```
salt '*' virt.vm_virt_type <domain>
```

20.9.368 salt.modules.smartos_vmadm

Module for running vmadm command on SmartOS

`salt.modules.smartos_vmadm.create(from_file=None, **kwargs)`

Create a new vm

from_file [string] json file to create the vm from – if present, all other options will be ignored

kwargs [string|int|...] options to set for the vm

CLI Example:

```
salt '*' vmadm.create from_file=/tmp/new_vm.json
salt '*' vmadm.create image_uuid='...' alias='...' nics='[{"nic_tag": "admin",
↳ "ip": "198.51.100.123", ...}, {...}]' [...]
```

`salt.modules.smartos_vmadm.create_snapshot(vm, name, key='uuid')`

Create snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.create_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.create_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.delete`(*vm*, *key*='uuid')

Delete a vm

vm [string] vm to be deleted

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.delete nacl key=alias
```

`salt.modules.smartos_vmadm.delete_snapshot`(*vm*, *name*, *key*='uuid')

Delete snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_.:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.delete_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.delete_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.get`(*vm*, *key*='uuid')

Output the JSON object describing a VM

vm [string] vm to be targeted

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.get 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.get nacl key=alias
```

`salt.modules.smartos_vmadm.info`(*vm*, *info_type*='all', *key*='uuid')

Lookup info on running kvm

vm [string] vm to be targeted

info_type [string [all|block|blockstats|chardev|cpus|kvm|pci|spice|version|vnc]] info type to return

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.info 186da9ab-7392-4f55-91a5-b8f1fe770543 vnc
salt '*' vmadm.info nacl key=alias
salt '*' vmadm.info nacl vnc key=alias
```

`salt.modules.smartos_vmadm.list_vms`(*search*=None, *sort*=None, *order*='uuid', *type*, *ram*, *state*, *alias*', *keyed*=True)

Return a list of VMs

search [string] vmadm filter property

sort [string] vmadm sort (-s) property

order [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias

keyed [boolean]

specified if the output should be an array (False) or dict (True) For a dict the key is the first item from the order parameter. Note: If key is not unique last vm wins.

CLI Example:

```
salt '*' vmadm.list
salt '*' vmadm.list order=alias,ram,cpu_cap sort=-ram,-cpu_cap
salt '*' vmadm.list search='type=KVM'
```

`salt.modules.smartos_vmadm.lookup` (*search=None, order=None, one=False*)

Return a list of VMs using lookup

search [string] vmadm filter property

order [string] vmadm order (-o) property – Default: uuid,type,ram,state,alias

one [boolean] return only one result (vmadm's -1)

CLI Example:

```
salt '*' vmadm.lookup search='state=running'
salt '*' vmadm.lookup search='state=running' order=uuid,alias,hostname
salt '*' vmadm.lookup search='alias=nacl' one=True
```

`salt.modules.smartos_vmadm.reboot` (*vm, force=False, key='uuid'*)

Reboot a vm

vm [string] vm to be rebooted

force [boolean] force reboot of vm if true

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.reboot 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.reboot vm=nacl key=alias
salt '*' vmadm.reboot vm=nina.example.org key=hostname
```

`salt.modules.smartos_vmadm.receive` (*uuid, source*)

Receive a vm from a directory

uuid [string] uuid of vm to be received

source [string] source directory

CLI Example:

```
salt '*' vmadm.receive 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
```

`salt.modules.smartos_vmadm.reprovision` (*vm, image, key='uuid'*)

Reprovision a vm

vm [string] vm to be reprovisioned

image [string] uuid of new image

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.reprovision 186da9ab-7392-4f55-91a5-b8f1fe770543 c02a2044-c1bd-
->11e4-bd8c-dfc1db8b0182
salt '*' vmadm.reprovision nacl c02a2044-c1bd-11e4-bd8c-dfc1db8b0182 key=alias
```

`salt.modules.smartos_vmadm.rollback_snapshot` (*vm, name, key='uuid'*)

Rollback snapshot of a vm

vm [string] vm to be targeted

name [string]

snapshot name The snapname must be 64 characters or less and must only contain alphanumeric characters and characters in the set [-_:%] to comply with ZFS restrictions.

key [string [uuid|alias|hostname]] value type of 'vm' parameter

CLI Example:

```
salt '*' vmadm.rollback_snapshot 186da9ab-7392-4f55-91a5-b8f1fe770543 baseline
salt '*' vmadm.rollback_snapshot nacl baseline key=alias
```

`salt.modules.smartos_vmadm.send` (*vm, target, key='uuid'*)

Send a vm to a directory

vm [string] vm to be sent
target [string] target directory
key [string [uuid|alias|hostname]] value type of 'vm' parameter
 CLI Example:

```
salt '*' vmadm.send 186da9ab-7392-4f55-91a5-b8f1fe770543 /opt/backups
salt '*' vmadm.send vm=nacl target=/opt/backups key=alias
```

salt.modules.smartos_vmadm.start(*vm, options=None, key='uuid'*)

Start a vm
vm [string] vm to be started
options [string] optional additional options
key [string [uuid|alias|hostname]] value type of 'vm' parameter
 CLI Example:

```
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.start 186da9ab-7392-4f55-91a5-b8f1fe770543 'order=c,once=d cdrom=
↳path/to/image.iso,ide'
salt '*' vmadm.start vm=nacl key=alias
salt '*' vmadm.start vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.stop(*vm, force=False, key='uuid'*)

Stop a vm
vm [string] vm to be stopped
force [boolean] force stop of vm if true
key [string [uuid|alias|hostname]] value type of 'vm' parameter
 CLI Example:

```
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543
salt '*' vmadm.stop 186da9ab-7392-4f55-91a5-b8f1fe770543 True
salt '*' vmadm.stop vm=nacl key=alias
salt '*' vmadm.stop vm=nina.example.org key=hostname
```

salt.modules.smartos_vmadm.sysrq(*vm, action='nmi', key='uuid'*)

Send non-maskable interrupt to vm or capture a screenshot
vm [string] vm to be targeted
action [string] nmi or screenshot - Default: nmi
key [string [uuid|alias|hostname]] value type of 'vm' parameter
 CLI Example:

```
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 nmi
salt '*' vmadm.sysrq 186da9ab-7392-4f55-91a5-b8f1fe770543 screenshot
salt '*' vmadm.sysrq nacl nmi key=alias
```

salt.modules.smartos_vmadm.update(*vm, from_file=None, key='uuid', **kwargs*)

Update a new vm
vm [string] vm to be updated
from_file [string] json file to update the vm with - if present, all other options will be ignored
key [string [uuid|alias|hostname]] value type of 'vm' parameter
kwargs [string|int|...] options to update for the vm
 CLI Example:

```
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 from_file=/tmp/new_
↳vm.json
salt '*' vmadm.update vm=nacl key=alias from_file=/tmp/new_vm.json
salt '*' vmadm.update vm=186da9ab-7392-4f55-91a5-b8f1fe770543 max_physical_
↳memory=1024
```

(continues on next page)

(continued from previous page)

20.9.369 salt.modules.smbios

Interface to SMBIOS/DMI

(Parsing through dmidecode)

External References

Desktop Management Interface (DMI)

System Management BIOS

Dmidecode

`salt.modules.smbios.get` (*string*, *clean=True*)

Get an individual DMI string from SMBIOS info

string

The string to fetch. Dmidecode supports:

- bios-vendor
- bios-version
- bios-release-date
- system-manufacturer
- system-product-name
- system-version
- system-serial-number
- system-uuid
- baseboard-manufacturer
- baseboard-product-name
- baseboard-version
- baseboard-serial-number
- baseboard-asset-tag
- chassis-manufacturer
- chassis-type
- chassis-version
- chassis-serial-number
- chassis-asset-tag
- processor-family
- processor-manufacturer
- processor-version
- processor-frequency

clean

Don't return well-known false information

(invalid UUID's, serial 000000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.get system-uuid clean=False
```

`salt.modules.smbios.records` (*rec_type=None*, *fields=None*, *clean=True*)

Return DMI records from SMBIOS

type Return only records of type(s) The SMBIOS specification defines the following DMI types:

Type	Information
0	BIOS
1	System
2	Baseboard
3	Chassis
4	Processor
5	Memory Controller
6	Memory Module
7	Cache
8	Port Connector
9	System Slots
10	On Board Devices
11	OEM Strings
12	System Configuration Options
13	BIOS Language
14	Group Associations
15	System Event Log
16	Physical Memory Array
17	Memory Device
18	32-bit Memory Error
19	Memory Array Mapped Address
20	Memory Device Mapped Address
21	Built-in Pointing Device
22	Portable Battery
23	System Reset
24	Hardware Security
25	System Power Controls
26	Voltage Probe
27	Cooling Device
28	Temperature Probe
29	Electrical Current Probe
30	Out-of-band Remote Access
31	Boot Integrity Services
32	System Boot
33	64-bit Memory Error
34	Management Device
35	Management Device Component
36	Management Device Threshold Data
37	Memory Channel
38	IPMI Device
39	Power Supply
40	Additional Information
41	Onboard Devices Extended Information
42	Management Controller Host Interface

clean

Don't return well-known false information
(invalid UUID's, serial 00000000's, etcetera)

Defaults to True

CLI Example:

```
salt '*' smbios.records clean=False
salt '*' smbios.records 14
salt '*' smbios.records 4 core_count,thread_count,current_speed
```

20.9.370 salt.modules.smf

Service support for Solaris 10 and 11, should work with other systems that use SMF also. (e.g. SmartOS)

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

salt.modules.smf.available(name)

Returns True if the specified service is available, otherwise returns False.

We look up the name with the svcs command to get back the FMRI This allows users to use simpler service names

CLI Example:

```
salt '*' service.available net-snmp
```

salt.modules.smf.disable(name, **kwargs)

Disable the named service to start at boot

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.smf.disabled(name)

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.smf.enable(name, **kwargs)

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

salt.modules.smf.enabled(name, **kwargs)

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

salt.modules.smf.get_all()

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.smf.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.smf.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.smf.get_running()`

Return the running services

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.smf.get_stopped()`

Return the stopped services

CLI Example:

```
salt '*' service.get_stopped
```

`salt.modules.smf.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing net-snmp
```

`salt.modules.smf.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.smf.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.smf.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.smf.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.smf.stop`(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

20.9.371 salt.modules.smtp

Module for Sending Messages via SMTP

New in version 2014.7.0.

depends

- smtplib python module

configuration This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass

another-smtp-login:
  smtp.server: smtp.domain.com
  smtp.tls: True
  smtp.sender: admin@domain.com
  smtp.username: myuser
  smtp.password: verybadpass
```

`salt.modules.smtp.send_msg`(*recipient*, *message*, *subject*='Message from Salt', *sender*=None, *server*=None, *use_ssl*='True', *username*=None, *password*=None, *profile*=None)

Send a message to an SMTP recipient. Designed for use in states.

CLI Examples:

```
smtp.send_msg 'admin@example.com' 'This is a salt module test'
↪profile='my-smtp-account'
smtp.send_msg 'admin@example.com' 'This is a salt module test'
↪username='myuser' password='verybadpass' sender="admin@example.com"
↪server='smtp.domain.com'
```

20.9.372 salt.modules.solaris_fmadm

Module for running `fmadm` and `fmdump` on Solaris

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform solaris,illumos

New in version 2016.3.0.

`salt.modules.solaris_fmadm.acquit`(*fmri*)

Acquit resource or acquit case

fmri: string fmri or uuid

CLI Example:

```
salt '*' fmadm.acquit fmri | uuid
```

`salt.modules.solaris_fmadm.config`()

Display fault manager configuration

CLI Example:

```
salt '*' fmadm.config
```

`salt.modules.solaris_fmadm.faulty`()

Display list of faulty resources

CLI Example:

```
salt '*' fmadm.faulty
```

`salt.modules.solaris_fmadm.flush`(*fmri*)

Flush cached state for resource

fmri: string fmri

CLI Example:

```
salt '*' fmadm.flush fmri
```

`salt.modules.solaris_fmadm.healthy`()

Return whether `fmadm` is reporting faults

CLI Example:

```
salt '*' fmadm.healthy
```

`salt.modules.solaris_fmadm.list_records` (*after=None, before=None*)

Display fault management logs

after [string] filter events after time, see man fmdump for format

before [string] filter events before time, see man fmdump for format

CLI Example:

```
salt '*' fmadm.list
```

`salt.modules.solaris_fmadm.load` (*path*)

Load specified fault manager module

path: string path of fault manager module

CLI Example:

```
salt '*' fmadm.load /module/path
```

`salt.modules.solaris_fmadm.repaired` (*fmri*)

Notify fault manager that resource has been repaired

fmri: string fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.replaced` (*fmri*)

Notify fault manager that resource has been replaced

fmri: string fmri

CLI Example:

```
salt '*' fmadm.repaired fmri
```

`salt.modules.solaris_fmadm.reset` (*module, serd=None*)

Reset module or sub-component

module: string module to unload

serd [string] serd sub module

CLI Example:

```
salt '*' fmadm.reset software-response
```

`salt.modules.solaris_fmadm.show` (*uuid*)

Display log details

uuid: string uuid of fault

CLI Example:

```
salt '*' fmadm.show 11b4070f-4358-62fa-9e1e-998f485977e1
```

`salt.modules.solaris_fmadm.unload` (*module*)

Unload specified fault manager module

module: string module to unload

CLI Example:

```
salt '*' fmadm.unload software-response
```

20.9.373 salt.modules.solaris_group

Manage groups on Solaris

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.solaris_group.add(name, gid=None, **kwargs)`
Add the specified group

CLI Example:

```
salt '*' group.add foo 3456
```

`salt.modules.solaris_group.chgid(name, gid)`
Change the gid for a named group

CLI Example:

```
salt '*' group.chgid foo 4376
```

`salt.modules.solaris_group.delete(name)`
Remove the named group

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.solaris_group.getent(refresh=False)`
Return info on all groups

CLI Example:

```
salt '*' group.getent
```

`salt.modules.solaris_group.info(name)`
Return information about a group

CLI Example:

```
salt '*' group.info foo
```

20.9.374 salt.modules.solaris_shadow

Manage the password database on Solaris systems

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

`salt.modules.solaris_shadow.default_hash()`
Returns the default hash used for unset passwords

CLI Example:

```
salt '*' shadow.default_hash
```

`salt.modules.solaris_shadow.del_password(name)`

New in version 2015.8.8.

Delete the password from name user

CLI Example:

```
salt '*' shadow.del_password username
```

`salt.modules.solaris_shadow.gen_password(password, crypt_salt=None, algorithm='sha512')`

New in version 2015.8.8.

Generate hashed password

Note: When called this function is called directly via remote-execution, the password argument may be displayed in the system's process list. This may be a security risk on certain systems.

password Plaintext password to be hashed.

crypt_salt Cryptographic salt. If not given, a random 8-character salt will be generated.

algorithm The following hash algorithms are supported:

- md5
- blowfish (not in mainline glibc, only available in distros that add it)
- sha256
- sha512 (default)

CLI Example:

```
salt '*' shadow.gen_password 'I_am_password'
salt '*' shadow.gen_password 'I_am_password' crypt_salt='I_am_salt'
↪algorithm=sha256
```

`salt.modules.solaris_shadow.info(name)`

Return information for the specified user

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.solaris_shadow.set_maxdays(name, maxdays)`

Set the maximum number of days during which a password is valid. See man passwd.

CLI Example:

```
salt '*' shadow.set_maxdays username 90
```

`salt.modules.solaris_shadow.set_mindays(name, mindays)`

Set the minimum number of days between password changes. See man passwd.

CLI Example:

```
salt '*' shadow.set_mindays username 7
```

`salt.modules.solaris_shadow.set_password(name, password)`

Set the password for a named user. The password must be a properly defined hash, the password hash can be generated with this command: `openssl passwd -1 <plaintext password>`

CLI Example:

```
salt '*' shadow.set_password root $1$UYCIxa628.9qXjpQCjM4a..
```

`salt.modules.solaris_shadow.set_warndays(name, warndays)`
Set the number of days of warning before a password change is required. See man passwd.

CLI Example:

```
salt '*' shadow.set_warndays username 7
```

20.9.375 salt.modules.solaris_system

Support for reboot, shutdown, etc

This module assumes we are using solaris-like shutdown

New in version 2016.3.0.

`salt.modules.solaris_system.halt()`
Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.solaris_system.init(state)`
Change the system runlevel on sysV compatible systems

CLI Example:

state [string] Init state

```
salt '*' system.init 3
```

`salt.modules.solaris_system.poweroff()`
Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.solaris_system.reboot(delay=0, message=None)`
Reboot the system
delay [int] Optional wait time in seconds before the system will be rebooted.
message [string] Optional message to broadcast before rebooting.
CLI Example:

```
salt '*' system.reboot
salt '*' system.reboot 60 "=== system upgraded ==="
```

`salt.modules.solaris_system.shutdown(delay=0, message=None)`
Shutdown a running system
delay [int] Optional wait time in seconds before the system will be shutdown.
message [string] Optional message to broadcast before rebooting.
CLI Example:

```
salt '*' system.shutdown
salt '*' system.shutdown 60 "=== disk replacement ==="
```

20.9.376 salt.modules.solaris_user

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

`salt.modules.solaris_user.add` (*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *fullname=""*, *roomnumber=""*, *workphone=""*, *home-phone=""*, *createhome=True*, ***kwargs*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.solaris_user.chfullname` (*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.solaris_user.chgid` (*name*, *gid*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.solaris_user.chgroups` (*name*, *groups*, *append=False*)

Change the groups to which a user belongs

name Username to modify

groups List of groups to set for the user. Can be passed as a comma-separated list or a Python list.

append [False] Set to True to append these groups to the user's existing list of groups. Otherwise, the specified groups will replace any existing groups for the user.

CLI Example:

```
salt '*' user.chgroups foo wheel,root True
```

`salt.modules.solaris_user.chhome` (*name*, *home*, *persist=False*)

Set a new home directory for an existing user

name Username to modify

home New home directory to set

persist [False] Set to True to prevent configuration files in the new home directory from being overwritten by the files from the skeleton directory.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.solaris_user.chhomephone` (*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo "7735551234"
```

`salt.modules.solaris_user.chroomnumber` (*name*, *roomnumber*)

Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.solaris_user.chshell` (*name*, *shell*)

Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.solaris_user.chuid` (*name*, *uid*)

Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.solaris_user.chworkphone` (*name*, *workphone*)

Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo "7735550123"
```

`salt.modules.solaris_user.delete` (*name*, *remove=False*, *force=False*)

Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.solaris_user.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.solaris_user.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.solaris_user.list_groups` (*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.solaris_user.list_users` ()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.solaris_user.rename`(*name*, *new_name*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

20.9.377 salt.modules.solarisips

IPS pkg support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to *'pkg.install' is not available*), see [here](#).

This module provides support for Solaris 11 new package management - IPS (Image Packaging System). This is the default pkg module for Solaris 11 (and later).

If you want to use also other packaging module (e.g. pkgutil) together with IPS, you need to override the pkg provider in sls for each package:

```
mypackage:
  pkg.installed:
    - provider: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

Or you can override it globally by setting the *providers* parameter in your Minion config file like this:

```
providers:
  pkg: pkgutil
```

`salt.modules.solarisips.available_version`(*name*, ***kwargs*)

This function is an alias of `latest_version`.

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

`salt.modules.solarisips.get_fmri`(*name*, ***kwargs*)

Returns FMRI from partial name. Returns empty string (") if not found. In case of multiple match, the function returns list of all matched packages.

CLI Example:

```
salt '*' pkg.get_fmri bash
```

`salt.modules.solarisips.install`(*name=None, refresh=False, pkgs=None, version=None, test=False, **kwargs*)

Install the named package using the IPS pkg command. Accepts full or partial FMRI.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Multiple Package Installation Options:

pkgs A list of packages to install. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install vim
salt '*' pkg.install pkg://solaris/editor/vim
salt '*' pkg.install pkg://solaris/editor/vim refresh=True
salt '*' pkg.install pkgs=['foo', 'bar']
```

`salt.modules.solarisips.is_installed`(*name, **kwargs*)

Returns True if the package is installed. Otherwise returns False. Name can be full or partial FMRI. In case of multiple match from partial FMRI name, it returns True.

CLI Example:

```
salt '*' pkg.is_installed bash
```

`salt.modules.solarisips.latest_version`(*name, **kwargs*)

The available version of the package in the repository. In case of multiple matches, it returns list of all matched packages. Accepts full or partial FMRI. Please use `pkg.latest_version` as `pkg.available_version` is being deprecated.

CLI Example:

```
salt '*' pkg.latest_version pkg://solaris/entire
```

`salt.modules.solarisips.list_pkgs`(*versions_as_list=False, **kwargs*)

List the currently installed packages as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarisips.list_upgrades`(*refresh=True, **kwargs*)

Lists all packages available for update.

When run in global zone, it reports only upgradable packages for the global zone.

When run in non-global zone, it can report more upgradable packages than `pkg update -vn`, because `pkg update` hides packages that require newer version of `pkg://solaris/entire` (which means that they can be upgraded only from the global zone). If `pkg://solaris/entire` is found in the list of upgrades, then the global zone should be updated to get all possible updates. Use `refresh=True` to refresh the package database.

refresh [True] Runs a full package database refresh before listing. Set to `False` to disable running the refresh.

Changed in version 2017.7.0.

In previous versions of Salt, `refresh` defaulted to `False`. This was changed to default to `True` in the 2017.7.0 release to make the behavior more consistent with the other package modules, which all default to `True`.

CLI Example:

```
salt '*' pkg.list_upgrades
salt '*' pkg.list_upgrades refresh=False
```

`salt.modules.solarisips.normalize_name(name, **kwargs)`

Internal function. Normalizes pkg name to full FMRI before running `pkg.install`. In case of multiple matches or no match, it returns the name without modifications.

CLI Example:

```
salt '*' pkg.normalize_name vim
```

`salt.modules.solarisips.purge(name, **kwargs)`

Remove specified package. Accepts full or partial FMRI.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.purge <package name>
```

`salt.modules.solarisips.refresh_db(full=False)`

Updates the remote repos database.

`full` : False

Set to `True` to force a refresh of the pkg DB from all publishers, regardless of the last refresh time.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db full=True
```

`salt.modules.solarisips.remove(name=None, pkgs=None, **kwargs)`

Remove specified package. Accepts full or partial FMRI. In case of multiple match, the command fails and won't modify the OS.

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove tcsh
salt '*' pkg.remove pkg://solaris/shell/tcsh
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.solarisips.search(name, versions_as_list=False, **kwargs)`

Searches the repository for given pkg name. The name can be full or partial FMRI. All matches are printed. Globs are also supported.

CLI Example:

```
salt '*' pkg.search bash
```

`salt.modules.solarisips.upgrade`(*refresh=False*, ***kwargs*)

Upgrade all packages to the latest possible version. When run in global zone, it updates also all non-global zones. In non-global zones upgrade is limited by dependency constrains linked to the version of `pkg://solaris/entire`.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

When there is a failure, an explanation is also included in the error message, based on the return code of the `pkg update` command.

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.solarisips.upgrade_available`(*name*)

Check if there is an upgrade available for a certain package Accepts full or partial FMRI. Returns all matches found.

CLI Example:

```
salt '*' pkg.upgrade_available apache-22
```

`salt.modules.solarisips.version`(**names*, ***kwargs*)

Common interface for obtaining the version of installed packages. Accepts full or partial FMRI. If called using `pkg_resource`, full FMRI is required.

CLI Example:

```
salt '*' pkg.version vim
salt '*' pkg.version foo bar baz
salt '*' pkg_resource.version pkg://solaris/entire
```

20.9.378 salt.modules.solarispkg

Package support for Solaris

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

`salt.modules.solarispkg.install`(*name=None*, *sources=None*, *saltenv='base'*, ***kwargs*)

Install the passed package. Can install packages from the following sources:

- Locally (package already exists on the minion)
- HTTP/HTTPS server
- FTP server
- Salt master

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Examples:

```
# Installing a data stream pkg that already exists on the minion
salt '*' pkg.install sources='[{"<pkg name>": "/dir/on/minion/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-sol10-
↳sparc-local.pkg"}]'

# Installing a data stream pkg that exists on the salt master

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "salt://pkgs/gcc-3.4.6-sol10-sparc-
↳local.pkg"}]'
```

CLI Example:

```
# Installing a data stream pkg that exists on a HTTP server
salt '*' pkg.install sources='[{"<pkg name>": "http://packages.server.com/<pkg
↳filename>"}]'
salt '*' pkg.install sources='[{"SMClgcc346": "http://packages.server.com/gcc-3.4.
↳6-sol10-sparc-local.pkg"}]'
```

If working with solaris zones and you want to install a package only in the global zone you can pass 'current_zone_only=True' to salt to have the package only installed in the global zone. (Behind the scenes this is passing '-G' to the pkgadd command.) Solaris default when installing a package in the global zone is to install it in all zones. This overrides that and installs the package only in the global.

CLI Example:

```
# Installing a data stream package only in the global zone:
salt 'global_zone' pkg.install sources='[{"SMClgcc346": "/var/spool/pkg/gcc-3.4.6-
↳sol10-sparc-local.pkg"}]' current_zone_only=True
```

By default salt automatically provides an adminfile, to automate package installation, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

CLI Example:

```
# Overriding the 'instance' adminfile option when calling the module directly
salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↳instance="overwrite"
```

SLS Example:

```
# Overriding the 'instance' adminfile option when used in a state

SMClgcc346:
  pkg.installed:
    - sources:
      - SMClgcc346: salt://srv/salt/pkgs/gcc-3.4.6-sol10-sparc-local.pkg
    - instance: overwrite
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

CLI Example:

```
# Providing your own adminfile when calling the module directly

salt '*' pkg.install sources='[{"<pkg name>": "salt://pkgs/<pkg filename>"}]'
↪admin_source='salt://pkgs/<adminfile filename>'

# Providing your own adminfile when using states

<pkg name>:
  pkg.installed:
    - sources:
      - <pkg name>: salt://pkgs/<pkg filename>
    - admin_source: salt://pkgs/<adminfile filename>
```

Note: The ID declaration is ignored, as the package name is read from the `sources` parameter.

`salt.modules.solarispkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

NOTE: As package repositories are not presently supported for Solaris pkgadd, this function will always return an empty string for a given package.

`salt.modules.solarispkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.solarispkg.purge(name=None, pkgs=None, **kwargs)`

Package purges are not supported, this function is identical to `remove()`.

name The name of the package to be deleted

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs=['foo', 'bar']
```

`salt.modules.solarispkg.remove`(*name=None, pkgs=None, saltenv='base', **kwargs*)

Remove packages with pkgrm

name The name of the package to be deleted

By default salt automatically provides an adminfile, to automate package removal, with these options set:

```
email=
instance=quit
partial=nocheck
runlevel=nocheck
idepend=nocheck
rdepend=nocheck
space=nocheck
setuid=nocheck
conflict=nocheck
action=nocheck
basedir=default
```

You can override any of these options in two ways. First you can optionally pass any of the options as a kwarg to the module/state to override the default value or you can optionally pass the 'admin_source' option providing your own adminfile to the minions.

Note: You can find all of the possible options to provide to the adminfile by reading the admin man page:

```
man -s 4 admin
```

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove SUNWgit
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.solarispkg.upgrade_available`(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.solarispkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

20.9.379 salt.modules.solr

Apache Solr Salt Module

Author: Jed Glazner Version: 0.2.1 Modified: 12/09/2011

This module uses HTTP requests to talk to the apache solr request handlers to gather information and report errors. Because of this the minion doesn't necessarily need to reside on the actual slave. However if you want to use the signal function the minion must reside on the physical solr host.

This module supports multi-core and standard setups. Certain methods are master/slave specific. Make sure you set the solr.type. If you have questions or want a feature request please ask.

Coming Features in 0.3

1. Add command for checking for replication failures on slaves
2. Improve match_index_versions since it's pointless on busy solr masters
3. Add additional local fs checks for backups to make sure they succeeded

Override these in the minion config

solr.cores A list of core names e.g. ['core1','core2']. An empty list indicates non-multicore setup.

solr.baseurl The root level URL to access solr via HTTP

solr.request_timeout The number of seconds before timing out an HTTP/HTTPS/FTP request. If nothing is specified then the python global timeout setting is used.

solr.type Possible values are 'master' or 'slave'

solr.backup_path The path to store your backups. If you are using cores and you can specify to append the core name to the path in the backup method.

solr.num_backups For versions of solr >= 3.5. Indicates the number of backups to keep. This option is ignored if your version is less.

solr.init_script The full path to your init script with start/stop options

solr.dih.options A list of options to pass to the DIH.

Required Options for DIH

clean [False] Clear the index before importing

commit [True] Commit the documents to the index upon completion

optimize [True] Optimize the index after commit is complete

verbose [True] Get verbose output

`salt.modules.solr.abort_import` (*handler, host=None, core_name=None, verbose=False*)

MASTER ONLY Aborts an existing import command to the specified handler. This command can only be run if the minion is configured with `solr.type=master`

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.abort_import dataimport None music {'clean':True}
```

`salt.modules.solr.backup` (*host=None, core_name=None, append_core_to_path=False*)

Tell solr make a backup. This method can be mis-leading since it uses the backup API. If an error happens during the backup you are not notified. The status: 'OK' in the response simply means that solr received the request successfully.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

append_core_to_path [boolean (False)] If True add the name of the core to the backup path. Assumes that minion backup path is not None.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.backup music
```

`salt.modules.solr.core_status` (*host=None, core_name=None*)

MULTI-CORE HOSTS ONLY Get the status for a given core or all cores if no core is specified

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.core_status None music
```

`salt.modules.solr.delta_import` (*handler, host=None, core_name=None, options=None, extra=None*)

Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

options [dict (`__opts__`)] A list of options such as `clean`, `optimize commit`, `verbose`, and `pause_replication`. leave blank to use `__opts__` defaults. options will be merged with `__opts__`

extra [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.delta_import dataimport None music {'clean':True}
```

salt.modules.solr.full_import(*handler, host=None, core_name=None, options=None, extra=None*)
 MASTER ONLY Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type=master`
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. `__opts__['host']` is default.
core [str (None)] The core the handler belongs to.
options [dict (`__opts__`)] A list of options such as `clean`, `optimize commit`, `verbose`, and `pause_replication`.
 leave blank to use `__opts__` defaults. options will be merged with `__opts__`
extra [dict ({})] Extra name value pairs to pass to the handler. e.g. ["name=value"]
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.full_import dataimport None music {'clean':True}
```

salt.modules.solr.import_status(*handler, host=None, core_name=None, verbose=False*)
 Submits an import command to the specified handler using specified options. This command can only be run if the minion is configured with `solr.type: 'master'`
handler [str] The name of the data import handler.
host [str (None)] The solr host to query. `__opts__['host']` is default.
core [str (None)] The core the handler belongs to.
verbose [boolean (False)] Specifies verbose output
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.import_status dataimport None music False
```

salt.modules.solr.is_replication_enabled(*host=None, core_name=None*)
 SLAVE CALL Check for errors, and determine if a slave is replicating or not.
host [str (None)] The solr host to query. `__opts__['host']` is default.
core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.
 Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.is_replication_enabled music
```

salt.modules.solr.lucene_version(*core_name=None*)
 Gets the lucene version that solr is using. If you are running a multi-core setup you should specify a core name since all the cores run under the same servlet container, they will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return: dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.lucene_version
```

salt.modules.solr.match_index_versions (*host=None, core_name=None*)

SLAVE CALL Verifies that the master and the slave versions are in sync by comparing the index version. If you are constantly pushing updates the index the master and slave versions will seldom match. A solution to this is pause indexing every so often to allow the slave to replicate and then call this method before allowing indexing to resume.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.match_index_versions music
```

salt.modules.solr.optimize (*host=None, core_name=None*)

Search queries fast, but it is a very expensive operation. The ideal process is to run this with a master/slave configuration. Then you can optimize the master, and push the optimized index to the slaves. If you are running a single solr instance, or if you are going to run this on a slave be aware than search performance will be horrible while this command is being run. Additionally it can take a LONG time to run and your HTTP request may timeout. If that happens adjust your timeout settings.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.optimize music
```

salt.modules.solr.ping (*host=None, core_name=None*)

Does a health check on solr, makes sure solr can talk to the indexes.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.ping music
```

`salt.modules.solr.reload_core` (*host=None, core_name=None*)

MULTI-CORE HOSTS ONLY Load a new core from the same configuration as an existing registered core. While the "new" core is initializing, the "old" one will continue to accept requests. Once it has finished, all new request will go to the "new" core, and the "old" core will be unloaded.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str] The name of the core to reload

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_core None music
```

Return data is in the following format:

```
{'success':bool, 'data':dict, 'errors':list, 'warnings':list}
```

`salt.modules.solr.reload_import_config` (*handler, host=None, core_name=None, verbose=False*)

MASTER ONLY re-loads the handler config XML file. This command can only be run if the minion is a 'master' type

handler [str] The name of the data import handler.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core [str (None)] The core the handler belongs to.

verbose [boolean (False)] Run the command with verbose output.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.reload_import_config dataimport None music {'clean':True}
```

`salt.modules.solr.replication_details` (*host=None, core_name=None*)

Get the full replication details.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.replication_details music
```

`salt.modules.solr.set_is_polling` (*polling, host=None, core_name=None*)

SLAVE CALL Prevent the slaves from polling the master for updates.

polling [boolean] True will enable polling. False will disable it.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_is_polling False
```

salt.modules.solr.set_replication_enabled(*status, host=None, core_name=None*)

MASTER ONLY Sets the master to ignore poll requests from the slaves. Useful when you don't want the slaves replicating during indexing or when clearing the index.

status [boolean] Sets the replication status to the specified state.

host [str (None)] The solr host to query. `__opts__['host']` is default.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to set the status on all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.set_replication_enabled false, None, music
```

salt.modules.solr.signal(*signal=None*)

Signals Apache Solr to start, stop, or restart. Obviously this is only going to work if the minion resides on the solr host. Additionally Solr doesn't ship with an init script so one must be created.

signal [str (None)] The command to pass to the apache solr init valid values are 'start', 'stop', and 'restart'

CLI Example:

```
salt '*' solr.signal restart
```

salt.modules.solr.version(*core_name=None*)

Gets the solr version for the core specified. You should specify a core here as all the cores will run under the same servlet container and so will all have the same version.

core_name [str (None)] The name of the solr core if using cores. Leave this blank if you are not using cores or if you want to check all cores.

Return : dict<str,obj>:

```
{'success':boolean, 'data':dict, 'errors':list, 'warnings':list}
```

CLI Example:

```
salt '*' solr.version
```

20.9.380 salt.modules.solrcloud module

Module for solrcloud configuration

New in version 2017.7.0.

For now, module is limited to http-exposed API. It doesn't implement config upload via Solr zkCli

salt.modules.solrcloud.BOOL_PROPS_LIST = ['transient', 'loadOnStartup']

Collections options type definition Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-api1>

`salt.modules.solrcloud.DICT_OPTIONS_LIST = ['properties']`

Collection unmodifiable options Reference: <https://cwiki.apache.org/confluence/display/solr/Collections+API#CollectionsAPI-modifycoll>

`salt.modules.solrcloud.alias_exists(alias_name, **kwargs)`

Check alias existence

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_exists my_alias
```

`salt.modules.solrcloud.alias_get_collections(alias_name, **kwargs)`

Get collection list for an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_get my_alias
```

`salt.modules.solrcloud.alias_set_collections(alias_name, collections=None, **kwargs)`

Define an alias

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.alias_set my_alias collections=[collection1, collection2]
```

`salt.modules.solrcloud.cluster_status(**kwargs)`

Get cluster status

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.cluster_status
```

`salt.modules.solrcloud.collection_backup(collection_name, location, backup_name=None, **kwargs)`

Create a backup for a collection.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup collection_name /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_backup_all(location, backup_name=None, **kwargs)`

Create a backup for all collection present on the server.

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.core_backup /mnt/nfs_backup
```

`salt.modules.solrcloud.collection_check_options(options)`

Check collections options

CLI Example:

```
salt '*' solrcloud.collection_check_options '{"replicationFactor":4}'
```

`salt.modules.solrcloud.collection_create(collection_name, options=None, **kwargs)`

Create a collection,

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_create collection_name
```

Collection creation options may be passed using the "options" parameter. Do not include option "name" since it already specified by the mandatory parameter "collection_name"

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3}
```

Cores options may be passed using the "properties" key in options. Do not include property "name"

```
salt '*' solrcloud.collection_create collection_name options={"replicationFactor":2, "numShards":3, "properties":{"dataDir":"/srv/solr/hugePartitionSollection"}}
```

`salt.modules.solrcloud.collection_creation_options()`

Get collection option list that can only be defined at creation

CLI Example:

```
salt '*' solrcloud.collection_creation_options
```

`salt.modules.solrcloud.collection_exists(collection_name, **kwargs)`

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_exists collection_name
```

`salt.modules.solrcloud.collection_get_options(collection_name, **kwargs)`

Get collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_get_options collection_name
```

`salt.modules.solrcloud.collection_list(**kwargs)`

List all collections

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_list
```

`salt.modules.solrcloud.collection_reload(collection, **kwargs)`

Check if a collection exists

Additional parameters (kwargs) may be passed, they will be proxied to http.query

CLI Example:

```
salt '*' solrcloud.collection_reload collection_name
```

`salt.modules.solrcloud.collection_set_options`(*collection_name*, *options*, ***kwargs*)

Change collection options

Additional parameters (kwargs) may be passed, they will be proxied to http.query

Note that not every parameter can be changed after collection creation

CLI Example:

```
salt '*' solrcloud.collection_set_options collection_name options={
↪ "replicationFactor":4}
```

`salt.modules.solrcloud.log` = <SaltLoggingClass `salt.modules.solrcloud` (GARBAGE)>

Core properties type definition. Reference: <https://cwiki.apache.org/confluence/display/solr/Defining+core.properties>

20.9.381 salt.modules.splunk

Module for interop with the Splunk API

New in version 2016.3.0..

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

`salt.modules.splunk.create_user`(*email*, *profile='splunk'*, ***kwargs*)

create a splunk user by name/email

CLI Example:

```
salt myminion splunk.create_user user@example.com roles=['user'] realname="Test User"
name=testuser
```

`salt.modules.splunk.delete_user`(*email*, *profile='splunk'*)

Delete a splunk user by email

CLI Example:

```
salt myminion splunk_user.delete 'user@example.com'
```

`salt.modules.splunk.get_user`(*email*, *profile='splunk'*, ***kwargs*)

Get a splunk user by name/email

CLI Example:

```
salt myminion splunk.get_user 'user@example.com' user_details=false salt myminion
splunk.get_user 'user@example.com' user_details=true
```

`salt.modules.splunk.list_users(profile='splunk')`

List all users in the splunk DB

CLI Example:

```
salt myminion splunk.list_users
```

`salt.modules.splunk.update_user(email, profile='splunk', **kwargs)`

Create a splunk user by email

CLI Example:

```
salt myminion splunk.update_user example@domain.com roles=['user'] realname="Test User"
```

20.9.382 salt.modules.splunk_search

Module for interop with the Splunk API

New in version 2015.5.0.

depends

- splunk-sdk python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config. The module will use the 'splunk' key by default, if defined.

For example:

```
splunk:
  username: alice
  password: abc123
  host: example.splunkcloud.com
  port: 8080
```

`salt.modules.splunk_search.create(name, profile='splunk', **kwargs)`

Create a splunk search

CLI Example:

```
splunk_search.create 'my search name' search='error msg'
```

`salt.modules.splunk_search.delete(name, profile='splunk')`

Delete a splunk search

CLI Example:

```
splunk_search.delete 'my search name'
```

`salt.modules.splunk_search.get(name, profile='splunk')`

Get a splunk search

CLI Example:

```
splunk_search.get 'my search name'
```

`salt.modules.splunk_search.list_(profile='splunk')`

List splunk searches (names only)

CLI Example: `splunk_search.list`

`salt.modules.splunk_search.list_all(prefix=None, app=None, owner=None, description_contains=None, name_not_contains=None, profile='splunk')`

Get all splunk search details. Produces results that can be used to create an sls file.

if app or owner are specified, results will be limited to matching saved searches.

if `description_contains` is specified, results will be limited to those where "description_contains in description" is true if `name_not_contains` is specified, results will be limited to those where "name_not_contains not in name" is true.

If `prefix` parameter is given, alarm names in the output will be prepended with the prefix; alarms that have the prefix will be skipped. This can be used to convert existing alarms to be managed by salt, as follows:

CLI example:

1. **Make a "backup" of all existing searches** `$ salt-call splunk_search.list_all -out=txt | sed "s/local: //" > legacy_searches.sls`
2. **Get all searches with new prefixed names** `$ salt-call splunk_search.list_all "prefix=**MANAGED BY SALT**" -out=txt | sed "s/local: //" > managed_searches.sls`
3. **Insert the managed searches into splunk** `$ salt-call state.sls managed_searches.sls`
4. Manually verify that the new searches look right
5. Delete the original searches `$ sed s/present/absent/ legacy_searches.sls > remove_legacy_searches.sls $ salt-call state.sls remove_legacy_searches.sls`
6. Get all searches again, verify no changes `$ salt-call splunk_search.list_all -out=txt | sed "s/local: //" > final_searches.sls $ diff final_searches.sls managed_searches.sls`

`salt.modules.splunk_search.update` (*name*, *profile='splunk'*, ***kwargs*)
Update a splunk search

CLI Example:

```
splunk_search.update 'my search name' sharing=app
```

20.9.383 salt.modules.sqlite3

Support for SQLite3

`salt.modules.sqlite3.fetch` (*db=None*, *sql=None*)
Retrieve data from an sqlite3 db (returns all rows, be careful!)

CLI Example:

```
salt '*' sqlite3.fetch /root/test.db 'SELECT * FROM test;'
```

`salt.modules.sqlite3.indexes` (*db=None*)
Show all indices in the database, for people with poor spelling skills

CLI Example:

```
salt '*' sqlite3.indexes /root/test.db
```

`salt.modules.sqlite3.indices` (*db=None*)
Show all indices in the database

CLI Example:

```
salt '*' sqlite3.indices /root/test.db
```

`salt.modules.sqlite3.modify` (*db=None*, *sql=None*)
Issue an SQL query to sqlite3 (with no return data), usually used to modify the database in some way (insert, delete, create, etc)

CLI Example:

```
salt '*' sqlite3.modify /root/test.db 'CREATE TABLE test(id INT, testdata TEXT);'
```

`salt.modules.sqlite3.sqlite_version()`

Return version of sqlite

CLI Example:

```
salt '*' sqlite3.sqlite_version
```

`salt.modules.sqlite3.tables(db=None)`

Show all tables in the database

CLI Example:

```
salt '*' sqlite3.tables /root/test.db
```

`salt.modules.sqlite3.version()`

Return version of pysqlite

CLI Example:

```
salt '*' sqlite3.version
```

20.9.384 salt.modules.ssh

Manage client ssh components

Note: This module requires the use of MD5 hashing. Certain security audits may not permit the use of MD5. For those cases, this module should be disabled or removed.

`salt.modules.ssh.auth_keys` (*user=None*, *config='.ssh/authorized_keys'*, *finger-
print_hash_type=None*)

Return the authorized keys for users

CLI Example:

```
salt '*' ssh.auth_keys
salt '*' ssh.auth_keys root
salt '*' ssh.auth_keys user=root
salt '*' ssh.auth_keys user="[user1, user2]"
```

`salt.modules.ssh.check_key` (*user*, *key*, *enc*, *comment*, *options*, *config='.ssh/authorized_keys'*,
cache_keys=None, *fingerprnt_hash_type=None*)

Check to see if a key needs updating, returns "update", "add" or "exists"

CLI Example:

```
salt '*' ssh.check_key <user> <key> <enc> <comment> <options>
```

`salt.modules.ssh.check_key_file` (*user*, *source*, *config='.ssh/authorized_keys'*, *saltenv='base'*, *fin-
gerprnt_hash_type=None*)

Check a keyfile from a source destination against the local keys and return the keys to change

CLI Example:

```
salt '*' ssh.check_key_file root salt://ssh/keyfile
```

`salt.modules.ssh.check_known_host` (*user=None, hostname=None, key=None, fingerprint=None, config=None, port=None, fingerprint_hash_type=None*)

Check the record in known_hosts file, either by its value or by fingerprint (it's enough to set up either key or fingerprint, you don't need to set up both).

If provided key or fingerprint doesn't match with stored value, return "update", if no value is found for a given host, return "add", otherwise return "exists".

If neither key, nor fingerprint is defined, then additional validation is not performed.

CLI Example:

```
salt '*' ssh.check_known_host <user> <hostname> key='AAAA...FAaQ=='
```

`salt.modules.ssh.get_known_host` (*user, hostname, config=None, port=None, fingerprint_hash_type=None*)

Deprecated since version 2018.3.0: Use `ssh.get_known_host_entries` instead.

Return information about known host from the configfile, if any. If there is no such key, return None.

CLI Example:

```
salt '*' ssh.get_known_host <user> <hostname>
```

`salt.modules.ssh.get_known_host_entries` (*user, hostname, config=None, port=None, fingerprint_hash_type=None*)

New in version 2018.3.0.

Return information about known host entries from the configfile, if any. If there are no entries for a matching hostname, return None.

CLI Example:

```
salt '*' ssh.get_known_host_entries <user> <hostname>
```

`salt.modules.ssh.hash_known_hosts` (*user=None, config=None*)

Hash all the hostnames in the known hosts file.

New in version 2014.7.0.

user hash known hosts of this user

config path to known hosts file: can be absolute or relative to user's home directory

CLI Example:

```
salt '*' ssh.hash_known_hosts
```

`salt.modules.ssh.host_keys` (*keydir=None, private=True, certs=True*)

Return the minion's host keys

CLI Example:

```
salt '*' ssh.host_keys
salt '*' ssh.host_keys keydir=/etc/ssh
salt '*' ssh.host_keys keydir=/etc/ssh private=False
salt '*' ssh.host_keys keydir=/etc/ssh certs=False
```

`salt.modules.ssh.key_is_encrypted` (*key*)

New in version 2015.8.7.

Function to determine whether or not a private key is encrypted with a passphrase.

Checks key for a Proc-Type header with ENCRYPTED in the value. If found, returns True, otherwise returns False.

CLI Example:

```
salt '*' ssh.key_is_encrypted /root/id_rsa
```

`salt.modules.ssh.recv_known_host`(*hostname*, *enc=None*, *port=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

Retrieve information about host public key from remote server

Deprecated since version 2018.3.0: Use `ssh.recv_known_host_entries` instead.

hostname The name of the remote host (e.g. "github.com")

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.recv_known_host_entries`(*hostname*, *enc=None*, *port=None*, *hash_known_hosts=True*, *timeout=5*, *fingerprint_hash_type=None*)

New in version 2018.3.0.

Retrieve information about host public keys from remote server

hostname The name of the remote host (e.g. "github.com")

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

port Optional parameter, denoting the port of the remote host on which an SSH daemon is running. By default the port 22 is used.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If `timeout` seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

fingerprint_hash_type The fingerprint hash type that the public key fingerprints were originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.recv_known_host_entries <hostname> enc=<enc> port=<port>
```

`salt.modules.ssh.rm_auth_key`(*user*, *key*, *config='.ssh/authorized_keys'*, *fingerprint_hash_type=None*)

Remove an authorized key from the specified user's authorized key file

CLI Example:

```
salt '*' ssh.rm_auth_key <user> <key>
```

`ssh.rm_auth_key_from_file`(*user*, *source*, *config*='ssh/authorized_keys',
saltenv='base', *fingerprint_hash_type*=None)
Remove an authorized key from the specified user's authorized key file, using a file as source

CLI Example:

```
salt '*' ssh.rm_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`ssh.rm_known_host`(*user*=None, *hostname*=None, *config*=None, *port*=None)
Remove all keys belonging to hostname from a known_hosts file.

CLI Example:

```
salt '*' ssh.rm_known_host <user> <hostname>
```

`ssh.set_auth_key`(*user*, *key*, *enc*='ssh-rsa', *comment*="", *options*=None, *config*='ssh/authorized_keys',
cache_keys=None, *fingerprint_hash_type*=None)
Add a key to the authorized_keys file. The "key" parameter must only be the string of text that is the encoded key. If the key begins with "ssh-rsa" or ends with user@host, remove those from the key before passing it to this function.

CLI Example:

```
salt '*' ssh.set_auth_key <user> '<key>' enc='dsa'
```

`ssh.set_auth_key_from_file`(*user*, *source*, *config*='ssh/authorized_keys',
saltenv='base', *fingerprint_hash_type*=None)
Add a key to the authorized_keys file, using a file as the source.

CLI Example:

```
salt '*' ssh.set_auth_key_from_file <user> salt://ssh_keys/<user>.id_rsa.pub
```

`ssh.set_known_host`(*user*=None, *hostname*=None, *fingerprint*=None, *key*=None,
port=None, *enc*=None, *config*=None, *hash_known_hosts*=True,
timeout=5, *fingerprint_hash_type*=None)
Download SSH public key from remote host "hostname", optionally validate its fingerprint against "fingerprint" variable and save the record in the known_hosts file.

If such a record does already exist in there, do nothing.

user The user who owns the ssh authorized keys file to modify

hostname The name of the remote host (e.g. "github.com")

fingerprint The fingerprint of the key which must be present in the known_hosts file (optional if key specified)

key The public key which must be presented in the known_hosts file (optional if fingerprint specified)

port optional parameter, denoting the port of the remote host, which will be used in case, if the public key will be requested from it. By default the port 22 is used.

enc Defines what type of key is being used, can be ed25519, ecdsa ssh-rsa or ssh-dss

config The location of the authorized keys file relative to the user's home directory, defaults to ".ssh/known_hosts". If no user is specified, defaults to "/etc/ssh/ssh_known_hosts". If present, must be an absolute path when a user is not specified.

hash_known_hosts [True] Hash all hostnames and addresses in the known hosts file.

timeout [int] Set the timeout for connection attempts. If timeout seconds have elapsed since a connection was initiated to a host or since the last time anything was read from that host, then the connection is closed and the host in question considered unavailable. Default is 5 seconds.

New in version 2016.3.0.

fingerprint_hash_type The public key fingerprint hash type that the public key fingerprint was originally hashed with. This defaults to sha256 if not specified.

New in version 2016.11.4.

Changed in version 2017.7.0:: default changed from md5 to sha256

CLI Example:

```
salt '*' ssh.set_known_host <user> fingerprint='xx:xx:..:xx' enc='ssh-rsa' config=
↳ '.ssh/known_hosts'
```

salt.modules.ssh.user_keys (*user=None, pubfile=None, prvfile=None*)

Return the user's ssh keys on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' ssh.user_keys
salt '*' ssh.user_keys user=user1
salt '*' ssh.user_keys user=user1 pubfile=/home/user1/.ssh/id_rsa.pub prvfile=/
↳ home/user1/.ssh/id_rsa
salt '*' ssh.user_keys user=user1 prvfile=False
salt '*' ssh.user_keys user=["'user1','user2'] pubfile=id_rsa.pub prvfile=id_rsa
```

As you can see you can tell Salt not to read from the user's private (or public) key file by setting the file path to False. This can be useful to prevent Salt from publishing private data via Salt Mine or others.

20.9.385 salt.modules.ssh_package module

Service support for the REST example

salt.modules.ssh_package.install (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs*)

salt.modules.ssh_package.list_pkgs (*versions_as_list=False, **kwargs*)

salt.modules.ssh_package.remove (*name=None, pkgs=None, **kwargs*)

20.9.386 salt.modules.ssh_service module

Provide the service module for the proxy-minion SSH sample .. versionadded:: 2015.8.2

salt.modules.ssh_service.enabled (*name, sig=None*)

Only the 'redbull' service is 'enabled' in the test

salt.modules.ssh_service.get_all ()

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

salt.modules.ssh_service.list_ ()

Return a list of all available services.

CLI Example:

```
salt '*' service.list
```

`salt.modules.ssh_service.restart`(*name*, *sig=None*)
Restart the specified service with rest_sample CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.ssh_service.running`(*name*, *sig=None*)
Return whether this service is running.

`salt.modules.ssh_service.start`(*name*, *sig=None*)
Start the specified service on the ssh_sample

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.ssh_service.status`(*name*, *sig=None*)
Return the status for a service via ssh_sample. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. salt*)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.ssh_service.stop`(*name*, *sig=None*)
Stop the specified service on the rest_sample

CLI Example:

```
salt '*' service.stop <service name>
```

20.9.387 salt.modules.snapper module

Module to manage filesystem snapshots with snapper

New in version 2016.11.0.

codeauthor Duncan Mac-Vicar P. <dmacvicar@suse.de>

codeauthor Pablo Suárez Hernández <psuarezhernandez@suse.de>

depends dbus Python module.

depends snapper <http://snapper.io>, available in most distros

maturity new

platform Linux

`salt.modules.snapper.changed_files`(*config='root'*, *num_pre=None*, *num_post=None*)
Returns the files changed between two snapshots

config Configuration name.
num_pre first snapshot ID to compare. Default is last snapshot
num_post last snapshot ID to compare. Default is 0 (current state)
 CLI example:

```
salt '*' snapper.changed_files
salt '*' snapper.changed_files num_pre=19 num_post=20
```

salt.modules.snapper.create_baseline(tag='baseline', config='root')

Creates a snapshot marked as baseline
tag Tag name for the baseline
config Configuration name.
 CLI Example:

```
salt '*' snapper.create_baseline
salt '*' snapper.create_baseline my_custom_baseline
```

salt.modules.snapper.create_config(name=None, subvolume=None, fstype=None, template=None, extra_opts=None)

Creates a new Snapper configuration
name Name of the new Snapper configuration.
subvolume Path to the related subvolume.
fstype Filesystem type of the subvolume.
template Configuration template to use. (Default: default)
extra_opts Extra Snapper configuration opts dictionary. It will override the values provided by the given template (if any).
 CLI example:

```
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
↳template="default"
salt '*' snapper.create_config name=myconfig subvolume=/foo/bar/ fstype=btrfs
↳extra_opts='{"NUMBER_CLEANUP": False}'
```

salt.modules.snapper.create_snapshot(config='root', snapshot_type='single', pre_number=None, description=None, cleanup_algorithm='number', userdata=None, **kwargs)

Creates an snapshot
config Configuration name.
snapshot_type Specifies the type of the new snapshot. Possible values are single, pre and post.
pre_number For post snapshots the number of the pre snapshot must be provided.
description Description for the snapshot. If not given, the salt job will be used.
cleanup_algorithm Set the cleanup algorithm for the snapshot.
number Deletes old snapshots when a certain number of snapshots is reached.
timeline Deletes old snapshots but keeps a number of hourly, daily, weekly, monthly and yearly snapshots.
empty-pre-post Deletes pre/post snapshot pairs with empty diffs.
userdata Set userdata for the snapshot (key-value pairs).
 Returns the number of the created snapshot.

CLI example:

```
salt '*' snapper.create_snapshot
```

salt.modules.snapper.delete_snapshot(snapshots_ids=None, config='root')

Deletes an snapshot

config Configuration name. (Default: root)
snapshots_ids List of the snapshots IDs to be deleted.
CLI example:

```
salt '*' snapper.delete_snapshot 54
salt '*' snapper.delete_snapshot config=root 54
salt '*' snapper.delete_snapshot config=root snapshots_ids=[54,55,56]
```

salt.modules.snapper.diff(*config='root', filename=None, num_pre=None, num_post=None*)

Returns the differences between two snapshots

config Configuration name.

filename if not provided the showing differences between snapshots for all "text" files

num_pre first snapshot ID to compare. Default is last snapshot

num_post last snapshot ID to compare. Default is 0 (current state)

CLI Example:

```
salt '*' snapper.diff
salt '*' snapper.diff filename=/var/log/snapper.log num_pre=19 num_post=20
```

salt.modules.snapper.diff_jid(*jid, config='root'*)

Returns the changes applied by a *jid*

jid The job id to lookup

config Configuration name.

CLI Example:

```
salt '*' snapper.diff_jid jid=20160607130930720112
```

salt.modules.snapper.get_config(*name='root'*)

Retrieves all values from a given configuration

CLI example:

```
salt '*' snapper.get_config
```

salt.modules.snapper.get_snapshot(*number=0, config='root'*)

Get detailed information about a given snapshot

CLI example:

```
salt '*' snapper.get_snapshot 1
```

salt.modules.snapper.list_configs()

List all available configs

CLI example:

```
salt '*' snapper.list_configs
```

salt.modules.snapper.list_snapshots(*config='root'*)

List available snapshots

CLI example:

```
salt '*' snapper.list_snapshots config=myconfig
```

salt.modules.snapper.modify_snapshot(*snapshot_id=None, description=None, userdata=None, cleanup=None, config='root'*)

Modify attributes of an existing snapshot.

config Configuration name. (Default: root)
snapshot_id ID of the snapshot to be modified.
cleanup Change the cleanup method of the snapshot. (str)
description Change the description of the snapshot. (str)
userdata Change the userdata dictionary of the snapshot. (dict)
 CLI example:

```
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 description="my snapshot description"
salt '*' snapper.modify_snapshot 54 userdata={'foo': "bar"}
salt '*' snapper.modify_snapshot snapshot_id=54 cleanup="number"
```

salt.modules.snapper.run(*function*, *args, **kwargs)

Runs a function from an execution module creating pre and post snapshots and associating the salt job id with those snapshots for easy undo and cleanup.

function Salt function to call.

config Configuration name. (default: "root")

description A description for the snapshots. (default: None)

userdata Data to include in the snapshot metadata. (default: None)

cleanup_algorithm Snapper cleanup algorithm. (default: "number")

***args** args for the function to call. (default: None)

****kwargs** kwargs for the function to call (default: None)

This would run append text to /etc/motd using the file.append module, and will create two snapshots, pre and post with the associated metadata. The `jid` will be available as `salt_jid` in the userdata of the snapshot.

You can immediately see the changes

CLI Example:

```
salt '*' snapper.run file.append args='["/etc/motd", "some text"]'
```

salt.modules.snapper.set_config(*name='root'*, **kwargs)

Set configuration values

CLI example:

```
salt '*' snapper.set_config SYNC_ACL=True
```

Keys are case insensitive as they will be always uppercased to snapper convention. The above example is equivalent to:

```
salt '*' snapper.set_config sync_acl=True
```

salt.modules.snapper.status(*config='root'*, *num_pre=None*, *num_post=None*)

Returns a comparison between two snapshots

config Configuration name.

num_pre first snapshot ID to compare. Default is last snapshot

num_post last snapshot ID to compare. Default is 0 (current state)

CLI example:

```
salt '*' snapper.status
salt '*' snapper.status num_pre=19 num_post=20
```

salt.modules.snapper.status_to_string(*dbus_status*)

Converts a numeric dbus snapper status into a string

CLI Example:

```
salt '*' snapper.status_to_string <dbus_status>
```

`salt.modules.snapper.undo` (*config='root', files=None, num_pre=None, num_post=None*)

Undo all file changes that happened between `num_pre` and `num_post`, leaving the files into the state of `num_pre`.

Warning: If one of the files has changes after `num_post`, they will be overwritten. The snapshots are used to determine the file list, but the current version of the files will be overwritten by the versions in `num_pre`. You to undo changes between `num_pre` and the current version of the files use `num_post=0`.

CLI Example:

```
salt '*' snapper.undo
```

`salt.modules.snapper.undo_jid` (*jid, config='root'*)

Undo the changes applied by a salt job

jid The job id to lookup

config Configuration name.

CLI Example:

```
salt '*' snapper.undo_jid jid=20160607130930720112
```

20.9.388 salt.modules.state

Control the state system on the minion.

State Caching

When a highstate is called, the minion automatically caches a copy of the last high data. If you then run a highstate with `cache=True` it will use that cached highdata and won't hit the fileserver except for `salt://` links in the states themselves.

`salt.modules.state.apply_` (*mods=None, **kwargs*)

New in version 2015.5.0.

This function will call `state.highstate` or `state.sls` based on the arguments passed to this function. It exists as a more intuitive way of applying states.

APPLYING ALL STATES CONFIGURED IN TOP.SLS (A.K.A. HIGHSTATE)

To apply all configured states, simply run `state.apply`:

```
salt '*' state.apply
```

The following additional arguments are also accepted when applying all states configured in `top.sls`:

test Run states in test-only (dry-run) mode

mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.apply exclude=bar,baz
salt '*' state.apply exclude=foo*
salt '*' state.apply exclude="['id': 'id_to_exclude'], {'sls': 'sls_to_
→exclude'}]"
```

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply localconfig=/path/to/minion.yml
```

APPLYING INDIVIDUAL SLS FILES (A.K.A. STATE . SLS)

To apply individual SLS files, pass them as a comma-separated list:

```
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
salt '*' state.apply stuff
# Run the states configured in salt://stuff.sls (or salt://stuff/init.sls)
# and salt://pkgs.sls (or salt://pkgs/init.sls).
salt '*' state.apply stuff,pkgs
```

The following additional arguments are also accepted when applying individual SLS files:

test Run states in test-only (dry-run) mode

mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

```
salt '*' state.apply stuff localconfig=/path/to/minion.yml
```

sync_mods If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.apply stuff sync_mods=states,modules
salt '*' state.apply stuff sync_mods=all
```

Note: This option is ignored when no SLS files are specified, as a `highstate` automatically syncs all custom module types.

New in version 2017.7.8,2018.3.3,Fluorine.

`salt.modules.state.check_request` (`name=None`)

New in version 2015.5.0.

Return the state request information, if any

CLI Example:

```
salt '*' state.check_request
```

`salt.modules.state.clear_cache` ()

Clear out cached state files, forcing even cache runs to refresh the cache on the next state execution.

Remember that the state cache is completely disabled by default, this execution only applies if `cache=True` is used in states

CLI Example:

```
salt '*' state.clear_cache
```

`salt.modules.state.clear_request` (`name=None`)

New in version 2015.5.0.

Clear out the state execution request without executing it

CLI Example:

```
salt '*' state.clear_request
```

`salt.modules.state.disable(states)`

Disable state runs.

CLI Example:

```
salt '*' state.disable highstate
salt '*' state.disable highstate,test.succeed_without_changes
```

Note: To disable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

`salt.modules.state.enable(states)`

Enable state function or sls run

CLI Example:

```
salt '*' state.enable highstate
salt '*' state.enable test.succeed_without_changes
```

Note: To enable a state file from running provide the same name that would be passed in a state.sls call.

```
salt '*' state.disable bind.config
```

`salt.modules.state.event(tagmatch='*', count=-1, quiet=False, sock_dir=None, pretty=False, node='minion')`

Watch Salt's event bus and block until the given tag is matched

New in version 2016.3.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** – the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** – this number is decremented for each event that matches the tagmatch parameter; pass -1 to listen forever.
- **quiet** – do not print to stdout; just block
- **sock_dir** – path to the Salt master's event socket file.
- **pretty** – Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** – Watch the minion-side or master-side event bus.

CLI Example:

```
salt-call --local state.event pretty=True
```

`salt.modules.state.get_pauses(jid=None)`

Get a report on all of the currently paused state runs and pause run settings. Optionally send in a jid if you only desire to see a single pause data set.

`salt.modules.state.high`(*data*, *test=None*, *queue=False*, ***kwargs*)

Execute the compound calls stored in a single set of high data

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.high '{"vim": {"pkg": ["installed"]}}'
```

`salt.modules.state.highstate`(*test=None*, *queue=False*, ***kwargs*)

Retrieve the state data from the salt master for this minion and execute it

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

pillar_enc Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.highstate exclude=bar,baz
salt '*' state.highstate exclude=foo*
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
→exclude'}]"
```

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for a `saltenv` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

localconfig Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, `file_roots`, etc.

mock The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

CLI Examples:

```

salt '*' state.highstate

salt '*' state.highstate whitelist=sls1_to_run,sls2_to_run
salt '*' state.highstate exclude=sls_to_exclude
salt '*' state.highstate exclude="[{'id': 'id_to_exclude'}, {'sls': 'sls_to_
↪exclude'}]"

salt '*' state.highstate pillar="{foo: 'Foo!', bar: 'Bar!'}"

```

salt.modules.state.list_disabled()

List the states which are currently disabled

CLI Example:

```
salt '*' state.list_disabled
```

salt.modules.state.low(*data*, *queue=False*, ***kwargs*)

Execute a single low data call

This function is mostly intended for testing the state system and is not likely to be needed in everyday usage.

CLI Example:

```
salt '*' state.low '{"state": "pkg", "fun": "installed", "name": "vi"}'
```

salt.modules.state.orchestrate(*mods*, *saltenv='base'*, *test=None*, *exclude=None*, *pillar=None*, *pillarenv=None*)

New in version 2016.11.0.

Execute the orchestrate runner from a masterless minion.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- Docs for the ``salt`` state module <salt.states.saltmod>

CLI Examples:

```

salt-call --local state.orchestrate webserver
salt-call --local state.orchestrate webserver saltenv=dev test=True
salt-call --local state.orchestrate webserver saltenv=dev pillarenv=aws

```

salt.modules.state.pause(*jid*, *state_id=None*, *duration=None*)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds. If a state_id is not passed then the jid referenced will be paused at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```

vim:
  pkg.installed: []

```

The state_id to pass to *pause* is *vim*

CLI Examples:

```

salt '*' state.pause 20171130110407769519
salt '*' state.pause 20171130110407769519 vim
salt '*' state.pause 20171130110407769519 vim 20

```

`salt.modules.state.pkg`(*pkg_path*, *pkg_sum*, *hash_type*, *test=None*, ***kwargs*)

Execute a packaged state run, the packaged state run will exist in a tarball available locally. This packaged state can be generated using salt-ssh.

CLI Example:

```
salt '*' state.pkg /tmp/salt_state.tgz 760a9353810e36f6d81416366fc426dc md5
```

`salt.modules.state.request`(*mods=None*, ***kwargs*)

New in version 2015.5.0.

Request that the local admin execute a state run via *salt-call state.run_request* All arguments match state.apply

CLI Example:

```
salt '*' state.request
salt '*' state.request stuff
salt '*' state.request stuff, pkgs
```

`salt.modules.state.resume`(*jid*, *state_id=None*)

Remove a pause from a jid, allowing it to continue. If the *state_id* is not specified then the a general pause will be resumed.

The given *state_id* is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The *state_id* to pass to *rm_pause* is *vim*

CLI Examples:

```
salt '*' state.resume 20171130110407769519
salt '*' state.resume 20171130110407769519 vim
```

`salt.modules.state.run_request`(*name='default'*, ***kwargs*)

New in version 2015.5.0.

Execute the pending state request

CLI Example:

```
salt '*' state.run_request
```

`salt.modules.state.running`(*concurrent=False*)

Return a list of strings that contain state return data if a state function is already running. This function is used to prevent multiple state calls from being run at the same time.

CLI Example:

```
salt '*' state.running
```

`salt.modules.state.show_highstate`(*queue=False*, ***kwargs*)

Retrieve the highstate data from the salt master and display it

Custom Pillar data can be passed with the *pillar* kwarg.

CLI Example:

```
salt '*' state.show_highstate
```

`salt.modules.state.show_low_sls` (*mods*, *test=None*, *queue=False*, ***kwargs*)

Display the low data from a specific sls. The default environment is `base`, use `saltenv` to specify a different environment.

saltenv Specify a salt fileserver environment to be used when applying states

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.show_low_sls stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_low_sls foo
salt '*' state.show_low_sls foo saltenv=dev
```

`salt.modules.state.show_lowstate` (*queue=False*, ***kwargs*)

List out the low data that will be applied to this minion

CLI Example:

```
salt '*' state.show_lowstate
```

`salt.modules.state.show_sls` (*mods*, *test=None*, *queue=False*, ***kwargs*)

Display the state data from a specific sls or list of sls files on the master. The default environment is `base`, use `saltenv` to specify a different environment.

This function does not support topfiles. For `top.sls` please use `show_top` instead.

Custom Pillar data can be passed with the `pillar` kwarg.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

CLI Example:

```
salt '*' state.show_sls core,edit.vim saltenv=dev
```

`salt.modules.state.show_state_usage` (*queue=False*, ***kwargs*)

Retrieve the highstate data from the salt master to analyse used and unused states

Custom Pillar data can be passed with the `pillar` kwarg.

CLI Example:

```
salt '*' state.show_state_usage
```

`salt.modules.state.show_top` (*queue=False*, ***kwargs*)

Return the top data that the minion will use for a highstate

CLI Example:

```
salt '*' state.show_top
```

`salt.modules.state.single`(*fun, name, test=None, queue=False, **kwargs*)

Execute a single state function with the named kwargs, returns False if insufficient data is sent to the command

By default, the values of the kwargs will be parsed as YAML. So, you can specify lists values, or lists of single entry key-value maps, as you would in a YAML salt file. Alternatively, JSON format of keyword values is also supported.

CLI Example:

```
salt '*' state.single pkg.installed name=vim
```

`salt.modules.state.sls`(*mods, test=None, exclude=None, queue=False, sync_mods=None, **kwargs*)

Execute the states in one or more SLS files

test Run states in test-only (dry-run) mode

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.apply stuff pillar='{"foo": "bar"}'
```

Note: Values passed this way will override existing Pillar values set via `pillar_roots` or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

Changed in version 2016.3.0: GPG-encrypted CLI Pillar data is now supported via the GPG renderer. See [here](#) for details.

pillar_enc Specify which renderer to use to decrypt encrypted data located within the `pillar` value. Currently, only `gpg` is supported.

New in version 2016.3.0.

exclude Exclude specific states from execution. Accepts a list of sls names, a comma-separated string of sls names, or a list of dictionaries containing `sls` or `id` keys. Glob-patterns may be used to match multiple states.

```
salt '*' state.sls foo,bar,baz exclude=bar,baz
salt '*' state.sls foo,bar,baz exclude=ba*
salt '*' state.sls foo,bar,baz exclude="['id': 'id_to_exclude'], {'sls':
→'sls_to_exclude'}]"
```

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

concurrent [False] Execute state runs concurrently instead of serially

Warning: This flag is potentially dangerous. It is designed for use when multiple state runs can safely be run at the same time. Do *not* use this flag for performance optimization.

saltenv Specify a salt fileserver environment to be used when applying states

Changed in version 0.17.0: Argument name changed from `env` to `saltenv`.

Changed in version 2014.7.0: If no `saltenv` is specified, the minion config will be checked for an `environment` parameter and if found, it will be used. If none is found, `base` will be used. In prior releases, the minion config was not checked and `base` would always be assumed when the `saltenv` was not explicitly set.

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

localconfig

Optionally, instead of using the minion config, load minion opts from the file specified by this argument, and then merge them with the options from the minion config. This functionality allows for specific states to be run with their own custom minion configuration, including different pillars, file_roots, etc.

mock: The mock option allows for the state run to execute without actually calling any states. This then returns a mocked return which will show the requisite ordering as well as fully validate the state run.

New in version 2015.8.4.

sync_mods If specified, the desired custom module types will be synced prior to running the SLS files:

```
salt '*' state.sls stuff sync_mods=states,modules
salt '*' state.sls stuff sync_mods=all
```

New in version 2017.7.8,2018.3.3,Fluorine.

CLI Example:

```
salt '*' state.sls core,edit.vim dev
salt '*' state.sls core exclude="{ 'id': 'id_to_exclude'}, {'sls': 'sls_to_exclude'
↪ }]"

salt '*' state.sls myslsfile pillar="{foo: 'Foo!', bar: 'Bar!'}"
```

salt.modules.state.sls_id(*id_*, *mods*, *test=None*, *queue=False*, ***kwargs*)

Call a single ID from the named module(s) and handle all requisites

The state ID comes *before* the module ID(s) on the command line.

id ID to call

mods Comma-delimited list of modules to search for given id and its requisites

New in version 2014.7.0.

saltenv [base] Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the *pillarenv* option. When neither the *pillarenv* minion config option nor this CLI argument is used, all Pillar environments will be merged together.

pillar Custom Pillar values, passed as a dictionary of key-value pairs

```
salt '*' state.sls_id my_state my_module pillar="{ 'foo': 'bar' }"
```

Note: Values passed this way will override existing Pillar values set via *pillar_roots* or an external Pillar source. Pillar values that are not included in the kwarg will not be overwritten.

New in version 2018.3.0.

CLI Example:

```
salt '*' state.sls_id my_state my_module

salt '*' state.sls_id my_state my_module,a_common_module
```

salt.modules.state.soft_kill(*jid*, *state_id=None*)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a *state_id* is not passed then the jid referenced will be safely exited at the beginning of the next state run.

The given state id is the id got a given state execution, so given a state that looks like this:

```
vim:
  pkg.installed: []
```

The `state_id` to pass to `soft_kill` is `vim`

CLI Examples:

```
salt '*' state.soft_kill 20171130110407769519
salt '*' state.soft_kill 20171130110407769519 vim
```

`salt.modules.state.template` (*tem*, *queue=False*, ***kwargs*)

Execute the information stored in a template file on the minion.

This function does not ask a master for a SLS file to render but instead directly processes the file at the provided path on the minion.

CLI Example:

```
salt '*' state.template '<Path to template on the minion>'
```

`salt.modules.state.template_str` (*tem*, *queue=False*, ***kwargs*)

Execute the information stored in a string from an sls template

CLI Example:

```
salt '*' state.template_str '<Template String>'
```

`salt.modules.state.top` (*topfn*, *test=None*, *queue=False*, ***kwargs*)

Execute a specific top file instead of the default. This is useful to apply configurations from a different environment (for example, dev or prod), without modifying the default top file.

queue [False] Instead of failing immediately when another state run is in progress, queue the new state run to begin running once the other has finished.

This option starts a new thread for each queued state run, so use this option sparingly.

saltenv Specify a salt fileserver environment to be used when applying states

pillarenv Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2017.7.0.

CLI Example:

```
salt '*' state.top reverse_top.sls
salt '*' state.top prod_top.sls exclude=sls_to_exclude
salt '*' state.top dev_top.sls exclude="['id': 'id_to_exclude'], {'sls': 'sls_to_
↪exclude'}]"
```

20.9.389 salt.modules.status

Module for returning various status data about a minion. These data can be useful for compiling into stats later.

`salt.modules.status.all_status`()

Return a composite of all status data and info for this minion. Warning: There is a LOT here!

CLI Example:

```
salt '*' status.all_status
```

salt.modules.status.cpuinfo()

Changed in version 2016.3.2: Return the CPU info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for NetBSD and OpenBSD

CLI Example:

```
salt '*' status.cpuinfo
```

salt.modules.status.cputats()

Return the CPU stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.cputats
```

salt.modules.status.custom()

Return a custom composite of status data and info for this minion, based on the minion config file. An example config like might be:

```
status.cputats.custom: [ 'cpu', 'ctxt', 'btime', 'processes' ]
```

Where status refers to status.py, cputats is the function where we get our data, and custom is this function It is followed by a list of keys that we want returned.

This function is meant to replace all_status(), which returns anything and everything, which we probably don't want.

By default, nothing is returned. Warning: Depending on what you include, there can be a LOT here!

CLI Example:

```
salt '*' status.custom
```

salt.modules.status.diskstats()

Changed in version 2016.3.2: Return the disk stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.diskstats
```

salt.modules.status.diskusage(*args)

Return the disk usage for this minion

Usage:

```
salt '*' status.diskusage [paths and/or filesystem types]
```

CLI Example:

```
salt '*' status.diskusage      # usage for all filesystems
salt '*' status.diskusage / /tmp # usage for / and /tmp
salt '*' status.diskusage ext?  # usage for ext[234] filesystems
salt '*' status.diskusage / ext? # usage for / and all ext filesystems
```

salt.modules.status.loadavg()

Return the load averages for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.loadavg
:raises CommandExecutionError: If the system cannot report loadaverages to Python
```

salt.modules.status.master(*master=None, connected=True*)

New in version 2014.7.0.

Return the connection status with master. Fire an event if the connection to master is not as expected. This function is meant to be run via a scheduled job from the minion. If *master_ip* is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.master
```

salt.modules.status.meminfo()

Return the memory info for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.meminfo
```

salt.modules.status.netdev()

Changed in version 2016.3.2: Return the network device stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.netdev
```

salt.modules.status.netstats()

Return the network stats for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.netstats
```

salt.modules.status.nproc()

Return the number of processing units available on this system

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for Darwin, FreeBSD and OpenBSD

CLI Example:

```
salt '*' status.nproc
```

`salt.modules.status.pid(sig)`

Return the PID or an empty string if the process is running or not. Pass a signature to use to find the process via ps. Note you can pass a Python-compatible regular expression to return all pids of processes matching the regexp.

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.pid <sig>
```

`salt.modules.status.ping_master(master)`

New in version 2016.3.0.

Sends ping request to the given master. Fires `'__master_failback'` event on success. Returns bool result.

CLI Example:

```
salt '*' status.ping_master localhost
```

`salt.modules.status.procs()`

Return the process data

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.procs
```

`salt.modules.status.proxy_reconnect(proxy_name, opts=None)`

Forces proxy minion reconnection when not alive.

proxy_name The virtual name of the proxy module.

opts: None Opts dictionary. Not intended for CLI usage.

CLI Example:

```
salt '*' status.proxy_reconnect rest_sample
```

`salt.modules.status.time_(format='%A, %d. %B %Y %I:%M%p')`

New in version 2016.3.0.

Return the current time on the minion, formatted based on the format parameter.

Default date format: Monday, 27. July 2015 07:55AM

CLI Example:

```
salt '*' status.time
salt '*' status.time '%s'
```

`salt.modules.status.uptime()`

Return the uptime for this system.

Changed in version 2015.8.9: The uptime function was changed to return a dictionary of easy-to-read key/value pairs containing uptime information, instead of the output from a `cmd.run` call.

Changed in version 2016.11.0: Support for OpenBSD, FreeBSD, NetBSD, MacOS, and Solaris

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.uptime
```

`salt.modules.status.version()`

Return the system version for this minion

Changed in version 2016.11.4: Added support for AIX

Changed in version 2018.3.0: Added support for OpenBSD

CLI Example:

```
salt '*' status.version
```

`salt.modules.status.vmstats()`

Changed in version 2016.3.2: Return the virtual memory stats for this minion

Changed in version 2016.11.4: Added support for AIX

CLI Example:

```
salt '*' status.vmstats
```

`salt.modules.status.w()`

Return a list of logged in users for this minion, using the w command

CLI Example:

```
salt '*' status.w
```

20.9.390 salt.modules.statuspage

StatusPage

Handle requests for the StatusPage API.

In the minion configuration file, the following block is required:

```
statuspage:  
  api_key: <API_KEY>  
  page_id: <PAGE_ID>
```

New in version 2017.7.0.

`salt.modules.statuspage.create` (*endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None, **kwargs*)

Insert a new entry under a specific endpoint.

endpoint: incidents Insert under this specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.create endpoint='components' name='my component' group_↵  
↵id='993vgplshj12'
```

Example output:

```

minion:
  -----
  comment:
  out:
    -----
    created_at:
      2017-01-05T19:35:27.135Z
    description:
      None
    group_id:
      993vgplshj12
    id:
      mjkm5t5lhdgc
    name:
      my component
    page_id:
      ksdhgyiuhaa
    position:

    updated_at:
      2017-01-05T19:35:27.135Z
  result:
    True

```

`salt.modules.statuspage.delete` (*endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None*)

Remove an entry from an endpoint.

endpoint: incidents Request a specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.delete endpoint='components' id='ftgks51sfs2d'
```

Example output:

```

minion:
  -----
  comment:
  out:
    None
  result:
    True

```

`salt.modules.statuspage.retrieve` (*endpoint='incidents', api_url=None, page_id=None, api_key=None, api_version=None*)

Retrieve a specific endpoint from the Statuspage API.

endpoint: incidents Request a specific endpoint.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.retrieve components
```

Example output:

```
minion:

```

`salt.modules.statuspage.update`(*endpoint='incidents', id=None, api_url=None, page_id=None, api_key=None, api_version=None, **kwargs*)

Update attribute(s) of a specific endpoint.

id The unique ID of the endpoint entry.

endpoint: incidents Endpoint name.

page_id Page ID. Can also be specified in the config file.

api_key API key. Can also be specified in the config file.

api_version: 1 API version. Can also be specified in the config file.

api_url Custom API URL in case the user has a StatusPage service running in a custom environment.

CLI Example:

```
salt 'minion' statuspage.update id=dz959yz2nd4l status=resolved
```

Example output:

```

minion:
  -----

```

20.9.391 salt.modules.supervisord

Provide the service module for system supervisord or supervisord in a virtualenv

salt.modules.supervisord.add(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Activates any updates in config for process/group.

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.add <name>
```

salt.modules.supervisord.custom(*command*, *user=None*, *conf_file=None*, *bin_env=None*)

Run any custom supervisord command

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.custom "mstop '*gunicorn*'"
```

salt.modules.supervisord.options(*name*, *conf_file=None*)

New in version 2014.1.0.

Read the config file and return the config options for a given process

name Name of the configured process

conf_file path to supervisord config file

CLI Example:

```
salt '*' supervisord.options foo
```

salt.modules.supervisord.remove(*name*, *user=None*, *conf_file=None*, *bin_env=None*)

Removes process/group from active config

user user to run supervisorctl as

conf_file path to supervisord config file

bin_env path to supervisorctl bin or path to virtualenv with supervisor installed

CLI Example:

```
salt '*' supervisord.remove <name>
```

salt.modules.supervisord.reread(*user=None*, *conf_file=None*, *bin_env=None*)

Reload the daemon's configuration files

user user to run supervisorctl as
conf_file path to supervisor config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
 CLI Example:

```
salt '*' supervisorctl.reread
```

salt.modules.supervisord.restart (*name='all', user=None, conf_file=None, bin_env=None*)
 Restart the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as
conf_file path to supervisor config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
 CLI Example:

```
salt '*' supervisorctl.restart <service>
salt '*' supervisorctl.restart <group>:
```

salt.modules.supervisord.start (*name='all', user=None, conf_file=None, bin_env=None*)
 Start the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as
conf_file path to supervisor config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
 CLI Example:

```
salt '*' supervisorctl.start <service>
salt '*' supervisorctl.start <group>:
```

salt.modules.supervisord.status (*name=None, user=None, conf_file=None, bin_env=None*)
 List programs and its state

user user to run supervisorctl as
conf_file path to supervisor config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
 CLI Example:

```
salt '*' supervisorctl.status
```

salt.modules.supervisord.status_raw (*name=None, user=None, conf_file=None, bin_env=None*)
 Display the raw output of status

user user to run supervisorctl as
conf_file path to supervisor config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
 CLI Example:

```
salt '*' supervisorctl.status_raw
```

salt.modules.supervisord.stop (*name='all', user=None, conf_file=None, bin_env=None*)
 Stop the named service. Process group names should not include a trailing asterisk.

user user to run supervisorctl as
conf_file path to supervisor config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
 CLI Example:

```
salt '*' supervisorctl.stop <service>
salt '*' supervisorctl.stop <group>:
```

`salt.modules.supervisord.update`(*user=None, conf_file=None, bin_env=None, name=None*)
Reload config and add/remove/update as necessary
user user to run supervisorctl as
conf_file path to supervisord config file
bin_env path to supervisorctl bin or path to virtualenv with supervisor installed
name name of the process group to update. if none then update any process group that has changes
CLI Example:

```
salt '*' supervisord.update
```

20.9.392 salt.modules.suse_apache

Support for Apache

Please note: The functions in here are SUSE-specific. Placing them in this separate file will allow them to load only on SUSE systems, while still loading under the apache namespace.

`salt.modules.suse_apache.a2dismod`(*mod*)
Runs a2dismod for the given mod.

CLI Example:

```
salt '*' apache.a2dismod vhost_alias
```

`salt.modules.suse_apache.a2enmod`(*mod*)
Runs a2enmod for the given mod.

CLI Example:

```
salt '*' apache.a2enmod vhost_alias
```

`salt.modules.suse_apache.check_mod_enabled`(*mod*)
Checks to see if the specific apache mod is enabled.

This will only be functional on operating systems that support `a2enmod -l` to list the enabled mods.

CLI Example:

```
salt '*' apache.check_mod_enabled status
```

20.9.393 salt.modules.svn

Subversion SCM

`salt.modules.svn.add`(*cwd, targets, user=None, username=None, password=None, *opts*)
Add files to be tracked by the Subversion working-copy checkout
cwd The path to the Subversion repository
targets [None] files and directories to pass to the command as arguments
user [None] Run svn as a user other than what the minion runs as
username [None] Connect to the Subversion server as another user
password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.add /path/to/repo /path/to/new/file
```

`salt.modules.svn.checkout`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, **opts*)

Download a working copy of the remote Subversion repository directory or file

cwd The path to the Subversion repository

remote [None] URL to checkout

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.checkout /path/to/repo svn://remote/repo
```

`salt.modules.svn.commit`(*cwd*, *targets=None*, *msg=None*, *user=None*, *username=None*, *password=None*, **opts*)

Commit the current directory, files, or directories to the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses ``

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.commit /path/to/repo
```

`salt.modules.svn.diff`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Return the diff of the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses ``

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.diff /path/to/repo
```

`salt.modules.svn.export`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*, *revision='HEAD'*, **opts*)

Create an unversioned copy of a tree.

cwd The path to the Subversion repository

remote [None] URL and path to file or directory checkout

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.export /path/to/repo svn://remote/repo
```

`salt.modules.svn.info`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, *fmt='str'*)

Display the Subversion information from the checkout.

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments svn uses `` by default

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

fmt [str] How to fmt the output from info. (str, xml, list, dict)

CLI Example:

```
salt '*' svn.info /path/to/svn/repo
```

`salt.modules.svn.remove`(*cwd*, *targets*, *msg=None*, *user=None*, *username=None*, *password=None*,
**opts*)

Remove files and directories from the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments

msg [None] Message to attach to the commit log

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.remove /path/to/repo /path/to/repo/remove
```

`salt.modules.svn.status`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Display the status of the current directory, files, or directories in the Subversion repository

cwd The path to the Subversion repository

targets [None] files, directories, and URLs to pass to the command as arguments Default: svn uses ``

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

CLI Example:

```
salt '*' svn.status /path/to/repo
```

`salt.modules.svn.switch`(*cwd*, *remote*, *target=None*, *user=None*, *username=None*, *password=None*,
**opts*)

New in version 2014.1.0.

Switch a working copy of a remote Subversion repository directory

cwd The path to the Subversion repository

remote [None] URL to switch

target [None] The name to give the file or directory working copy Default: svn uses the remote basename

user [None] Run svn as a user other than what the minion runs as

username [None] Connect to the Subversion server as another user

password [None] Connect to the Subversion server with this password

CLI Example:

```
salt '*' svn.switch /path/to/repo svn://remote/repo
```

`salt.modules.svn.update`(*cwd*, *targets=None*, *user=None*, *username=None*, *password=None*, **opts*)

Update the current directory, files, or directories from the remote Subversion repository

cwd The path to the Subversion repository

targets [None] files and directories to pass to the command as arguments Default: svn uses ``

user [None] Run svn as a user other than what the minion runs as

password [None] Connect to the Subversion server with this password

New in version 0.17.0.

username [None] Connect to the Subversion server as another user

CLI Example:

```
salt '*' svn.update /path/to/repo
```

20.9.394 salt.modules.swarm

Docker Swarm Module using Docker's Python SDK

codeauthor Tyler Jones <jonestyler806@gmail.com>

New in version 2018.3.0.

The Docker Swarm Module is used to manage and create Docker Swarms.

Dependencies

- Docker installed on the host
- Docker python sdk >= 2.5.1

Docker Python SDK

```
pip install -U docker
```

More information: <https://docker-py.readthedocs.io/en/stable/>

`salt.modules.swarm.joinswarm`(*remote_addr=<class 'int'>*, *listen_addr=<class 'int'>*, *token=<class 'str'>*)

Join a Swarm Worker to the cluster

remote_addr The manager node you want to connect to for the swarm

listen_addr Listen address used for inter-manager communication if the node gets promoted to manager, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP)

token Either the manager join token or the worker join token. You can get the worker or manager token via `salt '*' swarm.swarm_tokens`

CLI Example:

```
salt '*' swarm.joinswarm remote_addr=192.168.50.10 listen_addr='0.0.0.0'
↪ token='SWMTKN-1-64tux2g0701r84ofq93zppcih0pe081akq45owe9ts61f30x4t-
↪06trjugdu7x2z47j938s54il'
```

`salt.modules.swarm.leave_swarm`(*force=<class 'bool'>*)

Force the minion to leave the swarm

force Will force the minion/worker/manager to leave the swarm

CLI Example:

```
salt '*' swarm.leave_swarm force=False
```

salt.modules.swarm.node_ls (*server=<class 'str'>*)

Displays Information about Swarm Nodes with passing in the server

server The minion/server name

CLI Example:

```
salt '*' swarm.node_ls server=minion1
```

salt.modules.swarm.remove_node (*node_id=<class 'str'>*, *force=<class 'bool'>*)

Remove a node from a swarm and the target needs to be a swarm manager

node_id The node id from the return of `swarm.node_ls`

force Forcefully remove the node/minion from the service

CLI Example:

```
salt '*' swarm.remove_node node_id=z4gjb9rwmqahc2a91snvolm5 force=false
```

salt.modules.swarm.remove_service (*service=<class 'str'>*)

Remove Swarm Service

service The name of the service

CLI Example:

```
salt '*' swarm.remove_service service=Test_Service
```

salt.modules.swarm.service_create (*image=<class 'str'>*, *name=<class 'str'>*, *command=<class 'str'>*, *hostname=<class 'str'>*, *replicas=<class 'int'>*, *target_port=<class 'int'>*, *published_port=<class 'int'>*)

Create Docker Swarm Service Create

image The docker image

name Is the service name

command The docker command to run in the container at launch

hostname The hostname of the containers

replicas How many replicas you want running in the swarm

target_port The target port on the container

published_port port thats published on the host/os

CLI Example:

```
salt '*' swarm.service_create image=httpd name=Test_Service
↳command=None hostname=salthttpd replicas=6 target_port=80 published_port=80
```

salt.modules.swarm.swarm_init (*advertise_addr=<class 'str'>*, *listen_addr=<class 'int'>*, *force_new_cluster=<class 'bool'>*)

Initialize Docker on Minion as a Swarm Manager

advertise_addr The ip of the manager

listen_addr Listen address used for inter-manager communication, as well as determining the networking interface used for the VXLAN Tunnel Endpoint (VTEP). This can either be an address/port combination in the form 192.168.1.1:4567, or an interface followed by a port number, like eth0:4567

force_new_cluster Force a new cluster if True is passed

CLI Example:

```
salt '*' swarm.swarm_init advertise_addr='192.168.50.10' listen_addr='0.0.0.0'
↳force_new_cluster=False
```

`salt.modules.swarm.swarm_service_info` (*service_name*=<class 'str'>)

Swarm Service Information

service_name The name of the service that you want information on about the service

CLI Example:

```
salt '*' swarm.swarm_service_info service_name=Test_Service
```

`salt.modules.swarm.swarm_tokens` ()

Get the Docker Swarm Manager or Worker join tokens

CLI Example:

```
salt '*' swarm.swarm_tokens
```

`salt.modules.swarm.update_node` (*availability*=<class 'str'>, *node_name*=<class 'str'>, *role*=<class 'str'>, *node_id*=<class 'str'>, *version*=<class 'int'>)

Updates docker swarm nodes/needs to target a manager node/minion

availability Drain or Active

node_name minion/node

role role of manager or worker

node_id The Id and that can be obtained via `swarm.node_ls`

version Is obtained by `swarm.node_ls`

CLI Example:

```
salt '*' docker_util.update_node availability=drain node_name=minion2
↳role=worker node_id=3k9x7t8m4pel9c0nqr3iajnzp version=19
```

20.9.395 salt.modules.swift

Module for handling OpenStack Swift calls Author: Anthony Stanton <anthony.stanton@gmail.com>

Inspired by the S3 and Nova modules

depends

- swiftclient Python module

configuration This module is not usable until the user, tenant, auth URL, and password or `auth_key` are specified either in a pillar or in the minion's config file. For example:

```
keystone.user: admin
keystone.tenant: admin
keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
keystone.password: verybadpass
# or
keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

If configuration for multiple OpenStack accounts is required, they can be set up as different configuration profiles: For example:

```
openstack1:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 203802934809284k2j34lkj2l3kj43k
```

(continues on next page)

(continued from previous page)

```

openstack2:
  keystone.user: admin
  keystone.tenant: admin
  keystone.auth_url: 'http://127.0.0.2:5000/v2.0/'
  keystone.password: verybadpass
  # or
  keystone.auth_key: 303802934809284k2j34lkj2l3kj43k

```

With this configuration in place, any of the swift functions can make use of a configuration profile by declaring it explicitly. For example:

```
salt '*' swift.get mycontainer myfile /tmp/file profile=openstack1
```

NOTE: For Rackspace cloud files setting `keystone.auth_version = 1` is recommended.

`salt.modules.swift.delete` (*cont, path=None, profile=None*)

Delete a container, or delete an object from a container.

CLI Example to delete a container:

```
salt myminion swift.delete mycontainer
```

CLI Example to delete an object from a container:

```
salt myminion swift.delete mycontainer remoteobject
```

`salt.modules.swift.get` (*cont=None, path=None, local_file=None, return_bin=False, profile=None*)

List the contents of a container, or return an object from a container. Set `return_bin` to `True` in order to retrieve an object wholesale. Otherwise, Salt will attempt to parse an XML response.

CLI Example to list containers:

```
salt myminion swift.get
```

CLI Example to list the contents of a container:

```
salt myminion swift.get mycontainer
```

CLI Example to return the binary contents of an object:

```
salt myminion swift.get mycontainer myfile.png return_bin=True
```

CLI Example to save the binary contents of an object to a local file:

```
salt myminion swift.get mycontainer myfile.png local_file=/tmp/myfile.png
```

`salt.modules.swift.head`()

`salt.modules.swift.put` (*cont, path=None, local_file=None, profile=None*)

Create a new container, or upload an object to a container.

CLI Example to create a container:

```
salt myminion swift.put mycontainer
```

CLI Example to upload an object to a container:

```
salt myminion swift.put mycontainer remotepath local_file=/path/to/file
```

20.9.396 salt.modules.sysbench

The 'sysbench' module is used to analyze the performance of the minions, right from the master! It measures various system parameters such as CPU, Memory, File I/O, Threads and Mutex.

salt.modules.sysbench.cpu()

Tests for the CPU performance of minions.

CLI Examples:

```
salt '*' sysbench.cpu
```

salt.modules.sysbench.fileio()

This tests for the file read and write operations Various modes of operations are

- sequential write
- sequential rewrite
- sequential read
- random read
- random write
- random read and write

The test works with 32 files with each file being 1Gb in size The test consumes a lot of time. Be patient!

CLI Examples:

```
salt '*' sysbench.fileio
```

salt.modules.sysbench.memory()

This tests the memory for read and write operations.

CLI Examples:

```
salt '*' sysbench.memory
```

salt.modules.sysbench.mutex()

Tests the implementation of mutex

CLI Examples:

```
salt '*' sysbench.mutex
```

salt.modules.sysbench.ping()

salt.modules.sysbench.threads()

This tests the performance of the processor's scheduler

CLI Example:

```
salt '*' sysbench.threads
```

20.9.397 salt.modules.sysfs module

Module for interfacing with SysFS

See also:

<https://www.kernel.org/doc/Documentation/filesystems/sysfs.txt>

New in version 2016.3.0.

`salt.modules.sysfs.attr` (*key*, *value=None*)

Access/write a SysFS attribute. If the attribute is a symlink, it's destination is returned

Returns value or bool

CLI example:

```
salt '*' sysfs.attr block/sda/queue/logical_block_size
```

`salt.modules.sysfs.interfaces` (*root*)

Generate a dictionary with all available interfaces relative to root. Symlinks are not followed.

CLI example:

```
salt '*' sysfs.interfaces block/bcache0/bcache
```

Output example:

```
{
  "r": [
    "state",
    "partial_stripes_expensive",
    "writeback_rate_debug",
    "stripe_size",
    "dirty_data",
    "stats_total/cache_hits",
    "stats_total/cache_bypass_misses",
    "stats_total/bypassed",
    "stats_total/cache_readaheads",
    "stats_total/cache_hit_ratio",
    "stats_total/cache_miss_collisions",
    "stats_total/cache_misses",
    "stats_total/cache_bypass_hits",
  ],
  "rw": [
    "writeback_rate",
    "writeback_rate_update_seconds",
    "cache_mode",
    "writeback_delay",
    "label",
    "writeback_running",
    "writeback_metadata",
    "running",
    "writeback_rate_p_term_inverse",
    "sequential_cutoff",
    "writeback_percent",
    "writeback_rate_d_term",
    "readahead"
  ],
  "w": [
    "stop",
    "clear_stats",
    "attach",
    "detach"
  ]
}
```

Note:

- 'r' interfaces are read-only
- 'w' interfaces are write-only (e.g. actions)
- 'rw' are interfaces that can both be read or written

`salt.modules.sysfs.read(key, root="")`

Read from SysFS

Parameters **key** – file or path in SysFS; if key is a list then root will be prefixed on each key

Returns the full (tree of) SysFS attributes under key

CLI example:

```
salt '*' sysfs.read class/net/em1/statistics
```

`salt.modules.sysfs.target(key, full=True)`

Return the basename of a SysFS key path

Parameters

- **key** – the location to resolve within SysFS
- **full** – full path instead of basename

Returns fullpath or basename of path

CLI example:

```
salt '*' sysfs.read class/ttyS0
```

`salt.modules.sysfs.write(key, value)`

Write a SysFS attribute/action

CLI example:

```
salt '*' sysfs.write devices/system/cpu/cpu0/cpufreq/scaling_governor
→ 'performance'
```

20.9.398 salt.modules.syslog_ng

Module for getting information about syslog-ng

maintainer Tibor Benke <btibi@sch.bme.hu>

maturity new

depends cmd

platform all

This module is capable of managing syslog-ng instances which were installed via a package manager or from source. Users can use a directory as a parameter in the case of most functions, which contains the syslog-ng and syslog-ng-ctl binaries.

Syslog-ng can be installed via a package manager or from source. In the latter case, the syslog-ng and syslog-ng-ctl binaries are not available from the PATH, so users should set location of the sbin directory with `syslog_ng.set_binary_path`.

Similarly, users can specify the location of the configuration file with `syslog_ng.set_config_file`, then the module will use it. If it is not set, syslog-ng uses the default configuration file.

class `salt.modules.syslog_ng.Argument` (`value=""`)

A TypedParameterValue has one or more Arguments. For example this can be the value of `key_file`.

Does not need examples.

build()

class salt.modules.syslog_ng.**Buildable**(*iterable*, *join_body_on=""*, *ap-
pend_extra_newline=True*)

Base class of most classes, which have a build method.

It contains a common build function.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with it's children.

build_body()

Builds the body of a syslog-ng configuration object.

build_header()

Builds the header of a syslog-ng configuration object.

build_tail()

Builds the tail of a syslog-ng configuration object.

class salt.modules.syslog_ng.**GivenStatement**(*value*, *add_newline=True*)

This statement returns a string without modification. It can be used to use existing configuration snippets.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with it's children.

class salt.modules.syslog_ng.**NamedStatement**(*type*, *id=""*, *options=None*)

It represents a configuration statement, which has a name, e.g. a source.

Does not need examples.

class salt.modules.syslog_ng.**Option**(*type=""*, *params=None*)

A Statement class contains Option instances.

An instance of Option can represent a file(), tcp(), udp(), etc. option.

Does not need examples.

add_parameter(param)**build()**

Builds the textual representation of the whole configuration object with it's children.

class salt.modules.syslog_ng.**Parameter**(*iterable=None*, *join_body_on=""*)

An Option has one or more Parameter instances.

Does not need examples.

class salt.modules.syslog_ng.**ParameterValue**(*iterable=None*, *join_body_on=""*)

A TypedParameter can have one or more values.

Does not need examples.

class salt.modules.syslog_ng.**SimpleParameter**(*value=""*)

A Parameter is a SimpleParameter, if it's just a simple type, like a string.

For example:

```
destination d_file {  
    file(  
        '/var/log/messages'
```

(continues on next page)

(continued from previous page)

```
);
};
```

`/var/log/messages` is a `SimpleParameter`.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with it's children.

class `salt.modules.syslog_ng.SimpleParameterValue` (*value=""*)

A `ParameterValue` which holds a simple type, like a string or a number.

For example in `ip(127.0.0.1)` `127.0.0.1` is a `SimpleParameterValue`.

Does not need examples.

build()

Builds the textual representation of the whole configuration object with it's children.

class `salt.modules.syslog_ng.Statement` (*type, id="", options=None, has_name=True*)

It represents a syslog-ng configuration statement, e.g. source, destination, filter.

Does not need examples.

add_child (*option*)

build_header ()

Builds the header of a syslog-ng configuration object.

build_tail ()

Builds the tail of a syslog-ng configuration object.

exception `salt.modules.syslog_ng.SyslogNgError`

class `salt.modules.syslog_ng.TypedParameter` (*type="", values=None*)

A `Parameter`, which has a type:

```
destination d_tcp {
    tcp(
        ip(127.0.0.1)
    );
};
```

`ip(127.0.0.1)` is a `TypedParameter`.

Does not need examples.

add_value (*value*)

build ()

Builds the textual representation of the whole configuration object with it's children.

class `salt.modules.syslog_ng.TypedParameterValue` (*type="", arguments=None*)

We have to go deeper...

A `TypedParameter` can have a 'parameter', which also have a type. For example `key_file` and `cert_file`:

```
source demo_tls_source {
    tcp(
        ip(0.0.0.0)
        port(1999)
    );
};
```

(continues on next page)

(continued from previous page)

```

        tls(
            key_file('/opt/syslog-ng/etc/syslog-ng/key.d/syslog-ng.key')
            cert_file('/opt/syslog-ng/etc/syslog-ng/cert.d/syslog-ng.cert')
        )
    );
};

```

Does not need examples.

add_argument(*arg*)

build()

Builds the textual representation of the whole configuration object with it's children.

class salt.modules.syslog_ng.UnnamedStatement(*type*, *options=None*)

It represents a configuration statement, which doesn't have a name, e.g. a log path.

Does not need examples.

salt.modules.syslog_ng.config(*name*, *config*, *write=True*)

Builds syslog-ng configuration. This function is intended to be used from the state module, users should not use it directly!

name : the id of the Salt document or it is the format of <statement name>.id
config : the parsed YAML code
write : if True, it writes the config into the configuration file, otherwise just returns it

CLI Example:

```

salt '*' syslog_ng.config name='s_local' config="[{ 'tcp': [{ 'ip': '127.0.0.1' }, {
↪ 'port': 1233 } ] } ]"

```

salt.modules.syslog_ng.config_test(*syslog_ng_sbin_dir=None*, *cfgfile=None*)

Runs syntax check against *cfgfile*. If *syslog_ng_sbin_dir* is specified, it is added to the PATH during the test.

CLI Example:

```

salt '*' syslog_ng.config_test
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin
salt '*' syslog_ng.config_test /home/user/install/syslog-ng/sbin /etc/syslog-ng/
↪syslog-ng.conf

```

salt.modules.syslog_ng.get_config_file()

Returns the configuration directory, which contains *syslog-ng.conf*.

CLI Example:

```

salt '*' syslog_ng.get_config_file

```

salt.modules.syslog_ng.modules(*syslog_ng_sbin_dir=None*)

Returns the available modules. If *syslog_ng_sbin_dir* is specified, it is added to the PATH during the execution of the command *syslog-ng*.

CLI Example:

```

salt '*' syslog_ng.modules
salt '*' syslog_ng.modules /home/user/install/syslog-ng/sbin

```

salt.modules.syslog_ng.reload_(*name*)

Reloads *syslog-ng*. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.reload
```

`salt.modules.syslog_ng.set_binary_path(name)`

Sets the path, where the syslog-ng binary can be found. This function is intended to be used from states.

If syslog-ng is installed via a package manager, users don't need to use this function.

CLI Example:

```
salt '*' syslog_ng.set_binary_path name=/usr/sbin
```

`salt.modules.syslog_ng.set_config_file(name)`

Sets the configuration's name. This function is intended to be used from states.

CLI Example:

```
salt '*' syslog_ng.set_config_file name=/etc/syslog-ng
```

`salt.modules.syslog_ng.set_parameters(version=None, binary_path=None, config_file=None, *args, **kwargs)`

Sets variables.

CLI Example:

```
salt '*' syslog_ng.set_parameters version='3.6'
salt '*' syslog_ng.set_parameters binary_path=/home/user/install/syslog-ng/sbin
↪ config_file=/home/user/install/syslog-ng/etc/syslog-ng.conf
```

`salt.modules.syslog_ng.start(name=None, user=None, group=None, chroot=None, caps=None, no_caps=False, pidfile=None, enable_core=False, fd_limit=None, verbose=False, debug=False, trace=False, yydebug=False, persist_file=None, control=None, worker_threads=None)`

Ensures, that syslog-ng is started via the given parameters. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file`, is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.start
```

`salt.modules.syslog_ng.stats(syslog_ng_sbin_dir=None)`

Returns statistics from the running syslog-ng instance. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng-ctl`.

CLI Example:

```
salt '*' syslog_ng.stats
salt '*' syslog_ng.stats /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.stop(name=None)`

Kills syslog-ng. This function is intended to be used from the state module.

Users shouldn't use this function, if the service module is available on their system. If `syslog_ng.set_config_file` is called before, this function will use the set binary path.

CLI Example:

```
salt '*' syslog_ng.stop
```

`salt.modules.syslog_ng.version`(*syslog_ng_sbin_dir=None*)

Returns the version of the installed syslog-ng. If `syslog_ng_sbin_dir` is specified, it is added to the PATH during the execution of the command `syslog-ng`.

CLI Example:

```
salt '*' syslog_ng.version
salt '*' syslog_ng.version /home/user/install/syslog-ng/sbin
```

`salt.modules.syslog_ng.write_config`(*config, newlines=2*)

Writes the given parameter `config` into the config file. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_config config='# comment'
```

`salt.modules.syslog_ng.write_version`(*name*)

Removes the previous configuration file, then creates a new one and writes the name line. This function is intended to be used from states.

If `syslog_ng.set_config_file`, is called before, this function will use the set config file.

CLI Example:

```
salt '*' syslog_ng.write_version name="3.6"
```

20.9.399 salt.modules.sysmod

The `sys` module provides information about the available functions on the minion

`salt.modules.sysmod.argspec`(*module=""*)

Return the argument specification of functions in Salt execution modules.

CLI Example:

```
salt '*' sys.argspec pkg.install
salt '*' sys.argspec sys
salt '*' sys.argspec
```

Module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.argspec 'pkg.*'
```

`salt.modules.sysmod.doc`(**args*)

Return the docstrings for all modules. Optionally, specify a module or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple modules/functions can be specified.

CLI Example:

```
salt '*' sys.doc
salt '*' sys.doc sys
salt '*' sys.doc sys.doc
salt '*' sys.doc network.traceroute user.info
```

Modules can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.doc 'sys.*'
salt '*' sys.doc 'sys.list_*'
```

`salt.modules.sysmod.list_functions(*args, **kwargs)`

List the functions for all modules. Optionally, specify a module or modules from which to list.

CLI Example:

```
salt '*' sys.list_functions
salt '*' sys.list_functions sys
salt '*' sys.list_functions sys user
```

Function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_functions 'sys.list_*'
```

New in version ?.

```
salt '*' sys.list_functions 'module.specific_function'
```

`salt.modules.sysmod.list_modules(*args)`

List the modules loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_modules
```

Module names can be specified as globs.

```
salt '*' sys.list_modules 's*'
```

`salt.modules.sysmod.list_renderers(*args)`

List the renderers loaded on the minion

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.list_renderers
```

Render names can be specified as globs.

```
salt '*' sys.list_renderers 'yaml*'
```

`salt.modules.sysmod.list_returner_functions(*args, **kwargs)`

List the functions for all returner modules. Optionally, specify a returner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returner_functions
salt '*' sys.list_returner_functions mysql
salt '*' sys.list_returner_functions mysql etcd
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returner_functions 'sqlite3.get_*'
```

`salt.modules.sysmod.list_returners(*args)`

List the returners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_returners
```

Returner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_returners 's*'
```

`salt.modules.sysmod.list_runner_functions(*args, **kwargs)`

List the functions for all runner modules. Optionally, specify a runner module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runner_functions
salt '*' sys.list_runner_functions state
salt '*' sys.list_runner_functions state virt
```

Runner function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runner_functions 'state.*' 'virt.*'
```

`salt.modules.sysmod.list_runners(*args)`

List the runners loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_runners
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_runners 'm*'
```

`salt.modules.sysmod.list_state_functions(*args, **kwargs)`

List the functions for all state modules. Optionally, specify a state module or modules from which to list.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_functions
salt '*' sys.list_state_functions file
salt '*' sys.list_state_functions pkg user
```

State function names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_functions 'file.*'
salt '*' sys.list_state_functions 'file.s*'
```

New in version ?.

```
salt '*' sys.list_state_functions 'module.specific_function'
```

`salt.modules.sysmod.list_state_modules(*args)`

List the modules loaded on the minion

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.list_state_modules
```

State module names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.list_state_modules 'mysql_*'
```

`salt.modules.sysmod.reload_modules()`

Tell the minion to reload the execution modules

CLI Example:

```
salt '*' sys.reload_modules
```

`salt.modules.sysmod.renderer_doc(*args)`

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers can be specified.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc cheetah
salt '*' sys.renderer_doc jinja json
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_doc 'c*' 'j*'
```

`salt.modules.sysmod.renderer_argspec` (*module=*)

Return the argument specification of functions in Salt renderer modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.renderer_argspec xmpp
salt '*' sys.renderer_argspec xmpp smtp
salt '*' sys.renderer_argspec
```

Renderer names can be specified as globs.

```
salt '*' sys.renderer_argspec 'sqlite3.*'
```

`salt.modules.sysmod.renderer_doc` (**args*)

Return the docstrings for all renderers. Optionally, specify a renderer or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple renderers/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.renderer_doc
salt '*' sys.renderer_doc sqlite3
salt '*' sys.renderer_doc sqlite3.get_fun
salt '*' sys.renderer_doc sqlite3.get_fun etcd.get_fun
```

Renderer names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.renderer_doc 'sqlite3.get_*'
```

`salt.modules.sysmod.runner_argspec` (*module=*)

Return the argument specification of functions in Salt runner modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.runner_argspec state
salt '*' sys.runner_argspec http
salt '*' sys.runner_argspec
```

Runner names can be specified as globs.

```
salt '*' sys.runner_argspec 'winrepo.*'
```

`salt.modules.sysmod.runner_doc` (**args*)

Return the docstrings for all runners. Optionally, specify a runner or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple runners/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.runner_doc
salt '*' sys.runner_doc cache
salt '*' sys.runner_doc cache.grains
salt '*' sys.runner_doc cache.grains mine.get
```

Runner names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.runner_doc 'cache.clear_*'
```

`salt.modules.sysmod.state_argspec`(*module=""*)

Return the argument specification of functions in Salt state modules.

New in version 2015.5.0.

CLI Example:

```
salt '*' sys.state_argspec pkg.installed
salt '*' sys.state_argspec file
salt '*' sys.state_argspec
```

State names can be specified as globs.

```
salt '*' sys.state_argspec 'pkg.*'
```

`salt.modules.sysmod.state_doc`(**args*)

Return the docstrings for all states. Optionally, specify a state or a function to narrow the selection.

The strings are aggregated into a single document on the master for easy reading.

Multiple states/functions can be specified.

New in version 2014.7.0.

CLI Example:

```
salt '*' sys.state_doc
salt '*' sys.state_doc service
salt '*' sys.state_doc service.running
salt '*' sys.state_doc service.running ipables.append
```

State names can be specified as globs.

New in version 2015.5.0.

```
salt '*' sys.state_doc 'service.*' 'iptables.*'
```

`salt.modules.sysmod.state_schema`(*module=""*)

Return a JSON Schema for the given state function(s)

New in version 2016.3.0.

CLI Example:

```
salt '*' sys.state_schema
salt '*' sys.state_schema pkg.installed
```

20.9.400 salt.modules.sysrc

sysrc module for FreeBSD

salt.modules.sysrc.get(***kwargs*)

Return system rc configuration variables

CLI Example:

```
salt '*' sysrc.get includeDefaults=True
```

salt.modules.sysrc.remove(*name, **kwargs*)

Remove system rc configuration variables

CLI Example:

```
salt '*' sysrc.remove name=sshd_enable
```

salt.modules.sysrc.set_(*name, value, **kwargs*)

Set system rc configuration variables

CLI Example:

```
salt '*' sysrc.set name=sshd_flags value="-p 2222"
```

20.9.401 salt.modules.system

Support for reboot, shutdown, etc on POSIX-like systems.

Note: If you have configured a wrapper such as molly-guard to intercept *interactive* shutdown commands, be aware that calling `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` with `salt-call` will hang indefinitely while the wrapper script waits for user input. Calling them with `salt` will work as expected.

salt.modules.system.get_computer_desc()

Get PRETTY_HOSTNAME value stored in /etc/machine-info If this file doesn't exist or the variable doesn't exist return False.

Returns Value of PRETTY_HOSTNAME if this does not exist False.

Return type `str`

CLI Example:

```
salt '*' system.get_computer_desc
```

salt.modules.system.get_computer_name()

Get hostname.

CLI Example:

```
salt '*' network.get_hostname
```

salt.modules.system.get_system_date(*utc_offset=None*)

Get the system date

Parameters **utc_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system date.

Return type `str`

CLI Example:

```
salt '*' system.get_system_date
```

`salt.modules.system.get_system_date_time(utc_offset=None)`

Get the system date/time.

Parameters `utc_offset` (`str`) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in YYYY-MM-DD hh:mm:ss format.

Return type `str`

CLI Example:

```
salt '*' system.get_system_date_time "'-0500'"
```

`salt.modules.system.get_system_time(utc_offset=None)`

Get the system time.

Parameters `utc_offset` (`str`) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type `str`

CLI Example:

```
salt '*' system.get_system_time
```

`salt.modules.system.halt()`

Halt a running system

CLI Example:

```
salt '*' system.halt
```

`salt.modules.system.has_settable_hwclock()`

Returns True if the system has a hardware clock capable of being set from software.

CLI Example:

```
salt '*' system.has_settable_hwclock
```

`salt.modules.system.init(runlevel)`

Change the system runlevel on sysV compatible systems

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.system.poweroff()`

Poweroff a running system

CLI Example:

```
salt '*' system.poweroff
```

`salt.modules.system.reboot` (*at_time=None*)

Reboot the system

at_time The wait time in minutes before the system will be rebooted.

CLI Example:

```
salt '*' system.reboot
```

`salt.modules.system.set_computer_desc` (*desc*)

Set PRETTY_HOSTNAME value stored in /etc/machine-info This will create the file if it does not exist. If it is unable to create or modify this file returns False.

Parameters **desc** (*str*) – The computer description

Returns False on failure. True if successful.

CLI Example:

```
salt '*' system.set_computer_desc "Michael's laptop"
```

`salt.modules.system.set_computer_name` (*hostname*)

Modify hostname.

CLI Example:

```
salt '*' system.set_computer_name master.saltstack.com
```

`salt.modules.system.set_system_date` (*newdate, utc_offset=None*)

Set the system date. Use <mm-dd-yy> format for the date.

Parameters **newdate** (*str*) – The date to set. Can be any of the following formats:

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY
- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.system.set_system_date_time` (*years=None, months=None, days=None, hours=None, minutes=None, seconds=None, utc_offset=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

Updates hardware clock, if present, in addition to software (kernel) clock.

Parameters

- **years** (*int*) – Years digit, ie: 2015
- **months** (*int*) – Months digit: 1 - 12
- **days** (*int*) – Days digit: 1 - 31
- **hours** (*int*) – Hours digit: 0 - 23
- **minutes** (*int*) – Minutes digit: 0 - 59
- **seconds** (*int*) – Seconds digit: 0 - 59
- **utc_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns True if successful. Otherwise False.

Return type `bool`

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53 "'-0500'"
```

`salt.modules.system.set_system_time(newtime, utc_offset=None)`

Set the system time.

Parameters

- **newtime** (*str*) – The time to set. Can be any of the following formats. - HH:MM:SS AM/PM - HH:MM AM/PM - HH:MM:SS (24 hour) - HH:MM (24 hour)

Note that the salt command line parser parses the date/time before we obtain the argument (preventing us from doing utc) Therefore the argument must be passed in as a string. Meaning you may have to quote the text twice from the command line.

- **utc_offset** (*str*) – The utc offset in 4 digit (+0600) format with an optional sign (+/-). Will default to None which will use the local timezone. To set the time based off of UTC use "+0000". Note: if being passed through the command line will need to be quoted twice to allow negative offsets.

Returns Returns True if successful. Otherwise False.

Return type `bool`

CLI Example:

```
salt '*' system.set_system_time "'11:20'"
```

`salt.modules.system.shutdown(at_time=None)`

Shutdown a running system

at_time The wait time in minutes before the system will be shutdown.

CLI Example:

```
salt '*' system.shutdown 5
```

20.9.402 salt.modules.system_profiler

System Profiler Module

Interface with macOS's command-line System Profiler utility to get information about package receipts and installed applications.

New in version 2015.5.0.

`salt.modules.system_profiler.applications()`

Return the results of a call to `system_profiler -xml -detail full SPApplicationsDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

Note that this can take a long time depending on how many applications are installed on the target Mac.

CLI Example:

```
salt '*' systemprofiler.applications
```

`salt.modules.system_profiler.receipts()`

Return the results of a call to `system_profiler -xml -detail full SPIInstallHistoryDataType` as a dictionary. Top-level keys of the dictionary are the names of each set of install receipts, since there can be multiple receipts with the same name. Contents of each key are a list of dictionaries.

CLI Example:

```
salt '*' systemprofiler.receipts
```

20.9.403 salt.modules.systemd

Provides the service module for systemd

New in version 0.10.0.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

salt.modules.systemd.available(*name*)

New in version 0.10.4.

Check that the given service is available taking into account template units.

CLI Example:

```
salt '*' service.available sshd
```

salt.modules.systemd.disable(*name*, *no_block=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Disable the named service to not start when the system boots

no_block [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.disable <service name>
```

salt.modules.systemd.disabled(*name*)

Return if the named service is disabled from starting on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

salt.modules.systemd.enable(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*, ***kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Enable the named service to start when the system boots

no_block [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to enable the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before enabling. This behavior is no longer the default.

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.systemd.enabled(name, **kwargs)`

Return if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.systemd.execs()`

New in version 2014.7.0.

Return a list of all files specified as ExecStart for all services.

CLI Example:

```
salt '*' service.execs
```

`salt.modules.systemd.force_reload(name, no_block=True, unmask=False, unmask_runtime=False)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

New in version 0.12.0.

Force-reload the specified service with systemd

no_block [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to force-reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before force-reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.systemd.get_all()`

Return a list of all available services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.systemd.get_disabled()`

Return a list of all disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.systemd.get_enabled()`

Return a list of all enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.systemd.get_running()`

Return a list of all running services, so far as systemd is concerned

CLI Example:

```
salt '*' service.get_running
```

`salt.modules.systemd.get_static()`

New in version 2015.8.5.

Return a list of all static services

CLI Example:

```
salt '*' service.get_static
```

`salt.modules.systemd.mask(name, runtime=False)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Mask the specified service with systemd

runtime [False] Set to True to mask this service only until the next reboot

New in version 2015.8.5.

CLI Example:

```
salt '*' service.mask foo
salt '*' service.mask foo runtime=True
```

`salt.modules.systemd.masked(name, runtime=False)`

New in version 2015.8.0.

Changed in version 2015.8.5: The return data for this function has changed. If the service is masked, the return value will now be the output of the `systemctl is-enabled` command (so that a persistent mask can be distinguished from a runtime mask). If the service is not masked, then `False` will be returned.

Changed in version 2017.7.0: This function now returns a boolean telling the user whether a mask specified by the new `runtime` argument is set. If `runtime` is `False`, this function will return `True` if an indefinite mask is set for the named service (otherwise `False` will be returned). If `runtime` is `False`, this function will return `True` if a runtime mask is set, otherwise `False`.

Check whether or not a service is masked

runtime [False] Set to True to check for a runtime mask

New in version 2017.7.0: In previous versions, this function would simply return the output of `systemctl is-enabled` when the service was found to be masked. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now only checks for runtime masks if this argument is set to True. Otherwise, it will check for an indefinite mask.

CLI Examples:

```
salt '*' service.masked foo
salt '*' service.masked foo runtime=True
```

salt.modules.systemd.missing(*name*)

New in version 2014.1.0.

The inverse of *service.available*. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

salt.modules.systemd.reload_(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of False (no quotes).

Reload the specified service with `systemd`

no_block [False] Set to True to reload the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

unmask_runtime [False] Set to True to remove a runtime mask before attempting to reload the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before reloading. This behavior is no longer the default.

CLI Example:

```
salt '*' service.reload <service name>
```

salt.modules.systemd.restart(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of False (no quotes).

Restart the specified service with `systemd`

no_block [False] Set to True to start the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to True to remove an indefinite mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

unmask_runtime [False] Set to `True` to remove a runtime mask before attempting to restart the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before restarting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.restart <service name>
```

salt.modules.systemd.show(*name*)

New in version 2014.7.0.

Show properties of one or more units/jobs or the manager

CLI Example:

```
salt '*' service.show <service name>
```

salt.modules.systemd.start(*name*, *no_block=False*, *unmask=False*, *unmask_runtime=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Start the specified service with `systemd`

no_block [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

unmask [False] Set to `True` to remove an indefinite mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

unmask_runtime [False] Set to `True` to remove a runtime mask before attempting to start the service.

New in version 2017.7.0: In previous releases, Salt would simply unmask a service before starting. This behavior is no longer the default.

CLI Example:

```
salt '*' service.start <service name>
```

salt.modules.systemd.status(*name*, *sig=None*)

Return the status for a service via `systemd`. If the name contains globbing, a dict mapping service name to `True/False` values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Not implemented

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.systemd.stop(*name*, *no_block=False*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is be-

ing modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Stop the specified service with `systemd`

no_block [False] Set to `True` to start the service using `--no-block`.

New in version 2017.7.0.

CLI Example:

```
salt '*' service.stop <service name>
```

`salt.modules.systemd.systemctl_reload()`

New in version 0.15.0.

Reloads `systemctl`, an action needed whenever unit files are updated.

CLI Example:

```
salt '*' service.systemctl_reload
```

`salt.modules.systemd.unmask_(name, runtime=False)`

New in version 2015.5.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands run by this function from the `salt-minion` daemon's control group. This is done to avoid a race condition in cases where the `salt-minion` service is restarted while a service is being modified. If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Unmask the specified service with `systemd`

runtime [False] Set to `True` to unmask this service only until the next reboot

New in version 2017.7.0: In previous versions, this function would remove whichever mask was identified by running `systemctl is-enabled` on the service. However, since it is possible to both have both indefinite and runtime masks on a service simultaneously, this function now removes a runtime mask only when this argument is set to `True`, and otherwise removes an indefinite mask.

CLI Example:

```
salt '*' service.unmask foo
salt '*' service.unmask foo runtime=True
```

20.9.404 salt.modules.telegram

Module for sending messages via Telegram.

configuration In order to send a message via the Telegram, certain configuration is required in `/etc/salt/minion` on the relevant minions or in the pillar. Some sample configs might look like:

```
telegram.chat_id: '123456789'
telegram.token: '00000000:xxxxxxxxxxxxxxxxxxxxxxxxxxxx'
```

`salt.modules.telegram.post_message(message, chat_id=None, token=None)`

Send a message to a Telegram chat.

Parameters

- **message** – The message to send to the Telegram chat.
- **chat_id** – (optional) The Telegram chat id.
- **token** – (optional) The Telegram API token.

Returns Boolean if message was sent successfully.

CLI Example:

```
salt '*' telegram.post_message message="Hello Telegram!"
```

20.9.405 salt.modules.telemetry

Connection module for Telemetry

New in version 2016.3.0.

<https://github.com/mongolab/mongolab-telemetry-api-docs/blob/master/alerts.md>

configuration This module accepts explicit telemetry credentials or can also read api key credentials from a pillar. More Information available [here](#).

In the minion's config file:

```
telemetry.telemetry_api_keys:
- abc123 # Key 1
- efg321 # Backup Key 1
telemetry_api_base_url: https://telemetry-api.mongolab.com/v0
```

depends requests

salt.modules.telemetry.create_alarm(*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*)

create an telemetry alarms.

data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.create_alarm rs-ds033197 {} profile=telemetry
```

salt.modules.telemetry.delete_alarms(*deployment_id*, *alert_id=None*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

delete an alert specified by alert_id or if not specified blows away all the alerts in the current deployment.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.delete_alarms rs-ds033197 profile=telemetry
```

salt.modules.telemetry.get_alarms(*deployment_id*, *profile='telemetry'*)

get all the alarms set up against the current deployment

Returns dictionary of alarm information

CLI Example:

```
salt myminion telemetry.get_alarms rs-ds033197 profile=telemetry
```

salt.modules.telemetry.get_alert_config(*deployment_id*, *metric_name=None*, *api_key=None*, *profile='telemetry'*)

Get all alert definitions associated with a given deployment or if *metric_name* is specified, obtain the specific alert config

Returns dictionary or list of dictionaries.

CLI Example:

```
salt myminion telemetry.get_alert_config rs-ds033197 currentConnections profile=telemetry salt
myminion telemetry.get_alert_config rs-ds033197 profile=telemetry
```

`salt.modules.telemetry.get_notification_channel_id`(*notify_channel*, *profile*, *file='telemetry'*)

Given an email address, creates a notification-channels if one is not found and also returns the corresponding notification channel id.

notify_channel Email escalation policy

profile A dict of telemetry config information.

CLI Example:

```
salt myminion telemetry.get_notification_channel_id userx@company.com profile=telemetry
```

`salt.modules.telemetry.update_alarm`(*deployment_id*, *metric_name*, *data*, *api_key=None*, *profile='telemetry'*)

update an telemetry alarms. data is a dict of alert configuration data.

Returns (bool success, str message) tuple.

CLI Example:

```
salt myminion telemetry.update_alarm rs-ds033197 {} profile=telemetry
```

20.9.406 salt.modules.temp

Simple module for creating temporary directories and files

This is a thin wrapper around Python's tempfile module

New in version 2015.8.0.

`salt.modules.temp.dir`(*suffix=""*, *prefix='tmp'*, *parent=None*)

Create a temporary directory

CLI Example:

```
salt '*' temp.dir
salt '*' temp.dir prefix='mytemp-' parent='/var/run/'
```

`salt.modules.temp.file`(*suffix=""*, *prefix='tmp'*, *parent=None*)

Create a temporary file

CLI Example:

```
salt '*' temp.file
salt '*' temp.file prefix='mytemp-' parent='/var/run/'
```

20.9.407 salt.modules.test

Module for running arbitrary tests

`salt.modules.test.arg`(**args*, ***kwargs*)

Print out the data passed into the function **args* and *kwargs*, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns {"args": args, "kwargs": kwargs}.

CLI Example:

```
salt '*' test.arg 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}
```

`salt.modules.test.arg_clean`(**args*, ***kwargs*)

Like test.arg but cleans kwargs of the `__pub*` items CLI Example:

```
salt '*' test.arg_clean 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_repr(*args, **kwargs)`

Print out the data passed into the function `*args` and `kwargs`, this is used to both test the publication data and cli argument passing, but also to display the information available within the publication data. Returns `{"args": repr(args), "kwargs": repr(kwargs)}`.

CLI Example:

```
salt '*' test.arg_repr 1 "two" 3.1 txt="hello" wow='{a: 1, b: "hello"}'
```

`salt.modules.test.arg_type(*args, **kwargs)`

Print out the types of the args and kwargs. This is used to test the types of the args and kwargs passed down to the minion

CLI Example:

```
salt '*' test.arg_type 1 'int'
```

`salt.modules.test.assertion(assertion)`

Assert the given argument

CLI Example:

```
salt '*' test.assertion False
```

`salt.modules.test.attr_call()`

Call `grains.items` via the attribute

CLI Example:

```
salt '*' test.attr_call
```

`salt.modules.test.collatz(start)`

Execute the collatz conjecture from the passed starting number, returns the sequence and the time it took to compute. Used for performance tests.

CLI Example:

```
salt '*' test.collatz 3
```

`salt.modules.test.conf_test()`

Return the value for `test.foo` in the minion configuration file, or return the default value

CLI Example:

```
salt '*' test.conf_test
```

`salt.modules.test.cross_test(func, args=None)`

Execute a minion function via the `__salt__` object in the test module, used to verify that the minion functions can be called via the `__salt__` module.

CLI Example:

```
salt '*' test.cross_test file.gid_to_group 0
```

`salt.modules.test.echo(text)`

Return a string - used for testing the connection

CLI Example:

```
salt '*' test.echo 'foo bar baz quo qux'
```

`salt.modules.test.exception(message='Test Exception')`

Raise an exception

Optionally provide an error message or output the full stack.

CLI Example:

```
salt '*' test.exception 'Oh noes!'
```

`salt.modules.test.false_()`

Always return False

CLI Example:

```
salt '*' test.false
```

`salt.modules.test.fib(num)`

Return the num-th Fibonacci number, and the time it took to compute in seconds. Used for performance tests.

This function is designed to have terrible performance.

CLI Example:

```
salt '*' test.fib 3
```

`salt.modules.test.get_opts()`

Return the configuration options passed to this minion

CLI Example:

```
salt '*' test.get_opts
```

`salt.modules.test.kwarg(**kwargs)`

Print out the data passed into the function `**kwargs`, this is used to both test the publication data and cli kwarg passing, but also to display the information available within the publication data.

CLI Example:

```
salt '*' test.kwarg num=1 txt="two" env='{a: 1, b: "hello"}'
```

`salt.modules.test.missing_func()`

`salt.modules.test.module_report()`

Return a dict containing all of the execution modules with a report on the overall availability via different references

CLI Example:

```
salt '*' test.module_report
```

`salt.modules.test.not_loaded()`

List the modules that were not loaded by the salt loader system

CLI Example:

```
salt '*' test.not_loaded
```

salt.modules.test.opts_pkg()

Return an opts package with the grains and opts for this minion. This is primarily used to create the options used for master side state compiling routines

CLI Example:

```
salt '*' test.opts_pkg
```

salt.modules.test.outputter(*data*)

Test the outputter, pass in data to return

CLI Example:

```
salt '*' test.outputter foobar
```

salt.modules.test.ping()

Used to make sure the minion is up and responding. Not an ICMP ping.

Returns True.

CLI Example:

```
salt '*' test.ping
```

salt.modules.test.provider(*module*)

Pass in a function name to discover what provider is being used

CLI Example:

```
salt '*' test.provider service
```

salt.modules.test.providers()

Return a dict of the provider names and the files that provided them

CLI Example:

```
salt '*' test.providers
```

salt.modules.test.rand_sleep(*max=60*)

Sleep for a random number of seconds, used to test long-running commands and minions returning at differing intervals

CLI Example:

```
salt '*' test.rand_sleep 60
```

salt.modules.test.random_hash(*size=999999999, hash_type=None*)

New in version 2015.5.2.

Changed in version 2018.3.0: Function has been renamed from `test.rand_str` to `test.random_hash`

Generates a random number between 1 and `size`, then returns a hash of that number. If no `hash_type` is passed, the `hash_type` specified by the minion's `hash_type` config option is used.

CLI Example:

```
salt '*' test.random_hash
salt '*' test.random_hash hash_type=sha512
```

salt.modules.test.retcode(*code=42*)

Test that the returncode system is functioning correctly

CLI Example:

```
salt '*' test.retcode 42
```

`salt.modules.test.sleep(length)`

Instruct the minion to initiate a process that will sleep for a given period of time.

CLI Example:

```
salt '*' test.sleep 20
```

`salt.modules.test.stack()`

Return the current stack trace

CLI Example:

```
salt '*' test.stack
```

`salt.modules.test.true_()`

Always return True

CLI Example:

```
salt '*' test.true
```

`salt.modules.test.try_(module, return_try_exception=False, **kwargs)`

Try to run a module command. On an exception return None. If *return_try_exception* is set True return the exception. This can be helpful in templates where running a module might fail as expected.

CLI Example:

```
<pre>
{% for i in range(0,230) %}
  {{ salt['test.try'](module='ipmi.get_users', bmc_host='172.2.2.
  →'+i)|yaml(False) }}
{% endfor %}
</pre>
```

`salt.modules.test.tty(*args, **kwargs)`

Deprecated! Moved to cmdmod.

CLI Example:

```
salt '*' test.tty tty0 'This is a test'
salt '*' test.tty pts3 'This is a test'
```

`salt.modules.test.version()`

Return the version of salt on the minion

CLI Example:

```
salt '*' test.version
```

`salt.modules.test.versions()`

This function is an alias of `versions_report`.

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

`salt.modules.test.versions_information()`

Report the versions of dependent and system software

CLI Example:

```
salt '*' test.versions_information
```

`salt.modules.test.versions_report()`

Returns versions of components used by salt

CLI Example:

```
salt '*' test.versions_report
```

20.9.408 salt.modules.testinframod module

This module exposes the functionality of the TestInfra library for use with SaltStack in order to verify the state of your minions. In order to allow for the addition of new resource types in TestInfra this module dynamically generates wrappers for the various resources by iterating over the values in the `__all__` variable exposed by the `testinfra.modules` namespace.

20.9.409 salt.modules.test_virtual

Module for running arbitrary tests with a `__virtual__` function

`salt.modules.test_virtual.ping()`

20.9.410 salt.modules.textfsm_mod module

TextFSM

New in version 2018.3.0.

Execution module that processes plain text and extracts data using TextFSM templates. The output is presented in JSON serializable data, and can be easily re-used in other modules, or directly inside the renderer (Jinja, Mako, Genshi, etc.).

depends

- textfsm Python library

Note: For Python 2/3 compatibility, it is more recommended to install the `jtextfsm` library: `pip install jtextfsm`.

`salt.modules.textfsm_mod.extract(template_path, raw_text=None, raw_text_file=None, saltenv='base')`

Extracts the data entities from the unstructured raw text sent as input and returns the data mapping, processing using the TextFSM template.

template_path The path to the TextFSM template. This can be specified using the absolute path to the file, or using one of the following URL schemes:

- `salt://`, to fetch the template from the Salt fileserver.

- http:// or https://
- ftp://
- s3://
- swift://

raw_text: **None** The unstructured text to be parsed.

raw_text_file: **None** Text file to read, having the raw text to be parsed using the TextFSM template. Supports the same URL schemes as the `template_path` argument.

saltenv: **base** Salt fileserver environment from which to retrieve the file. Ignored if `template_path` is not a `salt://` URL.

CLI Example:

```
salt '*' textfsm.extract salt://textfsm/juniper_version_template raw_text_
↳file=s3://junos_ver.txt
salt '*' textfsm.extract http://some-server/textfsm/juniper_version_template raw_
↳text='Hostname: router.abc ... snip ...'
```

Jinja template example:

```
{%- set raw_text = 'Hostname: router.abc ... snip ...' -%}
{%- set textfsm_extract = salt.textfsm.extract('https://some-server/textfsm/
↳juniper_version_template', raw_text) -%}
```

Raw text example:

```
Hostname: router.abc
Model: mx960
JUNOS Base OS boot [9.1S3.5]
JUNOS Base OS Software Suite [9.1S3.5]
JUNOS Kernel Software Suite [9.1S3.5]
JUNOS Crypto Software Suite [9.1S3.5]
JUNOS Packet Forwarding Engine Support (M/T Common) [9.1S3.5]
JUNOS Packet Forwarding Engine Support (MX Common) [9.1S3.5]
JUNOS Online Documentation [9.1S3.5]
JUNOS Routing Software Suite [9.1S3.5]
```

TextFSM Example:

```
Value Chassis (\S+)
Value Required Model (\S+)
Value Boot (.* )
Value Base (.* )
Value Kernel (.* )
Value Crypto (.* )
Value Documentation (.* )
Value Routing (.* )

Start
# Support multiple chassis systems.
^\S+:\$ -> Continue.Record
^{\Chassis}:\$
^Model: \{\Model\}
^JUNOS Base OS boot \[\{\Boot}\]
^JUNOS Software Release \[\{\Base}\]
^JUNOS Base OS Software Suite \[\{\Base}\]
^JUNOS Kernel Software Suite \[\{\Kernel}\]
^JUNOS Crypto Software Suite \[\{\Crypto}\]
^JUNOS Online Documentation \[\{\Documentation}\]
^JUNOS Routing Software Suite \[\{\Routing}\]
```

Output example:

```
{
  "comment": "",
  "result": true,
  "out": [
    {
      "kernel": "9.1S3.5",
      "documentation": "9.1S3.5",
      "boot": "9.1S3.5",
      "crypto": "9.1S3.5",
      "chassis": "",
      "routing": "9.1S3.5",
      "base": "9.1S3.5",
      "model": "mx960"
    }
  ]
}
```

`salt.modules.textfsm_mod.index`(*command*, *platform=None*, *platform_grain_name=None*, *platform_column_name=None*, *output=None*, *output_file=None*, *textfsm_path=None*, *index_file=None*, *saltenv='base'*, *include_empty=False*, *include_pat=None*, *exclude_pat=None*)

Dynamically identify the template required to extract the information from the unstructured raw text.

The output has the same structure as the `extract` execution function, the difference being that `index` is capable to identify what template to use, based on the platform details and the `command`.

command The command executed on the device, to get the output.

platform The platform name, as defined in the TextFSM index file.

Note: For ease of use, it is recommended to define the TextFSM indexfile with values that can be matches using the grains.

platform_grain_name The name of the grain used to identify the platform name in the TextFSM index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_grain`.

Note: This option is ignored when `platform` is specified.

platform_column_name: Platform The column name used to identify the platform, exactly as specified in the TextFSM index file. Default: `Platform`.

Note: This field is case sensitive, make sure to assign the correct value to this option, exactly as defined in the index file.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_platform_column_name`.

output The raw output from the device, to be parsed and extract the structured data.

output_file The path to a file that contains the raw output from the device, used to extract the structured data. This option supports the usual Salt-specific schemes: `file://`, `salt://`, `http://`, `https://`,

ftp://, s3://, swift://.

textfsm_path The path where the TextFSM templates can be found. This can be either absolute path on the server, either specified using the following URL schemes: file://, salt://, http://, https://, ftp://, s3://, swift://.

Note: This needs to be a directory with a flat structure, having an index file (whose name can be specified using the `index_file` option) and a number of TextFSM templates.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_path`.

index_file: `index` The name of the TextFSM index file, under the `textfsm_path`. Default: `index`.

Note: This option can be also specified in the minion configuration file or pillar as `textfsm_index_file`.

saltenv: `base` Salt fileserver environment from which to retrieve the file. Ignored if `textfsm_path` is not a `salt://` URL.

include_empty: `False` Include empty files under the `textfsm_path`.

include_pat Glob or regex to narrow down the files cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

exclude_pat Glob or regex to exclude certain files from being cached from the given path. If matching with a regex, the regex must be prefixed with `E@`, otherwise the expression will be interpreted as a glob.

Note: If used with `include_pat`, files matching this pattern will be excluded from the subset of files defined by `include_pat`.

CLI Example:

```
salt '*' textfsm.index 'sh ver' platform=Juniper output_file=salt://textfsm/
↳juniper_version_example textfsm_path=salt://textfsm/
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
↳example textfsm_path=ftp://textfsm/ platform_column_name=Vendor
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_
↳example textfsm_path=https://some-server/textfsm/ platform_column_name=Vendor
↳platform_grain_name=vendor
```

TextFSM index file example:

```
salt://textfsm/index
```

```
Template, Hostname, Vendor, Command
juniper_version_template, .*, Juniper, sh[[ow]] ve[[rsion]]
```

The usage can be simplified, by defining (some of) the following options: `textfsm_platform_grain`, `textfsm_path`, `textfsm_platform_column_name`, or `textfsm_index_file`, in the (proxy) minion configuration file or pillar.

Configuration example:

```
textfsm_platform_grain: vendor
textfsm_path: salt://textfsm/
textfsm_platform_column_name: Vendor
```

And the CLI usage becomes as simple as:

```
salt '*' textfsm.index 'sh ver' output_file=salt://textfsm/juniper_version_example
```

Usgae inside a Jinja template:

```
{%- set command = 'sh ver' -%}  
{%- set output = salt.net.cli(command) -%}  
{%- set textfsm_extract = salt.textfsm.index(command, output=output) -%}
```

20.9.411 salt.modules.timezone

Module for managing timezone on POSIX-like systems.

salt.modules.timezone.get_hwclock()

Get current hardware clock setting (UTC or localtime)

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.timezone.get_offset()

Get current numeric timezone offset from UCT (i.e. -0700)

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.timezone.get_zone()

Get current timezone (i.e. America/Denver)

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values can also be returned 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.timezone.get_zonecode()

Get current timezone (i.e. PST, MDT, etc)

CLI Example:

```
salt '*' timezone.get_zonecode
```

salt.modules.timezone.set_hwclock(*clock*)

Sets the hardware clock to be either UTC or localtime

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

salt.modules.timezone.set_zone(*timezone*)

Unlinks, then symlinks /etc/localtime to the set timezone.

The timezone is crucial to several system processes, each of which SHOULD be restarted (for instance, whatever you system uses as its cron and syslog daemons). This will not be automatically done and must be done manually!

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

Changed in version 2016.11.4.

Note: On AIX operating systems, Posix values are also allowed, see below

```
salt '*' timezone.set_zone 'CST6CDT,M3.2.0/2:00:00,M11.1.0/2:00:00'
```

`salt.modules.timezone.zone_compare`(*timezone*)

Compares the given timezone name with the system timezone name. Checks the hash sum between the given timezone, and the one set in `/etc/localtime`. Returns True if names and hash sums match, and False if not. Mostly useful for running state checks.

Changed in version 2016.3.0.

Note: On Solaris-link operating systems only a string comparison is done.

Changed in version 2016.11.4.

Note: On AIX operating systems only a string comparison is done.

CLI Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

20.9.412 salt.modules.tls

A salt module for SSL/TLS. Can create a Certificate Authority (CA) or use Self-Signed certificates.

depends PyOpenSSL Python module (0.10 or later, 0.14 or later for X509 extension support)

configuration Add the following values in `/etc/salt/minion` for the CA module to function properly:

```
ca.cert_base_path: '/etc/pki'
```

CLI Example #1: Creating a CA, a server request and its signed certificate:

```
# salt-call tls.create_ca my_little \  
days=5 \  
CN='My Little CA' \  
C=US \  
ST=Utah \  
L=Salt Lake City \  
O=Saltstack \  
emailAddress=pleasedontemail@example.com  
  
Created Private Key: "/etc/pki/my_little/my_little_ca_cert.key"  
Created CA "my_little_ca": "/etc/pki/my_little_ca/my_little_ca_cert.crt"  
  
# salt-call tls.create_csr my_little CN=www.example.com
```

(continues on next page)

(continued from previous page)

```
Created Private Key: "/etc/pki/my_little/certs/www.example.com.key
Created CSR for "www.example.com": "/etc/pki/my_little/certs/www.example.com.csr"

# salt-call tls.create_ca_signed_cert my_little CN=www.example.com
Created Certificate for "www.example.com": /etc/pki/my_little/certs/www.example.com.
↪ crt"
```

CLI Example #2: Creating a client request and its signed certificate

```
# salt-call tls.create_csr my_little CN=DBReplica_No.1 cert_type=client
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.csr."

# salt-call tls.create_ca_signed_cert my_little CN=DBReplica_No.1
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt
↪ "
```

CLI Example #3: Creating both a server and client req + cert for the same CN

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=client
Created Private Key: "/etc/pki/my_little/certs/MasterDBReplica_No.2.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/MasterDBReplica_No.2.csr."

# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Created Certificate for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1.crt
↪ "
```

salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
cert_type=server
Certificate "MasterDBReplica_No.2" already exists

(doh!)

```
# salt-call tls.create_csr my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/DBReplica_No.1_client.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/DBReplica_No.1_client.csr."
↪ "
```

salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2
Certificate "MasterDBReplica_No.2" already exists

(DOH!)

```
# salt-call tls.create_ca_signed_cert my_little CN=MasterDBReplica_No.2 \
    cert_type=server type_ext=True
Created Certificate for "MasterDBReplica_No.2": "/etc/pki/my_little/certs/
↪ MasterDBReplica_No.2_server.crt"
```

CLI Example #4: Create a server req + cert with non-CN filename for the cert

```
# salt-call tls.create_csr my_little CN=www.anothersometh.ing \
    cert_type=server type_ext=True
Created Private Key: "/etc/pki/my_little/certs/www.anothersometh.ing_server.key."
Created CSR for "DBReplica_No.1": "/etc/pki/my_little/certs/www.anothersometh.ing_
↪ server.csr."
```

(continues on next page)

(continued from previous page)

```
# salt-call tls_create_ca_signed_cert my_little CN=www.anothersometh.ing \
    cert_type=server cert_filename="something_completely_different"
Created Certificate for "www.anothersometh.ing": /etc/pki/my_little/certs/something_
↳completely_different.crt
```

salt.modules.tls.ca_exists(*ca_name*, *cacert_path*=None, *ca_filename*=None)

Verify whether a Certificate Authority (CA) already exists

ca_name name of the CA

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.ca_exists test_ca /etc/certs
```

salt.modules.tls.cert_base_path(*cacert_path*=None)

Return the base path for certs from CLI or from options

cacert_path absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.cert_base_path
```

salt.modules.tls.cert_info(*cert*, *digest*='sha256')

Return information for a particular certificate

cert path to the certificate PEM file or string

Changed in version 2018.3.4.

digest what digest to use for fingerprinting

CLI Example:

```
salt '*' tls.cert_info /dir/for/certs/cert.pem
```

salt.modules.tls.create_ca(*ca_name*, *bits*=2048, *days*=365, *CN*='localhost', *C*='US', *ST*='Utah', *L*='Salt Lake City', *O*='SaltStack', *OU*=None, *emailAddress*=None, *fix-mode*=False, *cacert_path*=None, *ca_filename*=None, *digest*='sha256', *onlyif*=None, *unless*=None, *replace*=False)

Create a Certificate Authority (CA)

ca_name name of the CA

bits number of RSA key bits, default is 2048

days number of days the CA will be valid, default is 365

CN common name in the request, default is "localhost"

C country, default is "US"

ST state, default is "Utah"

L locality, default is "Centerville", the city where SaltStack originated

O organization, default is "SaltStack"

OU organizational unit, default is None

emailAddress email address for the CA owner, default is None

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by `EVP_get_digestbyname`, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a CA certificate based upon defined config values. If the file already exists, the function just returns assuming the CA certificate already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'  
ca_name='koji'
```

the resulting CA, and corresponding key, would be written in the following location:

```
/etc/pki/koji/koji_ca_cert.crt  
/etc/pki/koji/koji_ca_cert.key
```

CLI Example:

```
salt '*' tls.create_ca test_ca
```

```
salt.modules.tls.create_ca_signed_cert(ca_name, CN, days=365, cacert_path=None,  
                                       ca_filename=None, cert_path=None,  
                                       cert_filename=None, digest='sha256',  
                                       cert_type=None, type_ext=False, replace=False)
```

Create a Certificate (CERT) signed by a named Certificate Authority (CA)

If the certificate file already exists, the function just returns assuming the CERT already exists.

The CN *must* match an existing CSR generated by create_csr. If it does not, this method does nothing.

ca_name name of the CA

CN common name matching the certificate signing request

days number of days certificate is valid, default is 365 (1 year)

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

cert_path full path to the certificates directory

cert_filename alternative filename for the certificate, useful when using special characters in the CN. If this option is set it will override the certificate filename output effects of cert_type. type_ext will be completely overridden.

New in version 2015.5.3.

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace Replace this certificate even if it exists

New in version 2015.5.1.

cert_type string. Either 'server' or 'client' (see create_csr() for details).

If create_csr(type_ext=True) this function **must** be called with the same cert_type so it can find the CSR file.

Note: create_csr() defaults to cert_type='server'; therefore, if it was also called with type_ext, cert_type becomes a required argument for create_ca_signed_cert()

type_ext bool. If set True, use cert_type as an extension to the CN when formatting the filename.

e.g.: some_subject_CN_server.crt or some_subject_CN_client.crt

This facilitates the context where both types are required for the same subject

If `cert_filename` is *not None*, setting `type_ext` has no effect

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
```

CLI Example:

```
salt '*' tls.create_ca_signed_cert test localhost
```

```
salt.modules.tls.create_csr(ca_name, bits=2048, CN='localhost', C='US', ST='Utah', L='Salt
Lake City', O='SaltStack', OU=None, emailAddress=None,
subjectAltName=None, cacert_path=None, ca_filename=None,
csr_path=None, csr_filename=None, digest='sha256', type_ext=False,
cert_type='server', replace=False)
```

Create a Certificate Signing Request (CSR) for a particular Certificate Authority (CA)

ca_name name of the CA

bits number of RSA key bits, default is 2048

CN common name in the request, default is "localhost"

C country, default is "US"

ST state, default is "Utah"

L locality, default is "Centerville", the city where SaltStack originated

O organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU organizational unit, default is None

emailAddress email address for the request, default is None

subjectAltName valid subjectAltNames in full form, e.g. to add DNS entry you would call this function with this value:

```
examples: ['DNS:somednsname.com', 'DNS:1.2.3.4', 'IP:1.2.3.4', 'IP:2001:4801:7821:77:be76:4eff:fe11:e51',
'email:me@i.like.pie.com']
```

Note: some libraries do not properly query IP: prefixes, instead looking for the given req. source with a DNS: prefix. To be thorough, you may want to include both DNS: and IP: entries if you are using subjectAltNames for destinations for your TLS connections. e.g.: requests to <https://1.2.3.4> will fail from python's requests library w/out the second entry in the above list

New in version 2015.8.0.

cert_type Specify the general certificate type. Can be either *server* or *client*. Indicates the set of common extensions added to the CSR.

```
server: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'serverAuth',
  'keyUsage': 'digitalSignature, keyEncipherment'
}

client: {
  'basicConstraints': 'CA:FALSE',
  'extendedKeyUsage': 'clientAuth',
  'keyUsage': 'nonRepudiation, digitalSignature, keyEncipherment'
}
```

type_ext boolean. Whether or not to extend the filename with CN_[cert_type] This can be useful if a server and client certificate are needed for the same CN. Defaults to False to avoid introducing an unexpected file naming pattern

The files normally named some_subject_CN.csr and some_subject_CN.key will then be saved
replace Replace this signing request even if it exists

New in version 2015.5.1.

Writes out a Certificate Signing Request (CSR) If the file already exists, the function just returns assuming the CSR already exists.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting CSR, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.csr
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_csr test
```

`salt.modules.tls.create_empty_crl`(*ca_name*, *cacert_path=None*, *ca_filename=None*, *crl_file=None*)

Create an empty Certificate Revocation List.

New in version 2015.8.0.

ca_name name of the CA

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

crl_file full path to the CRL file

CLI Example:

```
salt '*' tls.create_empty_crl ca_name='koji' ca_filename='ca'
↪ crl_file='/etc/openvpn/team1/crl.pem'
```

`salt.modules.tls.create_pkcs12`(*ca_name*, *CN*, *passphrase=""*, *cacert_path=None*, *replace=False*)

Create a PKCS#12 browser certificate for a particular Certificate (CN)

ca_name name of the CA

CN common name matching the certificate signing request

passphrase used to unlock the PKCS#12 certificate when loaded into the browser

cacert_path absolute path to ca certificates root directory

replace Replace this certificate even if it exists

New in version 2015.5.1.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
ca_name='koji'
CN='test.egavas.org'
```

the resulting signed certificate would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.p12
```

CLI Example:

```
salt '*' tls.create_pkcs12 test localhost
```

```
salt.modules.tls.create_self_signed_cert(tls_dir='tls', bits=2048, days=365, CN='localhost',
                                         C='US', ST='Utah', L='Salt Lake City',
                                         O='SaltStack', OU=None, emailAddress=None,
                                         cacert_path=None, cert_filename=None,
                                         digest='sha256', replace=False)
```

Create a Self-Signed Certificate (CERT)

tls_dir location appended to the ca.cert_base_path, default is 'tls'

bits number of RSA key bits, default is 2048

CN common name in the request, default is "localhost"

C country, default is "US"

ST state, default is "Utah"

L locality, default is "Centerville", the city where SaltStack originated

O organization, default is "SaltStack" NOTE: Must the same as CA certificate or an error will be raised

OU organizational unit, default is None

emailAddress email address for the request, default is None

cacert_path absolute path to ca certificates root directory

digest The message digest algorithm. Must be a string describing a digest algorithm supported by OpenSSL (by EVP_get_digestbyname, specifically). For example, "md5" or "sha1". Default: 'sha256'

replace Replace this certificate even if it exists

New in version 2015.5.1.

Writes out a Self-Signed Certificate (CERT). If the file already exists, the function just returns.

If the following values were set:

```
ca.cert_base_path='/etc/pki'
tls_dir='koji'
CN='test.egavas.org'
```

the resulting CERT, and corresponding key, would be written in the following location:

```
/etc/pki/koji/certs/test.egavas.org.crt
/etc/pki/koji/certs/test.egavas.org.key
```

CLI Example:

```
salt '*' tls.create_self_signed_cert
```

Passing options from the command line:

```
salt 'minion' tls.create_self_signed_cert CN='test.mysite.org'
```

```
salt.modules.tls.get_ca(ca_name, as_text=False, cacert_path=None)
```

Get the certificate path or content

ca_name name of the CA

as_text if true, return the certificate content instead of the path

cacert_path absolute path to ca certificates root directory

CLI Example:

```
salt '*' tls.get_ca test_ca as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_ca_signed_cert`(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *cert_filename=None*)

Get the certificate path or content

ca_name name of the CA

CN common name of the certificate

as_text if true, return the certificate content instead of the path

cacert_path absolute path to certificates root directory

cert_filename alternative filename for the certificate, useful when using special characters in the CN

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.get_ca_signed_cert test_ca CN=localhost as_text=False cacert_path=/
↳ etc/certs
```

`salt.modules.tls.get_ca_signed_key`(*ca_name*, *CN='localhost'*, *as_text=False*, *cacert_path=None*, *key_filename=None*)

Get the certificate path or content

ca_name name of the CA

CN common name of the certificate

as_text if true, return the certificate content instead of the path

cacert_path absolute path to certificates root directory

key_filename alternative filename for the key, useful when using special characters

New in version 2015.5.3.

in the CN

CLI Example:

```
salt '*' tls.get_ca_signed_key test_ca CN=localhost
↳ as_text=False cacert_path=/etc/certs
```

`salt.modules.tls.get_extensions`(*cert_type*)

Fetch X509 and CSR extension definitions from `tls:extensions:` (`common|server|client`) or set them to standard defaults.

New in version 2015.8.0.

cert_type: The type of certificate such as `server` or `client`.

CLI Example:

```
salt '*' tls.get_extensions client
```

`salt.modules.tls.maybe_fix_ssl_version`(*ca_name*, *cacert_path=None*, *ca_filename=None*)

Check that the X509 version is correct (was incorrectly set in previous salt versions). This will fix the version if needed.

ca_name ca authority name

cacert_path absolute path to ca certificates root directory

ca_filename alternative filename for the CA

New in version 2015.5.3.

CLI Example:

```
salt '*' tls.maybe_fix_ssl_version test_ca /etc/certs
```

```
salt.modules.tls.revoke_cert(ca_name, CN, cacert_path=None, ca_filename=None,
                             cert_path=None, cert_filename=None, crl_file=None)
```

Revoke a certificate.

New in version 2015.8.0.

ca_name Name of the CA.

CN Common name matching the certificate signing request.

cacert_path Absolute path to ca certificates root directory.

ca_filename Alternative filename for the CA.

cert_path Path to the cert file.

cert_filename Alternative filename for the certificate, useful when using special characters in the CN.

crl_file Full path to the CRL file.

CLI Example:

```
salt '*' tls.revoke_cert ca_name='koji' ca_filename='ca'
↪ crl_file='/etc/openvpn/team1/crl.pem'
```

```
salt.modules.tls.set_ca_path(cacert_path)
```

If wanted, store the aforementioned `cacert_path` in context to be used as the basepath for further operations

CLI Example:

```
salt '*' tls.set_ca_path /etc/certs
```

20.9.413 salt.modules.tomcat

Support for Tomcat

This module uses the manager webapp to manage Apache tomcat webapps. If the manager webapp is not configured some of the functions won't work.

configuration

- Java bin path should be in default path
- If ipv6 is enabled make sure you permit manager access to ipv6 interface "0:0:0:0:0:0:1"
- If you are using tomcat.tar.gz it has to be installed or symlinked under `/opt`, preferably using name tomcat
- "tomcat.signal start/stop" works but it does not use the startup scripts

The following grains/pillar should be set:

```
tomcat-manager:
  user: <username>
  passwd: <password>
```

or the old format:

```
tomcat-manager.user: <username>
tomcat-manager.passwd: <password>
```

Also configure a user in the `conf/tomcat-users.xml` file:

```
<?xml version='1.0' encoding='utf-8'?>
<tomcat-users>
  <role rolename="manager-script"/>
```

(continues on next page)

(continued from previous page)

```
<user username="tomcat" password="tomcat" roles="manager-script"/>
</tomcat-users>
```

Note:

- More information about tomcat manager: <http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html>
- if you use only this module for deployments you've might want to strict access to the manager only from localhost for more info: http://tomcat.apache.org/tomcat-7.0-doc/manager-howto.html#Configuring_Manager_Application_Access
- Tested on:

JVM Vendor: Sun Microsystems Inc.

JVM Version: 1.6.0_43-b01

OS Architecture: amd64

OS Name: Linux

OS Version: 2.6.32-358.el6.x86_64

Tomcat Version: Apache Tomcat/7.0.37

```
salt.modules.tomcat.deploy_war(war, context, force='no', url='http://localhost:8080/manager',
                               saltenv='base', timeout=180, temp_war_location=None, version=True)
```

Deploy a WAR file

war absolute path to WAR file (should be accessible by the user running tomcat) or a path supported by the salt.modules.cp.get_file function

context the context path to deploy

force [False] set True to deploy the webapp even one is deployed in the context

url [http://localhost:8080/manager] the URL of the server manager webapp

saltenv [base] the environment for WAR file in used by salt.modules.cp.get_url function

timeout [180] timeout for HTTP request

temp_war_location [None] use another location to temporarily copy to war file by default the system's temp directory is used

version [""] Specify the war version. If this argument is provided, it overrides the version encoded in the war file name, if one is present.

Examples:

```
salt '*' tomcat.deploy_war salt://salt-2015.8.6.war version=2015.08.r6
```

New in version 2015.8.6.

CLI Examples:

cp module

```
salt '*' tomcat.deploy_war salt://application.war /api
salt '*' tomcat.deploy_war salt://application.war /api no
salt '*' tomcat.deploy_war salt://application.war /api yes http://localhost:8080/
↪manager
```

minion local file system

```

salt '*' tomcat.deploy_war /tmp/application.war /api
salt '*' tomcat.deploy_war /tmp/application.war /api no
salt '*' tomcat.deploy_war /tmp/application.war /api yes http://localhost:8080/
↳manager

```

`salt.modules.tomcat.extract_war_version(war)`

Extract the version from the war file name. There does not seem to be a standard for encoding the version into the war file name

Examples:

```

/path/salt-2015.8.6.war -> 2015.8.6
/path/V6R2013xD5.war -> None

```

`salt.modules.tomcat.fullversion()`

Return all server information from catalina.sh version

CLI Example:

```

salt '*' tomcat.fullversion

```

`salt.modules.tomcat.leaks(url='http://localhost:8080/manager', timeout=180)`

Find memory leaks in tomcat

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```

salt '*' tomcat.leaks

```

`salt.modules.tomcat.ls(url='http://localhost:8080/manager', timeout=180)`

list all the deployed webapps

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```

salt '*' tomcat.ls
salt '*' tomcat.ls http://localhost:8080/manager

```

`salt.modules.tomcat.passwd(passwd, user="", alg='sha1', realm=None)`

This function replaces the \$CATALINA_HOME/bin/digest.sh script convert a clear-text password to the \$CATALINA_BASE/conf/tomcat-users.xml format

CLI Examples:

```

salt '*' tomcat.passwd secret
salt '*' tomcat.passwd secret tomcat sha1
salt '*' tomcat.passwd secret tomcat sha1 'Protected Realm'

```

`salt.modules.tomcat.reload_(app, url='http://localhost:8080/manager', timeout=180)`

Reload the webapp

app the webapp context path

url [<http://localhost:8080/manager>] the URL of the server manager webapp

timeout [180] timeout for HTTP request

CLI Examples:

```

salt '*' tomcat.reload /jenkins
salt '*' tomcat.reload /jenkins http://localhost:8080/manager

```

`salt.modules.tomcat.serverinfo` (*url*='http://localhost:8080/manager', *timeout*=180)
return details about the server
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.serverinfo
salt '*' tomcat.serverinfo http://localhost:8080/manager
```

`salt.modules.tomcat.sessions` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)
return the status of the webapp sessions
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.sessions /jenkins
salt '*' tomcat.sessions /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.signal` (*signal*=None)
Signals catalina to start, stop, securestart, forcestop.
CLI Example:

```
salt '*' tomcat.signal start
```

`salt.modules.tomcat.start` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)
Start the webapp
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.start /jenkins
salt '*' tomcat.start /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.status` (*url*='http://localhost:8080/manager', *timeout*=180)
Used to test if the tomcat manager is up
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.status
salt '*' tomcat.status http://localhost:8080/manager
```

`salt.modules.tomcat.status_webapp` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)
return the status of the webapp (stopped | running | missing)
app the webapp context path
url [http://localhost:8080/manager] the URL of the server manager webapp
timeout [180] timeout for HTTP request
CLI Examples:

```
salt '*' tomcat.status_webapp /jenkins
salt '*' tomcat.status_webapp /jenkins http://localhost:8080/manager
```

`salt.modules.tomcat.stop` (*app*, *url*='http://localhost:8080/manager', *timeout*=180)
Stop the webapp

app the webapp context path
url [<http://localhost:8080/manager>] the URL of the server manager webapp
timeout [180] timeout for HTTP request
 CLI Examples:

```
salt '*' tomcat.stop /jenkins
salt '*' tomcat.stop /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.undeploy(*app*, *url*='http://localhost:8080/manager', *timeout*=180)

Undeploy a webapp
app the webapp context path
url [<http://localhost:8080/manager>] the URL of the server manager webapp
timeout [180] timeout for HTTP request
 CLI Examples:

```
salt '*' tomcat.undeploy /jenkins
salt '*' tomcat.undeploy /jenkins http://localhost:8080/manager
```

salt.modules.tomcat.version()

Return server version from catalina.sh version

CLI Example:

```
salt '*' tomcat.version
```

20.9.414 salt.modules.trafficserver

Apache Traffic Server execution module.

New in version 2015.8.0.

traffic_ctl is used to execute individual Traffic Server commands and to script multiple commands in a shell.

salt.modules.trafficserver.alarms()

List all alarm events that have not been acknowledged (cleared).

```
salt '*' trafficserver.alarms
```

salt.modules.trafficserver.bounce_cluster()

Bounce all Traffic Server nodes in the cluster. Bouncing Traffic Server shuts down and immediately restarts Traffic Server, node-by-node.

```
salt '*' trafficserver.bounce_cluster
```

salt.modules.trafficserver.bounce_local(*drain*=False)

Bounce Traffic Server on the local node. Bouncing Traffic Server shuts down and immediately restarts the Traffic Server node.

drain This option modifies the restart behavior such that **traffic_server** is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.bounce_local
salt '*' trafficserver.bounce_local drain=True
```

salt.modules.trafficserver.clear_alarms(*alarm*)

Clear (acknowledge) an alarm event. The arguments are “all” for all current alarms, a specific alarm number (e.g. “1”), or an alarm string identifier (e.g. “MGMT_ALARM_PROXY_CONFIG_ERROR”).

```
salt '*' trafficserver.clear_alarms [all | #event | name]
```

`salt.modules.trafficserver.clear_cluster()`

Clears accumulated statistics on all nodes in the cluster.

```
salt '*' trafficserver.clear_cluster
```

`salt.modules.trafficserver.clear_node()`

Clears accumulated statistics on the local node.

```
salt '*' trafficserver.clear_node
```

`salt.modules.trafficserver.match_config(regex)`

Display the current values of all configuration variables whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_config regex
```

`salt.modules.trafficserver.match_metric(regex)`

Display the current values of all metrics whose names match the given regular expression.

New in version 2016.11.0.

```
salt '*' trafficserver.match_metric regex
```

`salt.modules.trafficserver.match_var(regex)`

Display the current values of all performance statistics or configuration variables whose names match the given regular expression.

Deprecated since version Fluorine: Use `match_metric` or `match_config` instead.

```
salt '*' trafficserver.match_var regex
```

`salt.modules.trafficserver.offline(path)`

Mark a cache storage device as offline. The storage is identified by a path which must match exactly a path specified in `storage.config`. This removes the storage from the cache and redirects requests that would have used this storage to other storage. This has exactly the same effect as a disk failure for that storage. This does not persist across restarts of the `traffic_server` process.

```
salt '*' trafficserver.offline /path/to/cache
```

`salt.modules.trafficserver.read_config(*args)`

Read Traffic Server configuration variable definitions.

New in version 2016.11.0.

```
salt '*' trafficserver.read_config proxy.config.http.keep_alive_post_out
```

`salt.modules.trafficserver.read_metric(*args)`

Read Traffic Server one or more metrics.

New in version 2016.11.0.

```
salt '*' trafficserver.read_metric proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.read_var(*args)`

Read variable definitions from the `traffic_line` command.

Deprecated since version Fluorine: Use `read_metric` or `read_config` instead. Note that this function does not work for Traffic Server versions ≥ 7.0 .

```
salt '*' trafficserver.read_var proxy.process.http.tcp_hit_count_stat
```

`salt.modules.trafficserver.refresh()`

Initiate a Traffic Server configuration file reread. Use this command to update the running configuration after any configuration file modification.

The timestamp of the last reconfiguration event (in seconds since epoch) is published in the `proxy.node.config.reconfigure_time` metric.

```
salt '*' trafficserver.refresh
```

`salt.modules.trafficserver.restart_cluster()`

Restart the `traffic_manager` process and the `traffic_server` process on all the nodes in a cluster.

```
salt '*' trafficserver.restart_cluster
```

`salt.modules.trafficserver.restart_local(drain=False)`

Restart the `traffic_manager` and `traffic_server` processes on the local node.

drain This option modifies the restart behavior such that `traffic_server` is not shut down until the number of active client connections drops to the number given by the `proxy.config.restart.active_client_threshold` configuration variable.

```
salt '*' trafficserver.restart_local
salt '*' trafficserver.restart_local drain=True
```

`salt.modules.trafficserver.set_config(variable, value)`

Set the value of a Traffic Server configuration variable.

variable Name of a Traffic Server configuration variable.

value The new value to set.

New in version 2016.11.0.

```
salt '*' trafficserver.set_config proxy.config.http.keep_alive_post_out 0
```

`salt.modules.trafficserver.set_var(variable, value)`

Deprecated since version Fluorine: Use `set_config` instead. Note that this function does not work for Traffic Server versions ≥ 7.0 .

```
salt '*' trafficserver.set_var proxy.config.http.server_ports
```

`salt.modules.trafficserver.shutdown()`

Shut down Traffic Server on the local node.

```
salt '*' trafficserver.shutdown
```

`salt.modules.trafficserver.startup()`

Start Traffic Server on the local node.

```
salt '*' trafficserver.start
```

`salt.modules.trafficserver.status()`

Show the current proxy server status, indicating if we're running or not.

```
salt '*' trafficserver.status
```

`salt.modules.trafficserver.zero_cluster()`

Reset performance statistics to zero across the cluster.

```
salt '*' trafficserver.zero_cluster
```

`salt.modules.trafficserver.zero_node()`

Reset performance statistics to zero on the local node.

```
salt '*' trafficserver.zero_cluster
```

20.9.415 salt.modules.travisci

Commands for working with travisci.

depends pyOpenSSL >= 16.0.0

`salt.modules.travisci.verify_webhook(signature, body)`

Verify the webhook signature from travisci

signature The signature header from the webhook header

body The full payload body from the webhook post

Note: The body needs to be the urlencoded version of the body.

CLI Example:

```
salt '*' travisci.verify_webhook 'M6NucCX5722bxisQs7e...' 'payload=%7B%22id%22
↪%3A183791261%2C%22repository...'
```

20.9.416 salt.modules.tuned

Interface to Red Hat tuned-adm module

maintainer Syed Ali <alicsyed@gmail.com>

maturity new

depends tuned-adm

platform Linux

`salt.modules.tuned.active()`

Return current active profile

CLI Example:

```
salt '*' tuned.active
```

`salt.modules.tuned.list_()`

List the profiles available

CLI Example:

```
salt '*' tuned.list
```

`salt.modules.tuned.off()`

Turn off all profiles

CLI Example:

```
salt '*' tuned.off
```

`salt.modules.tuned.profile(profile_name)`

Activate specified profile

CLI Example:

```
salt '*' tuned.profile virtual-guest
```

20.9.417 salt.modules.twilio_notify

Module for notifications via Twilio

New in version 2014.7.0.

depends

- twilio python module

configuration Configure this module by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-twilio-account:
  twilio.account_sid: AC32a3c83990934481add5ce1659f04d2
  twilio.auth_token: mytoken
```

`salt.modules.twilio_notify.send_sms(profile, body, to, from_)`

Send an sms

CLI Example:

```
twilio.send_sms twilio-account 'Test sms' '+18019999999' '+18011111111'
```

20.9.418 salt.modules.udev

Manage and query udev info

New in version 2015.8.0.

`salt.modules.udev.env(dev)`

Return all environment variables udev has for dev

CLI Example:

```
salt '*' udev.env /dev/sda
salt '*' udev.env /sys/class/net/eth0
```

`salt.modules.udev.exportdb()`

Return all the udev database

CLI Example:

```
salt '*' udev.exportdb
```

`salt.modules.udev.info`(*dev*)

Extract all info delivered by udevadm

CLI Example:

```
salt '*' udev.info /dev/sda
salt '*' udev.info /sys/class/net/eth0
```

`salt.modules.udev.links`(*dev*)

Return all udev-created device symlinks

CLI Example:

```
salt '*' udev.links /dev/sda
salt '*' udev.links /sys/class/net/eth0
```

`salt.modules.udev.name`(*dev*)

Return the actual dev name(s?) according to udev for dev

CLI Example:

```
salt '*' udev.dev /dev/sda
salt '*' udev.dev /sys/class/net/eth0
```

`salt.modules.udev.path`(*dev*)

Return the physical device path(s?) according to udev for dev

CLI Example:

```
salt '*' udev.path /dev/sda
salt '*' udev.path /sys/class/net/eth0
```

20.9.419 salt.modules.upstart

Module for the management of upstart systems. The Upstart system only supports service starting, stopping and restarting.

Important: If you feel that Salt should be using this module to manage services on a minion, and it is using a different module (or gives an error similar to `'service.start' is not available`), see [here](#).

Currently (as of Ubuntu 12.04) there is no tool available to disable Upstart services (like update-rc.d). This[1] is the recommended way to disable an Upstart service. So we assume that all Upstart services that have not been disabled in this manner are enabled.

But this is broken because we do not check to see that the dependent services are enabled. Otherwise we would have to do something like parse the output of `"initctl show-config"` to determine if all service dependencies are enabled to start on boot. For example, see the `"start on"` condition for the `lightdm` service below[2]. And this would be too hard. So we wait until the upstart developers have solved this problem. :) This is to say that an Upstart service that is enabled may not really be enabled.

Also, when an Upstart service is enabled, should the dependent services be enabled too? Probably not. But there should be a notice about this, at least.

[1] <http://upstart.ubuntu.com/cookbook/#disabling-a-job-from-automatically-starting>

[2] example upstart configuration file:

```
lightdm
emits login-session-start
emits desktop-session-start
emits desktop-shutdown
start on (((filesystem and runlevel [!06]) and started dbus) and (drm-device-added
↳card0 PRIMARY_DEVICE_FOR_DISPLAY=1 or stopped udev-fallback-graphics)) or runlevel
↳PREVLEVEL=S)
stop on runlevel [016]
```

Warning: This module should not be used on Red Hat systems. For these, the *rh_service* module should be used, as it supports the hybrid upstart/sysvinit system used in RHEL/CentOS 6.

`salt.modules.upstart.available(name)`

Returns True if the specified service is available, otherwise returns False.

CLI Example:

```
salt '*' service.available sshd
```

`salt.modules.upstart.disable(name, **kwargs)`

Disable the named service from starting on boot

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.upstart.disabled(name)`

Check to see if the named service is disabled to start on boot

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.upstart.enable(name, **kwargs)`

Enable the named service to start at boot

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.upstart.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.upstart.force_reload(name)`

Force-reload the named service

CLI Example:

```
salt '*' service.force_reload <service name>
```

`salt.modules.upstart.full_restart(name)`

Do a full restart (stop/start) of the named service

CLI Example:

```
salt '*' service.full_restart <service name>
```

`salt.modules.upstart.get_all()`

Return all installed services

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.upstart.get_disabled()`

Return the disabled services

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.upstart.get_enabled()`

Return the enabled services

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.upstart.missing(name)`

The inverse of `service.available`. Returns True if the specified service is not available, otherwise returns False.

CLI Example:

```
salt '*' service.missing sshd
```

`salt.modules.upstart.reload_(name)`

Reload the named service

CLI Example:

```
salt '*' service.reload <service name>
```

`salt.modules.upstart.restart(name)`

Restart the named service

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.upstart.start(name)`

Start the specified service

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.upstart.status(name, sig=None)`

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters

- **name** (*str*) – The name of the service to check
- **sig** (*str*) – Signature to use to find the service via ps

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type bool

CLI Example:

```
salt '*' service.status <service name> [service signature]
```

salt.modules.upstart.stop(*name*)

Stop the specified service

CLI Example:

```
salt '*' service.stop <service name>
```

20.9.420 salt.modules.uptime

Wrapper around uptime API

salt.modules.uptime.check_exists(*name*)

Check if a given URL is in being monitored by uptime

CLI Example:

```
salt '*' uptime.check_exists http://example.org
```

salt.modules.uptime.checks_list()

List URL checked by uptime

CLI Example:

```
salt '*' uptime.checks_list
```

salt.modules.uptime.create(*name*, ***params*)

Create a check on a given URL.

Additional parameters can be used and are passed to API (for example interval, maxTime, etc). See the documentation <https://github.com/fzaninotto/uptime> for a full list of the parameters.

CLI Example:

```
salt '*' uptime.create http://example.org
```

salt.modules.uptime.delete(*name*)

Delete a check on a given URL

CLI Example:

```
salt '*' uptime.delete http://example.org
```

20.9.421 salt.modules.useradd

Manage users with the useradd command

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

`salt.modules.useradd.add`(*name*, *uid=None*, *gid=None*, *groups=None*, *home=None*, *shell=None*, *unique=True*, *system=False*, *fullname=""*, *roomnumber=""*, *workphone=""*, *homephone=""*, *other=""*, *createhome=True*, *loginclass=None*, *root=None*, *nologinit=False*)

Add a user to the minion

CLI Example:

```
salt '*' user.add name <uid> <gid> <groups> <home> <shell>
```

`salt.modules.useradd.chfullname`(*name*, *fullname*)

Change the user's Full Name

CLI Example:

```
salt '*' user.chfullname foo "Foo Bar"
```

`salt.modules.useradd.chgid`(*name*, *gid*, *root=None*)

Change the default group of the user

CLI Example:

```
salt '*' user.chgid foo 4376
```

`salt.modules.useradd.chgroups`(*name*, *groups*, *append=False*, *root=None*)

Change the groups to which this user belongs

name User to modify

groups Groups to set for the user

append [False] If True, append the specified group(s). Otherwise, this function will replace the user's groups with the specified group(s).

CLI Examples:

```
salt '*' user.chgroups foo wheel,root
salt '*' user.chgroups foo wheel,root append=True
```

`salt.modules.useradd.chhome`(*name*, *home*, *persist=False*, *root=None*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

CLI Example:

```
salt '*' user.chhome foo /home/users/foo True
```

`salt.modules.useradd.chhomephone`(*name*, *homephone*)

Change the user's Home Phone

CLI Example:

```
salt '*' user.chhomephone foo 7735551234
```

`salt.modules.useradd.chloginclass`(*name*, *loginclass*, *root=None*)

Change the default login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.chloginclass foo staff
```

`salt.modules.useradd.chother` (*name*, *other*)
Change the user's other GECOS attribute

CLI Example:

```
salt '*' user.chother foobar
```

`salt.modules.useradd.chroomnumber` (*name*, *roomnumber*)
Change the user's Room Number

CLI Example:

```
salt '*' user.chroomnumber foo 123
```

`salt.modules.useradd.chshell` (*name*, *shell*, *root=None*)
Change the default shell of the user

CLI Example:

```
salt '*' user.chshell foo /bin/zsh
```

`salt.modules.useradd.chuid` (*name*, *uid*)
Change the uid for a named user

CLI Example:

```
salt '*' user.chuid foo 4376
```

`salt.modules.useradd.chworkphone` (*name*, *workphone*)
Change the user's Work Phone

CLI Example:

```
salt '*' user.chworkphone foo 7735550123
```

`salt.modules.useradd.delete` (*name*, *remove=False*, *force=False*, *root=None*)
Remove a user from the minion

CLI Example:

```
salt '*' user.delete name remove=True force=True
```

`salt.modules.useradd.get_loginclass` (*name*)
Get the login class of the user

Note: This function only applies to OpenBSD systems.

CLI Example:

```
salt '*' user.get_loginclass foo
```

`salt.modules.useradd.getent` (*refresh=False*)

Return the list of all info for all users

CLI Example:

```
salt '*' user.getent
```

`salt.modules.useradd.info` (*name*)

Return user information

CLI Example:

```
salt '*' user.info root
```

`salt.modules.useradd.list_groups` (*name*)

Return a list of groups the named user belongs to

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.useradd.list_users` ()

Return a list of all users

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.useradd.primary_group` (*name*)

Return the primary group of the named user

New in version 2016.3.0.

CLI Example:

```
salt '*' user.primary_group saltadmin
```

`salt.modules.useradd.rename` (*name, new_name, root=None*)

Change the username for a named user

CLI Example:

```
salt '*' user.rename name new_name
```

20.9.422 salt.modules.uwsgi

uWSGI stats server <https://uwsgi-docs.readthedocs.io/en/latest/StatsServer.html>

maintainer Peter Baumgartner <pete@lincolnloop.com>

maturity new

platform all

`salt.modules.uwsgi.stats` (*socket*)

Return the data from `uwsgi -connect-and-read` as a dictionary.

socket The socket the uWSGI stats server is listening on

CLI Example:

```
salt '*' uwsgi.stats /var/run/mystatsserver.sock
salt '*' uwsgi.stats 127.0.0.1:5050
```

20.9.423 salt.modules.vagrant

Work with virtual machines managed by Vagrant.

New in version 2018.3.0.

Mapping between a Salt node id and the Vagrant machine name (and the path to the Vagrantfile where it is defined) is stored in a Salt sdb database on the Vagrant host (minion) machine. In order to use this module, sdb must be configured. An SQLite database is the recommended storage method. The URI used for the sdb lookup is "sdb://vagrant_sdb_data".

requirements:

- the VM host machine must have salt-minion, Vagrant and a vm provider installed.
- the VM host must have a valid definition for `sdb://vagrant_sdb_data`

Configuration example:

```
# file /etc/salt/minion.d/vagrant_sdb.conf
vagrant_sdb_data:
  driver: sqlite3
  database: /var/cache/salt/vagrant.sqlite
  table: sdb
  create_table: True
```

`salt.modules.vagrant.destroy(name)`

Destroy and delete a virtual machine. (`vagrant destroy -f`)

This also removes the `salt_id` name defined by `vagrant.init`.

CLI Example:

```
salt <host> vagrant.destroy <salt_id>
```

`salt.modules.vagrant.get_machine_id(machine, cwd)`

returns the `salt_id` name of the Vagrant VM

Parameters

- **machine** – the Vagrant machine name
- **cwd** – the path to Vagrantfile

Returns `salt_id` name

`salt.modules.vagrant.get_ssh_config(name, network_mask="", get_private_key=False)`

Retrieve hints of how you might connect to a Vagrant VM.

Parameters

- **name** – the `salt_id` of the machine
- **network_mask** – a CIDR mask to search for the VM's address
- **get_private_key** – (default: False) return the key used for ssh login

Returns a dict of ssh login information for the VM

CLI Example:

```
salt <host> vagrant.get_ssh_config <salt_id>
salt my_laptop vagrant.get_ssh_config quail1 network_mask=10.0.0.0/8 get_private_
↪key=True
```

The returned dictionary contains:

- **key_filename**: the name of the private key file on the VM host computer
- **ssh_username**: the username to be used to log in to the VM
- **ssh_host**: the IP address used to log in to the VM. (This will usually be *127.0.0.1*)
- **ssh_port**: the TCP port used to log in to the VM. (This will often be *2222*)
- **[ip_address:]** (if *network_mask* is defined. see below)
- **[private_key:]** (if *get_private_key* is True) the private key for *ssh_username*

About *network_mask*:

Vagrant usually uses a redirected TCP port on its host computer to log in to a VM using ssh. This redirected port and its IP address are "ssh_port" and "ssh_host". The ssh_host is usually the localhost (127.0.0.1). This makes it impossible for a third machine (such as a salt-cloud master) to contact the VM unless the VM has another network interface defined. You will usually want a bridged network defined by having a *config.vm.network "public_network"* statement in your *Vagrantfile*.

The IP address of the bridged adapter will typically be assigned by DHCP and unknown to you, but you should be able to determine what IP network the address will be chosen from. If you enter a CIDR network mask, Salt will attempt to find the VM's address for you. The host machine will send an "ifconfig" command to the VM (using ssh to *ssh_host:ssh_port*) and return the IP address of the first interface it can find which matches your mask.

salt.modules.vagrant.get_vm_info(*name*)

get the information for a VM.

Parameters **name** – salt_id name

Returns dictionary of {'machine': x, 'cwd': y, ...}.

salt.modules.vagrant.init(*name*, *cwd=None*, *machine=""*, *runas=None*, *start=False*, *vagrant_provider=""*, *vm=None*)

Initialize a new Vagrant VM.

This inputs all the information needed to start a Vagrant VM. These settings are stored in a Salt sdb database on the Vagrant host minion and used to start, control, and query the guest VMs. The salt_id assigned here is the key field for that database and must be unique.

Parameters

- **name** – The salt_id name you will use to control this VM
- **cwd** – The path to the directory where the Vagrantfile is located
- **machine** – The machine name in the Vagrantfile. If blank, the primary machine will be used.
- **runas** – The username on the host who owns the Vagrant work files.
- **start** – (default: False) Start the virtual machine now.
- **vagrant_provider** – The name of a Vagrant VM provider (if not the default).
- **vm** – Optionally, all the above information may be supplied in this dictionary.

Returns A string indicating success, or False.

CLI Example:

```
salt <host> vagrant.init <salt_id> /path/to/Vagrantfile
salt my_laptop vagrant.init x1 /projects/bevy_master machine=quail1
```

salt.modules.vagrant.list_active_vms(*cwd=None*)

Return a list of machine names for active virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' vagrant.list_active_vms cwd=/projects/project_1
```

`salt.modules.vagrant.list_domains()`

Return a list of the `salt_id` names of all available Vagrant VMs on this host without regard to the path where they are defined.

CLI Example:

```
salt '*' vagrant.list_domains --log-level=info
```

The log shows information about all known Vagrant environments on this machine. This data is cached and may not be completely up-to-date.

`salt.modules.vagrant.list_inactive_vms(cwd=None)`

Return a list of machine names for inactive virtual machine on the host, which are defined in the Vagrantfile at the indicated path.

CLI Example:

```
salt '*' virt.list_inactive_vms cwd=/projects/project_1
```

`salt.modules.vagrant.pause(name)`

Pause (vagrant suspend) the named VM.

CLI Example:

```
salt <host> vagrant.pause <salt_id>
```

`salt.modules.vagrant.reboot(name, provision=False)`

Reboot a VM. (vagrant reload)

CLI Example:

```
salt <host> vagrant.reboot <salt_id> provision=True
```

Parameters

- **name** – The `salt_id` name you will use to control this VM
- **provision** – (False) also re-run the Vagrant provisioning scripts.

`salt.modules.vagrant.shutdown(name)`

Send a soft shutdown (vagrant halt) signal to the named vm.

This does the same thing as `vagrant.stop`. Other-VM control modules use "stop" and "shutdown" to differentiate between hard and soft shutdowns.

CLI Example:

```
salt <host> vagrant.shutdown <salt_id>
```

`salt.modules.vagrant.start(name)`

Start (vagrant up) a virtual machine defined by `salt_id` name. The machine must have been previously defined using "vagrant.init".

CLI Example:

```
salt <host> vagrant.start <salt_id>
```

`salt.modules.vagrant.stop(name)`

Hard shutdown the virtual machine. (vagrant halt)

CLI Example:

```
salt <host> vagrant.stop <salt_id>
```

`salt.modules.vagrant.version()`

Return the version of Vagrant on the minion

CLI Example:

```
salt '*' vagrant.version
```

`salt.modules.vagrant.vm_state(name="", cwd=None)`

Return list of information for all the vms indicating their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs defined by the Vagrantfile in the `cwd` directory.

CLI Example:

```
salt '*' vagrant.vm_state <name> cwd=/projects/project_1
```

returns a list of dictionaries with machine name, state, provider, and salt_id name.

```
datum = {'machine': _, # Vagrant machine name,
         'state': _, # string indicating machine state, like 'running'
         'provider': _, # the Vagrant VM provider
         'name': _} # salt_id name
```

Known bug: if there are multiple machines in your Vagrantfile, and you request the status of the **primary** machine, which you defined by leaving the `machine` parameter blank, then you may receive the status of all of them. Please specify the actual machine name for each VM if there are more than one.

20.9.424 salt.modules.varnish

Support for Varnish

New in version 2014.7.0.

Note: These functions are designed to work with all implementations of Varnish from 3.x onwards

`salt.modules.varnish.ban(ban_expression)`

Add ban to the varnish cache

CLI Example:

```
salt '*' varnish.ban ban_expression
```

`salt.modules.varnish.ban_list()`

List varnish cache current bans

CLI Example:

```
salt '*' varnish.ban_list
```

`salt.modules.varnish.param_set(param, value)`

Set a param in varnish cache

CLI Example:

```
salt '*' varnish.param_set param value
```

`salt.modules.varnish.param_show`(*param=None*)

Show params of varnish cache

CLI Example:

```
salt '*' varnish.param_show param
```

`salt.modules.varnish.purge`()

Purge the varnish cache

CLI Example:

```
salt '*' varnish.purge
```

`salt.modules.varnish.version`()

Return server version from varnishd -V

CLI Example:

```
salt '*' varnish.version
```

20.9.425 salt.modules.vault module

Functions to interact with Hashicorp Vault.

maintainer SaltStack

maturity new

platform all

note If you see the following error, you'll need to upgrade `requests` to atleast 2.4.2

```
<timestamp> [salt.pillar][CRITICAL][14337] Pillar render error: Failed to load ext_
→pillar vault: {'error': "request() got an unexpected keyword argument 'json'"}
```

configuration The salt-master must be configured to allow peer-runner configuration, as well as configuration for the module.

Add this segment to the master configuration file, or `/etc/salt/master.d/vault.conf`:

```
vault:
  url: https://vault.service.domain:8200
  verify: /etc/ssl/certs/ca-certificates.crt
  auth:
    method: token
    token: 11111111-2222-3333-4444-555555555555
  policies:
    - saltstack/minions
    - saltstack/minion/{minion}
    .. more policies
```

url Url to your Vault installation. Required.

verify For details please see <http://docs.python-requests.org/en/master/user/advanced/#ssl-cert-verification>

New in version 2018.3.0.

auth Currently only token auth is supported. The token must be able to create tokens with the policies that should be assigned to minions. Required.

You can still use the token via a OS environment variable via this config example:

And then export the VAULT_TOKEN variable in your OS:

policies Policies that are assigned to minions when requesting a token. These can either be static, eg `saltstack/minions`, or templated, eg `saltstack/minion/{minion}`. `{minion}` is shorthand for `grains[id]`. Grains are also available, for example like this: `my-policies/{grains[os]}`

If a template contains a grain which evaluates to a list, it will be expanded into multiple policies. For example, given the template `saltstack/by-role/{grains[roles]}`, and a minion having these grains:

The minion will have the policies `saltstack/by-role/web` and `saltstack/by-role/database`. Note however that list members which do not have simple string representations, such as dictionaries or objects, do not work and will throw an exception. Strings and numbers are examples of types which work well.

Optional. If `policies` is not configured, `saltstack/minions` and `saltstack/{minion}` are used as defaults.

Add this segment to the master configuration file, or `/etc/salt/master.d/peer_run.conf`:

```
peer_run:
  .*:
    - vault.generate_token
```

`salt.modules.vault.delete_secret(path)`

Delete secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.delete_secret "secret/my/secret"
```

`salt.modules.vault.list_secrets(path)`

List secret keys at the path in vault. The vault policy used must allow this. The path should end with a trailing slash.

CLI Example:

```
salt '*' vault.list_secrets "secret/my/"
```

`salt.modules.vault.read_secret(path, key=None)`

Return the value of key at path in vault, or entire secret

Jinja Example:

```
my-secret: {{ salt['vault'].read_secret('secret/my/secret', 'some-key') }}
```

```
{% set supersecret = salt['vault'].read_secret('secret/my/secret') %}
secrets:
  first: {{ supersecret.first }}
  second: {{ supersecret.second }}
```

`salt.modules.vault.write_secret(path, **kwargs)`

Set secret at the path in vault. The vault policy used must allow this.

CLI Example:

```
salt '*' vault.write_secret "secret/my/secret" user="foo" password="bar"
```

20.9.426 salt.modules.vbox_guest

VirtualBox Guest Additions installer

`salt.modules.vbox_guest.additions_install(**kwargs)`

Install VirtualBox Guest Additions. Uses the CD, connected by VirtualBox.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

See <https://www.virtualbox.org/manual/ch04.html#idp52733088> for more details.

CLI Example:

```
salt '*' vbox_guest.additions_install
salt '*' vbox_guest.additions_install reboot=True
salt '*' vbox_guest.additions_install upgrade_os=True
```

Parameters

- **reboot** (*bool*) – reboot computer to complete installation
- **upgrade_os** (*bool*) – upgrade OS (to ensure the latests version of kernel and developer tools are installed)

Returns version of VirtualBox Guest Additions or string with error

`salt.modules.vbox_guest.additions_mount()`

Mount VirtualBox Guest Additions CD to the temp directory.

To connect VirtualBox Guest Additions via VirtualBox graphical interface press 'Host+D' ('Host' is usually 'Right Ctrl').

CLI Example:

```
salt '*' vbox_guest.additions_mount
```

Returns True or OSError exception

`salt.modules.vbox_guest.additions_remove(**kwargs)`

Remove VirtualBox Guest Additions.

Firstly it tries to uninstall itself by executing '/opt/VBoxGuestAdditions-VERSION/uninstall.run uninstall'. It uses the CD, connected by VirtualBox if it fails.

CLI Example:

```
salt '*' vbox_guest.additions_remove
salt '*' vbox_guest.additions_remove force=True
```

Parameters **force** (*bool*) – force VirtualBox Guest Additions removing

Returns True if VirtualBox Guest Additions were removed successfully else False

`salt.modules.vbox_guest.additions_umount(mount_point)`

Unmount VirtualBox Guest Additions CD from the temp directory.

CLI Example:

```
salt '*' vbox_guest.additions_umount
```

Parameters **mount_point** – directory VirtualBox Guest Additions is mounted to

Returns True or an string with error

`salt.modules.vbox_guest.additions_version()`

Check VirtualBox Guest Additions version.

CLI Example:

```
salt '*' vbox_guest.additions_version
```

Returns version of VirtualBox Guest Additions or False if they are not installed

`salt.modules.vbox_guest.grant_access_to_shared_folders_to(name, users=None)`

Grant access to auto-mounted shared folders to the users.

User is specified by it's name. To grant access for several users use argument *users*. Access will be denied to the users not listed in *users* argument.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.grant_access_to_shared_folders_to fred
salt '*' vbox_guest.grant_access_to_shared_folders_to users ['fred', 'roman']
```

Parameters

- **name** (*str*) – name of the user to grant access to auto-mounted shared folders to
- **users** (*list of str*) – list of names of users to grant access to auto-mounted shared folders to (if specified, *name* will not be taken into account)

Returns list of users who have access to auto-mounted shared folders

`salt.modules.vbox_guest.list_shared_folders_users()`

List users who have access to auto-mounted shared folders.

See https://www.virtualbox.org/manual/ch04.html#sf_mount_auto for more details.

CLI Example:

```
salt '*' vbox_guest.list_shared_folders_users
```

Returns list of users who have access to auto-mounted shared folders

20.9.427 salt.modules.vboxmanage module

Support for VirtualBox using the VBoxManage command

New in version 2016.3.0.

If the `vboxdrv` kernel module is not loaded, this module can automatically load it by configuring `autoload_vboxdrv` in `/etc/salt/minion`:

The default for this setting is `False`.

depends virtualbox

`salt.modules.vboxmanage.clone_medium(medium, uuid_in=None, file_in=None, uuid_out=None, file_out=None, mformat=None, variant=None, existing=False, **kwargs)`

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonemedium <name> <new_name>
```

`salt.modules.vboxmanage.clonevm`(*name=None, uuid=None, new_name=None, snapshot_uuid=None, snapshot_name=None, mode='machine', options=None, basefolder=None, new_uuid=None, register=False, groups=None, **kwargs*)

Clone a new VM from an existing VM

CLI Example:

```
salt 'hypervisor' vboxmanage.clonevm <name> <new_name>
```

`salt.modules.vboxmanage.create`(*name, groups=None, ostype=None, register=True, basefolder=None, new_uuid=None, **kwargs*)

Create a new VM

CLI Example:

```
salt 'hypervisor' vboxmanage.create <name>
```

`salt.modules.vboxmanage.destroy`(*name*)

Unregister and destroy a VM

CLI Example:

```
salt '*' vboxmanage.destroy my_vm
```

`salt.modules.vboxmanage.list_items`(*item, details=False, group_by='UUID'*)

Return a list of a specific type of item. The following items are available:

vms runningvms ostones hostdvds hostfloppies intnets bridgedifs hostonlyifs natnets dhcpservers
hostinfo hostcpuids hddbackends hdds dvds floppies usbhost usbfilters systemproperties extpacks
groups webcams screenshotformats

CLI Example:

```
salt 'hypervisor' vboxmanage.items <item>
salt 'hypervisor' vboxmanage.items <item> details=True
salt 'hypervisor' vboxmanage.items <item> details=True group_by=Name
```

Some items do not display well, or at all, unless `details` is set to `True`. By default, items are grouped by the `UUID` field, but not all items contain that field. In those cases, another field must be specified.

`salt.modules.vboxmanage.list_nodes`()

Return a list of registered VMs

CLI Example:

```
salt '*' vboxmanage.list_nodes
```

`salt.modules.vboxmanage.list_nodes_full`()

Return a list of registered VMs, with detailed information

CLI Example:

```
salt '*' vboxmanage.list_nodes_full
```

`salt.modules.vboxmanage.list_nodes_min`()

Return a list of registered VMs, with minimal information

CLI Example:

```
salt '*' vboxmanage.list_nodes_min
```

`salt.modules.vboxmanage.list_ostypes()`

List the available OS Types

CLI Example:

```
salt '*' vboxmanage.list_ostypes
```

`salt.modules.vboxmanage.register(filename)`

Register a VM

CLI Example:

```
salt '*' vboxmanage.register my_vm_filename
```

`salt.modules.vboxmanage.start(name)`

Start a VM

CLI Example:

```
salt '*' vboxmanage.start my_vm
```

`salt.modules.vboxmanage.stop(name)`

Stop a VM

CLI Example:

```
salt '*' vboxmanage.stop my_vm
```

`salt.modules.vboxmanage.unregister(name, delete=False)`

Unregister a VM

CLI Example:

```
salt '*' vboxmanage.unregister my_vm_filename
```

`salt.modules.vboxmanage.vboxcmd()`

Return the location of the VBoxManage command

CLI Example:

```
salt '*' vboxmanage.vboxcmd
```

20.9.428 salt.modules.victorops

Support for VictorOps

New in version 2015.8.0.

Requires an `api_key` in `/etc/salt/minion`:

`salt.modules.victorops.create_event(message_type=None, routing_key='everybody', **kwargs)`

Create an event in VictorOps. Designed for use in states.

The following parameters are required:

Parameters **message_type** – One of the following values: INFO, WARNING, ACKNOWLEDGEMENT, CRITICAL, RECOVERY.

The following parameters are optional:

Parameters

- **routing_key** – The key for where messages should be routed. By default, sent to 'everyone' route.
- **entity_id** – The name of alerting entity. If not provided, a random name will be assigned.
- **timestamp** – Timestamp of the alert in seconds since epoch. Defaults to the time the alert is received at VictorOps.

:param timestamp_fmt The date format for the timestamp parameter.

Parameters

- **state_start_time** – The time this entity entered its current state (seconds since epoch). Defaults to the time alert is received.
- **state_start_time_fmt** – The date format for the timestamp parameter.
- **state_message** – Any additional status information from the alert item.
- **entity_is_host** – Used within VictorOps to select the appropriate display format for the incident.
- **entity_display_name** – Used within VictorOps to display a human-readable name for the entity.
- **ack_message** – A user entered comment for the acknowledgment.
- **ack_author** – The user that acknowledged the incident.

Returns A dictionary with result, entity_id, and message if result was failure.

CLI Example:

```
salt myminion victorops.create_event message_type='CRITICAL' routing_key='everyone
↳'
↳'                               entity_id='hostname/diskspace'

salt myminion victorops.create_event message_type='ACKNOWLEDGEMENT' routing_key=
↳'everyone'                               entity_id='hostname/diskspace' ack_message=
↳'Acknowledged' ack_author='username'

salt myminion victorops.create_event message_type='RECOVERY' routing_key='everyone
↳'
↳'                               entity_id='hostname/diskspace'
```

The following parameters are required: message_type

20.9.429 salt.modules.virt

Work with virtual machines managed by libvirt

depends libvirt Python module

salt.modules.virt.cpu_baseline (*full=False, migratable=False, out='libvirt'*)

Return the optimal 'custom' CPU baseline config for VM's on this minion

New in version 2016.3.0.

Parameters

- **full** – Return all CPU features rather than the ones on top of the closest CPU model
- **migratable** – Exclude CPU features that are unmigratable (libvirt 2.13+)
- **out** – 'libvirt' (default) for usable libvirt XML definition, 'salt' for nice dict

CLI Example:

```
salt '*' virt.cpu_baseline
```

salt.modules.virt.create_xml_path (*path*)

Start a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.create_xml_path <path to XML file on the node>
```

`salt.modules.virt.create_xml_str(xml)`

Start a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.create_xml_str <XML in string format>
```

`salt.modules.virt.ctrl_alt_del(vm_)`

Sends CTRL+ALT+DEL to a VM

CLI Example:

```
salt '*' virt.ctrl_alt_del <domain>
```

`salt.modules.virt.define_vol_xml_path(path)`

Define a volume based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_vol_xml_str(xml)`

Define a volume based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_vol_xml_str <XML in string format>
```

`salt.modules.virt.define_xml_path(path)`

Define a domain based on the XML-file path passed to the function

CLI Example:

```
salt '*' virt.define_xml_path <path to XML file on the node>
```

`salt.modules.virt.define_xml_str(xml)`

Define a domain based on the XML passed to the function

CLI Example:

```
salt '*' virt.define_xml_str <XML in string format>
```

`salt.modules.virt.delete_snapshots(name, *names, **kwargs)`

Delete one or more snapshots of the given VM.

Options:

- **all**: Remove all snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.delete_snapshots <domain> all=True
salt '*' virt.delete_snapshots <domain> <snapshot>
salt '*' virt.delete_snapshots <domain> <snapshot1> <snapshot2> ...
```

`salt.modules.virt.freecpu()`

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.virt.freemem()`

Return an int representing the amount of memory (in MB) that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.virt.full_info()`

Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.virt.get_disks(vm_)`

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <domain>
```

`salt.modules.virt.get_graphics(vm_)`

Returns the information on vnc for a given vm

CLI Example:

```
salt '*' virt.get_graphics <domain>
```

`salt.modules.virt.get_macs(vm_)`

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <domain>
```

`salt.modules.virt.get_nics(vm_)`

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <domain>
```

`salt.modules.virt.get_profiles(hypervisor=None)`

Return the virt profiles for hypervisor.

Currently there are profiles for:

- nic
- disk

CLI Example:

```
salt '*' virt.get_profiles
salt '*' virt.get_profiles hypervisor=esxi
```

salt.modules.virt.get_xml(*vm_*)

Returns the XML for a given vm

CLI Example:

```
salt '*' virt.get_xml <domain>
```

salt.modules.virt.init(*name*, *cpu*, *mem*, *image=None*, *nic='default'*, *hypervisor='kvm'*, *start=True*, *disk='default'*, *saltenv='base'*, *seed=True*, *install=True*, *pub_key=None*, *priv_key=None*, *seed_cmd='seed.apply'*, *enable_vnc=False*, *enable_qcow=False*, ***kwargs*)

Initialize a new vm

CLI Example:

```
salt 'hypervisor' virt.init vm_name 4 512 salt://path/to/image.raw
salt 'hypervisor' virt.init vm_name 4 512 /var/lib/libvirt/images/img.raw
salt 'hypervisor' virt.init vm_name 4 512 nic=profile disk=profile
```

salt.modules.virt.is_hyper()

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

salt.modules.virt.is_kvm_hyper()

Returns a bool whether or not this node is a KVM hypervisor

CLI Example:

```
salt '*' virt.is_kvm_hyper
```

salt.modules.virt.is_xen_hyper()

Returns a bool whether or not this node is a XEN hypervisor

CLI Example:

```
salt '*' virt.is_xen_hyper
```

salt.modules.virt.list_active_vms()

Return a list of names for active virtual machine on the minion

CLI Example:

```
salt '*' virt.list_active_vms
```

salt.modules.virt.list_domains()

Return a list of available domains.

CLI Example:

```
salt '*' virt.list_domains
```

salt.modules.virt.list_inactive_vms()

Return a list of names for inactive virtual machine on the minion

CLI Example:

```
salt '*' virt.list_inactive_vms
```

salt.modules.virt.list_snapshots(*domain=None*)

List available snapshots for certain vm or for all.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.list_snapshots
salt '*' virt.list_snapshots <domain>
```

salt.modules.virt.migrate(*vm_, target, ssh=False*)

Shared storage migration

CLI Example:

```
salt '*' virt.migrate <domain> <target hypervisor>
```

salt.modules.virt.migrate_non_shared(*vm_, target, ssh=False*)

Attempt to execute non-shared storage "all" migration

CLI Example:

```
salt '*' virt.migrate_non_shared <vm name> <target hypervisor>
```

salt.modules.virt.migrate_non_shared_inc(*vm_, target, ssh=False*)

Attempt to execute non-shared storage "all" migration

CLI Example:

```
salt '*' virt.migrate_non_shared_inc <vm name> <target hypervisor>
```

salt.modules.virt.node_info()

Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

salt.modules.virt.pause(*vm_*)

Pause the named vm

CLI Example:

```
salt '*' virt.pause <domain>
```

salt.modules.virt.purge(*vm_, dirs=False*)

Recursively destroy and delete a virtual machine, pass True for dir's to also delete the directories containing the virtual machine disk images - USE WITH EXTREME CAUTION!

CLI Example:

```
salt '*' virt.purge <domain>
```

salt.modules.virt.reboot(*name*)

Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <domain>
```

`salt.modules.virt.reset`(*vm_*)

Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <domain>
```

`salt.modules.virt.resume`(*vm_*)

Resume the named vm

CLI Example:

```
salt '*' virt.resume <domain>
```

`salt.modules.virt.revert_snapshot`(*name, snapshot=None, cleanup=False*)

Revert snapshot to the previous from current (if available) or to the specific.

Options:

- **cleanup**: Remove all newer than reverted snapshots. Values: True or False (default False).

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.revert <domain>
salt '*' virt.revert <domain> <snapshot>
```

`salt.modules.virt.seed_non_shared_migrate`(*disks, force=False*)

Non shared migration requires that the disks be present on the migration destination, pass the disks information via this function, to the migration destination before executing the migration.

CLI Example:

```
salt '*' virt.seed_non_shared_migrate <disks>
```

`salt.modules.virt.set_autostart`(*vm_, state='on'*)

Set the autostart flag on a VM so that the VM will start with the host system on reboot.

CLI Example:

```
salt "*" virt.set_autostart <domain> <on | off>
```

`salt.modules.virt.setmem`(*vm_, memory, config=False*)

Changes the amount of memory allocated to VM. The VM must be shutdown for this to work.

memory is to be specified in MB If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setmem <domain> <size>
salt '*' virt.setmem my_domain 768
```

`salt.modules.virt.setvcpus`(*vm_, vcpus, config=False*)

Changes the amount of vcpus allocated to VM. The VM must be shutdown for this to work.

vcpus is an int representing the number to be assigned If config is True then we ask libvirt to modify the config as well

CLI Example:

```
salt '*' virt.setvcpus <domain> <amount>
salt '*' virt.setvcpus my_domain 4
```

`salt.modules.virt.shutdown(vm_)`
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <domain>
```

`salt.modules.virt.snapshot(domain, name=None, suffix=None)`
Create a snapshot of a VM.

Options:

- **name:** Name of the snapshot. If the name is omitted, then will be used original domain name with ISO 8601 time as a suffix.
- **suffix:** Add suffix for the new name. Useful in states, where such snapshots can be distinguished from manually created.

New in version 2016.3.0.

CLI Example:

```
salt '*' virt.snapshot <domain>
```

`salt.modules.virt.start(name)`
Start a defined domain

CLI Example:

```
salt '*' virt.start <domain>
```

`salt.modules.virt.stop(name)`
Hard power down the virtual machine, this is equivalent to pulling the power.

CLI Example:

```
salt '*' virt.stop <domain>
```

`salt.modules.virt.undefine(vm_)`
Remove a defined vm, this does not purge the virtual machine image, and this only works if the vm is powered down

CLI Example:

```
salt '*' virt.undefine <domain>
```

`salt.modules.virt.virt_type()`
Returns the virtual machine type as a string

CLI Example:

```
salt '*' virt.virt_type
```

`salt.modules.virt.vm_cputime(vm_=None)`
Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
```

(continues on next page)

(continued from previous page)

```

    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

salt.modules.virt.vm_diskstats(*vm_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'rd_req' : 0,
    'rd_bytes' : 0,
    'wr_req' : 0,
    'wr_bytes' : 0,
    'errs' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_blockstats
```

salt.modules.virt.vm_info(*vm_=None*)

Return detailed information about the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cpu': <int>,
    'maxMem': <int>,
    'mem': <int>,
    'state': '<state>',
    'cputime' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

salt.modules.virt.vm_netstats(*vm_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'rx_bytes' : 0,
    'rx_packets' : 0,
    'rx_errs' : 0,
    'rx_drop' : 0,
    'tx_bytes' : 0,
    'tx_packets' : 0,
    'tx_errs' : 0,
    'tx_drop' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.virt.vm_state` (*vm_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <domain>
```

20.9.430 salt.modules.virtualenv

Create virtualenv environments.

New in version 0.17.0.

`salt.modules.virtualenv_mod.create` (*path*, *venv_bin=None*, *system_site_packages=False*, *distribute=False*, *clear=False*, *python=None*, *extra_search_dir=None*, *never_download=None*, *prompt=None*, *pip=False*, *symlinks=None*, *upgrade=None*, *user=None*, *use_vt=False*, *saltenv='base'*, ***kwargs*)

Create a virtualenv

path The path to the virtualenv to be created

venv_bin The name (and optionally path) of the virtualenv command. This can also be set globally in the minion config file as `virtualenv.venv_bin`. Defaults to `virtualenv`.

system_site_packages [False] Passthrough argument given to virtualenv or pyvenv

distribute [False] Passthrough argument given to virtualenv

pip [False] Install pip after creating a virtual environment. Implies `distribute=True`

clear [False] Passthrough argument given to virtualenv or pyvenv

python [None (default)] Passthrough argument given to virtualenv

extra_search_dir [None (default)] Passthrough argument given to virtualenv

never_download [None (default)] Passthrough argument given to virtualenv if True

prompt [None (default)] Passthrough argument given to virtualenv if not None

symlinks [None] Passthrough argument given to pyvenv if True

upgrade [None] Passthrough argument given to pyvenv if True

user [None] Set ownership for the virtualenv

Note: On Windows you must also pass a `password` parameter. Additionally, the user must have permissions to the location where the virtual environment is being created

runas [None] Set ownership for the virtualenv

Deprecated since version 2014.1.0: `user` should be used instead

use_vt [False] Use VT terminal emulation (see output while installing)

New in version 2015.5.0.

saltenv ['base'] Specify a different environment. The default environment is `base`.

New in version 2014.1.0.

Note: The `runas` argument is deprecated as of 2014.1.0. `user` should be used instead.

CLI Example:

```
salt '*' virtualenv.create /path/to/new/virtualenv
```

`salt.modules.virtualenv_mod.get_distribution_path(venv, distribution)`

Return the path to a distribution installed inside a virtualenv

New in version 2016.3.0.

venv Path to the virtualenv.

distribution Name of the distribution. Note, all non-alphanumeric characters will be converted to dashes.

CLI Example:

```
salt '*' virtualenv.get_distribution_path /path/to/my/venv my_distribution
```

`salt.modules.virtualenv_mod.get_resource_content(venv, package=None, resource=None)`

Return the content of a package resource installed inside a virtualenv

New in version 2015.5.0.

venv Path to the virtualenv

package Name of the package in which the resource resides

New in version 2016.3.0.

resource Name of the resource of which the content is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_content /path/to/my/venv my_package my/resource.  
↪xml
```

`salt.modules.virtualenv_mod.get_resource_path(venv, package=None, resource=None)`

Return the path to a package resource installed inside a virtualenv

New in version 2015.5.0.

venv Path to the virtualenv

package Name of the package in which the resource resides

New in version 2016.3.0.

resource Name of the resource of which the path is to be returned

New in version 2016.3.0.

CLI Example:

```
salt '*' virtualenv.get_resource_path /path/to/my/venv my_package my/resource.xml
```

`salt.modules.virtualenv_mod.get_site_packages(venv)`

Return the path to the site-packages directory of a virtualenv

venv Path to the virtualenv.

CLI Example:

```
salt '*' virtualenv.get_site_packages /path/to/my/venv
```

20.9.431 salt.modules.vsphere

Manage VMware vCenter servers and ESXi hosts.

New in version 2015.8.4.

codeauthor Alexandru Bleotu <alexandru.bleotu@morganstaley.com>

Dependencies

- pyVmomi Python Module
- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original vSphere Execution Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Note: Be aware that some functionality in this execution module may depend on the type of license attached to a vCenter Server or ESXi host(s).

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

About

This execution module was designed to be able to handle connections both to a vCenter Server, as well as to an ESXi host. It utilizes the `pyVmomi` Python library and the `ESXCLI` package to run remote execution functions against either the defined vCenter server or the ESXi host.

Whether or not the function runs against a vCenter Server or an ESXi host depends entirely upon the arguments passed into the function. Each function requires a `host` location, `username`, and `password`. If the credentials provided apply to a vCenter Server, then the function will be run against the vCenter Server. For example, when listing hosts using vCenter credentials, you'll get a list of hosts associated with that vCenter Server:

```
# salt my-minion vsphere.list_hosts <vcenter-ip> <vcenter-user> <vcenter-password>
my-minion:
- esxi-1.example.com
- esxi-2.example.com
```

However, some functions should be used against ESXi hosts, not vCenter Servers. Functionality such as getting a host's coredump network configuration should be performed against a host and not a vCenter server. If the authentication information you're using is against a vCenter server and not an ESXi host, you can provide the host name that is associated with the vCenter server in the command, as a list, using the `host_names` or `esxi_host` kwarg. For example:

```
# salt my-minion vsphere.get_coredump_network_config <vcenter-ip> <vcenter-user>
↳ <vcenter-password> esxi_hosts='[esxi-1.example.com, esxi-2.example.com]'
my-minion:
-----
  esxi-1.example.com:
    -----
    Coredump Config:
      -----
      enabled:
        False
  esxi-2.example.com:
    -----
    Coredump Config:
      -----
      enabled:
        True
      host_vnic:
        vmk0
```

(continues on next page)

(continued from previous page)

```

ip:
  coredump-location.example.com
port:
  6500

```

You can also use these functions against an ESXi host directly by establishing a connection to an ESXi host using the host's location, username, and password. If ESXi connection credentials are used instead of vCenter credentials, the `host_names` and `esxi_hosts` arguments are not needed.

```

# salt my-minion vsphere.get_coredump_network_config esxi-1.example.com root <host-
  ↳password>
local:
-----
  10.4.28.150:
    -----
    Coredump Config:
      -----
      enabled:

```

`salt.modules.vsphere.add_capacity_to_diskgroup` (*cache_disk_id*, *capacity_disk_ids*,
safety_checks=True, *service_instance=None*)

Adds capacity disks to the disk group with the specified cache disk.

cache_disk_id The canonical name of the cache disk.

capacity_disk_ids A list containing canonical names of the capacity disks to add.

safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

```

salt '*' vsphere.add_capacity_to_diskgroup
  cache_disk_id='naa.0000000000000001'
  capacity_disk_ids=['naa.0000000000000002, naa.0000000000000003']

```

`salt.modules.vsphere.add_license` (*key*, *description*, *safety_checks=True*, *service_instance=None*)

Adds a license to the vCenter or ESXi host

key License key.

description License description added in as a label.

safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

```

salt '*' vsphere.add_license key=<license_key> desc='License desc'

```

`salt.modules.vsphere.assign_default_storage_policy_to_datastore` (*policy*, *datastore*, *service_instance=None*)

Assigns a storage policy as the default policy to a datastore.

policy Name of the policy to assign.

datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.assign_storage_policy_to_datastore
      policy='policy name' datastore=ds1
```

salt.modules.vsphere.assign_license(*license_key, license_name, entity, entity_display_name, safety_checks=True, service_instance=None*)

Assigns a license to an entity

license_key Key of the license to assign See `_get_entity` docstrings for format.

license_name Display name of license

entity Dictionary representation of an entity

entity_display_name Entity name used in logging

safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default is False.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.assign_license license_key=000000:000000
      license name=test entity={type:cluster,datacenter:dc,cluster:cl}
```

salt.modules.vsphere.compare_vm_configs(*new_config, current_config*)

Compares virtual machine current and new configuration, the current is the one which is deployed now, and the new is the target config. Returns the differences between the objects in a dictionary, the keys are the configuration parameter keys and the values are differences objects: either list or recursive difference

new_config: New config dictionary with every available parameter

current_config Currently deployed configuration

salt.modules.vsphere.configure_host_cache(*enabled, datastore=None, swap_size_MiB=None, service_instance=None*)

Configures the host cache on the selected host.

enabled Boolean flag specifying whether the host cache is enabled.

datastore Name of the datastore that contains the host cache. Must be set if enabled is `true`.

swap_size_MiB Swap size in Mibibytes. Needs to be set if enabled is `true`. Must be smaller than the datastore size.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.configure_host_cache enabled=False

salt '*' vsphere.configure_host_cache enabled=True datastore=ds1
      swap_size_MiB=1024
```

salt.modules.vsphere.coredump_network_enable(*host, username, password, enabled, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Enable or disable ESXi core dump collection. Returns `True` if coredump is enabled and returns `False` if core dump is not enabled. If there was an error, the error will be the value printed in the `Error` key dictionary for the given host.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

enabled Python True or False to enable or disable coredumps.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more

ESXi machines.

credstore Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.coredump_network_enable my.esxi.host root bad-password True

# Used for connecting to a vCenter Server
salt '*' vsphere.coredump_network_enable my.vcenter.location root bad-password
↪ True          esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

salt.modules.vsphere.create_cluster (*cluster_dict*, *datacenter=None*, *cluster=None*, *service_instance=None*)

Creates a cluster.

Note: *cluster_dict*['name'] will be overridden by the cluster param value

config_dict Dictionary with the config values of the new cluster.

datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
# esxdatacenter proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.create_cluster cluster_dict=$cluster_dict
```

salt.modules.vsphere.create_datacenter (*datacenter_name*, *service_instance=None*)

Creates a datacenter.

Supported proxies: esxdatacenter

datacenter_name The datacenter name

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_datacenter dc1
```

salt.modules.vsphere.create_diskgroup (*cache_disk_id*, *capacity_disk_ids*, *safety_checks=True*, *service_instance=None*)

Creates disk group on an ESXi host with the specified cache and capacity disks.

cache_disk_id The canonical name of the disk to be used as a cache. The disk must be *ssd*.

capacity_disk_ids A list containing canonical names of the capacity disks. Must contain at least one id. Default is *True*.

safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is *True*.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is *None*.

```
salt '*' vsphere.create_diskgroup cache_disk_id='naa.0000000000000001'
capacity_disk_ids=['naa.0000000000000002, naa.0000000000000003]'
```

salt.modules.vsphere.create_dvportgroup (*portgroup_dict*, *portgroup_name*, *dvs*, *service_instance=None*)

Creates a distributed virtual portgroup.

Note: The *portgroup_name* param will override any name already set in *portgroup_dict*.

portgroup_dict Dictionary with the config values the portgroup should be created with (example in *salt.states.dvs*).

portgroup_name Name of the portgroup to be created.

dvs Name of the DVS that will contain the portgroup.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_dvportgroup portgroup_dict=<dict>
    portgroup_name=pg1 dvs=dvs1
```

salt.modules.vsphere.create_dvs (*dvs_dict, dvs_name, service_instance=None*)
 Creates a distributed virtual switch (DVS).

Note: The **dvs_name** param will override any name set in **dvs_dict**.
dvs_dict Dict representation of the new DVS (example in salt.states.dvs)
dvs_name Name of the DVS to be created.
service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_dvs dvs dict=$dvs_dict dvs_name=dvs_name
```

salt.modules.vsphere.create_storage_policy (*policy_name, policy_dict, service_instance=None*)

Creates a storage policy.

Supported capability types: scalar, set, range.

policy_name Name of the policy to create. The value of the argument will override any existing name in **policy_dict**.

policy_dict Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.create_storage_policy policy_name='policy name'
    policy_dict="$policy_dict"
```

salt.modules.vsphere.create_vm (*vm_name, cpu, memory, image, version, datacenter, datastore, placement, interfaces, disks, scsi_devices, serial_ports=None, ide_controllers=None, sata_controllers=None, cd_drives=None, advanced_configs=None, service_instance=None*)

Creates a virtual machine container.

CLI Example:

```
salt vm_minion vsphere.create_vm vm_name=vmname cpu='{count: 2, nested: True}' ...
```

vm_name Name of the virtual machine
cpu Properties of CPUs for freshly created machines
memory Memory size for freshly created machines
image Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier
version Virtual machine container hardware version
datacenter Datacenter where the virtual machine will be deployed (mandatory)
datastore Datastore where the virtual machine files will be placed
placement Resource pool or cluster or host or folder where the virtual machine will be deployed
devices interfaces

```
interfaces:
  adapter: 'Network adapter 1'
  name: vlan100
  switch_type: distributed or standard
  adapter_type: vmxnet3 or vmxnet, vmxnet2, vmxnet3, e1000, e1000e
  mac: '00:11:22:33:44:55'
  connectable:
    allow_guest_control: True
```

(continues on next page)

(continued from previous page)

```
connected: True
start_connected: True
```

disks

```
disks:
  adapter: 'Hard disk 1'
  size: 16
  unit: GB
  address: '0:0'
  controller: 'SCSI controller 0'
  thin_provision: False
  eagerly_scrub: False
  datastore: 'myshare'
  filename: 'vm/mydisk.vmdk'
```

scsi_devices

```
scsi_devices:
  controller: 'SCSI controller 0'
  type: paravirtual
  bus_sharing: no_sharing
```

serial_ports

```
serial_ports:
  adapter: 'Serial port 1'
  type: network
  backing:
    uri: 'telnet://something:port'
    direction: <client|server>
    filename: 'service_uri'
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
  yield: False
```

cd_drives

```
cd_drives:
  adapter: 'CD/DVD drive 0'
  controller: 'IDE 0'
  device_type: datastore_iso_file
  datastore_iso_file:
    path: path_to_iso
  connectable:
    allow_guest_control: True
    connected: True
    start_connected: True
```

advanced_config Advanced config parameters to be set for the virtual machine

salt.modules.vsphere.create_vmfs_datastore (*datastore_name, disk_id, vmfs_major_version, safety_checks=True, service_instance=None*)

Creates a ESXi host disk group with the specified cache and capacity disks.

datastore_name The name of the datastore to be created.

disk_id The disk id (canonical name) on which the datastore is created.

vmfs_major_version The VMFS major version.

safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default is True.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.create_vmfs_datastore datastore_name=ds1 disk_id=
vmfs_major_version=5
```

salt.modules.vsphere.delete_advanced_configs(*vm_name*, *datacenter*, *advanced_configs*,
service_instance=None)

Removes extra config parameters from a virtual machine

vm_name Virtual machine name

datacenter Datacenter name where the virtual machine is available

advanced_configs List of advanced config values to be removed

service_instance vCenter service instance for connection and configuration

salt.modules.vsphere.delete_vm(*name*, *datacenter*, *placement=None*, *power_off=False*, *ser-*
vice_instance=None)

Deletes a virtual machine defined by name and placement

name Name of the virtual machine

datacenter Datacenter of the virtual machine

placement Placement information of the virtual machine

service_instance vCenter service instance for connection and configuration

```
salt '*' vsphere.delete_vm name=my_vm datacenter=my_datacenter
```

salt.modules.vsphere.disconnect(*service_instance*)

Disconnects from a vCenter or ESXi host

Note: Should be used by state functions, not invoked directly.

service_instance Service instance (vim.ServiceInstance)

CLI Example:

See note above.

salt.modules.vsphere.enable_firewall_ruleset(*host*, *username*, *password*, *ruleset_enable*,
ruleset_name, *protocol=None*, *port=None*,
esxi_hosts=None, *credstore=None*)

Enable or disable an ESXi firewall rule set.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

ruleset_enable True to enable the ruleset, false to disable.

ruleset_name Name of ruleset to target.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns A standard `cmd.run_all` dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.enable_firewall_ruleset my.esxi.host root bad-password True
↳ 'syslog'

# Used for connecting to a vCenter Server
salt '*' vsphere.enable_firewall_ruleset my.vcenter.location root bad-password
↳ True 'syslog' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.erase_disk_partitions`(*disk_id=None, scsi_address=None, service_instance=None*)

Erases the partitions on a disk. The disk can be specified either by the canonical name, or by the `scsi_address`. **disk_id** Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

scsi_address Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```
salt '*' vsphere.erase_disk_partitions scsi_address='vmhba0:C0:T0:L0'

salt '*' vsphere.erase_disk_partitions disk_id='naa.0000000000000001'
```

`salt.modules.vsphere.esxcli_cmd`(*cmd_str, host=None, username=None, password=None, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Run an ESXCLI command directly on the host or list of hosts.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

cmd_str The ESXCLI command to run. Note: This should not include the `-s`, `-u`, `-p`, `-h`, `--protocol`, or `--portnumber` arguments that are frequently passed when using a bare ESXCLI command from the command line. Those arguments are handled by this function via the other args and kwargs.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.esxcli_cmd my.esxi.host root bad-password 'system
↳ coredump network get'

# Used for connecting to a vCenter Server
salt '*' vsphere.esxcli_cmd my.vcenter.location root bad-password
↳ 'system coredump network get' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_advanced_configs`(*vm_name, datacenter, service_instance=None*)

Returns extra config parameters from a virtual machine advanced config list

vm_name Virtual machine name

datacenter Datacenter name where the virtual machine is available

service_instance vCenter service instance for connection and configuration

`salt.modules.vsphere.get_coredump_network_config`(*host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Retrieve information on ESXi or vCenter network dump collection and format it into a dictionary.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns A dictionary with the network configuration, or, if getting the network config failed, a an error message retrieved from the standard `cmd.run_all` dictionary, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_coredump_network_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_coredump_network_config my.vcenter.location root bad-
↳password esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_firewall_status(host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None)`

Show status of all firewall rule sets.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Nested dictionary with two toplevel keys `rulesets` and `success` `success` will be True or False depending on query success `rulesets` will list the rulesets and their statuses if `success` was true, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_firewall_status my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_firewall_status my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_host_cache(service_instance=None)`

Returns the host cache configuration on the proxy host.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is `None`.

```
salt '*' vsphere.get_host_cache
```

`salt.modules.vsphere.get_proxy_type()`

Returns the proxy type retrieved either from the pillar or from the proxy minion's config. Returns `<undefined>` otherwise.

CLI Example:

```
salt '*' vsphere.get_proxy_type
```

`salt.modules.vsphere.get_service_instance_via_proxy` (*service_instance=None*)

Returns a service instance to the proxied endpoint (vCenter/ESXi host).

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

Note: Should be used by state functions not invoked directly.

CLI Example: See note above

`salt.modules.vsphere.get_syslog_config` (*host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Retrieve the syslog configuration.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is `443`.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Dictionary with keys and values corresponding to the syslog configuration, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.get_syslog_config my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.get_syslog_config my.vcenter.location root bad-password
↪ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.get_vm` (*name, datacenter=None, vm_properties=None, traversal_spec=None, parent_ref=None, service_instance=None*)

Returns vm object properties.

name Name of the virtual machine.

datacenter Datacenter name

vm_properties List of vm properties.

traversal_spec Traversal Spec object(s) for searching.

parent_ref Container Reference object for searching under a given object.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is `None`.

`salt.modules.vsphere.get_vm_config` (*name, datacenter=None, objects=True, service_instance=None*)

Queries and converts the virtual machine properties to the available format from the schema. If the `objects` attribute is `True` the config objects will have extra properties, like `'object'` which will include the `vim.vm.device.VirtualDevice`, this is necessary for deletion and update actions.

name Name of the virtual machine

datacenter Datacenter's name where the virtual machine is available

objects Indicates whether to return the vmware object properties (eg. `object, key`) or just the properties which can be set

service_instance vCenter service instance for connection and configuration

`salt.modules.vsphere.get_vm_config_file`(*name*, *datacenter*, *placement*, *datastore*, *service_instance=None*)

Queries the virtual machine config file and returns `vim.host.DatastoreBrowser.SearchResults` object on success
None on failure

name Name of the virtual machine

datacenter Datacenter name

datastore Datastore where the virtual machine files are stored

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

`salt.modules.vsphere.gets_service_instance_via_proxy`(*fn*)

Decorator that connects to a target system (vCenter or ESXi host) using the proxy details and passes the connection (`vim.ServiceInstance`) to the decorated function.

Supported proxies: `esxi`, `esxcluster`, `esxdatacenter`.

Notes

1. The decorated function must have a `service_instance` parameter or a `**kwargs` type argument (name of argument is not important); 2. If the `service_instance` parameter is already defined, the value is passed through to the decorated function; 3. If the `service_instance` parameter is not defined, the connection is created using the proxy details and the service instance is returned.

CLI Example: None, this is a decorator

`salt.modules.vsphere.list_assigned_licenses`(*entity*, *entity_display_name*, *license_keys=None*, *service_instance=None*)

Lists the licenses assigned to an entity

entity Dictionary representation of an entity. See `_get_entity` docstrings for format.

entity_display_name Entity name used in logging

license_keys: List of license keys to be retrieved. Default is None.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_assigned_licenses
      entity={type:cluster,datacenter:dc,cluster:cl}
      entity_display_name=cl
```

`salt.modules.vsphere.list_capability_definitions`(*service_instance=None*)

Returns a list of the metadata of all capabilities in the vCenter.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_capabilities
```

`salt.modules.vsphere.list_cluster`(*datacenter=None*, *cluster=None*, *service_instance=None*)

Returns a dict representation of an ESX cluster.

datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
# vcenter proxy
salt '*' vsphere.list_cluster datacenter=dc1 cluster=cl1

# esxdatacenter proxy
salt '*' vsphere.list_cluster cluster=cl1

# esxcluster proxy
salt '*' vsphere.list_cluster
```

`salt.modules.vsphere.list_datacenters_via_proxy` (*datacenter_names=None*, *service_instance=None*)

Returns a list of dict representations of VMware datacenters. Connection is done via the proxy details.

Supported proxies: esxdatacenter

datacenter_names List of datacenter names. Default is None.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_datacenters_via_proxy
salt '*' vsphere.list_datacenters_via_proxy dc1
salt '*' vsphere.list_datacenters_via_proxy dc1,dc2
salt '*' vsphere.list_datacenters_via_proxy datacenter_names=[dc1, dc2]
```

`salt.modules.vsphere.list_datastores_via_proxy` (*datastore_names=None*, *backing_disk_ids=None*, *backing_disk_scsi_addresses=None*, *service_instance=None*)

Returns a list of dict representations of the datastores visible to the proxy object. The list of datastores can be filtered by datastore names, backing disk ids (canonical names) or backing disk scsi addresses.

Supported proxy types: esxi, esxcluster, esxdatacenter

datastore_names List of the names of datastores to filter on

backing_disk_ids List of canonical names of the backing disks of the datastores to filter. Default is None.

backing_disk_scsi_addresses List of scsi addresses of the backing disks of the datastores to filter. Default is None.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_datastores_via_proxy
salt '*' vsphere.list_datastores_via_proxy datastore_names=[ds1, ds2]
```

`salt.modules.vsphere.list_default_storage_policy_of_datastore` (*datastore*, *service_instance=None*)

Returns a list of datastores assign the the storage policies.

datastore Name of the datastore to assign. The datastore needs to be visible to the VMware entity the proxy points to.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_default_storage_policy_of_datastore datastore=ds1
```

`salt.modules.vsphere.list_default_vsan_policy` (*service_instance=None*)

Returns the default vsan storage policy.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

`salt.modules.vsphere.list_disk_partitions` (*disk_id=None*, *scsi_address=None*, *service_instance=None*)

Lists the partitions on a disk. The disk can be specified either by the canonical name, or by the `scsi_address`.

disk_id Canonical name of the disk. Either `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

scsi_address Scsi address of the disk. `disk_id` or `scsi_address` needs to be specified (`disk_id` supersedes `scsi_address`).

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_disk_partitions scsi_address='vmhba0:C0:T0:L0'
salt '*' vsphere.list_disk_partitions disk_id='naa.0000000000000001'
```

salt.modules.vsphere.list_diskgroups (*cache_disk_ids=None, service_instance=None*)

Returns a list of disk group dict representation on an ESXi host. The list of disk groups can be filtered by the cache disks canonical names. If no filtering is applied, all disk groups are returned.

cache_disk_ids: List of cache disk canonical names of the disk groups to be retrieved. Default is None.

use_proxy_details Specify whether to use the proxy minion's details instead of the arguments

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_diskgroups
salt '*' vsphere.list_diskgroups cache_disk_ids='[naa.0000000000000001]'
```

salt.modules.vsphere.list_disks (*disk_ids=None, scsi_addresses=None, service_instance=None*)

Returns a list of dict representations of the disks in an ESXi host. The list of disks can be filtered by disk canonical names or scsi addresses.

disk_ids: List of disk canonical names to be retrieved. Default is None.

scsi_addresses List of scsi addresses of disks to be retrieved. Default is None

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_disks
salt '*' vsphere.list_disks disk_ids='[naa.00, naa.001]'
salt '*' vsphere.list_disks
      scsi_addresses='[vmhba0:C0:T0:L0, vmhba1:C0:T0:L0]'
```

salt.modules.vsphere.list_dvportgroups (*dvs=None, portgroup_names=None, service_instance=None*)

Returns a list of distributed virtual switch portgroups. The list can be filtered by the portgroup names or by the DVS.

dvs Name of the DVS containing the portgroups. Default value is None.

portgroup_names List of portgroup names to look for. If None, all portgroups are returned. Default value is None

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.list_dvportgroups
salt '*' vsphere.list_dvportgroups dvs=dvs1
salt '*' vsphere.list_dvportgroups portgroup_names=[pg1]
salt '*' vsphere.list_dvportgroups dvs=dvs1 portgroup_names=[pg1]
```

salt.modules.vsphere.list_dvss (*datacenter=None, dvs_names=None, service_instance=None*)

Returns a list of distributed virtual switches (DVSs). The list can be filtered by the datacenter or DVS names.

datacenter The datacenter to look for DVSs in. Default value is None.

dvs_names List of DVS names to look for. If None, all DVSs are returned. Default value is None.

```
salt '*' vsphere.list_dvss
salt '*' vsphere.list_dvss dvs_names=[dvs1,dvs2]
```

`salt.modules.vsphere.list_hosts_via_proxy` (*hostnames=None, datacenter=None, cluster=None, service_instance=None*)

Returns a list of hosts for the the specified VMware environment. The list of hosts can be filtered by datacenter name and/or cluster name

hostnames Hostnames to filter on.

datacenter_name Name of datacenter. Only hosts in this datacenter will be retrieved. Default is None.

cluster_name Name of cluster. Only hosts in this cluster will be retrieved. If a datacenter is not specified the first cluster with this name will be considered. Default is None.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

CLI Example:

```
salt '*' vsphere.list_hosts_via_proxy
salt '*' vsphere.list_hosts_via_proxy hostnames=[esxi1.example.com]
salt '*' vsphere.list_hosts_via_proxy datacenter=dc1 cluster=cluster1
```

`salt.modules.vsphere.list_licenses` (*service_instance=None*)

Lists all licenses on a vCenter.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.list_licenses
```

`salt.modules.vsphere.list_storage_policies` (*policy_names=None, service_instance=None*)

Returns a list of storage policies.

policy_names Names of policies to list. If None, all policies are listed. Default is None.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_storage_policies
salt '*' vsphere.list_storage_policy policy_names=[policy_name]
```

`salt.modules.vsphere.list_uplink_dvportgroup` (*dvs, service_instance=None*)

Returns the uplink portgroup of a distributed virtual switch.

dvs Name of the DVS containing the portgroup.

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.list_uplink_dvportgroup dvs=dvs_name
```

`salt.modules.vsphere.power_off_vm` (*name, datacenter=None, service_instance=None*)

Powers off a virtual machine specified by it's name.

name Name of the virtual machine

datacenter Datacenter of the virtual machine

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.power_off_vm name=my_vm
```

`salt.modules.vsphere.power_on_vm` (*name, datacenter=None, service_instance=None*)

Powers on a virtual machine specified by it's name.

name Name of the virtual machine

datacenter Datacenter of the virtual machine

service_instance Service instance (`vim.ServiceInstance`) of the vCenter. Default is None.

```
salt '*' vsphere.power_on_vm name=my_vm
```

`salt.modules.vsphere.register_vm` (*name, datacenter, placement, vmx_path, service_instance=None*)

Registers a virtual machine to the inventory with the given vmx file. Returns comments and change list

name Name of the virtual machine

datacenter Datacenter of the virtual machine

placement Placement dictionary of the virtual machine, host or cluster

vmx_path: Full path to the vmx file, datastore name should be included

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt.modules.vsphere.remove_capacity_from_diskgroup(cache_disk_id, capacity_disk_ids,
                                                    data_evacuation=True,
                                                    safety_checks=True,           ser-
                                                    vice_instance=None)
```

Remove capacity disks from the disk group with the specified cache disk.

cache_disk_id The canonical name of the cache disk.

capacity_disk_ids A list containing canonical names of the capacity disks to add.

data_evacuation Specifies whether to gracefully evacuate the data on the capacity disks before removing them from the disk group. Default value is True.

safety_checks Specify whether to perform safety check or to skip the checks and try performing the required task. Default value is True.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_capacity_from_diskgroup
      cache_disk_id='naa.0000000000000001'
      capacity_disk_ids=['naa.0000000000000002, naa.0000000000000003']
```

```
salt.modules.vsphere.remove_datastore(datastore, service_instance=None)
```

Removes a datastore. If multiple datastores an error is raised.

datastore Datastore name

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_datastore ds_name
```

```
salt.modules.vsphere.remove_diskgroup(cache_disk_id, data_accessibility=True, ser-
                                       vice_instance=None)
```

Remove the diskgroup with the specified cache disk.

cache_disk_id The canonical name of the cache disk.

data_accessibility Specifies whether to ensure data accessibility. Default value is True.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.remove_diskgroup cache_disk_id='naa.0000000000000001'
```

```
salt.modules.vsphere.remove_dvportgroup(portgroup, dvs, service_instance=None)
```

Removes a distributed virtual portgroup.

portgroup Name of the portgroup to be removed.

dvs Name of the DVS containing the portgroups.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.remove_dvportgroup portgroup=pg1 dvs=dvs1
```

```
salt.modules.vsphere.rename_datastore(datastore_name, new_datastore_name, ser-
                                       vice_instance=None)
```

Renames a datastore. The datastore needs to be visible to the proxy.

datastore_name Current datastore name.

new_datastore_name New datastore name.

service_instance Service instance (vim.ServiceInstance) of the vCenter/ESXi host. Default is None.

```
salt '*' vsphere.rename_datastore old_name new_name
```

```
salt.modules.vsphere.reset_syslog_config(host, username, password, protocol=None,
                                         port=None, syslog_config=None, esxi_hosts=None,
                                         credstore=None)
```

Reset the syslog service to its default settings.

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, `default-timeout`, or `all` for all of these.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

syslog_config List of parameters to reset, provided as a comma-delimited string, or `'all'` to reset all syslog configuration parameters. Required.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of `'success'` which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

`syslog_config` can be passed as a quoted, comma-separated string, e.g.

```
# Used for ESXi host connection information
salt '*' vsphere.reset_syslog_config my.esxi.host root bad-password
↳syslog_config='logdir,loghost'

# Used for connecting to a vCenter Server
salt '*' vsphere.reset_syslog_config my.vcenter.location root bad-password
↳ syslog_config='logdir,loghost' esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

```
salt.modules.vsphere.set_advanced_configs(vm_name, datacenter, advanced_configs, service_instance=None)
```

Appends extra config parameters to a virtual machine advanced config list

vm_name Virtual machine name

datacenter Datacenter name where the virtual machine is available

advanced_configs Dictionary with advanced parameter key value pairs

service_instance vCenter service instance for connection and configuration

```
salt.modules.vsphere.set_coredump_network_config(host, username, password, dump_ip,
                                                  protocol=None, port=None,
                                                  host_vnic='vmk0', dump_port=6500,
                                                  esxi_hosts=None, credstore=None)
```

Set the network parameters for a network coredump collection. Note that ESXi requires that the dumps first be enabled (see `coredump_network_enable`) before these parameters may be set.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

dump_ip IP address of host that will accept the dump.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

host_vnic Host VNIC port through which to communicate. Defaults to `vmk0`.

dump_port TCP port to use for the dump, defaults to 6500.

credstore Optionally set to path to the credential store file.

Returns A standard `cmd.run_all` dictionary with a `success` key added, per host. `success` will be True if the set succeeded, False otherwise.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_coredump_network_config my.esxi.host root bad-password 'dump_
↳ip.host.com'

# Used for connecting to a vCenter Server
salt '*' vsphere.set_coredump_network_config my.vcenter.location root bad-
↳password 'dump_ip.host.com' esxi_hosts='[esxi-1.host.com, esxi-2.
↳host.com]'
```

`salt.modules.vsphere.set_syslog_config`(*host*, *username*, *password*, *syslog_config*, *config_value*, *protocol=None*, *port=None*, *firewall=True*, *reset_service=True*, *esxi_hosts=None*, *credstore=None*)

Set the specified syslog configuration parameter. By default, this function will reset the syslog service after the configuration is set.

host ESXi or vCenter host to connect to.

username User to connect as, usually root.

password Password to connect with.

syslog_config Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (-))

Valid `syslog_config` values are `logdir`, `loghost`, `default-rotate``, ``default-size`, `default-timeout`, and `logdir-unique`.

config_value Value for the above parameter. For `loghost`, URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas.

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

firewall Enable the firewall rule set for syslog. Defaults to `True`.

reset_service After a successful parameter set, reset the service. Defaults to `True`.

esxi_hosts If host is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns Dictionary with a top-level key of 'success' which indicates if all the parameters were reset, and individual keys for each parameter indicating which succeeded or failed, per host.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.set_syslog_config my.esxi.host root bad-password
↳loghost ssl://localhost:5432,tcp://10.1.0.1:1514
```

(continues on next page)

(continued from previous page)

```
# Used for connecting to a vCenter Server
salt '*' vsphere.set_syslog_config my.vcenter.location root bad-password
↳ loghost ssl://localhost:5432,tcp://10.1.0.1:1514 esxi_hosts=
↳ '[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.supports_proxies` (**proxy_types*)

Decorator to specify which proxy types are supported by a function

proxy_types: Arbitrary list of strings with the supported types of proxies

`salt.modules.vsphere.syslog_service_reload` (*host, username, password, protocol=None, port=None, esxi_hosts=None, credstore=None*)

Reload the syslog service so it will pick up any changes.

host The location of the host.

username The username used to login to the host, such as `root`.

password The password used to login to the host.

protocol Optionally set to alternate protocol if the host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the host is not using the default port. Default port is 443.

esxi_hosts If `host` is a vCenter host, then use `esxi_hosts` to execute this function on a list of one or more ESXi machines.

credstore Optionally set to path to the credential store file.

Returns A standard `cmd.run_all` dictionary. This dictionary will at least have a `retcode` key. If `retcode` is 0 the command was successful.

CLI Example:

```
# Used for ESXi host connection information
salt '*' vsphere.syslog_service_reload my.esxi.host root bad-password

# Used for connecting to a vCenter Server
salt '*' vsphere.syslog_service_reload my.vcenter.location root bad-password
↳ esxi_hosts='[esxi-1.host.com, esxi-2.host.com]'
```

`salt.modules.vsphere.test_vcenter_connection` (*service_instance=None*)

Checks if a connection is to a vCenter

CLI Example:

```
salt '*' vsphere.test_vcenter_connection
```

`salt.modules.vsphere.unregister_vm` (*name, datacenter, placement=None, power_off=False, service_instance=None*)

Unregisters a virtual machine defined by name and placement

name Name of the virtual machine

datacenter Datacenter of the virtual machine

placement Placement information of the virtual machine

service_instance vCenter service instance for connection and configuration

```
salt '*' vsphere.unregister_vm name=my_vm datacenter=my_datacenter
```

`salt.modules.vsphere.update_cluster` (*cluster_dict, datacenter=None, cluster=None, service_instance=None*)

Updates a cluster.

config_dict Dictionary with the config values of the new cluster.

datacenter Name of datacenter containing the cluster. Ignored if already contained by proxy details. Default value is None.

cluster Name of cluster. Ignored if already contained by proxy details. Default value is None.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
# esxdatacenter proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict cluster=cl1

# esxcluster proxy
salt '*' vsphere.update_cluster cluster_dict=$cluster_dict
```

salt.modules.vsphere.update_dvportgroup(*portgroup_dict*, *portgroup*, *dvs*, *service_instance=True*)

Updates a distributed virtual portgroup.

portgroup_dict Dictionary with the values the portgroup should be update with (example in salt.states.dvs).

portgroup Name of the portgroup to be updated.

dvs Name of the DVS containing the portgroups.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1

salt '*' vsphere.update_dvportgroup portgroup_dict=<dict>
    portgroup=pg1 dvs=dvs1
```

salt.modules.vsphere.update_dvs(*dvs_dict*, *dvs*, *service_instance=None*)

Updates a distributed virtual switch (DVS).

Note: Updating the product info, capability, uplinks of a DVS is not supported so the corresponding entries in *dvs_dict* will be ignored.

dvs_dict Dictionary with the values the DVS should be update with (example in salt.states.dvs)

dvs Name of the DVS to be updated.

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.update_dvs dvs_dict=$dvs_dict dvs=dvs1
```

salt.modules.vsphere.update_storage_policy(*policy*, *policy_dict*, *service_instance=None*)

Updates a storage policy.

Supported capability types: scalar, set, range.

policy Name of the policy to update.

policy_dict Dictionary containing the changes to apply to the policy. (example in salt.states.pbm)

service_instance Service instance (vim.ServiceInstance) of the vCenter. Default is None.

```
salt '*' vsphere.update_storage_policy policy='policy name'
    policy_dict="$policy_dict"
```

salt.modules.vsphere.update_vm(*vm_name*, *cpu=None*, *memory=None*, *image=None*, *version=None*, *interfaces=None*, *disks=None*, *scsi_devices=None*, *serial_ports=None*, *datacenter=None*, *datastore=None*, *cd_dvd_drives=None*, *sata_controllers=None*, *advanced_configs=None*, *service_instance=None*)

Updates the configuration of the virtual machine if the config differs

vm_name Virtual Machine name to be updated

cpu CPU configuration options

memory Memory configuration options

version Virtual machine container hardware version

image Virtual machine guest OS version identifier VirtualMachineGuestOsIdentifier

interfaces Network interfaces configuration options
disks Disks configuration options
scsi_devices SCSI devices configuration options
serial_ports Serial ports configuration options
datacenter Datacenter where the virtual machine is available
datastore Datastore where the virtual machine config files are available
cd_dvd_drives CD/DVD drives configuration options
advanced_config Advanced config parameters to be set for the virtual machine
service_instance vCenter service instance for connection and configuration

20.9.432 salt.modules.win_autoruns

Module for listing programs that automatically run on startup (very alpha...not tested on anything but my Win 7x64)

salt.modules.win_autoruns.list_()
 Get a list of automatically running programs

CLI Example:

```
salt '*' autoruns.list
```

20.9.433 salt.modules.win_certutil module

This module allows you to install certificates into the windows certificate manager.

```
salt '*' certutil.add_store salt://cert.cer "TrustedPublisher"
```

salt.modules.win_certutil.add_store(*source, store, saltenv='base'*)

Add the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file

store The certificate store to add the certificate to

saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.add_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.del_store(*source, store, saltenv='base'*)

Delete the given cert into the given Certificate Store

source The source certificate file this can be in the form salt://path/to/file

store The certificate store to delete the certificate from

saltenv The salt environment to use this is ignored if the path is local

CLI Example:

```
salt '*' certutil.del_store salt://cert.cer TrustedPublisher
```

salt.modules.win_certutil.get_cert_serial(*cert_file*)

Get the serial number of a certificate file

cert_file The certificate file to find the serial for

CLI Example:

```
salt '*' certutil.get_cert_serial <certificate name>
```

`salt.modules.win_certutil.get_stored_cert_serials(store)`

Get all of the certificate serials in the specified store

store The store to get all the certificate serials from

CLI Example:

```
salt '*' certutil.get_stored_cert_serials <store>
```

20.9.434 salt.modules.win_dacl

Manage DACLs on Windows

depends

- winreg Python module

`salt.modules.win_dacl.add_ace(path, objectType, user, permission, acetype, propagation)`

add an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) **user**: user to add

permission: permissions for the user **acetype**: either allow/deny for each user/permission (ALLOW, DENY)

propagation: how the ACE applies to children for Registry Keys and Directories (KEY, KEY&SUBKEYS, SUBKEYS)

CLI Example:

```
allow domain\fakeuser full control on HKLM\SOFTWARE\somekey, propagate to this
↳key and subkeys
  salt 'myminion' win_dacl.add_ace 'HKEY_LOCAL_MACHINE\SOFTWARE\somekey'
↳'Registry' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS'
```

`salt.modules.win_dacl.check_ace(path, objectType, user, permission=None, acetype=None, propagation=None, exactPermissionMatch=False)`

Checks a path to verify the ACE (access control entry) specified exists

Parameters

- **path** – path to the file/reg key
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – user that the ACL is for
- **permission** – permission to test for (READ, FULLCONTROL, etc)
- **acetype** – the type of ACE (ALLOW or DENY)
- **propagation** – the propagation type of the ACE (FILES, FOLDERS, KEY, KEY&SUBKEYS, SUBKEYS, etc)
- **exactPermissionMatch** – the ACL must match exactly, IE if READ is specified, the user must have READ exactly and not FULLCONTROL (which also has the READ permission obviously)

Returns (dict): 'Exists' true if the ACE exists, false if it does not

CLI Example:

```
salt 'minion-id' win_dacl.check_ace c: emp directory <username> fullcontrol
```

`salt.modules.win_dacl.check_inheritance(path, objectType, user=None)`

Check a specified path to verify if inheritance is enabled

Parameters

- **path** – path of the registry key or file system object to check
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – if provided, will consider only the ACEs for that user

Returns (bool): 'Inheritance' of True/False

CLI Example:

```
salt 'minion-id' win_dacl.check_inheritance c: emp directory <username>
```

class salt.modules.win_dacl.daclConstants

DACL constants used throughout the module

getAceTypeBit(*t*)

returns the acetype bit of a text value

getAceTypeText(*t*)

returns the textual representation of a acetype bit

getObjectTypeBit(*t*)

returns the bit value of the string object type

getPermissionBit(*t, m*)

returns a permission bit of the string permission value for the specified object type

getPermissionText(*t, m*)

returns the permission textual representation of a specified permission bit/object type

getPropagationBit(*t, p*)

returns the propagation bit of a text value

getPropagationText(*t, p*)

returns the textual representation of a propagation bit

getSecurityHkey(*s*)

returns the necessary string value for an HKEY for the win32security module

processPath(*path, objectType*)

processes a path/object type combo and returns: registry types with the correct HKEY text representation files/directories with environment variables expanded

salt.modules.win_dacl.disable_inheritance(*path, objectType, copy=True*)

Disable inheritance on an object

Parameters

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **copy** – True will copy the Inherited ACEs to the DACL before disabling inheritance

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.disable_inheritance c: emp directory
```

salt.modules.win_dacl.enable_inheritance(*path, objectType, clear=False*)

enable/disable inheritance on an object

Parameters

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **clear** – True will remove non-Inherited ACEs from the ACL

Returns (dict): A dictionary containing the results

CLI Example:

```
salt 'minion-id' win_dacl.enable_inheritance c: emp directory
```

`salt.modules.win_dacl.get`(*path*, *objectType*, *user=None*)
Get the ACL of an object. Will filter by user if one is provided.

Parameters

- **path** – The path to the object
- **objectType** – The type of object (FILE, DIRECTORY, REGISTRY)
- **user** – A user name to filter by

Returns (dict): A dictionary containing the ACL

CLI Example:

```
salt 'minion-id' win_dacl.get c: emp directory
```

`salt.modules.win_dacl.rm_ace`(*path*, *objectType*, *user*, *permission=None*, *acetype=None*, *propagation=None*)

remove an ace to an object

path: path to the object (i.e. c:\temp\file, HKEY_LOCAL_MACHINE\SOFTWARE\KEY, etc) user: user to remove permission: permissions for the user acetypes: either allow/deny for each user/permission (ALLOW, DENY) propagation: how the ACE applies to children for Registry Keys and Directories(KEY, KEY&SUBKEYS, SUBKEYS)

If any of the optional parameters are omitted (or set to None) they act as wildcards.

CLI Example:

```
remove allow domain\fakeuser full control on HKLM\SOFTWARE\somekey propagated
↳ to this key and subkeys
  salt 'myminion' win_dacl.rm_ace 'Registry' 'HKEY_LOCAL_
↳ MACHINE\SOFTWARE\somekey' 'domain\fakeuser' 'FULLCONTROL' 'ALLOW' 'KEY&SUBKEYS
↳'
```

20.9.435 salt.modules.win_disk

Module for gathering disk information on Windows

depends

- win32api Python module

`salt.modules.win_disk.usage`()

Return usage information for volumes mounted on this minion

CLI Example:

```
salt '*' disk.usage
```

20.9.436 salt.modules.win_dism module

Install features/packages for Windows using DISM, which is useful for minions not running server versions of Windows. Some functions are only available on Windows 10.

`salt.modules.win_dism.add_capability`(*capability*, *source=None*, *limit_access=False*, *image=None*, *restart=False*)

Install a capability

Parameters

- **capability** (*str*) – The capability to install

- **source** (*Optional[str]*) – The optional source of the capability. Default is set by group policy and can be Windows Update.
- **limit_access** (*Optional[bool]*) – Prevent DISM from contacting Windows Update for the source package
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.add_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.add_feature` (*feature, package=None, source=None, limit_access=False, enable_parent=False, image=None, restart=False*)

Install a feature using DISM

Parameters

- **feature** (*str*) – The feature to install
- **package** (*Optional[str]*) – The parent package for the feature. You do not have to specify the package if it is the Windows Foundation Package. Otherwise, use package to specify the parent package of the feature
- **source** (*Optional[str]*) – The optional source of the capability. Default is set by group policy and can be Windows Update
- **limit_access** (*Optional[bool]*) – Prevent DISM from contacting Windows Update for the source package
- **enable_parent** (*Optional[bool]*) – True will enable all parent features of the specified feature
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.add_feature NetFx3
```

`salt.modules.win_dism.add_package` (*package, ignore_check=False, prevent_pending=False, image=None, restart=False*)

Install a package using DISM

Parameters

- **package** (*str*) – The package to install. Can be a .cab file, a .msu file, or a folder

Note: An .msu package is supported only when the target image is offline, either mounted or applied.

- **ignore_check** (*Optional[bool]*) – Skip installation of the package if the applicability checks fail
- **prevent_pending** (*Optional[bool]*) – Skip the installation of the package if there are pending online actions
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows

image. If *None* is passed, the running operating system is targeted. Default is *None*.

- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type `dict`

CLI Example:

```
salt '*' dism.add_package C:\Packages\package.cab
```

`salt.modules.win_dism.available_capabilities` (*image=None*)

List the capabilities available on the system

Parameters **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

Returns A list of available capabilities

Return type `list`

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.available_features` (*image=None*)

List the features available on the system

Parameters **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of available features

Return type `list`

CLI Example:

```
salt '*' dism.available_features
```

`salt.modules.win_dism.get_capabilities` (*image=None*)

List all capabilities on the system

Parameters **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

Returns A list of capabilities

Return type `list`

CLI Example:

```
salt '*' dism.get_capabilities
```

`salt.modules.win_dism.get_features` (*package=None, image=None*)

List features on the system or in a package

Parameters

- **package** (*Optional[str]*) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for .msu files

This can also be the name of a package as listed in `dism.installed_packages`

- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of features

Return type `list`

CLI Example:

```
# Return all features on the system
salt '*' dism.get_features

# Return all features in package.cab
salt '*' dism.get_features C:\packages\package.cab

# Return all features in the calc package
salt '*' dism.get_features Microsoft.Windows.Calc.Demo~6595b6144ccf1df~
↳x86~en~1.0.0.0
```

`salt.modules.win_dism.installed_capabilities` (*image=None*)

List the capabilities installed on the system

Parameters **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

Returns A list of installed capabilities

Return type `list`

CLI Example:

```
salt '*' dism.installed_capabilities
```

`salt.modules.win_dism.installed_features` (*image=None*)

List the features installed on the system

Parameters **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of installed features

Return type `list`

CLI Example:

```
salt '*' dism.installed_features
```

`salt.modules.win_dism.installed_packages` (*image=None*)

List the packages installed on the system

Parameters **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A list of installed packages

Return type `list`

CLI Example:

```
salt '*' dism.installed_packages
```

`salt.modules.win_dism.package_info` (*package, image=None*)

Display information about a package

Parameters

- **package** (*str*) – The full path to the package. Can be either a `.cab` file or a folder. Should point to the original source of the package, not to where the file is installed. You cannot use this command to get package information for `.msu` files

- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism. package_info C:\packages\package.cab
```

`salt.modules.win_dism.remove_capability` (*capability, image=None, restart=False*)

Uninstall a capability

Parameters

- **capability** (*str*) – The capability to be removed
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Raises

- **NotImplementedError** – For all versions of Windows that are not Windows 10
- **and later. Server editions of Windows use ServerManager instead.** –

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.remove_capability Tools.Graphics.DirectX~~~~0.0.1.0
```

`salt.modules.win_dism.remove_feature` (*feature, remove_payload=False, image=None, restart=False*)

Disables the feature.

Parameters

- **feature** (*str*) – The feature to uninstall
- **remove_payload** (*Optional[bool]*) – Remove the feature's payload. Must supply source when enabling in the future.
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
salt '*' dism.remove_feature NetFx3
```

`salt.modules.win_dism.remove_package` (*package, image=None, restart=False*)

Uninstall a package

Parameters

- **package** (*str*) – The full path to the package. Can be either a .cab file or a folder. Should point to the original source of the package, not to where the file is installed. This can also be the name of a package as listed in `dism.installed_packages`
- **image** (*Optional[str]*) – The path to the root directory of an offline Windows image. If *None* is passed, the running operating system is targeted. Default is *None*.
- **restart** (*Optional[bool]*) – Reboot the machine if required by the install

Returns A dictionary containing the results of the command

Return type dict

CLI Example:

```
# Remove the Calc Package
salt '*' dism.remove_package Microsoft.Windows.Calc.Demo~6595b6144ccf1df~x86~en~1.
↪0.0.0

# Remove the package.cab (does not remove C:\packages\package.cab)
salt '*' dism.remove_package C:\packages\package.cab
```

20.9.437 salt.modules.win_dns_client

Module for configuring DNS Client on Windows systems

salt.modules.win_dns_client.add_dns (*ip*, *interface='Local Area Connection'*, *index=1*)

Add the DNS server to the network interface (index starts from 1)

Note: if the interface DNS is configured by DHCP, all the DNS servers will be removed from the interface and the requested DNS will be the only one

CLI Example:

```
salt '*' win_dns_client.add_dns <ip> <interface> <index>
```

salt.modules.win_dns_client.dns_dhcp (*interface='Local Area Connection'*)

Configure the interface to get its DNS servers from the DHCP server

CLI Example:

```
salt '*' win_dns_client.dns_dhcp <interface>
```

salt.modules.win_dns_client.get_dns_config (*interface='Local Area Connection'*)

Get the type of DNS configuration (dhcp / static)

CLI Example:

```
salt '*' win_dns_client.get_dns_config 'Local Area Connection'
```

salt.modules.win_dns_client.get_dns_servers (*interface='Local Area Connection'*)

Return a list of the configured DNS servers of the specified interface

CLI Example:

```
salt '*' win_dns_client.get_dns_servers 'Local Area Connection'
```

salt.modules.win_dns_client.rm_dns (*ip*, *interface='Local Area Connection'*)

Remove the DNS server from the network interface

CLI Example:

```
salt '*' win_dns_client.rm_dns <ip> <interface>
```

20.9.438 salt.modules.win_dsc

Module for working with Windows PowerShell DSC (Desired State Configuration)

This module is Alpha

This module applies DSC Configurations in the form of PowerShell scripts or MOF (Managed Object Format) schema files.

Use the `psget` module to manage PowerShell resources.

The idea is to leverage Salt to push DSC configuration scripts or MOF files to the Minion.

depends

- PowerShell 5.0

`salt.modules.win_dsc.apply_config`(*path*, *source=None*, *salt_env='base'*)

Run an compiled DSC configuration (a folder containing a `.mof` file). The folder can be cached from the salt master using the `source` option.

Parameters

- **path** (*str*) – Local path to the directory that contains the `.mof` configuration file to apply. Required.
- **source** (*str*) – Path to the directory that contains the `.mof` file on the `file_roots`. The source directory will be copied to the `path` directory and then executed. If the `path` and `source` directories differ, the `source` directory will be applied. If `source` is not passed, the config located at `path` will be applied. Optional.
- **salt_env** (*str*) – The salt environment to use when copying your source. Default is `'base'`

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

To apply a config that already exists on the the system

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration
```

To cache a configuration from the master and apply it:

```
salt '*' dsc.apply_config C:\\DSC\\WebSiteConfiguration salt://dsc/configs/
↪WebSiteConfiguration
```

`salt.modules.win_dsc.compile_config`(*path*, *source=None*, *config_name=None*, *config_data=None*, *config_data_source=None*, *script_parameters=None*, *salt_env='base'*)

Compile a config from a PowerShell script (`.ps1`)

Parameters

- **path** (*str*) – Path (local) to the script that will create the `.mof` configuration file. If no `source` is passed, the file must exist locally. Required.
- **source** (*str*) – Path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If `source` is not passed, the config script located at `path` will be compiled. Optional.
- **config_name** (*str*) – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** (*str*) – Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config_data_source** (*str*) – The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script_parameters** (*str*) – Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt_env** (*str*) – The salt environment to use when copying the source. Default is 'base'

Returns A dictionary containing the results of the compilation

Return type `dict`

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.compile_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↳WebsiteConfig.ps1
```

`salt.modules.win_dsc.get_config()`

Get the current DSC Configuration

Returns A dictionary representing the DSC Configuration on the machine

Return type `dict`

Raises `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.get_config
```

`salt.modules.win_dsc.get_config_status()`

Get the status of the current DSC Configuration

Returns

A dictionary representing the status of the current DSC Configuration on the machine

Return type `dict`

CLI Example:

```
salt '*' dsc.get_config_status
```

`salt.modules.win_dsc.get_lcm_config()`

Get the current Local Configuration Manager settings

Returns

A dictionary representing the Local Configuration Manager settings on the machine

Return type `dict`

CLI Example:

```
salt '*' dsc.get_lcm_config
```

`salt.modules.win_dsc.remove_config(reset=False)`

Remove the current DSC Configuration. Removes current, pending, and previous dsc configurations.

New in version 2017.7.5.

Parameters **reset** (*bool*) – Attempts to reset the DSC configuration by removing the following from C:\Windows\System32\Configuration:

- File: DSCStatusHistory.mof
- File: DSCEngineCache.mof
- Dir: ConfigurationStatus

Default is False

Warning: `remove_config` may fail to reset the DSC environment if any of the files in the `ConfigurationStatus` directory. If you wait a few minutes and run again, it may complete successfully.

Returns True if successful

Return type `bool`

Raises `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.remove_config True
```

`salt.modules.win_dsc.restore_config()`

Reapplies the previous configuration.

New in version 2017.7.5.

Note: The current configuration will be come the previous configuration. If run a second time back-to-back it is like toggling between two configs.

Returns True if successfully restored

Return type `bool`

Raises `CommandExecutionError` – On failure

CLI Example:

```
salt '*' dsc.restore_config
```

`salt.modules.win_dsc.run_config(path, source=None, config_name=None, config_data=None, config_data_source=None, script_parameters=None, salt_env='base')`

Compile a DSC Configuration in the form of a PowerShell script (.ps1) and apply it. The PowerShell script can be cached from the master using the `source` option. If there is more than one config within the PowerShell script, the desired configuration can be applied by passing the name in the `config` option.

This command would be the equivalent of running `dsc.compile_config` followed by `dsc.apply_config`.

Parameters

- **path** (*str*) – The local path to the PowerShell script that contains the DSC Configuration. Required.
- **source** (*str*) – The path to the script on `file_roots` to cache at the location specified by `path`. The source file will be cached locally and then executed. If source is not passed, the config script located at `path` will be compiled. Optional.
- **config_name** (*str*) – The name of the Configuration within the script to apply. If the script contains multiple configurations within the file a `config_name` must be specified. If the `config_name` is not specified, the name of the file will be used as the `config_name` to run. Optional.
- **config_data** (*str*) – Configuration data in the form of a hash table that will be passed to the `ConfigurationData` parameter when the `config_name` is compiled. This can be the path to a `.psd1` file containing the proper hash table or the PowerShell code to create the hash table.

New in version 2017.7.0.

- **config_data_source** (*str*) – The path to the `.psd1` file on `file_roots` to cache at the location specified by `config_data`. If this is specified, `config_data` must be a local path instead of a hash table.

New in version 2017.7.0.

- **script_parameters** (*str*) – Any additional parameters expected by the configuration script. These must be defined in the script itself.

New in version 2017.7.0.

- **salt_env** (*str*) – The salt environment to use when copying the source. Default is 'base'

Returns True if successfully compiled and applied, otherwise False

Return type bool

CLI Example:

To compile a config from a script that already exists on the system:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1
```

To cache a config script to the system from the master and compile it:

```
salt '*' dsc.run_config C:\\DSC\\WebsiteConfig.ps1 salt://dsc/configs/
↳WebsiteConfig.ps1
```

```
salt.modules.win_dsc.set_lcm_config(config_mode=None, config_mode_freq=None, re-
fresh_freq=None, reboot_if_needed=None, ac-
tion_after_reboot=None, refresh_mode=None, cer-
tificate_id=None, configuration_id=None, al-
low_module_overwrite=None, debug_mode=False,
status_retention_days=None)
```

For detailed descriptions of the parameters see: <https://msdn.microsoft.com/en-us/PowerShell/DSC/metaConfig>

config_mode (str): How the LCM applies the configuration. Valid values are:

- ApplyOnly
- ApplyAndMonitor
- ApplyAndAutoCorrect

config_mode_freq (int): How often, in minutes, the current configuration is checked and applied. Ignored if config_mode is set to ApplyOnly. Default is 15.

refresh_mode (str): How the LCM gets configurations. Valid values are:

- Disabled
- Push
- Pull

refresh_freq (int): How often, in minutes, the LCM checks for updated configurations. (pull mode only) Default is 30.

reboot_if_needed (bool): Reboot the machine if needed after a configuration is applied. Default is False.

action_after_reboot (str): Action to take after reboot. Valid values are:

- ContinueConfiguration
- StopConfiguration

certificate_id (guid): A GUID that specifies a certificate used to access the configuration: (pull mode)

configuration_id (guid): A GUID that identifies the config file to get from a pull server. (pull mode)

allow_module_overwrite (bool): New configs are allowed to overwrite old ones on the target node.

debug_mode (str): Sets the debug level. Valid values are:

- None
- ForceModuleImport
- All

status_retention_days (int): Number of days to keep status of the current config.

Note: Either config_mode_freq or refresh_freq needs to be a multiple of the other. See documen-

tation on MSDN for more details.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' dsc.set_lcm_config ApplyOnly
```

`salt.modules.win_dsc.test_config()`

Tests the current applied DSC Configuration

Returns True if successfully applied, otherwise False

Return type `bool`

CLI Example:

```
salt '*' dsc.test_config
```

20.9.439 salt.modules.win_file

Manage information about files on the minion, set/read user, group data, modify the ACL of files/directories

depends

- win32api
- win32file
- win32con
- salt.utils.win_dacl

exception `salt.modules.win_file.WindowsError`

`salt.modules.win_file.check_perms(path, ret=None, owner=None, grant_perms=None, deny_perms=None, inheritance=True, reset=False)`

Check owner and permissions for the passed directory. This function checks the permissions and sets them, returning the changes made.

Parameters

- **path** (*str*) – The full path to the directory.
- **ret** (*dict*) – A dictionary to append changes to and return. If not passed, will create a new dictionary to return.
- **owner** (*str*) – The owner to set for the directory.
- **grant_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to check/grant, ie: `{'user': {'perms': 'basic_permission'}}`. Default is None.
- **deny_perms** (*dict*) – A dictionary containing the user/group and permissions to check/deny. Default is None.
- **inheritance** (*bool*) – True will check if inheritance is enabled and enable it. ``False will check if inheritance is disabled and disable it. Default is True.
- **reset** (*bool*) – True will show what permissions will be removed by resetting the DACL. False will do nothing. Default is False.

Returns A dictionary of changes that have been made

Return type `dict`

CLI Example:

```
# To see changes to ``C:\Temp`` if the 'Users' group is given 'read & execute'
↳permissions.
salt '*' file.check_perms C:\Temp\ {} Administrators "'Users': {'perms': 'read_
↳execute'}]"

# Locally using salt call
salt-call file.check_perms C:\Temp\ {} Administrators "'Users': {'perms': 'read_
↳execute', 'applies_to': 'this_folder_only'}]"

# Specify advanced attributes with a list
salt '*' file.check_perms C:\Temp\ {} Administrators "'jsnuffy': {'perms': [
↳'read_attributes', 'read_ea'], 'applies_to': 'files_only'}]"
```

`salt.modules.win_file.chgrp`(*path*, *group*)

Change the group of a file

Under Windows, this will do nothing.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to do nothing while still being compatible with Unix behavior. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to set the 'primary group' of a file, use `file.chpgrp`.

To set group permissions use `file.set_perms`

Parameters

- **path** (*str*) – The path to the file or directory
- **group** (*str*) – The group (unused)

Returns None

CLI Example:

```
salt '*' file.chpgrp c:\temp\test.txt administrators
```

`salt.modules.win_file.chown`(*path*, *user*, *group=None*, *pgroup=None*, *follow_symlinks=True*)

Chown a file, pass the file the desired user and group

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

Parameters

- **path** (*str*) – The path to the file or directory
- **user** (*str*) – The name of the user to own the file
- **group** (*str*) – The group (not used)
- **pgroup** (*str*) – The primary group to assign
- **follow_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns True if successful, otherwise error

Return type `bool`

CLI Example:

```

salt '*' file.chown c:\temp\test.txt myusername
salt '*' file.chown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.chown c:\temp\test.txt myusername "pgroup='None'"

```

`salt.modules.win_file.chpgrp(path, group)`

Change the group of a file

Under Windows, this will set the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (*str*) – The path to the file or directory
- **pgroup** (*str*) – The primary group to assign

Returns True if successful, otherwise error

Return type `bool`

CLI Example:

```

salt '*' file.chpgrp c:\temp\test.txt Administrators
salt '*' file.chpgrp c:\temp\test.txt "'None'"

```

`salt.modules.win_file.get_attributes(path)`

Return a dictionary object with the Windows file attributes for a file.

Parameters **path** (*str*) – The path to the file or directory

Returns A dictionary of file attributes

Return type `dict`

CLI Example:

```

salt '*' file.get_attributes c:\temp\A.txt

```

`salt.modules.win_file.get_gid(path, follow_symlinks=True)`

Return the id of the group that owns a given file

Under Windows, this will return the uid of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgid`.

Parameters

- **path** (*str*) – The path to the file or directory
- **follow_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The gid of the owner

Return type `str`

CLI Example:

```

salt '*' file.get_gid c:\temp\test.txt

```

`salt.modules.win_file.get_group(path, follow_symlinks=True)`

Return the group that owns a given file

Under Windows, this will return the user (owner) of the file.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps this function to provide functionality that somewhat resembles Unix behavior for API compatibility reasons. When managing Windows systems, this function is superfluous and will generate an info level log entry if used directly.

If you do actually want to access the 'primary group' of a file, use `file.get_pgroup`.

Parameters

- **path** (*str*) – The path to the file or directory
- **follow_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner

Return type *str*

CLI Example:

```
salt '*' file.get_group c:\temp\test.txt
```

`salt.modules.win_file.get_mode(path)`

Return the mode of a file

Right now we're just returning None because Windows' doesn't have a mode like Linux

Parameters **path** (*str*) – The path to the file or directory

Returns None

CLI Example:

```
salt '*' file.get_mode /etc/passwd
```

`salt.modules.win_file.get_pgid(path, follow_symlinks=True)`

Return the id of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

Parameters

- **path** (*str*) – The path to the file or directory
- **follow_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The gid of the primary group

Return type *str*

CLI Example:

```
salt '*' file.get_pgid c:\temp\test.txt
```

`salt.modules.win_file.get_pgroup(path, follow_symlinks=True)`

Return the name of the primary group that owns a given file (Windows only)

This function will return the rarely used primary group of a file. This generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

Ensure you know what you are doing before using this function.

The return value may be 'None', e.g. if the user is not on a domain. This is a valid group - do not confuse this with the Salt/Python value of None which means no value was returned. To be certain, use the `get_pgid` function which will return the SID, including for the system 'None' group.

Parameters

- **path** (*str*) – The path to the file or directory
- **follow_symlinks** (*bool*) – If the object specified by **path** is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the primary group

Return type *str*

CLI Example:

```
salt '*' file.get_pgroup c:\temp\test.txt
```

`salt.modules.win_file.get_uid(path, follow_symlinks=True)`

Return the id of the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

Parameters

- **path** (*str*) – The path to the file or directory
- **follow_symlinks** (*bool*) – If the object specified by **path** is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The uid of the owner

Return type *str*

CLI Example:

```
salt '*' file.get_uid c:\temp\test.txt
salt '*' file.get_uid c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.get_user(path, follow_symlinks=True)`

Return the user that owns a given file

Symlinks are followed by default to mimic Unix behavior. Specify `follow_symlinks=False` to turn off this behavior.

Parameters

- **path** (*str*) – The path to the file or directory
- **follow_symlinks** (*bool*) – If the object specified by **path** is a symlink, get attributes of the linked file instead of the symlink itself. Default is True

Returns The name of the owner

Return type *str*

CLI Example:

```
salt '*' file.get_user c:\temp\test.txt
salt '*' file.get_user c:\temp\test.txt follow_symlinks=False
```

`salt.modules.win_file.gid_to_group(gid)`

Convert the group id to the group name on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `uid_to_user`.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `uid_to_user` function instead; an info level log entry will be generated if this function is used directly.

Parameters **gid** (*str*) – The gid of the group

Returns The name of the group

Return type *str*

CLI Example:

```
salt '*' file.gid_to_group S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.group_to_gid(group)`

Convert the group to the gid on this system

Under Windows, because groups are just another ACL entity, this function behaves the same as `user_to_uid`, except if None is given, " is returned.

For maintaining Windows systems, this function is superfluous and only exists for API compatibility with Unix. Use the `user_to_uid` function instead; an info level log entry will be generated if this function is used directly.

Parameters `group` (*str*) – The name of the group

Returns The gid of the group

Return type `str`

CLI Example:

```
salt '*' file.group_to_gid administrators
```

`salt.modules.win_file.is_link(path)`

Check if the path is a symlink

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.

Parameters `path` (*str*) – The path to a file or directory

Returns True if path is a symlink, otherwise False

Return type `bool`

CLI Example:

```
salt '*' file.is_link /path/to/link
```

`salt.modules.win_file.lchown(path, user, group=None, pgroup=None)`

Chown a file, pass the file the desired user and group without following any symlinks.

Under Windows, the group parameter will be ignored.

This is because while files in Windows do have a 'primary group' property, this is rarely used. It generally has no bearing on permissions unless intentionally configured and is most commonly used to provide Unix compatibility (e.g. Services For Unix, NFS services).

If you do want to change the 'primary group' property and understand the implications, pass the Windows only parameter, `pgroup`, instead.

To set the primary group to 'None', it must be specified in quotes. Otherwise Salt will interpret it as the Python value of None and no primary group changes will occur. See the example below.

Parameters

- **path** (*str*) – The path to the file or directory
- **user** (*str*) – The name of the user to own the file
- **group** (*str*) – The group (not used)
- **pgroup** (*str*) – The primary group to assign

Returns True if successful, otherwise error

Return type `bool`

CLI Example:

```
salt '*' file.lchown c:\temp\test.txt myusername
salt '*' file.lchown c:\temp\test.txt myusername pgroup=Administrators
salt '*' file.lchown c:\temp\test.txt myusername "pgroup='None'"
```

`salt.modules.win_file.makedirs_` (*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the parent directory containing this path is available.

Parameters

- **path** (*str*) – The full path to the directory.

Note: The path must end with a trailing slash otherwise the directory(s) will be created up to the parent directory. For example if path is `C:\temp\test`, then it would be treated as `C:\temp\` but if the path ends with a trailing slash like `C:\temp\test\`, then it would be treated as `C:\temp\test\`.

- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) – If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns True if successful

Return type bool

Raises `CommandExecutionError` – If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs C:\Temp\ Administrators "{ 'Users': { 'perms': 'read_execute
↪'}}"

# Locally using salt call
salt-call file.makedirs C:\Temp\ Administrators "{ 'Users': { 'perms': 'read_execute
↪', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs C:\Temp\ Administrators "{ 'jsnuffy': { 'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.makedirs_perms` (*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=True*)

Set owner and permissions for each directory created.

Parameters

- **path** (*str*) – The full path to the directory.
- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM.
- **grant_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪ }
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

- **deny_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created
- **reset** (*bool*) – If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns True if successful, otherwise raises an error

Return type bool

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute'}}"

# Locally using salt call
salt-call file.makedirs_perms C:\Temp\ Administrators '{"Users': {'perms': 'read_
↪execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.makedirs_perms C:\Temp\ Administrators '{"jsnuffy': {'perms': [
↪'read_attributes', 'read_ea'], 'applies_to': 'this_folder_files'}}"
```

`salt.modules.win_file.mkdir` (*path*, *owner=None*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Ensure that the directory is available and permissions are set.

Parameters

- **path** (*str*) – The full path to the directory.
- **owner** (*str*) – The owner of the directory. If not passed, it will be the account that created the directory, likely SYSTEM
- **grant_perms** (*dict*) – A dictionary containing the user/group and the basic per-

missions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to
↪': 'this_folder'}}
```

- **deny_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.
- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created.
- **reset** (*bool*) – If `True` the existing DACL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns True if successful

Return type bool

Raises *CommandExecutionError* – If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.mkdir C:\Temp\ Administrators '{"Users': {'perms': 'read_execute',
↪'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.mkdir C:\Temp\ Administrators '{"jsnuffy': {'perms': ['read_
↪attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.readlink(path)`

Return the path that a symlink points to

This is only supported on Windows Vista or later.

Inline with Unix behavior, this function will raise an error if the path is not a symlink, however, the error raised will be a `SaltInvocationError`, not an `OSError`.

Parameters `path` (*str*) – The path to the symlink

Returns The path that the symlink points to

Return type *str*

CLI Example:

```
salt '*' file.readlink /path/to/link
```

`salt.modules.win_file.remove(path, force=False)`

Remove the named file or directory

Parameters

- **path** (*str*) – The path to the file or directory to remove.
- **force** (*bool*) – Remove even if marked Read-Only. Default is False

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt '*' file.remove C:\Temp
```

`salt.modules.win_file.set_attributes`(*path*, *archive=None*, *hidden=None*, *normal=None*, *notIndexed=None*, *readonly=None*, *system=None*, *temporary=None*)

Set file attributes for a file. Note that the normal attribute means that all others are false. So setting it will clear all others.

Parameters

- **path** (*str*) – The path to the file or directory
- **archive** (*bool*) – Sets the archive attribute. Default is None
- **hidden** (*bool*) – Sets the hidden attribute. Default is None
- **normal** (*bool*) – Resets the file attributes. Cannot be used in conjunction with any other attribute. Default is None
- **notIndexed** (*bool*) – Sets the indexed attribute. Default is None
- **readonly** (*bool*) – Sets the readonly attribute. Default is None
- **system** (*bool*) – Sets the system attribute. Default is None
- **temporary** (*bool*) – Sets the temporary attribute. Default is None

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' file.set_attributes c:\temp\a.txt normal=True
salt '*' file.set_attributes c:\temp\a.txt readonly=True hidden=True
```

`salt.modules.win_file.set_mode`(*path*, *mode*)

Set the mode of a file

This just calls `get_mode`, which returns None because we don't use mode on Windows

Parameters

- **path** – The path to the file or directory
- **mode** – The mode (not used)

Returns None

CLI Example:

```
salt '*' file.set_mode /etc/passwd 0644
```

`salt.modules.win_file.set_perms`(*path*, *grant_perms=None*, *deny_perms=None*, *inheritance=True*, *reset=False*)

Set permissions for the given path

Parameters

- **path** (*str*) – The full path to the directory.
- **grant_perms** (*dict*) – A dictionary containing the user/group and the basic permissions to grant, ie: `{'user': {'perms': 'basic_permission'}}`. You can also set the `applies_to` setting here. The default for `applies_to` is `this_folder_subfolders_files`. Specify another `applies_to` setting like this:

```
{'user': {'perms': 'full_control', 'applies_to': 'this_folder'}
↪}
```

To set advanced permissions use a list for the `perms` parameter, ie:

```
{'user': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder'}}
```

To see a list of available attributes and applies to settings see the documentation for `salt.utils.win_dacl`.

A value of `None` will make no changes to the `grant` portion of the DACL. Default is `None`.

- **deny_perms** (*dict*) – A dictionary containing the user/group and permissions to deny along with the `applies_to` setting. Use the same format used for the `grant_perms` parameter. Remember, deny permissions supersede grant permissions.

A value of `None` will make no changes to the `deny` portion of the DACL. Default is `None`.

- **inheritance** (*bool*) – If `True` the object will inherit permissions from the parent, if `False`, inheritance will be disabled. Inheritance setting will not apply to parent directories if they must be created. Default is `False`.
- **reset** (*bool*) – If `True` the existing DCL will be cleared and replaced with the settings defined in this function. If `False`, new entries will be appended to the existing DACL. Default is `False`.

New in version 2018.3.0.

Returns True if successful

Return type bool

Raises `CommandExecutionError` – If unsuccessful

CLI Example:

```
# To grant the 'Users' group 'read & execute' permissions.
salt '*' file.set_perms C:\Temp\ '{"Users': {'perms': 'read_execute'}}"

# Locally using salt call
salt-call file.set_perms C:\Temp\ '{"Users': {'perms': 'read_execute', 'applies_to': 'this_folder_only'}}"

# Specify advanced attributes with a list
salt '*' file.set_perms C:\Temp\ '{"jsnuffy': {'perms': ['read_attributes', 'read_ea'], 'applies_to': 'this_folder_only'}}"
```

`salt.modules.win_file.stats` (*path*, *hash_type*='sha256', *follow_symlinks*=True)

Return a dict containing the stats about a given file

Under Windows, *gid* will equal *uid* and *group* will equal *user*.

While a file in Windows does have a 'primary group', this rarely used attribute generally has no bearing on permissions unless intentionally configured and is only used to support Unix compatibility features (e.g. Services For Unix, NFS services).

Salt, therefore, remaps these properties to keep some kind of compatibility with Unix behavior. If the 'primary group' is required, it can be accessed in the *pgroup* and *pgid* properties.

Parameters

- **path** (*str*) – The path to the file or directory
- **hash_type** (*str*) – The type of hash to return
- **follow_symlinks** (*bool*) – If the object specified by `path` is a symlink, get attributes of the linked file instead of the symlink itself. Default is `True`

Returns A dictionary of file/directory stats

Return type `dict`

CLI Example:

```
salt '*' file.stats /etc/passwd
```

`salt.modules.win_file.symlink(src, link)`

Create a symbolic link to a file

This is only supported with Windows Vista or later and must be executed by a user with the SeCreateSymbolicLink privilege.

The behavior of this function matches the Unix equivalent, with one exception - invalid symlinks cannot be created. The source path must exist. If it doesn't, an error will be raised.

Parameters

- **src** (*str*) - The path to a file or directory
- **link** (*str*) - The path to the link

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' file.symlink /path/to/file /path/to/link
```

`salt.modules.win_file.uid_to_user(uid)`

Convert a uid to a user name

Parameters **uid** (*str*) - The user id to lookup

Returns The name of the user

Return type `str`

CLI Example:

```
salt '*' file.uid_to_user S-1-5-21-626487655-2533044672-482107328-1010
```

`salt.modules.win_file.user_to_uid(user)`

Convert user name to a uid

Parameters **user** (*str*) - The user to lookup

Returns The user id of the user

Return type `str`

CLI Example:

```
salt '*' file.user_to_uid myusername
```

20.9.440 salt.modules.win_firewall

Module for configuring Windows Firewall using netsh

`salt.modules.win_firewall.add_rule(name, localport, protocol='tcp', action='allow', dir='in', remoteip='any')`

New in version 2015.5.0.

Add a new inbound or outbound rule to the firewall policy

Parameters

- **name** (*str*) - The name of the rule. Must be unique and cannot be "all". Required.
- **localport** (*int*) - The port the rule applies to. Must be a number between 0 and 65535. Can be a range. Can specify multiple ports separated by commas. Required.
- **protocol** (*Optional[str]*) - The protocol. Can be any of the following:
 - A number between 0 and 255
 - icmpv4

- icmpv6
- tcp
- udp
- any
- **action** (*Optional[str]*) – The action the rule performs. Can be any of the following:
 - allow
 - block
 - bypass
- **dir** (*Optional[str]*) – The direction. Can be `in` or `out`.
- **remoteip** (*Optional [str]*) – The remote IP. Can be any of the following:
 - any
 - localsubnet
 - dns
 - dhcp
 - wins
 - defaultgateway
 - Any valid IPv4 address (192.168.0.12)
 - Any valid IPv6 address (2002:9b3b:1a31:4:208:74ff:fe39:6c43)
 - Any valid subnet (192.168.1.0/24)
 - Any valid range of IP addresses (192.168.0.1-192.168.0.12)
 - A list of valid IP addresses

Can be combinations of the above separated by commas.

Returns True if successful

Return type `bool`

Raises `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.add_rule 'test' '8080' 'tcp'
salt '*' firewall.add_rule 'test' 'i' 'icmpv4'
salt '*' firewall.add_rule 'test_remote_ip' '8000' 'tcp' 'allow' 'in' '192.168.0.1
↪'
```

`salt.modules.win_firewall.delete_rule` (*name=None, localport=None, protocol=None, dir=None, remoteip=None*)

New in version 2015.8.0.

Delete an existing firewall rule identified by name and optionally by ports, protocols, direction, and remote IP.

Parameters

- **name** (*str*) – The name of the rule to delete. If the name `all` is used you must specify additional parameters.
- **localport** (*Optional[str]*) – The port of the rule. If protocol is not specified, protocol will be set to `tcp`
- **protocol** (*Optional[str]*) – The protocol of the rule. Default is `tcp` when `localport` is specified
- **dir** (*Optional[str]*) – The direction of the rule.
- **remoteip** (*Optional[str]*) – The remote IP of the rule.

Returns True if successful

Return type `bool`

Raises `CommandExecutionError` – If the command fails

CLI Example:

```
# Delete incoming tcp port 8080 in the rule named 'test'
salt '*' firewall.delete_rule 'test' '8080' 'tcp' 'in'
```

(continues on next page)

(continued from previous page)

```
# Delete the incoming tcp port 8000 from 192.168.0.1 in the rule named
# 'test_remote_ip'
salt '*' firewall.delete_rule 'test_remote_ip' '8000' 'tcp' 'in' '192.168.0.1'

# Delete all rules for local port 80:
salt '*' firewall.delete_rule all 80 tcp

# Delete a rule called 'allow80':
salt '*' firewall.delete_rule allow80
```

`salt.modules.win_firewall.disable(profile='allprofiles')`

Disable firewall profile

Parameters `profile` (*Optional[str]*) – The name of the profile to disable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

Returns True if successful

Return type `bool`

Raises `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.disable
```

`salt.modules.win_firewall.enable(profile='allprofiles')`

New in version 2015.5.0.

Enable firewall profile

Parameters `profile` (*Optional[str]*) – The name of the profile to enable. Default is `allprofiles`. Valid options are:

- `allprofiles`
- `domainprofile`
- `privateprofile`
- `publicprofile`

Returns True if successful

Return type `bool`

Raises `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.enable
```

`salt.modules.win_firewall.get_all_profiles(store='local')`

Gets all properties for all profiles in the specified store

New in version 2018.3.4.

New in version Fluorine.

Parameters `store` (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- `lgpo`
- `local`

Default is `local`

Returns A dictionary containing the specified settings for each profile

Return type `dict`

CLI Example:

```
# Get all firewall settings for all profiles
salt * firewall.get_all_settings

# Get all firewall settings for all profiles as defined by local group
# policy
salt * firewall.get_all_settings lgpo
```

`salt.modules.win_firewall.get_all_settings` (*domain*, *store='local'*)

Gets all the properties for the specified profile in the specified store

New in version 2018.3.4.

New in version Fluorine.

Parameters

- **profile** (*str*) – The firewall profile to query. Valid options are:
 - domain
 - public
 - private
- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
 - lgpo
 - local

Default is `local`

Returns A dictionary containing the specified settings

Return type `dict`

CLI Example:

```
# Get all firewall settings for connections on the domain profile
salt * win_firewall.get_all_settings domain

# Get all firewall settings for connections on the domain profile as
# defined by local group policy
salt * win_firewall.get_all_settings domain lgpo
```

`salt.modules.win_firewall.get_config`()

Get the status of all the firewall profiles

Returns A dictionary of all profiles on the system

Return type `dict`

Raises `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.get_config
```

`salt.modules.win_firewall.get_rule` (*name='all'*)

New in version 2015.5.0.

Display all matching rules as specified by name

Parameters **name** (*Optional[str]*) – The full name of the rule. `all` will return all rules.

Default is `all`

Returns A dictionary of all rules or rules that match the name exactly

Return type `dict`

Raises `CommandExecutionError` – If the command fails

CLI Example:

```
salt '*' firewall.get_rule 'MyAppPort'
```

`salt.modules.win_firewall.get_settings` (*profile*, *section*, *store*='local')

Get the firewall property from the specified profile in the specified store as returned by `netsh advfirewall`.

New in version 2018.3.4.

New in version Fluorine.

Parameters

- **profile** (*str*) – The firewall profile to query. Valid options are:
 - domain
 - public
 - private
- **section** (*str*) – The property to query within the selected profile. Valid options are:
 - `firewallpolicy` : inbound/outbound behavior
 - `logging` : firewall logging settings
 - `settings` : firewall properties
 - `state` : firewalls state (on | off)
- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
 - `lgpo`
 - `local`

Default is `local`

Returns A dictionary containing the properties for the specified profile

Return type `dict`

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
# Get the inbound/outbound firewall settings for connections on the
# local domain profile
salt * win_firewall.get_settings domain firewallpolicy

# Get the inbound/outbound firewall settings for connections on the
# domain profile as defined by local group policy
salt * win_firewall.get_settings domain firewallpolicy lgpo
```

`salt.modules.win_firewall.rule_exists` (*name*)

New in version 2016.11.6.

Checks if a firewall rule exists in the firewall policy

Parameters **name** (*str*) – The name of the rule

Returns True if exists, otherwise False

Return type `bool`

CLI Example:

```
# Is there a rule named RemoteDesktop
salt '*' firewall.rule_exists RemoteDesktop
```

`salt.modules.win_firewall.set_firewall_settings` (*profile*, *inbound*=None, *outbound*=None, *store*='local')

Set the firewall inbound/outbound settings for the specified profile and store

New in version 2018.3.4.

New in version Fluorine.

Parameters

- **profile** (*str*) – The firewall profile to query. Valid options are:
 - domain
 - public
 - private
- **inbound** (*str*) – The inbound setting. If None is passed, the setting will remain unchanged. Valid values are:
 - blockinbound
 - blockinboundalways
 - allowinbound
 - notconfigured
 Default is None
- **outbound** (*str*) – The outbound setting. If None is passed, the setting will remain unchanged. Valid values are:
 - allowoutbound
 - blockoutbound
 - notconfigured
 Default is None
- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
 - lgpo
 - local
 Default is local

Returns True if successful

Return type bool

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
# Set the inbound setting for the domain profile to block inbound
# connections
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'

# Set the outbound setting for the domain profile to allow outbound
# connections
salt * firewall.set_firewall_settings domain='domain' outbound='allowoutbound'

# Set inbound/outbound settings for the domain profile in the group
# policy to block inbound and allow outbound
salt * firewall.set_firewall_settings domain='domain' inbound='blockinbound'
↳outbound='allowoutbound' store='lgpo'
```

`salt.modules.win_firewall.set_logging_settings` (*profile, setting, value, store='local'*)

Configure logging settings for the Windows firewall.

New in version 2018.3.4.

New in version Fluorine.

Parameters

- **profile** (*str*) – The firewall profile to configure. Valid options are:
 - domain
 - public
 - private
- **setting** (*str*) – The logging setting to configure. Valid options are:

- allowedconnections
- droppedconnections
- filename
- maxfilesize
- **value** (*str*) – The value to apply to the setting. Valid values are dependent upon the setting being configured. Valid options are:

allowedconnections:

- enable
- disable
- notconfigured

droppedconnections:

- enable
- disable
- notconfigured

filename:

- Full path and name of the firewall log file
- notconfigured

maxfilesize:

- 1 - 32767
- notconfigured

Note: `notconfigured` can only be used when using the `lgpo` store

- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
 - `lgpo`
 - `local`

Default is `local`

Returns True if successful

Return type `bool`

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
# Log allowed connections and set that in local group policy
salt * firewall.set_logging_settings domain allowedconnections enable lgpo

# Don't log dropped connections
salt * firewall.set_logging_settings profile=private setting=droppedconnections
↪value=disable

# Set the location of the log file
salt * firewall.set_logging_settings domain filename C:\windows\logs\firewall.log

# You can also use environment variables
salt * firewall.set_logging_settings domain filename %systemroot
↪%\system32\LogFiles\Firewall\pfirewall.log

# Set the max file size of the log to 2048 Kb
salt * firewall.set_logging_settings domain maxfilesize 2048
```

`salt.modules.win_firewall.set_settings(profile, setting, value, store='local')`

Configure firewall settings.

New in version 2018.3.4.

New in version Fluorine.

Parameters

- **profile** (*str*) – The firewall profile to configure. Valid options are:
 - domain
 - public
 - private
- **setting** (*str*) – The firewall setting to configure. Valid options are:
 - localfirewallrules
 - localconsecrules
 - inboundusernotification
 - remotemanagement
 - unicastresponsetomulticast
- **value** (*str*) – The value to apply to the setting. Valid options are:
 - enable
 - disable
 - notconfigured

Note: `notconfigured` can only be used when using the `lgpo` store

- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:
 - `lgpo`
 - `local`Default is `local`

Returns True if successful

Return type `bool`

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
# Merge local rules with those distributed through group policy
salt * firewall.set_settings domain localfirewallrules enable

# Allow remote management of Windows Firewall
salt * firewall.set_settings domain remotemanagement enable
```

`salt.modules.win_firewall.set_state` (*profile, state, store='local'*)

Configure the firewall state.

New in version 2018.3.4.

New in version Fluorine.

Parameters

- **profile** (*str*) – The firewall profile to configure. Valid options are:
 - domain
 - public
 - private
- **state** (*str*) – The firewall state. Valid options are:
 - on
 - off
 - notconfigured

Note: `notconfigured` can only be used when using the `lgpo` store

- **store** (*str*) – The store to use. This is either the local firewall policy or the policy defined by local group policy. Valid options are:

- `lgpo`
- `local`

Default is `local`

Returns True if successful

Return type `bool`

Raises

- **CommandExecutionError** – If an error occurs
- **ValueError** – If the parameters are incorrect

CLI Example:

```
# Turn the firewall off when the domain profile is active
salt * firewall.set_state domain off

# Turn the firewall on when the public profile is active and set that in
# the local group policy
salt * firewall.set_state public on lgpo
```

20.9.441 salt.modules.win_groupadd

Manage groups on Windows

Important: If you feel that Salt should be using this module to manage groups on a minion, and it is using a different module (or gives an error similar to `'group.info' is not available`), see [here](#).

`salt.modules.win_groupadd.add`(*name*, ***kwargs*)

Add the specified group

Parameters **name** (*str*) – The name of the group to add

Returns A dictionary of results

Return type `dict`

CLI Example:

```
salt '*' group.add foo
```

`salt.modules.win_groupadd.adduser`(*name*, *username*, ***kwargs*)

Add a user to a group

Parameters

- **name** (*str*) – The name of the group to modify
- **username** (*str*) – The name of the user to add to the group

Returns A dictionary of results

Return type `dict`

CLI Example:

```
salt '*' group.adduser foo username
```

`salt.modules.win_groupadd.delete`(*name*, ***kwargs*)

Remove the named group

Parameters **name** (*str*) – The name of the group to remove

Returns A dictionary of results

Return type `dict`

CLI Example:

```
salt '*' group.delete foo
```

`salt.modules.win_groupadd.deluser`(*name*, *username*, ***kwargs*)

Remove a user from a group

Parameters

- **name** (*str*) – The name of the group to modify
- **username** (*str*) – The name of the user to remove from the group

Returns A dictionary of results

Return type `dict`

CLI Example:

```
salt '*' group.deluser foo username
```

`salt.modules.win_groupadd.getent`(*refresh=False*)

Return info on all groups

Parameters **refresh** (*bool*) – Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True the `__context__` will be refreshed with current data and returned. Default is False

Returns A list of groups and their information

CLI Example:

```
salt '*' group.getent
```

`salt.modules.win_groupadd.info`(*name*)

Return information about a group

Parameters **name** (*str*) – The name of the group for which to get information

Returns A dictionary of information about the group

Return type `dict`

CLI Example:

```
salt '*' group.info foo
```

`salt.modules.win_groupadd.list_groups`(*refresh=False*)

Return a list of groups

Parameters **refresh** (*bool*) – Refresh the info for all groups in `__context__`. If False only the groups in `__context__` will be returned. If True, the `__context__` will be refreshed with current data and returned. Default is False

Returns A list of groups on the machine

Return type `list`

CLI Example:

```
salt '*' group.list_groups
```

`salt.modules.win_groupadd.members`(*name*, *members_list*, ***kwargs*)

Ensure a group contains only the members in the list

Parameters

- **name** (*str*) – The name of the group to modify
- **members_list** (*str*) – A single user or a comma separated list of users. The group will contain only the users specified in this list.

Returns A dictionary of results

Return type `dict`

CLI Example:

```
salt '*' group.members foo 'user1,user2,user3'
```

20.9.442 salt.modules.win_iis module

Microsoft IIS site management via WebAdministration powershell module

maintainer Shane Lee <slee@saltstack.com>, Robert Booth <rbooth@saltstack.com>

platform Windows

depends PowerShell

depends WebAdministration module (PowerShell) (IIS)

New in version 2016.3.0.

salt.modules.win_iis.create_app(*name*, *site*, *sourcepath*, *apppool=None*)
Create an IIS application.

Note: This function only validates against the application name, and will return True even if the application already exists with a different configuration. It will not modify the configuration of an existing application.

Parameters

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **apppool** (*str*) – The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.create_app name='app0' site='site0' sourcepath='C:\site0'
↳ apppool='site0'
```

salt.modules.win_iis.create_apppool(*name*)
Create an IIS application pool.

Note: This function only validates against the application pool name, and will return True even if the application pool already exists with a different configuration. It will not modify the configuration of an existing application pool.

Parameters **name** (*str*) – The name of the IIS application pool.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.create_apppool name='MyTestPool'
```

salt.modules.win_iis.create_backup(*name*)
Backup an IIS Configuration on the System.

New in version 2017.7.0.

Note: Backups are stored in the `$env:Windir\System32\inetmgr\backup` folder.

Parameters **name** (*str*) – The name to give the backup

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_backup good_config_20170209
```

`salt.modules.win_iis.create_binding(site, hostheader="", ipaddress="", port=80, protocol='http', sslflags=None)`

Create an IIS Web Binding.

Note: This function only validates against the binding `ipaddress:port:hostheader` combination, and will return True even if the binding already exists with a different configuration. It will not modify the configuration of an existing binding.

Parameters

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding. Usually a hostname.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding.
- **sslflags** (*str*) – The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_binding site='site0' hostheader='example.com' ipaddress='*'
↳ 'port='80'
```

`salt.modules.win_iis.create_cert_binding(name, site, hostheader="", ipaddress="", port=443, sslflags=0)`

Assign a certificate to an IIS Web Binding.

New in version 2016.11.0.

Note: The web binding that the certificate is being assigned to must already exist.

Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **sslflags** (*int*) – Flags representing certificate type and certificate storage of the binding.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_cert_binding name='AAA000' site='site0' hostheader=
↳ 'example.com' ipaddress='*' port='443'
```

`salt.modules.win_iis.create_site`(*name*, *sourcepath*, *apppool*=", *hostheader*=", *ipaddress*='*', *port*=80, *protocol*='http')

Create a basic website in IIS.

Note: This function only validates against the site name, and will return True even if the site already exists with a different configuration. It will not modify the configuration of an existing site.

Parameters

- **name** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path of the IIS site.
- **apppool** (*str*) – The name of the IIS application pool.
- **hostheader** (*str*) – The host header of the binding. Usually the hostname or website name, ie: www.contoso.com
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **protocol** (*str*) – The application protocol of the binding. (http, https, etc.)

Returns True if successful, otherwise False.

Return type `bool`

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.create_site name='My Test Site' sourcepath='c:\stage' apppool=
↳ 'TestPool'
```

`salt.modules.win_iis.create_vdir`(*name*, *site*, *sourcepath*, *app*='')

Create an IIS virtual directory.

Note: This function only validates against the virtual directory name, and will return True even if the virtual directory already exists with a different configuration. It will not modify the configuration of an existing virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.
- **site** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path.
- **app** (*str*) – The IIS application.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.create_vdir name='vd0' site='site0' sourcepath=
↳ 'C:\inetpub\vdirs\vd0'
```

`salt.modules.win_iis.get_container_setting`(*name*, *container*, *settings*)

Get the value of the setting for the IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) – The name of the IIS container.
- **container** (*str*) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) – A dictionary of the setting names and their values.

Returns A dictionary of the provided settings and their values.

Return type `dict`

CLI Example:

```
salt '*' win_iis.get_container_setting name='MyTestPool' container='AppPools'
settings=["processModel.identityType"]
```

`salt.modules.win_iis.get_webapp_settings(name, site, settings)`

New in version 2017.7.0.

Get the value of the setting for the IIS web application.

Note: Params are case sensitive

Parameters

- **name** (*str*) – The name of the IIS web application.
- **site** (*str*) – The site name contains the web application. Example: Default Web Site
- **settings** (*str*) – A dictionary of the setting names and their values. Available settings: physicalPath, applicationPool, userName, password

Returns A dictionary of the provided settings and their values.

Return type `dict`

CLI Example:

```
salt '*' win_iis.get_webapp_settings name='app0' site='Default Web Site'
settings=["physicalPath','applicationPool']"
```

`salt.modules.win_iis.list_apppools()`

List all configured IIS application pools.

Returns A dictionary of IIS application pools and their details.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_apppools
```

`salt.modules.win_iis.list_apps(site)`

Get all configured IIS applications for the specified site.

Parameters **site** (*str*) – The IIS site name.

Returns: A dictionary of the application names and properties.

CLI Example:

```
salt '*' win_iis.list_apps site
```

`salt.modules.win_iis.list_backups()`

List the IIS Configuration Backups on the System.

New in version 2017.7.0.

Note: Backups are made when a configuration is edited. Manual backups are stored in the `$env:Windir\System32\inetsrv\backup` folder.

Returns A dictionary of IIS Configurations backed up on the system.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_backups
```

`salt.modules.win_iis.list_bindings(site)`

Get all configured IIS bindings for the specified site.

Parameters `site` (*str*) – The name of the IIS Site

Returns A dictionary of the binding names and properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_cert_bindings(site)`

List certificate bindings for an IIS site.

New in version 2016.11.0.

Parameters `site` (*str*) – The IIS site name.

Returns A dictionary of the binding names and properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_bindings site
```

`salt.modules.win_iis.list_sites()`

List all the currently deployed websites.

Returns A dictionary of the IIS sites and their properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_sites
```

`salt.modules.win_iis.list_vdirs(site, app='')`

Get all configured IIS virtual directories for the specified site, or for the combination of site and application.

Parameters

- `site` (*str*) – The IIS site name.

- `app` (*str*) – The IIS application.

Returns A dictionary of the virtual directory names and properties.

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_vdirs site
```

`salt.modules.win_iis.list_worker_processes(apppool)`

Returns a list of worker processes that correspond to the passed application pool.

New in version 2017.7.0.

Parameters `apppool` (*str*) – The application pool to query

Returns A dictionary of worker processes with their process IDs

Return type `dict`

CLI Example:

```
salt '*' win_iis.list_worker_processes 'My App Pool'
```

`salt.modules.win_iis.modify_binding(site, binding, hostheader=None, ipaddress=None, port=None, sslflags=None)`

Modify an IIS Web Binding. Use `site` and `binding` to target the binding.

New in version 2017.7.0.

Parameters

- **site** (*str*) – The IIS site name.
- **binding** (*str*) – The binding to edit. This is a combination of the IP address, port, and hostheader. It is in the following format: `ipaddress:port:hostheader`. For example, `*:80:` or `*:80:salt.com`
- **hostheader** (*str*) – The host header of the binding. Usually the hostname.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.
- **sslflags** (*str*) – The flags representing certificate type and storage of the binding.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

The following will set the host header of binding `*:80:` for `site0` to `example.com`

```
salt '*' win_iis.modify_binding site='site0' binding='*:80:' hostheader='example.  
↪com'
```

`salt.modules.win_iis.modify_site(name, sourcepath=None, apppool=None)`

Modify a basic website in IIS.

New in version 2017.7.0.

Parameters

- **name** (*str*) – The IIS site name.
- **sourcepath** (*str*) – The physical path of the IIS site.
- **apppool** (*str*) – The name of the IIS application pool.

Returns True if successful, otherwise False.

Return type `bool`

Note: If an application pool is specified, and that application pool does not already exist, it will be created.

CLI Example:

```
salt '*' win_iis.modify_site name='My Test Site' sourcepath='c:\new_path' apppool=  
↪'NewTestPool'
```

`salt.modules.win_iis.remove_app(name, site)`

Remove an IIS application.

Parameters

- **name** (*str*) – The application name.
- **site** (*str*) – The IIS site name.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_app name='app0' site='site0'
```

`salt.modules.win_iis.remove_appool`(*name*)

Remove an IIS application pool.

Parameters *name* (*str*) – The name of the IIS application pool.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_appool name='MyTestPool'
```

`salt.modules.win_iis.remove_backup`(*name*)

Remove an IIS Configuration backup from the System.

New in version 2017.7.0.

Parameters *name* (*str*) – The name of the backup to remove

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_backup backup_20170209
```

`salt.modules.win_iis.remove_binding`(*site*, *hostheader=""*, *ipaddress=""*, *port=80*)

Remove an IIS binding.

Parameters

- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_binding site='site0' hostheader='example.com' ipaddress='*'
↳ 'port='80'
```

`salt.modules.win_iis.remove_cert_binding`(*name*, *site*, *hostheader=""*, *ipaddress=""*, *port=443*)

Remove a certificate from an IIS Web Binding.

New in version 2016.11.0.

Note: This function only removes the certificate from the web binding. It does not remove the web binding itself.

Parameters

- **name** (*str*) – The thumbprint of the certificate.
- **site** (*str*) – The IIS site name.
- **hostheader** (*str*) – The host header of the binding.
- **ipaddress** (*str*) – The IP address of the binding.
- **port** (*int*) – The TCP port of the binding.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_cert_binding name='AAA000' site='site0' hostheader=
↳'example.com' ipaddress='*' port='443'
```

`salt.modules.win_iis.remove_site(name)`

Delete a website from IIS.

Parameters `name` (*str*) – The IIS site name.

Returns True if successful, otherwise False

Return type `bool`

Note: This will not remove the application pool used by the site.

CLI Example:

```
salt '*' win_iis.remove_site name='My Test Site'
```

`salt.modules.win_iis.remove_vdir(name, site, app='')`

Remove an IIS virtual directory.

Parameters

- **name** (*str*) – The virtual directory name.

- **site** (*str*) – The IIS site name.

- **app** (*str*) – The IIS application.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.remove_vdir name='vdir0' site='site0'
```

`salt.modules.win_iis.restart_appool(name)`

Restart an IIS application pool.

New in version 2016.11.0.

Parameters `name` (*str*) – The name of the IIS application pool.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.restart_appool name='MyTestPool'
```

`salt.modules.win_iis.restart_site(name)`

Restart a Web Site in IIS.

New in version 2017.7.0.

Parameters `name` (*str*) – The name of the website to restart.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_iis.restart_site name='My Test Site'
```

`salt.modules.win_iis.set_container_setting(name, container, settings)`

Set the value of the setting for an IIS container.

New in version 2016.11.0.

Parameters

- **name** (*str*) – The name of the IIS container.

- **container** (*str*) – The type of IIS container. The container types are: AppPools, Sites, SslBindings
- **settings** (*dict*) – A dictionary of the setting names and their values.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.set_container_setting name='MyTestPool' container='AppPools'
settings="{ 'managedPipeLineMode': 'Integrated' }"
```

`salt.modules.win_iis.set_webapp_settings(name, site, settings)`

New in version 2017.7.0.

Configure an IIS application.

Note: This function only configures an existing app. Params are case sensitive.

Parameters

- **name** (*str*) – The IIS application.
- **site** (*str*) – The IIS site name.
- **settings** (*str*) – A dictionary of the setting names and their values. - physical-Path: The physical path of the webapp. - applicationPool: The application pool for the webapp. - userName: "connectAs" user - password: "connectAs" password for user

Returns A boolean representing whether all changes succeeded.

Return type bool

CLI Example:

```
salt '*' win_iis.set_webapp_settings name='app0' site='site0' settings="{
↪ 'physicalPath': 'C:\site0', 'apppool': 'site0' }"
```

`salt.modules.win_iis.start_apppool(name)`

Start an IIS application pool.

New in version 2017.7.0.

Parameters **name** (*str*) – The name of the App Pool to start.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.start_apppool name='MyTestPool'
```

`salt.modules.win_iis.start_site(name)`

Start a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** (*str*) – The name of the website to start.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.start_site name='My Test Site'
```

`salt.modules.win_iis.stop_apppool(name)`

Stop an IIS application pool.

New in version 2017.7.0.

Parameters **name** (*str*) – The name of the App Pool to stop.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.stop_appool name='MyTestPool'
```

salt.modules.win_iis.stop_site(*name*)

Stop a Web Site in IIS.

New in version 2017.7.0.

Parameters **name** (*str*) – The name of the website to stop.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' win_iis.stop_site name='My Test Site'
```

20.9.443 salt.modules.win_ip

The networking module for Windows based systems

salt.modules.win_ip.disable(*iface*)

Disable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.disable 'Local Area Connection #2'
```

salt.modules.win_ip.enable(*iface*)

Enable an interface

CLI Example:

```
salt -G 'os_family:Windows' ip.enable 'Local Area Connection #2'
```

salt.modules.win_ip.get_all_interfaces()

Return configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.get_all_interfaces
```

salt.modules.win_ip.get_default_gateway()

Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.get_default_gateway
```

salt.modules.win_ip.get_interface(*iface*)

Return the configuration of a network interface

CLI Example:

```
salt -G 'os_family:Windows' ip.get_interface 'Local Area Connection'
```

`salt.modules.win_ip.get_subnet_length(mask)`
 Convenience function to convert the netmask to the CIDR subnet length

CLI Example:

```
salt -G 'os_family:Windows' ip.get_subnet_length 255.255.255.0
```

`salt.modules.win_ip.is_disabled(iface)`
 Returns True if interface is disabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_disabled 'Local Area Connection #2'
```

`salt.modules.win_ip.is_enabled(iface)`
 Returns True if interface is enabled, otherwise False

CLI Example:

```
salt -G 'os_family:Windows' ip.is_enabled 'Local Area Connection #2'
```

`salt.modules.win_ip.raw_interface_configs()`
 Return raw configs for all interfaces

CLI Example:

```
salt -G 'os_family:Windows' ip.raw_interface_configs
```

`salt.modules.win_ip.set_dhcp_all(iface)`
 Set both IP Address and DNS to DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_all 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_dns(iface)`
 Set DNS source to DHCP on Windows

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_dns 'Local Area Connection'
```

`salt.modules.win_ip.set_dhcp_ip(iface)`
 Set Windows NIC to get IP from DHCP

CLI Example:

```
salt -G 'os_family:Windows' ip.set_dhcp_ip 'Local Area Connection'
```

`salt.modules.win_ip.set_static_dns(iface, *addrs)`
 Set static DNS configuration on a Windows NIC

Parameters

- **iface** (*str*) – The name of the interface to set
- **addrs** – One or more DNS servers to be added. To clear the list of DNS servers pass an empty list (`[]`). If undefined or `NONE` no changes will be made.

Returns A dictionary containing the new DNS settings

Return type `dict`

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.1
↪'
salt -G 'os_family:Windows' ip.set_static_dns 'Local Area Connection' '192.168.1.
↪252' '192.168.1.253'
```

`salt.modules.win_ip.set_static_ip`(*iface*, *addr*, *gateway=None*, *append=False*)

Set static IP configuration on a Windows NIC

iface The name of the interface to manage

addr IP address with subnet length (ex. 10.1.2.3/24). The `ip.get_subnet_length` function can be used to calculate the subnet length from a netmask.

gateway [None] If specified, the default gateway will be set to this value.

append [False] If True, this IP address will be added to the interface. Default is False, which overrides any existing configuration for the interface and sets `addr` as the only address on the interface.

CLI Example:

```
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.3/24
↪gateway=10.1.2.1
salt -G 'os_family:Windows' ip.set_static_ip 'Local Area Connection' 10.1.2.4/24
↪append=True
```

20.9.444 salt.modules.win_lgpo module

Manage Local Policy on Windows

This module allows configuring local group policy (i.e. `gpedit.msc`) on a Windows server.

New in version 2016.11.0.

Administrative Templates

Administrative template policies are dynamically read from ADMX/ADML files on the server.

Windows Settings

Policies contained in the "Windows Settings" section of the `gpedit.msc` GUI are statically defined in this module. Each policy is configured for the section (Machine/User) in the module's `_policy_info` class. The `_policy_info` class contains a "policies" dict on how the module will configure the policy, where the policy resides in the GUI (for display purposes), data validation data, data transformation data, etc.

Current known limitations

- At this time, start/shutdown scripts policies are displayed, but are not configurable.
- Not all "Security Settings" policies exist in the `_policy_info` class

depends

- pywin32 Python module
- lxml
- uuid
- struct

- salt.utils.win_reg

salt.modules.win_lgpo.get(policy_class=None, return_full_policy_names=True, hierarchical_return=False, adml_language='en-US', return_not_configured=False)

Get a policy value

Parameters

- **policy_class** (*str*) – Some policies are both user and computer, by default all policies will be pulled, but this can be used to retrieve only a specific policy class User/USER/user = retrieve user policies Machine/MACHINE/machine/Computer/COMPUTER/computer = retrieve machine/computer policies
- **return_full_policy_names** (*bool*) – True/False to return the policy name as it is seen in the gpedit.msc GUI or to only return the policy key/id.
- **hierarchical_return** (*bool*) – True/False to return the policy data in the hierarchy as seen in the gpedit.msc GUI. The default of False will return data split only into User/Computer configuration sections
- **adml_language** (*str*) – The ADML language to use for processing display/descriptive names and enumeration values of ADMX template data, defaults to en-US
- **return_not_configured** (*bool*) – Include Administrative Template policies that are 'Not Configured' in the return data

Returns A dictionary containing the policy values for the specified class

Return type dict

CLI Example:

```
salt '*' lgpo.get machine return_full_policy_names=True
```

salt.modules.win_lgpo.get_policy_info(policy_name, policy_class, adml_language='en-US')

Returns information about a specified policy

Parameters

- **policy_name** (*str*) – The name of the policy to lookup
- **policy_class** (*str*) – The class of policy, i.e. machine, user, both
- **adml_language** (*str*) – The ADML language to use for Administrative Template data lookup

Returns Information about the specified policy

Return type dict

CLI Example:

```
salt '*' lgpo.get_policy_info 'Maximum password age' machine
```

You can use lgpo.get_policy_info to get all the possible names that could be used in a state file or from the command line (along with elements that need to be set/etc). The key is to match the text you see in the gpedit.msc gui exactly, including quotes around words or phrases. The "full path" style is really only needed when there are multiple policies that use the same base name. For example, Access data sources across domains exists in ~10 different paths. If you put that through get_policy_info you'll get back a message that it is used for multiple policies and you need to be more specific.

CLI Example:

```
salt-call --local lgpo.get_policy_info ShellRemoveOrderPrints_2 machine

local:
-----
message:
policy_aliases:
  - Turn off the "Order Prints" picture task
```

(continues on next page)

(continued from previous page)

```

    - ShellRemoveOrderPrints_2
    - System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task
  policy_class:
    machine
  policy_elements:
  policy_found:
    True
  policy_name:
    ShellRemoveOrderPrints_2
  rights_assignment:
    False

```

Escaping can get tricky in cmd/Powershell. The following is an example of escaping in Powershell using backquotes:

```

PS>salt-call --local lgpo.get_policy_info "Turn off the ``"Order Prints``"
↪picture task" machine

local:
-----
  message:
  policy_aliases:
    - Turn off the "Order Prints" picture task
    - ShellRemoveOrderPrints_2
    - System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task
  policy_class:
    machine
  policy_elements:
  policy_found:
    True
  policy_name:
    Turn off the "Order Prints" picture task
  rights_assignment:
    False

```

This function can then be used to get the options available for specifying Group Policy Objects to be used in state files. Based on the above any of these *should* be usable:

```

internet_communications_settings:
  lgpo.set:
    - computer_policy:
      Turn off the "Order Prints" picture task: Enabled

```

```

internet_communications_settings:
  lgpo.set:
    - computer_policy:
      ShellRemoveOrderPrints_2: Enabled

```

When using the full path, it might be a good idea to use single quotes around the path:

```

internet_communications_settings:
  lgpo.set:
    - computer_policy:
      'System\Internet Communication Management\Internet Communication
↪settings\Turn off the "Order Prints" picture task': 'Enabled'

```

(continues on next page)

(continued from previous page)

If you struggle to find the policy from `get_policy_info` using the name as you see in `gpedit.msc`, the names such as "ShellRemoveOrderPrints_2" come from the `.admx` files. If you know nothing about `.admx`/`.adml` relationships (ADML holds what you see in the GUI, ADMX holds the more technical details), then this may be a little bit too much info, but here is an example with the above policy using Powershell:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.adml |
↪Select-String "Order Prints"

C:\windows\PolicyDefinitions\en-US\ICM.adml:152:    <string id=
↪"ShellRemoveOrderPrints">Turn off the "Order Prints" picture task</string>
C:\windows\PolicyDefinitions\en-US\ICM.adml:153:    <string id=
↪"ShellRemoveOrderPrints_Help">This policy setting specifies whether the "Order
↪Prints Online" task is available from Picture Tasks in Windows folders.
C:\windows\PolicyDefinitions\en-US\ICM.adml:155:The Order Prints Online Wizard is
↪used to download a list of providers and allow users to order prints online.
C:\windows\PolicyDefinitions\en-US\ICM.adml:157:If you enable this policy setting,
↪the task "Order Prints Online" is removed from Picture Tasks in File Explorer
↪folders.
```

From this grep, we can see id "ShellRemoveOrderPrints" is the ID of the string used to describe this policy, then we search for it in the ADMX:

```
PS>Get-ChildItem -Path C:\Windows\PolicyDefinitions -Recurse -Filter *.admx |
↪Select-String "ShellRemoveOrderPrints"

C:\windows\PolicyDefinitions\ICM.admx:661:    <policy name=
↪"ShellRemoveOrderPrints_1" class="User" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_Help)"
↪key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName=
↪"NoOnlinePrintsWizard">
C:\windows\PolicyDefinitions\ICM.admx:671:    <policy name=
↪"ShellRemoveOrderPrints_2" class="Machine" displayName="$(string.
↪ShellRemoveOrderPrints)" explainText="$(string.ShellRemoveOrderPrints_Help)"
↪key="Software\Microsoft\Windows\CurrentVersion\Policies\Explorer" valueName=
↪"NoOnlinePrintsWizard">
```

Now we have two to pick from. And if you notice the `class="Machine"` and `class="User"` (which details if it is a computer policy or user policy respectively) the `ShellRemoveOrderPrints_2` is the "short name" we could use to pass through `get_policy_info` to see what the module itself is expecting.

```
salt.modules.win_lgpo.set_(computer_policy=None, user_policy=None, cumula-
                           tive_rights_assignments=True, adml_language='en-US')
```

Set a local server policy.

Parameters

- **computer_policy** (*dict*) – A dictionary of "policyname: value" pairs of computer policies to set. 'value' should be how it is displayed in the `gpedit` GUI, i.e. if a setting can be 'Enabled'/'Disabled', then that should be passed

Administrative Template data may require dicts within dicts, to specify each element of the Administrative Template policy. Administrative Templates policies are always cumulative.

Policy names can be specified in a number of ways based on the type of policy:

Windows Settings Policies:

These policies can be specified using the GUI display name

or the key name from the `_policy_info` class in this module. The GUI display name is also contained in the `_policy_info` class in this module.

Administrative Template Policies:

These can be specified using the policy name as displayed in the GUI (case sensitive). Some policies have the same name, but a different location (for example, "Access data sources across domains"). These can be differentiated by the "path" in the GUI (for example, "Windows ComponentsInternet ExplorerInternet Control PanelSecurity PageInternet ZoneAccess data sources across domains").

Additionally, policies can be specified using the "name" and "id" attributes from the ADMX files.

For Administrative Templates that have policy elements, each element can be specified using the text string as seen in the GUI or using the ID attribute from the ADMX file. Due to the way some of the GUI text is laid out, some policy element names could include descriptive text that appears before the policy element in the GUI.

Use the `get_policy_info` function for the policy name to view the element ID/names that the module will accept.

- **user_policy** (*dict*) – The same setup as the `computer_policy`, except with data to configure the local user policy.
- **cumulative_rights_assignments** (*bool*) – Determine how user rights assignment policies are configured.

If True, user right assignment specifications are simply added to the existing policy

If False, only the users specified will get the right (any existing will have the right revoked)

- **adml_language** (*str*) – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True is successful, otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set computer_policy="{ 'LockoutDuration': 2, 'RestrictAnonymous':
↳ 'Enabled', 'AuditProcessTracking': 'Success, Failure' }"
```

```
salt.modules.win_lgpo.set_computer_policy(name, setting, cumulative_rights_assignments=True, adml_language='en-US')
```

Set a single computer policy

Parameters

- **name** (*str*) – The name of the policy to configure
- **setting** (*str*) – The setting to configure the named policy with
- **cumulative_rights_assignments** (*bool*) – Determine how user rights assignment policies are configured. If True, user right assignment specifications are simply added to the existing policy. If False, only the users specified will get the right (any existing will have the right revoked)
- **adml_language** (*str*) – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set_computer_policy LockoutDuration 1440
```

`salt.modules.win_lgpo.set_user_policy`(*name*, *setting*, *adml_language*='en-US')

Set a single user policy

Parameters

- **name** (*str*) – The name of the policy to configure
- **setting** (*str*) – The setting to configure the named policy with
- **adml_language** (*str*) – The language files to use for looking up Administrative Template policy data (i.e. how the policy is displayed in the GUI). Defaults to 'en-US' (U.S. English).

Returns True if successful, Otherwise False

Return type bool

CLI Example:

```
salt '*' lgpo.set_user_policy "Control Panel\Display\Disable the Display Control
↪Panel" Enabled
```

20.9.445 salt.modules.win_license module

This module allows you to manage windows licensing via slmgr.vbs

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.activate`()

Attempt to activate the current machine via Windows Activation

CLI Example:

```
salt '*' license.activate
```

`salt.modules.win_license.info`()

Return information about the license, if the license is not correctly activated this will return None.

CLI Example:

```
salt '*' license.info
```

`salt.modules.win_license.install`(*product_key*)

Install the given product key

CLI Example:

```
salt '*' license.install XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.installed`(*product_key*)

Check to see if the product key is already installed.

Note: This is not 100% accurate as we can only see the last 5 digits of the license.

CLI Example:

```
salt '*' license.installed XXXXX-XXXXX-XXXXX-XXXXX-XXXXX
```

`salt.modules.win_license.licensed()`

Return true if the current machine is licensed correctly

CLI Example:

```
salt '*' license.licensed
```

`salt.modules.win_license.uninstall()`

Uninstall the current product key

CLI Example:

```
salt '*' license.uninstall
```

20.9.446 salt.modules.win_network

Module for gathering and managing network information

`salt.modules.win_network.connect(host, port=None, **kwargs)`

Test connectivity to a host using a particular port from the minion.

New in version 2016.3.0.

CLI Example:

```
salt '*' network.connect archlinux.org 80

salt '*' network.connect archlinux.org 80 timeout=3

salt '*' network.connect archlinux.org 80 timeout=3 family=ipv4

salt '*' network.connect google-public-dns-a.google.com port=53 proto=udp
↳timeout=3
```

`salt.modules.win_network.dig(host)`

Performs a DNS lookup with dig

Note: dig must be installed on the Windows minion

CLI Example:

```
salt '*' network.dig archlinux.org
```

`salt.modules.win_network.get_route(ip)`

Return routing information for given destination ip

New in version 2016.11.5.

CLI Example:

```
salt '*' network.get_route 10.10.10.10
```

`salt.modules.win_network.hw_addr(iface)`

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.hwaddr`(*iface*)

This function is an alias of `hw_addr`.

Return the hardware address (a.k.a. MAC address) for a given interface

CLI Example:

```
salt '*' network.hw_addr 'Wireless Connection #1'
```

`salt.modules.win_network.in_subnet`(*cidr*)

Returns True if host is within specified subnet, otherwise False

CLI Example:

```
salt '*' network.in_subnet 10.0.0.0/16
```

`salt.modules.win_network.interfaces`()

Return a dictionary of information about all the interfaces on the minion

CLI Example:

```
salt '*' network.interfaces
```

`salt.modules.win_network.interfaces_names`()

Return a list of all the interfaces names

CLI Example:

```
salt '*' network.interfaces_names
```

`salt.modules.win_network.ip_addrs`(*interface=None, include_loopback=False*)

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.win_network.ip_addrs6`(*interface=None, include_loopback=False*)

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.win_network.ipaddrs`(*interface=None, include_loopback=False*)

This function is an alias of `ip_addrs`.

Returns a list of IPv4 addresses assigned to the host. 127.0.0.1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs
```

`salt.modules.win_network.ipaddrs6`(*interface=None, include_loopback=False*)

This function is an alias of `ip_addrs6`.

Returns a list of IPv6 addresses assigned to the host. ::1 is ignored, unless 'include_loopback=True' is indicated. If 'interface' is provided, then only IP addresses from that interface will be returned.

CLI Example:

```
salt '*' network.ip_addrs6
```

`salt.modules.win_network.netstat()`
Return information on open ports and states

CLI Example:

```
salt '*' network.netstat
```

`salt.modules.win_network.nslookup(host)`
Query DNS for information about a domain or ip address

CLI Example:

```
salt '*' network.nslookup archlinux.org
```

`salt.modules.win_network.ping(host, timeout=False, return_boolean=False)`
Performs a ping to a host

CLI Example:

```
salt '*' network.ping archlinux.org
```

New in version 2016.11.0.

Return a True or False instead of ping output.

```
salt '*' network.ping archlinux.org return_boolean=True
```

Set the time to wait for a response in seconds.

```
salt '*' network.ping archlinux.org timeout=3
```

`salt.modules.win_network.subnets()`
Returns a list of subnets to which the host belongs

CLI Example:

```
salt '*' network.subnets
```

`salt.modules.win_network.traceroute(host)`
Performs a traceroute to a 3rd party host

CLI Example:

```
salt '*' network.traceroute archlinux.org
```

20.9.447 salt.modules.win_ntp

Management of NTP servers on Windows

New in version 2014.1.0.

`salt.modules.win_ntp.get_servers()`
Get list of configured NTP servers

CLI Example:

```
salt '*' ntp.get_servers
```

`salt.modules.win_ntp.set_servers(*servers)`

Set Windows to use a list of NTP servers

CLI Example:

```
salt '*' ntp.set_servers 'pool.ntp.org' 'us.pool.ntp.org'
```

20.9.448 salt.modules.win_path

Manage the Windows System PATH

Note that not all Windows applications will rehash the PATH environment variable, Only the ones that listen to the WM_SETTINGCHANGE message <http://support.microsoft.com/kb/104011>

`salt.modules.win_path.add(path, index=None, **kwargs)`

Add the directory to the SYSTEM path in the index location. Returns True if successful, otherwise False.

path Directory to add to path

index Optionally specify an index at which to insert the directory

rehash [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Examples:

```
# Will add to the beginning of the path
salt '*' win_path.add 'c:\python27' 0

# Will add to the end of the path
salt '*' win_path.add 'c:\python27' index='-1'
```

`salt.modules.win_path.exists(path)`

Check if the directory is configured in the SYSTEM path Case-insensitive and ignores trailing backslash

Returns boolean True if path exists, False if not

CLI Example:

```
salt '*' win_path.exists 'c:\python27'
salt '*' win_path.exists 'c:\python27\'
salt '*' win_path.exists 'C:\pyThon27'
```

`salt.modules.win_path.get_path()`

Returns a list of items in the SYSTEM path

CLI Example:

```
salt '*' win_path.get_path
```

`salt.modules.win_path.rehash()`

Send a WM_SETTINGCHANGE Broadcast to Windows to refresh the Environment variables for new processes.

Note: This will only affect new processes that aren't launched by services. To apply changes to the path to services, the host must be restarted. The salt-minion, if running as a service, will not see changes to the environment until the system is restarted. See [MSDN Documentation](#)

CLI Example:

```
salt '*' win_path.rehash
```

`salt.modules.win_path.remove`(*path*, ***kwargs*)

Remove the directory from the SYSTEM path

Returns boolean True if successful, False if unsuccessful

rehash [True] If the registry was updated, and this value is set to True, sends a WM_SETTINGCHANGE broadcast to refresh the environment variables. Set this to False to skip this broadcast.

CLI Example:

```
# Will remove C:\Python27 from the path
salt '*' win_path.remove 'c:\\python27'
```

20.9.449 salt.modules.win_pkg

A module to manage software on Windows

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

The following functions require the existence of a *windows repository* metadata DB, typically created by running `pkg.refresh_db`:

- `pkg.get_repo_data`
- `pkg.install`
- `pkg.latest_version`
- `pkg.list_available`
- `pkg.list_pkgs`
- `pkg.list_upgrades`
- `pkg.remove`

If a metadata DB does not already exist and one of these functions is run, then one will be created from the repo SLS files that are present.

As the creation of this metadata can take some time, the `winrepo_cache_expire_min` minion config option can be used to suppress refreshes when the metadata is less than a given number of seconds old.

Note: Version numbers can be version number string, latest and Not Found, where Not Found means this module was not able to determine the version of the software installed, it can also be used as the version number in sls definitions file in these cases. Versions numbers are sorted in order of 0, Not Found, order version numbers, ..., latest.

`salt.modules.win_pkg.compare_versions`(*ver1=""*, *oper='=='*, *ver2=""*)

Compare software package versions

Parameters

- **ver1** (*str*) – A software version to compare
- **oper** (*str*) – The operand to use to compare
- **ver2** (*str*) – A software version to compare

Returns True if the comparison is valid, otherwise False

Return type `bool`

CLI Example:

```
salt '*' pkg.compare_versions 1.2 >= 1.3
```

`salt.modules.win_pkg.genrepo` (**kwargs)

Generate package metadata db based on files within the winrepo_source_dir

Kwargs:

saltenv (str): Salt environment. Default: base

verbose (bool): Return verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default `False`.

failhard (bool): If `True`, an error will be raised if any repo SLS files failed to process. If `False`, no error will be raised, and a dictionary containing the full results will be returned.

Note:

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.

Returns A dictionary of the results of the command

Return type `dict`

CLI Example:

```
salt-run pkg.genrepo
salt -G 'os:windows' pkg.genrepo verbose=true failhard=false
salt -G 'os:windows' pkg.genrepo saltenv=base
```

`salt.modules.win_pkg.get_repo_data` (saltenv='base')

Returns the existing package metadata db. Will create it, if it does not exist, however will not refresh it.

Parameters **saltenv** (str) – Salt environment. Default base

Returns A dict containing contents of metadata db.

Return type `dict`

CLI Example:

```
salt '*' pkg.get_repo_data
```

`salt.modules.win_pkg.install` (name=None, refresh=False, pkgs=None, **kwargs)

Install the passed package(s) on the system using winrepo

Parameters

- **name** (str) – The name of a single package, or a comma-separated list of packages to install. (no spaces after the commas)
- **refresh** (bool) – Boolean value representing whether or not to refresh the winrepo db. Default `False`.
- **pkgs** (list) – A list of packages to install from a software repository. All packages listed under `pkgs` will be installed via a single command.

You can specify a version by passing the item as a dict:

CLI Example:

```
# will install the latest version of foo and bar
salt '*' pkg.install pkgs=['foo', 'bar']

# will install the latest version of foo and version 1.2.3 of
↳bar
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3'}]
```

Kwargs:

version (str): The specific version to install. If omitted, the latest version will be installed. Recommend for use when installing a single package.

If passed with a list of packages in the `pkgs` parameter, the version will be ignored.

CLI Example:

```
# Version is ignored
salt '*' pkg.install pkgs="['foo', 'bar']" version=1.2.3
```

If passed with a comma separated list in the `name` parameter, the version will apply to all packages in the list.

CLI Example:

```
# Version 1.2.3 will apply to packages foo and bar
salt '*' pkg.install foo,bar version=1.2.3
```

extra_install_flags (str): Additional install flags that will be appended to the `install_flags` defined in the software definition file. Only applies when single package is passed.

saltenv (str): Salt environment. Default 'base'

report_reboot_exit_codes (bool): If the installer exits with a recognized exit code indicating that a reboot is required, the module function

`win_system.set_reboot_required_witnessed`

will be called, preserving the knowledge of this event for the remainder of the current boot session. For the time being, 3010 is the only recognized exit code. The value of this param defaults to True.

New in version 2016.11.0.

Returns

Return a dict containing the new package names and versions. If the package is already installed, an empty dict is returned.

If the package is installed by `pkg.install`:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

Return type `dict`

The following example will refresh the winrepo and install a single package, 7zip.

CLI Example:

```
salt '*' pkg.install 7zip refresh=True
```

CLI Example:

```
salt '*' pkg.install 7zip
salt '*' pkg.install 7zip,filezilla
salt '*' pkg.install pkgs='["7zip","filezilla"]'
```

WinRepo Definition File Examples:

The following example demonstrates the use of `cache_file`. This would be used if you have multiple installers in the same directory that use the same `install.ini` file and you don't want to download the additional installers.

```
ntp:
  4.2.8:
```

(continues on next page)

(continued from previous page)

```

installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
full_name: Meinberg NTP Windows Client
locale: en_US
reboot: False
cache_file: 'salt://win/repo/ntp/install.ini'
install_flags: '/'
↪USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
uninstaller: 'NTP/uninst.exe'

```

The following example demonstrates the use of `cache_dir`. It assumes a file named `install.ini` resides in the same directory as the installer.

```

ntp:
  4.2.8:
    installer: 'salt://win/repo/ntp/ntp-4.2.8-win32-setup.exe'
    full_name: Meinberg NTP Windows Client
    locale: en_US
    reboot: False
    cache_dir: True
    install_flags: '/'
    ↪USEFILE=C:\salt\var\cache\salt\minion\files\base\win\repo\ntp\install.ini'
    uninstaller: 'NTP/uninst.exe'

```

`salt.modules.win_pkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

Parameters `names` (*str*) – A single or multiple names to lookup

Kwargs: `saltenv` (*str*): Salt environment. `Default base refresh` (*bool*): Refresh package metadata. `Default True`

Returns A dictionary of packages with the latest version available

Return type `dict`

CLI Example:

```

salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...

```

`salt.modules.win_pkg.list_available(*names, **kwargs)`

Return a list of available versions of the specified package.

Parameters `names` (*str*) – One or more package names

Kwargs:

`saltenv` (*str*): The salt environment to use. `Default base`.

`refresh` (*bool*): Refresh package metadata. `Default False`.

`return_dict_always` (*bool*): `Default False` dict when a single package name is queried.

Returns The package name with its available versions

Return type `dict`

```
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.list_available <package name> return_dict_always=True
salt '*' pkg.list_available <package name01> <package name02>
```

`salt.modules.win_pkg.list_pkgs` (*versions_as_list=False*, ***kwargs*)

List the packages currently installed

version_as_list (bool): Returns the versions as a list *saltenv* (str): The salt environment to use. Default `base`.

refresh (bool): Refresh package metadata. Default `False`.

Returns A dictionary of installed software with versions installed

Return type `dict`

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs versions_as_list=True
```

`salt.modules.win_pkg.list_upgrades` (*refresh=True*, ***kwargs*)

List all available package upgrades on this system

Parameters **refresh** (*bool*) – Refresh package metadata. Default `True`

Kwargs: *saltenv* (str): Salt environment. Default `base`

Returns A dictionary of packages with available upgrades

Return type `dict`

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.win_pkg.purge` (*name=None*, *pkgs=None*, ***kwargs*)

Package purges are not supported, this function is identical to `remove()`.

New in version 0.16.0.

Parameters

- **name** (*str*) – The name of the package to be deleted.
- **version** (*str*) – The version of the package to be deleted. If this option is used in combination with the `pkgs` option below, then this version will be applied to all targeted packages.
- **pkgs** (*list*) – A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Kwargs: *saltenv* (str): Salt environment. Default `base` *refresh* (bool): Refresh package metadata. Default `False`

Returns A dict containing the changes.

Return type `dict`

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.refresh_db` (***kwargs*)

Generates the local software metadata database (*winrepo.p*) on the minion. The database is stored in a serialized format located by default at the following location:

C:saltvarcachesaltminionfilesbasewinrepo-ngwinrepo.p

This module performs the following steps to generate the software metadata database:

- Fetch the package definition files (.sls) from *winrepo_source_dir* (default *salt://win/repo-ng*) and cache them in *<cachedir>files<saltenv><winrepo_source_dir>* (default: *C:saltvarcachesaltminionfilesbasewinrepo-ng*)
- Call *pkg.genrepo* to parse the package definition files and generate the repository metadata database file (*winrepo.p*)
- Return the report received from *pkg.genrepo*

The default winrepo directory on the master is */srv/salt/win/repo-ng*. All files that end with *.sls* in this and all subdirectories will be used to generate the repository metadata database (*winrepo.p*).

Note:

- Hidden directories (directories beginning with '.', such as '.git') will be ignored.
-

Note: There is no need to call *pkg.refresh_db* every time you work with the pkg module. Automatic refresh will occur based on the following minion configuration settings:

- *winrepo_cache_expire_min*
- *winrepo_cache_expire_max*

However, if the package definition files have changed, as would be the case if you are developing a new package definition, this function should be called to ensure the minion has the latest information about packages available to it.

Warning: Directories and files fetched from *<winrepo_source_dir>* (*/srv/salt/win/repo-ng*) will be processed in alphabetical order. If two or more software definition files contain the same name, the last one processed replaces all data from the files processed before it.

For more information see *Windows Software Repository*

Arguments:

saltenv (str): Salt environment. Default: *base*

verbose (bool): Return a verbose data structure which includes 'success_list', a list of all sls files and the package names contained within. Default is 'False'

failhard (bool): If *True*, an error will be raised if any repo SLS files fails to process. If *False*, no error will be raised, and a dictionary containing the full results will be returned.

Returns A dictionary containing the results of the database refresh.

Return type *dict*

Note: A result with a *total: 0* generally means that the files are in the wrong location on the master. Try running the following command on the minion: *salt-call -l debug pkg.refresh saltenv=base*

Warning: When calling this command from a state using *module.run* be sure to pass *failhard: False*. Otherwise the state will report failure if it encounters a bad software definition file.

CLI Example:

```
salt '*' pkg.refresh_db
salt '*' pkg.refresh_db saltenv=base
```

`salt.modules.win_pkg.remove` (*name=None, pkgs=None, **kwargs*)

Remove the passed package(s) from the system using winrepo

New in version 0.16.0.

Parameters

- **name** (*str*) – The name(s) of the package(s) to be uninstalled. Can be a single package or a comma delimited list of packages, no spaces.
- **pkgs** (*list*) – A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Kwargs:

version (*str*): The version of the package to be uninstalled. If this option is used to to uninstall multiple packages, then this version will be applied to all targeted packages. Recommended using only when uninstalling a single package. If this parameter is omitted, the latest version will be uninstalled.

saltenv (*str*): Salt environment. Default base
refresh (*bool*): Refresh package metadata. Default False

Returns

Returns a dict containing the changes.

If the package is removed by `pkg.remove`:

```
{<package>: {'old': '<old-version>', 'new': '<new-version>'}}
```

If the package is already uninstalled:

```
{<package>: {'current': 'not installed'}}
```

Return type `dict`

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs='["foo", "bar"]'
```

`salt.modules.win_pkg.upgrade` (***kwargs*)

Upgrade all software. Currently not implemented

Kwargs: **saltenv** (*str*): The salt environment to use. Default base. **refresh** (*bool*): Refresh package metadata. Default True.

Note: This feature is not yet implemented for Windows.

Returns Empty dict, until implemented

Return type `dict`

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.win_pkg.upgrade_available` (*name, **kwargs*)

Check whether or not an upgrade is available for a given package

Parameters **name** (*str*) – The name of a single package

Kwargs: **refresh** (*bool*): Refresh package metadata. Default True **saltenv** (*str*): The salt environment. Default base

Returns True if new version available, otherwise False

Return type bool

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.win_pkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

Parameters **name** (*str*) – One or more package names

Kwargs: **saltenv** (*str*): The salt environment to use. Default base. **refresh** (*bool*): Refresh package metadata. Default False.

Returns version string when a single package is specified. dict: The package name(s) with the installed versions.

Return type str

```
{['<version>', '<version>', ]} OR
{'<package name>': ['<version>', '<version>', ]}
```

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package name01> <package name02>
```

20.9.450 salt.modules.win_pki module

Microsoft certificate management via the PKI Client PowerShell module. <https://technet.microsoft.com/en-us/itpro/powershell/windows/pkiclient/pkiclient>

The PKI Client PowerShell module is only available on Windows 8+ and Windows Server 2012+. [https://technet.microsoft.com/en-us/library/hh848636\(v=wps.620\).aspx](https://technet.microsoft.com/en-us/library/hh848636(v=wps.620).aspx)

platform Windows

depends

- PowerShell 4
- PKI Client Module (Windows 8+ / Windows Server 2012+)

New in version 2016.11.0.

`salt.modules.win_pki.export_cert(name, thumbprint, cert_format='cer', context='LocalMachine', store='My', password='')`

Export the certificate to a file from the given certificate store.

Parameters

- **name** (*str*) – The destination path for the exported certificate file.
- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **cert_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.export_cert name='C:\certs\example.cer' thumbprint='AAA000'
```

`salt.modules.win_pki.get_cert_file(name, cert_format='cer', password=")`

Get the details of the certificate file.

Parameters

- **name** (*str*) – The filesystem path of the certificate file.
- **cert_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.

Returns A dictionary of the certificate thumbprints and properties.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_cert_file name='C:\certs\example.cer'
```

`salt.modules.win_pki.get_certs(context='LocalMachine', store='My')`

Get the available certificates in the given store.

Parameters

- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.

Returns A dictionary of the certificate thumbprints and properties.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_certs
```

`salt.modules.win_pki.get_stores()`

Get the certificate location contexts and their corresponding stores.

Returns A dictionary of the certificate location contexts and stores.

Return type `dict`

CLI Example:

```
salt '*' win_pki.get_stores
```

`salt.modules.win_pki.import_cert(name, cert_format='cer', context='LocalMachine', store='My', exportable=True, password="", saltenv='base')`

Import the certificate file into the given certificate store.

Parameters

- **name** (*str*) – The path of the certificate file to import.
- **cert_format** (*str*) – The certificate format. Specify 'cer' for X.509, or 'pfx' for PKCS #12.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **exportable** (*bool*) – Mark the certificate as exportable. Only applicable to pfx format.
- **password** (*str*) – The password of the certificate. Only applicable to pfx format. Note that if used interactively, the password will be seen by all minions. To protect the password, use a state and get the password from pillar.
- **saltenv** (*str*) – The environment the file resides in.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.import_cert name='salt://cert.cer'
```

`salt.modules.win_pki.remove_cert(thumbprint, context='LocalMachine', store='My')`

Remove the certificate from the given certificate store.

Parameters

- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_pki.remove_cert thumbprint='AAA000'
```

`salt.modules.win_pki.test_cert(thumbprint, context='LocalMachine', store='My', untrusted_root=False, dns_name="", eku="")`

Check the certificate for validity.

Parameters

- **thumbprint** (*str*) – The thumbprint value of the target certificate.
- **context** (*str*) – The name of the certificate store location context.
- **store** (*str*) – The name of the certificate store.
- **untrusted_root** (*bool*) – Whether the root certificate is required to be trusted in chain building.
- **dns_name** (*str*) – The DNS name to verify as valid for the certificate.
- **eku** (*str*) – The enhanced key usage object identifiers to verify for the certificate chain.

Returns A boolean representing whether the certificate was considered valid.

Return type `bool`

CLI Example:

```
salt '*' win_pki.test_cert thumbprint='AAA000' dns_name='example.test'
```

20.9.451 salt.modules.win_powercfg

This module allows you to control the power settings of a windows minion via powercfg.

New in version 2015.8.0.

```
# Set monitor to never turn off on Battery power
salt '*' powercfg.set_monitor_timeout 0 power=dc
# Set disk timeout to 120 minutes on AC power
salt '*' powercfg.set_disk_timeout 120 power=ac
```

`salt.modules.win_powercfg.get_disk_timeout(scheme=None)`

Get the current disk timeout of the given scheme

Parameters **scheme** (*str*) – The scheme to use, leave as `NONE` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_disk_timeout
```

`salt.modules.win_powercfg.get_hibernate_timeout` (*scheme=None*)

Get the current hibernate timeout of the given scheme

scheme (*str*): The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_hibernate_timeout
```

`salt.modules.win_powercfg.get_monitor_timeout` (*scheme=None*)

Get the current monitor timeout of the given scheme

Parameters **scheme** (*str*) - The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_monitor_timeout
```

`salt.modules.win_powercfg.get_standby_timeout` (*scheme=None*)

Get the current standby timeout of the given scheme

scheme (*str*): The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- `SCHEME_BALANCED` - Balanced
- `SCHEME_MAX` - Power saver
- `SCHEME_MIN` - High performance

Returns A dictionary of both the AC and DC settings

Return type `dict`

CLI Example:

```
salt '*' powercfg.get_standby_timeout
```

`salt.modules.win_powercfg.set_disk_timeout` (*timeout, power='ac', scheme=None*)

Set the disk timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) - The amount of time in minutes before the disk will timeout
- **power** (*str*) - Set the value for AC or DC power. Default is `ac`. Valid options are:
 - `ac` (AC Power)
 - `dc` (Battery)
- **scheme** (*str*) - The scheme to use, leave as `None` to use the current. Default is `None`. This can be the GUID or the Alias for the Scheme. Known Aliases are:
 - `SCHEME_BALANCED` - Balanced

- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the disk timeout to 30 minutes on battery
salt '*' powercfg.set_disk_timeout 30 power=dc
```

`salt.modules.win_powercfg.set_hibernate_timeout(timeout, power='ac', scheme=None)`

Set the hibernate timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) - The amount of time in minutes before the computer hibernates
- **power** (*str*) - Set the value for AC or DC power. Default is ac. Valid options are:
 - ac (AC Power)
 - dc (Battery)
- **scheme** (*str*) - The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
 - SCHEME_BALANCED - Balanced
 - SCHEME_MAX - Power saver
 - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the hibernate timeout to 30 minutes on Battery
salt '*' powercfg.set_hibernate_timeout 30 power=dc
```

`salt.modules.win_powercfg.set_monitor_timeout(timeout, power='ac', scheme=None)`

Set the monitor timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) - The amount of time in minutes before the monitor will timeout
- **power** (*str*) - Set the value for AC or DC power. Default is ac. Valid options are:
 - ac (AC Power)
 - dc (Battery)
- **scheme** (*str*) - The scheme to use, leave as None to use the current. Default is None. This can be the GUID or the Alias for the Scheme. Known Aliases are:
 - SCHEME_BALANCED - Balanced
 - SCHEME_MAX - Power saver
 - SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the monitor timeout to 30 minutes
salt '*' powercfg.set_monitor_timeout 30
```

`salt.modules.win_powercfg.set_standby_timeout(timeout, power='ac', scheme=None)`

Set the standby timeout in minutes for the given power scheme

Parameters

- **timeout** (*int*) - The amount of time in minutes before the computer sleeps
- **power** (*str*) - Set the value for AC or DC power. Default is ac. Valid options are:
 - ac (AC Power)
 - dc (Battery)
- **scheme** (*str*) - The scheme to use, leave as None to use the current. Default is

None. This can be the GUID or the Alias for the Scheme. Known Aliases are:

- SCHEME_BALANCED - Balanced
- SCHEME_MAX - Power saver
- SCHEME_MIN - High performance

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
# Sets the system standby timeout to 30 minutes on Battery
salt '*' powercfg.set_standby_timeout 30 power=dc
```

20.9.452 salt.modules.win_psget module

Module for managing PowerShell through PowerShellGet (PSGet)

depends

- PowerShell 5.0
- PSGet

Support for PowerShell

salt.modules.win_psget.avail_modules(*desc=False*)

List available modules in registered Powershell module repositories.

Parameters **desc** (bool) – If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.avail_modules
salt 'win01' psget.avail_modules desc=True
```

salt.modules.win_psget.bootstrap()

Make sure that nuget-anycpu.exe is installed. This will download the official nuget-anycpu.exe from the internet.

CLI Example:

```
salt 'win01' psget.bootstrap
```

salt.modules.win_psget.get_repository(*name*)

Get the details of a local PSGet repository

Parameters **name** (str) – Name of the repository

CLI Example:

```
salt 'win01' psget.get_repository MyRepo
```

salt.modules.win_psget.install(*name, minimum_version=None, required_version=None, scope=None, repository=None*)

Install a Powershell module from powershell gallery on the system.

Parameters

- **name** (str) – Name of a Powershell module
- **minimum_version** (str) – The maximum version to install, e.g. 1.23.2
- **required_version** (str) – Install a specific version
- **scope** (str) – The scope to install the module to, e.g. CurrentUser, Computer
- **repository** (str) – The friendly name of a private repository, e.g. MyREpo

CLI Example:

```
salt 'win01' psget.install PowerPlan
```

`salt.modules.win_psget.list_modules` (*desc=False*)

List currently installed PSGet Modules on the system.

Parameters `desc` (bool) – If True, the verbose description will be returned.

CLI Example:

```
salt 'win01' psget.list_modules
salt 'win01' psget.list_modules desc=True
```

`salt.modules.win_psget.register_repository` (*name, location, installation_policy=None*)

Register a PSGet repository on the local machine

Parameters

- **name** (str) – The name for the repository
- **location** (str) – The URI for the repository
- **installation_policy** (str) – The installation policy for packages, e.g. Trusted, Untrusted

CLI Example:

```
salt 'win01' psget.register_repository MyRepo https://myrepo.mycompany.com/
↳ packages
```

`salt.modules.win_psget.remove` (*name*)

Remove a Powershell DSC module from the system.

Parameters `name` (str) – Name of a Powershell DSC module

CLI Example:

```
salt 'win01' psget.remove PowerPlan
```

`salt.modules.win_psget.update` (*name, maximum_version=None, required_version=None*)

Update a PowerShell module to a specific version, or the newest

Parameters

- **name** (str) – Name of a Powershell module
- **maximum_version** (str) – The maximum version to install, e.g. 1.23.2
- **required_version** (str) – Install a specific version

CLI Example:

```
salt 'win01' psget.update PowerPlan
```

20.9.453 salt.modules.win_repo

Module to manage Windows software repo on a Standalone Minion

`file_client`: `local` must be set in the minion config file.

For documentation on Salt's Windows Repo feature, see [here](#).

`salt.modules.win_repo.genrepo` ()

Generate `winrepo_cache`file based on `sls` files in the `winrepo_dir`

CLI Example:

```
salt-call winrepo.genrepo
```

`salt.modules.win_repo.show_sls` (*name, saltenv='base'*)

New in version 2015.8.0.

Display the rendered software definition from a specific sls file in the local winrepo cache. This will parse all Jinja. Run `pkg.refresh_db` to pull the latest software definitions from the master.

Note: This function does not ask a master for an sls file to render. Instead it directly processes the file specified in *name*

Parameters

- **str** (*saltenv*) – The name/path of the package you want to view. This can be the
- **path to a file on the minion file system or a file on the local** (*full*) –
- **cache.** (*minion*) –
- **str** – The default environment is base

Returns Returns a dictionary containing the rendered data structure

Return type `dict`

Note: To use a file from the minion cache start from the local winrepo root (C:\salt\var\cache\salt\minion\files\base\win\repo-ng). If you have `.sls` files organized in subdirectories you'll have to denote them with `..`. For example, if you have a `test` directory in the winrepo root with a `gvim.sls` file inside, would target that file like so: `test.gvim`. Directories can be targeted as well as long as they contain an `init.sls` inside. For example, if you have a `node` directory with an `init.sls` inside, target that like so: `node`.

CLI Example:

```
salt '*' winrepo.show_sls gvim
salt '*' winrepo.show_sls test.npp
salt '*' winrepo.show_sls C:\test\gvim.sls
```

`salt.modules.win_repo.update_git_repos` (*clean=False*)

Checkout git repos containing *Windows Software Package Definitions*.

Important: This function requires [Git for Windows](#) to be installed in order to work. When installing, make sure to select an installation option which permits the git executable to be run from the Command Prompt.

clean [False] Clean repo cachedirs which are not configured under *winrepo_remotes*.

Note: This option only applies if either [pygit2](#) or [GitPython](#) is installed into Salt's bundled Python.

Warning: This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Example:

```
salt-call winrepo.update_git_repos
```

20.9.454 salt.modules.win_servermanager

Manage Windows features via the ServerManager powershell module. Can list available and installed roles/features. Can install and remove roles/features.

maintainer Shane Lee <slee@saltstack.com>

platform Windows Server 2008R2 or greater

depends PowerShell module ServerManager

salt.modules.win_servermanager.**install** (*feature, recurse=False, restart=False, source=None, exclude=None*)

Install a feature

Note: Some features require reboot after un/installation, if so until the server is restarted other features can not be installed!

Note: Some features take a long time to complete un/installation, set -t with a long timeout

Parameters

- **feature** (*str, list*) - The name of the feature(s) to install. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
New in version 2018.3.0: Added the ability to pass a list of features to be installed.
- **recurse** (*Options[bool]*) - Install all sub-features. Default is False
- **restart** (*Optional[bool]*) - Restarts the computer when installation is complete, if required by the role/feature installed. Will also trigger a reboot if an item in `exclude` requires a reboot to be properly removed. Default is False
- **source** (*Optional[str]*) - Path to the source files if missing from the target system. None means that the system will use windows update services to find the required files. Default is None
- **exclude** (*Optional[str]*) - The name of the feature to exclude when installing the named feature. This can be a single feature, a string of features in a comma-delimited list (no spaces), or a list of features.

Warning: As there is no exclude option for the Add-WindowsFeature or Install-WindowsFeature PowerShell commands the features named in `exclude` will be installed with other sub-features and will then be removed. **If the feature named in “exclude“ is not a sub-feature of one of the installed items it will still be removed.**

Returns A dictionary containing the results of the install

Return type dict

CLI Example:

```
# Install the Telnet Client passing a single string
salt '*' win_servermanager.install Telnet-Client

# Install the TFTP Client and the SNMP Service passing a comma-delimited
# string. Install all sub-features
salt '*' win_servermanager.install TFTP-Client,SNMP-Service recurse=True
```

(continues on next page)

(continued from previous page)

```
# Install the TFTP Client from d:\side-by-side
salt '*' win_servermanager.install TFTP-Client source=d:\\side-by-side

# Install the XPS Viewer, SNMP Service, and Remote Access passing a
# list. Install all sub-features, but exclude the Web Server
salt '*' win_servermanager.install ["XPS-Viewer", 'SNMP-Service', 'RemoteAccess']
↳" True recurse=True exclude="Web-Server"
```

salt.modules.win_servermanager.list_available()

List available features to install

Returns A list of available features as returned by the Get-WindowsFeature PowerShell command**Return type** str

CLI Example:

```
salt '*' win_servermanager.list_available
```

salt.modules.win_servermanager.list_installed()

List installed features. Supported on Windows Server 2008 and Windows 8 and newer.

Returns A dictionary of installed features**Return type** dict

CLI Example:

```
salt '*' win_servermanager.list_installed
```

salt.modules.win_servermanager.remove(feature, remove_payload=False, restart=False)

Remove an installed feature

Note: Some features require a reboot after installation/uninstallation. If one of these features are modified, then other features cannot be installed until the server is restarted. Additionally, some features take a while to complete installation/uninstallation, so it is a good idea to use the `-t` option to set a longer timeout.

Parameters

- **feature** (*str, list*) – The name of the feature(s) to remove. This can be a single feature, a string of features in a comma delimited list (no spaces), or a list of features.
New in version 2018.3.0: Added the ability to pass a list of features to be removed.
- **remove_payload** (*Optional[bool]*) – True will cause the feature to be removed from the side-by-side store (%SystemDrive%\Windows\WinSxS). Default is False
- **restart** (*Optional[bool]*) – Restarts the computer when uninstall is complete, if required by the role/feature removed. Default is False

Returns A dictionary containing the results of the uninstall**Return type** dict

CLI Example:

```
salt -t 600 '*' win_servermanager.remove Telnet-Client
```

20.9.455 salt.modules.win_service

Windows Service module.

Changed in version 2016.11.0: - Rewritten to use PyWin32

`salt.modules.win_service.available(name)`

Check if a service is available on the system.

Parameters `name` (*str*) – The name of the service to check

Returns True if the service is available, False otherwise

Return type bool

CLI Example:

```
salt '*' service.available <service name>
```

`salt.modules.win_service.create(name, bin_path, exe_args=None, display_name=None, description=None, service_type='own', start_type='manual', start_delayed=False, error_control='normal', load_order_group=None, dependencies=None, account_name='.\LocalSystem', account_password=None, run_interactive=False, **kwargs)`

Create the named service.

New in version 2015.8.0.

Parameters

- **name** (*str*) – Specifies the service name. This is not the `display_name`
- **bin_path** (*str*) – Specifies the path to the service binary file. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe_args** (*str*) – Any additional arguments required by the service binary.
- **display_name** (*str*) – The name to be displayed in the service manager. If not passed, the name will be used
- **description** (*str*) – A description of the service
- **service_type** (*str*) – Specifies the service type. Default is `own`. Valid options are as follows:
 - `kernel`: Driver service
 - `filesystem`: File system driver service
 - `adapter`: Adapter driver service (reserved)
 - `recognizer`: Recognizer driver service (reserved)
 - `own` (default): Service runs in its own process
 - `share`: Service shares a process with one or more other services
- **start_type** (*str*) – Specifies the service start type. Valid options are as follows:
 - `boot`: Device driver that is loaded by the boot loader
 - `system`: Device driver that is started during kernel initialization
 - `auto`: Service that automatically starts
 - `manual` (default): Service must be started manually
 - `disabled`: Service cannot be started
- **start_delayed** (*bool*) – Set the service to `Auto(Delayed Start)`. Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set. Default is `False`
- **error_control** (*str*) – The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
 - `normal` (normal): Error is logged and a message box is displayed
 - `severe`: Error is logged and computer attempts a restart with the last known good configuration
 - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
 - `ignore`: Error is logged and startup continues, no notification is given to the user
- **load_order_group** (*str*) – The name of the load order group to which this ser-

vice belongs

- **dependencies** (*list*) – A list of services or load ordering groups that must start before this service
- **account_name** (*str*) – The name of the account under which the service should run. For own type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
 - NT AuthorityLocalService
 - NT AuthorityNetworkService
 - NT AuthorityLocalSystem
 - .LocalSystem
- **account_password** (*str*) – The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run_interactive** (*bool*) – If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns A dictionary containing information about the new service

Return type `dict`

CLI Example:

```
salt '*' service.create <service name> <path to exe> display_name='<display name>'
```

`salt.modules.win_service.create_win_salt_restart_task()`

Create a task in Windows task scheduler to enable restarting the salt-minion

Returns `True` if successful, otherwise `False`

Return type `bool`

CLI Example:

```
salt '*' service.create_win_salt_restart_task()
```

`salt.modules.win_service.delete(name, timeout=90)`

Delete the named service

Parameters

- **name** (*str*) – The name of the service to delete
- **timeout** (*int*) – The time in seconds to wait for the service to be deleted before returning. This is necessary because a service must be stopped before it can be deleted. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

Returns

True if successful, otherwise **False**. Also returns **True** if the service is not present

Return type `bool`

CLI Example:

```
salt '*' service.delete <service name>
```

`salt.modules.win_service.disable(name, **kwargs)`

Disable the named service to start at boot

Parameters **name** (*str*) – The name of the service to disable

Returns `True` if disabled, `False` otherwise

Return type `bool`

CLI Example:

```
salt '*' service.disable <service name>
```

`salt.modules.win_service.disabled(name)`

Check to see if the named service is disabled to start on boot

Parameters `name` (*str*) – The name of the service to check

Returns True if the service is disabled

Return type `bool`

CLI Example:

```
salt '*' service.disabled <service name>
```

`salt.modules.win_service.enable(name, start_type='auto', start_delayed=False, **kwargs)`

Enable the named service to start at boot

Parameters

- **name** (*str*) – The name of the service to enable.
- **start_type** (*str*) – Specifies the service start type. Valid options are as follows:
 - `boot`: Device driver that is loaded by the boot loader
 - `system`: Device driver that is started during kernel initialization
 - `auto`: Service that automatically starts
 - `manual`: Service must be started manually
 - `disabled`: Service cannot be started
- **start_delayed** (*bool*) – Set the service to Auto(Delayed Start). Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.

Returns True if successful, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.enable <service name>
```

`salt.modules.win_service.enabled(name, **kwargs)`

Check to see if the named service is enabled to start on boot

Parameters `name` (*str*) – The name of the service to check

Returns True if the service is set to start

Return type `bool`

CLI Example:

```
salt '*' service.enabled <service name>
```

`salt.modules.win_service.execute_salt_restart_task()`

Run the Windows Salt restart task

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' service.execute_salt_restart_task()
```

`salt.modules.win_service.get_all()`

Return all installed services

Returns Returns a list of all services on the system.

Return type `list`

CLI Example:

```
salt '*' service.get_all
```

`salt.modules.win_service.get_disabled()`

Return a list of disabled services. Disabled is defined as a service that is marked 'Disabled' or 'Manual'.

Returns A list of disabled services.

Return type `list`

CLI Example:

```
salt '*' service.get_disabled
```

`salt.modules.win_service.get_enabled()`

Return a list of enabled services. Enabled is defined as a service that is marked to Auto Start.

Returns A list of enabled services

Return type `list`

CLI Example:

```
salt '*' service.get_enabled
```

`salt.modules.win_service.get_service_name(*args)`

The Display Name is what is displayed in Windows when services.msc is executed. Each Display Name has an associated Service Name which is the actual name of the service. This function allows you to discover the Service Name by returning a dictionary of Display Names and Service Names, or filter by adding arguments of Display Names.

If no args are passed, return a dict of all services where the keys are the service Display Names and the values are the Service Names.

If arguments are passed, create a dict of Display Names and Service Names

Returns A dictionary of display names and service names

Return type `dict`

CLI Examples:

```
salt '*' service.get_service_name
salt '*' service.get_service_name 'Google Update Service (gupdate)' 'DHCP Client'
```

`salt.modules.win_service.getsid(name)`

Return the SID for this windows service

Parameters **name** (`str`) – The name of the service for which to return the SID

Returns A string representing the SID for the service

Return type `str`

CLI Example:

```
salt '*' service.getsid <service name>
```

`salt.modules.win_service.info(name)`

Get information about a service on the system

Parameters **name** (`str`) – The name of the service. This is not the display name. Use `get_service_name` to find the service name.

Returns A dictionary containing information about the service.

Return type `dict`

CLI Example:

```
salt '*' service.info spooler
```

`salt.modules.win_service.missing(name)`

The inverse of service.available.

Parameters **name** (`str`) – The name of the service to check

Returns True if the service is missing, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.missing <service name>
```

```
salt.modules.win_service.modify(name, bin_path=None, exe_args=None, display_name=None, description=None, service_type=None, start_type=None, start_delayed=None, error_control=None, load_order_group=None, dependencies=None, account_name=None, account_password=None, run_interactive=None)
```

Modify a service's parameters. Changes will not be made for parameters that are not passed.

New in version 2016.11.0.

Parameters

- **name** (*str*) - The name of the service. Can be found using the `service.get_service_name` function
- **bin_path** (*str*) - The path to the service executable. Backslashes must be escaped, eg: `C:\path\to\binary.exe`
- **exe_args** (*str*) - Any arguments required by the service executable
- **display_name** (*str*) - The name to display in the service manager
- **description** (*str*) - The description to display for the service
- **service_type** (*str*) - Specifies the service type. Default is `own`. Valid options are as follows:
 - `kernel`: Driver service
 - `filesystem`: File system driver service
 - `adapter`: Adapter driver service (reserved)
 - `recognizer`: Recognizer driver service (reserved)
 - `own` (default): Service runs in its own process
 - `share`: Service shares a process with one or more other services
- **start_type** (*str*) - Specifies the service start type. Valid options are as follows:
 - `boot`: Device driver that is loaded by the boot loader
 - `system`: Device driver that is started during kernel initialization
 - `auto`: Service that automatically starts
 - `manual`: Service must be started manually
 - `disabled`: Service cannot be started
- **start_delayed** (*bool*) - Set the service to `Auto(Delayed Start)`. Only valid if the `start_type` is set to `Auto`. If `service_type` is not passed, but the service is already set to `Auto`, then the flag will be set.
- **error_control** (*str*) - The severity of the error, and action taken, if this service fails to start. Valid options are as follows:
 - `normal`: Error is logged and a message box is displayed
 - `severe`: Error is logged and computer attempts a restart with the last known good configuration
 - `critical`: Error is logged, computer attempts to restart with the last known good configuration, system halts on failure
 - `ignore`: Error is logged and startup continues, no notification is given to the user
- **load_order_group** (*str*) - The name of the load order group to which this service belongs
- **dependencies** (*list*) - A list of services or load ordering groups that must start before this service
- **account_name** (*str*) - The name of the account under which the service should run. For `own` type services this should be in the `domain\username` format. The following are examples of valid built-in service accounts:
 - `NT AuthorityLocalService`
 - `NT AuthorityNetworkService`

- NT AuthorityLocalSystem
- .LocalSystem
- **account_password** (*str*) – The password for the account name specified in `account_name`. For the above built-in accounts, this can be `None`. Otherwise a password must be specified.
- **run_interactive** (*bool*) – If this setting is `True`, the service will be allowed to interact with the user. Not recommended for services that run with elevated privileges.

Returns a dictionary of changes made

Return type `dict`

CLI Example:

```
salt '*' service.modify spooler start_type=disabled
```

`salt.modules.win_service.restart`(*name*, *timeout=90*)

Restart the named service. This issues a stop command followed by a start.

Parameters

- **name** – The name of the service to restart.

Note: If the name passed is `salt-minion` a scheduled task is created and executed to restart the salt-minion service.

- **timeout** (*int*) – The time in seconds to wait for the service to stop and start before returning. Default is 90 seconds

Note: The timeout is cumulative meaning it is applied to the stop and then to the start command. A timeout of 90 could take up to 180 seconds if the service is long in stopping and starting

New in version 2017.7.9,2018.3.4.

Returns `True` if successful, otherwise `False`

Return type `bool`

CLI Example:

```
salt '*' service.restart <service name>
```

`salt.modules.win_service.start`(*name*, *timeout=90*)

Start the specified service.

Warning: You cannot start a disabled service in Windows. If the service is disabled, it will be changed to Manual start.

Parameters

- **name** (*str*) – The name of the service to start
- **timeout** (*int*) – The time in seconds to wait for the service to start before returning. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

Returns

True if successful, otherwise **False**. Also returns **True** if the service is already started

Return type `bool`

CLI Example:

```
salt '*' service.start <service name>
```

`salt.modules.win_service.status`(*name*, **args*, ***kwargs*)

Return the status for a service. If the name contains globbing, a dict mapping service name to True/False values is returned.

Changed in version 2018.3.0: The service name can now be a glob (e.g. `salt*`)

Parameters *name* (*str*) – The name of the service to check

Returns True if running, False otherwise dict: Maps service name to True if running, False otherwise

Return type `bool`

CLI Example:

```
salt '*' service.status <service name>
```

`salt.modules.win_service.stop`(*name*, *timeout=90*)

Stop the specified service

Parameters

- **name** (*str*) – The name of the service to stop
- **timeout** (*int*) – The time in seconds to wait for the service to stop before returning. Default is 90 seconds

New in version 2017.7.9,2018.3.4.

Returns

True if successful, otherwise **False**. Also returns **True** if the service is already stopped

Return type `bool`

CLI Example:

```
salt '*' service.stop <service name>
```

20.9.456 salt.modules.win_shadow

Manage the shadow file

Important: If you feel that Salt should be using this module to manage passwords on a minion, and it is using a different module (or gives an error similar to `'shadow.info' is not available`), see [here](#).

`salt.modules.win_shadow.info`(*name*)

Return information for the specified user This is just returns dummy data so that salt states can work.

Parameters *name* (*str*) – The name of the user account to show.

CLI Example:

```
salt '*' shadow.info root
```

`salt.modules.win_shadow.require_password_change`(*name*)

Require the user to change their password the next time they log in.

Parameters *name* – The name of the user account to require a password change.

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.require_password_change <username>
```

`salt.modules.win_shadow.set_expire(name, expire)`

Set the expiration date for a user account.

Parameters

- **name** – The name of the user account to edit.
- **expire** – The date the account will expire.

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_expire <username> 2016/7/1
```

`salt.modules.win_shadow.set_password(name, password)`

Set the password for a named user.

Parameters

- **name** (*str*) – The name of the user account
- **password** (*str*) – The new password

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.set_password root mysecretpassword
```

`salt.modules.win_shadow.unlock_account(name)`

Unlocks a user account.

Parameters **name** – The name of the user account to unlock.

Returns True if successful. False if unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' shadow.unlock_account <username>
```

20.9.457 salt.modules.win_smtp_server module

Module for managing IIS SMTP server configuration on Windows servers. The Windows features 'SMTP-Server' and 'Web-WMI' must be installed.

depends `wmi`

`salt.modules.win_smtp_server.get_connection_ip_list(as_wmi_format=False, server='SmtpSvc/1')`

Get the IPGrant list for the SMTP virtual server.

Parameters

- **as_wmi_format** (*bool*) – Returns the connection IPs as a list in the format WMI expects.
- **server** (*str*) – The SMTP server name.

Returns A dictionary of the IP and subnet pairs.

Return type `dict`

CLI Example:

```
salt '*' win_smtp_server.get_connection_ip_list
```

`salt.modules.win_smtp_server.get_log_format(server='SmtpSvc/1')`

Get the active log format for the SMTP virtual server.

Parameters **server** (*str*) – The SMTP server name.

Returns A string of the log format name.

Return type *str*

CLI Example:

```
salt '*' win_smtp_server.get_log_format
```

`salt.modules.win_smtp_server.get_log_format_types()`

Get all available log format names and ids.

Returns A dictionary of the log format names and ids.

Return type *dict*

CLI Example:

```
salt '*' win_smtp_server.get_log_format_types
```

`salt.modules.win_smtp_server.get_relay_ip_list(server='SmtpSvc/1')`

Get the RelayIpList list for the SMTP virtual server.

Parameters **server** (*str*) – The SMTP server name.

Returns A list of the relay IPs.

Return type *list*

Note: A return value of None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

CLI Example:

```
salt '*' win_smtp_server.get_relay_ip_list
```

`salt.modules.win_smtp_server.get_server_setting(settings, server='SmtpSvc/1')`

Get the value of the setting for the SMTP virtual server.

Parameters

- **settings** (*str*) – A list of the setting names.

- **server** (*str*) – The SMTP server name.

Returns A dictionary of the provided settings and their values.

Return type *dict*

CLI Example:

```
salt '*' win_smtp_server.get_server_setting settings="['MaxRecipients']"
```

`salt.modules.win_smtp_server.get_servers()`

Get the SMTP virtual server names.

Returns A list of the SMTP virtual servers.

Return type *list*

CLI Example:

```
salt '*' win_smtp_server.get_servers
```

`salt.modules.win_smtp_server.set_connection_ip_list(addresses=None, grant_by_default=False, server='SmtpSvc/1')`

Set the IPGrant list for the SMTP virtual server.

Parameters

- **addresses** (*str*) – A dictionary of IP + subnet pairs.

- **grant_by_default** (*bool*) – Whether the addresses should be a blacklist or whitelist.
- **server** (*str*) – The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_smtp_server.set_connection_ip_list addresses="{ '127.0.0.1': '255.255.255.255' }"
```

`salt.modules.win_smtp_server.set_log_format(log_format, server='SmtSvc/1')`

Set the active log format for the SMTP virtual server.

Parameters

- **log_format** (*str*) – The log format name.
- **server** (*str*) – The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_smtp_server.set_log_format 'Microsoft IIS Log File Format'
```

`salt.modules.win_smtp_server.set_relay_ip_list(addresses=None, server='SmtSvc/1')`

Set the RelayIpList list for the SMTP virtual server.

Due to the unusual way that Windows stores the relay IPs, it is advisable to retrieve the existing list you wish to set from a pre-configured server.

For example, setting '127.0.0.1' as an allowed relay IP through the GUI would generate an actual relay IP list similar to the following:

```
['24.0.0.128', '32.0.0.128', '60.0.0.128', '68.0.0.128', '1.0.0.0', '76.0.0.0', '0.0.0.0', '0.0.0.0', '1.0.0.0', '1.0.0.0', '2.0.0.0', '2.0.0.0', '4.0.0.0', '0.0.0.0', '76.0.0.128', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '0.0.0.0', '255.255.255.255', '127.0.0.1']
```

Note: Setting the list to None corresponds to the restrictive 'Only the list below' GUI parameter with an empty access list configured, and setting an empty list/tuple corresponds to the more permissive 'All except the list below' GUI parameter.

Parameters

- **addresses** (*str*) – A list of the relay IPs. The order of the list is important.
- **server** (*str*) – The SMTP server name.

Returns A boolean representing whether the change succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_smtp_server.set_relay_ip_list addresses="['192.168.1.1', '172.16.1.1']"
```

`salt.modules.win_smtp_server.set_server_setting(settings, server='SmtSvc/1')`

Set the value of the setting for the SMTP virtual server.

Note: The setting names are case-sensitive.

Parameters

- **settings** (*str*) – A dictionary of the setting names and their values.
- **server** (*str*) – The SMTP server name.

Returns A boolean representing whether all changes succeeded.

Return type `bool`

CLI Example:

```
salt '*' win_smtp_server.set_server_setting settings="{ 'MaxRecipients': '500' }"
```

20.9.458 salt.modules.win_snmp module

Module for managing SNMP service settings on Windows servers. The Windows feature 'SNMP-Service' must be installed.

`salt.modules.win_snmp.get_agent_service_types()`

Get the sysServices types that can be configured.

Returns A list of service types.

Return type `list`

CLI Example:

```
salt '*' win_snmp.get_agent_service_types
```

`salt.modules.win_snmp.get_agent_settings()`

Determine the value of the SNMP sysContact, sysLocation, and sysServices settings.

Returns A dictionary of the agent settings.

Return type `dict`

CLI Example:

```
salt '*' win_snmp.get_agent_settings
```

`salt.modules.win_snmp.get_auth_traps_enabled()`

Determine whether the host is configured to send authentication traps.

Returns True if traps are enabled, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_snmp.get_auth_traps_enabled
```

`salt.modules.win_snmp.get_community_names()`

Get the current accepted SNMP community names and their permissions.

If community names are being managed by Group Policy, those values will be returned instead like this:

```
TestCommunity:
  Managed by GPO
```

Community names managed normally will denote the permission instead:

```
TestCommunity:
  Read Only
```

Returns A dictionary of community names and permissions.

Return type `dict`

CLI Example:

```
salt '*' win_snmp.get_community_names
```

`salt.modules.win_snmp.get_permission_types()`

Get the permission types that can be configured for communities.

Returns A list of permission types.

Return type `list`

CLI Example:

```
salt '*' win_snmp.get_permission_types
```

`salt.modules.win_snmp.set_agent_settings(contact=None, location=None, services=None)`

Manage the SNMP sysContact, sysLocation, and sysServices settings.

Parameters

- **contact** (*str, optional*) – The SNMP contact.
- **location** (*str, optional*) – The SNMP location.
- **services** (*list, optional*) – A list of selected services. The possible service names can be found via `win_snmp.get_agent_service_types`. To disable all services pass a list of None, ie: ['None']

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_snmp.set_agent_settings contact='Contact Name' location='Place'
↳services="['Physical']"
```

`salt.modules.win_snmp.set_auth_traps_enabled(status=True)`

Manage the sending of authentication traps.

Parameters **status** (*bool*) – True to enable traps. False to disable.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' win_snmp.set_auth_traps_enabled status='True'
```

`salt.modules.win_snmp.set_community_names(communities)`

Manage the SNMP accepted community names and their permissions.

Note: Settings managed by Group Policy will always take precedence over those set using the SNMP interface. Therefore if this function finds Group Policy settings it will raise a `CommandExecutionError`

Parameters **communities** (*dict*) – A dictionary of SNMP community names and permissions.

The possible permissions can be found via `win_snmp.get_permission_types`.

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` – If SNMP settings are being managed by Group Policy

CLI Example:

```
salt '*' win_snmp.set_community_names communities="{ 'TestCommunity': 'Read Only' }"
```

20.9.459 salt.modules.win_status

Module for returning various status data about a minion. These data can be useful for compiling into stats later, or for problem solving if your minion is having problems.

New in version 0.12.0.

depends

- wmi

`salt.modules.win_status.cpuload()`

New in version 2015.8.0.

Return the processor load as a percentage

CLI Example:

```
salt '*' status.cpuload
```

`salt.modules.win_status.diskusage(human_readable=False, path=None)`

New in version 2015.8.0.

Return the disk usage for this minion

human_readable [False] If True, usage will be in KB/MB/GB etc.

CLI Example:

```
salt '*' status.diskusage path=c:/salt
```

`salt.modules.win_status.master(master=None, connected=True)`

New in version 2015.5.0.

Fire an event if the minion gets disconnected from its master. This function is meant to be run via a scheduled job from the minion. If `master_ip` is an FQDN/Hostname, it must be resolvable to a valid IPv4 address.

CLI Example:

```
salt '*' status.master
```

`salt.modules.win_status.procs(count=False)`

Return the process data

count [False] If True, this function will simply return the number of processes.

New in version 2015.8.0.

CLI Example:

```
salt '*' status.procs
salt '*' status.procs count
```

`salt.modules.win_status.saltmem(human_readable=False)`

New in version 2015.8.0.

Returns the amount of memory that salt is using

human_readable [False] return the value in a nicely formatted number

CLI Example:

```
salt '*' status.saltmem
salt '*' status.saltmem human_readable=True
```

`salt.modules.win_status.uptime(human_readable=False)`

New in version 2015.8.0.

Return the system uptime for the machine

Parameters **human_readable** (*bool*) – Return uptime in human readable format if True, otherwise return seconds. Default is False

Note: Human readable format is days, hours:min:sec. Days will only be displayed if more than 0

Returns The uptime in seconds or human readable format depending on the value of human_readable

Return type str

CLI Example:

```
salt '*' status.uptime
salt '*' status.uptime human_readable=True
```

20.9.460 salt.modules.win_system

Module for managing windows systems.

depends

- pythoncom
- pywintypes
- win32api
- win32con
- win32net
- wmi

Support for reboot, shutdown, etc

salt.modules.win_system.get_computer_desc()

Get the Windows computer description

Returns Returns the computer description if found. Otherwise returns False.

Return type str

CLI Example:

```
salt 'minion-id' system.get_computer_desc
```

salt.modules.win_system.get_computer_name()

Get the Windows computer name

Returns Returns the computer name if found. Otherwise returns False.

Return type str

CLI Example:

```
salt 'minion-id' system.get_computer_name
```

salt.modules.win_system.get_domain_workgroup()

Get the domain or workgroup the computer belongs to.

New in version 2015.5.7.

New in version 2015.8.2.

Returns The name of the domain or workgroup

Return type `str`

CLI Example:

```
salt 'minion-id' system.get_domain_workgroup
```

`salt.modules.win_system.get_hostname()`

Get the hostname of the windows minion

New in version 2016.3.0.

Returns Returns the hostname of the windows minion

Return type `str`

CLI Example:

```
salt 'minion-id' system.get_hostname
```

`salt.modules.win_system.get_pending_component_servicing()`

Determine whether there are pending Component Based Servicing tasks that require a reboot.

New in version 2016.11.0.

Returns True if there are pending Component Based Servicing tasks, otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.get_pending_component_servicing
```

`salt.modules.win_system.get_pending_computer_name()`

Get a pending computer name. If the computer name has been changed, and the change is pending a system reboot, this function will return the pending computer name. Otherwise, None will be returned. If there was an error retrieving the pending computer name, False will be returned, and an error message will be logged to the minion log.

Returns Returns the pending name if pending restart. Returns None if not pending restart.

Return type `str`

CLI Example:

```
salt 'minion-id' system.get_pending_computer_name
```

`salt.modules.win_system.get_pending_domain_join()`

Determine whether there is a pending domain join action that requires a reboot.

New in version 2016.11.0.

Returns True if there is a pending domain join action, otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.get_pending_domain_join
```

`salt.modules.win_system.get_pending_file_rename()`

Determine whether there are pending file rename operations that require a reboot.

New in version 2016.11.0.

Returns True if there are pending file rename operations, otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.get_pending_file_rename
```

`salt.modules.win_system.get_pending_reboot()`

Determine whether there is a reboot pending.

New in version 2016.11.0.

Returns True if the system is pending reboot, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_reboot
```

salt.modules.win_system.get_pending_servermanager()

Determine whether there are pending Server Manager tasks that require a reboot.

New in version 2016.11.0.

Returns True if there are pending Server Manager tasks, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_servermanager
```

salt.modules.win_system.get_pending_update()

Determine whether there are pending updates that require a reboot.

New in version 2016.11.0.

Returns True if there are pending updates, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_pending_update
```

salt.modules.win_system.get_reboot_required_witnessed()

Determine if at any time during the current boot session the salt minion witnessed an event indicating that a reboot is required.

This function will return True if an install completed with exit code 3010 during the current boot session and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns True if the Requires reboot registry flag is set to 1, otherwise False

Return type bool

CLI Example:

```
salt '*' system.get_reboot_required_witnessed
```

salt.modules.win_system.get_system_date()

Get the Windows system date

Returns Returns the system date

Return type str

CLI Example:

```
salt '*' system.get_system_date
```

salt.modules.win_system.get_system_info()

Get system information.

Returns Dictionary containing information about the system to include name, description, version, etc...

Return type dict

CLI Example:

```
salt 'minion-id' system.get_system_info
```

`salt.modules.win_system.get_system_time()`

Get the system time.

Returns Returns the system time in HH:MM:SS AM/PM format.

Return type `str`

CLI Example:

```
salt 'minion-id' system.get_system_time
```

`salt.modules.win_system.halt(timeout=5, in_seconds=False)`

Halt a running system.

Parameters

- **timeout** (*int*) – Number of seconds before halting the system. Default is 5 seconds.
- **in_seconds** (*bool*) – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' system.halt 5 True
```

`salt.modules.win_system.init(runlevel)`

Change the system runlevel on sysV compatible systems. Not applicable to Windows

CLI Example:

```
salt '*' system.init 3
```

`salt.modules.win_system.join_domain(domain, username=None, password=None, account_ou=None, account_exists=False, restart=False)`

Join a computer to an Active Directory domain. Requires a reboot.

Parameters

- **domain** (*str*) – The domain to which the computer should be joined, e.g. example.com
- **username** (*str*) – Username of an account which is authorized to join computers to the specified domain. Needs to be either fully qualified like user@domain.tld or simply user
- **password** (*str*) – Password of the specified user
- **account_ou** (*str*) – The DN of the OU below which the account for this computer should be created when joining the domain, e.g. ou=computers, ou=departm_432, dc=my-company, dc=com
- **account_exists** (*bool*) – If set to True the computer will only join the domain if the account already exists. If set to False the computer account will be created if it does not exist, otherwise it will use the existing account. Default is False
- **restart** (*bool*) – True will restart the computer after a successful join. Default is False

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise False

Return type `dict`

CLI Example:

```
salt 'minion-id' system.join_domain domain='domain.tld' \
    username='joinuser' password='joinpassword' \
```

(continues on next page)

(continued from previous page)

```
account_ou='ou=clients,ou=org,dc=domain,dc=tld' \
account_exists=False, restart=True
```

`salt.modules.win_system.lock()`

Lock the workstation.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' system.lock
```

`salt.modules.win_system.poweroff(timeout=5, in_seconds=False)`

Power off a running system.

Parameters

- **timeout** (*int*) – Number of seconds before powering off the system. Default is 5 seconds.
- **in_seconds** (*bool*) – Whether to treat timeout as seconds or minutes.

New in version 2015.8.0.

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.poweroff 5
```

`salt.modules.win_system.reboot(timeout=5, in_seconds=False, wait_for_reboot=False, only_on_pending_reboot=False)`

Reboot a running system.

Parameters

- **timeout** (*int*) – The number of minutes/seconds before rebooting the system. Use of minutes or seconds depends on the value of `in_seconds`. Default is 5 minutes.
- **in_seconds** (*bool*) – **True** will cause the **timeout** parameter to be in seconds. **False** will be in minutes. Default is **False**.

New in version 2015.8.0.

- **wait_for_reboot** (*bool*) – **True** will sleep for `timeout + 30` seconds after reboot has been initiated. This is useful for use in a highstate. For example, you may have states that you want to apply only after the reboot. Default is **False**.

New in version 2015.8.0.

- **only_on_pending_reboot** (*bool*) – If this is set to **True**, then the reboot will only proceed if the system reports a pending reboot. Setting this parameter to **True** could be useful when calling this function from a final housekeeping state intended to be executed at the end of a state run (using *order: last*). Default is **False**.

Returns True if successful (a reboot will occur), otherwise False

Return type bool

CLI Example:

```
salt '*' system.reboot 5
salt '*' system.reboot 5 True
```

Invoking this function from a final housekeeping state:

```
final_housekeeping:
  module.run:
```

(continues on next page)

(continued from previous page)

```
- name: system.reboot
- only_on_pending_reboot: True
- order: last
```

`salt.modules.win_system.set_computer_desc(desc=None)`

Set the Windows computer description

Parameters `desc` (*str*) – The computer description

Returns Description if successful, otherwise `False`

Return type `str`

CLI Example:

```
salt 'minion-id' system.set_computer_desc 'This computer belongs to Dave!'
```

`salt.modules.win_system.set_computer_name(name)`

Set the Windows computer name

Parameters `name` (*str*) – The new name to give the computer. Requires a reboot to take effect.

Returns Returns a dictionary containing the old and new names if successful. `False` if not.

Return type `dict`

CLI Example:

```
salt 'minion-id' system.set_computer_name 'DavesComputer'
```

`salt.modules.win_system.set_hostname(hostname)`

Set the hostname of the windows minion, requires a restart before this will be updated.

New in version 2016.3.0.

Parameters `hostname` (*str*) – The hostname to set

Returns True if successful, otherwise `False`

Return type `bool`

CLI Example:

```
salt 'minion-id' system.set_hostname newhostname
```

`salt.modules.win_system.set_reboot_required_witnessed()`

This function is used to remember that an event indicating that a reboot is required was witnessed. This function relies on the salt-minion's ability to create the following volatile registry key in the *HKLM* hive:

```
SYSTEM\CurrentControlSet\Services\salt-minion\Volatile-Data
```

Because this registry key is volatile, it will not persist beyond the current boot session. Also, in the scope of this key, the name *'Reboot required'* will be assigned the value of *1*.

For the time being, this function is being used whenever an install completes with exit code 3010 and can be extended where appropriate in the future.

New in version 2016.11.0.

Returns True if successful, otherwise `False`

Return type `bool`

CLI Example:

```
salt '*' system.set_reboot_required_witnessed
```

`salt.modules.win_system.set_system_date(newdate)`

Set the Windows system date. Use <mm-dd-yy> format for the date.

Parameters `newdate` (*str*) – The date to set. Can be any of the following formats

- YYYY-MM-DD
- MM-DD-YYYY
- MM-DD-YY

- MM/DD/YYYY
- MM/DD/YY
- YYYY/MM/DD

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.set_system_date '03-28-13'
```

`salt.modules.win_system.set_system_date_time`(*years=None, months=None, days=None, hours=None, minutes=None, seconds=None*)

Set the system date and time. Each argument is an element of the date, but not required. If an element is not passed, the current system value for that element will be used. For example, if you don't pass the year, the current system year will be used. (Used by `set_system_date` and `set_system_time`)

Parameters

- **years** (*int*) – Years digit, ie: 2015
- **months** (*int*) – Months digit: 1 - 12
- **days** (*int*) – Days digit: 1 - 31
- **hours** (*int*) – Hours digit: 0 - 23
- **minutes** (*int*) – Minutes digit: 0 - 59
- **seconds** (*int*) – Seconds digit: 0 - 59

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' system.set_system_date_time 2015 5 12 11 37 53
```

`salt.modules.win_system.set_system_time`(*newtime*)

Set the system time.

Parameters *newtime* (*str*) – The time to set. Can be any of the following formats:

- HH:MM:SS AM/PM
- HH:MM AM/PM
- HH:MM:SS (24 hour)
- HH:MM (24 hour)

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt 'minion-id' system.set_system_time 12:01
```

`salt.modules.win_system.shutdown`(*message=None, timeout=5, force_close=True, reboot=False, in_seconds=False, only_on_pending_reboot=False*)

Shutdown a running system.

Parameters

- **message** (*str*) – The message to display to the user before shutting down.
- **timeout** (*int*) – The length of time (in seconds) that the shutdown dialog box should be displayed. While this dialog box is displayed, the shutdown can be aborted using the `system.shutdown_abort` function.

If timeout is not zero, `InitiateSystemShutdown` displays a dialog box on the specified computer. The dialog box displays the name of the user who called the function, the message specified by the `lpMessage` parameter, and prompts the user to log off. The dialog box beeps when it is created and remains on top of other windows (system modal). The dialog box can be moved but not closed. A timer counts down the remaining time before the shutdown occurs.

If timeout is zero, the computer shuts down immediately without displaying the dialog box and cannot be stopped by `system.shutdown_abort`.

Default is 5 minutes

- **in_seconds** (*bool*) – **True** will cause the **timeout** parameter to be in seconds. **False** will be in minutes. Default is **False**.
New in version 2015.8.0.
- **force_close** (*bool*) – **True** will force close all open applications. **False** will display a dialog box instructing the user to close open applications. Default is **True**.
- **reboot** (*bool*) – **True** restarts the computer immediately after shutdown. **False** powers down the system. Default is **False**.
- **only_on_pending_reboot** (*bool*) – If this is set to **True**, then the shutdown will only proceed if the system reports a pending reboot. To optionally shutdown in a highstate, consider using the shutdown state instead of this module.
- **only_on_pending_reboot** – If **True** the shutdown will only proceed if there is a reboot pending. **False** will shutdown the system. Default is **False**.

Returns True if successful (a shutdown or reboot will occur), otherwise **False**

Return type `bool`

CLI Example:

```
salt '*' system.shutdown "System will shutdown in 5 minutes"
```

`salt.modules.win_system.shutdown_abort()`

Abort a shutdown. Only available while the dialog box is being displayed to the user. Once the shutdown has initiated, it cannot be aborted.

Returns True if successful, otherwise **False**

Return type `bool`

CLI Example:

```
salt 'minion-id' system.shutdown_abort
```

`salt.modules.win_system.shutdown_hard()`

Shutdown a running system with no timeout or warning.

Returns True if successful, otherwise **False**

Return type `bool`

CLI Example:

```
salt '*' system.shutdown_hard
```

`salt.modules.win_system.start_time_service()`

Start the Windows time service

Returns True if successful, otherwise **False**

Return type `bool`

CLI Example:

```
salt '*' system.start_time_service
```

`salt.modules.win_system.stop_time_service()`

Stop the Windows time service

Returns True if successful, otherwise **False**

Return type `bool`

CLI Example:

```
salt '*' system.stop_time_service
```

`salt.modules.win_system.unjoin_domain` (*username=None, password=None, domain=None, workgroup='WORKGROUP', disable=False, restart=False*)

Unjoin a computer from an Active Directory Domain. Requires a restart.

Parameters

- **username** (*str*) – Username of an account which is authorized to manage computer accounts on the domain. Needs to be a fully qualified name like `user@domain.tld` or `domain.tld\user`. If the domain is not specified, the passed domain will be used. If the computer account doesn't need to be disabled after the computer is unjoined, this can be `None`.
- **password** (*str*) – The password of the specified user
- **domain** (*str*) – The domain from which to unjoin the computer. Can be `None`
- **workgroup** (*str*) – The workgroup to join the computer to. Default is `WORKGROUP`

New in version 2015.8.2/2015.5.7.

- **disable** (*bool*) – True to disable the computer account in Active Directory. Default is `False`
- **restart** (*bool*) – True will restart the computer after successful unjoin. Default is `False`

New in version 2015.8.2/2015.5.7.

Returns Returns a dictionary if successful, otherwise `False`

Return type `dict`

CLI Example:

```
salt 'minion-id' system.unjoin_domain restart=True

salt 'minion-id' system.unjoin_domain username='unjoinuser' \
    password='unjoinpassword' disable=True \
    restart=True
```

20.9.461 salt.modules.win_task module

Windows Task Scheduler Module .. versionadded:: 2016.3.0

A module for working with the Windows Task Scheduler. You can add and edit existing tasks. You can add and clear triggers and actions. You can list all tasks, folders, triggers, and actions.

`salt.modules.win_task.add_action` (*name=None, location='\'', action_type='Execute', **kwargs*)

Add an action to a task.

Parameters

- **name** (*str*) – The name of the task to which to add the action.
- **location** (*str*) – A string value representing the location of the task. Default is `'\'` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **action_type** (*str*) – The type of action to add. There are three action types. Each one requires its own set of Keyword Arguments (`kwargs`). Valid values are:
 - `Execute`
 - `Email`
 - `Message`

Required arguments for each `action_type`:

Execute - Execute a command or an executable

Parameters

- **cmd** (*str*) – (required) The command / executable to run.
- **arguments** (*str*) – (optional) Arguments to be passed to the command / executable. To launch a script the first command will need to be the interpreter for the script. For

example, to run a vbscript you would pass `cscript.exe` in the `cmd` parameter and pass the script in the `arguments` parameter as follows:

```
- cmd='cscript.exe' arguments='c:\scripts\myscript.vbs'
```

Batch files do not need an interpreter and may be passed to the `cmd` parameter directly.

- **start_in** (*str*) – (optional) The current working directory for the command.

Email - Send and email. Requires `server`, `from`, and `to` or `cc`.

Parameters

- **from** (*str*) – The sender
- **reply_to** (*str*) – Who to reply to
- **to** (*str*) – The recipient
- **cc** (*str*) – The CC recipient
- **bcc** (*str*) – The BCC recipient
- **subject** (*str*) – The subject of the email
- **body** (*str*) – The Message Body of the email
- **server** (*str*) – The server used to send the email
- **attachments** (*list*) – A list of attachments. These will be the paths to the files to attach. ie: `attachments=["'C:\attachment1.txt', 'C:\att'"]`

Message - Display a dialog box. The task must be set to "Run only when user is logged on" in order for the dialog box to display. Both parameters are required.

Parameters

- **title** (*str*) – The dialog box title.
- **message** (*str*) – The dialog box message body

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.add_action <task_name> cmd='del /Q /S C:\\Temp'
```

```
salt.modules.win_task.add_trigger(name=None, location='\\', trigger_type=None, trigger_enabled=True, start_date=None, start_time=None, end_date=None, end_time=None, random_delay=None, repeat_interval=None, repeat_duration=None, repeat_stop_at_duration_end=False, execution_time_limit=None, **kwargs)
```

Parameters

- **name** (*str*) – The name of the task to which to add the trigger.
- **location** (*str*) – A string value representing the location of the task. Default is `'\\'` which is the root for the task scheduler (`C:\Windows\System32\tasks`).
- **trigger_type** (*str*) – The type of trigger to create. This is defined when the trigger is created and cannot be changed later. Options are as follows:

- Event
- Once
- Daily
- Weekly
- Monthly
- MonthlyDay
- OnIdle
- OnTaskCreation
- OnBoot
- OnLogon
- OnSessionChange

Parameters

- **trigger_enabled** (*bool*) – Boolean value that indicates whether the trigger is enabled.
- **start_date** (*str*) – The date when the trigger is activated. If no value is passed, the current date will be used. Can be one of the following formats:

- %Y-%m-%d
- %m-%d-%y
- %m-%d-%Y
- %m/%d/%y
- %m/%d/%Y
- %Y/%m/%d

Parameters **start_time** (*str*) – The time when the trigger is activated. If no value is passed, midnight will be used. Can be one of the following formats:

- %I:%M:%S %p
- %I:%M %p
- %H:%M:%S
- %H:%M

Parameters **end_date** (*str*) – The date when the trigger is deactivated. The trigger cannot start the task after it is deactivated. Can be one of the following formats:

- %Y-%m-%d
- %m-%d-%y
- %m-%d-%Y
- %m/%d/%y
- %m/%d/%Y
- %Y/%m/%d

Parameters **end_time** (*str*) – The time when the trigger is deactivated. If this is not passed with `end_date` it will be set to midnight. Can be one of the following formats:

- %I:%M:%S %p
- %I:%M %p
- %H:%M:%S
- %H:%M

Parameters **random_delay** (*str*) – The delay time that is randomly added to the start time of the trigger. Valid values are:

- 30 seconds
- 1 minute
- 30 minutes
- 1 hour
- 8 hours
- 1 day

Parameters **repeat_interval** (*str*) – The amount of time between each restart of the task. Valid values are:

- 5 minutes
- 10 minutes
- 15 minutes
- 30 minutes
- 1 hour

Parameters **repeat_duration** (*str*) – How long the pattern is repeated. Valid values are:

- Indefinitely

- 15 minutes
- 30 minutes
- 1 hour
- 12 hours
- 1 day

Parameters

- **repeat_stop_at_duration_end** (*bool*) – Boolean value that indicates if a running instance of the task is stopped at the end of the repetition pattern duration.
- **execution_time_limit** (*str*) – The maximum amount of time that the task launched by the trigger is allowed to run. Valid values are:

- 30 minutes
- 1 hour
- 2 hours
- 4 hours
- 8 hours
- 12 hours
- 1 day
- 3 days (default)

kwargs

There are optional keyword arguments determined by the type of trigger being defined. They are as follows:

Event

- Parameters** **subscription** (*str*) – An event definition in xml format that fires the trigger. The easiest way to get this would be to create an event in windows task scheduler and then copy the xml text.

Once

No special parameters required.

Daily

- Parameters** **days_interval** (*int*) – The interval between days in the schedule. An interval of 1 produces a daily schedule. An interval of 2 produces an every-other day schedule. If no interval is specified, 1 is used. Valid entries are 1 - 999.

Weekly

- Parameters** **weeks_interval** (*int*) – The interval between weeks in the schedule. An interval of 1 produces a weekly schedule. An interval of 2 produces an every-other week schedule. If no interval is specified, 1 is used. Valid entries are 1 - 52.

param list days_of_week: Sets the days of the week on which the task runs. Should be a list. ie: ['Monday', 'Wednesday', 'Friday']. Valid entries are the names of the days of the week.

Monthly

Parameters

- **months_of_year** (*list*) – Sets the months of the year during which the task runs. Should be a list. ie: ['January', 'July']. Valid entries are the full names of all the months.
- **days_of_month** (*list*) – Sets the days of the month during which the task runs. Should be a list. ie: [1, 15, 'Last']. Options are all days of the month 1 - 31 and the word 'Last' to indicate the last day of the month.
- **last_day_of_month** (*bool*) – Boolean value that indicates that the task runs on the last day of the month regardless of the actual date of that day.

You can set the task to run on the last day of the month by either including the word 'Last' in the list of days, or setting the parameter 'last_day_of_month' equal to True.

MonthlyDay

Parameters

- **months_of_year** (*list*) – Sets the months of the year during which the task runs. Should be a list. ie: ['January','July']. Valid entries are the full names of all the months.
- **weeks_of_month** (*list*) – Sets the weeks of the month during which the task runs. Should be a list. ie: ['First','Third']. Valid options are:
 - First
 - Second
 - Third
 - Fourth

Parameters

- **last_week_of_month** (*bool*) – Boolean value that indicates that the task runs on the last week of the month.
- **days_of_week** (*list*) – Sets the days of the week during which the task runs. Should be a list. ie: ['Monday','Wednesday','Friday']. Valid entries are the names of the days of the week.

OnIdle No special parameters required.

OnTaskCreation No special parameters required.

OnBoot No special parameters required.

OnLogon No special parameters required.

OnSessionChange**Parameters**

- **session_user_name** (*str*) – Sets the user for the Terminal Server session. When a session state change is detected for this user, a task is started. To detect session status change for any user, do not pass this parameter.
- **state_change** (*str*) – Sets the kind of Terminal Server session change that would trigger a task launch. Valid options are:
 - ConsoleConnect: When you connect to a user session (switch users)
 - ConsoleDisconnect: When you disconnect a user session (switch users)
 - RemoteConnect: When a user connects via Remote Desktop
 - RemoteDisconnect: When a user disconnects via Remote Desktop
 - SessionLock: When the workstation is locked
 - SessionUnlock: When the workstation is unlocked

Note: Arguments are parsed by the YAML loader and are subject to yaml's idiosyncrasies. Therefore, time values in some formats (%H:%M:%S and %H:%M) should to be quoted. See [YAML IDIOSYNCRASIES](#) for more details.

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.add_trigger <task_name> trigger_type=Once trigger_
→enabled=True start_date=2016/12/1 start_time='"12:01"'
```

`salt.modules.win_task.clear_triggers`(*name*, *location*='\\')

Remove all triggers from the task.

Parameters

- **name** (*str*) – The name of the task from which to clear all triggers.

- **location** (*str*) – A string value representing the location of the task. Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.clear_trigger <task_name>
```

`salt.modules.win_task.create_folder` (*name*, *location*='\\')

Create a folder in which to create tasks.

Parameters

- **name** (*str*) – The name of the folder. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the folder. Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.create_folder <folder_name>
```

`salt.modules.win_task.create_task` (*name*, *location*='\\', *user_name*='System', *password*=None, *force*=False, ***kwargs*)

Create a new task in the designated location. This function has many keyword arguments that are not listed here. For additional arguments see:

- `edit_task()`
- `add_action()`
- `add_trigger()`

Parameters

- **name** (*str*) – The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).
- **user_name** (*str*) – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.
- **force** (*bool*) – If the task exists, overwrite the existing task.

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.create_task <task_name> user_name=System force=True action_
↪type=Execute cmd='del /Q /S C:\\Temp' trigger_type=Once start_date=2016-12-1
↪start_time=01:00
```

`salt.modules.win_task.create_task_from_xml` (*name*, *location*='\\', *xml_text*=None, *xml_path*=None, *user_name*='System', *password*=None)

Create a task based on XML. Source can be a file or a string of XML.

Parameters

- **name** (*str*) – The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the task. Default is `\` which is the root for the task scheduler (C:WindowsSystem32tasks).

- **xml_text** (*str*) – A string of xml representing the task to be created. This will be overridden by *xml_path* if passed.
- **xml_path** (*str*) – The path to an XML file on the local system containing the xml that defines the task. This will override *xml_text*
- **user_name** (*str*) – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.
- **password** (*str*) – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.create_task_from_xml <task_name> xml_path=C:\task.xml
```

`salt.modules.win_task.delete_folder` (*name*, *location*='\')

Delete a folder from the task scheduler.

Parameters

- **name** (*str*) – The name of the folder to delete.
- **location** (*str*) – A string value representing the location of the folder. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_folder <folder_name>
```

`salt.modules.win_task.delete_task` (*name*, *location*='\')

Delete a task from the task scheduler.

Parameters

- **name** (*str*) – The name of the task to delete.
- **location** (*str*) – A string value representing the location of the task. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type bool

CLI Example:

```
salt 'minion-id' task.delete_task <task_name>
```

`salt.modules.win_task.edit_task` (*name*=None, *location*='\', *user_name*=None, *password*=None, *description*=None, *enabled*=None, *hidden*=None, *run_if_idle*=None, *idle_duration*=None, *idle_wait_timeout*=None, *idle_stop_on_end*=None, *idle_restart*=None, *ac_only*=None, *stop_if_on_batteries*=None, *wake_to_run*=None, *run_if_network*=None, *network_id*=None, *network_name*=None, *allow_demand_start*=None, *start_when_available*=None, *restart_every*=None, *restart_count*=3, *execution_time_limit*=None, *force_stop*=None, *delete_after*=None, *multiple_instances*=None, ***kwargs*)

Edit the parameters of a task. Triggers and Actions cannot be edited yet.

Parameters

- **name** (*str*) – The name of the task. This will be displayed in the task scheduler.
- **location** (*str*) – A string value representing the location in which to create the task. Default is '\' which is the root for the task scheduler (C:WindowsSystem32tasks).
- **user_name** (*str*) – The user account under which to run the task. To specify the 'System' account, use 'System'. The password will be ignored.

- **password** (*str*) – The password to use for authentication. This should set the task to run whether the user is logged in or not, but is currently not working.

Note: The combination of `user_name` and `password` determine how the task runs. For example, if a username is passed without a password the task will only run when the user is logged in. If a password is passed as well the task will run whether the user is logged on or not. If you pass 'System' as the username the task will run as the system account (the password parameter is ignored).

Parameters

- **description** (*str*) – A string representing the text that will be displayed in the description field in the task scheduler.
- **enabled** (*bool*) – A boolean value representing whether or not the task is enabled.
- **hidden** (*bool*) – A boolean value representing whether or not the task is hidden.
- **run_if_idle** (*bool*) – Boolean value that indicates that the Task Scheduler will run the task only if the computer is in an idle state.
- **idle_duration** (*str*) – A value that indicates the amount of time that the computer must be in an idle state before the task is run. Valid values are:
 - 1 minute
 - 5 minutes
 - 10 minutes
 - 15 minutes
 - 30 minutes
 - 1 hour

Parameters **idle_wait_timeout** (*str*) – A value that indicates the amount of time that the Task Scheduler will wait for an idle condition to occur. Valid values are:

- Do not wait
- 1 minute
- 5 minutes
- 10 minutes
- 15 minutes
- 30 minutes
- 1 hour
- 2 hours

Parameters

- **idle_stop_on_end** (*bool*) – Boolean value that indicates that the Task Scheduler will terminate the task if the idle condition ends before the task is completed.
- **idle_restart** (*bool*) – Boolean value that indicates whether the task is restarted when the computer cycles into an idle condition more than once.
- **ac_only** (*bool*) – Boolean value that indicates that the Task Scheduler will launch the task only while on AC power.
- **stop_if_on_batteries** (*bool*) – Boolean value that indicates that the task will be stopped if the computer begins to run on battery power.
- **wake_to_run** (*bool*) – Boolean value that indicates that the Task Scheduler will wake the computer when it is time to run the task.
- **run_if_network** (*bool*) – Boolean value that indicates that the Task Scheduler will run the task only when a network is available.
- **network_id** (*guid*) – GUID value that identifies a network profile.
- **network_name** (*str*) – Sets the name of a network profile. The name is used for display purposes.
- **allow_demand_start** (*bool*) – Boolean value that indicates that the task can be started by using either the Run command or the Context menu.

- **start_when_available** (*bool*) – Boolean value that indicates that the Task Scheduler can start the task at any time after its scheduled time has passed.
- **restart_every** – A value that specifies the interval between task restart attempts. Valid values are:

- False (to disable)
- 1 minute
- 5 minutes
- 10 minutes
- 15 minutes
- 30 minutes
- 1 hour
- 2 hours

Parameters

- **restart_count** (*int*) – The number of times the Task Scheduler will attempt to restart the task. Valid values are integers 1 - 999.
- **execution_time_limit** – The amount of time allowed to complete the task. Valid values are:

- False (to disable)
- 1 hour
- 2 hours
- 4 hours
- 8 hours
- 12 hours
- 1 day
- 3 days

Parameters

- **force_stop** (*bool*) – Boolean value that indicates that the task may be terminated by using `TerminateProcess`.
- **delete_after** – The amount of time that the Task Scheduler will wait before deleting the task after it expires. Requires a trigger with an expiration date. Valid values are:

- False (to disable)
- Immediately
- 30 days
- 90 days
- 180 days
- 365 days

Parameters **multiple_instances** (*str*) – Sets the policy that defines how the Task Scheduler deals with multiple instances of the task. Valid values are:

- Parallel
- Queue
- No New Instance
- Stop Existing

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.edit_task <task_name> description='This task is awesome'
```

`salt.modules.win_task.info(name, location='\\')`

Get the details about a task in the task scheduler.

Parameters

- **name** (*str*) – The name of the task for which to return the status
- **location** (*str*) – A string value representing the location of the task. Default is `'\'` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns

Return type `dict`

CLI Example:

```
salt 'minion-id' task.info <task_name>
```

`salt.modules.win_task.list_actions(name, location='\\')`

List all actions that pertain to a task in the specified location.

Parameters

- **name** (*str*) – The name of the task for which list actions.
- **location** (*str*) – A string value representing the location of the task from which to list actions. Default is `'\'` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of actions.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_actions <task_name>
```

`salt.modules.win_task.list_folders(location='\\')`

List all folders located in a specific location in the task scheduler.

Parameters **location** (*str*) – A string value representing the folder from which you want to list tasks. Default is `'\'` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of folders.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_folders
```

`salt.modules.win_task.list_tasks(location='\\')`

List all tasks located in a specific location in the task scheduler.

Parameters **location** (*str*) – A string value representing the folder from which you want to list tasks. Default is `'\'` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of tasks.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_tasks
```

`salt.modules.win_task.list_triggers(name, location='\\')`

List all triggers that pertain to a task in the specified location.

Parameters

- **name** (*str*) – The name of the task for which list triggers.
- **location** (*str*) – A string value representing the location of the task from which to list triggers. Default is `'\'` which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns Returns a list of triggers.

Return type `list`

CLI Example:

```
salt 'minion-id' task.list_triggers <task_name>
```

`salt.modules.win_task.run`(*name*, *location*='')

Run a scheduled task manually.

Parameters

- **name** (*str*) – The name of the task to run.
- **location** (*str*) – A string value representing the location of the task. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.list_run <task_name>
```

`salt.modules.win_task.run_wait`(*name*, *location*='')

Run a scheduled task and return when the task finishes

Parameters

- **name** (*str*) – The name of the task to run.
- **location** (*str*) – A string value representing the location of the task. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.list_run_wait <task_name>
```

`salt.modules.win_task.status`(*name*, *location*='')

Determine the status of a task. Is it Running, Queued, Ready, etc.

Parameters

- **name** (*str*) – The name of the task for which to return the status
- **location** (*str*) – A string value representing the location of the task. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns The current status of the task. Will be one of the following:

- Unknown
- Disabled
- Queued
- Ready
- Running

Return type `string`

CLI Example:

```
salt 'minion-id' task.list_status <task_name>
```

`salt.modules.win_task.stop`(*name*, *location*='')

Stop a scheduled task.

Parameters

- **name** (*str*) – The name of the task to stop.
- **location** (*str*) – A string value representing the location of the task. Default is '' which is the root for the task scheduler (C:WindowsSystem32tasks).

Returns True if successful, False if unsuccessful

Return type `bool`

CLI Example:

```
salt 'minion-id' task.list_stop <task_name>
```

20.9.462 salt.modules.win_timezone

Module for managing timezone on Windows systems.

class salt.modules.win_timezone.**TzMapper**(*unix_to_win*)

add(*k*, *v*)

get_unix(*key*, *default=None*)

get_win(*key*, *default=None*)

list_unix()

list_win()

remove(*k*)

salt.modules.win_timezone.**get_hwclock**()

Get current hardware clock setting (UTC or localtime)

Note: The hardware clock is always local time on Windows so this will always return "localtime"

CLI Example:

```
salt '*' timezone.get_hwclock
```

salt.modules.win_timezone.**get_offset**()

Get current numeric timezone offset from UTC (i.e. -0700)

Returns Offset from UTC

Return type str

CLI Example:

```
salt '*' timezone.get_offset
```

salt.modules.win_timezone.**get_zone**()

Get current timezone (i.e. America/Denver)

Returns Timezone in unix format

Return type str

Raises *CommandExecutionError* – If timezone could not be gathered

CLI Example:

```
salt '*' timezone.get_zone
```

salt.modules.win_timezone.**get_zonecode**()

Get current timezone (i.e. PST, MDT, etc)

Returns An abbreviated timezone code

Return type str

CLI Example:

```
salt '*' timezone.get_zonecode
```

`salt.modules.win_timezone.list(unix_style=True)`

Return a list of Timezones that this module supports. These can be in either Unix or Windows format.

New in version 2018.3.3.

Parameters `unix_style` (*bool*) – True returns Unix-style timezones. False returns Windows-style timezones. Default is True

Returns A list of supported timezones

Return type `list`

CLI Example:

```
# Unix-style timezones
salt '*' timezone.list

# Windows-style timezones
salt '*' timezone.list unix_style=False
```

`salt.modules.win_timezone.set_hwclock(clock)`

Sets the hardware clock to be either UTC or localtime

Note: The hardware clock is always local time on Windows so this will always return False

CLI Example:

```
salt '*' timezone.set_hwclock UTC
```

`salt.modules.win_timezone.set_zone(timezone)`

Sets the timezone using the tzutil.

Parameters `timezone` (*str*) – A valid timezone

Returns True if successful, otherwise False

Return type `bool`

Raises `CommandExecutionError` – If invalid timezone is passed

CLI Example:

```
salt '*' timezone.set_zone 'America/Denver'
```

`salt.modules.win_timezone.zone_compare(timezone)`

Compares the given timezone with the machine timezone. Mostly useful for running state checks.

Parameters `timezone` (*str*) – The timezone to compare. This can be in Windows or Unix format. Can be any of the values returned by the `timezone.list` function

Returns True if they match, otherwise False

Return type `bool`

Example:

```
salt '*' timezone.zone_compare 'America/Denver'
```

20.9.463 salt.modules.win_update

Module for running windows updates.

This module is being deprecated and will be removed in Salt Fluorine. Please use the `win_wua` module instead.

depends

- win32com
- win32con

- win32api
- pywintypes

New in version 2014.7.0.

Set windows updates to run by category. Default behavior is to install all updates that do not require user interaction to complete. Optionally set `categories` to a category of your choice to only install certain updates. Default is to set to install all available but driver updates. The following example will install all Security and Critical Updates, and download but not install standard updates.

```
salt '*' win_update.install_updates categories="['Critical Updates', 'Security Updates
↪']"
```

You can also specify a number of features about the update to have a fine grain approach to specific types of updates. These are the following features/states of updates available for configuring:

```
'UI' - User interaction required, skipped by default
'downloaded' - Already downloaded, included by default
'present' - Present on computer, included by default
'installed' - Already installed, skipped by default
'reboot' - Reboot required, included by default
'hidden' - Skip hidden updates, skipped by default
'software' - Software updates, included by default
'driver' - Driver updates, included by default
```

The following example installs all updates that don't require a reboot: .. code-block:: bash

```
salt '*' win_update.install_updates skips="{reboot:True}"
```

Once installed Salt will return a similar output:

```
2 : Windows Server 2012 Update (KB123456)
4 : Internet Explorer Security Update (KB098765)
2 : Malware Definition Update (KB321456)
...
```

The number at the beginning of the line is an `OperationResultCode` from the Windows Update Agent, it's enumeration is described here: [https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095\(v=vs.85\).aspx](https://msdn.microsoft.com/en-us/library/windows/desktop/aa387095(v=vs.85).aspx). The result code is then followed by the update name and its KB identifier.

```
class salt.modules.win_update.PyWinUpdater (categories=None, skipUI=True, skip-
Downloaded=False, skipInstalled=True,
skipReboot=False, skipPresent=False, skipSoft-
wareUpdates=False, skipDriverUpdates=False,
skipHidden=True)
```

AutoSearch()

this function generates a search string. simplifying the search function while still providing as many features as possible.

Download()

GetAvailableCategories()

GetCategories()

GetDownloadResults()

GetInstallationResults()

this gets results of installation process.

GetInstallationResultsPretty()

converts the installation results into a pretty print.

GetSearchResults (*fields=None*)

Reduce full updates information to the most important information.

GetSearchResultsVerbose()**Install()****Search** (*searchString*)**SetCategories** (*categories*)**SetSkip** (*skip, state*)**SetSkips** (*skips*)

`salt.modules.win_update.download_updates` (*skips=None, retries=5, categories=None*)

Downloads all available updates, skipping those that require user interaction.

Various aspects of the updates can be included or excluded. this feature is still in development.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to update. Must be passed as a list.

```
salt '*' win_update.download_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.download_updates

# Download critical updates only
salt '*' win_update.download_updates categories="['Critical Updates']"
```

`salt.modules.win_update.install_updates` (*skips=None, retries=5, categories=None*)

Downloads and installs all available updates, skipping those that require user interaction.

Add `cached` to only install those updates which have already been downloaded.

you can set the maximum number of retries to `n` in the search process by adding: `retries=n`

various aspects of the updates can be included or excluded. This function is still under development.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to install. Must be passed as a list.

```
salt '*' win_update.install_updates categories="['Updates']"
```

Categories include the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.install_updates

# Install all critical updates
salt '*' win_update.install_updates categories="['Critical Updates']"
```

`salt.modules.win_update.list_updates` (*verbose=False, fields=None, skips=None, retries=5, categories=None*)

Returns a summary of available updates, grouped into their non-mutually exclusive categories.

verbose Return full set of results, including several fields from the COM.

fields Return a list of specific fields for each update. The optional values here are those at the root level of the verbose list. This is superseded by the verbose option.

retries Number of retries to make before giving up. This is total, not per step.

categories Specify the categories to list. Must be passed as a list.

```
salt '*' win_update.list_updates categories="['Updates']"
```

Categories include, but are not limited to, the following:

- Updates
- Windows 7
- Critical Updates
- Security Updates
- Update Rollups

CLI Examples:

```
# Normal Usage
salt '*' win_update.list_updates

# Specific Fields
salt '*' win_update.list_updates fields="['Title', 'Description']"

# List all critical updates list in verbose detail
salt '*' win_update.list_updates categories="['Critical Updates']" verbose=True
```

20.9.464 salt.modules.win_useradd

Module for managing Windows Users

Important: If you feel that Salt should be using this module to manage users on a minion, and it is using a different module (or gives an error similar to `'user.info' is not available`), see [here](#).

depends

- pythoncom
- pywintypes
- win32api
- win32con
- win32net
- win32netcon
- win32profile

- win32security
- win32ts
- wmi

Note: This currently only works with local user accounts, not domain accounts

`salt.modules.win_useradd.add`(*name*, *password=None*, *fullname=None*, *description=None*, *groups=None*, *home=None*, *homedrive=None*, *profile=None*, *logonscript=None*)

Add a user to the minion.

Parameters

- **name** (*str*) – User name
- **password** (*str*, *optional*) – User’s password in plain text.
- **fullname** (*str*, *optional*) – The user’s full name.
- **description** (*str*, *optional*) – A brief description of the user account.
- **groups** (*str*, *optional*) – A list of groups to add the user to. (see chgroups)
- **home** (*str*, *optional*) – The path to the user’s home directory.
- **homedrive** (*str*, *optional*) – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **profile** (*str*, *optional*) – An explicit path to a profile. Can be a UNC or a folder on the system. If left blank, windows uses it’s default profile directory.
- **logonscript** (*str*, *optional*) – Path to a login script to run when the user logs on.

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.add name password
```

`salt.modules.win_useradd.addgroup`(*name*, *group*)

Add user to a group

Parameters

- **name** (*str*) – The user name to add to the group
- **group** (*str*) – The name of the group to which to add the user

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' user.addgroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.chfullname`(*name*, *fullname*)

Change the full name of the user

Parameters

- **name** (*str*) – The user name for which to change the full name
- **fullname** (*str*) – The new value for the full name

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' user.chfullname user 'First Last'
```

`salt.modules.win_useradd.chgroups`(*name*, *groups*, *append=True*)

Change the groups this user belongs to, add `append=False` to make the user a member of only the specified

groups

Parameters

- **name** (*str*) – The user name for which to change groups
- **groups** (*str*, *list*) – A single group or a list of groups to assign to the user. For multiple groups this can be a comma delimited string or a list.
- **append** (*bool*, *optional*) – True adds the passed groups to the user's current groups. False sets the user's groups to the passed groups only. Default is True.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' user.chgroups jsnuffy Administrators,Users True
```

`salt.modules.win_useradd.chhome` (*name*, *home*, ***kwargs*)

Change the home directory of the user, pass True for persist to move files to the new home directory if the old home directory exist.

Parameters

- **name** (*str*) – The name of the user whose home directory you wish to change
- **home** (*str*) – The new location of the home directory

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' user.chhome foo \\fileserver\home\foo True
```

`salt.modules.win_useradd.chprofile` (*name*, *profile*)

Change the profile directory of the user

Parameters

- **name** (*str*) – The name of the user whose profile you wish to change
- **profile** (*str*) – The new location of the profile

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' user.chprofile foo \\fileserver\profiles\foo
```

`salt.modules.win_useradd.current` (*sam=False*)

Get the username that salt-minion is running under. If salt-minion is running as a service it should return the Local System account. If salt is running from a command prompt it should return the username that started the command prompt.

New in version 2015.5.6.

Parameters **sam** (*bool*, *optional*) – False returns just the username without any domain notation. True returns the domain with the username in the SAM format. Ie: domain\username

Returns Returns username

Return type `str`

CLI Example:

```
salt '*' user.current
```

`salt.modules.win_useradd.delete` (*name*, *purge=False*, *force=False*)

Remove a user from the minion

Parameters

- **name** (*str*) – The name of the user to delete

- **purge**(*bool*, *optional*) – Boolean value indicating that the user profile should also be removed when the user account is deleted. If set to True the profile will be removed. Default is False.
- **force**(*bool*, *optional*) – Boolean value indicating that the user account should be deleted even if the user is logged in. True will log the user out and delete user.

Returns True if successful, otherwise False

Return type `bool`

CLI Example:

```
salt '*' user.delete name
```

`salt.modules.win_useradd.getUserSid`(*username*)

Get the Security ID for the user

Parameters **username** (*str*) – The user name for which to look up the SID

Returns The user SID

Return type `str`

CLI Example:

```
salt '*' user.getUserSid jsnuffy
```

`salt.modules.win_useradd.getent`(*refresh=False*)

Return the list of all info for all users

Parameters **refresh** (*bool*, *optional*) – Refresh the cached user information. Useful when used from within a state function. Default is False.

Returns A dictionary containing information about all users on the system

Return type `dict`

CLI Example:

```
salt '*' user.getent
```

`salt.modules.win_useradd.info`(*name*)

Return user information

Parameters **name** (*str*) – Username for which to display information

Returns

A dictionary containing user information

- fullname
- username
- SID
- passwd (will always return None)
- comment (same as description, left here for backwards compatibility)
- description
- active
- logonscript
- profile
- home
- homedrive
- groups
- password_changed
- successful_logon_attempts
- failed_logon_attempts
- last_logon
- account_disabled
- account_locked
- password_never_expires
- disallow_change_password

- gid

Return type dict

CLI Example:

```
salt '*' user.info jsnuffy
```

`salt.modules.win_useradd.list_groups(name)`

Return a list of groups the named user belongs to

Parameters **name** (*str*) – The user name for which to list groups

Returns A list of groups to which the user belongs

Return type list

CLI Example:

```
salt '*' user.list_groups foo
```

`salt.modules.win_useradd.list_users()`

Return a list of all users on Windows

Returns A list of all users on the system

Return type list

CLI Example:

```
salt '*' user.list_users
```

`salt.modules.win_useradd.removegroup(name, group)`

Remove user from a group

Parameters

- **name** (*str*) – The user name to remove from the group
- **group** (*str*) – The name of the group from which to remove the user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.removegroup jsnuffy 'Power Users'
```

`salt.modules.win_useradd.rename(name, new_name)`

Change the username for a named user

Parameters

- **name** (*str*) – The user name to change
- **new_name** (*str*) – The new name for the current user

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.rename jsnuffy jshmoe
```

`salt.modules.win_useradd.setpassword(name, password)`

Set the user's password

Parameters

- **name** (*str*) – The user name for which to set the password
- **password** (*str*) – The new password

Returns True if successful, otherwise False

Return type bool

CLI Example:

```
salt '*' user.setpassword jsnuffy sup3rs3cr3t
```

`salt.modules.win_useradd.update`(*name*, *password=None*, *fullname=None*, *description=None*, *home=None*, *homedrive=None*, *logonscript=None*, *profile=None*, *expiration_date=None*, *expired=None*, *account_disabled=None*, *unlock_account=None*, *password_never_expires=None*, *disallow_change_password=None*)

Updates settings for the windows user. Name is the only required parameter. Settings will only be changed if the parameter is passed a value.

New in version 2015.8.0.

Parameters

- **name** (*str*) – The user name to update.
- **password** (*str*, *optional*) – New user password in plain text.
- **fullname** (*str*, *optional*) – The user’s full name.
- **description** (*str*, *optional*) – A brief description of the user account.
- **home** (*str*, *optional*) – The path to the user’s home directory.
- **homedrive** (*str*, *optional*) – The drive letter to assign to the home directory. Must be the Drive Letter followed by a colon. ie: U:
- **logonscript** (*str*, *optional*) – The path to the logon script.
- **profile** (*str*, *optional*) – The path to the user’s profile directory.
- **expiration_date** (*date*, *optional*) – The date and time when the account expires. Can be a valid date/time string. To set to never expire pass the string 'Never'.
- **expired** (*bool*, *optional*) – Pass *True* to expire the account. The user will be prompted to change their password at the next logon. Pass *False* to mark the account as 'not expired'. You can't use this to negate the expiration if the expiration was caused by the account expiring. You'll have to change the *expiration_date* as well.
- **account_disabled** (*bool*, *optional*) – True disables the account. False enables the account.
- **unlock_account** (*bool*, *optional*) – True unlocks a locked user account. False is ignored.
- **password_never_expires** (*bool*, *optional*) – True sets the password to never expire. False allows the password to expire.
- **disallow_change_password** (*bool*, *optional*) – True blocks the user from changing the password. False allows the user to change the password.

Returns True if successful. False is unsuccessful.

Return type `bool`

CLI Example:

```
salt '*' user.update bob password=secret profile=C:\Users\Bob
home=\server\homeshareob homedrive=U:
```

20.9.465 salt.modules.win_wua

Module for managing Windows Updates using the Windows Update Agent.

List updates on the system using the following functions:

- `win_wua.available`
- `win_wua.list`

This is an easy way to find additional information about updates available to to the system, such as the GUID, KB number, or description.

Once you have the GUID or a KB number for the update you can get information about the update, download, install, or uninstall it using these functions:

- `win_wua.get`
- `win_wua.download`
- `win_wua.install`
- `win_wua.uninstall`

The `get` function expects a name in the form of a GUID, KB, or Title and should return information about a single update. The other functions accept either a single item or a list of items for downloading/installing/uninstalling a specific list of items.

The `win_wua.list` and `win_wua.get` functions are utility functions. In addition to returning information about updates they can also download and install updates by setting `download=True` or `install=True`. So, with `py:func:win_wua.list <salt.modules.win_wua.list_>` for example, you could run the function with the filters you want to see what is available. Then just add `install=True` to install everything on that list.

If you want to download, install, or uninstall specific updates, use `win_wua.download`, `win_wua.install`, or `win_wua.uninstall`. To update your system with the latest updates use `win_wua.list` and set `install=True`

You can also adjust the Windows Update settings using the `win_wua.set_wu_settings` function. This function is only supported on the following operating systems:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

As of Windows 10 and Windows Server 2016, the ability to modify the Windows Update settings has been restricted. The settings can be modified in the Local Group Policy using the `lgpo` module.

New in version 2015.8.0.

depends salt.utils.win_update

`salt.modules.win_wua.available` (`software=True`, `drivers=True`, `summary=False`,
`skip_installed=True`, `skip_hidden=True`, `skip_mandatory=False`,
`skip_reboot=False`, `categories=None`, `severities=None`)

New in version 2017.7.0.

List updates that match the passed criteria. This allows for more filter options than `list()`. Good for finding a specific GUID or KB.

Parameters

- **software** (`bool`) – Include software updates in the results (default is True)
- **drivers** (`bool`) – Include driver updates in the results (default is True)
- **summary** (`bool`) –
 - True: Return a summary of updates available for each category.
 - False (default): Return a detailed list of available updates.
- **skip_installed** (`bool`) – Skip updates that are already installed. Default is False.
- **skip_hidden** (`bool`) – Skip updates that have been hidden. Default is True.
- **skip_mandatory** (`bool`) – Skip mandatory updates. Default is False.
- **skip_reboot** (`bool`) – Skip updates that require a reboot. Default is False.
- **categories** (`list`) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
 - Definition Updates
 - Drivers (make sure you set drivers=True)
 - Feature Packs
 - Security Updates
 - Update Rollups
 - Updates
 - Update Rollups
 - Windows 7
 - Windows 8.1
 - Windows 8.1 drivers
 - Windows 8.1 and later drivers
 - Windows Defender
- **severities** (*list*) - Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>,
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↪reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
                          '<category 2>',
                          ...]
          }
}

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
}
```

Return type dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.available
```

(continues on next page)

(continued from previous page)

```
# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.available categories=["Critical Updates","Drivers"]

# List all Critical Security Updates
salt '*' win_wua.available categories=["Security Updates"] severities=["Critical"]

# List all updates with a severity of Critical
salt '*' win_wua.available severities=["Critical"]

# A summary of all available updates
salt '*' win_wua.available summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.available categories=["Feature Packs","Windows 8.1"] summary=True
```

salt.modules.win_wua.download(names)

New in version 2017.7.0.

Downloads updates that match the list of passed identifiers. It's easier to use this function by using `list_updates` and setting `install=True`.

Parameters **names** (*str*, *list*) – A single update or a list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the names parameter

Returns A dictionary containing the details about the downloaded updates

Return type `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download names=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB2131233']
```

salt.modules.win_wua.download_update(name)

Deprecated since version 2017.7.0: Use `download()` instead

Downloads a single update.

Parameters **name** (*str*) – The name of the update to download. This can be a GUID, a KB number, or any part of the name. To ensure a single item is matched the GUID is preferred.

Note: If more than one result is returned an error will be raised.

Returns A dictionary containing the results of the download

Return type `dict`

CLI Examples:

```
salt '*' win_wua.download_update 12345678-abcd-1234-abcd-1234567890ab
salt '*' win_wua.download_update KB12312321
```

salt.modules.win_wua.download_updates(names)

Deprecated since version 2017.7.0: Use `download()` instead

Downloads updates that match the list of passed identifiers. It's easier to use this function by using `list_updates` and setting `install=True`.

Parameters `names` (*list*) – A list of updates to download. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns A dictionary containing the details about the downloaded updates

Return type `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.download_updates guid=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB2131233']
```

`salt.modules.win_wua.get`(*name*, *download=False*, *install=False*)

New in version 2017.7.0.

Returns details for the named update

Parameters

- **name** (*str*) – The name of the update you're searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list` to get the GUID for the update you're looking for.
- **download** (*bool*) – Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) – Install the update returned by this function. Run this function first to see if the update exists, then set `install=True` to install the update.

Returns

Returns a dict containing a list of updates that match the name if `download` and `install` are both set to `False`. Should usually be a single update, but can return multiple if a partial name is given.

If `download` or `install` is set to `true` it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>,
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↳reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
                          '<category 2>',
                          ...]
           }
}
```

Return type `dict`

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
```

(continues on next page)

(continued from previous page)

```

salt '*' win_wua.get 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number
# Not all updates have an associated KB
salt '*' win_wua.get KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.get 'Microsoft Camera Codec Pack'

```

salt.modules.win_wua.get_needs_reboot()

Determines if the system needs to be rebooted.

Returns True if the system requires a reboot, otherwise False

Return type bool

CLI Examples:

```

salt '*' win_wua.get_needs_reboot

```

salt.modules.win_wua.get_wu_settings()

Get current Windows Update settings.

Returns

A dictionary of Windows Update settings:

Featured Updates: Boolean value that indicates whether to display notifications for featured updates.

Group Policy Required (Read-only): Boolean value that indicates whether Group Policy requires the Automatic Updates service.

Microsoft Update: Boolean value that indicates whether to turn on Microsoft Update for other Microsoft Products

Needs Reboot: Boolean value that indicates whether the machine is in a reboot pending state.

Non Admins Elevated: Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.

Notification Level:

Number 1 to 4 indicating the update level:

1. Never check for updates
2. Check for updates but let me choose whether to download and install them
3. Download updates but let me choose whether to install them
4. Install updates automatically

Read Only (Read-only): Boolean value that indicates whether the Automatic Update settings are read-only.

Recommended Updates: Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.

Scheduled Day: Days of the week on which Automatic Updates installs or uninstalls updates.

Scheduled Time: Time at which Automatic Updates installs or uninstalls updates.

Return type dict

CLI Examples:

```
salt '*' win_wua.get_wu_settings
```

`salt.modules.win_wua.install(names)`

New in version 2017.7.0.

Installs updates that match the list of identifiers. It may be easier to use the `list_updates` function and set `install=True`.

Parameters `names` (*str*, *list*) – A single update or a list of updates to install. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Note: An error will be raised if there are more results than there are items in the `names` parameter

Returns A dictionary containing the details about the installed updates

Return type `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install KB12323211
```

`salt.modules.win_wua.install_update(name)`

Deprecated since version 2017.7.0: Use `install()` instead

Installs a single update

Parameters

- **name** (*str*) – The name of the update to install. This can be a GUID, a KB
- **or any part of the name. To ensure a single item is matched the** (*number*,) –
- **is preferred.** (*GUID*) –

Note: If no results or more than one result is returned an error will be raised.

Returns A dictionary containing the results of the install

Return type `dict`

CLI Examples:

```
salt '*' win_wua.install_update 12345678-abcd-1234-abcd-1234567890ab

salt '*' win_wua.install_update KB12312231
```

`salt.modules.win_wua.install_updates(names)`

Deprecated since version 2017.7.0: Use `install()` instead

Installs updates that match the list of identifiers. It may be easier to use the `list_updates` function and set `install=True`.

Parameters

- **names** (*list*) – A list of updates to install. This can be any combination
- **GUIDs, KB numbers, or names. GUIDs or KBs are preferred.** (*of*) –

Returns A dictionary containing the details about the installed updates

Return type `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.install_updates guid=['12345678-abcd-1234-abcd-1234567890ab',
↪ 'KB12323211']
```

`salt.modules.win_wua.list_` (*software=True, drivers=False, summary=False, skip_installed=True, categories=None, severities=None, download=False, install=False*)

New in version 2017.7.0.

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software** (*bool*) – Include software updates in the results (default is True)
- **drivers** (*bool*) – Include driver updates in the results (default is False)
- **summary** (*bool*) –
 - True: Return a summary of updates available for each category.
 - False (default): Return a detailed list of available updates.
- **skip_installed** (*bool*) – Skip installed updates in the results (default is False)
- **download** (*bool*) – (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) – (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (*list*) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
- Definition Updates
- Drivers (make sure you set `drivers=True`)
- Feature Packs
- Security Updates
- Update Rollups
- Updates
- Update Rollups
- Windows 7
- Windows 8.1
- Windows 8.1 drivers
- Windows 8.1 and later drivers
- Windows Defender
- **severities** (*list*) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>,
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
```

(continues on next page)

(continued from previous page)

```

    'Installed': <has the update been installed>,
    'Mandatory': <is the update mandatory>,
    'UserInput': <is user input required>,
    'EULAAccepted': <has the EULA been accepted>,
    'Severity': <update severity>,
    'NeedsReboot': <is the update installed and awaiting
↪reboot>,
    'RebootBehavior': <will the update require a reboot>,
    'Categories': [ '<category 1>',
                    '<category 2>',
                    ... ]
        }
    }

Summary of Updates:
{'Total': <total number of updates returned>,
 'Available': <updates that are not downloaded or installed>,
 'Downloaded': <updates that are downloaded but not installed>,
 'Installed': <updates installed (usually 0 unless installed=True)>,
 'Categories': { <category 1>: <total for that category>,
                 <category 2>: <total for category 2>,
                 ... }
}

```

Return type dict

CLI Examples:

```

# Normal Usage (list all software updates)
salt '*' win_wua.list

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list categories=['Security Updates'] severities=['Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list categories=['Feature Packs','Windows 8.1'] summary=True

```

salt.modules.win_wua.list_update(name, download=False, install=False)Deprecated since version 2017.7.0: Use `get()` instead

Returns details for all updates that match the search criteria

Parameters

- **name** (*str*) – The name of the update you’re searching for. This can be the GUID, a KB number, or any part of the name of the update. GUIDs and KBs are preferred. Run `list_updates` to get the GUID for the update you’re looking for.
- **download** (*bool*) – Download the update returned by this function. Run this function first to see if the update exists, then set `download=True` to download the update.
- **install** (*bool*) – Install the update returned by this function. Run this function

first to see if the update exists, then set `install=True` to install the update.

Returns

Returns a dict containing a list of updates that match the name if download and install are both set to False. Should usually be a single update, but can return multiple if a partial name is given.

If download or install is set to true it will return the results of the operation.

```
List of Updates:
{'<GUID>': {'Title': <title>,
           'KB': <KB>,
           'GUID': <the globally unique identifier for the update>
           'Description': <description>,
           'Downloaded': <has the update been downloaded>,
           'Installed': <has the update been installed>,
           'Mandatory': <is the update mandatory>,
           'UserInput': <is user input required>,
           'EULAAccepted': <has the EULA been accepted>,
           'Severity': <update severity>,
           'NeedsReboot': <is the update installed and awaiting
↪reboot>,
           'RebootBehavior': <will the update require a reboot>,
           'Categories': [ '<category 1>',
                          '<category 2>',
                          ...]
           }
}
```

Return type dict

CLI Examples:

```
# Recommended Usage using GUID without braces
# Use this to find the status of a specific update
salt '*' win_wua.list_update 12345678-abcd-1234-abcd-1234567890ab

# Use the following if you don't know the GUID:

# Using a KB number (could possibly return multiple results)
# Not all updates have an associated KB
salt '*' win_wua.list_update KB3030298

# Using part or all of the name of the update
# Could possibly return multiple results
# Not all updates have an associated KB
salt '*' win_wua.list_update 'Microsoft Camera Codec Pack'
```

```
salt.modules.win_wua.list_updates(software=True, drivers=False, summary=False,
                                 skip_installed=True, categories=None, severities=None,
                                 download=False, install=False)
```

Deprecated since version 2017.7.0: Use `list()` instead

Returns a detailed list of available updates or a summary. If download or install is True the same list will be downloaded and/or installed.

Parameters

- **software** (*bool*) – Include software updates in the results (default is True)
- **drivers** (*bool*) – Include driver updates in the results (default is False)
- **summary** (*bool*) –
 - True: Return a summary of updates available for each category.

- False (default): Return a detailed list of available updates.
- **skip_installed** (*bool*) – Skip installed updates in the results (default is False)
- **download** (*bool*) – (Overrides reporting functionality) Download the list of updates returned by this function. Run this function first with `download=False` to see what will be downloaded, then set `download=True` to download the updates.
- **install** (*bool*) – (Overrides reporting functionality) Install the list of updates returned by this function. Run this function first with `install=False` to see what will be installed, then set `install=True` to install the updates.
- **categories** (*list*) – Specify the categories to list. Must be passed as a list. All categories returned by default.

Categories include the following:

- Critical Updates
 - Definition Updates
 - Drivers (make sure you set `drivers=True`)
 - Feature Packs
 - Security Updates
 - Update Rollups
 - Updates
 - Update Rollups
 - Windows 7
 - Windows 8.1
 - Windows 8.1 drivers
 - Windows 8.1 and later drivers
 - Windows Defender
- **severities** (*list*) – Specify the severities to include. Must be passed as a list. All severities returned by default.

Severities include the following:

- Critical
- Important

Returns

Returns a dict containing either a summary or a list of updates:

```
List of Updates:
{'<GUID>': {'Title': <title>,
            'KB': <KB>,
            'GUID': <the globally unique identifier for the update>,
            'Description': <description>,
            'Downloaded': <has the update been downloaded>,
            'Installed': <has the update been installed>,
            'Mandatory': <is the update mandatory>,
            'UserInput': <is user input required>,
            'EULAAccepted': <has the EULA been accepted>,
            'Severity': <update severity>,
            'NeedsReboot': <is the update installed and awaiting
↪reboot>,
            'RebootBehavior': <will the update require a reboot>,
            'Categories': [ '<category 1>',
                           '<category 2>',
                           ...]
          }
}

Summary of Updates:
{'Total': <total number of updates returned>,

```

(continues on next page)

(continued from previous page)

```
'Available': <updates that are not downloaded or installed>,
'Downloaded': <updates that are downloaded but not installed>,
'Installed': <updates installed (usually 0 unless installed=True)>,
'Categories': { <category 1>: <total for that category>,
                <category 2>: <total for category 2>,
                ... }
}
```

Return type dict

CLI Examples:

```
# Normal Usage (list all software updates)
salt '*' win_wua.list_updates

# List all updates with categories of Critical Updates and Drivers
salt '*' win_wua.list_updates categories=['Critical Updates','Drivers']

# List all Critical Security Updates
salt '*' win_wua.list_updates categories=['Security Updates'] severities=[
    ↪'Critical']

# List all updates with a severity of Critical
salt '*' win_wua.list_updates severities=['Critical']

# A summary of all available updates
salt '*' win_wua.list_updates summary=True

# A summary of all Feature Packs and Windows 8.1 Updates
salt '*' win_wua.list_updates categories=['Feature Packs','Windows 8.1'] ↪
    ↪summary=True
```

`salt.modules.win_wua.set_wu_settings`(*level=None, recommended=None, featured=None, elevated=None, msupdate=None, day=None, time=None*)

Change Windows Update settings. If no parameters are passed, the current value will be returned.

Supported:

- Windows Vista / Server 2008
- Windows 7 / Server 2008R2
- Windows 8 / Server 2012
- Windows 8.1 / Server 2012R2

Parameters

- **level** (*int*) – Number from 1 to 4 indicating the update level:
 1. Never check for updates
 2. Check for updates but let me choose whether to download and install them
 3. Download updates but let me choose whether to install them
 4. Install updates automatically
- **recommended** (*bool*) – Boolean value that indicates whether to include optional or recommended updates when a search for updates and installation of updates is performed.
- **featured** (*bool*) – Boolean value that indicates whether to display notifications for featured updates.
- **elevated** (*bool*) – Boolean value that indicates whether non-administrators can perform some update-related actions without administrator approval.
- **msupdate** (*bool*) – Boolean value that indicates whether to turn on Microsoft Update for other Microsoft products
- **day** (*str*) – Days of the week on which Automatic Updates installs or uninstalls

updates. Accepted values:

- Everyday
- Monday
- Tuesday
- Wednesday
- Thursday
- Friday
- Saturday
- **time** (*str*) - Time at which Automatic Updates installs or uninstalls updates. Must be in the `##:##` 24hr format, eg. 3:00 PM would be 15:00. Must be in 1 hour increments.

Returns Returns a dictionary containing the results.

Return type `dict`

CLI Examples:

```
salt '*' win_wua.set_wu_settings level=4 recommended=True featured=False
```

`salt.modules.win_wua.uninstall(names)`

New in version 2017.7.0.

Uninstall updates.

Parameters **names** (*str*, *list*) - A single update or a list of updates to uninstall. This can be any combination of GUIDs, KB numbers, or names. GUIDs or KBs are preferred.

Returns A dictionary containing the details about the uninstalled updates

Return type `dict`

CLI Examples:

```
# Normal Usage
salt '*' win_wua.uninstall KB3121212

# As a list
salt '*' win_wua.uninstall guid=['12345678-abcd-1234-abcd-1234567890ab',
↳ 'KB1231231']
```

20.9.466 salt.modules.x509

Manage X509 certificates

New in version 2015.8.0.

depends M2Crypto

`salt.modules.x509.create_certificate(path=None, text=False, overwrite=True, ca_server=None, **kwargs)`

Create an X509 certificate.

path: Path to write the certificate to.

text: If True, return the PEM text without writing to a file. Default False.

overwrite: If True(default), `create_certificate` will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

kwargs: Any of the properties below can be included as additional keyword arguments.

ca_server: Request a remotely signed certificate from `ca_server`. For this to work, a `signing_policy` must be specified, and that same policy must be configured on the `ca_server`. See `signing_policy` for details. Also the salt master must permit peers to call the `sign_remote_certificate` function.

Example:

```
/etc/salt/master.d/peer.conf
```

```
peer:
  .*:
    - x509.sign_remote_certificate
```

subject properties: Any of the values below can be included to set subject properties Any other subject properties supported by OpenSSL should also work.

C: 2 letter Country code

CN: Certificate common name, typically the FQDN.

Email: Email address

GN: Given Name

L: Locality

O: Organization

OU: Organization Unit

SN: SurName

ST: State or Province

signing_private_key: A path or string of the private key in PEM format that will be used to sign this certificate. If neither `signing_cert`, `public_key`, or `csr` are included, it will be assumed that this is a self-signed certificate, and the public key matching `signing_private_key` will be used to create the certificate.

signing_private_key_passphrase: Passphrase used to decrypt the `signing_private_key`.

signing_cert: A certificate matching the private key that will be used to sign this certificate. This is used to populate the issuer values in the resulting certificate. Do not include this value for self-signed certificates.

public_key: The public key to be included in this certificate. This can be sourced from a public key, certificate, csr or private key. If a private key is used, the matching public key from the private key will be generated before any processing is done. This means you can request a certificate from a remote CA using a private key file as your `public_key` and only the public key will be sent across the network to the CA. If neither `public_key` or `csr` are specified, it will be assumed that this is a self-signed certificate, and the public key derived from `signing_private_key` will be used. Specify either `public_key` or `csr`, not both. Because you can input a CSR as a public key or as a CSR, it is important to understand the difference. If you import a CSR as a public key, only the public key will be added to the certificate, subject or extension information in the CSR will be lost.

public_key_passphrase: If the public key is supplied as a private key, this is the passphrase used to decrypt it.

csr: A file or PEM string containing a certificate signing request. This will be used to supply the subject, extensions and public key of a certificate. Any subject or extensions specified explicitly will overwrite any in the CSR.

basicConstraints: X509v3 Basic Constraints extension.

extensions: The following arguments set X509v3 Extension values. If the value starts with `critical`, the extension will be marked as critical.

Some special extensions are `subjectKeyIdentifier` and `authorityKeyIdentifier`.

`subjectKeyIdentifier` can be an explicit value or it can be the special string `hash`. `hash` will set the `subjectKeyIdentifier` equal to the SHA1 hash of the modulus of the public key in this certificate. Note that this is not the exact same hashing method used by OpenSSL when using the `hash` value.

`authorityKeyIdentifier` Use values acceptable to the openssl CLI tools. This will automatically populate `authorityKeyIdentifier` with the `subjectKeyIdentifier` of `signing_cert`. If this is a self-signed cert these values will be the same.

basicConstraints: X509v3 Basic Constraints

keyUsage: X509v3 Key Usage

extendedKeyUsage: X509v3 Extended Key Usage

subjectKeyIdentifier: X509v3 Subject Key Identifier

issuerAltName: X509v3 Issuer Alternative Name

subjectAltName: X509v3 Subject Alternative Name

crlDistributionPoints: X509v3 CRL distribution points
issuingDistributionPoint: X509v3 Issuing Distribution Point
certificatePolicies: X509v3 Certificate Policies
policyConstraints: X509v3 Policy Constraints
inhibitAnyPolicy: X509v3 Inhibit Any Policy
nameConstraints: X509v3 Name Constraints
noCheck: X509v3 OCSP No Check
nsComment: Netscape Comment
nsCertType: Netscape Certificate Type
days_valid: The number of days this certificate should be valid. This sets the `notAfter` property of the certificate. Defaults to 365.
version: The version of the X509 certificate. Defaults to 3. This is automatically converted to the version value, so `version=3` sets the certificate version field to 0x2.
serial_number: The serial number to assign to this certificate. If omitted a random serial number of size `serial_bits` is generated.
serial_bits: The number of bits to use when randomly generating a serial number. Defaults to 64.
algorithm: The hashing algorithm to be used for signing this certificate. Defaults to sha256.
copypath: An additional path to copy the resulting certificate to. Can be used to maintain a copy of all certificates issued for revocation purposes.
prepend_cn: If set to True, the CN and a dash will be prepended to the copypath's filename.
Example: `/etc/pki/issued_certs/www.example.com-DE:CA:FB:AD:00:00:00:00.crt`
signing_policy: A signing policy that should be used to create this certificate. Signing policies should be defined in the minion configuration, or in a minion pillar. It should be a yaml formatted list of arguments which will override any arguments passed to this function. If the `match_on` key is included in the signing policy, only minions matching that pattern will be permitted to remotely request certificates from that policy.

Example:

```

x509_signing_policies:
  www:
    - minions: 'www*'
    - signing_private_key: /etc/pki/ca.key
    - signing_cert: /etc/pki/ca.crt
    - C: US
    - ST: Utah
    - L: Salt Lake City
    - basicConstraints: "critical CA:false"
    - keyUsage: "critical cRLSign, keyCertSign"
    - subjectKeyIdentifier: hash
    - authorityKeyIdentifier: keyid,issuer:always
    - days_valid: 90
    - copypath: /etc/pki/issued_certs/
  
```

The above signing policy can be invoked with `signing_policy=www`
 CLI Example:

```

salt '*' x509.create_certificate path=/etc/pki/myca.crt signing_private_key='/etc/
↳ pki/myca.key' csr='/etc/pki/myca.csr'}
  
```

```

salt.modules.x509.create_crl(path=None, text=False, signing_private_key=None, sign-
ing_private_key_passphrase=None, signing_cert=None, re-
voked=None, include_expired=False, days_valid=100, digest="")
  
```

Create a CRL

Depends

- PyOpenSSL Python module

path: Path to write the crl to.

text: If True, return the PEM text without writing to a file. Default False.

signing_private_key: A path or string of the private key in PEM format that will be used to sign this crl. This is required.

signing_private_key_passphrase: Passphrase to decrypt the private key.

signing_cert: A certificate matching the private key that will be used to sign this crl. This is required.

revoked: A list of dicts containing all the certificates to revoke. Each dict represents one certificate. A dict must contain either the key `serial_number` with the value of the serial number to revoke, or `certificate` with either the PEM encoded text of the certificate, or a path to the certificate to revoke.

The dict can optionally contain the `revocation_date` key. If this key is omitted the revocation date will be set to now. If should be a string in the format `"%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `not_after` key. This is redundant if the `certificate` key is included. If the `Certificate` key is not included, this can be used for the logic behind the `include_expired` parameter. If should be a string in the format `"%Y-%m-%d %H:%M:%S"`.

The dict can also optionally contain the `reason` key. This is the reason code for the revocation. Available choices are `unspecified`, `keyCompromise`, `CACompromise`, `affiliationChanged`, `superseded`, `cessationOfOperation` and `certificateHold`.

include_expired: Include expired certificates in the CRL. Default is False.

days_valid: The number of days that the CRL should be valid. This sets the Next Update field in the CRL.

digest: The digest to use for signing the CRL. This has no effect on versions of pyOpenSSL less than 0.14

CLI Example:

```
salt '*' x509.create_crl path=/etc/pki/mykey.key signing_private_key=/etc/pki/ca.
↳key signing_cert=/etc/pki/ca.crt revoked="{ 'compromized-web-key': {'certificate
↳': '/etc/pki/certs/www1.crt', 'revocation_date': '2015-03-01 00:00:00'} }"
```

`salt.modules.x509.create_csr` (*path=None, text=False, **kwargs*)

Create a certificate signing request.

path: Path to write the certificate to.

text: If True, return the PEM text without writing to a file. Default False.

algorithm: The hashing algorithm to be used for signing this request. Defaults to sha256.

kwargs: The subject, extension and version arguments from `x509.create_certificate` can be used.

CLI Example:

```
salt '*' x509.create_csr path=/etc/pki/myca.csr public_key='/etc/pki/myca.key' CN=
↳'My Cert'
```

`salt.modules.x509.create_private_key` (*path=None, text=False, bits=2048, passphrase=None, cipher='aes_128_cbc', verbose=True*)

Creates a private key in PEM format.

path: The path to write the file to, either `path` or `text` are required.

text: If True, return the PEM text without writing to a file. Default False.

bits: Length of the private key in bits. Default 2048

passphrase: Passphrase for encrypting the private key

cipher: Cipher for encrypting the private key. Has no effect if passphrase is None.

verbose: Provide visual feedback on stdout. Default True

New in version 2016.11.0.

CLI Example:

```
salt '*' x509.create_private_key path=/etc/pki/mykey.key
```

`salt.modules.x509.expired` (*certificate*)

Returns a dict containing limited details of a certificate and whether the certificate has expired.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.expired "/etc/pki/mycert.crt"
```

salt.modules.x509.get_pem_entries(*glob_path*)

Returns a dict containing PEM entries in files matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.get_pem_entries "/etc/pki/*.crt"
```

salt.modules.x509.get_pem_entry(*text*, *pem_type=None*)

Returns a properly formatted PEM string from the input text fixing any whitespace or line-break issues

text: Text containing the X509 PEM entry to be returned or path to a file containing the text.

pem_type: If specified, this function will only return a pem of a certain type, for example 'CERTIFICATE' or 'CERTIFICATE REQUEST'.

CLI Example:

```
salt '*' x509.get_pem_entry "-----BEGIN CERTIFICATE REQUEST-----MIICyzCC Ar8CAQI..  
↪.-----END CERTIFICATE REQUEST"
```

salt.modules.x509.get_private_key_size(*private_key*, *passphrase=None*)

Returns the bit length of a private key in PEM format.

private_key: A path or PEM encoded string containing a private key.

CLI Example:

```
salt '*' x509.get_private_key_size /etc/pki/mycert.key
```

salt.modules.x509.get_public_key(*key*, *passphrase=None*, *asObj=False*)

Returns a string containing the public key in PEM format.

key: A path or PEM encoded string containing a CSR, Certificate or Private Key from which a public key can be retrieved.

CLI Example:

```
salt '*' x509.get_public_key /etc/pki/mycert.cer
```

salt.modules.x509.get_signing_policy(*signing_policy_name*)

Returns the details of a names signing policy, including the text of the public key that will be used to sign it. Does not return the private key.

CLI Example:

```
salt '*' x509.get_signing_policy www
```

salt.modules.x509.read_certificate(*certificate*)

Returns a dict containing details of a certificate. Input can be a PEM string or file path.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.read_certificate /etc/pki/mycert.crt
```

salt.modules.x509.read_certificates(*glob_path*)

Returns a dict containing details of a all certificates matching a glob

glob_path: A path to certificates to be read and returned.

CLI Example:

```
salt '*' x509.read_certificates "/etc/pki/*.crt"
```

`salt.modules.x509.read_crl(crl)`

Returns a dict containing details of a certificate revocation list. Input can be a PEM string or file path.

Depends

- OpenSSL command line tool

cs: A path or PEM encoded string containing the CSL to read.

CLI Example:

```
salt '*' x509.read_crl /etc/pki/mycrl.crl
```

`salt.modules.x509.read_csr(csr)`

Returns a dict containing details of a certificate request.

Depends

- OpenSSL command line tool

csr: A path or PEM encoded string containing the CSR to read.

CLI Example:

```
salt '*' x509.read_csr /etc/pki/mycert.csr
```

`salt.modules.x509.sign_remote_certificate(argdic, **kwargs)`

Request a certificate to be remotely signed according to a signing policy.

argdic: A dict containing all the arguments to be passed into the `create_certificate` function. This will become `kwargs` when passed to `create_certificate`.

kwargs: kwargs delivered from `publish.publish`

CLI Example:

```
salt '*' x509.sign_remote_certificate argdic="{ 'public_key': '/etc/pki/www.key',
→ 'signing_policy': 'www' }" __pub_id='www1'
```

`salt.modules.x509.verify_crl(crl, cert)`

Validate a CRL against a certificate. Parses openssl command line output, this is a workaround for M2Crypto's inability to get them from CSR objects.

crl: The CRL to verify

cert: The certificate to verify the CRL against

CLI Example:

```
salt '*' x509.verify_crl crl=/etc/pki/myca.crl cert=/etc/pki/myca.crt
```

`salt.modules.x509.verify_private_key(private_key, public_key, passphrase=None)`

Verify that 'private_key' matches 'public_key'

private_key: The private key to verify, can be a string or path to a private key in PEM format.

public_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or another private key.

passphrase: Passphrase to decrypt the private key.

CLI Example:

```
salt '*' x509.verify_private_key private_key=/etc/pki/myca.key \
public_key=/etc/pki/myca.crt
```

`salt.modules.x509.verify_signature`(*certificate*, *signing_pub_key=*None, *signing_pub_key_passphrase=*None)

Verify that *certificate* has been signed by *signing_pub_key*

certificate: The certificate to verify. Can be a path or string containing a PEM formatted certificate.

signing_pub_key: The public key to verify, can be a string or path to a PEM formatted certificate, csr, or private key.

signing_pub_key_passphrase: Passphrase to the *signing_pub_key* if it is an encrypted private key.

CLI Example:

```
salt '*' x509.verify_signature /etc/pki/mycert.pem \
    signing_pub_key=/etc/pki/myca.crt
```

`salt.modules.x509.will_expire`(*certificate*, *days*)

Returns a dict containing details of a certificate and whether the certificate will expire in the specified number of days. Input can be a PEM string or file path.

New in version 2016.11.0.

certificate: The certificate to be read. Can be a path to a certificate file, or a string containing the PEM formatted text of the certificate.

CLI Example:

```
salt '*' x509.will_expire "/etc/pki/mycert.crt" days=30
```

`salt.modules.x509.write_pem`(*text*, *path*, *overwrite=*True, *pem_type=*None)

Writes out a PEM string fixing any formatting or whitespace issues before writing.

text: PEM string input to be written out.

path: Path of the file to write the pem out to.

overwrite: If True(default), *write_pem* will overwrite the entire pem file. Set False to preserve existing private keys and dh params that may exist in the pem file.

pem_type: The PEM type to be saved, for example CERTIFICATE or PUBLIC KEY. Adding this will allow the function to take input that may contain multiple pem types.

CLI Example:

```
salt '*' x509.write_pem "-----BEGIN CERTIFICATE-----MIIGMzCCBbugA..." path=/etc/
    ->pki/mycert.crt
```

20.9.467 salt.modules.xapi

This module (mostly) uses the XenAPI to manage Xen virtual machines.

Big fat warning: the XenAPI used in this file is the one bundled with Xen Source, NOT XenServer nor Xen Cloud Platform. As a matter of fact it *will* fail under those platforms. From what I've read, little work is needed to adapt this code to XS/XCP, mostly playing with XenAPI version, but as XCP is not taking precedence on Xen Source on many platforms, please keep compatibility in mind.

Useful documentation:

. <http://downloads.xen.org/Wiki/XenAPI/xenapi-1.0.6.pdf> . http://docs.vmd.citrix.com/XenServer/6.0.0/1.0/en_gb/api/ . <https://github.com/xapi-project/xen-api/tree/master/scripts/examples/python> . <http://xenbits.xen.org/gitweb/?p=xen.git;a=tree;f=tools/python/xen/xm;hb=HEAD>

`salt.modules.xapi.freecpu`()

Return an int representing the number of unallocated cpus on this hypervisor

CLI Example:

```
salt '*' virt.freecpu
```

`salt.modules.xapi.freemem()`

Return an int representing the amount of memory that has not been given to virtual machines on this node

CLI Example:

```
salt '*' virt.freemem
```

`salt.modules.xapi.full_info()`

Return the node_info, vm_info and freemem

CLI Example:

```
salt '*' virt.full_info
```

`salt.modules.xapi.get_disks(vm_)`

Return the disks of a named vm

CLI Example:

```
salt '*' virt.get_disks <vm name>
```

`salt.modules.xapi.get_macs(vm_)`

Return a list off MAC addresses from the named vm

CLI Example:

```
salt '*' virt.get_macs <vm name>
```

`salt.modules.xapi.get_nics(vm_)`

Return info about the network interfaces of a named vm

CLI Example:

```
salt '*' virt.get_nics <vm name>
```

`salt.modules.xapi.is_hyper()`

Returns a bool whether or not this node is a hypervisor of any kind

CLI Example:

```
salt '*' virt.is_hyper
```

`salt.modules.xapi.list_domains()`

Return a list of virtual machine names on the minion

CLI Example:

```
salt '*' virt.list_domains
```

`salt.modules.xapi.migrate(vm_, target, live=1, port=0, node=-1, ssl=None, change_home_server=0)`

Migrates the virtual machine to another hypervisor

CLI Example:

```
salt '*' virt.migrate <vm name> <target hypervisor> [live] [port] [node] [ssl]
↪ [change_home_server]
```

Optional values:

live Use live migration
port Use a specified port
node Use specified NUMA node on target
ssl use ssl connection for migration
change_home_server change home server for managed domains

`salt.modules.xapi.node_info()`
Return a dict with information about this node

CLI Example:

```
salt '*' virt.node_info
```

`salt.modules.xapi.pause(vm_)`
Pause the named vm

CLI Example:

```
salt '*' virt.pause <vm name>
```

`salt.modules.xapi.reboot(vm_)`
Reboot a domain via ACPI request

CLI Example:

```
salt '*' virt.reboot <vm name>
```

`salt.modules.xapi.reset(vm_)`
Reset a VM by emulating the reset button on a physical machine

CLI Example:

```
salt '*' virt.reset <vm name>
```

`salt.modules.xapi.resume(vm_)`
Resume the named vm

CLI Example:

```
salt '*' virt.resume <vm name>
```

`salt.modules.xapi.setmem(vm_, memory)`
Changes the amount of memory allocated to VM.

Memory is to be specified in MB

CLI Example:

```
salt '*' virt.setmem myvm 768
```

`salt.modules.xapi.setvcpus(vm_, vcpus)`
Changes the amount of vcpus allocated to VM.
vcpus is an int representing the number to be assigned

CLI Example:

```
salt '*' virt.setvcpus myvm 2
```

`salt.modules.xapi.shutdown(vm_)`
Send a soft shutdown signal to the named vm

CLI Example:

```
salt '*' virt.shutdown <vm name>
```

`salt.modules.xapi.start`(*config_*)

Start a defined domain

CLI Example:

```
salt '*' virt.start <path to Xen cfg file>
```

`salt.modules.xapi.stop`(*vm_*)

Hard power down the virtual machine, this is equivalent to pulling the power

CLI Example:

```
salt '*' virt.stop <vm name>
```

`salt.modules.xapi.vcpu_pin`(*vm_*, *vcpu*, *cpus*)

Set which CPUs a VCPU can use.

CLI Example:

```
salt 'foo' virt.vcpu_pin domU-id 2 1
salt 'foo' virt.vcpu_pin domU-id 2 2-6
```

`salt.modules.xapi.vm_cputime`(*vm_=None*)

Return cputime used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'cputime' <int>
    'cputime_percent' <int>
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_cputime
```

`salt.modules.xapi.vm_diskstats`(*vm_=None*)

Return disk usage counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs' : 0,
    'io_write_kbs' : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_diskstats
```

`salt.modules.xapi.vm_info` (*vm_=None*)

Return detailed information about the vms.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_info
```

`salt.modules.xapi.vm_netstats` (*vm_=None*)

Return combined network counters used by the vms on this hyper in a list of dicts:

```
[
  'your-vm': {
    'io_read_kbs'           : 0,
    'io_total_read_kbs'    : 0,
    'io_total_write_kbs'   : 0,
    'io_write_kbs'         : 0
  },
  ...
]
```

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_netstats
```

`salt.modules.xapi.vm_state` (*vm_=None*)

Return list of all the vms and their state.

If you pass a VM name in as an argument then it will return info for just the named VM, otherwise it will return all VMs.

CLI Example:

```
salt '*' virt.vm_state <vm name>
```

20.9.468 salt.modules.xbpspkg module

Package support for XBPS package manager (used by VoidLinux)

New in version 2016.11.0.

`salt.modules.xbpspkg.add_repo` (*repo*, *conf*file='/usr/share/xbps.d/15-saltstack.conf')

Add an XBPS repository to the system.

repo url of repo to add (persistent).

conffile path to xbps conf file to add this repo default: /usr/share/xbps.d/15-saltstack.conf

CLI Examples:

```
salt '*' pkg.add_repo <repo url> [conf
```

`salt.modules.xbpspkg.available_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.del_repo(repo)`

Remove an XBPS repository from the system.

repo url of repo to remove (persistent).

CLI Examples:

```
salt '*' pkg.del_repo <repo url>
```

`salt.modules.xbpspkg.get_repo(repo, **kwargs)`

Display information about the repo.

CLI Examples:

```
salt '*' pkg.get_repo 'repo-url'
```

`salt.modules.xbpspkg.install(name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, **kwargs)`

Install the passed package

name The name of the package to be installed.

refresh Whether or not to refresh the package database before installing.

fromrepo Specify a package repository (url) to install from.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list.

CLI Example:

```
salt '*' pkg.install pkgs='["foo","bar"]'
```

sources A list of packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.deb"}, {"bar": "salt://bar.
↳ deb"}]
```

Return a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.install <package name>
```

`salt.modules.xbpspkg.latest_version(*names, **kwargs)`

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.xbpspkg.list_pkgs` (*versions_as_list=False*, ***kwargs*)

List the packages currently installed as a dict:

```
{'<package_name>': '<version>'}
```

CLI Example:

```
salt '*' pkg.list_pkgs
```

`salt.modules.xbpspkg.list_repos`()

List all repos known by XBPS

CLI Example:

```
salt '*' pkg.list_repos
```

`salt.modules.xbpspkg.list_upgrades` (*refresh=True*)

Check whether or not an upgrade is available for all packages

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.xbpspkg.refresh_db`()

Update list of available packages from installed repos

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.xbpspkg.remove` (*name=None*, *pkgs=None*, *recursive=True*, ***kwargs*)

name The name of the package to be deleted.

recursive Also remove dependent packages (not required elsewhere). Default mode: enabled.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

Returns a list containing the removed packages.

CLI Example:

```
salt '*' pkg.remove <package name> [recursive=False]
salt '*' pkg.remove <package1>,<package2>,<package3> [recursive=False]
salt '*' pkg.remove pkgs='["foo", "bar"]' [recursive=False]
```

`salt.modules.xbpspkg.upgrade` (*refresh=True*)

Run a full system upgrade

refresh Whether or not to refresh the package database before installing. Default is *True*.

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
```

`salt.modules.xbpspkg.upgrade_available(name)`

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.xbpspkg.version(*names, **kwargs)`

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

20.9.469 salt.modules.xfs

Module for managing XFS file systems.

`salt.modules.xfs.defragment(device)`

Defragment mounted XFS filesystem. In order to mount a filesystem, device should be properly mounted and writable.

CLI Example:

```
salt '*' xfs.defragment /dev/sda1
```

`salt.modules.xfs.devices()`

Get known XFS formatted devices on the system.

CLI Example:

```
salt '*' xfs.devices
```

`salt.modules.xfs.dump(device, destination, level=0, label=None, noerase=None)`

Dump filesystem device to the media (file, tape etc).

Required parameters:

- **device:** XFS device, content of which to be dumped.
- **destination:** Specifies a dump destination.

Valid options are:

- **label:** Label of the dump. Otherwise automatically generated label is used.
- **level:** Specifies a dump level of 0 to 9.
- **noerase:** Pre-erase media.

Other options are not used in order to let `xfsdump` use its default values, as they are most optimal. See the `xfsdump(8)` manpage for a more complete description of these options.

CLI Example:

```
salt '*' xfs.dump /dev/sda1 /detination/on/the/client
salt '*' xfs.dump /dev/sda1 /detination/on/the/client label='Company accountancy'
salt '*' xfs.dump /dev/sda1 /detination/on/the/client noerase=True
```

`salt.modules.xfs.estimate` (*path*)

Estimate the space that an XFS filesystem will take. For each directory estimate the space that directory would take if it were copied to an XFS filesystem. Estimation does not cross mount points.

CLI Example:

```
salt '*' xfs.estimate /path/to/file
salt '*' xfs.estimate /path/to/dir/*
```

`salt.modules.xfs.info` (*device*)

Get filesystem geometry information.

CLI Example:

```
salt '*' xfs.info /dev/sda1
```

`salt.modules.xfs.inventory` ()

Display XFS dump inventory without restoration.

CLI Example:

```
salt '*' xfs.inventory
```

`salt.modules.xfs.mkfs` (*device*, *label=None*, *ssize=None*, *noforce=None*, *bso=None*, *gmo=None*, *ino=None*, *lso=None*, *rso=None*, *nmo=None*, *dso=None*)

Create a file system on the specified device. By default wipes out with force.

General options:

- **label**: Specify volume label.
- **ssize**: Specify the fundamental sector size of the filesystem.
- **noforce**: Do not force create filesystem, if disk is already formatted.

Filesystem geometry options:

- **bso**: Block size options.
- **gmo**: Global metadata options.
- **dso**: **Data section options**. These options specify the location, size, and other parameters of the data section of the filesystem.
- **ino**: Inode options to specify the inode size of the filesystem, and other inode allocation parameters.
- **lso**: Log section options.
- **nmo**: Naming options.
- **rso**: Realtime section options.

See the `mkfs.xfs(8)` manpage for a more complete description of corresponding options description.

CLI Example:

```
salt '*' xfs.mkfs /dev/sda1
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' noforce=True
salt '*' xfs.mkfs /dev/sda1 dso='su=32k,sw=6' lso='logdev=/dev/sda2,size=10000b'
```

`salt.modules.xfs.modify` (*device*, *label=None*, *lazy_counting=None*, *uuid=None*)

Modify parameters of an XFS filesystem.

CLI Example:

```
salt '*' xfs.modify /dev/sda1 label='My backup' lazy_counting=False
salt '*' xfs.modify /dev/sda1 uuid=False
salt '*' xfs.modify /dev/sda1 uuid=True
```

`salt.modules.xfs.prune_dump` (*sessionid*)

Prunes the dump session identified by the given session id.

CLI Example:

```
salt '*' xfs.prune_dump b74a3586-e52e-4a4a-8775-c3334fa8ea2c
```

20.9.470 salt.modules.xmpp

Module for Sending Messages via XMPP (a.k.a. Jabber)

New in version 2014.1.0.

depends

- sleekxmpp>=1.3.1
- pyasn1
- pyasn1-modules
- dnspython

configuration This module can be used by either passing a jid and password directly to `send_message`, or by specifying the name of a configuration profile in the minion config, minion pillar, or master config.

For example:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/resourcename
  xmpp.password: verybadpass
```

The resourcename refers to the resource that is using this account. It is user-definable, and optional. The following configurations are both valid:

```
my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org/salt
  xmpp.password: verybadpass

my-xmpp-login:
  xmpp.jid: myuser@jabber.example.org
  xmpp.password: verybadpass
```

class salt.modules.xmpp.**SendMsgBot**(jid, password, recipient, msg)

classmethod **create_multi**(jid, password, msg, recipients=None, rooms=None, nick='SaltStack Bot')

Alternate constructor that accept multiple recipients and rooms

start(event)

class salt.modules.xmpp.**SleekXMPPMUC**(name="")

filter(record)

Determine if the specified record is to be logged.

Is the specified record to be logged? Returns 0 for no, nonzero for yes. If deemed appropriate, the record may be modified in-place.

salt.modules.xmpp.**send_msg**(recipient, message, jid=None, password=None, profile=None)

Send a message to an XMPP recipient. Designed for use in states.

CLI Examples:

```
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
↳ profile='my-xmpp-account'
xmpp.send_msg 'admins@xmpp.example.com' 'This is a salt module test'
↳ jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

`salt.modules.xmpp.send_msg_multi`(*message*, *recipients=None*, *rooms=None*, *jid=None*, *password=None*, *nick='SaltStack Bot'*, *profile=None*)

Send a message to an XMPP recipient, support send message to multiple recipients or chat room.

CLI Examples:

```
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳ 'secret@conference.xmpp.example.com'] 'This is a salt module test'
↳ profile='my-xmpp-account'
xmpp.send_msg recipients=['admins@xmpp.example.com'] rooms=[
↳ 'secret@conference.xmpp.example.com'] 'This is a salt module test'
↳ jid='myuser@xmpp.example.com/salt' password='verybadpass'
```

20.9.471 salt.modules.yumpkg

Support for YUM/DNF

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

Note: DNF is fully supported as of version 2015.5.10 and 2015.8.4 (partial support for DNF was initially added in 2015.8.0), and DNF is used automatically in place of YUM in Fedora 22 and newer.

class `salt.modules.yumpkg.AvailablePackages`(*args, **kwargs)

`salt.modules.yumpkg.clean_metadata`(**kwargs)

New in version 2014.1.0.

Cleans local yum metadata. Functionally identical to `refresh_db()`.

CLI Example:

```
salt '*' pkg.clean_metadata
```

`salt.modules.yumpkg.del_repo`(*repo*, *basedir=None*, **kwargs)

Delete a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

If the `.repo` file in which the repo exists does not contain any other repo configuration, the file itself will be deleted.

CLI Examples:

```
salt '*' pkg.del_repo myrepo
salt '*' pkg.del_repo myrepo basedir=/path/to/dir
salt '*' pkg.del_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.diff(*paths)`

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters `path` – Full path to the installed file

Returns Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

`salt.modules.yumpkg.download(*packages)`

New in version 2015.5.0.

Download packages to the local disk. Requires `yumdownloader` from `yum-utils` package.

Note: `yum-utils` will already be installed on the minion if the package was installed from the Fedora / EPEL repositories.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.yumpkg.file_dict(*packages)`

New in version 2014.1.0.

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.file_list(*packages)`

New in version 2014.1.0.

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.yumpkg.get_repo(name, basedir=None, **kwargs)`

Display a repo from <basedir> (default basedir: all dirs in `reposdir` yum option).

CLI Examples:

```
salt '*' pkg.get_repo myrepo
salt '*' pkg.get_repo myrepo basedir=/path/to/dir
salt '*' pkg.get_repo myrepo basedir=/path/to/dir,/path/to/another/dir
```

`salt.modules.yumpkg.group_diff(name)`

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: Environment groups are now supported. The key names have been renamed, similar to the changes made in *pkg.group_info*.

Lists which of a group's packages are installed and which are not installed

CLI Example:

```
salt '*' pkg.group_diff 'Perl Support'
```

`salt.modules.yumpkg.group_info`(*name*, *expand=False*)

New in version 2014.1.0.

Changed in version 2016.3.0,2015.8.4,2015.5.10: The return data has changed. A new key `type` has been added to distinguish environment groups from package groups. Also, keys for the group name and group ID have been added. The mandatory `packages`, `optional packages`, and `default packages` keys have been renamed to `mandatory`, `optional`, and `default` for accuracy, as environment groups include other groups, and not packages. Finally, this function now properly identifies conditional packages.

Lists packages belonging to a certain group

name Name of the group to query

expand [False] If the specified group is an environment group, then the group will be expanded and the return data will include package names instead of group names.

New in version 2016.3.0.

CLI Example:

```
salt '*' pkg.group_info 'Perl Support'
```

`salt.modules.yumpkg.group_install`(*name*, *skip=()*, *include=()*, ***kwargs*)

New in version 2014.1.0.

Install the passed package group(s). This is basically a wrapper around *pkg.install*, which performs package group resolution for the user. This function is currently considered experimental, and should be expected to undergo changes.

name Package group to install. To install more than one group, either use a comma-separated list or pass the value as a python list.

CLI Examples:

```
salt '*' pkg.group_install 'Group 1'
salt '*' pkg.group_install 'Group 1,Group 2'
salt '*' pkg.group_install '["Group 1", "Group 2"]'
```

skip Packages that would normally be installed by the package group ("default" packages), which should not be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' skip='foo,bar'
salt '*' pkg.group_install 'My Group' skip='["foo", "bar"]'
```

include Packages which are included in a group, which would not normally be installed by a yum groupinstall ("optional" packages). Note that this will not enforce group membership; if you include packages which are not members of the specified groups, they will still be installed. Can be passed either as a comma-separated list or a python list.

CLI Examples:

```
salt '*' pkg.group_install 'My Group' include='foo,bar'
salt '*' pkg.group_install 'My Group' include='["foo", "bar"]'
```

Note: Because this is essentially a wrapper around `pkg.install`, any argument which can be passed to `pkg.install` may also be included here, and it will be passed along wholesale.

`salt.modules.yumpkg.group_list()`

New in version 2014.1.0.

Lists all groups known by yum on this system

CLI Example:

```
salt '*' pkg.group_list
```

`salt.modules.yumpkg.hold(name=None, pkgs=None, sources=None, normalize=True, **kwargs)`

New in version 2014.7.0.

Version-lock packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
 - On RHEL 6 & 7: `yum-plugin-versionlock`
 - On Fedora: `python-dnf-plugins-extras-versionlock`
-

name The name of the package to be held.

Multiple Package Options:

pkgs A list of packages to hold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.hold <package name>
salt '*' pkg.hold pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.info_installed(*names)`

New in version 2015.8.1.

Return the information of the named package(s), installed on the system.

CLI example:

```
salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.install(name=None, refresh=False, skip_verify=False, pkgs=None, sources=None, downloadonly=False, reinstall=False, normalize=True, update_holds=False, saltenv='base', ignore_epoch=False, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd` >=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to clean the yum database before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either "pkgs" or "sources" is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the "sources" option.

32-bit packages can be installed on 64-bit systems by appending the architecture designation (.i686, .i586, etc.) to the end of the package name.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh Whether or not to update the yum database before executing.

reinstall Specifying `reinstall=True` will use `yum reinstall` rather than `yum install` for requested packages that are already installed.

If a version is specified with the requested package, then `yum reinstall` will only be used if the installed version matches the requested version.

Works with `sources` when the package header of the source can be matched to the name and version of an installed package.

New in version 2014.7.0.

skip_verify Skip the GPG verification check (e.g., `--nogpgcheck`)

downloadonly Only download the packages, do not install.

version Install a specific version of the package, e.g. 1.2.3-4.el5. Ignored if "pkgs" or "sources" is passed.

Changed in version 2018.3.0: version can now contain comparison operators (e.g. `>1.2.3`, `<=2.0`, etc.)

update_holds [False] If True, and this function would update the package version, any packages held using the yum/dnf "versionlock" plugin will be unheld so that they can be updated. Otherwise, if this function attempts to update a held package, the held package(s) will be skipped and an error will be raised.

New in version 2016.11.0.

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.0.

ignore_epoch [False] Only used when the version of a package is specified using a comparison operator (e.g. `>4.1`). If set to True, then the epoch will be ignored when comparing the currently-installed version to the desired version.

New in version 2018.3.0.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version.

CLI Examples:

```
salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': "1.2.3-4.el5"}]
```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources='[{"foo": "salt://foo.rpm"}, {"bar": "salt://
↳bar.rpm"}]'
```

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.install gpfs.gplbin-2.6.32-279.31.1.el6.x86_64
↳normalize=False
```

New in version 2014.7.0.

diff_attr: If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},

  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If an attribute list in `diff_attr` is specified, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},

  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}}
```

salt.modules.yumpkg.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty string will be returned for that package.

A specific repo can be requested using the `fromrepo` keyword argument, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package name> fromrepo=epel-testing
salt '*' pkg.latest_version <package name> disableexcludes=main
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.list_downloaded()`

New in version 2017.7.0.

List prefetched packages downloaded by Yum in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

`salt.modules.yumpkg.list_holds(pattern='[\\w+](?:[-][^~]+)*', full=True)`

Changed in version 2016.3.0,2015.8.4,2015.5.10: Function renamed from `pkg.get_locked_pkgs` to `pkg.list_holds`.

List information on locked packages

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
 - On RHEL 6 & 7: `yum-plugin-versionlock`
 - On Fedora: `python-dnf-plugins-extras-versionlock`
-

pattern `[w+(?:[-][^~]+)*]` Regular expression used to match the package name

full `[True]` Show the full hold definition including version and epoch. Set to `False` to return just the name of the package(s) being held.

CLI Example:

```
salt '*' pkg.list_holds
salt '*' pkg.list_holds full=False
```

`salt.modules.yumpkg.list_installed_patches()`

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.yumpkg.list_patches(refresh=False)`

New in version 2017.7.0.

List all known advisory patches from available repos.

refresh force a refresh if set to `True`. If set to `False` (default) it depends on yum if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.yumpkg.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{'<package_name>': '<version>[,<version>...']}
```

versions_as_list: If set to true, the versions are provided as a list

```
{'package_name': ['<version>', '<version>']}
```

attr: If a list of package attributes is specified, returned value will contain them in addition to version, eg:

```
{'package_name': [{'version' : 'version', 'arch' : 'arch'}]}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['version', 'arch']
```

`salt.modules.yumpkg.list_repo_pkgs(*args, **kwargs)`

New in version 2014.1.0.

Changed in version 2014.7.0: All available versions of each package are now returned. This required a slight modification to the structure of the return dict. The return data shown below reflects the updated return dict structure. Note that packages which are version-locked using `pkg.hold` will only show the currently-installed version, as locking a package will make other versions appear unavailable to yum/dnf.

Changed in version 2017.7.0: By default, the versions for each package are no longer organized by repository. To get results organized by repository, use `byrepo=True`.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

Warning: Running this function on RHEL/CentOS 6 and earlier will be more resource-intensive, as the version of yum that ships with older RHEL/CentOS has no yum subcommand for listing packages from a repository. Thus, a `yum list installed` and `yum list available` are run, which generates a lot of output, which must then be analyzed to determine which package information to include in the return data.

This function can be helpful in discovering the version or repo to specify in a `pkg.installed` state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If `byrepo` is set to `True`, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.1.2-15.el6_5.2',
           '4.1.2-15.el6_5.1',
           '4.1.2-15.el6_4'],
  'kernel': ['2.6.32-431.29.2.el6',
             '2.6.32-431.23.3.el6',
             '2.6.32-431.20.5.el6',
             '2.6.32-431.20.3.el6',
             '2.6.32-431.17.1.el6',
             '2.6.32-431.11.2.el6',
             '2.6.32-431.5.1.el6',
```

(continues on next page)

(continued from previous page)

```

        '2.6.32-431.3.1.el6',
        '2.6.32-431.1.2.0.1.el6',
        '2.6.32-431.el6']
    }
    # With byrepo=True
    {
        'base': {
            'bash': ['4.1.2-15.el6_4'],
            'kernel': ['2.6.32-431.el6']
        },
        'updates': {
            'bash': ['4.1.2-15.el6_5.2', '4.1.2-15.el6_5.1'],
            'kernel': ['2.6.32-431.29.2.el6',
                '2.6.32-431.23.3.el6',
                '2.6.32-431.20.5.el6',
                '2.6.32-431.20.3.el6',
                '2.6.32-431.17.1.el6',
                '2.6.32-431.11.2.el6',
                '2.6.32-431.5.1.el6',
                '2.6.32-431.3.1.el6',
                '2.6.32-431.1.2.0.1.el6']
        }
    }
}

```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

enablerepo (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., yum --enablerepo='somerepo')

New in version 2017.7.0.

disablerepo (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., yum --disablerepo='somerepo')

New in version 2017.7.0.

byrepo [False] When True, the return data for each package will be organized by repository.

New in version 2017.7.0.

cacheonly [False] When True, the repo information will be retrieved from the cached repo metadata. This is equivalent to passing the -C option to yum/dnf.

New in version 2017.7.0.

CLI Examples:

```

salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'samba4*' fromrepo=base,updates
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True

```

salt.modules.yumpkg.list_repos (*basedir=None*)

Lists all repos in <basedir> (default: all dirs in *reposdir* yum option).

CLI Example:

```

salt '*' pkg.list_repos
salt '*' pkg.list_repos basedir=/path/to/dir
salt '*' pkg.list_repos basedir=/path/to/dir,/path/to/another/dir

```

`salt.modules.yumpkg.list_upgrades` (*refresh=True, **kwargs*)

Check whether or not an upgrade is available for all packages

The `fromrepo`, `enablerepo`, and `disablerepo` arguments are supported, as used in `pkg` states, and the `disableexcludes` option is also supported.

New in version 2014.7.0: Support for the `disableexcludes` option

CLI Example:

```
salt '*' pkg.list_upgrades
```

`salt.modules.yumpkg.mod_repo` (*repo, basedir=None, **kwargs*)

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo name by which the yum refers to the repo

name a human-readable name for the repo

baseurl the URL for yum to reference

mirrorlist the URL for yum to reference

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a baseurl can only be deleted if a mirrorlist is specified (or vice versa).

CLI Examples:

```
salt '*' pkg.mod_repo reponame enabled=1 gpgcheck=1
salt '*' pkg.mod_repo reponame basedir=/path/to/dir enabled=1
salt '*' pkg.mod_repo reponame baseurl= mirrorlist=http://host.com/
```

`salt.modules.yumpkg.modified` (**packages, **flags*)

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

size Include only files where size changed.

mode Include only files which file's mode has been changed.

checksum Include only files which MD5 checksum has been changed.

device Include only files which major and minor numbers has been changed.

symlink Include only files which are symbolic link contents.

owner Include only files where owner has been changed.

group Include only files where group has been changed.

time Include only files where modification time of the file has been changed.

capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.yumpkg.normalize_name` (*name*)

Strips the architecture from the specified package name, if necessary. Circumstances where this would be done include:

- If the arch is 32 bit and the package name ends in a 32-bit arch.
- If the arch matches the OS arch, or is noarch.

CLI Example:

```
salt '*' pkg.normalize_name zsh.x86_64
```

`salt.modules.yumpkg.owner(*paths)`

New in version 2014.7.0.

Return the name of the package that owns the file. Multiple file paths can be passed. Like `pkg.version`, if a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.yumpkg.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `yum/dnf` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Package purges are not supported by yum, this function is identical to `pkg.remove`.

name The name of the package to be purged

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>, <package2>, <package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.yumpkg.refresh_db(**kwargs)`

Check the yum repos for updated packages

Returns:

- True: Updates are available
- False: An error occurred
- None: No updates are available

repo Refresh just the specified repo

disablerepo Do not refresh the specified repo

enablerepo Refresh a disabled repo using this option

branch Add the specified branch when refreshing

disableexcludes Disable the excludes defined in your config files. Takes one of three options: - `all` - disable all excludes - `main` - disable excludes defined in `[main]` in `yum.conf` - `repo id` - disable excludes defined for that repo

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.yumpkg.remove` (*name=None, pkgs=None, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages

name The name of the package to be removed

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>, <package2>, <package3>
salt '*' pkg.remove pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.unhold` (*name=None, pkgs=None, sources=None, **kwargs*)

New in version 2014.7.0.

Remove version locks

Note: Requires the appropriate `versionlock` plugin package to be installed:

- On RHEL 5: `yum-versionlock`
 - On RHEL 6 & 7: `yum-plugin-versionlock`
 - On Fedora: `python-dnf-plugins-extras-versionlock`
-

name The name of the package to be unheld

Multiple Package Options:

pkgs A list of packages to unhold. Must be passed as a python list. The `name` parameter will be ignored if this option is passed.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.unhold <package name>
salt '*' pkg.unhold pkgs=['foo', 'bar']
```

`salt.modules.yumpkg.upgrade` (*name=None, pkgs=None, refresh=True, skip_verify=False, normalize=True, **kwargs*)

Run a full system upgrade (a `yum upgrade` or `dnf upgrade`), or upgrade specified packages. If the packages aren't installed, they will not be installed.

Changed in version 2014.7.0.

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any yum/dnf commands spawned by Salt when the `salt-minion`

service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a yum upgrade

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade name=openssl
```

Repository Options:

fromrepo Specify a package repository (or repositories) from which to install. (e.g., `yum --disablerepo='*' --enablerepo='somerepo'`)

enablerepo (ignored if **fromrepo** is specified) Specify a disabled package repository (or repositories) to enable. (e.g., `yum --enablerepo='somerepo'`)

disablerepo (ignored if **fromrepo** is specified) Specify an enabled package repository (or repositories) to disable. (e.g., `yum --disablerepo='somerepo'`)

disableexcludes Disable exclude from main, for a repo or for everything. (e.g., `yum --disableexcludes='main'`)

New in version 2014.7.

name The name of the package to be upgraded. Note that this parameter is ignored if "pkgs" is passed.

32-bit packages can be upgraded on 64-bit systems by appending the architecture designation (`.i686`, `.i586`, etc.) to the end of the package name.

Warning: if you forget 'name=' and run `pkg.upgrade openssl`, ALL packages are upgraded. This will be addressed in next releases.

CLI Example:

```
salt '*' pkg.upgrade name=openssl
```

New in version 2016.3.0.

pkgs A list of packages to upgrade from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. If the package was not already installed on the system, it will not be installed.

CLI Examples:

```
salt '*' pkg.upgrade pkgs=['foo', 'bar']
salt '*' pkg.upgrade pkgs=['foo', {'bar': '1.2.3-4.el5'}]
```

New in version 2016.3.0.

normalize [True] Normalize the package name by removing the architecture. This is useful for poorly created packages which might include the architecture as an actual part of the name such as kernel modules which match a specific kernel version.

```
salt -G role:nsd pkg.upgrade gpgs.gplbin-2.6.32-279.31.1.el6.x86_64
→normalize=False
```

New in version 2016.3.0.

Note: To add extra arguments to the yum upgrade command, pass them as key word arguments. For arguments without assignments, pass True

```
salt '*' pkg.upgrade security=True exclude='kernel*'
```

`salt.modules.yumpkg.upgrade_available`(*name*)

Check whether or not an upgrade is available for a given package

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.yumpkg.verify`(**names*, ***kwargs*)

New in version 2014.1.0.

Runs an rpm -Va on a system, and returns the results in a dict

Pass options to modify rpm verify behavior using the `verify_options` keyword argument

Files with an attribute of config, doc, ghost, license or readme in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
salt '*' pkg.verify 'httpd postfix' verify_options=['nodeps','nosize']
```

`salt.modules.yumpkg.version`(**names*, ***kwargs*)

Returns a string representing the package version or an empty string if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.yumpkg.version_cmp`(*pkg1*, *pkg2*, *ignore_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if `pkg1 < pkg2`, 0 if `pkg1 == pkg2`, and 1 if `pkg1 > pkg2`. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

20.9.472 salt.modules.zabbix module

Support for Zabbix

optdepends

- zabbix server

configuration This module is not usable until the zabbix user and zabbix password are specified either in a pillar or in the minion's config file. Zabbix url should be also specified.

```
zabbix.user: Admin
zabbix.password: mypassword
zabbix.url: http://127.0.0.1/zabbix/api_jsonrpc.php
```

Connection arguments from the minion config file can be overridden on the CLI by using arguments with `_connection_` prefix.

```
zabbix.apiinfo_version _connection_user=Admin _connection_
→password=zabbix _connection_url=http://host/zabbix/
```

codeauthor Jiri Kotlin <jiri.kotlin@ultimum.io>

`salt.modules.zabbix.apiinfo_version(**connection_args)`

Retrieve the version of the Zabbix API.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success string with Zabbix API version, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.apiinfo_version
```

`salt.modules.zabbix.host_create(host, groups, interfaces, **connection_args)`

New in version 2016.3.0.

Create new host

Note: This function accepts all standard host properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **host** – technical name of the host
- **groups** – groupids of host groups to add the host to
- **interfaces** – interfaces to be created for the host
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)
- **visible_name** – string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

return: ID of the created host.

CLI Example:

```
salt '*' zabbix.host_create technicalname 4
interfaces='{type: 1, main: 1, useip: 1, ip: "192.168.3.1", dns: "", port: 10050}'
visible_name='Host Visible Name'
```

`salt.modules.zabbix.host_delete`(*hostids*, ***connection_args*)

Delete hosts.

New in version 2016.3.0.

Parameters

- **hostids** – Hosts (hostids) to delete.
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_delete 10106
```

`salt.modules.zabbix.host_exists`(*host=None*, *hostid=None*, *name=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one host that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **host** – technical name of the host
- **hostids** – Hosts (hostids) to delete.
- **name** – visible name of the host
- **node** – name of the node the hosts must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the node the hosts must belong to (zabbix API < 2.4)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted hosts, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.host_exists 'Zabbix server'
```

`salt.modules.zabbix.host_get`(*host=None*, *name=None*, *hostids=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve hosts according to the given parameters

Note: This function accepts all optional `host.get` parameters: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **host** – technical name of the host
- **name** – visible name of the host
- **hostids** – ids of the hosts
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with convenient hosts details, False if no host found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_get 'Zabbix server'

`salt.modules.zabbix.host_list(**connection_args)`

Retrieve all hosts.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with details about hosts, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_list

`salt.modules.zabbix.host_update(hostid, **connection_args)`

New in version 2016.3.0.

Update existing hosts

Note: This function accepts all standard host and host.update properties: keyword argument names differ depending on your zabbix version, see the documentation for [host objects](#) and the documentation for [updating hosts](#).

Parameters

- **hostid** – ID of the host to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)
- **visible_name** – string with visible name of the host, use 'visible_name' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns ID of the updated host.

CLI Example: .. code-block:: bash
salt '*' zabbix.host_update 10084 name='Zabbix server2'

`salt.modules.zabbix.hostgroup_create(name, **connection_args)`

New in version 2016.3.0.

Create a host group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host group.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_create MyNewGroup
```

```
salt.modules.zabbix.hostgroup_delete(hostgroupids, **connection_args)
```

Delete the host group.

New in version 2016.3.0.

Parameters

- **hostgroupids** – IDs of the host groups to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the deleted host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_delete 23
```

```
salt.modules.zabbix.hostgroup_exists(name=None, groupid=None, node=None, nodeids=None,
                                     **connection_args)
```

Checks if at least one host group that matches the given filter criteria exists.

New in version 2016.3.0.

Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to (zabbix API < 2.4)
- **nodeids** – IDs of the nodes the host groups must belong to (zabbix API < 2.4)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one host group exists, False if not or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_exists MyNewGroup
```

```
salt.modules.zabbix.hostgroup_get(name=None, groupids=None, hostids=None,
                                  **connection_args)
```

New in version 2016.3.0.

Retrieve host groups according to the given parameters

Note: This function accepts all standard `hostgroup.get` properties: keyword argument names differ depending

on your zabbix version, see [here](#).

Parameters

- **name** – names of the host groups
- **groupid** – host group IDs
- **node** – name of the node the host groups must belong to
- **nodeids** – IDs of the nodes the host groups must belong to
- **hostids** – return only host groups that contain the given hosts
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host groups details, False if no convenient host group found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_get MyNewGroup
```

```
salt.modules.zabbix.hostgroup_list(**connection_args)
```

Retrieve all host groups.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details about host groups, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_list
```

```
salt.modules.zabbix.hostgroup_update(groupid, name=None, **connection_args)
```

New in version 2016.3.0.

Update existing hosts group

Note: This function accepts all standard host group properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **groupid** – ID of the host group to update
- **name** – name of the host group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of updated host groups.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostgroup_update 24 name='Renamed Name'
```

`salt.modules.zabbix.hostinterface_create`(*hostid*, *ip*, *dns=""*, *main=1*, *type=1*, *useip=1*, *port=None*, ***connection_args*)

New in version 2016.3.0.

Create new host interface

Note: This function accepts all standard host group interface: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **hostid** – ID of the host the interface belongs to
- **ip** – IP address used by the interface
- **dns** – DNS name used by the interface
- **main** – whether the interface is used as default on the host (0 - not default, 1 - default)
- **port** – port number used by the interface
- **type** – Interface type (1 - agent; 2 - SNMP; 3 - IPMI; 4 - JMX)
- **useip** – Whether the connection should be made via IP (0 - connect using host DNS name; 1 - connect using host IP address for this host interface)
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the created host interface, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_create 10105 192.193.194.197
```

`salt.modules.zabbix.hostinterface_delete`(*interfaceids*, ***connection_args*)

Delete host interface

New in version 2016.3.0.

Parameters

- **interfaceids** – IDs of the host interfaces to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of deleted host interfaces, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.hostinterface_delete 50
```

`salt.modules.zabbix.hostinterface_get`(*hostids*, ***connection_args*)

New in version 2016.3.0.

Retrieve host groups according to the given parameters

Note: This function accepts all standard `hostinterface.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **hostids** – Return only host interfaces used by the given hosts.

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with host interfaces details, False if no convenient host interfaces found or on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_get 101054

`salt.modules.zabbix.hostinterface_update`(*interfaceid*, ***connection_args*)

New in version 2016.3.0.

Update host interface

Note: This function accepts all standard hostinterface: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **interfaceid** – ID of the hostinterface to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns ID of the updated host interface, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.hostinterface_update 6 ip=0.0.0.2

`salt.modules.zabbix.mediatype_create`(*name*, *mediatype*, ***connection_args*)

Create new mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **mediatype** – media type - 0: email, 1: script, 2: sms, 3: Jabber, 100: Ez Texting
- **exec_path** – exec path - Required for script and Ez Texting types, see Zabbix API docs
- **gsm_modem** – exec path - Required for sms type, see Zabbix API docs
- **smtp_email** – email address from which notifications will be sent, required for email type
- **smtp_helo** – SMTP HELO, required for email type
- **smtp_server** – SMTP server, required for email type
- **status** – whether the media type is enabled - 0: enabled, 1: disabled
- **username** – authentication user, required for Jabber and Ez Texting types
- **passwd** – authentication password, required for Jabber and Ez Texting types
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)

- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

return: ID of the created mediatype.

CLI Example:

```
salt '*' zabbix.mediatype_create 'Email' 0 smtp_email='noreply@example.com'
smtp_server='mailserver.example.com' smtp_helo='zabbix.example.com'
```

`salt.modules.zabbix.mediatype_delete` (*mediatypeids*, ***connection_args*)

Delete mediatype

Parameters

- **interfaceids** – IDs of the mediatypes to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns ID of deleted mediatype, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.mediatype_delete 3
```

`salt.modules.zabbix.mediatype_get` (*name=None*, *mediatypeids=None*, ***connection_args*)

Retrieve mediatypes according to the given parameters.

Parameters

- **name** – Name or description of the mediatype
- **mediatypeids** – ids of the mediatypes
- **connection_args** (*optional*) – `_connection_user`: zabbix user (can also be set in opts or pillar, see module’s docstring) `_connection_password`: zabbix password (can also be set in opts or pillar, see module’s docstring) `_connection_url`: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional mediatype.get parameters: keyword argument names differ depending on your zabbix version, see:

<https://www.zabbix.com/documentation/2.2/manual/api/reference/mediatype/get>

Returns Array with mediatype details, False if no mediatype found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.mediatype_get name='Email' salt '*' zabbix.mediatype_get mediatypeids="[1, '2', '3']"
```

`salt.modules.zabbix.mediatype_update` (*mediatypeid*, *name=False*, *mediatype=False*, ***connection_args*)

Update existing mediatype

Note: This function accepts all standard mediatype properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **mediatypeid** – ID of the mediatype to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)

- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns IDs of the updated mediatypes, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usergroup_update 8 name="Email update"
```

`salt.modules.zabbix.run_query` (*method*, *params*, ***connection_args*)

Send Zabbix API call

Parameters

- **method** – actual operation to perform via the API
- **params** – parameters required for specific method
- **connection_args** (*optional*) – **_connection_user**: zabbix user (can also be set in opts or pillar, see module’s docstring) **_connection_password**: zabbix password (can also be set in opts or pillar, see module’s docstring) **_connection_url**: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional `template.get` parameters: keyword argument names differ depending on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/>

Returns Response from Zabbix API

CLI Example: .. code-block:: bash

```
salt '*' zabbix.run_query proxy.create '{"host": "zabbixproxy.domain.com", "status": "5"}'
```

`salt.modules.zabbix.template_get` (*name=None*, *host=None*, *templateids=None*, ***connection_args*)

Retrieve templates according to the given parameters.

Parameters

- **host** – technical name of the template
- **name** – visible name of the template
- **hostids** – ids of the templates
- **connection_args** (*optional*) – **_connection_user**: zabbix user (can also be set in opts or pillar, see module’s docstring) **_connection_password**: zabbix password (can also be set in opts or pillar, see module’s docstring) **_connection_url**: url of zabbix frontend (can also be set in opts or pillar, see module’s docstring)

all optional `template.get` parameters: keyword argument names differ depending on your zabbix version, see:

<https://www.zabbix.com/documentation/2.4/manual/api/reference/template/get>

Returns Array with convenient template details, False if no template found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.template_get name='Template OS Linux' salt '*' zabbix.template_get templateids="[10050, 10001]"
```

`salt.modules.zabbix.user_addmedia` (*userids*, *active*, *mediatypeid*, *period*, *sendto*, *severity*, ***connection_args*)

Add new media to multiple users.

New in version 2016.3.0.

Parameters

- **userids** – ID of the user that uses the media
- **active** – Whether the media is enabled (0 enabled, 1 disabled)
- **mediatypeid** – ID of the media type used by the media
- **period** – Time when the notifications can be sent as a time period
- **sendto** – Address, user name or other identifier of the recipient

- **severity** – Trigger severities to send notifications about
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created media.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_addmedia 4 active=0 mediatypeid=1 period='1-7,00:00-24:00'
sendto='support2@example.com' severity=63
```

`salt.modules.zabbix.user_create` (*alias*, *passwd*, *usrgrps*, ***connection_args*)

New in version 2016.3.0.

Create new zabbix user

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **alias** – user alias
- **passwd** – user's password
- **usrgrps** – user groups to add the user to
- **_connection_user** – zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – url of zabbix frontend (can also be set in opts or pillar, see module's docstring)
- **firstname** – string with firstname of the user, use 'firstname' instead of 'name' parameter to not mess with value supplied from Salt sls file.

Returns On success string with id of the created user.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_create james password007 '[7, 12]' firstname='James Bond'
```

`salt.modules.zabbix.user_delete` (*users*, ***connection_args*)

Delete zabbix users.

New in version 2016.3.0.

Parameters

- **users** – array of users (userids) to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns On success array with userids of deleted users.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_delete 15
```

`salt.modules.zabbix.user_deletemedia` (*mediaids*, ***connection_args*)

Delete media by id.

New in version 2016.3.0.

Parameters

- **mediaids** – IDs of the media to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted media, False on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_deletemedia 27
```

`salt.modules.zabbix.user_exists`(*alias*, ***connection_args*)

Checks if user with given alias exists.

New in version 2016.3.0.

Parameters

- **alias** – user alias
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if user exists, else False.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_exists james
```

`salt.modules.zabbix.user_get`(*alias=None*, *userids=None*, ***connection_args*)

Retrieve users according to the given parameters.

New in version 2016.3.0.

Parameters

- **alias** – user alias
- **userids** – return only users with the given IDs
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with details of convenient users, False on failure of if no user found.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.user_get james
```

`salt.modules.zabbix.user_getmedia`(*userids=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve media according to the given parameters

Note: This function accepts all standard `usermedia.get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **userids** – return only media that are used by the given users

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns List of retrieved media, False on failure.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_getmedia

`salt.modules.zabbix.user_list(**connection_args)`
Retrieve all of the configured users.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Array with user details.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_list

`salt.modules.zabbix.user_update(userid, **connection_args)`
New in version 2016.3.0.

Update existing users

Note: This function accepts all standard user properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **userid** – id of the user to update
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module’s docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module’s docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module’s docstring)

Returns Id of the updated user on success.

CLI Example: .. code-block:: bash
salt '*' zabbix.user_update 16 visible_name='James Brown'

`salt.modules.zabbix.usergroup_create(name, **connection_args)`
New in version 2016.3.0.

Create new user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **name** – name of the user group
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the created user groups.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_create GroupName

`salt.modules.zabbix.usergroup_delete` (*usergroupids*, ***connection_args*)

New in version 2016.3.0.

Parameters

- **usergroupids** – IDs of the user groups to delete
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the deleted user groups.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_delete 28

`salt.modules.zabbix.usergroup_exists` (*name=None*, *node=None*, *nodeids=None*, ***connection_args*)

Checks if at least one user group that matches the given filter criteria exists

New in version 2016.3.0.

Parameters

- **name** – names of the user groups
- **node** – name of the node the user groups must belong to (This will override the nodeids parameter.)
- **nodeids** – IDs of the nodes the user groups must belong to
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns True if at least one user group that matches the given filter criteria exists, else False.

CLI Example: .. code-block:: bash
salt '*' zabbix.usergroup_exists Guests

`salt.modules.zabbix.usergroup_get` (*name=None*, *usrgrpids=None*, *userid=None*, ***connection_args*)

New in version 2016.3.0.

Retrieve user groups according to the given parameters

Note: This function accepts all `usergroup_get` properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **name** – names of the user groups
- **usrgrpids** – return only user groups with the given IDs
- **userids** – return only user groups that contain the given users
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with convenient user groups details, False if no user group found or on failure.

CLI Example: .. code-block:: bash
 salt '*' zabbix.usergroup_get Guests

`salt.modules.zabbix.usergroup_list(**connection_args)`

Retrieve all enabled user groups.

New in version 2016.3.0.

Parameters

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns Array with enabled user groups details, False on failure.

CLI Example: .. code-block:: bash
 salt '*' zabbix.usergroup_list

`salt.modules.zabbix.usergroup_update(usrgrpid, **connection_args)`

New in version 2016.3.0.

Update existing user group

Note: This function accepts all standard user group properties: keyword argument names differ depending on your zabbix version, see [here](#).

Parameters

- **usrgrpid** – ID of the user group to update.
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

Returns IDs of the updated user group, False on failure.

CLI Example: .. code-block:: bash
 salt '*' zabbix.usergroup_update 8 name=guestsRenamed

`salt.modules.zabbix.usermacro_create(macro, value, hostid, **connection_args)`

Create new host usermacro.

Parameters

- **macro** – name of the host usermacro
- **value** – value of the host usermacro
- **hostid** – hostid or templateid

- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_create '{$SNMP_COMMUNITY}' 'public' 1
```

`salt.modules.zabbix.usermacro_createglobal`(*macro*, *value*, ***connection_args*)

Create new global usermacro.

Parameters

- **macro** – name of the global usermacro
- **value** – value of the global usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the created global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_createglobal '{$SNMP_COMMUNITY}' 'public'
```

`salt.modules.zabbix.usermacro_delete`(*macroids*, ***connection_args*)

Delete host usermacros.

Parameters

- **macroids** – macroids of the host usermacros
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_delete 21
```

`salt.modules.zabbix.usermacro_deleteglobal`(*macroids*, ***connection_args*)

Delete global usermacros.

Parameters

- **macroids** – macroids of the global usermacros
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: IDs of the deleted global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_deleteglobal 21
```

```
salt.modules.zabbix.usermacro_get(macro=None, hostids=None, templateids=None, host-
    macroids=None, globalmacroids=None, globalmacro=False,
    **connection_args)
```

Retrieve user macros according to the given parameters.

Parameters

- **macro** – name of the usermacro
- **hostids** – Return macros for the given hostids
- **templateids** – Return macros for the given templateids
- **hostmacroids** – Return macros with the given hostmacroids
- **globalmacroids** – Return macros with the given globalmacroids (implies globalmacro=True)
- **globalmacro** – if True, returns only global macros
- **connection_args** (*optional*) – **_connection_user**: zabbix user (can also be set in opts or pillar, see module's docstring) **_connection_password**: zabbix password (can also be set in opts or pillar, see module's docstring) **_connection_url**: url of zabbix frontend (can also be set in opts or pillar, see module's docstring)

Returns Array with usermacro details, False if no usermacro found or on failure.

CLI Example: .. code-block:: bash

```
salt '*' zabbix.usermacro_get macro='${SNMP_COMMUNITY}'
```

```
salt.modules.zabbix.usermacro_update(hostmacroid, value, **connection_args)
```

Update existing host usermacro.

Parameters

- **hostmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update host usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_update 1 'public'
```

```
salt.modules.zabbix.usermacro_updateglobal(globalmacroid, value, **connection_args)
```

Update existing global usermacro.

Parameters

- **globalmacroid** – id of the host usermacro
- **value** – new value of the host usermacro
- **_connection_user** – Optional - zabbix user (can also be set in opts or pillar, see module's docstring)
- **_connection_password** – Optional - zabbix password (can also be set in opts or pillar, see module's docstring)
- **_connection_url** – Optional - url of zabbix frontend (can also be set in opts, pillar, see module's docstring)

return: ID of the update global usermacro.

CLI Example:

```
salt '*' zabbix.usermacro_updateglobal 1 'public'
```

20.9.473 salt.modules.zcbuildout

Management of zc.buildout

New in version 2014.1.0.

This module is inspired by [minitage's buildout maker](#)

Note: The zc.buildout integration is still in beta; the API is subject to change

General notes

You have those following methods:

- upgrade_bootstrap
- bootstrap
- run_buildout
- buildout

`salt.modules.zcbuildout.bootstrap(*a, **kw)`
Run the buildout bootstrap dance (python bootstrap.py).
directory directory to execute in
config alternative buildout configuration file to use
runas User used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
offline are we executing buildout in offline mode
distribute Forcing use of distribute
new_st Forcing use of setuptools >= 0.7
python path to a python executable to use in place of default (salt one)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
use_vt Use the new salt VT to stream output [experimental]
CLI Example:

```
salt '*' buildout.bootstrap /srv/mybuildout
```

`salt.modules.zcbuildout.buildout(*a, **kw)`
Run buildout in a directory.
directory directory to execute in
config buildout config to use
parts specific buildout parts to run
runas user used to run buildout as
env environment variables to set when running
buildout_ver force a specific buildout version (1 | 2)
test_release buildout accept test release
new_st Forcing use of setuptools >= 0.7
distribute use distribute over setuptools if possible

offline does buildout run offline
python python to use
debug run buildout with -D debug flag
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
 CLI Example:

```
salt '*' buildout.buildout /srv/mybuildout
```

`salt.modules.zcbuildout.run_buildout(*a, **kw)`

Run a buildout in a directory.
directory directory to execute in
config alternative buildout configuration file to use
offline are we executing buildout in offline mode
runas user used to run buildout as
env environment variables to set when running
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
newest run buildout in newest mode
force run buildout unconditionally
verbose run buildout in verbose mode (-vvvvv)
use_vt Use the new salt VT to stream output [experimental]
 CLI Example:

```
salt '*' buildout.run_buildout /srv/mybuildout
```

`salt.modules.zcbuildout.upgrade_bootstrap(*a, **kw)`

Upgrade current bootstrap.py with the last released one.

Indeed, when we first run a buildout, a common source of problem is to have a locally stale bootstrap, we just try to grab a new copy

directory directory to execute in
offline are we executing buildout in offline mode
buildout_ver forcing to use a specific buildout version (1 | 2)
onlyif Only execute cmd if statement on the host return 0
unless Do not execute cmd if statement on the host return 0
 CLI Example:

```
salt '*' buildout.upgrade_bootstrap /srv/mybuildout
```

20.9.474 salt.modules.zenoss

Module for working with the Zenoss API

New in version 2016.3.0.

depends requests

configuration This module requires a 'zenoss' entry in the master/minion config.

For example:

```
zenoss:
  hostname: https://zenoss.example.com
  username: admin
  password: admin123
```

```
salt.modules.zenoss.add_device(device=None, device_class=None, collector='localhost',
                               prod_state=1000)
```

A function to connect to a zenoss server and add a new device entry.

Parameters

- **device** – (Optional) Will use the grain 'fqdn' by default.
- **device_class** – (Optional) The device class to use. If none, will determine based on kernel grain.
- **collector** – (Optional) The collector to use for this device. Defaults to 'localhost'.
- **prod_state** – (Optional) The prodState to set on the device. If none, defaults to 1000 (production)

CLI Example: salt '*' zenoss.add_device

```
salt.modules.zenoss.device_exists(device=None)
```

Check to see if a device already exists in Zenoss.

Parameters **device** – (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '*' zenoss.device_exists

```
salt.modules.zenoss.find_device(device=None)
```

Find a device in Zenoss. If device not found, returns None.

Parameters **device** – (Optional) Will use the grain 'fqdn' by default

CLI Example: salt '*' zenoss.find_device

```
salt.modules.zenoss.set_prod_state(prod_state, device=None)
```

A function to set the prod_state in zenoss.

Parameters

- **prod_state** – (Required) Integer value of the state
- **device** – (Optional) Will use the grain 'fqdn' by default.

CLI Example: salt zenoss.set_prod_state 1000 hostname

20.9.475 salt.modules.zfs

Module for running ZFS command

codeauthor Nitin Madhok <nmadhok@clemsn.edu>, Jorge Schrauwen <sjorge@blackdot.be>

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.utils.zfs

platform illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

```
salt.modules.zfs.bookmark(snapshot, bookmark)
```

Creates a bookmark of the given snapshot

Note: Bookmarks mark the point in time when the snapshot was created, and can be used as the incremental source for a zfs send command.

This feature must be enabled to be used. See `zpool-features(5)` for details on ZFS feature flags and the bookmarks feature.

snapshot [string] name of snapshot to bookmark

bookmark [string] name of bookmark

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.bookmark myzpool/mydataset@yesterday myzpool/mydataset#complete
```

`salt.modules.zfs.clone`(*name_a*, *name_b*, ***kwargs*)

Creates a clone of the given snapshot.

name_a [string] name of snapshot

name_b [string] name of filesystem or volume

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

properties [dict] additional zfs properties (`-o`)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.clone myzpool/mydataset@yesterday myzpool/mydataset_yesterday
```

`salt.modules.zfs.create`(*name*, ***kwargs*)

Create a ZFS File System.

name [string] name of dataset or volume

volume_size [string] if specified, a zvol will be created instead of a dataset

sparse [boolean] create sparse volume

create_parent [boolean] creates all the non-existing parent datasets. any property specified on the command line using the `-o` option is ignored.

properties [dict] additional zfs properties (`-o`)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2015.5.0.

CLI Example:

```

salt '*' zfs.create myzpool/mydataset [create_parent=True|False]
salt '*' zfs.create myzpool/mydataset properties="{mountpoint: '/export/zfs',
↪ 'sharenfs': 'on'}"
salt '*' zfs.create myzpool/volume volume_size=1G [sparse=True|False]`
salt '*' zfs.create myzpool/volume volume_size=1G properties="{volblocksize:
↪ '512'}" [sparse=True|False]

```

`salt.modules.zfs.destroy`(*name*, ***kwargs*)

Destroy a ZFS File System.

name [string] name of dataset, volume, or snapshot

force [boolean] force an unmount of any file systems using the unmount -f command.

recursive [boolean] recursively destroy all children. (-r)

recursive_all [boolean] recursively destroy all dependents, including cloned file systems outside the target hierarchy. (-R)

Warning: watch out when using recursive and recursive_all

New in version 2015.5.0.

CLI Example:

```

salt '*' zfs.destroy myzpool/mydataset [force=True|False]

```

`salt.modules.zfs.diff`(*name_a*, *name_b=None*, ***kwargs*)

Display the difference between a snapshot of a given filesystem and another snapshot of that filesystem from a later time or the current contents of the filesystem.

name_a [string] name of snapshot

name_b [string] (optional) name of snapshot or filesystem

show_changetime [boolean] display the path's inode change time as the first column of output. (default = True)

show_indication [boolean] display an indication of the type of file. (default = True)

parsable [boolean] if true we don't parse the timestamp to a more readable date (default = True)

New in version 2016.3.0.

CLI Example:

```

salt '*' zfs.diff myzpool/mydataset@yesterday myzpool/mydataset

```

`salt.modules.zfs.exists`(*name*, ***kwargs*)

Check if a ZFS filesystem or volume or snapshot exists.

name [string] name of dataset

type [string] also check if dataset is of a certain type, valid choices are: filesystem, snapshot, volume, bookmark, or all.

New in version 2015.5.0.

CLI Example:

```

salt '*' zfs.exists myzpool/mydataset
salt '*' zfs.exists myzpool/myvolume type=volume

```

`salt.modules.zfs.get`(**dataset*, ***kwargs*)

Displays properties for the given datasets.

dataset [string] name of snapshot(s), filesystem(s), or volume(s)

properties [string] comma-separated list of properties to list, defaults to all

recursive [boolean] recursively list children

depth [int] recursively list children to depth
fields [string] comma-separated list of fields to include, the name and property field will always be added
type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.
source [string] comma-separated list of sources to display. Must be one of the following: local, default, inherited, temporary, and none. The default value is all sources.
parsable [boolean] display numbers in parsable (exact) values (default = True) .. versionadded:: 2018.3.0

Note: If no datasets are specified, then the command displays properties for all datasets on the system.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.get
salt '*' zfs.get myzpool/mydataset [recursive=True|False]
salt '*' zfs.get myzpool/mydataset properties="sharenfs,mountpoint"
↪ [recursive=True|False]
salt '*' zfs.get myzpool/mydataset myzpool/myotherdataset properties=available
↪ fields=value depth=1
```

`salt.modules.zfs.hold`(*tag*, **snapshot*, ***kwargs*)

Adds a single reference, named with the tag argument, to the specified snapshot or snapshots.

Note: Each snapshot has its own tag namespace, and tags must be unique within that space.

If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

tag [string] name of tag

snapshot [string] name of snapshot(s)

recursive [boolean] specifies that a hold with the given tag is applied recursively to the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

Warning: As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.hold mytag myzpool/mydataset@mysnapshot myzpool/
↪ mydataset@myothersnapshot
```

`salt.modules.zfs.holds`(*snapshot*, ***kwargs*)

Lists all existing user references for the given snapshot or snapshots.

snapshot [string] name of snapshot

recursive [boolean] lists the holds that are set on the named descendent snapshots also.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.holds myzpool/mydataset@baseline
```

`salt.modules.zfs.inherit`(*prop*, *name*, ***kwargs*)

Clears the specified property

prop [string] name of property

name [string] name of the filesystem, volume, or snapshot

recursive [boolean] recursively inherit the given property for all children.

revert [boolean] revert the property to the received value if one exists; otherwise operate as if the -S option was not specified.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.inherit canmount myzpool/mydataset [recursive=True|False]
```

`salt.modules.zfs.list_`(*name=None*, ***kwargs*)

Return a list of all datasets or a specified dataset on the system and the values of their used, available, referenced, and mountpoint properties.

name [string] name of dataset, volume, or snapshot

recursive [boolean] recursively list children

depth [int] limit recursion to depth

properties [string] comma-separated list of properties to list, the name property will always be added

type [string] comma-separated list of types to display, where type is one of filesystem, snapshot, volume, bookmark, or all.

sort [string] property to sort on (default = name)

order [string [ascending|descending]] sort order (default = ascending)

parsable [boolean] display numbers in parsable (exact) values .. versionadded:: 2018.3.0

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.list
salt '*' zfs.list myzpool/mydataset [recursive=True|False]
salt '*' zfs.list myzpool/mydataset properties="sharenfs,mountpoint"
```

`salt.modules.zfs.list_mount`()

List mounted zfs filesystems

New in version 2018.3.1.

CLI Example:

```
salt '*' zfs.list_mount
```

`salt.modules.zfs.mount`(*name=None*, ***kwargs*)

Mounts ZFS file systems

name [string] name of the filesystem, having this set to None will mount all filesystems. (this is the default)

overlay [boolean] perform an overlay mount.

options [string] optional comma-separated list of mount options to use temporarily for the duration of the mount.

New in version 2016.3.0.

Changed in version 2018.3.1.

Warning: Passing '-a' as name is deprecated and will be removed 2 verions after Fluorine.

CLI Example:

```
salt '*' zfs.mount
salt '*' zfs.mount myzpool/mydataset
salt '*' zfs.mount myzpool/mydataset options=ro
```

`salt.modules.zfs.promote(name)`

Promotes a clone file system to no longer be dependent on its "origin" snapshot.

Note: This makes it possible to destroy the file system that the clone was created from. The clone parent-child dependency relationship is reversed, so that the origin file system becomes a clone of the specified file system.

The snapshot that was cloned, and any snapshots previous to this snapshot, are now owned by the promoted clone. The space they use moves from the origin file system to the promoted clone, so enough space must be available to accommodate these snapshots. No new space is consumed by this operation, but the space accounting is adjusted. The promoted clone must not have any conflicting snapshot names of its own. The rename subcommand can be used to rename any conflicting snapshots.

name [string] name of clone-filesystem

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.promote myzpool/myclone
```

`salt.modules.zfs.release(tag, *snapshot, **kwargs)`

Removes a single reference, named with the tag argument, from the specified snapshot or snapshots.

Note: The tag must already exist for each snapshot. If a hold exists on a snapshot, attempts to destroy that snapshot by using the zfs destroy command return EBUSY.

tag [string] name of tag

snapshot [string] name of snapshot(s)

recursive [boolean] recursively releases a hold with the given tag on the snapshots of all descendent file systems.

New in version 2016.3.0.

Changed in version 2018.3.1.

Warning: As of 2018.3.1 the tag parameter no longer accepts a comma-separated value. It's is now possible to create a tag that contains a comma, this was impossible before.

CLI Example:

```
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot [recursive=True]
salt '*' zfs.release mytag myzpool/mydataset@mysnapshot myzpool/
↳mydataset@myothersnapshot
```

`salt.modules.zfs.rename(name, new_name, **kwargs)`

Rename or Relocate a ZFS File System.

name [string] name of dataset, volume, or snapshot

new_name [string] new name of dataset, volume, or snapshot

force [boolean] force unmount any filesystems that need to be unmounted in the process.

create_parent [boolean] creates all the nonexistent parent datasets. Datasets created in this manner are automatically mounted according to the mountpoint property inherited from their parent.

recursive [boolean] recursively rename the snapshots of all descendent datasets. snapshots are the only dataset that can be renamed recursively.

New in version 2015.5.0.

CLI Example:

```
salt '*' zfs.rename myzpool/mydataset myzpool/renameddataset
```

`salt.modules.zfs.rollback`(*name*, ***kwargs*)

Roll back the given dataset to a previous snapshot.

name [string] name of snapshot

recursive [boolean] destroy any snapshots and bookmarks more recent than the one specified.

recursive_all [boolean] destroy any more recent snapshots and bookmarks, as well as any clones of those snapshots.

force [boolean] used with the -R option to force an unmount of any clone file systems that are to be destroyed.

Warning: When a dataset is rolled back, all data that has changed since the snapshot is discarded, and the dataset reverts to the state at the time of the snapshot. By default, the command refuses to roll back to a snapshot other than the most recent one.

In order to do so, all intermediate snapshots and bookmarks must be destroyed by specifying the -r option.

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.rollback myzpool/mydataset@yesterday
```

`salt.modules.zfs.set`(**dataset*, ***kwargs*)

Sets the property or list of properties to the given value(s) for each dataset.

dataset [string] name of snapshot(s), filesystem(s), or volume(s)

properties [string] additional zfs properties pairs

Note: properties are passed as key-value pairs. e.g.
compression=off

Note: Only some properties can be edited.

See the Properties section for more information on what properties can be set and acceptable values.

Numeric values can be specified as exact values, or in a human-readable form with a suffix of B, K, M, G, T, P, E (for bytes, kilobytes, megabytes, gigabytes, terabytes, petabytes, or exabytes respectively).

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.set myzpool/mydataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=off
salt '*' zfs.set myzpool/mydataset myzpool/myotherdataset compression=lz4
↪ canmount=off
```

`salt.modules.zfs.snapshot(*snapshot, **kwargs)`

Creates snapshots with the given names.

snapshot [string] name of snapshot(s)

recursive [boolean] recursively create snapshots of all descendent datasets.

properties [dict] additional zfs properties (-o)

Note: ZFS properties can be specified at the time of creation of the filesystem by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

New in version 2016.3.0.

CLI Example:

```
salt '*' zfs.snapshot myzpool/mydataset@yesterday [recursive=True]
salt '*' zfs.snapshot myzpool/mydataset@yesterday myzpool/
↳myotherdataset@yesterday [recursive=True]
```

`salt.modules.zfs.unmount(name, **kwargs)`

Unmounts ZFS file systems

name [string] name of the filesystem, you can use None to unmount all mounted filesystems.

force [boolean] forcefully unmount the file system, even if it is currently in use.

Warning: Using `-a` for the name parameter will probably break your system, unless your rootfs is not on zfs.

New in version 2016.3.0.

Changed in version 2018.3.1.

Warning: Passing `'-a'` as name is deprecated and will be removed 2 verions after Fluorine.

CLI Example:

```
salt '*' zfs.unmount myzpool/mydataset [force=True|False]
```

20.9.476 salt.modules.zk_concurrency

Concurrency controls in zookeeper

depends kazoo

configuration See `salt.modules.zookeeper` for setup instructions.

This module allows you to acquire and release a slot. This is primarily useful for ensuring that no more than N hosts take a specific action at once. This can also be used to coordinate between masters.

`salt.modules.zk_concurrency.lock(path, zk_hosts=None, identifier=None, max_concurrency=1, timeout=None, ephemeral_lease=False, force=False, profile=None, scheme=None, username=None, password=None, default_acl=None)`

Get lock (with optional timeout)

path The path in zookeeper where the lock is

zk_hosts zookeeper connect string

identifier Name to identify this minion, if unspecified defaults to the hostname

max_concurrency Maximum number of lock holders

timeout timeout to wait for the lock. A None timeout will block forever

ephemeral_lease Whether the locks in zookeeper should be ephemeral

force Forcibly acquire the lock regardless of available slots

Example:

```
salt.modules.zk_concurrency.lock_holders(path, zk_hosts=None, identifier=None,
                                           max_concurrency=1, timeout=None,
                                           ephemeral_lease=False, profile=None,
                                           scheme=None, username=None, password=None,
                                           default_acl=None)
```

Return an un-ordered list of lock holders

path The path in zookeeper where the lock is

zk_hosts zookeeper connect string

identifier Name to identify this minion, if unspecified defaults to hostname

max_concurrency Maximum number of lock holders

timeout timeout to wait for the lock. A None timeout will block forever

ephemeral_lease Whether the locks in zookeeper should be ephemeral

Example:

```
salt.modules.zk_concurrency.party_members(path, zk_hosts=None, min_nodes=1, block-
                                           ing=False, profile=None, scheme=None,
                                           username=None, password=None, de-
                                           fault_acl=None)
```

Get the List of identifiers in a particular party, optionally waiting for the specified minimum number of nodes (min_nodes) to appear

path The path in zookeeper where the lock is

zk_hosts zookeeper connect string

min_nodes The minimum number of nodes expected to be present in the party

blocking The boolean indicating if we need to block until min_nodes are available

Example:

```
salt.modules.zk_concurrency.unlock(path, zk_hosts=None, identifier=None, max_concurrency=1,
                                     ephemeral_lease=False, scheme=None, profile=None, user-
                                     name=None, password=None, default_acl=None)
```

Remove lease from semaphore

path The path in zookeeper where the lock is

zk_hosts zookeeper connect string

identifier Name to identify this minion, if unspecified defaults to hostname

max_concurrency Maximum number of lock holders

timeout timeout to wait for the lock. A None timeout will block forever

ephemeral_lease Whether the locks in zookeeper should be ephemeral

Example:

20.9.477 salt.modules.znc

znc - An advanced IRC bouncer

New in version 2014.7.0.

Provides an interface to basic ZNC functionality

`salt.modules.znc.buildmod(*modules)`

Build module using znc-buildmod

CLI Example:

```
salt '*' znc.buildmod module.cpp [...]
```

`salt.modules.znc.dumpconf()`

Write the active configuration state to config file

CLI Example:

```
salt '*' znc.dumpconf
```

`salt.modules.znc.rehashconf()`

Rehash the active configuration state from config file

CLI Example:

```
salt '*' znc.rehashconf
```

`salt.modules.znc.version()`

Return server version from znc -version

CLI Example:

```
salt '*' znc.version
```

20.9.478 salt.modules.zoneadm

Module for Solaris 10's zoneadm

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10

New in version 2017.7.0.

Warning: Oracle Solaris 11's zoneadm is not supported by this module!

`salt.modules.zoneadm.attach(zone, force=False, brand_opts=None)`

Attach the specified zone.

zone [string] name of the zone

force [boolean] force the zone into the "installed" state with no validation

brand_opts [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.attach lawrence
salt '*' zoneadm.attach lawrence True
```

`salt.modules.zoneadm.boot(zone, single=False, altinit=None, smf_options=None)`

Boot (or activate) the specified zone.

zone [string] name or uuid of the zone

single [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit [string] valid path to an alternative executable to be the primordial process.

smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.boot clementine
salt '*' zoneadm.boot maeve single=True
salt '*' zoneadm.boot teddy single=True smf_options=verbose
```

salt.modules.zoneadm.clone(*zone*, *source*, *snapshot=None*)

Install a zone by copying an existing installed zone.

zone [string] name of the zone

source [string] zone to clone from

snapshot [string] optional name of snapshot to use as source

CLI Example:

```
salt '*' zoneadm.clone clementine dolores
```

salt.modules.zoneadm.detach(*zone*)

Detach the specified zone.

zone [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.detach kissy
```

salt.modules.zoneadm.halt(*zone*)

Halt the specified zone.

zone [string] name or uuid of the zone

Note: To cleanly shutdown the zone use the shutdown function.

CLI Example:

```
salt '*' zoneadm.halt hector
```

salt.modules.zoneadm.install(*zone*, *nodataset=False*, *brand_opts=None*)

Install the specified zone from the system.

zone [string] name of the zone

nodataset [boolean] do not create a ZFS file system

brand_opts [string] brand specific options to pass

CLI Example:

```
salt '*' zoneadm.install dolores
salt '*' zoneadm.install teddy True
```

salt.modules.zoneadm.list_zones(*verbose=True*, *installed=False*, *configured=False*,
hide_global=True)

List all zones

verbose [boolean] display additional zone information

installed [boolean] include installed zones in output

configured [boolean] include configured zones in output

hide_global [boolean] do not include global zone

CLI Example:

```
salt '*' zoneadm.list
```

`salt.modules.zoneadm.move(zone, zonepath)`

Move zone to new zonepath.

zone [string] name or uuid of the zone

zonepath [string] new zonepath

CLI Example:

```
salt '*' zoneadm.move meave /sweetwater/meave
```

`salt.modules.zoneadm.ready(zone)`

Prepares a zone for running applications.

zone [string] name or uuid of the zone

CLI Example:

```
salt '*' zoneadm.ready clementine
```

`salt.modules.zoneadm.reboot(zone, single=False, altinit=None, smf_options=None)`

Restart the zone. This is equivalent to a halt boot sequence.

zone [string] name or uuid of the zone

single [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit [string] valid path to an alternative executable to be the primordial process.

smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.reboot dolores
salt '*' zoneadm.reboot teddy single=True
```

`salt.modules.zoneadm.shutdown(zone, reboot=False, single=False, altinit=None, smf_options=None)`

Gracefully shutdown the specified zone.

zone [string] name or uuid of the zone

reboot [boolean] reboot zone after shutdown (equivalent of shutdown -i6 -g0 -y)

single [boolean] boots only to milestone svc:/milestone/single-user:default.

altinit [string] valid path to an alternative executable to be the primordial process.

smf_options [string] include two categories of options to control booting behavior of the service management facility: recovery options and messages options.

CLI Example:

```
salt '*' zoneadm.shutdown peter
salt '*' zoneadm.shutdown armistice reboot=True
```

`salt.modules.zoneadm.uninstall(zone)`

Uninstall the specified zone from the system.

zone [string] name or uuid of the zone

Warning: The -F flag is always used to avoid the prompts when uninstalling.

CLI Example:

```
salt '*' zoneadm.uninstall teddy
```

`salt.modules.zoneadm.verify(zone)`

Check to make sure the configuration of the specified zone can safely be installed on the machine.

zone [string] name of the zone

CLI Example:

```
salt '*' zoneadm.verify dolores
```

20.9.479 salt.modules.zonecfg

Module for Solaris 10's zonecfg

maintainer Jorge Schrauwen <sjorge@blackdot.be>
maturity new
platform OmniOS,OpenIndiana,SmartOS,OpenSolaris,Solaris 10
depend salt.modules.file

New in version 2017.7.0.

Warning: Oracle Solaris 11's zonecfg is not supported by this module!

salt.modules.zonecfg.add_resource(*zone, resource_type, **kwargs*)

Add a resource
zone [string] name of zone
resource_type [string] type of resource
kwargs [string|int|...] resource properties
CLI Example:

```
salt '*' zonecfg.add_resource tallgeese rctl name=zone.max-locked-memory value=  
->'(priv=privileged,limit=33554432,action=deny)'
```

salt.modules.zonecfg.clear_property(*zone, key*)

Clear a property
zone [string] name of zone
key [string] name of property
CLI Example:

```
salt '*' zonecfg.clear_property deathscythe cpu-shares
```

salt.modules.zonecfg.create(*zone, brand, zonepath, force=False*)

Create an in-memory configuration for the specified zone.
zone [string] name of zone
brand [string] brand name
zonepath [string] path of zone
force [boolean] overwrite configuration
CLI Example:

```
salt '*' zonecfg.create deathscythe ipkg /zones/deathscythe
```

salt.modules.zonecfg.create_from_template(*zone, template*)

Create an in-memory configuration from a template for the specified zone.
zone [string] name of zone
template [string] name of template

Warning: existing config will be overwritten!

CLI Example:

```
salt '*' zonecfg.create_from_template leo tallgeese
```

`salt.modules.zonecfg.delete`(*zone*)

Delete the specified configuration from memory and stable storage.

zone [string] name of zone

CLI Example:

```
salt '*' zonecfg.delete epyon
```

`salt.modules.zonecfg.export`(*zone*, *path=None*)

Export the configuration from memory to stable storage.

zone [string] name of zone

path [string] path of file to export to

CLI Example:

```
salt '*' zonecfg.export epyon
salt '*' zonecfg.export epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.import_`(*zone*, *path*)

Import the configuration to memory from stable storage.

zone [string] name of zone

path [string] path of file to export to

CLI Example:

```
salt '*' zonecfg.import epyon /zones/epyon.cfg
```

`salt.modules.zonecfg.info`(*zone*, *show_all=False*)

Display the configuration from memory

zone [string] name of zone

show_all [boolean] also include calculated values like capped-cpu, cpu-shares, ...

CLI Example:

```
salt '*' zonecfg.info tallgeese
```

`salt.modules.zonecfg.remove_resource`(*zone*, *resource_type*, *resource_key*, *resource_value*)

Remove a resource

zone [string] name of zone

resource_type [string] type of resource

resource_key [string] key for resource selection

resource_value [string] value for resource selection

Note: Set `resource_selector` to `None` for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.remove_resource tallgeese rctl name zone.max-locked-memory
```

`salt.modules.zonecfg.set_property`(*zone*, *key*, *value*)

Set a property

zone [string] name of zone

key [string] name of property

value [string] value of property

CLI Example:

```
salt '*' zonecfg.set_property deathscythe cpu-shares 100
```

`salt.modules.zonecfg.update_resource`(*zone*, *resource_type*, *resource_selector*, ***kwargs*)

Add a resource

zone [string] name of zone

resource_type [string] type of resource

resource_selector [string] unique resource identifier

kwargs [string|int|...] resource properties

Note: Set `resource_selector` to `None` for resource that do not require one.

CLI Example:

```
salt '*' zonecfg.update_resource tallgeese rctl name name=zone.max-locked-memory
↳value='(priv=privileged,limit=33554432,action=deny)'
```

20.9.480 salt.modules.zookeeper

Zookeeper Module

maintainer SaltStack

maturity new

platform all

depends kazoo

New in version 2018.3.0.

Configuration

configuration This module is not usable until the following are specified either in a pillar or in the minion's config file:

```
zookeeper:
  hosts: zoo1,zoo2,zoo3
  default_acl:
    - username: daniel
      password: test
      read: true
      write: true
      create: true
      delete: true
      admin: true
  username: daniel
  password: test
```

If configuration for multiple zookeeper environments is required, they can be set up as different configuration profiles. For example:

```
zookeeper:
  prod:
    hosts: zoo1,zoo2,zoo3
```

(continues on next page)

(continued from previous page)

```

default_acl:
  - username: daniel
    password: test
    read: true
    write: true
    create: true
    delete: true
    admin: true
username: daniel
password: test
dev:
hosts:
  - dev1
  - dev2
  - dev3
default_acl:
  - username: daniel
    password: test
    read: true
    write: true
    create: true
    delete: true
    admin: true
username: daniel
password: test

```

`salt.modules.zookeeper.create`(*path*, *value=""*, *acls=None*, *ephemeral=False*, *sequence=False*, *makepath=False*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Create Znode

path path of znode to create

value value to assign to znode (Default: ")

acls list of acl dictionaries to be assigned (Default: None)

ephemeral indicate node is ephemeral (Default: False)

sequence indicate node is suffixed with a unique index (Default: False)

makepath Create parent paths if they do not exist (Default: False)

profile Configured Zookeeper profile to authenticate with (Default: None)

hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme Scheme to authenticate with (Default: 'digest')

username Username to authenticate (Default: None)

password Password to authenticate (Default: None)

default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.create /test/name daniel profile=prod
```

`salt.modules.zookeeper.delete`(*path*, *version=-1*, *recursive=False*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Delete znode

path path to znode

version only delete if version matches (Default: -1 (always matches))

profile Configured Zookeeper profile to authenticate with (Default: None)

hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme Scheme to authenticate with (Default: 'digest')

username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:

```
salt minion1 zookeeper.delete /test/name profile=prod
```

salt.modules.zookeeper.ensure_path(*path, acls=None, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*)

Ensure Znode path exists
path Parent path to create
acls list of acls dictionaries to be assigned (Default: None)
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:

```
salt minion1 zookeeper.ensure_path /test/name profile=prod
```

salt.modules.zookeeper.exists(*path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*)

Check if path exists
path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:

```
salt minion1 zookeeper.exists /test/name profile=prod
```

salt.modules.zookeeper.get(*path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*)

Get value saved in znode
path path to check
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')
scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
CLI Example:

```
salt minion1 zookeeper.get /test/name profile=prod
```

salt.modules.zookeeper.get_acls(*path, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*)

Get acls on a znode
path path to znode
profile Configured Zookeeper profile to authenticate with (Default: None)
hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme Scheme to authenticate with (Default: 'digest')
username Username to authenticate (Default: None)
password Password to authenticate (Default: None)
default_acl Default acls to assign if a node is created in this connection (Default: None)
 CLI Example:

```
salt minion1 zookeeper.get_acls /test/name profile=prod
```

`salt.modules.zookeeper.get_children`(*path*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Get children in znode path

path path to check

profile Configured Zookeeper profile to authenticate with (Default: None)

hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme Scheme to authenticate with (Default: 'digest')

username Username to authenticate (Default: None)

password Password to authenticate (Default: None)

default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.get_children /test profile=prod
```

`salt.modules.zookeeper.make_digest_acl`(*username*, *password*, *read=False*, *write=False*, *create=False*, *delete=False*, *admin=False*, *allperms=False*)

Generate acl object

Note: This is heavily used in the zookeeper state and probably is not useful as a cli module

username username of acl

password plain text password of acl

read read acl

write write acl

create create acl

delete delete acl

admin admin acl

allperms set all other acls to True

CLI Example:

```
salt minion1 zookeeper.make_digest_acl username=daniel password=myspass
↪allperms=True
```

`salt.modules.zookeeper.set`(*path*, *value*, *version=-1*, *profile=None*, *hosts=None*, *scheme=None*, *username=None*, *password=None*, *default_acl=None*)

Update znode with new value

path znode to update

value value to set in znode

version only update znode if version matches (Default: -1 (always matches))

profile Configured Zookeeper profile to authenticate with (Default: None)

hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme Scheme to authenticate with (Default: 'digest')

username Username to authenticate (Default: None)

password Password to authenticate (Default: None)

default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set /test/name gtmanfred profile=prod
```

`salt.modules.zookeeper.set_acls` (*path, acls, version=-1, profile=None, hosts=None, scheme=None, username=None, password=None, default_acl=None*)

Set acls on a znode

path path to znode

acls list of acl dictionaries to set on the znode

version only set acls if version matches (Default: -1 (always matches))

profile Configured Zookeeper profile to authenticate with (Default: None)

hosts Lists of Zookeeper Hosts (Default: '127.0.0.1:2181')

scheme Scheme to authenticate with (Default: 'digest')

username Username to authenticate (Default: None)

password Password to authenticate (Default: None)

default_acl Default acls to assign if a node is created in this connection (Default: None)

CLI Example:

```
salt minion1 zookeeper.set_acls /test/name acls='[{"username": "gtmanfred",
↪"password": "test", "all": True}]' profile=prod
```

20.9.481 salt.modules.zpool

Module for running ZFS zpool command

codeauthor Nitin Madhok <nmadhok@clemsun.edu>, Jorge Schrauwen <sjorge@blackdot.be>

maintainer Jorge Schrauwen <sjorge@blackdot.be>

maturity new

depends salt.utils.zfs

platform illumos,freebsd,linux

Changed in version 2018.3.1: Big refactor to remove duplicate code, better type conversions and improved consistency in output.

`salt.modules.zpool.add` (*zpool, *vdevs, **kwargs*)

Add the specified vdev's to the given storage pool

zpool [string] Name of storage pool

vdevs [string] One or more devices

force [boolean] Forces use of device

CLI Example:

```
salt '*' zpool.add myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.attach` (*zpool, device, new_device, force=False*)

Attach specified device to zpool

zpool [string] Name of storage pool

device [string] Existing device name too

new_device [string] New device name (to be attached to device)

force [boolean] Forces use of device

CLI Example:

```
salt '*' zpool.attach myzpool /path/to/vdev1 /path/to/vdev2 [...]
```

`salt.modules.zpool.clear` (*zpool*, *device=None*)
Clears device errors in a pool.

Warning: The device must not be part of an active pool configuration.

zpool [string] name of storage pool
device [string] (optional) specific device to clear

New in version 2018.3.1.

CLI Example:

```
salt '*' zpool.clear mypool
salt '*' zpool.clear mypool /path/to/dev
```

`salt.modules.zpool.create` (*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Create a simple zpool, a mirrored zpool, a zpool having nested VDEVs, a hybrid zpool with cache, spare and log drives or a zpool with RAIDZ-1, RAIDZ-2 or RAIDZ-3

zpool [string] Name of storage pool
vdevs [string] One or more devices
force [boolean] Forces use of vdevs, even if they appear in use or specify a conflicting replication level.
mountpoint [string] Sets the mount point for the root dataset
altroot [string] Equivalent to "-o cachefile=none,altroot=root"
properties [dict] Additional pool properties
filesystem_properties [dict] Additional filesystem properties
createboot [boolean] create a boot partition

New in version 2018.3.0.

CLI Examples:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] [force=True|False]
↪ [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/
↪ to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /
↪ path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/
↪ vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] [force=True|False]
↪ [force=True|False]
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Filesystem properties can be specified at the time of creation of the pool by passing an additional argument called "filesystem_properties" and specifying the properties with their respective values in the form of a python dictionary:

```
filesystem_properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] properties="{ 'property1':
↳ 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zpool.create myzpool /path/to/vdev1 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 /path/to/vdev2 [...] ✘
↳ [force=True|False]
salt '*' zpool.create myzpool raidz1 /path/to/vdev1 /path/to/vdev2 raidz2 /path/
↳ to/vdev3 /path/to/vdev4 /path/to/vdev5 [...] [force=True|False]
salt '*' zpool.create myzpool mirror /path/to/vdev1 [...] mirror /path/to/vdev2 /
↳ path/to/vdev3 [...] [force=True|False]
salt '*' zpool.create myhybridzpool mirror /tmp/file1 [...] log mirror /path/to/
↳ vdev1 [...] cache /path/to/vdev2 [...] spare /path/to/vdev3 [...] ✘
↳ [force=True|False]
```

`salt.modules.zpool.create_file_vdev`(*size*, **vdevs*)

Creates file based virtual devices for a zpool

CLI Example:

```
salt '*' zpool.create_file_vdev 7G /path/to/vdev1 [/path/to/vdev2] [...]
```

Note: Depending on file size, the above command may take a while to return.

`salt.modules.zpool.destroy`(*zpool*, *force=False*)

Destroys a storage pool

zpool [string] Name of storage pool

force [boolean] Force destroy of pool

CLI Example:

```
salt '*' zpool.destroy myzpool
```

`salt.modules.zpool.detach`(*zpool*, *device*)

Detach specified device to zpool

zpool [string] Name of storage pool

device [string] Device to detach

CLI Example:

```
salt '*' zpool.detach myzpool /path/to/vdev1
```

`salt.modules.zpool.exists`(*zpool*)

Check if a ZFS storage pool is active

zpool [string] Name of storage pool

CLI Example:

```
salt '*' zpool.exists myzpool
```

`salt.modules.zpool.export`(**pools*, ***kwargs*)

New in version 2015.5.0.

Export storage pools

pools [string] One or more storage pools to export

force [boolean] Force export of storage pools

CLI Example:

```
salt '*' zpool.export myzpool ... [force=True|False]
salt '*' zpool.export myzpool2 myzpool2 ... [force=True|False]
```

`salt.modules.zpool.get(zpool, prop=None, show_source=False, parsable=True)`

New in version 2016.3.0.

Retrieves the given list of properties

zpool [string] Name of storage pool

prop [string] Optional name of property to retrieve

show_source [boolean] Show source of property

parsable [boolean] Display numbers in parsable (exact) values

New in version 2018.3.0.

CLI Example:

```
salt '*' zpool.get myzpool
```

`salt.modules.zpool.healthy()`

Check if all zpools are healthy

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.healthy
```

`salt.modules.zpool.history(zpool=None, internal=False, verbose=False)`

New in version 2016.3.0.

Displays the command history of the specified pools, or all pools if no pool is specified

zpool [string] Optional storage pool

internal [boolean] Toggle display of internally logged ZFS events

verbose [boolean] Toggle display of the user name, the hostname, and the zone in which the operation was performed

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

`salt.modules.zpool.import_(zpool=None, new_name=None, **kwargs)`

New in version 2015.5.0.

Import storage pools or list pools available for import

zpool [string] Optional name of storage pool

new_name [string] Optional new name for the storage pool

mntopts [string] Comma-separated list of mount options to use when mounting datasets within the pool.

force [boolean] Forces import, even if the pool appears to be potentially active.

altroot [string] Equivalent to "-o cachefile=None,altroot=root"

dir [string] Searches for devices or files in dir, multiple dirs can be specified as follows: dir="dir1,dir2"

no_mount [boolean] Import the pool without mounting any file systems.

only_destroyed [boolean] Imports destroyed pools only. This also sets force=True.

recovery [bool|str] false: do not try to recovery broken pools true: try to recovery the pool by rolling back the latest transactions test: check if a pool can be recovered, but don't import it nolog: allow import without log device, recent transactions might be lost

Note: If feature flags are not support this forced to the default of 'false'

Warning: When recovery is set to 'test' the result will be have imported set to True if the pool can be imported. The pool might also be imported if the pool was not broken to begin with.

properties [dict] Additional pool properties

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

CLI Example:

```
salt '*' zpool.import [force=True|False]
salt '*' zpool.import myzpool [mynewzpool] [force=True|False]
salt '*' zpool.import myzpool dir='/tmp'
```

salt.modules.zpool.iostat (*zpool=None, sample_time=5, parsable=True*)

Display I/O statistics for the given pools

zpool [string] optional name of storage pool

sample_time [int] seconds to capture data before output default a sample of 5 seconds is used

parsable [boolean] display data in pythonc values (True, False, Bytes,...)

New in version 2016.3.0.

Changed in version 2018.3.1: Added `parsable` parameter that defaults to True

CLI Example:

```
salt '*' zpool.iostat myzpool
```

salt.modules.zpool.labelclear (*device, force=False*)

New in version 2018.3.0.

Removes ZFS label information from the specified device

device [string] Device name; must not be part of an active pool configuration.

force [boolean] Treat exported or foreign devices as inactive

CLI Example:

```
salt '*' zpool.labelclear /path/to/dev
```

salt.modules.zpool.list_ (*properties='size, alloc, free, cap, frag, health', zpool=None, parsable=True*)

New in version 2015.5.0.

Return information about (all) storage pools

zpool [string] optional name of storage pool

properties [string] comma-separated list of properties to list

parsable [boolean] display numbers in parsable (exact) values

New in version 2018.3.0.

Note: The name property will always be included, while the frag property will get removed if not available

zpool [string] optional zpool

Note: Multiple storage pool can be provided as a space separated list

CLI Example:

```
salt '*' zpool.list
salt '*' zpool.list zpool=tank
salt '*' zpool.list 'size,free'
salt '*' zpool.list 'size,free' tank
```

`salt.modules.zpool.offline`(*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Ensure that the specified devices are offline

Warning: By default, the OFFLINE state is persistent. The device remains offline when the system is rebooted. To temporarily take a device offline, use `temporary=True`.

zpool [string] name of storage pool
vdevs [string] One or more devices
temporary [boolean] Enable temporarily offline

CLI Example:

```
salt '*' zpool.offline myzpool /path/to/vdev1 [...] [temporary=True|False]
```

`salt.modules.zpool.online`(*zpool*, **vdevs*, ***kwargs*)

New in version 2015.5.0.

Ensure that the specified devices are online

zpool [string] name of storage pool
vdevs [string] one or more devices
expand [boolean] Expand the device to use all available space.

Note: If the device is part of a mirror or raidz then all devices must be expanded before the new space will become available to the pool.

CLI Example:

```
salt '*' zpool.online myzpool /path/to/vdev1 [...]
```

`salt.modules.zpool.reguid`(*zpool*)

Generates a new unique identifier for the pool

Warning: You must ensure that all devices in this pool are online and healthy before performing this action.

zpool [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reguid myzpool
```

`salt.modules.zpool.reopen`(*zpool*)

Reopen all the vdevs associated with the pool

zpool [string] name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.reopen myzpool
```

`salt.modules.zpool.replace`(*zpool*, *old_device*, *new_device=None*, *force=False*)

Replaces *old_device* with *new_device*

Note: This is equivalent to attaching *new_device*, waiting for it to resilver, and then detaching *old_device*.

The size of *new_device* must be greater than or equal to the minimum size of all the devices in a mirror or raidz configuration.

zpool [string] Name of storage pool

old_device [string] Old device to replace

new_device [string] Optional new device

force [boolean] Forces use of *new_device*, even if its appears to be in use.

CLI Example:

```
salt '*' zpool.replace myzpool /path/to/vdev1 /path/to/vdev2
```

`salt.modules.zpool.scrub`(*zpool*, *stop=False*, *pause=False*)

Scrub a storage pool

zpool [string] Name of storage pool

stop [boolean] If True, cancel ongoing scrub

pause [boolean] If True, pause ongoing scrub

New in version 2018.3.0.

Note: Pause is only available on recent versions of ZFS.

If both *pause* and *stop* are True, then *stop* will win.

CLI Example:

```
salt '*' zpool.scrub myzpool
```

`salt.modules.zpool.set`(*zpool*, *prop*, *value*)

Sets the given property on the specified pool

zpool [string] Name of storage pool

prop [string] Name of property to set

value [string] Value to set for the specified property

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.set myzpool readonly yes
```

`salt.modules.zpool.split`(*zpool*, *newzpool*, ***kwargs*)

New in version 2018.3.0.

Splits devices off pool creating *newpool*.

Note: All *vdevs* in pool must be mirrors. At the time of the split, *newpool* will be a replica of *zpool*.

After splitting, do not forget to import the new pool!

zpool [string] Name of storage pool
newzpool [string] Name of new storage pool
mountpoint [string] Sets the mount point for the root dataset
altroot [string] Sets altroot for newzpool
properties [dict] Additional pool properties for newzpool

CLI Examples:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

Note: Zpool properties can be specified at the time of creation of the pool by passing an additional argument called "properties" and specifying the properties with their respective values in the form of a python dictionary:

```
properties="{ 'property1': 'value1', 'property2': 'value2' }"
```

Example:

```
salt '*' zpool.split datamirror databackup properties="{ 'readonly': 'on' }"
```

CLI Example:

```
salt '*' zpool.split datamirror databackup
salt '*' zpool.split datamirror databackup altroot=/backup
```

salt.modules.zpool.status (*zpool=None*)

Return the status of the named zpool

zpool [string] optional name of storage pool

New in version 2016.3.0.

CLI Example:

```
salt '*' zpool.status myzpool
```

salt.modules.zpool.upgrade (*zpool=None, version=None*)

New in version 2016.3.0.

Enables all supported features on the given pool

zpool [string] Optional storage pool, applies to all otherwise

version [int] Version to upgrade to, if unspecified upgrade to the highest possible

Warning: Once this is done, the pool will no longer be accessible on systems that do not support feature flags. See `zpool-features(5)` for details on compatibility with systems that support feature flags, but do not support all features enabled on the pool.

CLI Example:

```
salt '*' zpool.upgrade myzpool
```

20.9.482 salt.modules.zypper

Package support for openSUSE via the zypper package manager

depends

- rpm Python module. Install with `zypper install rpm-python`

Important: If you feel that Salt should be using this module to manage packages on a minion, and it is using a different module (or gives an error similar to `'pkg.install' is not available`), see [here](#).

class salt.modules.zypper.**Wildcard**(zypper)

New in version 2017.7.0.

Converts string wildcard to a zypper query. .. rubric:: Example

'1.2.3.4*' is '1.2.3.4.whatever.is.here' and is equal to: '1.2.3.4 >= and < 1.2.3.5'

Parameters **ptn** – Pattern

Returns Query range

Z_OP = ['<', '<=', '=', '>=', '>']

salt.modules.zypper.**add_lock**(packages, **kwargs)

Add a package lock. Specify packages to lock by exact name.

CLI Example:

```
salt '*' pkg.add_lock <package name>
salt '*' pkg.add_lock <package1>, <package2>, <package3>
salt '*' pkg.add_lock pkgs='["foo", "bar"]'
```

salt.modules.zypper.**clean_locks**()

Remove unused locks that do not currently (with regard to repositories used) lock any package.

CLI Example:

```
salt '*' pkg.clean_locks
```

salt.modules.zypper.**del_repo**(repo)

Delete a repo.

CLI Examples:

```
salt '*' pkg.del_repo alias
```

salt.modules.zypper.**diff**(*paths)

Return a formatted diff between current files and original in a package. NOTE: this function includes all files (configuration and not), but does not work on binary content.

Parameters **path** – Full path to the installed file

Returns Difference string or raises an exception if examined file is binary.

CLI example:

```
salt '*' pkg.diff /etc/apache2/httpd.conf /etc/sudoers
```

salt.modules.zypper.**download**(*packages, **kwargs)

Download packages to the local disk.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI example:

```
salt '*' pkg.download httpd
salt '*' pkg.download httpd postfix
```

`salt.modules.zypper.file_dict(*packages)`

List the files that belong to a package, grouped by package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypper.file_list(*packages)`

List the files that belong to a package. Not specifying any packages will return a list of every file on the system's rpm database (not generally recommended).

CLI Examples:

```
salt '*' pkg.file_list httpd
salt '*' pkg.file_list httpd postfix
salt '*' pkg.file_list
```

`salt.modules.zypper.get_repo(repo, **kwargs)`

Display a repo.

CLI Example:

```
salt '*' pkg.get_repo alias
```

`salt.modules.zypper.info_available(*names, **kwargs)`

Return the information of the named package available for the system.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.info_available <package1>
salt '*' pkg.info_available <package1> <package2> <package3> ...
```

`salt.modules.zypper.info_installed(*names, **kwargs)`

Return the information of the named package(s), installed on the system.

Parameters

- **names** – Names of the packages to get information about.
- **attr** – Comma-separated package attributes. If no 'attr' is specified, all available attributes returned.
Valid attributes are: version, vendor, release, build_date, build_date_time_t, install_date, install_date_time_t, build_host, group, source_rpm, arch, epoch, size, license, signature, packager, url, summary, description.
- **errors** – Handle RPM field errors. If 'ignore' is chosen, then various mistakes are simply ignored and omitted from the texts or strings. If 'report' is chosen, then a field with a mistake is not returned, instead a 'N/A (broken)' (not available, broken) text is placed.
Valid attributes are: ignore, report

CLI example:

```

salt '*' pkg.info_installed <package1>
salt '*' pkg.info_installed <package1> <package2> <package3> ...
salt '*' pkg.info_installed <package1> attr=version,vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳vendor
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳vendor errors=ignore
salt '*' pkg.info_installed <package1> <package2> <package3> ... attr=version,
↳vendor errors=report

```

`salt.modules.zypper.install` (*name=None, refresh=False, fromrepo=None, pkgs=None, sources=None, downloadonly=None, skip_verify=False, version=None, ignore_repo_failure=False, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd>=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Install the passed package(s), add `refresh=True` to force a 'zypper refresh' before package is installed.

name The name of the package to be installed. Note that this parameter is ignored if either `pkgs` or `sources` is passed. Additionally, please note that this option can only be used to install packages from a software repository. To install a package file manually, use the `sources` option.

CLI Example:

```
salt '*' pkg.install <package name>
```

refresh force a refresh if set to `True`. If set to `False` (default) it depends on `zypper` if a refresh is executed.

fromrepo Specify a package repository to install from.

downloadonly Only download the packages, do not install.

skip_verify Skip the GPG verification check (e.g., `--no-gpg-checks`)

version Can be either a version number, or the combination of a comparison operator (`<`, `>`, `<=`, `>=`, `=`) and a version number (ex. `'>1.2.3-4'`). This parameter is ignored if `pkgs` or `sources` is passed.

resolve_capabilities If this option is set to `True` `zypper` will take capabilities into account. In this case names which are just provided by a package will get installed. Default is `False`.

Multiple Package Installation Options:

pkgs A list of packages to install from a software repository. Must be passed as a python list. A specific version number can be specified by using a single-element dict representing the package and its version. As with the `version` parameter above, comparison operators can be used to target a specific version of a package.

CLI Examples:

```

salt '*' pkg.install pkgs=['foo', 'bar']
salt '*' pkg.install pkgs=['foo', {'bar': '1.2.3-4'}]
salt '*' pkg.install pkgs=['foo', {'bar': '<1.2.3-4'}]

```

sources A list of RPM packages to install. Must be passed as a list of dicts, with the keys being package names, and the values being the source URI or local path to the package.

CLI Example:

```
salt '*' pkg.install sources=[{"foo": "salt://foo.rpm"}, {"bar": "salt://bar.
↳rpm"}]
```

ignore_repo_failure `Zypper` returns error code 106 if one of the repositories are not available for various reasons. In case to set strict check, this parameter needs to be set to `True`. Default: `False`.

diff_attr: If a list of package attributes is specified, returned value will contain them, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},
  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

Returns a dict containing the new package names and versions:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

If an attribute list is specified in **diff_attr**, the dict will also contain any specified attribute, eg.:

```
{'<package>': {
  'old': {
    'version': '<old-version>',
    'arch': '<old-arch>'},
  'new': {
    'version': '<new-version>',
    'arch': '<new-arch>'}}
```

salt.modules.zypper.latest_version(*names, **kwargs)

Return the latest version of the named package available for upgrade or installation. If more than one package name is specified, a dict of name/version pairs is returned.

If the latest version of a given package is already installed, an empty dict will be returned for that package.

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI example:

```
salt '*' pkg.latest_version <package name>
salt '*' pkg.latest_version <package1> <package2> <package3> ...
```

salt.modules.zypper.list_downloaded()

New in version 2017.7.0.

List prefetched packages downloaded by Zypper in the local disk.

CLI example:

```
salt '*' pkg.list_downloaded
```

salt.modules.zypper.list_installed_patches()

New in version 2017.7.0.

List installed advisory patches on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patches
```

`salt.modules.zypper.list_installed_patterns()`

List installed patterns on the system.

CLI Examples:

```
salt '*' pkg.list_installed_patterns
```

`salt.modules.zypper.list_locks()`

List current package locks.

Return a dict containing the locked package with attributes:

```
{ '<package>': { 'case_sensitive': '<case_sensitive>',
                'match_type': '<match_type>'
                'type': '<type>'}}
```

CLI Example:

```
salt '*' pkg.list_locks
```

`salt.modules.zypper.list_patches(refresh=False)`

New in version 2017.7.0.

List all known advisory patches from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patches
```

`salt.modules.zypper.list_patterns(refresh=False)`

List all known patterns from available repos.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

CLI Examples:

```
salt '*' pkg.list_patterns
```

`salt.modules.zypper.list_pkgs(versions_as_list=False, **kwargs)`

List the packages currently installed as a dict. By default, the dict contains versions as a comma separated string:

```
{ '<package_name>': '<version>[,<version>...]' }
```

versions_as_list: If set to true, the versions are provided as a list

```
{ '<package_name>': ['<version>', '<version>'] }
```

attr: If a list of package attributes is specified, returned value will contain them in addition to version, eg:

```
{ '<package_name>': [{ 'version' : 'version', 'arch' : 'arch' } ] }
```

Valid attributes are: epoch, version, release, arch, install_date, install_date_time_t.

If all is specified, all valid attributes will be returned.

New in version 2018.3.0.

removed: not supported

purge_desired: not supported

CLI Example:

```
salt '*' pkg.list_pkgs
salt '*' pkg.list_pkgs attr=version,arch
salt '*' pkg.list_pkgs attr=['version', 'arch']
```

`salt.modules.zypper.list_products` (*all=False*, *refresh=False*)

List all available or installed SUSE products.

all List all products available or only installed. Default is False.

refresh force a refresh if set to True. If set to False (default) it depends on zypper if a refresh is executed.

Includes handling for OEM products, which read the OEM productline file and overwrite the release value.

CLI Examples:

```
salt '*' pkg.list_products
salt '*' pkg.list_products all=True
```

`salt.modules.zypper.list_provides` (**kwargs)

New in version 2018.3.0.

List package provides of installed packages as a dict. {'<provided_name>': ['<package_name>', '<package_name>', ...]}

CLI Examples:

```
salt '*' pkg.list_provides
```

`salt.modules.zypper.list_repo_pkgs` (*args, **kwargs)

New in version 2017.7.5,2018.3.1.

Returns all available packages. Optionally, package names (and name globs) can be passed and the results will be filtered to packages matching those names. This is recommended as it speeds up the function considerably.

This function can be helpful in discovering the version or repo to specify in a *pkg.installed* state.

The return data will be a dictionary mapping package names to a list of version numbers, ordered from newest to oldest. If *byrepo* is set to True, then the return dictionary will contain repository names at the top level, and each repository will map packages to lists of version numbers. For example:

```
# With byrepo=False (default)
{
  'bash': ['4.3-83.3.1',
           '4.3-82.6'],
  'vim': ['7.4.326-12.1']
}
{
  'OSS': {
    'bash': ['4.3-82.6'],
    'vim': ['7.4.326-12.1']
  },
  'OSS Update': {
    'bash': ['4.3-83.3.1']
  }
}
```

fromrepo [None] Only include results from the specified repo(s). Multiple repos can be specified, comma-separated.

byrepo [False] When True, the return data for each package will be organized by repository.

CLI Examples:

```

salt '*' pkg.list_repo_pkgs
salt '*' pkg.list_repo_pkgs foo bar baz
salt '*' pkg.list_repo_pkgs 'python2-*' byrepo=True
salt '*' pkg.list_repo_pkgs 'python2-*' fromrepo='OSS Updates'

```

`salt.modules.zypper.list_repos()`

Lists all repos.

CLI Example:

```

salt '*' pkg.list_repos

```

`salt.modules.zypper.list_upgrades(refresh=True, **kwargs)`

List all available package upgrades on this system

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

CLI Example:

```

salt '*' pkg.list_upgrades

```

`salt.modules.zypper.mod_repo(repo, **kwargs)`

Modify one or more values for a repo. If the repo does not exist, it will be created, so long as the following values are specified:

repo or **alias** alias by which Zypper refers to the repo

url, **mirrorlist** or **baseurl** the URL for Zypper to reference

enabled Enable or disable (True or False) repository, but do not remove if disabled.

refresh Enable or disable (True or False) auto-refresh of the repository.

cache Enable or disable (True or False) RPM files caching.

gpgcheck Enable or disable (True or False) GPG check for this repository.

gpgautoimport [False] If set to True, automatically trust and import public GPG key for the repository.

Key/Value pairs may also be removed from a repo's configuration by setting a key to a blank value. Bear in mind that a name cannot be deleted, and a URL can only be deleted if a **mirrorlist** is specified (or vice versa).

CLI Examples:

```

salt '*' pkg.mod_repo alias alias=new_alias
salt '*' pkg.mod_repo alias url=mirrorlist=http://host.com/

```

`salt.modules.zypper.modified(*packages, **flags)`

List the modified files that belong to a package. Not specifying any packages will return a list of `_all_` modified files on the system's RPM database.

New in version 2015.5.0.

Filtering by flags (True or False):

size Include only files where size changed.

mode Include only files which file's mode has been changed.

checksum Include only files which MD5 checksum has been changed.

device Include only files which major and minor numbers has been changed.

symlink Include only files which are symbolic link contents.

owner Include only files where owner has been changed.

group Include only files where group has been changed.

time Include only files where modification time of the file has been changed.

capabilities Include only files where capabilities differ or not. Note: supported only on newer RPM versions.

CLI Examples:

```
salt '*' pkg.modified
salt '*' pkg.modified httpd
salt '*' pkg.modified httpd postfix
salt '*' pkg.modified httpd owner=True group=False
```

`salt.modules.zypper.owner(*paths)`

Return the name of the package that owns the file. Multiple file paths can be passed. If a single path is passed, a string will be returned, and if multiple paths are passed, a dictionary of file/package name pairs will be returned.

If the file is not owned by a package, or is not present on the minion, then an empty string will be returned for that path.

CLI Examples:

```
salt '*' pkg.owner /usr/bin/apachectl
salt '*' pkg.owner /usr/bin/apachectl /etc/httpd/conf/httpd.conf
```

`salt.modules.zypper.purge(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Recursively remove a package and all dependencies which were installed with it, this will call a `zypper -n remove -u`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The name parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.purge <package name>
salt '*' pkg.purge <package1>,<package2>,<package3>
salt '*' pkg.purge pkgs='["foo", "bar"]'
```

`salt.modules.zypper.refresh_db()`

Force a repository refresh by calling `zypper refresh --force`, return a dict:

```
{'<database name>': Bool}
```

CLI Example:

```
salt '*' pkg.refresh_db
```

`salt.modules.zypper.remove(name=None, pkgs=None, **kwargs)`

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running `systemd<=205`, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep `systemd` from killing any `zypper` commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Remove packages with `zypper -n remove`

name The name of the package to be deleted.

Multiple Package Options:

pkgs A list of packages to delete. Must be passed as a python list. The **name** parameter will be ignored if this option is passed.

New in version 0.16.0.

Returns a dict containing the changes.

CLI Example:

```
salt '*' pkg.remove <package name>
salt '*' pkg.remove <package1>,<package2>,<package3>
salt '*' pkg.remove pkgs=['foo', 'bar']'
```

`salt.modules.zypper.remove_lock`(*packages*, ***kwargs*)

Remove specified package lock.

CLI Example:

```
salt '*' pkg.remove_lock <package name>
salt '*' pkg.remove_lock <package1>,<package2>,<package3>
salt '*' pkg.remove_lock pkgs=['foo', 'bar']'
```

`salt.modules.zypper.resolve_capabilities`(*pkgs*, *refresh*, ***kwargs*)

New in version 2018.3.0.

Convert name provides in *pkgs* into real package names if `resolve_capabilities` parameter is set to True. In case of `resolve_capabilities` is set to False the package list is returned unchanged.

refresh force a refresh if set to True. If set to False (default) it depends on `zypper` if a refresh is executed.

resolve_capabilities If this option is set to True the input will be checked if a package with this name exists. If not, this function will search for a package which provides this name. If one is found the output is exchanged with the real package name. In case this option is set to False (Default) the input will be returned unchanged.

CLI Examples:

```
salt '*' pkg.resolve_capabilities resolve_capabilities=True w3m_ssl
```

`salt.modules.zypper.search`(*criteria*, *refresh=False*, ***kwargs*)

List known packages, available to the system.

refresh force a refresh if set to True. If set to False (default) it depends on `zypper` if a refresh is executed.

match (*str*) One of *exact*, *words*, *substrings*. Search for an *exact* match or for the whole *words* only. Default to *substrings* to patch partial words.

provides (*bool*) Search for packages which provide the search strings.

recommends (*bool*) Search for packages which recommend the search strings.

requires (*bool*) Search for packages which require the search strings.

suggests (*bool*) Search for packages which suggest the search strings.

conflicts (*bool*) Search packages conflicting with search strings.

obsoletes (*bool*) Search for packages which obsolete the search strings.

file_list (*bool*) Search for a match in the file list of packages.

search_descriptions (*bool*) Search also in package summaries and descriptions.

case_sensitive (*bool*) Perform case-sensitive search.

installed_only (*bool*) Show only installed packages.

not_installed_only (*bool*) Show only packages which are not installed.

details (*bool*) Show version and repository

CLI Examples:

```
salt '*' pkg.search <criteria>
```

`salt.modules.zypper.upgrade`(*refresh=True, dryrun=False, dist_upgrade=False, fromrepo=None, novendorchange=False, skip_verify=False, **kwargs*)

Changed in version 2015.8.12,2016.3.3,2016.11.0: On minions running systemd<=205, `systemd-run(1)` is now used to isolate commands which modify installed packages from the `salt-minion` daemon's control group. This is done to keep systemd from killing any zypper commands spawned by Salt when the `salt-minion` service is restarted. (see `KillMode` in the `systemd.kill(5)` manpage for more information). If desired, usage of `systemd-run(1)` can be suppressed by setting a *config option* called `systemd.scope`, with a value of `False` (no quotes).

Run a full system upgrade, a zypper upgrade

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed.

dryrun If set to True, it creates a debug solver log file and then perform a dry-run upgrade (no changes are made). Default: False

dist_upgrade Perform a system dist-upgrade. Default: False

fromrepo Specify a list of package repositories to upgrade from. Default: None

novendorchange If set to True, no allow vendor changes. Default: False

skip_verify Skip the GPG verification check (e.g., `--no-gpg-checks`)

Returns a dictionary containing the changes:

```
{'<package>': {'old': '<old-version>',
               'new': '<new-version>'}}
```

CLI Example:

```
salt '*' pkg.upgrade
salt '*' pkg.upgrade dist-upgrade=True fromrepo='["MyRepoName"]'
↳ novendorchange=True
salt '*' pkg.upgrade dist-upgrade=True dryrun=True
```

`salt.modules.zypper.upgrade_available`(*name, **kwargs*)

Check whether or not an upgrade is available for a given package

refresh force a refresh if set to True (default). If set to False it depends on zypper if a refresh is executed or not.

CLI Example:

```
salt '*' pkg.upgrade_available <package name>
```

`salt.modules.zypper.verify`(**names, **kwargs*)

Runs an `rpm -Va` on a system, and returns the results in a dict

Files with an attribute of `config`, `doc`, `ghost`, `license` or `readme` in the package header can be ignored using the `ignore_types` keyword argument

CLI Example:

```
salt '*' pkg.verify
salt '*' pkg.verify httpd
salt '*' pkg.verify 'httpd postfix'
salt '*' pkg.verify 'httpd postfix' ignore_types=['config','doc']
```

`salt.modules.zypper.version`(**names, **kwargs*)

Returns a string representing the package version or an empty dict if not installed. If more than one package name is specified, a dict of name/version pairs is returned.

CLI Example:

```
salt '*' pkg.version <package name>
salt '*' pkg.version <package1> <package2> <package3> ...
```

`salt.modules.zypper.version_cmp` (*ver1*, *ver2*, *ignore_epoch=False*)

New in version 2015.5.4.

Do a cmp-style comparison on two packages. Return -1 if *ver1* < *ver2*, 0 if *ver1* == *ver2*, and 1 if *ver1* > *ver2*. Return None if there was a problem making the comparison.

ignore_epoch [False] Set to True to ignore the epoch when comparing versions

New in version 2015.8.10,2016.3.2.

CLI Example:

```
salt '*' pkg.version_cmp '0.2-001' '0.2.0.1-002'
```

A REST API for Salt

depends

- CherryPy Python module.

Note: there is a [known SSL traceback for CherryPy versions 3.2.5 through 3.7.x](#). Please use version 3.2.3 or the latest 10.x version instead.

optdepends

- ws4py Python module for websockets support.

client_libraries

- Java: <https://github.com/SUSE/salt-netapi-client>
- Python: <https://github.com/saltstack/pepper>

setup All steps below are performed on the machine running the Salt Master daemon. Configuration goes into the Master configuration file.

1. Install `salt-api`. (This step varies between OS and Linux distros. Some package systems have a split package, others include `salt-api` in the main Salt package. Ensure the `salt-api --version` output matches the `salt --version` output.)
2. Install CherryPy. (Read the version caveat in the section above.)
3. Optional: generate self-signed SSL certificates.

Using a secure HTTPS connection is strongly recommended since Salt eauth authentication credentials will be sent over the wire.

1. Install the PyOpenSSL package.
2. Generate a self-signed certificate using the `create_self_signed_cert()` execution function.

```
salt-call --local tls.create_self_signed_cert
```

4. Edit the master config to create at least one external auth user or group following the [full external auth instructions](#).
5. Edit the master config with the following production-ready example to enable the `rest_cherrypy` module. (Adjust cert paths as needed, or disable SSL (not recommended!))

```

rest_cherrypy:
  port: 8000
  ssl_cert: /etc/pki/tls/certs/localhost.crt
  ssl_key: /etc/pki/tls/certs/localhost.key

```

6. Restart the `salt-master` daemon.

7. Start the `salt-api` daemon.

configuration All available configuration options are detailed below. These settings configure the CherryPy HTTP server and do not apply when using an external server such as Apache or Nginx.

port Required

The port for the webserver to listen on.

host [0.0.0.0] The socket interface for the HTTP server to listen on.

debug [False] Starts the web server in development mode. It will reload itself when the underlying code is changed and will output more debugging info.

log_access_file Path to a file to write HTTP access logs.

New in version 2016.11.0.

log_error_file Path to a file to write HTTP error logs.

New in version 2016.11.0.

ssl_cert The path to a SSL certificate. (See below)

ssl_key The path to the private key for your SSL certificate. (See below)

ssl_chain (Optional when using PyOpenSSL) the certificate chain to pass to `Context.load_verify_locations`.

disable_ssl A flag to disable SSL. Warning: your Salt authentication credentials will be sent in the clear!

webhook_disable_auth [False] The *Webhook* URL requires authentication by default but external services cannot always be configured to send authentication. See the Webhook documentation for suggestions on securing this interface.

webhook_url [/hook] Configure the URL endpoint for the *Webhook* entry point.

thread_pool [100] The number of worker threads to start up in the pool.

socket_queue_size [30] Specify the maximum number of HTTP connections to queue.

expire_responses [True] Whether to check for and kill HTTP responses that have exceeded the default timeout.

Deprecated since version 2016.11.9,2017.7.3,2018.3.0: The "expire_responses" configuration setting, which corresponds to the `timeout_monitor` setting in CherryPy, is no longer supported in CherryPy versions $\geq 12.0.0$.

max_request_body_size [1048576] Maximum size for the HTTP request body.

collect_stats [False] Collect and report statistics about the CherryPy server

Reports are available via the *Stats* URL.

stats_disable_auth [False] Do not require authentication to access the `/stats` endpoint.

New in version 2018.3.0.

static A filesystem path to static HTML/JavaScript/CSS/image assets.

static_path [/static] The URL prefix to use when serving static assets out of the directory specified in the `static` setting.

enable_sessions [True] Enable or disable all endpoints that rely on session cookies. This can be useful to enforce only header-based authentication.

New in version 2017.7.0.

app [`index.html`] A filesystem path to an HTML file that will be served as a static file. This is useful for bootstrapping a single-page JavaScript app.

Warning! If you set this option to a custom web application, anything that uses cookie-based authentication is vulnerable to XSRF attacks. Send the custom `X-Auth-Token` header instead and consider disabling the `enable_sessions` setting.

Changed in version 2017.7.0: Add a proof-of-concept JavaScript single-page app.

app_path [`/app`] The URL prefix to use for serving the HTML file specified in the `app` setting. This should be a simple name containing no slashes.

Any path information after the specified path is ignored; this is useful for apps that utilize the HTML5 history API.

root_prefix [`/`] A URL path to the main entry point for the application. This is useful for serving multiple applications from the same URL.

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the `Login` URL.

The token may be sent in one of two ways: as a custom header or as a session cookie. The latter is far more convenient for clients that support cookies.

- Include a custom header named `X-Auth-Token`.

For example, using curl:

```
curl -sSk https://localhost:8000/login \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \
  -d password=saltdev \
  -d eauth=auto
```

Copy the token value from the output and include it in subsequent requests:

```
curl -sSk https://localhost:8000 \
  -H 'Accept: application/x-yaml' \
  -H 'X-Auth-Token: 697adbdc8fe971d09ae4c2a3add7248859c87079' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping
```

- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

For example, using curl:

```
# Write the cookie file:
curl -sSk https://localhost:8000/login \
  -c ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d username=saltdev \
  -d password=saltdev \
  -d eauth=auto

# Read the cookie file:
```

(continues on next page)

(continued from previous page)

```
curl -sSk https://localhost:8000 \
  -b ~/cookies.txt \
  -H 'Accept: application/x-yaml' \
  -d client=local \
  -d tgt='*' \
  -d fun=test.ping
```

Another example using the **requests** library in Python:

```
>>> import requests
>>> session = requests.Session()
>>> session.post('http://localhost:8000/login', json={
    'username': 'saltdev',
    'password': 'saltdev',
    'eauth': 'auto',
})
<Response [200]>
>>> resp = session.post('http://localhost:8000', json=[{
    'client': 'local',
    'tgt': '*',
    'fun': 'test.arg',
    'arg': ['foo', 'bar'],
    'kwarg': {'baz': 'Baz!'}},
])
>>> resp.json()
{'return': [{
    ...snip...
}]}
```

See also:

You can bypass the session handling via the *Run* URL.

Usage

This interface directly exposes Salt's *Python API*. Everything possible at the CLI is possible through the Python API. Commands are executed on the Salt Master.

The root URL (/) is RPC-like in that it accepts instructions in the request body for what Salt functions to execute, and the response contains the result of those function calls.

For example:

```
% curl -sSi https://localhost:8000 -H 'Content-type: application/json'
↪ -d '[{
    "client": "local",
    "tgt": "*",
    "fun": "test.ping"
}]'
HTTP/1.1 200 OK
Content-Type: application/json
[...snip...]

{"return": [{"jerry": true}]}
```

The request body must be an array of commands. Use this workflow to build a command:

1. Choose a client interface.
2. Choose a function.
3. Fill out the remaining parameters needed for the chosen client.

The `client` field is a reference to the main Python classes used in Salt's Python API. Read the full [Client APIs](#) documentation, but in short:

- "local" uses [LocalClient](#) which sends commands to Minions. Equivalent to the `salt` CLI command.
- "runner" uses [RunnerClient](#) which invokes runner modules on the Master. Equivalent to the `salt-run` CLI command.
- "wheel" uses [WheelClient](#) which invokes wheel modules on the Master. Wheel modules do not have a direct CLI equivalent but they typically manage Master-side resources such as state files, pillar files, the Salt config files, and the [key wheel module](#) exposes similar functionality as the `salt-key` CLI command.

Most clients have variants like synchronous or asynchronous execution as well as others like batch execution. See the [full list of client interfaces](#).

Each client requires different arguments and sometimes has different syntax. For example, `LocalClient` requires the `tgt` argument because it forwards the command to Minions and the other client interfaces do not. `LocalClient` also takes `arg` (array) and `kwarg` (dictionary) arguments because these values are sent to the Minions and used to execute the requested function there. `RunnerClient` and `WheelClient` are executed directly on the Master and thus do not need or accept those arguments.

Read the method signatures in the client documentation linked above, but hopefully an example will help illustrate the concept. This example causes Salt to execute two functions – the [test.arg execution function](#) using `LocalClient` and the [test.arg runner function](#) using `RunnerClient`; note the different structure for each command. The results for both are combined and returned as one response.

```
% curl -b ~/cookies.txt -sSi localhost:8000 -H 'Content-type: application/json
↪ ' -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.arg",
    "arg": ["positional arg one", "positional arg two"],
    "kwarg": {
      "keyword arg one": "Hello from a minion",
      "keyword arg two": "Hello again from a minion"
    }
  },
  {
    "client": "runner",
    "fun": "test.arg",
    "keyword arg one": "Hello from a master",
    "keyword arg two": "Runners do not support positional args"
  }
],
'
```

```
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "args": [
```

(continues on next page)

(continued from previous page)

```

        "positional arg one",
        "positional arg two"
    ],
    "kwargs": {
        "keyword arg one": "Hello from a minion",
        "keyword arg two": "Hello again from a minion",
        [...snip...]
    }
},
[...snip; other minion returns here...]
},
{
    "args": [],
    "kwargs": {
        "keyword arg two": "Runners do not support positional args",
        "keyword arg one": "Hello from a master"
    }
}
]
}

```

One more example, this time with more commonly used functions:

```

curl -b /tmp/cookies.txt -sSi localhost:8000      -H 'Content-type: application/
↪json'      -d '
[
  {
    "client": "local",
    "tgt": "*",
    "fun": "state.sls",
    "kwarg": {
      "mods": "apache",
      "pillar": {
        "lookup": {
          "wwwdir": "/srv/httpd/htdocs"
        }
      }
    }
  },
  {
    "client": "runner",
    "fun": "cloud.create",
    "provider": "my-ec2-provider",
    "instances": "my-centos-6",
    "image": "ami-1624987f",
    "delvol_on_destroy": true
  }
]
'
HTTP/1.1 200 OK
[...snip...]
{
  "return": [
    {
      "jerry": {
        "pkg_|-install_apache_|-httpd_|-installed": {

```

(continues on next page)

(continued from previous page)

```

        [...snip full state return here...]
    }
}
[...snip other minion returns here...]
},
{
    [...snip full salt-cloud output here...]
}
]
}

```

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

We recommend the JSON format for most HTTP requests. urlencoded data is simple and cannot express complex data structures – and that is often required for some Salt commands, such as starting a state run that uses Pillar data. Salt’s CLI tool can reformat strings passed in at the CLI into complex data structures, and that behavior also works via salt-api, but that can be brittle and since salt-api can accept JSON it is best just to send JSON.

Here is an example of sending urlencoded data:

```

curl -sSik https://localhost:8000 \
  -b ~/cookies.txt \
  -d client=runner \
  -d fun='jobs.lookup_jid' \
  -d jid='20150129182456704682'

```

urlencoded data caveats

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated query string parameters. E.g., `?foo[]=fooone&foo[]=footwo`. This is **not** supported; send `?foo=fooone&foo=footwo` instead, or send JSON or YAML.

A note about `curl`

The `-d` flag to `curl` does *not* automatically urlencode data which can affect passwords and other data that contains characters that must be encoded. Use the `--data-urlencode` flag instead. E.g.:

```

curl -ksi http://localhost:8000/login \
  -H "Accept: application/json" \
  -d username='myapiuser' \
  --data-urlencode password='1234+' \
  -d eauth='pam'

```

Performance Expectations and Recommended Usage

This module provides a thin wrapper around *Salt's Python API*. Executing a Salt command via `rest_cherry.py` is directly analogous to executing a Salt command via Salt's CLI (which also uses the Python API) – they share the same semantics, performance characteristics, and 98% of the same code. As a rule-of-thumb: if you wouldn't do it at the CLI don't do it via this API.

Long-Running HTTP Connections

The CherryPy server is a production-ready, threading HTTP server written in Python. Because it makes use of a thread pool to process HTTP requests it is not ideally suited to maintaining large numbers of concurrent, synchronous connections. On moderate hardware with default settings it should top-out at around 30 to 50 concurrent connections.

That number of long-running, synchronous Salt processes is also not ideal. Like at the CLI, each Salt command run will start a process that instantiates its own `LocalClient`, which instantiates its own listener to the Salt event bus, and sends out its own periodic `saltutil.find_job` queries to determine if a Minion is still running the command. Not exactly a lightweight operation.

Timeouts

In addition to the above resource overhead for long-running connections, there are the usual HTTP timeout semantics for the CherryPy server, any HTTP client being used, as well as any hardware in between such as proxies, gateways, or load balancers. `rest_cherry.py` can be configured not to time-out long responses via the `expire_responses` setting, and both `LocalClient` and `RunnerClient` have their own timeout parameters that may be passed as top-level keywords:

```
curl -b /tmp/cookies.txt -sSi localhost:8000 -H 'Content-type: application/
→json' -d '[
  {
    "client": "local",
    "tgt": "*",
    "fun": "test.sleep",
    "kwarg": {"length": 30},
    "timeout": 60
  },
  {
    "client": "runner",
    "fun": "test.sleep",
    "kwarg": {"s_time": 30},
    "timeout": 60
  }
]
```

Best Practices

Given the performance overhead and HTTP timeouts for long-running operations described above, the most effective and most scalable way to use both Salt and `salt-api` is to run commands asynchronously using the `local_async`, `runner_async`, and `wheel_async` clients.

Running asynchronous jobs results in being able to process 3x more commands per second for `LocalClient` and 17x more commands per second for `RunnerClient`, in addition to much less network traffic and memory requirements. Job returns can be fetched from Salt's job cache via the `/jobs/<jid>` endpoint, or they can be collected into a data store using Salt's *Returner system*.

The `/events` endpoint is specifically designed to handle long-running HTTP connections and it exposes Salt's event bus which includes job returns. Watching this endpoint first, then executing asynchronous Salt commands second, is the most lightweight and scalable way to use `rest_cherry` while still receiving job returns in real-time. But this requires clients that can properly handle the inherent asynchronicity of that workflow.

Performance Tuning

The `thread_pool` and `socket_queue_size` settings can be used to increase the capacity of `rest_cherry` to handle incoming requests. Keep an eye on RAM usage as well as available file handles while testing changes to these settings. As `salt-api` is a thin wrapper around Salt's Python API, also keep an eye on the performance of Salt when testing.

Future Plans

Now that Salt uses the Tornado concurrency library internally, we plan to improve performance in the API by taking advantage of existing processes and event listeners and to use lightweight coroutines to facilitate more simultaneous HTTP connections and better support for synchronous operations. That effort can be tracked in [issue 26505](#), but until that issue is closed `rest_cherry` will remain the officially recommended REST API.

Deployment

The `rest_cherry` `netapi` module is a standard Python WSGI app. It can be deployed one of two ways.

`salt-api` using the CherryPy server

The default configuration is to run this module using `salt-api` to start the Python-based CherryPy server. This server is lightweight, multi-threaded, encrypted with SSL, and should be considered production-ready. See the section above for performance expectations.

Using a WSGI-compliant web server

This module may be deployed on any WSGI-compliant server such as Apache with `mod_wsgi` or Nginx with `FastCGI`, to name just two (there are many).

Note, external WSGI servers handle URLs, paths, and SSL certs directly. The `rest_cherry` configuration options are ignored and the `salt-api` daemon does not need to be running at all. Remember Salt authentication credentials are sent in the clear unless SSL is being enforced!

An example Apache virtual host configuration:

```
<VirtualHost *:80>
    ServerName example.com
    ServerAlias *.example.com

    ServerAdmin webmaster@example.com
```

(continues on next page)

(continued from previous page)

```

LogLevel warn
ErrorLog /var/www/example.com/logs/error.log
CustomLog /var/www/example.com/logs/access.log combined

DocumentRoot /var/www/example.com/htdocs

WSGIScriptAlias / /path/to/salt/netapi/rest_cherry.py
</VirtualHost>

```

GET /

Request Headers

- **Accept** – the desired response format.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000
```

```
GET / HTTP/1.1
Host: localhost:8000
Accept: application/json
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
```

POST

Mock out specified imports.

This allows autodoc to do its thing without having oodles of req'd installed libs. This doesn't work with `import * imports`.

This Mock class can be configured to return a specific values at specific names, if required.

<http://read-the-docs.readthedocs.org/en/latest/faq.html#i-get-import-errors-on-libraries-that-depend-on-c-modules>

/login

class salt.netapi.rest_cherry.py.app.Login(*args, **kwargs)

Log in to receive a session token

Authentication information.

GET()

Present the login interface

GET /login

An explanation of how to log in.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/login
```

```
GET /login HTTP/1.1
Host: localhost:8000
Accept: text/html
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: text/html
```

POST (**kwargs)

Authenticate against Salt's eauth system

POST /login

Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

Form Parameters

- **eauth** – the eauth backend configured for the user
- **username** – username
- **password** – password

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -si localhost:8000/login \
  -c ~/cookies.txt \
  -H "Accept: application/json" \
  -H "Content-type: application/json" \
  -d '{
    "username": "saltuser",
    "password": "saltuser",
    "eauth": "auto"
  }'
```

```
POST / HTTP/1.1
Host: localhost:8000
Content-Length: 42
```

(continues on next page)

(continued from previous page)

```
Content-Type: application/json
Accept: application/json

{"username": "saltuser", "password": "saltuser", "eauth": "auto"}
```

Example response:

```
HTTP/1.1 200 OK
Content-Type: application/json
Content-Length: 206
X-Auth-Token: 6d1b722e
Set-Cookie: session_id=6d1b722e; expires=Sat, 17 Nov 2012 03:23:52 GMT;␣
↳Path=/

{"return": {
  "token": "6d1b722e",
  "start": 1363805943.776223,
  "expire": 1363849143.776224,
  "user": "saltuser",
  "eauth": "pam",
  "perms": [
    "grains.*",
    "status.*",
    "sys.*",
    "test.*"
  ]
}}
```

/logout**class** salt.netapi.rest_cherry.py.app.**Logout**

Class to remove or invalidate sessions

POST()

Destroy the currently active session and expire the session cookie

/minions**class** salt.netapi.rest_cherry.py.app.**Minions**

Convenience URLs for working with minions

GET (*mid=None*)

A convenience URL for getting lists of minions or getting minion details

GET **/minions/** (*mid*)

Request Headers

- **X-Auth-Token** – a session token from [Login](#).
- **Accept** – the desired response format.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/minions/ms-3
```

```
GET /minions/ms-3 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 129005
Content-Type: application/x-yaml

return:
- ms-3:
  grains.items:
    ...
```

POST (***kwargs*)

Start an execution command and immediately return the job id

POST /minions

Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.
- **Content-Type** – the format of the request body.

Response Headers

- **Content-Type** – the format of the response body; depends on the *Accept* request header.

Status Codes

- **200** – success
- **400** – bad or malformed request
- **401** – authentication required
- **406** – requested Content-Type not available

Lowstate data describing Salt commands must be sent in the request body. The `client` option will be set to `local_async()`.

Example request:

```
curl -sSi localhost:8000/minions \
  -b ~/cookies.txt \
  -H "Accept: application/x-yaml" \
  -d '["tgt": "*", "fun": "status.diskusage"]'
```

```
POST /minions HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Type: application/json

tgt=*&fun=status.diskusage
```

Example response:

```
HTTP/1.1 202 Accepted
Content-Length: 86
Content-Type: application/x-yaml
```

(continues on next page)

(continued from previous page)

```

return:
- jid: '20130603122505459265'
  minions: [ms-4, ms-3, ms-2, ms-1, ms-0]
_links:
  jobs:
    - href: /jobs/20130603122505459265

```

/jobs

class salt.netapi.rest_cherry.py.app.**Jobs**

GET (*jid=None, timeout=""*)

A convenience URL for getting lists of previously run jobs or getting the return from a single job

GET **/jobs/**(*jid*)

List jobs or show a single job from the job cache.

Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/jobs
```

```
GET /jobs HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
- '20121130104633606931':
  Arguments:
  - '3'
  Function: test.fib
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: jerry
  Target-type: glob

```

Example request:

```
curl -i localhost:8000/jobs/20121130104633606931
```

```
GET /jobs/20121130104633606931 HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

info:
- Arguments:
  - '3'
  Function: test.fib
  Minions:
  - jerry
  Start Time: 2012, Nov 30 10:46:33.606931
  Target: '*'
  Target-type: glob
  User: saltdev
  jid: '20121130104633606931'
return:
- jerry:
  - - 0
  - 1
  - 1
  - 2
  - 6.9141387939453125e-06

```

/run**class** salt.netapi.rest_cherry.py.app.Run

Run commands bypassing the *normal session handling*

salt-api does not enforce authorization, Salt's eauth system does that. Local/Runner/WheelClient all accept username/password/eauth or token kwargs that are then checked by the eauth system. The session mechanism in rest_cherry simply pairs a session with a Salt eauth token and then passes the token kwarg in automatically.

If you already have a Salt eauth token, perhaps generated by the *mk_token* function in the Auth Runner module, then there is no reason to use sessions.

This endpoint accepts either a username, password, eauth trio, or a token kwarg and does not make use of sessions at all.

POST (**kwargs)

Run commands bypassing the *normal session handling* Other than that this URL is identical to the *root URL* (/).

POST /run

An array of lowstate data describing Salt commands must be sent in the request body.

Status Codes

- **200** – success
- **400** – bad or malformed request
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```

curl -sS localhost:8000/run \
  -H 'Accept: application/x-yaml' \

```

(continues on next page)

(continued from previous page)

```
-H 'Content-type: application/json' \
-d '[[
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "username": "saltdev",
  "password": "saltdev",
  "eauth": "auto"
]]'
```

Or using a Salt Eauth token:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-H 'Content-type: application/json' \
-d '[[
  "client": "local",
  "tgt": "*",
  "fun": "test.ping",
  "token": "<salt eauth token here>"
]]'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/json

[{"client": "local", "tgt": "*", "fun": "test.ping", "username": "saltdev",
  ↪"password": "saltdev", "eauth": "auto"}]
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
- ms-0: true
  ms-1: true
  ms-2: true
  ms-3: true
  ms-4: true
```

The /run endpoint can also be used to issue commands using the salt-ssh subsystem.

When using salt-ssh, eauth credentials should not be supplied. Instead, authentication should be handled by the SSH layer itself. The use of the salt-ssh client does not require a salt master to be running. Instead, only a roster file must be present in the salt configuration directory.

All SSH client requests are synchronous.

Example SSH client request:

```
curl -sS localhost:8000/run \
-H 'Accept: application/x-yaml' \
-d client='ssh' \
```

(continues on next page)

(continued from previous page)

```
-d tgt='*' \
-d fun='test.ping'
```

```
POST /run HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
Content-Length: 75
Content-Type: application/x-www-form-urlencoded

client=ssh&tgt=*&fun=test.ping
```

Example SSH response:

```
return:
- silver:
  fun: test.ping
  fun_args: []
  id: silver
  jid: '20141203103525666185'
  retcode: 0
  return: true
  success: true
```

/events**class** salt.netapi.rest_cherry.py.app.Events

Expose the Salt event bus

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure.

See also:

[Events & Reactor](#)**GET** (*token=None, salt_token=None*)

An HTTP stream of the Salt master event bus

This stream is formatted per the Server Sent Events (SSE) spec. Each event is formatted as JSON.

GET /events

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Query Parameters

- **token** – optional parameter containing the token ordinarily supplied via the X-Auth-Token header in order to allow cross-domain requests in browsers that do not include CORS support in the EventSource API. E.g., `curl -NsS localhost:8000/events?token=308650d`
- **salt_token** – optional parameter containing a raw Salt *auth token* (not to be confused with the token returned from the /login URL). E.g., `curl -NsS localhost:8000/events?salt_token=30742765`

Example request:

```
curl -NsS localhost:8000/events
```

```
GET /events HTTP/1.1
Host: localhost:8000
```

Example response:

Note, the `tag` field is not part of the spec. SSE compliant clients should ignore unknown fields. This addition allows non-compliant clients to only watch for certain tags without having to deserialize the JSON object each time.

```
HTTP/1.1 200 OK
Connection: keep-alive
Cache-Control: no-cache
Content-Type: text/event-stream;charset=utf-8

retry: 400

tag: salt/job/20130802115730568475/new
data: {'tag': 'salt/job/20130802115730568475/new', 'data': {'minions': ['ms-4
↪', 'ms-3', 'ms-2', 'ms-1', 'ms-0']}}

tag: salt/job/20130802115730568475/ret/jerry
data: {'tag': 'salt/job/20130802115730568475/ret/jerry', 'data': {'jid':
↪ '20130802115730568475', 'return': True, 'retcode': 0, 'success': True, 'cmd
↪': '_return', 'fun': 'test.ping', 'id': 'ms-1'}}
```

The event stream can be easily consumed via JavaScript:

```
var source = new EventSource('/events');
source.onopen = function() { console.info('Listening ...') };
source.onerror = function(err) { console.error(err) };
source.onmessage = function(message) {
    var saltEvent = JSON.parse(message.data);
    console.log(saltEvent.tag, saltEvent.data);
};
```

Note, the SSE stream is fast and completely asynchronous and Salt is very fast. If a job is created using a regular POST request, it is possible that the job return will be available on the SSE stream before the response for the POST request arrives. It is important to take that asynchronicity into account when designing an application. Below are some general guidelines.

- Subscribe to the SSE stream `_before_` creating any events.
- Process SSE events directly as they arrive and don't wait for any other process to "complete" first (like an ajax request).
- Keep a buffer of events if the event stream must be used for synchronous lookups.
- Be cautious in writing Salt's event stream directly to the DOM. It is very busy and can quickly overwhelm the memory allocated to a browser tab.

A full, working proof-of-concept JavaScript application is available [adjacent to this file](#). It can be viewed by pointing a browser at the `/app` endpoint in a running `rest_cherryypy` instance.

Or using CORS:

```
var source = new EventSource('/events?
↪token=ecd589e4e01912cf3c4035afad73426dbb8dba75', {withCredentials: true});
```

It is also possible to consume the stream via the shell.

Records are separated by blank lines; the `data:` and `tag:` prefixes will need to be removed manually before attempting to unserialize the JSON.

curl's `-N` flag turns off input buffering which is required to process the stream incrementally.

Here is a basic example of printing each event as it comes in:

```
curl -NsS localhost:8000/events | \
  while IFS= read -r line ; do
    echo $line
  done
```

Here is an example of using `awk` to filter events based on tag:

```
curl -NsS localhost:8000/events | \
  awk '
    BEGIN { RS=""; FS="\n" }
    $1 ~ /^tag: salt\/job\/[0-9]+\\/new$/ { print $0 }
  '
tag: salt/job/20140112010149808995/new
data: {"tag": "salt/job/20140112010149808995/new", "data": {"tgt_type": "glob
↪", "jid": "20140112010149808995", "tgt": "jerry", "_stamp": "2014-01-12_
↪01:01:49.809617", "user": "shouse", "arg": [], "fun": "test.ping", "minions
↪": ["jerry"]}}
tag: 20140112010149808995
data: {"tag": "20140112010149808995", "data": {"fun_args": [], "jid":
↪"20140112010149808995", "return": true, "retcode": 0, "success": true, "cmd
↪": "_return", "_stamp": "2014-01-12_01:01:49.819316", "fun": "test.ping",
↪"id": "jerry"}}
```

/hook

`class salt.netapi.rest_cherry.py.app.Webhook`

A generic web hook entry point that fires an event on Salt's event bus

External services can POST data to this URL to trigger an event in Salt. For example, Amazon SNS, Jenkins-CI or Travis-CI, or GitHub web hooks.

Note: Be mindful of security

Salt's Reactor can run any code. A Reactor SLS that responds to a hook event is responsible for validating that the event came from a trusted source and contains valid data.

This is a generic interface and securing it is up to you!

This URL requires authentication however not all external services can be configured to authenticate. For this reason authentication can be selectively disabled for this URL. Follow best practices – always use SSL, pass a secret key, configure the firewall to only allow traffic from a known source, etc.

The event data is taken from the request body. The *Content-Type* header is respected for the payload.

The event tag is prefixed with `salt/netapi/hook` and the URL path is appended to the end. For example, a POST request sent to `/hook/mycompany/myapp/mydata` will produce a Salt event with the tag `salt/netapi/hook/mycompany/myapp/mydata`.

The following is an example `.travis.yml` file to send notifications to Salt of successful test runs:

```

language: python
script: python -m unittest tests
after_success:
  - |
    curl -sSk https://saltapi-url.example.com:8000/hook/travis/build/success -d branch="${TRAVIS_BRANCH}" -d commit="${TRAVIS_COMMIT}"

```

See also:

Events & Reactor, reactor

POST (*args, **kwargs)

Fire an event in Salt with a custom event tag and data

POST /hook

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available
- **413** – request body is too large

Example request:

```

curl -sS localhost:8000/hook \
  -H 'Content-type: application/json' \
  -d '{"foo": "Foo!", "bar": "Bar!"}'

```

```

POST /hook HTTP/1.1
Host: localhost:8000
Content-Length: 16
Content-Type: application/json

{"foo": "Foo!", "bar": "Bar!"}

```

Example response:

```

HTTP/1.1 200 OK
Content-Length: 14
Content-Type: application/json

{"success": true}

```

As a practical example, an internal continuous-integration build server could send an HTTP POST request to the URL `https://localhost:8000/hook/mycompany/build/success` which contains the result of a build and the SHA of the version that was built as JSON. That would then produce the following event in Salt that could be used to kick off a deployment via Salt's Reactor:

```

Event fired at Fri Feb 14 17:40:11 2014
*****
Tag: salt/netapi/hook/mycompany/build/success
Data:
{'_stamp': '2014-02-14_17:40:11.440996',
  'headers': {
    'X-My-Secret-Key': 'F0fAgoQjIT@W',
    'Content-Length': '37',
    'Content-Type': 'application/json',

```

(continues on next page)

(continued from previous page)

```
'Host': 'localhost:8000',
'Remote-Addr': '127.0.0.1'},
'post': {'revision': 'aa22a3c4b2e7', 'result': True}}
```

Salt's Reactor could listen for the event:

```
reactor:
- 'salt/netapi/hook/mycompany/build/*':
- /srv/reactor/react_ci_builds.sls
```

And finally deploy the new build:

```
{% set secret_key = data.get('headers', {}).get('X-My-Secret-Key') %}
{% set build = data.get('post', {}) %}

{% if secret_key == 'F0fAgoQjIT@W' and build.result == True %}
deploy_my_app:
  cmd.state.sls:
    - tgt: 'application*'
    - arg:
      - myapp.deploy
    - kwarg:
      pillar:
        revision: {{ revision }}
{% endif %}
```

/keys

class salt.netapi.rest_cherry.py.app.Keys

Convenience URLs for working with minion keys

New in version 2014.7.0.

These URLs wrap the functionality provided by the *key wheel module* functions.

GET (*mid=None*)

Show the list of minion keys or detail on a specific key

New in version 2014.7.0.

GET /keys/ (*mid*)

List all keys or show a specific key

Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

Example request:

```
curl -i localhost:8000/keys
```

```
GET /keys HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 165
Content-Type: application/x-yaml

return:
  local:
    - master.pem
    - master.pub
  minions:
    - jerry
  minions_pre: []
  minions_rejected: []
```

Example request:

```
curl -i localhost:8000/keys/jerry
```

```
GET /keys/jerry HTTP/1.1
Host: localhost:8000
Accept: application/x-yaml
```

Example response:

```
HTTP/1.1 200 OK
Content-Length: 73
Content-Type: application/x-yaml

return:
  minions:
    jerry: 51:93:b3:d0:9f:3a:6d:e5:28:67:c2:4b:27:d6:cd:2b
```

POST (***kwargs*)

Easily generate keys for a minion and auto-accept the new key

Accepts all the same parameters as the [key.gen_accept](#).

Note: A note about curl Avoid using the `-i` flag or HTTP headers will be written and produce an invalid tar file.

Example partial kickstart script to bootstrap a new minion:

```
%post
mkdir -p /etc/salt/pki/minion
curl -sSk https://localhost:8000/keys \
    -d mid=jerry \
    -d username=kickstart \
    -d password=kickstart \
    -d eauth=pam \
    | tar -C /etc/salt/pki/minion -xf -
```

(continues on next page)

```
curl -NsS <...snip...> localhost:8000/ws?format_events
```

Reqheader X-Auth-Token an authentication token from *Login*.

Status 101 switching to the websockets protocol

Status 401 authentication required

Status 406 requested Content-Type not available

Example request:

```
curl -NsSk \
-H 'X-Auth-Token: ffedf49d' \
-H 'Host: localhost:8000' \
-H 'Connection: Upgrade' \
-H 'Upgrade: websocket' \
-H 'Origin: https://localhost:8000' \
-H 'Sec-WebSocket-Version: 13' \
-H 'Sec-WebSocket-Key: "$(echo -n $RANDOM | base64)"' \
localhost:8000/ws
```

```
GET /ws HTTP/1.1
Connection: Upgrade
Upgrade: websocket
Host: localhost:8000
Origin: https://localhost:8000
Sec-WebSocket-Version: 13
Sec-WebSocket-Key: s65VsgHigh7v/Jcf4nXHnA==
X-Auth-Token: ffedf49d
```

Example response:

```
HTTP/1.1 101 Switching Protocols
Upgrade: websocket
Connection: Upgrade
Sec-WebSocket-Accept: mWZjBV9FCglzn1rIKJAxrTFlnJE=
Sec-WebSocket-Version: 13
```

An authentication token **may optionally** be passed as part of the URL for browsers that cannot be configured to send the authentication header or cookie:

```
curl -NsS <...snip...> localhost:8000/ws/ffedf49d
```

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!
var source = new WebSocket('ws://localhost:8000/ws/d0ce6c1a');
source.onerror = function(e) { console.debug('error!', e); };
source.onmessage = function(e) { console.debug(e.data); };

source.send('websocket client ready')

source.close();
```

Or via Python, using the Python module `websocket-client` for example.

```
# Note, you must be authenticated!

from websocket import create_connection
```

(continues on next page)

(continued from previous page)

```

ws = create_connection('ws://localhost:8000/ws/d0ce6c1a')
ws.send('websocket client ready')

# Look at https://pypi.python.org/pypi/websocket-client/ for more
# examples.
while listening_to_events:
    print ws.recv()

ws.close()

```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

/stats

class salt.netapi.rest_cherry.py.app.Stats

Expose statistics on the running CherryPy server

GET()

Return a dump of statistics collected from the CherryPy server

GET /stats

Request Headers

- **X-Auth-Token** – a session token from *Login*.
- **Accept** – the desired response format.

Response Headers

- **Content-Type** – the format of the response body; depends on the *Accept* request header.

Status Codes

- **200** – success
- **401** – authentication required
- **406** – requested Content-Type not available

20.10.2 rest_tornado

A non-blocking REST API for Salt

depends

- tornado Python module

configuration All authentication is done through Salt's *external auth* system which requires additional configuration not described here.

In order to run `rest_tornado` with the salt-master add the following to the Salt master config file.

```

rest_tornado:
    # can be any port
    port: 8000
    # address to bind to (defaults to 0.0.0.0)
    address: 0.0.0.0
    # socket backlog
    backlog: 128

```

(continues on next page)

(continued from previous page)

```
ssl_cert: /etc/pki/api/certs/server.crt
# no need to specify ssl_key if cert and key
# are in one single file
ssl_key: /etc/pki/api/certs/server.key
debug: False
disable_ssl: False
webhook_disable_auth: False
cors_origin: null
```

Authentication

Authentication is performed by passing a session token with each request. Tokens are generated via the `SaltAuthHandler` URL.

The token may be sent in one of two ways:

- Include a custom header named `X-Auth-Token`.
- Sent via a cookie. This option is a convenience for HTTP clients that automatically handle cookie support (such as browsers).

See also:

You can bypass the session handling via the `RunSaltAPIHandler` URL.

CORS

`rest_tornado` supports Cross-site HTTP requests out of the box. It is by default deactivated and controlled by the `cors_origin` config key.

You can allow all origins by settings `cors_origin` to `*`.

You can allow only one origin with this configuration:

```
rest_tornado:
  cors_origin: http://salt.yourcompany.com
```

You can also be more specific and select only a few allowed origins by using a list. For example:

```
rest_tornado:
  cors_origin:
    - http://salt.yourcompany.com
    - http://salt-preprod.yourcompany.com
```

The format for origin are full URL, with both scheme and port if not standard.

In this case, `rest_tornado` will check if the Origin header is in the allowed list if it's the case allow the origin. Else it will returns nothing, effectively preventing the origin to make request.

For reference, CORS is a mechanism used by browser to allow (or disallow) requests made from browser from a different origin than salt-api. It's complementary to Authentication and mandatory only if you plan to use a salt client developed as a Javascript browser application.

Usage

Commands are sent to a running Salt master via this module by sending HTTP requests to the URLs detailed below.

Content negotiation

This REST interface is flexible in what data formats it will accept as well as what formats it will return (e.g., JSON, YAML, x-www-form-urlencoded).

- Specify the format of data in the request body by including the *Content-Type* header.
- Specify the desired data format for the response body with the *Accept* header.

Data sent in **POST** and **PUT** requests must be in the format of a list of lowstate dictionaries. This allows multiple commands to be executed in a single HTTP request.

lowstate A dictionary containing various keys that instruct Salt which command to run, where that command lives, any parameters for that command, any authentication credentials, what returner to use, etc.

Salt uses the lowstate data format internally in many places to pass command data between functions. Salt also uses lowstate for the *LocalClient()* Python API interface.

The following example (in JSON format) causes Salt to execute two commands:

```
[{
  "client": "local",
  "tgt": "*",
  "fun": "test.fib",
  "arg": ["10"]
},
{
  "client": "runner",
  "fun": "jobs.lookup_jid",
  "jid": "20130603122505459265"
}]
```

Multiple commands in a Salt API request will be executed in serial and makes no gaurantees that all commands will run. Meaning that if test.fib (from the example above) had an exception, the API would still execute "jobs.lookup_jid".

Responses to these lowstates are an in-order list of dicts containing the return data, a yaml response could look like:

```
- ms-1: true
  ms-2: true
- ms-1: foo
  ms-2: bar
```

In the event of an exception while executing a command the return for that lowstate will be a string, for example if no minions matched the first lowstate we would get a return like:

```
- No minions matched the target. No command was sent, no jid was assigned.
- ms-1: true
  ms-2: true
```

x-www-form-urlencoded

Sending JSON or YAML in the request body is simple and most flexible, however sending data in urlencoded format is also supported with the caveats below. It is the default format for HTML forms, many JavaScript libraries, and the **curl** command.

For example, the equivalent to running `salt '*' test.ping` is sending `fun=test.ping&arg&client=local&tgt=*` in the HTTP request body.

Caveats:

- Only a single command may be sent per HTTP request.
- Repeating the `arg` parameter multiple times will cause those parameters to be combined into a single list.

Note, some popular frameworks and languages (notably jQuery, PHP, and Ruby on Rails) will automatically append empty brackets onto repeated parameters. E.g., `arg=one`, `arg=two` will be sent as `arg[]=one`, `arg[]=two`. This is not supported; send JSON or YAML instead.

A Websockets add-on to saltnado

depends

- tornado Python module

In order to enable `saltnado_websockets` you must add `websockets: True` to your `saltnado` config block.

```
rest_tornado:
  # can be any port
  port: 8000
  ssl_cert: /etc/pki/api/certs/server.crt
  # no need to specify ssl_key if cert and key
  # are in one single file
  ssl_key: /etc/pki/api/certs/server.key
  debug: False
  disable_ssl: False
  websockets: True
```

All Events

Exposes all "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
  -H "Accept: application/json" \
  -d username='salt' \
  -d password='salt' \
  -d eauth='pam'
```

Which results in the response

```
{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();
```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado` client.

```
# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/all_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()          # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
↳self signed cert
```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Formatted Events

Exposes `formatted` "real-time" events from Salt's event bus on a websocket connection. It should be noted that "Real-time" here means these events are made available to the server as soon as any salt related action (changes to minions, new jobs etc) happens. Clients are however assumed to be able to tolerate any network transport related latencies. Functionality provided by this endpoint is similar to the `/events` end point.

The event bus on the Salt master exposes a large variety of things, notably when executions are started on the master and also when minions ultimately return their results. This URL provides a real-time window into a running Salt infrastructure. Uses websocket as the transport mechanism.

Formatted events parses the raw "real time" event stream and maintains a current view of the following:

- minions
- jobs

A change to the minions (such as addition, removal of keys or connection drops) or jobs is processed and clients are updated. Since we use salt's presence events to track minions, please enable `presence_events` and set a small value for the `loop_interval` in the salt master config file.

Exposes GET method to return websocket connections. All requests should include an auth token. A way to obtain authentication tokens is shown below.

```
% curl -si localhost:8000/login \
  -H "Accept: application/json" \
  -d username='salt' \
  -d password='salt' \
  -d eauth='pam'
```

Which results in the response

```
{
  "return": [{
    "perms": [".*", "@runner", "@wheel"],
    "start": 1400556492.277421,
    "token": "d0ce6c1a37e99dcc0374392f272fe19c0090cca7",
    "expire": 1400599692.277422,
    "user": "salt",
    "eauth": "pam"
  }]
}
```

In this example the token returned is `d0ce6c1a37e99dcc0374392f272fe19c0090cca7` and can be included in subsequent websocket requests (as part of the URL).

The event stream can be easily consumed via JavaScript:

```
// Note, you must be authenticated!

// Get the Websocket connection to Salt
var source = new WebSocket('wss://localhost:8000/formatted_events/
↪d0ce6c1a37e99dcc0374392f272fe19c0090cca7');

// Get Salt's "real time" event stream.
```

(continues on next page)

(continued from previous page)

```

source.onopen = function() { source.send('websocket client ready'); };

// Other handlers
source.onerror = function(e) { console.debug('error!', e); };

// e.data represents Salt's "real time" event data as serialized JSON.
source.onmessage = function(e) { console.debug(e.data); };

// Terminates websocket connection and Salt's "real time" event stream on the server.
source.close();

```

Or via Python, using the Python module `websocket-client` for example. Or the `tornado` client.

```

# Note, you must be authenticated!

from websocket import create_connection

# Get the Websocket connection to Salt
ws = create_connection('wss://localhost:8000/formatted_events/
↳d0ce6c1a37e99dcc0374392f272fe19c0090cca7')

# Get Salt's "real time" event stream.
ws.send('websocket client ready')

# Simple listener to print results of Salt's "real time" event stream.
# Look at https://pypi.python.org/pypi/websocket-client/ for more examples.
while listening_to_events:
    print ws.recv()      # Salt's "real time" event data as serialized JSON.

# Terminates websocket connection and Salt's "real time" event stream on the server.
ws.close()

# Please refer to https://github.com/liris/websocket-client/issues/81 when using a
↳self signed cert

```

Above examples show how to establish a websocket connection to Salt and activating real time updates from Salt's event stream by signaling `websocket client ready`.

Example responses

Minion information is a dictionary keyed by each connected minion's `id` (`mid`), grains information for each minion is also included.

Minion information is sent in response to the following minion events:

- **connection drops**
 - requires running `manage.present` periodically every `loop_interval` seconds
- minion addition
- minion removal

```

# Not all grains are shown
data: {
  "minions": {

```

(continues on next page)

(continued from previous page)

```
    "minion1": {
      "id": "minion1",
      "grains": {
        "kernel": "Darwin",
        "domain": "local",
        "zmqversion": "4.0.3",
        "kernelrelease": "13.2.0"
      }
    }
  }
}
```

Job information is also tracked and delivered.

Job information is also a dictionary in which each job's information is keyed by salt's `jid`.

```
data: {
  "jobs": {
    "20140609153646699137": {
      "tgt_type": "glob",
      "jid": "20140609153646699137",
      "tgt": "*",
      "start_time": "2014-06-09T15:36:46.700315",
      "state": "complete",
      "fun": "test.ping",
      "minions": {
        "minion1": {
          "return": true,
          "retcode": 0,
          "success": true
        }
      }
    }
  }
}
```

20.10.3 rest_wsgi

A minimalist REST API for Salt

This `rest_wsgi` module provides a no-frills REST interface for sending commands to the Salt master. There are no dependencies.

Extra care must be taken when deploying this module into production. Please read this documentation in entirety.

All authentication is done through Salt's *external auth* system.

Usage

- All requests must be sent to the root URL (/).
- All requests must be sent as a POST request with JSON content in the request body.
- All responses are in JSON.

See also:

[rest_cherry.py](#)

The [rest_cherry.py](#) module is more full-featured, production-ready, and has builtin security features.

Deployment

The `rest_wsgi` netapi module is a standard Python WSGI app. It can be deployed one of two ways.

Using a WSGI-compliant web server

This module may be run via any WSGI-compliant production server such as Apache with `mod_wsgi` or Nginx with FastCGI.

It is strongly recommended that this app be used with a server that supports HTTPS encryption since raw Salt authentication credentials must be sent with every request. Any apps that access Salt through this interface will need to manually manage authentication credentials (either username and password or a Salt token). Tread carefully.

`salt-api` using a development-only server

If run directly via the `salt-api` daemon it uses the `wsgiref.simple_server()` that ships in the Python standard library. This is a single-threaded server that is intended for testing and development. **This server does not use encryption;** please note that raw Salt authentication credentials must be sent with every HTTP request.

Running this module via `salt-api` is not recommended!

In order to start this module via the `salt-api` daemon the following must be put into the Salt master config:

```
rest_wsgi:
  port: 8001
```

Usage examples

POST /

Example request for a basic `test.ping`:

```
% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
  ↪ "local","tgt":"*", "fun":"test.ping}]' localhost:8001
```

Example response:

```

HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
↪ true}]}

```

Example request for an asynchronous test.ping:

```

% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
↪ "local_async","tgt":"*","fun":"test.ping"}]' localhost:8001

```

Example response:

```

HTTP/1.0 200 OK
Content-Length: 103
Content-Type: application/json

{"return": [{"jid": "20130412192112593739", "minions": ["ms--4", "ms--3", "ms--2",
↪ "ms--1", "ms--0"]}]}

```

Example request for looking up a job ID:

```

% curl -sS -i \
  -H 'Content-Type: application/json' \
  -d '[{"eauth":"pam","username":"saltdev","password":"saltdev","client":
↪ "runner","fun":"jobs.lookup_jid","jid":"20130412192112593739"}]' localhost:8001

```

Example response:

```

HTTP/1.0 200 OK
Content-Length: 89
Content-Type: application/json

{"return": [{"ms--4": true, "ms--3": true, "ms--2": true, "ms--1": true, "ms--0":
↪ true}]}

```

form lowstate A list of lowstate data appropriate for the *client* interface you are calling.

status 200 success

status 401 authentication required

20.11 output modules

Follow one of the below links for further information and examples

<i>highstate</i>	Outputter for displaying results of state runs
<i>json_out</i>	Display return data in JSON format
<i>key</i>	Display salt-key output
<i>nested</i>	Recursively display nested data
<i>newline_values_only</i>	Display values only, separated by newlines

Continued on next page

Table 11 – continued from previous page

<code>no_out</code>	Display no output
<code>no_return</code>	Display output for minions that did not return
<code>overstatestage</code>	Display clean output of an overstate stage
<code>pony</code>	Display Pony output data structure
<code>pprint_out</code>	Python pretty-print (pprint)
<code>profile</code>	Display profiling data in a table format
<code>progress</code>	Display return data as a progress bar
<code>raw</code>	Display raw output data structure
<code>table_out</code>	Display output in a table format
<code>txt</code>	Simple text outputter
<code>virt_query</code>	virt.query outputter
<code>yaml_out</code>	Display return data in YAML format

20.11.1 salt.output.highstate

Outputter for displaying results of state runs

The return data from the Highstate command is a standard data structure which is parsed by the highstate outputter to deliver a clean and readable set of information about the HighState run on minions.

Two configurations can be set to modify the highstate outputter. These values can be set in the master config to change the output of the `salt` command or set in the minion config to change the output of the `salt-call` command.

state_verbose By default `state_verbose` is set to `True`, setting this to `False` will instruct the highstate outputter to omit displaying anything in green, this means that nothing with a result of `True` and no changes will not be printed

state_output: The highstate outputter has six output modes, `full`, `terse`, `mixed`, `changes` and `filter`

- The default is set to `full`, which will display many lines of detailed information for each executed chunk.
- If `terse` is used, then the output is greatly simplified and shown in only one line.
- If `mixed` is used, then terse output will be used unless a state failed, in which case full output will be used.
- If `changes` is used, then terse output will be used if there was no error and no changes, otherwise full output will be used.
- If `filter` is used, then either or both of two different filters can be used: `exclude` or `terse`.
 - for `exclude`, `state.highstate` expects a list of states to be excluded (or `None`) followed by `True` for terse output or `False` for regular output. Because of parsing nuances, if only one of these is used, it must still contain a comma. For instance: `exclude=True,`
 - for `terse`, `state.highstate` expects simply `True` or `False`.

These can be set as such from the command line, or in the Salt config as `state_output_exclude` or `state_output_terse`, respectively.

The output modes have one modifier:

`full_id`, `terse_id`, `mixed_id`, `changes_id` and `filter_id` If `_id` is used, then the corresponding form will be used, but the value for `name` will be drawn from the state ID. This is useful for cases where the `name` value might be very long and hard to read.

state_tabular: If *state_output* uses the terse output, set this to *True* for an aligned output format. If you wish to use a custom format, this can be set to a string.

Example usage:

If *state_output: filter* is set in the configuration file:

```
salt '*' state.highstate exclude=None,True
```

means to exclude no states from the highstate and turn on terse output.

```
salt twd state.highstate exclude=problemstate1,problemstate2,False
```

means to exclude states *problemstate1* and *problemstate2* from the highstate, and use regular output.

Example output for the above highstate call when *top.sls* defines only one other state to apply to minion *twd*:

```
twd:

Summary for twd
-----
Succeeded: 1 (changed=1)
Failed:    0
-----
Total states run:    1
```

Example output with no special settings in configuration files:

```
myminion:
-----
      ID: test.ping
      Function: module.run
      Result: True
      Comment: Module function test.ping executed
      Changes:
          -----
          ret:
              True

Summary for myminion
-----
Succeeded: 1
Failed:    0
-----
Total:    0
```

`salt.output.highstate.output(data, **kwargs)`

The HighState Outputter is only meant to be used with the `state.highstate` function, or a function that returns highstate return data.

20.11.2 salt.output.json_out

Display return data in JSON format

configuration The output format can be configured in two ways: Using the `--out-indent` CLI flag and specifying a positive integer or a negative integer to group JSON from each minion to a single line.

Or setting the `output_indent` setting in the Master or Minion configuration file with one of the following values:

- `Null`: put each minion return on a single line.
- `pretty`: use four-space indents and sort the keys.
- An integer: specify the indentation level.

Salt's outputters operate on a per-minion basis. Each minion return will be output as a single JSON object once it comes in to the master.

Some JSON parsers can guess when an object ends and a new one begins but many can not. A good way to differentiate between each minion return is to use the single-line output format and to parse each line individually. Example output (truncated):

```
{"dave": {"en0": {"hwaddr": "02:b0:26:32:4c:69", ...}}}  
{"jerry": {"en0": {"hwaddr": "02:26:ab:0d:b9:0d", ...}}}  
{"kevin": {"en0": {"hwaddr": "02:6d:7f:ce:9f:ee", ...}}}  
{"mike": {"en0": {"hwaddr": "02:48:a2:4b:70:a0", ...}}}  
{"phill": {"en0": {"hwaddr": "02:1d:cc:a2:33:55", ...}}}  
{"stuart": {"en0": {"hwaddr": "02:9a:e0:ea:9e:3c", ...}}}
```

`salt.output.json_out.output(data, **kwargs)`

Print the output data in JSON

20.11.3 salt.output.key

Display salt-key output

The `salt-key` command makes use of this outputter to format its output.

`salt.output.key.output(data, **kwargs)`

Read in the dict structure generated by the salt key API methods and print the structure.

20.11.4 salt.output.nested

Recursively display nested data

This is the default outputter for most execution functions.

Example output:

```
myminion:  
  -----  
  foo:  
    -----  
    bar:  
      baz  
    dictionary:  
      -----  
      abc:  
        123  
      def:  
        456  
  list:
```

(continues on next page)

(continued from previous page)

```
- Hello
- World
```

class salt.output.nested.**NestDisplay**(*retcode=0*)

Manage the nested display contents

display(*ret, indent, prefix, out*)

Recursively iterate down through data structures to determine output

ustring(*indent, color, msg, prefix="", suffix="", endc=None*)

salt.output.nested.**output**(*ret, **kwargs*)

Display ret data

20.11.5 salt.output.newline_values_only

Display values only, separated by newlines

New in version 2015.5.0.

This outputter is designed for Salt CLI return data. It will do the following to the return dict:

1. Get just the values (ignoring the minion IDs).
2. Each value, if it is iterable, is split a separate line.
3. Each minion's values are separated by newlines.

This results in a single string of return data containing all the values from the various minions.

Warning: As noted above, this outputter will discard the minion ID. If the minion ID is important, then an outputter that returns the full return dictionary in a parsable format (such as `json`, `pprint`, or `yaml`) may be more suitable.

Example 1

Input

```
{
  'myminion': ['127.0.0.1', '10.0.0.1'],
  'second-minion': ['127.0.0.1', '10.0.0.2']
}
```

Output

```
127.0.0.1
10.0.0.1
127.0.0.1
10.0.0.2
```

Example 2

Input

```
{
  'myminion': 8,
  'second-minion': 10
}
```

Output

```
8
10
```

`salt.output.newline_values_only.output(data, **kwargs)`
Display modified ret data

20.11.6 salt.output.no_out

Display no output

No output is produced when this outputter is selected

`salt.output.no_out.output(ret, **kwargs)`
Don't display data. Used when you only are interested in the return.

20.11.7 salt.output.no_return

Display output for minions that did not return

This outputter is used to display notices about which minions failed to return when a salt function is run with `-v` or `--verbose`. It should not be called directly from the CLI.

Example output:

```
virtucentos:
  Minion did not return
```

class salt.output.no_return.NestDisplay

Create generator for nested output

display(ret, indent, prefix, out)

Recursively iterate down through data structures to determine output

`salt.output.no_return.output(ret, **kwargs)`
Display ret data

20.11.8 salt.output.overstatestage

```
{'saltmine': {'foo': {'bar': 'baz',  
                    'dictionary': {'abc': 123, 'def': 456},  
                    'list': ['Hello', 'World']}}}}
```

`salt.output.pprint_out.output`(*data*, ***kwargs*)
Print out via pretty print

20.11.11 salt.output.profile

Display profiling data in a table format

Show profile data for returners that would normally show a highstate output.

salt MINION state.apply something -out=profile

Attempt to output the returns of state.sls and state.highstate as a table of names, modules and durations that looks somewhat like the following:

name	mod.fun	duration (ms)
I-fail-unless-stmt	other.function	-1.0000
old-minion-config	grains.list_present	1.1200
salt-data	group.present	48.3800
/etc/salt/minion	file.managed	63.1450

To get the above appearance, use settings something like these:

```
out.table.separate_rows: False  
out.table.justify: left  
out.table.delim: ' | '  
out.table.prefix: ''  
out.table.suffix: ''
```

`salt.output.profile.output`(*data*, ***kwargs*)
Display the profiling data in a table format.

20.11.12 salt.output.progress

Display return data as a progress bar

`salt.output.progress.output`(*ret*, *bar*, ***kwargs*)
Update the progress bar

`salt.output.progress.progress_iter`(*progress*)
Initialize and return a progress bar iter

20.11.13 salt.output.raw

Display raw output data structure

This outputter simply displays the output as a python data structure, by printing a string representation of it. It is similar to the `pprint` outputter, only the data is not nicely formatted/indented.

This was the original outputter used by Salt before the outputter system was developed.

Example output:

```
{'myminion': {'foo': {'list': ['Hello', 'World'], 'bar': 'baz', 'dictionary': {'abc': 123, 'def': 456}}}}
```

```
salt.output.raw.output(data, **kwargs)
```

Rather basic....

20.11.14 salt.output.table_out

Display output in a table format

New in version 2017.7.0.

This outputter displays a sequence of rows as table.

Example output:

```
edge01.bjm01:
-----
comment:
-----
out:
-----
| Active | Interface | Last Move | Mac | Moves | Static | Vlan |
| True | ae1.900 | 0.0 | 40:A6:77:5A:50:01 | 0 | False | 111 |
| True | ae1.111 | 0.0 | 64:16:8D:32:26:58 | 0 | False | 111 |
| True | ae1.111 | 0.0 | 8C:60:4F:73:2D:57 | 0 | False | 111 |
| True | ae1.111 | 0.0 | 8C:60:4F:73:2D:7C | 0 | False | 111 |
| True | ae1.222 | 0.0 | 8C:60:4F:73:2D:57 | 0 | False | 222 |
| True | ae1.222 | 0.0 | F4:0F:1B:76:9D:97 | 0 | False | 222 |
-----
result:
-----
```

```
class salt.output.table_out.TableDisplay(has_header=True, row_delimiter='-', delim='| ',
                                           justify='center', separate_rows=True, prefix='| ',
                                           suffix='|', width=50, wrapfunc=None)
```

Manage the table display content.

```
display(ret, indent, out, rows_key=None, labels_key=None)
    Display table(s).
```

```
display_rows(rows, labels, indent)
    Prepares row content and displays.
```

```
prepare_rows(rows, indent, has_header)
    Prepare rows content to be displayed.
```

```
ustring(indent, color, msg, prefix="", suffix="", endc=None)
    Build the unicode string to be displayed.
```

wrap_onspace (*text*)

When the text inside the column is longer than the width, will split by space and continue on the next line.

salt.output.table_out.output (*ret*, ***kwargs*)

Display the output as table.

Parameters

- **nested_indent** (*) – integer, specify the left alignment.
- **has_header** (*) – boolean specifying if header should be displayed. Default: True.
- **row_delimiter** (*) – character to separate rows. Default: `_`.
- **delim** (*) – character to separate columns. Default: `" | "`.
- **justify** (*) – text alignment. Default: `center`.
- **separate_rows** (*) – boolean specifying if row separator will be displayed between consecutive rows. Default: True.
- **prefix** (*) – character at the beginning of the row. Default: `" | "`.
- **suffix** (*) – character at the end of the row. Default: `" | "`.
- **width** (*) – column max width. Default: 50.
- **rows_key** (*) – display the rows under a specific key.
- **labels_key** (*) – use the labels under a certain key. Otherwise will try to use the dictionary keys (if any).
- **title** (*) – display title when only one table is selected (using the `rows_key` argument).

20.11.15 salt.output.txt

Simple text outputter

The txt outputter has been developed to make the output from shell commands on minions appear as they do when the command is executed on the minion.

salt.output.txt.output (*data*, ***kwargs*)

Output the data in lines, very nice for running commands

20.11.16 salt.output.virt_query

virt.query outputter

Used to display the output from the `virt.query` runner.

salt.output.virt_query.output (*data*, ***kwargs*)

Display output for the salt-run virt.query function

20.11.17 salt.output.yaml_out

Display return data in YAML format

This outputter defaults to printing in YAML block mode for better readability.

Example output:

```

saltmine:
  foo:
    bar: baz
    dictionary:
      abc: 123
      def: 456
    list:
      - Hello
      - World

```

`salt.output.yaml_out.output(data, **kwargs)`
 Print out YAML using the block mode

20.12 pillar modules

<code>cmd_json</code>	Execute a command and read the output as JSON.
<code>cmd_yaml</code>	Execute a command and read the output as YAML.
<code>cmd_yamllex</code>	Execute a command and read the output as YAMLEX.
<code>cobbler</code>	A module to pull data from Cobbler via its API into the Pillar dictionary
<code>confidant</code>	An external pillar module for getting credentials from confidant.
<code>consul_pillar</code>	Use Consul K/V as a Pillar source with values parsed as YAML
<code>csvpillar</code>	Store key/value pairs in a CSV file
<code>digicert</code>	Digicert Pillar Certificates
<code>django_orm</code>	Generate Pillar data from Django models through the Django ORM
<code>ec2_pillar</code>	Retrieve EC2 instance data for minions for <code>ec2_tags</code> and <code>ec2_tags_list</code>
<code>etcd_pillar</code>	Use etcd data as a Pillar source
<code>file_tree</code>	The <code>file_tree</code> external pillar allows values from all files in a directory tree to be imported as Pillar data.
<code>foreman</code>	A module to pull data from Foreman via its API into the Pillar dictionary
<code>git_pillar</code>	Use a git repository as a Pillar source
<code>gpg</code>	Decrypt pillar data through the builtin GPG renderer
<code>hg_pillar</code>	Use remote Mercurial repository as a Pillar source.
<code>hiera</code>	Use hiera data as a Pillar source
<code>http_json</code>	A module that adds data to the Pillar structure retrieved by an http request
<code>http_yaml</code>	A module that adds data to the Pillar structure retrieved by an http request
<code>libvirt</code>	Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner
<code>makostack</code>	Simple and flexible YAML <code>ext_pillar</code> which can read pillar from within pillar.
<code>mongo</code>	Read Pillar data from a mongodb collection
<code>mysql</code>	Retrieve Pillar data by doing a MySQL query

Continued on next page

Table 12 – continued from previous page

<i>neutron</i>	Use Openstack Neutron data as a Pillar source.
<i>nodegroups</i>	Nodegroups Pillar
<i>pepa</i>	Pepa
<i>pillar_ldap</i>	Use LDAP data as a Pillar source
<i>postgres</i>	Retrieve Pillar data by doing a postgres query
<i>puppet</i>	Execute an unmodified puppet_node_classifier and read the output as YAML.
<i>reclass_adapter</i>	Use the "reclass" database as a Pillar source
<i>redismod</i>	Read pillar data from a Redis backend
<i>s3</i>	Copy pillar data from a bucket in Amazon S3
<i>saltclass</i>	SaltClass Pillar Module
<i>sql_base</i>	Retrieve Pillar data by doing a SQL query
<i>sqlcipher</i>	Retrieve Pillar data by running a SQLCipher query
<i>sqlite3</i>	Retrieve Pillar data by doing a SQLite3 query
<i>stack</i>	Simple and flexible YAML ext_pillar which can read pillar from within pillar.
<i>svn_pillar</i>	Clone a remote SVN repository and use the filesystem as a Pillar source
<i>varstack_pillar</i>	Use Varstack data as a Pillar source
<i>vault</i>	Vault Pillar Module
<i>venafi</i>	Venafi Pillar Certificates
<i>virtkey</i>	Accept a key from a hypervisor if the virt runner has already submitted an authorization request
<i>vmware_pillar</i>	Pillar data from vCenter or an ESXi host

20.12.1 salt.pillar.cmd_json

Execute a command and read the output as JSON. The JSON data is then directly overlaid onto the minion's Pillar data.

`salt.pillar.cmd_json.ext_pillar` (*minion_id*, *pillar*, *command*)

Execute a command and read the output as JSON

20.12.2 salt.pillar.cmd_yaml

Execute a command and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yaml.ext_pillar` (*minion_id*, *pillar*, *command*)

Execute a command and read the output as YAML

20.12.3 salt.pillar.cmd_yamllex

Execute a command and read the output as YAMLEX.

The YAMLEX data is then directly overlaid onto the minion's Pillar data

`salt.pillar.cmd_yamllex.ext_pillar` (*minion_id*, *pillar*, *command*)

Execute a command and read the output as YAMLEX

20.12.4 salt.pillar.cobbler

A module to pull data from Cobbler via its API into the Pillar dictionary

Configuring the Cobbler ext_pillar

The same cobbler.* parameters are used for both the Cobbler tops and Cobbler pillar modules.

```

ext_pillar:
- cobbler:
    key: cobbler # Nest results within this key. By default, values are not nested.
    only: [parameters] # Add only these keys to pillar.

cobbler.url: https://example.com/cobbler_api #default is http://localhost/cobbler_api
cobbler.user: username # default is no username
cobbler.password: password # default is no password

```

Module Documentation

`salt.pillar.cobbler.ext_pillar` (*minion_id*, *pillar*, *key=None*, *only=()*)
 Read pillar data from Cobbler via its API.

20.12.5 salt.pillar.confidant

An external pillar module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via `ext_pillar` in the minion config:

`ext_pillar:`

- `confidant:`

```

profile: # The URL of the confidant web service url: 'https://confidant-production.example.com'
# The context to use for KMS authentication auth_context: from: example-production-
iad to: confidant-production-iad user_type: service # The KMS master key to use for au-
thentication auth_key: "alias/authnz" # Cache file for KMS auth token token_cache_file:
/run/confidant/confidant_token # The duration of the validity of a token, in minutes to-
ken_duration: 60 # key, keyid and region can be defined in the profile, but it's # generally
best to use IAM roles or environment variables for AWS # auth. keyid: 98nh9h9h908h09kjjk
key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0 region: us-east-1

```

`depends` confidant-common, confidant-client

Module Documentation

`salt.pillar.confidant.ext_pillar` (*minion_id*, *pillar*, *profile=None*)
 Read pillar data from Confidant via its API.

20.12.6 salt.pillar.consul_pillar module

Use Consul K/V as a Pillar source with values parsed as YAML

depends

- python-consul

In order to use an consul server, a profile must be created in the master configuration file:

```
my_consul_config:
  consul.host: 127.0.0.1
  consul.port: 8500
  consul.token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  consul.scheme: http
  consul.consistency: default
  consul.dc: dev
  consul.verify: True
```

All parameters are optional.

The `consul.token` requires `python-consul >= 0.4.7`.

If you have a multi-datacenter Consul cluster you can map your `pillarenv`s` to your data centers by providing a dictionary of mappings in `consul.dc` field:

```
my_consul_config:
  consul.dc:
    dev: us-east-1
    prod: us-west-1
```

In the example above we specifying static mapping between Pillar environments and data centers: the data for `dev` and `prod` Pillar environments will be fetched from `us-east-1` and `us-west-1` datacenter respectively.

In fact when `consul.dc` is set to dictionary keys are processed as regular expressions (that can capture named parameters) and values are processed as string templates as per PEP 3101.

```
my_consul_config:
  consul.dc:
    ^dev-.*$: dev-datacenter
    ^(?P<region>.*)-prod$: prod-datacenter-{region}
```

This example maps all Pillar environments starting with `dev-` to `dev-datacenter` whereas Pillar environment like `eu-prod` will be mapped to `prod-datacenter-eu`.

Before evaluation patterns are sorted by length in descending order.

If Pillar environment names correspond to data center names a single pattern can be used:

```
my_consul_config:
  consul.dc:
    ^(?P<env>.*): '{env}'
```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```
ext_pillar:
  - consul: my_consul_config

ext_pillar:
  - consul: my_consul_config root=salt
```

Using these configuration profiles, multiple consul sources may also be used:

```
ext_pillar:
- consul: my_consul_config
- consul: my_other_consul_config
```

Either the `minion_id`, or the `role`, or the `environment` grain may be used in the `root` path to expose minion-specific information stored in consul.

```
ext_pillar:
- consul: my_consul_config root=salt/%(minion_id)s
- consul: my_consul_config root=salt/%(role)s
- consul: my_consul_config root=salt/%(environment)s
```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
- consul: my_consul_config root=salt-shared
- consul: my_other_consul_config root=salt-private/%(minion_id)s
```

If using the `role` or `environment` grain in the consul key path, be sure to define it using `/etc/salt/grains`, or similar:

```
role: my-minion-role
environment: dev
```

It's possible to lock down where the pillar values are shared through minion targeting. Note that double quotes `"` are required around the target value and cannot be used inside the matching statement. See the section on Compound Matchers for more examples.

```
ext_pillar:
- consul: my_consul_config root=salt target="L@salt.example.com and G@osarch:x86_64"
```

`salt.pillar.consul_pillar.consul_fetch(client, path)`

Query consul for all keys/values within base path

`salt.pillar.consul_pillar.ext_pillar(minion_id, pillar, conf)`

Check consul for all data

`salt.pillar.consul_pillar.fetch_tree(client, path)`

Grab data from consul, trim base path and remove any keys which are folders. Take the remaining data and send it to be formatted in such a way as to be used as pillar data.

`salt.pillar.consul_pillar.get_conn(opts, profile)`

Return a client object for accessing consul

`salt.pillar.consul_pillar.pillar_format(ret, keys, value)`

Perform data formatting to be used as pillar data and merge it with the current pillar data

20.12.7 salt.pillar.csvpillar module

Store key/value pairs in a CSV file

New in version 2016.11.0.

Example configuration:

```

ext_pillar:
  - csv: /path/to/file.csv

# or

ext_pillar:
  - csv:
      path: /path/to/file.csv
      namespace: 'subkey'
      fieldnames:
        - col1
        - col2
        - col2

```

The first column must be minion IDs and the first row must be dictionary keys. E.g.:

id	role	env
jerry	web	prod
stuart	web	stage
dave	web	qa
phil	db	prod
kevin	db	stage
mike	db	qa

Will produce the following Pillar values for a minion named "jerry":

```

{
  'role': 'web',
  'env': 'prod',
}

```

`salt.pillar.csvpillar.ext_pillar`(*mid*, *pillar*, *path*, *idkey*='id', *namespace*=None, *fieldnames*=None, *restkey*=None, *restval*=None, *dialect*='excel')

Read a CSV into Pillar

Parameters

- **path** (*str*) – Absolute path to a CSV file.
- **idkey** (*str*) – (Optional) The column name of minion IDs.
- **namespace** (*str*) – (Optional) A pillar key to namespace the values under.
- **fieldnames** (*list*) – (Optional) if the first row of the CSV is not column names they may be specified here instead.

20.12.8 salt.pillar.digicert module

Digicert Pillar Certificates

This module will only return pillar data if the `digicert` runner module has already been used to create certificates.

To configure this module, set `digicert` to `True` in the `ext_pillar` section of your master configuration file:

```

ext_pillar:
  - digicert: True

```

`salt.pillar.digicert.ext_pillar`(*minion_id*, *pillar*, *conf*)

Return an existing set of certificates

20.12.9 salt.pillar.django_orm

Generate Pillar data from Django models through the Django ORM

```
maintainer Micah Hausler <micah.hausler@gmail.com>
maturity new
```

Configuring the django_orm ext_pillar

To use this module, your Django project must be on the salt master server with database access. This assumes you are using virtualenv with all the project's requirements installed.

```
ext_pillar:
- django_orm:
    pillar_name: my_application
    project_path: /path/to/project/
    settings_module: my_application.settings
    env_file: /path/to/env/file.sh
    # Optional: If your project is not using the system python,
    # add your virtualenv path below.
    env: /path/to/virtualenv/

    django_app:

        # Required: the app that is included in INSTALLED_APPS
        my_application.clients:

            # Required: the model name
            Client:

                # Required: model field to use as the key in the rendered
                # Pillar. Must be unique; must also be included in the
                # ``fields`` list below.
                name: shortname

                # Optional:
                # See Django's QuerySet documentation for how to use .filter()
                filter: {'kw': 'args'}

                # Required: a list of field names
                # List items will be used as arguments to the .values() method.
                # See Django's QuerySet documentation for how to use .values()
                fields:
                - field_1
                - field_2
```

This would return pillar data that would look like

```
my_application:
  my_application.clients:
    Client:
      client_1:
        field_1: data_from_field_1
        field_2: data_from_field_2
      client_2:
        field_1: data_from_field_1
        field_2: data_from_field_2
```

As another example, data from multiple database tables can be fetched using Django's regular lookup syntax. Note, using ManyToManyFields will not currently work since the return from values() changes if a ManyToMany is present.

```

ext_pillar:
- django_orm:
  pillar_name: djangotutorial
  project_path: /path/to/mysite
  settings_module: mysite.settings

  django_app:
  mysite.polls:
  Choices:
  name: poll__question
  fields:
  - poll__question
  - poll__id
  - choice_text
  - votes

```

Module Documentation

`salt.pillar.django_orm.ext_pillar` (*minion_id*, *pillar*, *pillar_name*, *project_path*, *settings_module*, *django_app*, *env=None*, *env_file=None*, **args*, ***kwargs*)

Connect to a Django database through the ORM and retrieve model fields

Parameters

- **pillar_name** (*str*) – The name of the pillar to be returned
- **project_path** (*str*) – The full path to your Django project (the directory `manage.py` is in)
- **settings_module** (*str*) – The settings module for your project. This can be found in your `manage.py` file
- **django_app** (*str*) – A dictionary containing your apps, models, and fields
- **env** (*str*) – The full path to the virtualenv for your Django project
- **env_file** (*str*) – An optional bash file that sets up your environment. The file is run in a subprocess and the changed variables are then added

20.12.10 salt.pillar.ec2_pillar

Retrieve EC2 instance data for minions for `ec2_tags` and `ec2_tags_list`

The minion id must be the AWS instance-id or value in 'tag_match_key'. For example set 'tag_match_key' to 'Name', to have the minion-id matched against the tag 'Name'. The tag contents must be unique. The value of tag_match_value can be 'uqdn' or 'asis'. if 'uqdn' strips any domain before comparison.

The option `use_grain` can be set to True. This allows the use of an instance-id grain instead of the minion-id. Since this is a potential security risk, the configuration can be further expanded to include a list of minions that are trusted to only allow the alternate id of the instances to specific hosts. There is no glob matching at this time.

The optional 'tag_list_key' indicates which keys should be added to 'ec2_tags_list' and be split by tag_list_sep (default ;). If a tag key is included in 'tag_list_key' it is removed from `ec2_tags`. If a tag does not exist it is still included as an empty list.

Note: restart the salt-master for changes to take effect.

```

ext_pillar:
- ec2_pillar:
    tag_match_key: 'Name'
    tag_match_value: 'asis'
    tag_list_key:
    - Role
    tag_list_sep: ';'
    use_grain: True
    minion_ids:
    - trusted-minion-1
    - trusted-minion-2
    - trusted-minion-3

```

This is a very simple pillar that simply retrieves the instance data from AWS. Currently the only portion implemented are EC2 tags, which returns a list of key/value pairs for all of the EC2 tags assigned to the instance.

```

salt.pillar.ec2_pillar.ext_pillar(minion_id, pillar, use_grain=False, minion_ids=None,
                                  tag_match_key=None, tag_match_value='asis',
                                  tag_list_key=None, tag_list_sep=';')

```

Execute a command and read the output as YAML

20.12.11 salt.pillar.etcd_pillar

Use etcd data as a Pillar source

New in version 2014.7.0.

depends

- python-etcd

In order to use an etcd server, a profile must be created in the master configuration file:

```

my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

```

After the profile is created, configure the external pillar system to use it. Optionally, a root may be specified.

```

ext_pillar:
- etcd: my_etcd_config

ext_pillar:
- etcd: my_etcd_config root=/salt

```

Using these configuration profiles, multiple etcd sources may also be used:

```

ext_pillar:
- etcd: my_etcd_config
- etcd: my_other_etcd_config

```

The `minion_id` may be used in the `root` path to expose minion-specific information stored in etcd.

```

ext_pillar:
- etcd: my_etcd_config root=/salt/%(minion_id)s

```

Minion-specific values may override shared values when the minion-specific root appears after the shared root:

```
ext_pillar:
- etcd: my_etcd_config root=/salt-shared
- etcd: my_other_etcd_config root=/salt-private/%(minion_id)s
```

Using the configuration above, the following commands could be used to share a key with all minions but override its value for a specific minion:

```
etcdctl set /salt-shared/mykey my_value
etcdctl set /salt-private/special_minion_id/mykey my_other_value
```

```
salt.pillar.etcd_pillar.ext_pillar(minion_id, pillar, conf)
    Check etcd for all data
```

20.12.12 salt.pillar.file_tree

The `file_tree` external pillar allows values from all files in a directory tree to be imported as Pillar data.

Note: This is an external pillar and is subject to the *rules and constraints* governing external pillars.

New in version 2015.5.0.

In this pillar, data is organized by either Minion ID or Nodegroup name. To setup pillar data for a specific Minion, place it in `<root_dir>/hosts/<minion_id>`. To setup pillar data for an entire Nodegroup, place it in `<root_dir>/nodegroups/<node_group>` where `<node_group>` is the Nodegroup's name.

Example `file_tree` Pillar

Master Configuration

```
ext_pillar:
- file_tree:
    root_dir: /srv/ext_pillar
    follow_dir_links: False
    keep_newline: True
```

The `root_dir` parameter is required and points to the directory where files for each host are stored. The `follow_dir_links` parameter is optional and defaults to `False`. If `follow_dir_links` is set to `True`, this external pillar will follow symbolic links to other directories.

Warning: Be careful when using `follow_dir_links`, as a recursive symlink chain will result in unexpected results.

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the *pillar_roots* of the environment specified by *pillarenv*. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

If `keep_newline` is set to `True`, then the pillar values for files ending in newlines will keep that newline. The default behavior is to remove the end-of-file newline. `keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a *file.managed* state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over

which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for minion IDs and nodegroups underneath the `root_dir` (see the layout examples in the below sections).

```
ext_pillar:
- file_tree:
  root_dir: /path/to/root/directory
  keep_newline:
  - files/testdir/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline` configuration. However, this module does not actually distinguish between binary and text files.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```
ext_pillar:
- file_tree:
  root_dir: /path/to/root/directory
  render_default: jinja|yaml
  renderer_blacklist:
  - gpg
  renderer_whitelist:
  - jinja
  - yaml
  template: True
```

Assigning Pillar Data to Individual Hosts

To configure pillar data for each host, this external pillar will recursively iterate over `root_dir/hosts/id` (where `id` is a minion ID), and compile pillar data with each subdirectory as a dictionary key and each file as a value.

For example, the following `root_dir` tree:

```
./hosts/
./hosts/test-host/
./hosts/test-host/files/
./hosts/test-host/files/testdir/
./hosts/test-host/files/testdir/file1.txt
./hosts/test-host/files/testdir/file2.txt
./hosts/test-host/files/another-testdir/
./hosts/test-host/files/another-testdir/symlink-to-file1.txt
```

will result in the following pillar tree for minion with ID `test-host`:

```
test-host:
-----
  apache:
  -----
    config.d:
    -----
      00_important.conf:
        <important_config important_setting="yes" />
      20_bob_extra.conf:
```

(continues on next page)

(continued from previous page)

```

        <bob_specific_cfg has_freeze_ray="yes" />
corporate_app:
  -----
  settings:
    -----
    common_settings:
      // This is the main settings file for the corporate
      // internal web app
      main_setting: probably
    bob_settings:
      role: bob

```

Note: The leaf data in the example shown is the contents of the pillar files.

```

salt.pillar.file_tree.ext_pillar(minion_id, pillar, root_dir=None, follow_dir_links=False,
                                  debug=False, keep_newline=False, render_default=None,
                                  renderer_blacklist=None, renderer_whitelist=None, tem-
                                  plate=False)

```

Compile pillar data from the given `root_dir` specific to Nodegroup names and Minion IDs.

If a Minion's ID is not found at `<root_dir>/host/<minion_id>` or if it is not included in any Nodegroups named at `<root_dir>/nodegroups/<node_group>`, no pillar data provided by this pillar module will be available for that Minion.

Changed in version 2017.7.0: Templating/rendering has been added. You can now specify a default render pipeline and a black- and whitelist of (dis)allowed renderers.

`template` must be set to `True` for templating to happen.

```

ext_pillar:
- file_tree:
  root_dir: /path/to/root/directory
  render_default: jinja|yaml
  renderer_blacklist:
  - gpg
  renderer_whitelist:
  - jinja
  - yaml
  template: True

```

Parameters

- **minion_id** – The ID of the Minion whose pillar data is to be collected
- **pillar** – Unused by the `file_tree` pillar module
- **root_dir** – Filesystem directory used as the root for pillar data (e.g. `/srv/ext_pillar`)

Changed in version 2018.3.0: If `root_dir` is a relative path, it will be treated as relative to the `pillar_roots` of the environment specified by `pillarenv`. If an environment specifies multiple roots, this module will search for files relative to all of them, in order, merging the results.

- **follow_dir_links** – Follow symbolic links to directories while collecting pillar files. Defaults to `False`.

Warning: Care should be exercised when enabling this option as it will follow links that point outside of `root_dir`.

Warning: Symbolic links that lead to infinite recursion are not filtered.

- **debug** – Enable debug information at log level `debug`. Defaults to `False`. This option may be useful to help debug errors when setting up the `file_tree` pillar module.
- **keep_newline** – Preserve the end-of-file newline in files. Defaults to `False`. This option may either be a boolean or a list of file globs (as defined by the [Python fnmatch package](#)) for which end-of-file newlines are to be kept.

`keep_newline` should be turned on if the pillar data is intended to be used to deploy a file using `contents_pillar` with a `file.managed` state.

Changed in version 2015.8.4: The `raw_data` parameter has been renamed to `keep_newline`. In earlier releases, `raw_data` must be used. Also, this parameter can now be a list of globs, allowing for more granular control over which pillar values keep their end-of-file newline. The globs match paths relative to the directories named for Minion IDs and Nodegroup names underneath the `root_dir`.

```
ext_pillar:
  - file_tree:
      root_dir: /srv/ext_pillar
      keep_newline:
        - apache/config.d/*
        - corporate_app/settings/*
```

Note: In earlier releases, this documentation incorrectly stated that binary files would not be affected by the `keep_newline`. However, this module does not actually distinguish between binary and text files.

- **render_default** – Override Salt's `default global renderer` for the `file_tree` pillar.

```
render_default: jinja
```

- **renderer_blacklist** – Disallow renderers for pillar files.

```
renderer_blacklist:
  - json
```

- **renderer_whitelist** – Allow renderers for pillar files.

```
renderer_whitelist:
  - yaml
  - jinja
```

- **template** – Enable templating of pillar files. Defaults to `False`.

20.12.13 salt.pillar.foreman

A module to pull data from Foreman via its API into the Pillar dictionary

Configuring the Foreman ext_pillar

Set the following Salt config to setup Foreman as external pillar source:

```
ext_pillar:
  - foreman:
      key: foreman # Nest results within this key
      only: ['hostgroup_name', 'parameters'] # Add only these keys to pillar

foreman.url: https://example.com/foreman_api
foreman.user: username # default is admin
foreman.password: password # default is changeme
```

The following options are optional:

```
foreman.api: apiversion # default is 2 (1 is not supported yet)
foreman.verifyssl: False # default is True
foreman.certfile: /etc/ssl/certs/mycert.pem # default is None
foreman.keyfile: /etc/ssl/private/mykey.pem # default is None
foreman.cacertfile: /etc/ssl/certs/mycert.ca.pem # default is None
foreman.lookup_parameters: True # default is True
```

An alternative would be to use the Foreman modules integrating Salt features in the Smart Proxy and the webinterface.

Further information can be found on [GitHub](#).

Module Documentation

`salt.pillar.foreman.ext_pillar(minion_id, pillar, key=None, only=())`
Read pillar data from Foreman via its API.

20.12.14 salt.pillar.git_pillar

Use a git repository as a Pillar source

This external pillar allows for a Pillar top file and Pillar SLS files to be sourced from a git repository.

However, since `git_pillar` does not have an equivalent to the `pillar_roots` parameter, configuration is slightly different. A Pillar top file is required to be in the git repository and must still contain the relevant environment, like so:

```
base:
  '*':
    - foo
```

The branch/tag which maps to that environment must then be specified along with the repo's URL. Configuration details can be found below.

Important: Each branch/tag used for `git_pillar` must have its own top file. This is different from how the top file works when configuring `States`. The reason for this is that each `git_pillar` branch/tag is processed separately from the rest. Therefore, if the `qa` branch is to be used for `git_pillar`, it would need to have its own top file, with the `qa` environment defined within it, like this:

```
qa:
  'dev-*':
    - bar
```

Additionally, while `git_pillar` allows for the branch/tag to be overridden (see [here](#)), keep in mind that the top file must reference the actual environment name. It is common practice to make the environment in a `git_pillar` top file match the branch/tag name, but when remapping, the environment of course no longer matches the branch/tag, and the top file needs to be adjusted accordingly. When expected Pillar values configured in `git_pillar` are missing, this is a common misconfiguration that may be to blame, and is a good first step in troubleshooting.

Configuring `git_pillar` for Salt

Beginning with Salt version 2015.8.0, `pygit2` is now supported in addition to `GitPython`. The requirements for `GitPython` and `pygit2` are the same as for `GitFS`, as described [here](#).

Important: `git_pillar` has its own set of global configuration parameters. While it may seem intuitive to use the global `gitfs` configuration parameters (`gitfs_base`, etc.) to manage `git_pillar`, this will not work. The main difference for this is the fact that the different components which use Salt's git backend code do not all function identically. For instance, in `git_pillar` it is necessary to specify which branch/tag to be used for `git_pillar` remotes. This is the reverse behavior from `gitfs`, where branches/tags make up your environments.

See [here](#) for documentation on the `git_pillar` configuration options and their usage.

Here is an example `git_pillar` configuration:

```
ext_pillar:
- git:
  # Use 'prod' instead of the branch name 'production' as the environment
  - production https://gitserver/git-pillar.git:
    - env: prod
  # Use 'dev' instead of the branch name 'develop' as the environment
  - develop https://gitserver/git-pillar.git:
    - env: dev
  # No per-remote config parameters (and no trailing colon), 'qa' will
  # be used as the environment
  - qa https://gitserver/git-pillar.git
  # SSH key authentication
  - master git@other-git-server:pillardata-ssh.git:
    # Pillar SLS files will be read from the 'pillar' subdirectory in
    # this repository
    - root: pillar
    - privkey: /path/to/key
    - pubkey: /path/to/key.pub
    - passphrase: CorrectHorseBatteryStaple
  # HTTPS authentication
  - master https://other-git-server/pillardata-https.git:
    - user: git
    - password: CorrectHorseBatteryStaple
```

The main difference between this and the old way of configuring `git_pillar` is that multiple remotes can be configured under one `git` section under `ext_pillar`. More than one `git` section can be used, but it is not necessary. Remotes will be evaluated sequentially.

Per-remote configuration parameters are supported (similar to *gitfs*), and global versions of the `git_pillar` configuration parameters can also be set.

To remap a specific branch to a specific Pillar environment, use the `env` per-remote parameter:

```
ext_pillar:
- git:
  - production https://gitserver/git-pillar.git:
    - env: prod
```

If `__env__` is specified as the branch name, then `git_pillar` will decide which branch to use based on the following criteria:

- If the minion has a `pillarenv` configured, it will use that pillar environment. (2016.11.2 and later)
- Otherwise, if the minion has an `environment` configured, it will use that environment.
- Otherwise, the master's `git_pillar_base` will be used.

Note: The use of `environment` to choose the pillar environment dates from a time before the `pillarenv` parameter was added. In a future release, it will be ignored and either the minion's `pillarenv` or the master's `git_pillar_base` will be used.

Here's an example of using `__env__` as the `git_pillar` environment:

```
ext_pillar:
- git:
  - __env__ https://gitserver/git-pillar.git:
    - root: pillar
```

The corresponding Pillar top file would look like this:

```
"{{saltenv}}":
  '*':
    - bar
```

With the addition of `pygit2` support, `git_pillar` can now interact with authenticated remotes. Authentication works just like in `gitfs` (as outlined in the *Git Fileserver Backend Walkthrough*), only with the global authentication parameter names prefixed with `git_pillar` instead of `gitfs` (e.g. `git_pillar_pubkey`, `git_pillar_privkey`, `git_pillar_passphrase`, etc.).

Note: The `name` parameter can be used to further differentiate between two remotes with the same URL and branch. When using two remotes with the same URL, the `name` option is required.

How Multiple Remotes Are Handled

As noted above, multiple remotes can be included in the same `git ext_pillar` configuration. Consider the following:

```
my_etcd_config:
  etcd.host: 127.0.0.1
  etcd.port: 4001

ext_pillar:
- etcd: my_etcd_config
```

(continues on next page)

(continued from previous page)

```

- git:
  - master https://mydomain.tld/foo.git:
    - root: pillar
  - master https://mydomain.tld/bar.git
  - master https://mydomain.tld/baz.git
  - dev https://mydomain.tld/qux.git
- git:
  - master https://mydomain.tld/abc.git
  - dev https://mydomain.tld/123.git

```

To understand how pillar data from these repos will be compiled, it's important to know how Salt will process them. The following points should be kept in mind:

1. Each `ext_pillar` is called separately from the others. So, in the above example, the `etcd` `ext_pillar` will be evaluated first, with the first group of `git_pillar` remotes evaluated next (and merged into the `etcd` pillar data). Lastly, the second group of `git_pillar` remotes will be evaluated, and then merged into the `ext_pillar` data evaluated before it.
2. Within a single group of `git_pillar` remotes, each remote will be evaluated in order, with results merged together as each remote is evaluated.

Note: Prior to the 2017.7.0 release, remotes would be evaluated in a non-deterministic order.

3. By default, when a repo is evaluated, other remotes' which share its pillar environment will have their files made available to the remote being processed.

The first point should be straightforward enough, but the second and third could use some additional clarification.

First, point #2. In the first group of `git_pillar` remotes, the `foo` remote will be evaluated first. The `bar` remote will be evaluated next, and its results will be merged into the pillar data compiled when the `foo` remote was evaluated. As the subsequent remotes are evaluated, their data will be merged in the same fashion.

But wait, don't these repositories belong to more than one pillar environments? Well, yes. The default method of generating pillar data compiles pillar data from all environments. This behavior can be overridden using a `pillarenv`. Setting a `pillarenv` in the minion config file will make that minion tell the master to ignore any pillar data from environments which don't match that `pillarenv`. A `pillarenv` can also be specified for a given minion or set of minions when *running states*, by using the `pillarenv` argument. The CLI `pillarenv` will override one set in the minion config file. So, assuming that a `pillarenv` of `base` was set for a minion, it would not get any of the pillar variables configured in the `qux` remote, since that remote is assigned to the `dev` environment. The only way to get its pillar data would be to specify a `pillarenv` of `dev`, which would mean that it would then ignore any items from the `base` `pillarenv`. A more detailed explanation of pillar environments can be found [here](#).

Moving on to point #3, and looking at the example `ext_pillar` configuration, as the `foo` remote is evaluated, it will also have access to the files from the `bar` and `baz` remotes, since all three are assigned to the `base` pillar environment. So, if an SLS file referenced by the `foo` remotes's top file does not exist in the `foo` remote, it will be searched for in the `bar` remote, followed by the `baz` remote. When it comes time to evaluate the `bar` remote, SLS files referenced by the `bar` remote's top file will first be looked for in the `bar` remote, followed by `foo`, and `baz`, and when the `baz` remote is processed, SLS files will be looked for in `baz`, followed by `foo` and `bar`. This "failover" logic is called a *directory overlay*, and it is also used by `file_roots` and `:conf_minion['pillar_roots']`. The ordering of which remote is checked for SLS files is determined by the order they are listed. First the remote being processed is checked, then the others that share the same environment are checked. However, before the 2017.7.0 release, since evaluation was unordered, the remote being processed would be checked, followed in no specific order by the other repos which share the same environment.

Beginning with the 2017.7.0 release, this behavior of `git_pillar` remotes having access to files in other repos which

share the same environment can be disabled by setting `git_pillar_includes` to `False`. If this is done, then all `git_pillar` remotes will only have access to their own SLS files. Another way of ensuring that a `git_pillar` remote will not have access to SLS files from other `git_pillar` remotes which share the same pillar environment is to put them in a separate `git` section under `ext_pillar`. Look again at the example configuration above. In the second group of `git_pillar` remotes, the `abc` remote would not have access to the SLS files from the `foo`, `bar`, and `baz` remotes, and vice-versa.

Mountpoints

New in version 2017.7.0.

Assume the following pillar top file:

```
base:
  'web*':
    - common
    - web.server.nginx
    - web.server.appdata
```

Now, assume that you would like to configure the `web.server.nginx` and `web.server.appdata` SLS files in separate repos. This could be done using the following `ext_pillar` configuration (assuming that `git_pillar_includes` has not been set to `False`):

```
ext_pillar:
- git:
  - master https://mydomain.tld/pillar-common.git
  - master https://mydomain.tld/pillar-nginx.git
  - master https://mydomain.tld/pillar-appdata.git
```

However, in order to get the files in the second and third `git_pillar` remotes to work, you would need to first create the directory structure underneath it (i.e. place them underneath `web/server/` in the repository). This also makes it tedious to reorganize the configuration, as changing `web.server.nginx` to `web.nginx` in the top file would require you to also move the SLS files in the `pillar-nginx` up a directory level.

For these reasons, much like `gitfs`, `git_pillar` now supports a "mountpoint" feature. Using the following `ext_pillar` configuration, the SLS files in the second and third `git_pillar` remotes can be placed in the root of the git repository:

```
ext_pillar:
- git:
  - master https://mydomain.tld/pillar-common.git
  - master https://mydomain.tld/pillar-nginx.git:
    - mountpoint: web/server/
  - master https://mydomain.tld/pillar-appdata.git:
    - mountpoint: web/server/
```

Now, if the top file changed the SLS target from `web.server.nginx`, instead of reorganizing the git repository, you would just need to adjust the mountpoint to `web/` (and restart the `salt-master` daemon).

Note:

- Leading and trailing slashes on the mountpoints are optional.
 - Use of the `mountpoint` feature requires that `git_pillar_includes` is not disabled.
 - Content from mounted `git_pillar` repos can only be referenced by a top file in the same pillar environment.
 - Salt versions prior to 2018.3.4 ignore the `root` parameter when `mountpoint` is set.
-

all_saltenvs

New in version 2018.3.4.

When `__env__` is specified as the branch name, `all_saltenvs` per-remote configuration parameter overrides the logic Salt uses to map branches/tags to pillar environments (i.e. `pillarenvs`). This allows a single branch/tag to appear in all `saltenvs`. Example:

```

ext_pillar:
- git:
  - __env__ https://mydomain.tld/top.git
  - all_saltenvs: master
  - __env__ https://mydomain.tld/pillar-nginx.git:
    - mountpoint: web/server/
  - __env__ https://mydomain.tld/pillar-appdata.git:
    - mountpoint: web/server/

```

`salt.pillar.git_pillar.ext_pillar` (*minion_id*, *pillar*, **repos*)
Checkout the `ext_pillar` sources and compile the resulting pillar SLS

20.12.15 salt.pillar.gpg module

Decrypt pillar data through the builtin GPG renderer

In most cases, you'll want to make this the last external pillar used. For example, to pair with the builtin stack pillar you could do something like this:

```

ext_pillar:
- stack: /path/to/stack.cfg
- gpg: {}

```

Set `gpg_keydir` in your config to adjust the homedir the renderer uses.

`salt.pillar.gpg.ext_pillar` (*minion_id*, *pillar*, **args*, ***kwargs*)

20.12.16 salt.pillar.hg_pillar

Use remote Mercurial repository as a Pillar source.

New in version 2015.8.0.

The module depends on the `hglib` python module being available. This is the same requirement as for `hgfs` so should not pose any extra hurdles.

This external Pillar source can be configured in the master config file as such:

```

ext_pillar:
- hg: ssh://hg@example.co/user/repo

```

class `salt.pillar.hg_pillar.Repo` (*repo_uri*)
Deal with remote hg (mercurial) repository for Pillar

close()
Cleanup mercurial command server

pull()

update (*branch='default'*)

Ensure we are using the latest revision in the hg repository

`salt.pillar.hg_pillar.ext_pillar` (*minion_id, pillar, repo, branch='default', root=None*)

Extract pillar from an hg repository

`salt.pillar.hg_pillar.update` (*repo_uri*)

Execute an hg pull on all the repos

20.12.17 salt.pillar.hiera

Use hiera data as a Pillar source

`salt.pillar.hiera.ext_pillar` (*minion_id, pillar, conf*)

Execute hiera and return the data

20.12.18 salt.pillar.http_json module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_JSON ext_pillar

Set the following Salt config to setup http json result as external pillar source:

```
ext_pillar:
- http_json:
  url: http://example.com/api/minion_id
  ::TODO::
  username: username
  password: password
```

If the `with_grains` parameter is set, grain keys wrapped in `<>` brackets in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_json:
  url: http://example.com/api/<nodename>
  with_grains: True
```

Changed in version 2018.3.0: If `%s` is present in the url, it will be automatically replaced by the `minion_id`:

```
ext_pillar:
- http_json:
  url: http://example.com/api/%s
```

Module Documentation

`salt.pillar.http_json.ext_pillar` (*minion_id, pillar, url, with_grains=False*)

Read pillar data from HTTP response.

Parameters

- **url** (*str*) – Url to request.
- **with_grains** (*bool*) – Whether to substitute strings in the url with their grain values.

Returns A dictionary of the pillar data to add.
Return type `dict`

20.12.19 `salt.pillar.http_yaml` module

A module that adds data to the Pillar structure retrieved by an http request

Configuring the HTTP_YAML `ext_pillar`

Set the following Salt config to setup an http endpoint as the external pillar source:

```
ext_pillar:
- http_yaml:
  url: http://example.com/api/minion_id
  ::TODO::
  username: username
  password: password
```

If the `with_grains` parameter is set, grain keys wrapped in can be provided (wrapped in <> brackets) in the url in order to populate pillar data based on the grain value.

```
ext_pillar:
- http_yaml:
  url: http://example.com/api/<nodename>
  with_grains: True
```

Changed in version 2018.3.0: If `%s` is present in the url, it will be automatically replaced by the `minion_id`:

```
ext_pillar:
- http_json:
  url: http://example.com/api/%s
```

Module Documentation

`salt.pillar.http_yaml.ext_pillar(minion_id, pillar, url, with_grains=False)`

Read pillar data from HTTP response.

Parameters

- **url** (*str*) – Url to request.
- **with_grains** (*bool*) – Whether to substitute strings in the url with their grain values.

Returns A dictionary of the pillar data to add.

Return type `dict`

20.12.20 `salt.pillar.libvirt`

Load up the libvirt keys into Pillar for a given minion if said keys have been generated using the libvirt key runner

depends `certtool`

`salt.pillar.libvirt.ext_pillar(minion_id, pillar, command)`

Read in the generated libvirt keys

`salt.pillar.libvirt.gen_hyper_keys`(*minion_id*, *country*='US', *state*='Utah', *locality*='Salt Lake City', *organization*='Salted', *expiration_days*='365')

Generate the keys to be used by libvirt hypervisors, this routine gens the keys and applies them to the pillar for the hypervisor minions

20.12.21 salt.pillar.makostack module

Simple and flexible YAML `ext_pillar` which can read pillar from within pillar.

New in version 2016.3.0.

This custom saltstack `ext_pillar` is a direct ripoff of the 'stack' `ext_pillar`, simply ported to use mako instead of jinja2 for templating.

It supports the following features:

- multiple config files that are mako templates with support for `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- a config file renders as an ordered list of files. Unless absolute, the paths of these files are relative to the current config file - if absolute, they will be treated literally.
- this list of files are read in order as mako templates with support for `stack`, `pillar`, `__grains__`, `__salt__`, `__opts__` objects.
- all these rendered files are then parsed as `yaml`.
- then all `yaml` dicts are merged in order, with support for the following. merging strategies: `merge-first`, `merge-last`, `remove`, and `overwrite`.
- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments.

Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure MakoStack in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single MakoStack config file like below:

```
ext_pillar:
- makostack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
- makostack:
  - /path/to/stack1.cfg
  - /path/to/stack2.cfg
```

Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: MakoStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```

ext_pillar:
  - makostack:
      pillar:environment:
        dev: /path/to/dev/stack.cfg
        prod: /path/to/prod/stack.cfg
      grains:custom:grain:
        value:
          - /path/to/stack1.cfg
          - /path/to/stack2.cfg
      opts:custom:opt:
        value: /path/to/stack0.cfg

```

Grafting data from files to arbitrary namespaces

An extended syntax for config files permits defining "graft points" on a per-config-file basis. As an example, if the file foo.cfg would produce the following:

```

foo:
  - bar
  - baz

```

and you specified the cfg file as /path/to/foo.cfg:yummy:fur, the following would actually end up in pillar after all merging was complete:

```

yummy:
  fur:
    foo:
      - bar
      - baz

```

MakoStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are mako templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

Unless an absolute path name is specified, the path of these `yaml` files is assumed to be relative to the directory containing the MakoStack config file. If a path begins with '/', however, it will be treated literally and can be anywhere on the filesystem.

The following variables are available in mako templating of makostack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call

- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a MakoStack config file which looks like:

```
$ cat /path/to/stack/config.cfg
core.yml
osarchs/{ __grains__['osarch'] }.yml
oscodenames/{ __grains__['oscodename'] }.yml
% for role in pillar.get('roles', []):
roles/{ role }.yml
% endfor
minions/{ minion_id }.yml
```

And the whole directory structure could look like:

```
$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── osarchs/
│   ├── amd64.yml
│   └── armhf.yml
├── oscodenames/
│   ├── wheezy.yml
│   └── jessie.yml
├── roles/
│   ├── web.yml
│   └── db.yml
└── minions/
    ├── test-1-dev.yml
    └── test-2-dev.yml
```

Overall process

In the above MakoStack configuration, given that `test-1-dev` minion is an `amd64` platform running Debian Jessie, and which pillar `roles` is `["db"]`, the following `yaml` files would be merged in order:

- `core.yml`
- `osarchs/amd64.yml`
- `oscodenames/jessie.yml`
- `roles/db.yml`
- `minions/test-1-dev.yml`

Before merging, every files above will be preprocessed as mako templates. The following variables are available in mako templating of `yaml` files:

- `stack`: the MakoStack pillar data object that has currently been merged (data from previous `yaml` files in MakoStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)

- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of mako to build your pillar data, and even use other pillar values that has already been merged by MakoStack (from previous `yaml` files in MakoStack configuration) through the `stack` variable.

Once a `yaml` file has been preprocessed by mako, we obtain a Python dict - let's call it `yaml_data` - then, MakoStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged MakoStack pillar data). By default, MakoStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every `yaml` files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by MakoStack. So MakoStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`, or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__: <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

`merge-last` (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

`merge-first` strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

`remove` strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - sysadmin - developer mat: uid: 1001 root: uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre> users: tom: uid: 500 roles: - sysadmin root: uid: 0 </pre>	<pre> users: __: merge-last tom: uid: 1000 roles: - developer mat: uid: 1001 </pre>	<pre> users: tom: uid: 1000 roles: - sysadmin - developer mat: uid: 1001 root: uid: 0 </pre>
<pre> users: tom: uid: 500 roles: - sysadmin root: uid: 0 </pre>	<pre> users: __: merge-first tom: uid: 1000 roles: - developer mat: uid: 1001 </pre>	<pre> users: tom: uid: 500 roles: - developer - sysadmin mat: uid: 1001 root: uid: 0 </pre>
<pre> users: tom: uid: 500 roles: - sysadmin root: uid: 0 </pre>	<pre> users: __: remove tom: mat: </pre>	<pre> users: root: uid: 0 </pre>
<pre> users: tom: uid: 500 roles: - sysadmin root: uid: 0 </pre>	<pre> users: __: overwrite tom: uid: 1000 roles: - developer mat: uid: 1001 </pre>	<pre> users: tom: uid: 1000 roles: - developer mat: uid: 1001 </pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

`salt.pillar.makostack.ext_pillar` (*minion_id*, *pillar*, **args*, ***kwargs*)

20.12.22 salt.pillar.mongo

Read Pillar data from a mongodb collection

depends pymongo (for salt-master)

This module will load a node-specific pillar dictionary from a mongo collection. It uses the node's id for lookups and can load either the whole document, or just a specific field from that document as the pillar dictionary.

Salt Master Mongo Configuration

The module shares the same base mongo connection variables as `salt.returners.mongo_return`. These variables go in your master config file.

- `mongo.db` - The mongo database to connect to. Defaults to 'salt'.
- `mongo.host` - The mongo host to connect to. Supports replica sets by specifying all hosts in the set, comma-delimited. Defaults to 'salt'.
- `mongo.port` - The port that the mongo database is running on. Defaults to 27017.
- `mongo.user` - The username for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.
- `mongo.password` - The password for connecting to mongo. Only required if you are using mongo authentication. Defaults to ''.

Configuring the Mongo ext_pillar

The Mongo ext_pillar takes advantage of the fact that the Salt Master configuration file is yaml. It uses a sub-dictionary of values to adjust specific features of the pillar. This is the explicit single-line dictionary notation for yaml. One may be able to get the easier-to-read multi-line dict to work correctly with some experimentation.

```
ext_pillar:
  - mongo: {collection: vm, id_field: name, re_pattern: \.example\.com, fields:
    ↪ [customer_id, software, apache_vhosts]}
```

In the example above, we've decided to use the `vm` collection in the database to store the data. Minion ids are stored in the `name` field on documents in that collection. And, since minion ids are FQDNs in most cases, we'll need to trim the domain name in order to find the minion by hostname in the collection. When we find a minion, return only the `customer_id`, `software`, and `apache_vhosts` fields, as that will contain the data we want for a given node. They will be available directly inside the `pillar` dict in your SLS templates.

Module Documentation

`salt.pillar.mongo.ext_pillar` (*minion_id*, *pillar*, *collection='pillar'*, *id_field='_id'*, *re_pattern=None*, *re_replace=""*, *fields=None*)

Connect to a mongo database and read per-node pillar information.

Parameters

- **collection** (*) – The mongodb collection to read data from. Defaults to 'pillar'.
- **id_field** (*) – The field in the collection that represents an individual minion id. Defaults to '_id'.
- **re_pattern** (*) – If your naming convention in the collection is shorter than the minion id, you can use this to trim the name. *re_pattern* will be used to match the name, and *re_replace* will be used to replace it. Backrefs are supported as they are in the Python standard library. If `None`, no mangling of the name will be performed - the collection will be searched with the entire minion id. Defaults to `None`.
- **re_replace** (*) – Use as the replacement value in node ids matched with *re_pattern*. Defaults to `"`. Feel free to use backreferences here.
- **fields** (*) – The specific fields in the document to use for the pillar data. If `None`, will use the entire document. If using the entire document, the `_id` field will be converted to string. Be careful with other fields in the document as they must be string serializable. Defaults to `None`.

20.12.23 salt.pillar.mysql

Retrieve Pillar data by doing a MySQL query

MariaDB provides Python support through the MySQL Python package. Therefore, you may use this module with both MySQL or MariaDB.

This module is a concrete implementation of the `sql_base` ext_pillar for MySQL.

maturity new

depends python-mysqldb

platform all

Configuring the mysql ext_pillar

Use the 'mysql' key under ext_pillar for configuration of queries.

MySQL configuration of the MySQL returner is being used (mysql.db, mysql.user, mysql.pass, mysql.port, mysql.host) for database connection info.

Required python modules: MySQLdb

Complete example

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'
  port: 3306
  ssl:
    cert: /etc/mysql/client-cert.pem
    key: /etc/mysql/client-key.pem

ext_pillar:
  - mysql:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
        depth: 5
        as_list: True
        with_lists: [1,3]
```

class salt.pillar.mysql.MySQLExtPillar

This class receives and processes the database rows from MySQL.

extract_queries (*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.mysql.**ext_pillar** (*minion_id*, *pillar*, **args*, ***kwargs*)

Execute queries against MySQL, merge and return as a dict

20.12.24 salt.pillar.neutron module

Use Openstack Neutron data as a Pillar source. Will list all networks listed inside of Neutron, to all minions.

New in version 2015.5.1.

depends

- python-neutronclient

A keystone profile must be used for the pillar to work (no generic keystone configuration here). For example:

```
my openstack_config:
  keystone.user: 'admin'
  keystone.password: 'password'
  keystone.tenant: 'admin'
  keystone.auth_url: 'http://127.0.0.1:5000/v2.0/'
```

(continues on next page)

(continued from previous page)

```
keystone.region_name: 'RegionOne'
keystone.service_type: 'network'
```

After the profile is created, configure the external pillar system to use it.

```
ext_pillar:
- neutron: my_openstack_config
```

Using these configuration profiles, multiple neutron sources may also be used:

```
ext_pillar:
- neutron: my_openstack_config
- neutron: my_other_openstack_config
```

By default, these networks will be returned as a pillar item called `networks`. In order to have them returned under a different name, add the name after the Keystone profile name:

```
ext_pillar:
  • neutron: my_openstack_config neutron_networks
```

```
salt.pillar.neutron.ext_pillar(minion_id, pillar, conf)
  Check neutron for all data
```

20.12.25 salt.pillar.nodegroups

Nodegroups Pillar

Introspection: to which nodegroups does my minion belong? Provides a pillar with the default name of `nodegroups` which contains a list of nodegroups which match for a given minion.

New in version 2016.11.0.

Command Line

```
salt-call pillar.get nodegroups
local:
  - class_infra
  - colo_sj
  - state_active
  - country_US
  - type_saltmaster
```

Configuring Nodegroups Pillar

```
extension_modules: /srv/salt/ext
ext_pillar:
- nodegroups:
  pillar_name: 'nodegroups'
```

```
salt.pillar.nodegroups.ext_pillar(minion_id, pillar, pillar_name=None)
  A salt external pillar which provides the list of nodegroups of which the minion is a member.
```

Parameters

- **minion_id** – used for compound matching nodegroups
- **pillar** – provided by salt, but not used by nodegroups ext_pillar
- **pillar_name** – optional name to use for the pillar, defaults to 'nodegroups'

Returns a dictionary which is included by the salt master in the pillars returned to the minion

20.12.26 salt.pillar.pepa

Pepa

Configuration templating for SaltStack using Hierarchical substitution and Jinja.

Configuring Pepa

```

extension_modules: /srv/salt/ext

ext_pillar:
  - pepa:
      resource: host                # Name of resource directory and sub-key in
      ↪pillars
      sequence:                    # Sequence used for hierarchical substitution
      - hostname:                 # Name of key
          name: input              # Alias used for template directory
          base_only: True         # Only use templates from Base environment, i.e.
      ↪no staging
      - default:
      - environment:
      - location..region:
          name: region
      - location..country:
          name: country
      - location..datacenter:
          name: datacenter
      - roles:
      - osfinger:
          name: os
      - hostname:
          name: override
          base_only: True
      subkey: True                 # Create a sub-key in pillars, named after the
      ↪resource in this case [host]
      subkey_only: True           # Only create a sub-key, and leave the top level
      ↪untouched

pepa_roots:                       # Base directory for each environment
  base: /srv/pepa/base           # Path for base environment
  dev: /srv/pepa/base            # Associate dev with base
  qa: /srv/pepa/qa
  prod: /srv/pepa/prod

# Use a different delimiter for nested dictionaries, defaults to '..' since some keys
↪may use '.' in the name
#pepa_delimiter: ..

```

(continues on next page)

(continued from previous page)

```
# Supply Grains for Pepa, this should **ONLY** be used for testing or validation
#pepa_grains:
# environment: dev

# Supply Pillar for Pepa, this should **ONLY** be used for testing or validation
#pepa_pillars:
# saltversion: 0.17.4

# Enable debug for Pepa, and keep Salt on warning
#log_level: debug

#log_granular_levels:
# salt: warning
# salt.loaded.ext.pillar.pepa: debug
```

Pepa can also be used in Master-less SaltStack setup.

Command line

```
usage: pepa.py [-h] [-c CONFIG] [-d] [-g GRAINS] [-p PILLAR] [-n] [-v]
             hostname

positional arguments:
  hostname              Hostname

optional arguments:
  -h, --help            show this help message and exit
  -c CONFIG, --config CONFIG
                       Configuration file
  -d, --debug           Print debug info
  -g GRAINS, --grains GRAINS
                       Input Grains as YAML
  -p PILLAR, --pillar PILLAR
                       Input Pillar as YAML
  -n, --no-color        No color output
  -v, --validate        Validate output
```

Templates

Templates is configuration for a host or software, that can use information from Grains or Pillars. These can then be used for hierarchically substitution.

Example File: host/input/test_example_com.yaml

```
location..region: emea
location..country: nl
location..datacenter: foobar
environment: dev
roles:
- salt.master
network..gateway: 10.0.0.254
network..interfaces..eth0..hwaddr: 00:20:26:a1:12:12
network..interfaces..eth0..dhcp: False
network..interfaces..eth0..ipv4: 10.0.0.3
```

(continues on next page)

(continued from previous page)

```

network.interfaces.eth0.netmask: 255.255.255.0
network.interfaces.eth0.fqdn: {{ hostname }}
cobbler.profile: fedora-19-x86_64

```

As you see in this example you can use Jinja directly inside the template.

Example File: host/region/amer.yaml

```

network.dns.servers:
- 10.0.0.1
- 10.0.0.2
time.ntp.servers:
- ntp1.amer.example.com
- ntp2.amer.example.com
- ntp3.amer.example.com
time.timezone: America/Chihuahua
yum.mirror: yum.amer.example.com

```

Each template is named after the value of the key using lowercase and all extended characters are replaced with underscore.

Example:

osfinger: Fedora-19

Would become:

fedora_19.yaml

Nested dictionaries

In order to create nested dictionaries as output you can use double dot "." as a delimiter. You can change this using "pepa_delimiter" we choose double dot since single dot is already used by key names in some modules, and using ":" requires quoting in the YAML.

Example:

```

network.dns.servers:
- 10.0.0.1
- 10.0.0.2
network.dns.options:
- timeout:2
- attempts:1
- ndots:1
network.dns.search:
- example.com

```

Would become:

```

network:
  dns:
    servers:
      - 10.0.0.1
      - 10.0.0.2
    options:
      - timeout:2
      - attempts:1

```

(continues on next page)

(continued from previous page)

```
- ndots:1
search:
- example.com
```

Operators

Operators can be used to merge/unset a list/hash or set the key as immutable, so it can't be changed.

Operator	Description
merge()	Merge list or hash
unset()	Unset key
immutable()	Set the key as immutable, so it can't be changed
imerge()	Set immutable and merge
iunset()	Set immutable and unset

Example:

```
network..dns..search..merge():
- foobar.com
- dummy.nl
owner..immutable(): Operations
host..printers..unset():
```

Validation

Since it's very hard to test Jinja as is, the best approach is to run all the permutations of input and validate the output, i.e. Unit Testing.

To facilitate this in Pepa we use YAML, Jinja and Cerberus <<https://github.com/nicolaiarocci/cerberus>>.

Schema

So this is a validation schema for network configuration, as you see it can be customized with Jinja just as Pepa templates.

This was designed to be run as a build job in Jenkins or similar tool. You can provide Grains/Pillar input using either the config file or command line arguments.

File Example: host/validation/network.yaml

```
network..dns..search:
  type: list
  allowed:
    - example.com

network..dns..options:
  type: list
  allowed: ['timeout:2', 'attempts:1', 'ndots:1']

network..dns..servers:
  type: list
  schema:
```

(continues on next page)

```

    regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..gateway:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% if network.interfaces is defined %}
{% for interface in network.interfaces %}

network..interfaces..{{ interface }}..dhcp:
  type: boolean

network..interfaces..{{ interface }}..fqdn:
  type: string
  regex: ^([a-z0-9]([a-z0-9-]{0,61}[a-z0-9])?\.)+[a-zA-Z]{2,6}$

network..interfaces..{{ interface }}..hwaddr:
  type: string
  regex: ^([0-9a-f]{1,2}\:){5}[0-9a-f]{1,2}$

network..interfaces..{{ interface }}..ipv4:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

network..interfaces..{{ interface }}..netmask:
  type: string
  regex: ^([0-9]{1,3}\.){3}[0-9]{1,3}$

{% endfor %}
{% endif %}

```

20.12.27 salt.pillar.pillar_ldap

Use LDAP data as a Pillar source

This pillar module executes a series of LDAP searches. Data returned by these searches are aggregated, whereby data returned by later searches override data by previous searches with the same key.

The final result is merged with existing pillar data.

The configuration of this external pillar module is done via an external file which provides the actual configuration for the LDAP searches.

Configuring the LDAP ext_pillar

The basic configuration is part of the `master` configuration.

```
ext_pillar:
  - pillar_ldap: /etc/salt/master.d/pillar_ldap.yaml
```

Note: When placing the file in the `master.d` directory, make sure its name doesn't end in `.conf`, otherwise the salt-master process will attempt to parse its content.

Warning: Make sure this file has very restrictive permissions, as it will contain possibly sensitive LDAP credentials!

The only required key in the master configuration is `pillar_ldap` pointing to a file containing the actual configuration.

Configuring the LDAP searches

The file is processed using *Salt's Renderers* `<renderers>` which makes it possible to reference grains within the configuration.

Warning: When using Jinja in this file, make sure to do it in a way which prevents leaking sensitive information. A rogue minion could send arbitrary grains to trick the master into returning secret data. Use only the 'id' grain which is verified through the minion's key/cert.

Map Mode

The `it-admins` configuration below returns the Pillar `it-admins` by:

- filtering for: - members of the group `it-admins` - objects with `objectclass=user`
- returning the data of users, where each user is a dictionary containing the configured string or list attributes.

Configuration

```
salt-users:
  server: ldap.company.tld
  port: 389
  tls: true
  dn: 'dc=company,dc=tld'
  binddn: 'cn=salt-pillars,ou=users,dc=company,dc=tld'
  bindpw: bi7ieBai5Ano
  referrals: false
  anonymous: false
  mode: map
  dn: 'ou=users,dc=company,dc=tld'
  filter: '(&(memberof=cn=it-admins,ou=groups,dc=company,dc=tld)(objectclass=user))'
```

(continues on next page)

(continued from previous page)

```

attrs:
  - cn
  - displayName
  - givenName
  - sn
lists:
  - memberOf

search_order:
  - salt-users

```

Result

```

{
  'salt-users': [
    {
      'cn': 'cn=johndoe,ou=users,dc=company,dc=tld',
      'displayName': 'John Doe'
      'givenName': 'John'
      'sn': 'Doe'
      'memberOf': [
        'cn=it-admins,ou=groups,dc=company,dc=tld',
        'cn=team01,ou=groups,dc=company'
      ]
    },
    {
      'cn': 'cn=janedoe,ou=users,dc=company,dc=tld',
      'displayName': 'Jane Doe',
      'givenName': 'Jane',
      'sn': 'Doe',
      'memberOf': [
        'cn=it-admins,ou=groups,dc=company,dc=tld',
        'cn=team02,ou=groups,dc=company'
      ]
    }
  ]
}

```

`salt.pillar.pillar_ldap.ext_pillar(minion_id, pillar, config_file)`

Execute LDAP searches and return the aggregated data

20.12.28 salt.pillar.postgres module

Retrieve Pillar data by doing a postgres query

New in version 2017.7.0.

maturity new

depends psycpg2

platform all

Complete Example

```
postgres:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - postgres:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE %s'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

class salt.pillar.postgres.POSTGRESExtPillar

This class receives and processes the database rows from POSTGRES.

extract_queries(*args, kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

salt.pillar.postgres.**ext_pillar**(*minion_id, pillar, *args, **kwargs*)

Execute queries against POSTGRES, merge and return as a dict

20.12.29 salt.pillar.puppet

Execute an unmodified puppet_node_classifier and read the output as YAML. The YAML data is then directly overlaid onto the minion's Pillar data.

salt.pillar.puppet.**ext_pillar**(*minion_id, pillar, command*)

Execute an unmodified puppet_node_classifier and read the output as YAML

20.12.30 salt.pillar.reclass_adapter

Use the "reclass" database as a Pillar source

This ext_pillar plugin provides access to the **reclass** database, such that Pillar data for a specific minion are fetched using **reclass**.

You can find more information about **reclass** at <http://reclass.pantsfullofunix.net>.

To use the plugin, add it to the ext_pillar list in the Salt master config and tell **reclass** by way of a few options how and where to find the inventory:

```
ext_pillar:
  - reclass:
      storage_type: yaml_fs
      inventory_base_uri: /srv/salt
```

This would cause **reclass** to read the inventory from YAML files in /srv/salt/nodes and /srv/salt/classes.

If you are also using **reclass** as master_tops plugin, and you want to avoid having to specify the same information for both, use YAML anchors (take note of the differing data types for ext_pillar and master_tops):

```
reclass: &reclass
  storage_type: yaml_fs
  inventory_base_uri: /srv/salt
  reclass_source_path: ~/code/reclass

ext_pillar:
  - reclass: *reclass

master_tops:
  reclass: *reclass
```

If you want to run reclass from source, rather than installing it, you can either let the master know via the PYTHONPATH environment variable, or by setting the configuration option, like in the example above.

`salt.pillar.reclass_adapter.ext_pillar(minion_id, pillar, **kwargs)`
Obtain the Pillar data from reclass for the given minion_id.

20.12.31 salt.pillar.redismod

Read pillar data from a Redis backend

New in version 2014.7.0.

depends

- redis Python module (on master)

Salt Master Redis Configuration

The module shares the same base Redis connection variables as `salt.returners.redis_return`. These variables go in your master config file.

- `redis.db` - The Redis database to use. Defaults to 0.
- `redis.host` - The Redis host to connect to. Defaults to 'salt'.
- `redis.port` - The port that the Redis database is listening on. Defaults to 6379.
- `redis.password` - The password for authenticating with Redis. Only required if you are using master auth. Defaults to None.

Configuring the Redis ext_pillar

```
ext_pillar:
  - redis: {function: key_value}
```

`salt.pillar.redismod.ext_pillar(minion_id, pillar, function, **kwargs)`
Grabs external pillar data based on configured function

`salt.pillar.redismod.key_json(minion_id, pillar, pillar_key=None)`
Pulls a string from redis and deserializes it from json. Deserialized dictionary data loaded directly into top level if pillar_key is not set.
`pillar_key` Pillar key to return data into

`salt.pillar.redismod.key_value(minion_id, pillar, pillar_key='redis_pillar')`

Looks for key in redis matching `minion_id`, returns a structure based on the data type of the redis key. String for string type, dict for hash type and lists for lists, sets and sorted sets.

`pillar_key` Pillar key to return data into

20.12.32 salt.pillar.s3

Copy pillar data from a bucket in Amazon S3

The S3 pillar can be configured in the master config file with the following options

```

ext_pillar:
  - s3:
      bucket: my.fancy.pillar.bucket
      keyid: KASKFJWAKJASJKDAJKSD
      key: ks\adfdLKDALSFKSD93q032sdDasdfasdfsadkf
      multiple_env: False
      environment: base
      prefix: somewhere/overthere
      verify_ssl: True
      service_url: s3.amazonaws.com
      kms_keyid: 01234567-89ab-cdef-0123-4567890abcde
      s3_cache_expire: 30
      s3_sync_on_update: True
      path_style: False
      https_enable: True

```

The `bucket` parameter specifies the target S3 bucket. It is required.

The `keyid` parameter specifies the key id to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `key` parameter specifies the key to use when access the S3 bucket. If it is not provided, an attempt to fetch it from EC2 instance meta-data will be made.

The `multiple_env` defaults to `False`. It specifies whether the pillar should interpret top level folders as pillar environments (see mode section below).

The `environment` defaults to `'base'`. It specifies which environment the bucket represents when in single environments mode (see mode section below). It is ignored if `multiple_env` is `True`.

The `prefix` defaults to `''`. It specifies a key prefix to use when searching for data in the bucket for the pillar. It works when `multiple_env` is `True` or `False`. Essentially it tells `ext_pillar` to look for your pillar data in a 'subdirectory' of your S3 bucket

The `verify_ssl` parameter defaults to `True`. It specifies whether to check for valid S3 SSL certificates. *NOTE* If you use bucket names with periods, this must be set to `False` else an invalid certificate error will be thrown (issue #12200).

The `service_url` parameter defaults to `'s3.amazonaws.com'`. It specifies the base url to use for accessing S3.

The `kms_keyid` parameter is optional. It specifies the ID of the Key Management Service (KMS) master key that was used to encrypt the object.

The `s3_cache_expire` parameter defaults to 30s. It specifies expiration time of S3 metadata cache file.

The `s3_sync_on_update` parameter defaults to `True`. It specifies if cache is synced on update rather than jit.

The `path_style` parameter defaults to `False`. It specifies whether to use path style requests or dns style requests

The `https_enable` parameter defaults to `True`. It specifies whether to use https protocol or http protocol

This pillar can operate in two modes, single environment per bucket or multiple environments per bucket.

Single environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<files>
```

Multiple environment mode must have this bucket structure:

```
s3://<bucket name>/<prefix>/<environment>/<files>
```

If you wish to define your pillar data entirely within S3 it's recommended that you use the *prefix=* parameter and specify one entry in *ext_pillar* for each environment rather than specifying *multiple_env*. This is due to issue #22471 (<https://github.com/saltstack/salt/issues/22471>)

```
class salt.pillar.s3.S3Credentials(key, keyid, bucket, service_url, verify_ssl=True,
                                  kms_keyid=None, location=None, path_style=False,
                                  https_enable=True)
```

```
salt.pillar.s3.ext_pillar(minion_id, pillar, bucket, key=None, keyid=None, verify_ssl=True,
                          location=None, multiple_env=False, environment='base', pre-
                          fix=", service_url=None, kms_keyid=None, s3_cache_expire=30,
                          s3_sync_on_update=True, path_style=False, https_enable=True)
```

Execute a command and read the output as YAML

20.12.33 salt.pillar.saltclass

SaltClass Pillar Module

```
ext_pillar:
- saltclass:
  - path: /srv/saltclass
```

For additional configuration instructions, see the *saltclass* module

```
salt.pillar.saltclass.ext_pillar(minion_id, pillar, *args, **kwargs)
    Compile pillar data
```

20.12.34 salt.pillar.sql_base module

Retrieve Pillar data by doing a SQL query

This module is not meant to be used directly as an *ext_pillar*. It is a place to put code common to PEP 249 compliant SQL database adapters. It exposes a python ABC that can be subclassed for new database providers.

```
maturity new
platform all
```

Theory of *sql_base* *ext_pillar*

Ok, here's the theory for how this works...

- First, any non-keyword args are processed in order.
- Then, remaining keywords are processed.

We do this so that it's backward compatible with older configs. Keyword arguments are sorted before being appended, so that they're predictable, but they will always be applied last so overall it's moot.

For each of those items we process, it depends on the object type:

- Strings are executed as is and the pillar depth is determined by the number of fields returned.
- A list has the first entry used as the query, the second as the pillar depth.
- A mapping uses the keys "query" and "depth" as the tuple

You can retrieve as many fields as you like, how they get used depends on the exact settings.

Configuring a `sql_base` `ext_pillar`

The `sql_base` `ext_pillar` cannot be used directly, but shares query configuration with its implementations. These examples use a fake 'sql_base' adapter, which should be replaced with the name of the adapter you are using.

A list of queries can be passed in

```
ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  - "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

Or you can pass in a mapping

```
ext_pillar:
- sql_base:
  main: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  extras: "SELECT pillar,value FROM more_pillars WHERE minion_id = %s"
```

The query can be provided as a string as we have just shown, but they can be provided as lists

```
ext_pillar:
- sql_base:
  - "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  2
```

Or as a mapping

```
ext_pillar:
- sql_base:
  - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
  depth: 2
```

The depth defines how the dicts are constructed. Essentially if you query for fields a,b,c,d for each row you'll get:

- With depth 1: {a: {"b": b, "c": c, "d": d}}
- With depth 2: {a: {b: {"c": c, "d": d}}}
- With depth 3: {a: {b: {c: d}}}

Depth greater than 3 wouldn't be different from 3 itself. Depth of 0 translates to the largest depth needed, so 3 in this case. (max depth == key count - 1)

Then they are merged in a similar way to plain pillar data, in the order returned by the SQL database.

Thus subsequent results overwrite previous ones when they collide.

The `ignore_null` option can be used to change the overwrite behavior so that only non-NULL values in subsequent results will overwrite. This can be used to selectively overwrite default values.

```
ext_pillar:
  - sql_base:
    - query: "SELECT pillar,value FROM pillars WHERE minion_id = 'default' and
↳minion_id != %s"
      depth: 2
    - query: "SELECT pillar,value FROM pillars WHERE minion_id = %s"
      depth: 2
      ignore_null: True
```

If you specify `as_list: True` in the mapping expression it will convert collisions to lists.

If you specify `with_lists: '...'` in the mapping expression it will convert the specified depths to list. The string provided is a sequence numbers that are comma separated. The string '1,3' will result in:

```
a,b,c,d,e,1 # field 1 same, field 3 differs
a,b,c,f,g,2 # ^^^^
a,z,h,y,j,3 # field 1 same, field 3 same
a,z,h,y,k,4 # ^^^^
  ^      ^
```

These columns define list grouping

```
{a: [
  {c: [
    {e: 1},
    {g: 2}
  ]},
  {h: [
    {j: 3, k: 4 }
  ]}
]}
```

The range for `with_lists` is 1 to `number_of_fields`, inclusive. Numbers outside this range are ignored.

Finally, if you pass the queries in via a mapping, the key will be the first level name where as passing them in as a list will place them in the root. This isolates the query results into their own subtrees. This may be a help or hindrance to your aims and can be used as such.

You can basically use any SELECT query that gets you the information, you could even do joins or subqueries in case your `minion_id` is stored elsewhere. It is capable of handling single rows or multiple rows per minion.

Configuration of the connection depends on the adapter in use.

More complete example for MySQL (to also show configuration)

```
mysql:
  user: 'salt'
  pass: 'super_secret_password'
  db: 'salt_db'

ext_pillar:
  - mysql:
```

(continues on next page)

(continued from previous page)

```

fromdb:
  query: 'SELECT col1,col2,col3,col4,col5,col6,col7
           FROM some_random_table
           WHERE minion_pattern LIKE %s'
  depth: 5
  as_list: True
  with_lists: [1,3]

```

class salt.pillar.sql_base.SqlBaseExtPillar

This class receives and processes the database rows in a database agnostic way.

as_list = False**depth** = 0**enter_root**(*root*)

Set self.focus for kwarg queries

extract_queries(*args*, *kwargs*)

This function normalizes the config block into a set of queries we can use. The return is a list of consistently laid out dicts.

fetch(*minion_id*, *pillar*, **args*, ***kwargs*)

Execute queries, merge and return as a dict.

field_names = None**focus** = None**ignore_null** = False**num_fields** = 0**process_fields**(*field_names*, *depth*)

The primary purpose of this function is to store the sql field list and the depth to which we process.

process_results(*rows*)

This function takes a list of database results and iterates over, merging them into a dict form.

result = None**with_lists** = None**20.12.35 salt.pillar.sqlcipher module**

Retrieve Pillar data by running a SQLCipher query

New in version 2016.3.0.

Python SQLCipher support is provided by the pysqlcipher Python package. You need this module installed to query Pillar data from a SQLCipher database.

This module is a concrete implementation of the sql_base ext_pillar for SQLCipher.

maturity new**depends** pysqlcipher (for py2) or pysqlcipher3 (for py3)**platform** all

Configuring the sqlcipher ext_pillar

Use the 'sqlcipher' key under ext_pillar for configuration of queries.

SQLCipher database connection configuration requires the following values configured in the master config:

- `sqlcipher.database` - The SQLCipher database to connect to. Defaults to `'/var/lib/salt/pillar-sqlcipher.db'`.
- `sqlcipher.pass` - The SQLCipher database decryption password.
- `sqlcipher.timeout` - The connection timeout in seconds.

Example configuration

```
sqlcipher:
  database: /var/lib/salt/pillar-sqlcipher.db
  pass: strong_pass_phrase
  timeout: 5.0
```

Complete Example

```
sqlcipher:
  database: '/var/lib/salt/pillar-sqlcipher.db'
  pass: strong_pass_phrase
  timeout: 5.0

ext_pillar:
  - sqlcipher:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

class salt.pillar.sqlcipher.SQLCipherExtPillar

This class receives and processes the database rows from SQLCipher.

`salt.pillar.sqlcipher.ext_pillar(minion_id, pillar, *args, **kwargs)`

Execute queries against SQLCipher, merge and return as a dict

20.12.36 salt.pillar.sqlite3 module

Retrieve Pillar data by doing a SQLite3 query

New in version 2015.8.0.

`sqlite3` is included in the `stdlib` since Python 2.5.

This module is a concrete implementation of the `sql_base` ext_pillar for SQLite3.

platform all

Configuring the sqlite3 ext_pillar

Use the 'sqlite3' key under ext_pillar for configuration of queries.

SQLite3 database connection configuration requires the following values configured in the master config:

Note, timeout is in seconds.

```
sqlite3.database: /var/lib/salt/pillar.db
sqlite3.timeout: 5.0
```

Complete Example

```
sqlite3:
  database: '/var/lib/salt/pillar.db'
  timeout: 5.0

ext_pillar:
  - sqlite3:
      fromdb:
        query: 'SELECT col1,col2,col3,col4,col5,col6,col7
                FROM some_random_table
                WHERE minion_pattern LIKE ?'
      depth: 5
      as_list: True
      with_lists: [1,3]
```

class salt.pillar.sqlite3.SQLite3ExtPillar

This class receives and processes the database rows from SQLite3.

salt.pillar.sqlite3.ext_pillar(minion_id, pillar, *args, **kwargs)

Execute queries against SQLite3, merge and return as a dict

20.12.37 salt.pillar.stack

Simple and flexible YAML ext_pillar which can read pillar from within pillar.

New in version 2016.3.0.

PillarStack is a custom saltstack ext_pillar which was inspired by varstack but is heavily based on Jinja2 for maximum flexibility.

Any issue should be reported to the upstream project at: <https://github.com/bbinet/pillarstack/issues>

It supports the following features:

- multiple config files that are jinja2 templates with support for pillar, __grains__, __salt__, __opts__ objects
- a config file renders as an ordered list of files (paths of these files are relative to the current config file)
- this list of files are read in ordered as jinja2 templates with support for stack, pillar, __grains__, __salt__, __opts__ objects
- all these rendered files are then parsed as yaml
- then all yaml dicts are merged in order with support for the following merging strategies: merge-first, merge-last, remove, and overwrite

- stack config files can be matched based on `pillar`, `grains`, or `opts` values, which make it possible to support kind of self-contained environments

Installation

PillarStack is already bundled with Salt since 2016.3.0 version so there is nothing to install from version 2016.3.0.

If you use an older Salt version or you want to override PillarStack with a more recent one, follow the installation procedure below.

Installing the PillarStack `ext_pillar` is as simple as dropping the `stack.py` file in the `<extension_modules>/pillar` directory (no external python module required), given that `extension_modules` is set in your salt-master configuration, see: <http://docs.saltstack.com/en/latest/ref/configuration/master.html#extension-modules>

Configuration in Salt

Like any other external pillar, its configuration takes place through the `ext_pillar` key in the master config file.

However, you can configure PillarStack in 3 different ways:

Single config file

This is the simplest option, you just need to set the path to your single PillarStack config file like below:

```
ext_pillar:
- stack: /path/to/stack.cfg
```

List of config files

You can also provide a list of config files:

```
ext_pillar:
- stack:
  - /path/to/stack1.cfg
  - /path/to/stack2.cfg
```

Select config files through grains|pillar|opts matching

You can also opt for a much more flexible configuration: PillarStack allows one to select the config files for the current minion based on matching values from either grains, or pillar, or opts objects.

Here is an example of such a configuration, which should speak by itself:

```
ext_pillar:
- stack:
  pillar:environment:
    dev: /path/to/dev/stack.cfg
    prod: /path/to/prod/stack.cfg
  grains:custom:grain:
    value:
```

(continues on next page)

(continued from previous page)

```

- /path/to/stack1.cfg
- /path/to/stack2.cfg
opts:custom:opt:
  value: /path/to/stack0.cfg

```

PillarStack configuration files

The config files that are referenced in the above `ext_pillar` configuration are jinja2 templates which must render as a simple ordered list of `yaml` files that will then be merged to build pillar data.

The path of these `yaml` files must be relative to the directory of the PillarStack config file. These paths support unix style pathname pattern expansion through the *Python glob module* <<https://docs.python.org/2/library/glob.html>>.

The following variables are available in jinja2 templating of PillarStack configuration files:

- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your list of `yaml` files that will be merged in pillar data.

For example, you could have a PillarStack config file which looks like:

```

$ cat /path/to/stack/config.cfg
core.yml
common/*.yml
osarchs/{{ __grains__['osarch'] }}.yml
oscodenames/{{ __grains__['oscodename'] }}.yml
{%- for role in pillar.get('roles', []) %}
roles/{{ role }}.yml
{%- endfor %}
minions/{{ minion_id }}.yml

```

And the whole directory structure could look like:

```

$ tree /path/to/stack/
/path/to/stack/
├── config.cfg
├── core.yml
├── common/
│   ├── xxx.yml
│   └── yyy.yml
├── osarchs/
│   ├── amd64.yml
│   └── armhf.yml
├── oscodenames/
│   ├── wheezy.yml
│   └── jessie.yml
└── roles/

```

(continues on next page)

Overall process

In the above PillarStack configuration, given that test-1-dev minion is an amd64 platform running Debian Jessie, and which pillar roles is ["db"], the following yaml files would be merged in order:

- core.yml
- common/xxx.yml
- common/yyy.yml
- osarchs/amd64.yml
- oscodenames/jessie.yml
- roles/db.yml
- minions/test-1-dev.yml

Before merging, every files above will be preprocessed as Jinja2 templates. The following variables are available in Jinja2 templating of yaml files:

- `stack`: the PillarStack pillar data object that has currently been merged (data from previous yaml files in PillarStack configuration)
- `pillar`: the pillar data (as passed by Salt to our `ext_pillar` function)
- `minion_id`: the minion id ;-)
- `__opts__`: a dictionary of mostly Salt configuration options
- `__grains__`: a dictionary of the grains of the minion making this pillar call
- `__salt__`: a dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist (note: runs on the master)

So you can use all the power of jinja2 to build your pillar data, and even use other pillar values that has already been merged by PillarStack (from previous yaml files in PillarStack configuration) through the `stack` variable.

Once a yaml file has been preprocessed by Jinja2, we obtain a Python dict - let's call it `yaml_data` - then, PillarStack will merge this `yaml_data` dict in the main `stack` dict (which contains already merged PillarStack pillar data). By default, PillarStack will deeply merge `yaml_data` in `stack` (similarly to the `recurse salt pillar_source_merging_strategy`), but 3 merging strategies are currently available for you to choose (see next section).

Once every yaml files have been processed, the `stack` dict will contain your whole own pillar data, merged in order by PillarStack. So PillarStack `ext_pillar` returns the `stack` dict, the contents of which Salt takes care to merge in with all of the other pillars and finally return the whole pillar to the minion.

Merging strategies

The way the data from a new `yaml_data` dict is merged with the existing `stack` data can be controlled by specifying a merging strategy. Right now this strategy can either be `merge-last` (the default), `merge-first`, `remove`,

or `overwrite`.

Note that scalar values like strings, integers, booleans, etc. are always evaluated using the `overwrite` strategy (other strategies don't make sense in that case).

The merging strategy can be set by including a dict in the form of:

```
__ : <merging strategy>
```

as the first item of the dict or list. This allows fine grained control over the merging process.

merge-last (default) strategy

If the `merge-last` strategy is selected (the default), then content of dict or list variables is merged recursively with previous definitions of this variable (similarly to the `recurse salt pillar_source_merging_strategy`). This allows for extending previously defined data.

merge-first strategy

If the `merge-first` strategy is selected, then the content of dict or list variables are swapped between the `yaml_data` and `stack` objects before being merged recursively with the `merge-last` previous strategy.

remove strategy

If the `remove` strategy is selected, then content of dict or list variables in `stack` are removed only if the corresponding item is present in the `yaml_data` dict. This allows for removing items from previously defined data.

overwrite strategy

If the `overwrite` strategy is selected, then the content of dict or list variables in `stack` is overwritten by the content of `yaml_data` dict. So this allows one to overwrite variables from previous definitions.

Merging examples

Let's go through small examples that should clarify what's going on when a `yaml_data` dict is merged in the `stack` dict.

When you don't specify any strategy, the default `merge-last` strategy is selected:

stack	yaml_data	stack (after merge)
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - sysadmin - developer mat: uid: 1001 root: uid: 0</pre>

Then you can select a custom merging strategy using the `__` key in a dict:

stack	yaml_data	stack (after merge)
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: merge-last tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - sysadmin - developer mat: uid: 1001 root: uid: 0</pre>
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: merge-first tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 500 roles: - developer - sysadmin mat: uid: 1001 root: uid: 0</pre>
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: remove tom: mat:</pre>	<pre>users: root: uid: 0</pre>
<pre>users: tom: uid: 500 roles: - sysadmin root: uid: 0</pre>	<pre>users: __: overwrite tom: uid: 1000 roles: - developer mat: uid: 1001</pre>	<pre>users: tom: uid: 1000 roles: - developer mat: uid: 1001</pre>

You can also select a custom merging strategy using a `__` object in a list:

stack	yaml_data	stack (after merge)
<pre>users: - tom - root</pre>	<pre>users: - __: merge-last - mat</pre>	<pre>users: - tom - root - mat</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: merge-first - mat</pre>	<pre>users: - mat - tom - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: remove - mat - tom</pre>	<pre>users: - root</pre>
<pre>users: - tom - root</pre>	<pre>users: - __: overwrite - mat</pre>	<pre>users: - mat</pre>

`salt.pillar.stack.ext_pillar(minion_id, pillar, *args, **kwargs)`

20.12.38 salt.pillar.svn_pillar

Clone a remote SVN repository and use the filesystem as a Pillar source

This external Pillar source can be configured in the master config file like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo root=subdirectory
```

The `root=` parameter is optional and used to set the subdirectory from where to look for Pillar files (such as `top.sls`).

Changed in version 2014.7.0: The optional `root` parameter will be added.

Note that this is not the same thing as configuring pillar data using the `pillar_roots` parameter. The branch referenced in the `ext_pillar` entry above (`master`), would evaluate to the `base` environment, so this branch needs to contain a `top.sls` with a `base` section in it, like this:

```
base:
  '*':
    - foo
```

To use other environments from the same SVN repo as `svn_pillar` sources, just add additional lines, like so:

```
ext_pillar:
- svn: trunk svn://svnserver/repo
- svn: dev svn://svnserver/repo
```

In this case, the `dev` branch would need its own `top.sls` with a `dev` section in it, like this:

```
dev:  
  '*':  
    - bar
```

class salt.pillar.svn_pillar.**SvnPillar**(*branch, repo_location, root, opts*)
Deal with the remote SVN repository for Pillar

pillar_dir()
Returns the directory of the pillars (repo cache + branch + root)

update()

salt.pillar.svn_pillar.**ext_pillar**(*minion_id, pillar, repo_string*)
Execute a command and read the output as YAML

20.12.39 salt.pillar.varstack_pillar

Use [Varstack](#) data as a Pillar source

Configuring Varstack

Using varstack in Salt is fairly simple. Just put the following into the config file of your master:

```
ext_pillar:  
  - varstack: /etc/varstack.yaml
```

Varstack will then use /etc/varstack.yaml to determine which configuration data to return as pillar information. From there you can take a look at the [README](#) of varstack on how this file is evaluated.

salt.pillar.varstack_pillar.**ext_pillar**(*minion_id, pillar, conf*)
Parse varstack data and return the result

20.12.40 salt.pillar.vault module

Vault Pillar Module

maintainer SaltStack

maturity New

platform all

New in version 2016.11.0.

This module allows pillar data to be stored in Hashicorp Vault.

Base configuration instructions are documented in the [execution module docs](#). Below are noted extra configuration required for the pillar module, but the base configuration must also be completed.

After the base Vault configuration is created, add the configuration below to the ext_pillar section in the Salt master configuration.

```
ext_pillar:  
  - vault: path=secret/salt
```

Each key needs to have all the key-value pairs with the names you require. Avoid naming every key 'password' as you they will collide:

```
$ vault write secret/salt auth=my_password master=127.0.0.1
```

The above will result in two pillars being available, `auth` and `master`.

You can then use normal pillar requests to get each key pair directly from pillar root. Example:

```
$ salt-ssh '*' pillar.get auth
```

Multiple Vault sources may also be used:

```
ext_pillar:
- vault: path=secret/salt
- vault: path=secret/root
- vault: path=secret/minions/{minion}/pass
```

`salt.pillar.vault.ext_pillar` (*minion_id*, *pillar*, *conf*)
Get pillar data from Vault for the configuration `conf`.

20.12.41 salt.pillar.venafi module

Venafi Pillar Certificates

This module will only return pillar data if the `venafi` runner module has already been used to create certificates.

To configure this module, set `venafi` to `True` in the `ext_pillar` section of your `master` configuration file:

```
ext_pillar:
- venafi: True
```

`salt.pillar.venafi.ext_pillar` (*minion_id*, *pillar*, *conf*)
Return an existing set of certificates

20.12.42 salt.pillar.virtkey

Accept a key from a hypervisor if the `virt` runner has already submitted an authorization request

`salt.pillar.virtkey.ext_pillar` (*hyper_id*, *pillar*, *name*, *key*)
Accept the key for the VM on the hyper, if authorized.

20.12.43 salt.pillar.vmware_pillar module

Pillar data from vCenter or an ESXi host

New in version 2017.7.0.

depends

- `pyVmomi`

This external pillar can pull attributes from objects in vCenter or an ESXi host and provide those attributes as pillar data to minions. This can allow for pillar based targeting of minions on ESXi host, Datastore, VM configuration, etc. This setup requires only the salt master have access to the vCenter server/ESXi hosts.

The pillar will return an empty dict if the `'os'` or `'virtual'` grain are not `'VMWare'`, `'ESXi'`, or `'VMWare ESXi'`.

Defaults

- The external pillar will search for Virtual Machines with the VM name matching the minion id.
- Data will be returned into the 'vmware' pillar key.
- The external pillar has a default set of properties to return for both VirtualMachine and HostSystem types.

Configuring the VMWare pillar

The required minimal configuration in the salt master ext_pillar setup:

```
ext_pillar:  
- vmware:  
  host: <vcenter/esx host>  
  username: <user to connect with>  
  password: <password>
```

Optionally, the following keyword arguments can be passed to the ext_pillar for customized configuration:

pillar_key Optionally set the pillar key to return the data into. Default is `vmware`.

protocol Optionally set to alternate protocol if the vCenter server or ESX/ESXi host is not using the default protocol. Default protocol is `https`.

port Optionally set to alternate port if the vCenter server or ESX/ESXi host is not using the default port. Default port is 443.

property_name Property name to match the minion id against. Defaults to `name`.

property_types Optionally specify a list of pyVmomi vim types to search for the minion id in 'property_name'. Default is ['VirtualMachine'].

For example, to search both `vim.VirtualMachine` and `vim.HostSystem` object types:

```
ext_pillar:  
- vmware:  
  host: myesx  
  username: root  
  password: complex_password  
  property_types:  
  - VirtualMachine  
  - HostSystem
```

Additionally, the list of property types can be dicts, the item of the dict being a list specifying the attribute to return for that vim object type.

The pillar will attempt to recurse the attribute and return all child attributes.

To explicitly specify deeper attributes without attempting to recurse an attribute, convert the list item to a dict with the item of the dict being the child attributes to return. Follow this pattern to return attributes as deep within the object as necessary.

Note: Be careful when specifying custom attributes! Many attributes have objects as attributes which have the parent object as an attribute and which will cause the pillar to fail due to the attempt to convert all sub-objects recursively (i.e. infinite attribute loops). Specifying only the sub-attributes you would like returned will keep the infinite recursion from occurring.

A maximum recursion exception will occur in this case and the pillar will not return as desired.

```

ext_pillar:
  - vmware:
      host: myvcenter
      username: my_user
      password: my_pass
      replace_default_attributes: True
      property_types:
        - VirtualMachine:
            - config:
                - bootOptions:
                    - bootDelay
                    - bootRetryDelay
            - HostSystem:
                - datastore:
                    - name

```

The above `ext_pillar` example would return a pillar like the following for a `VirtualMachine` object that's name matched the minion id:

```

vmware:
  config:
    bootOptions:
      bootDelay: 1000
      bootRetryDelay: 1000

```

If you were to retrieve these virtual machine attributes via `pyVmomi` directly, this would be the same as

```

vmObject.config.bootOptions.bootDelay
vmObject.config.bootOptions.bootRetryDelay

```

The above `ext_pillar` example would return a pillar like the following for a `HostSystem` object that's name matched the minion id:

```

vmware:
  datastore:
    - name: Datastore1
    - name: Datastore2

```

The 'datastore' property of a `HostSystem` object is a list of datastores, thus a list is returned.

replace_default_attributes If custom attributes are specified by the `property_types` parameter, `replace_default_attributes` determines if those will be added to default attributes (False) or replace the default attributes completely (True). The default setting is 'False'.

Note: vCenter "Custom Attributes" (i.e. Annotations) will always be returned if it exists on the object as part of the pillar regardless of this setting.

```

salt.pillar.vmware_pillar.ext_pillar(minion_id, pillar, **kwargs)

```

Check vmware/vcenter for all data

20.13 proxy modules

<i>chronos</i>	Chronos
<i>cimc</i>	Proxy Minion interface module for managing Cisco Integrated Management Controller devices
<i>cisconso</i>	Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO).
<i>dummy</i>	This is a dummy proxy-minion designed for testing the proxy minion subsystem.
<i>esxi</i>	Proxy Minion interface module for managing VMware ESXi hosts.
<i>fx2</i>	Dell FX2 chassis
<i>junos</i>	Interface with a Junos device via proxy-minion.
<i>marathon</i>	Marathon
<i>napalm</i>	NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support
<i>nxos</i>	Proxy Minion for Cisco NX OS Switches
<i>panos</i>	Proxy Minion interface module for managing Palo Alto firewall devices
<i>philips_hue</i>	Philips HUE lamps module for proxy.
<i>rest_sample</i>	This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example
<i>ssh_sample</i>	This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH.

20.13.1 salt.proxy.chronos module

Chronos

Proxy minion for managing a Chronos cluster.

Dependencies

- *chronos execution module (salt.modules.chronos)*

Pillar

The chronos proxy configuration requires a 'base_url' property that points to the chronos endpoint:

```
proxy:
  proxytype: chronos
  base_url: http://my-chronos-master.mydomain.com:4400
```

New in version 2015.8.2.

`salt.proxy.chronos.init(opts)`
Perform any needed setup.

`salt.proxy.chronos.ping()`
Is the chronos api responding?

`salt.proxy.chronos.shutdown` (*opts*)

For this proxy shutdown is a no-op

20.13.2 salt.proxy.cimc module

Proxy Minion interface module for managing Cisco Integrated Management Controller devices

New in version 2018.3.0.

codeauthor Spencer Ervin <spencer_ervin@hotmail.com>

maturity new

depends none

platform unix

This proxy minion enables Cisco Integrated Management Controller devices (hereafter referred to as simply 'cimc' devices) to be treated individually like a Salt Minion.

The cimc proxy leverages the XML API functionality on the Cisco Integrated Management Controller. The Salt proxy must have access to the cimc on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID.

```
proxy:
  proxytype: cimc
  host: <ip or dns name of cimc host>
  username: <cimc username>
  password: <cimc password>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this cimc Proxy Module, set this to `cimc`.

host

The location, or ip/dns, of the cimc host. Required.

username

The username used to login to the cimc host. Required.

password

The password used to login to the cimc host. Required.

`salt.proxy.cimc.get_config_resolver_class`(*cid=None, hierarchical=False*)
The `configResolveClass` method returns requested managed object in a given class.

`salt.proxy.cimc.grains`()
Get the grains from the proxied device

`salt.proxy.cimc.grains_refresh`()
Refresh the grains from the proxied device

`salt.proxy.cimc.init`(*opts*)
This function gets called when the proxy starts up.

`salt.proxy.cimc.initialized`()
Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init`() function has been called

`salt.proxy.cimc.logon`()
Logs into the cimc device and returns the session cookie.

`salt.proxy.cimc.logout`(*cookie=None*)
Closes the session with the device.

`salt.proxy.cimc.ping`()
Returns true if the device is reachable, else false.

`salt.proxy.cimc.prepare_return`(*x*)
Converts the etree to dict

`salt.proxy.cimc.set_config_modify`(*dn=None, inconfig=None, hierarchical=False*)
The `configConfMo` method configures the specified managed object in a single subtree (for example, DN).

`salt.proxy.cimc.shutdown`()
Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

20.13.3 salt.proxy.cisconso

Proxy Minion interface module for managing (practically) any network device with Cisco Network Services Orchestrator (Cisco NSO). Cisco NSO uses a series of remote polling agents, APIs and SSH commands to fetch network configuration and represent it in a data model. PyNSO, the Python module used by this proxy minion does the task of converting native Python dictionaries into NETCONF/YANG syntax that the REST API for Cisco NSO can then use to set the configuration of the target network device.

Supported devices:

- A10 AX Series
- Arista 7150 Series
- Ciena 3000, 5000, ESM
- H3c S5800 Series

- Overture 1400, 2200, 5000, 5100, 6000
- Accedian MetroNID
- Avaya ERS 4000, SR8000, VSP 9000
- Cisco: APIC-DC, ASA, IOS, IOS XE, IOS XR, er, ME-4600, NX OS, Prime Network Registrar, Quantum, StarOS, UCS ManagWSA
- Huawei: NE40E, quidway series, Enterprise Network Simulation Framework
- PaloAlto PA-2000, PA-3000, Virtualized Firewalls
- Adtran 900 Series
- Brocade ADX, MLX, Netiron, Vyatta
- Dell Force 10 Networking S-Series
- Infinera DTN-X Multi-Terabit Packet Optical Network Platform
- Pulsecom SuperG
- Adva 150CC Series
- CableLabs Converged Cable Access Platform
- Ericsson EFN324 Series, SE family
- Juniper: Contrail, EX, M, MX, QFX, SRX, Virtual SRX
- Quagga Routing Software
- Affirmed Networks
- Citrix Netscaler
- F5 BIG-IP
- NEC iPasolink
- Riverbed Steelhead Series
- Alcatel-Lucent 7XXX, SAM
- Clavister
- Fortinet
- Nominum DCS
- Sonus SBC 5000 Series
- Allied Telesys
- Open vSwitch

New in version 2016.11.0.

codeauthor *Anthony Shaw* <anthony.shaw@dimensiondata.com>

This proxy minion enables a consistent interface to fetch, control and maintain the configuration of network devices via a NETCONF-compliant control plane. Cisco Network Services Orchestrator.

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

Dependencies

- pynso Python module

PyNSO

PyNSO can be installed via pip:

```
pip install pynso
```

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the NSO host, the pillar should look like this:

```
proxy:
  proxytype: cisco_nso
  host: <ip or dns name of host>
  port: 8080
  use_ssl: false
  username: <username>
  password: password
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this Cisco NSO Proxy Module, set this to `cisco_nso`.

host

The location, or IP/dns, of the Cisco NSO API host. Required.

username

The username used to login to the Cisco NSO host, such as `admin`. Required.

passwords

The password for the given user. Required.

use_ssl

Whether to use HTTPS messaging to speak to the API.

port

The port that the Cisco NSO API is running on, 8080 by default

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the Cisco NSO host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the cisco host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the Cisco NSO host to make sure it is responding:

```
salt <id> test.ping
```

`salt.proxy.cisconso.apply_rollback(datastore, name)`

Apply a system rollback

Parameters

- **datastore** (`DatastoreType` (`str` enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **name** (`str`) – an ID of the rollback to restore

`salt.proxy.cisconso.get_data(datastore, path)`

Get the configuration of the device tree at the given path

Parameters

- **datastore** (`DatastoreType` (`str` enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (`List` of `str` OR `tuple`) – The device path, a list of element names in order, comma separated

Returns The network configuration at that tree

Return type `dict`

```
salt cisco-nso cisconso.get_data devices
```

`salt.proxy.cisconso.get_rollback(name)`

Get the backup of stored a configuration rollback

Parameters `name` (str) – Typically an ID of the backup

Return type str

Returns the contents of the rollback snapshot

`salt.proxy.cisconso.get_rollbacks()`

Get a list of stored configuration rollbacks

`salt.proxy.cisconso.grains()`

Get the grains from the proxy device.

`salt.proxy.cisconso.init(opts)`

`salt.proxy.cisconso.ping()`

Check to see if the host is responding. Returns False if the host didn't respond, True otherwise.

CLI Example:

```
salt cisco-nso test.ping
```

`salt.proxy.cisconso.set_data_value(datastore, path, data)`

Get a data entry in a datastore

Parameters

- **datastore** (DatastoreType (str enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (list of str OR tuple) – The device path to set the value at, a list of element names in order, comma separated
- **data** (dict) – The new value at the given path

Return type bool

Returns True if successful, otherwise error.

`salt.proxy.cisconso.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

20.13.4 salt.proxy.dummy module

This is a dummy proxy-minion designed for testing the proxy minion subsystem.

`salt.proxy.dummy.fns()`

`salt.proxy.dummy.grains()`

Make up some grains

`salt.proxy.dummy.grains_refresh()`

Refresh the grains

`salt.proxy.dummy.init(opts)`

`salt.proxy.dummy.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.dummy.package_install(name, **kwargs)`

Install a "package" on the REST server

`salt.proxy.dummy.package_list()`
List "packages" installed on the REST server

`salt.proxy.dummy.package_remove(name)`
Remove a "package" on the REST server

`salt.proxy.dummy.package_status(name)`
Check the installation status of a package on the REST server

`salt.proxy.dummy.ping()`
Degenerate ping

`salt.proxy.dummy.service_list()`
List "services" on the REST server

`salt.proxy.dummy.service_restart(name)`
Restart a "service" on the REST server

`salt.proxy.dummy.service_start(name)`
Start a "service" on the dummy server

`salt.proxy.dummy.service_status(name)`
Check if a service is running on the REST server

`salt.proxy.dummy.service_stop(name)`
Stop a "service" on the dummy server

`salt.proxy.dummy.shutdown(opts)`
For this proxy shutdown is a no-op

`salt.proxy.dummy.test_from_state()`
Test function so we have something to call from a state :return:

`salt.proxy.dummy.upgrade()`
"Upgrade" packages

`salt.proxy.dummy.uptodate()`
Call the REST endpoint to see if the packages on the "server" are up to date.

20.13.5 salt.proxy.esxi

Proxy Minion interface module for managing VMware ESXi hosts.

New in version 2015.8.4.

Special Note: SaltStack thanks [Adobe Corporation](#) for their support in creating this Proxy Minion integration.

This proxy minion enables VMware ESXi (hereafter referred to as simply 'ESXi') hosts to be treated individually like a Salt Minion.

Since the ESXi host may not necessarily run on an OS capable of hosting a Python stack, the ESXi host can't run a Salt Minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the Salt Master. The master does not know nor care that the target is not a "real" Salt Minion.

More in-depth conceptual reading on Proxy Minions can be found in the *Proxy Minion* section of Salt's documentation.

Dependencies

- pyVmomi Python Module

- ESXCLI

pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

Note: Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. At a minimum for communication with the ESXi host, the pillar should look like this:

```
proxy:
  proxytype: esxi
  host: <ip or dns name of esxi host>
  username: <ESXi username>
```

(continues on next page)

(continued from previous page)

```
passwords:
- first_password
- second_password
- third_password
credstore: <path to credential store>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this ESXi Proxy Module, set this to `esxi`.

host

The location, or ip/dns, of the ESXi host. Required.

username

The username used to login to the ESXi host, such as `root`. Required.

passwords

A list of passwords to be used to try and login to the ESXi host. At least one password in this list is required.

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password and the password you may be updating for an ESXi host either via the `vsphere.update_host_password` execution module function or via the `esxi.password_present` state function. This way, after the password is changed, you should not need to restart the proxy minion—it should just pick up the the new password provided in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

This also allows you to use any number of potential fallback passwords.

Note: When a password is changed on the host to one in the list of possible passwords, the further down on the list the password is, the longer individual commands will take to return. This is due to the nature of pyVmomi's login system. We have to wait for the first attempt to fail before trying the next password on the list.

This scenario is especially true, and even slower, when the proxy minion first starts. If the correct password is not the first password on the list, it may take up to a minute for `test.ping` to respond with a `True` result. Once the initial authorization is complete, the responses for commands will be a little faster.

To avoid these longer waiting periods, SaltStack recommends moving the correct password to the top of the list and restarting the proxy minion at your earliest convenience.

protocol

If the ESXi host is not using the default protocol, set this value to an alternate protocol. Default is `https`.

port

If the ESXi host is not using the default port, set this value to an alternate port. Default is 443.

credstore

If the ESXi host is using an untrusted SSL certificate, set this value to the file path where the credential store is located. This file is passed to `esxcli`. Default is `<HOME>/vmware/credstore/vicredentials.xml` on Linux and `<APPDATA>/VMware/credstore/vicredentials.xml` on Windows.

Note: HOME variable is sometimes not set for processes running as system services. If you want to rely on the default credential store location, make sure HOME is set for the proxy process.

Salt Proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your Salt Master and to the ESXi host in question. SaltStack recommends that the machine running the salt-proxy process also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can then start the salt-proxy process with:

```
salt-proxy --proxyid <id you want to give the host>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you gave the esxi host>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the ESXi host to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the host. For example, you can get the ESXi host's system information:

```
salt <id> esxi.cmd system_info
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `Salt.modules.vsphere` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials

and a target host. When credentials and a host aren't passed, Salt runs commands through `pyVmom` against the local machine. If you wanted, you could run functions from this module on any host where an appropriate version of `pyVmom` is installed, and that host would reach out over the network and communicate with the ESXi host.

`esxi.cmd` acts as a "shim" between the execution module and the proxy. Its first parameter is always the function from `salt.modules.vsphere`. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the ESXi host through the proxy, arranging for the credentials and hostname to be pulled from the Pillar section for this Proxy Minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the ESXi host, you'll want to look in `salt.modules.vsphere` instead of `salt.modules.esxi`.

States

Associated states are thoroughly documented in `salt.states.esxi`. Look there to find an example structure for Pillar as well as an example `.sls` file for standing up an ESXi host from scratch.

`salt.proxy.esxi.ch_config(cmd, *args, **kwargs)`

This function is called by the `salt.modules.esxi.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.vsphere` module. Passes the return through from the `vsphere` module.

cmd The command to call inside `salt.modules.vsphere`

args Arguments that need to be passed to that command.

kwargs Keyword arguments that need to be passed to that command.

`salt.proxy.esxi.find_credentials(host)`

Cycle through all the possible credentials and return the first one that works.

`salt.proxy.esxi.get_details()`

Return the proxy details

`salt.proxy.esxi.grains()`

Get the grains from the proxy device.

`salt.proxy.esxi.grains_refresh()`

Refresh the grains from the proxy device.

`salt.proxy.esxi.init(opts)`

This function gets called when the proxy starts up. For ESXi devices, the host, login credentials, and, if configured, the protocol and port are cached.

`salt.proxy.esxi.is_connected_via_vcenter()`

`salt.proxy.esxi.ping()`

Returns True if connection is to be done via a vCenter (no connection is attempted). Check to see if the host is responding when connecting directly via an ESXi host.

CLI Example:

```
salt esxi-host test.ping
```

`salt.proxy.esxi.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

20.13.6 salt.proxy.fx2

Dell FX2 chassis

New in version 2015.8.2.

Proxy minion interface module for managing Dell FX2 chassis (Dell Chassis Management Controller version 1.2 and above, iDRAC8 version 2.00 and above)

Dependencies

- *iDRAC Remote execution module (salt.modules.dracr)*
- *Chassis command shim (salt.modules.chassis)*
- *Dell Chassis States (salt.states.dellchassis)*
- Dell's racadm command line interface to CMC and iDRAC devices.

Special Note: SaltStack thanks [Adobe Corporation](#) for their support in creating this proxy minion integration.

This proxy minion enables Dell FX2 and FX2s (hereafter referred to as simply "chassis", "CMC", or "FX2") chassis to be treated individually like a salt-minion.

Since the CMC embedded in the chassis does not run an OS capable of hosting a Python stack, the chassis can't run a minion directly. Salt's "Proxy Minion" functionality enables you to designate another machine to host a minion process that "proxies" communication from the salt-master. The master does not know nor care that the target is not a real minion.

More in-depth conceptual reading on Proxy Minions can be found [in the Proxy Minion section](#) of Salt's documentation.

To configure this integration, follow these steps:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar, and a reference in the Pillar topfile that matches the ID. At a minimum for communication with the chassis the pillar should look like this:

```
proxy:
  host: <ip or dns name of chassis controller>
  admin_username: <iDRAC username for the CMC, usually 'root'>
  fallback_admin_username: <username to try if the first fails>
  passwords:
    - first_password
    - second_password
    - third_password
  proxytype: fx2
```

The `proxytype` line above is critical, it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the salt-master (if you have created your own proxy module, for example).

The proxy integration will try the passwords listed in order. It is configured this way so you can have a regular password, a potential fallback password, and the third password can be the one you intend to change the chassis to use. This way, after it is changed, you should not need to restart the proxy minion—it should just pick up the third password in the list. You can then change pillar at will to move that password to the front and retire the unused ones.

Beware, many Dell CMC and iDRAC units are configured to lockout IP addresses or users after too many failed password attempts. This can generate user panic in the form of "I no longer know what the password is!!!". To mitigate panic try the web interface from a different IP, or setup a emergency administrator user in the CMC before doing a wholesale password rotation.

The automatic lockout can be disabled via Salt with the following:

```
salt <cmc> chassis.cmd set_general cfgRacTuning cfgRacTuneIpBlkEnable 0
```

and then verified with

```
salt <cmc> chassis.cmd get_general cfgRacTuning cfgRacTuneIpBlkEnable
```

salt-proxy

After your pillar is in place, you can test the proxy. The proxy can run on any machine that has network connectivity to your salt-master and to the chassis in question. SaltStack recommends that this machine also run a regular minion, though it is not strictly necessary.

On the machine that will run the proxy, make sure there is an `/etc/salt/proxy` file with at least the following in it:

```
master: <ip or hostname of salt-master>
```

You can start the proxy with

```
salt-proxy --proxyid <id you want to give the chassis>
```

You may want to add `-l debug` to run the above in the foreground in debug mode just to make sure everything is OK.

Next, accept the key for the proxy on your salt-master, just like you would for a regular minion:

```
salt-key -a <id you want to give the chassis>
```

You can confirm that the pillar data is in place for the proxy:

```
salt <id> pillar.items
```

And now you should be able to ping the chassis to make sure it is responding:

```
salt <id> test.ping
```

At this point you can execute one-off commands against the chassis. For example, you can get the chassis inventory:

```
salt <id> chassis.cmd inventory
```

Note that you don't need to provide credentials or an ip/hostname. Salt knows to use the credentials you stored in Pillar.

It's important to understand how this particular proxy works. `Salt.modules.dracr` is a standard Salt execution module. If you pull up the docs for it you'll see that almost every function in the module takes credentials and a target host. When credentials and a host aren't passed, Salt runs `racadm` against the local machine. If you wanted you could run functions from this module on any host where an appropriate version of `racadm` is installed, and that host would reach out over the network and communicate with the chassis.

`Chassis.cmd` acts as a "shim" between the execution module and the proxy. It's first parameter is always the function from `salt.modules.dracr` to execute. If the function takes more positional or keyword arguments you can append them to the call. It's this shim that speaks to the chassis through the proxy, arranging for the credentials and hostname to be pulled from the pillar section for this proxy minion.

Because of the presence of the shim, to lookup documentation for what functions you can use to interface with the chassis, you'll want to look in `salt.modules.dracr` instead of `salt.modules.chassis`.

States

Associated states are thoroughly documented in `salt.states.dellchassis`. Look there to find an example structure for pillar as well as an example `.sls` file for standing up a Dell Chassis from scratch.

`salt.proxy.fx2.admin_password()`

Return the `admin_password` in the `DETAILS` dictionary, or 'calvin' (the Dell default) if there is none present

`salt.proxy.fx2.admin_username()`

Return the `admin_username` in the `DETAILS` dictionary, or `root` if there is none present

`salt.proxy.fx2.chconfig(cmd, *args, **kwargs)`

This function is called by the `salt.modules.chassis.cmd` shim. It then calls whatever is passed in `cmd` inside the `salt.modules.dracr` module.

Parameters

- **cmd** – The command to call inside `salt.modules.dracr`
- **args** – Arguments that need to be passed to that command
- **kwargs** – Keyword arguments that need to be passed to that command

Returns Passthrough the return from the `dracr` module.

`salt.proxy.fx2.find_credentials()`

Cycle through all the possible credentials and return the first one that works

`salt.proxy.fx2.grains()`

Get the grains from the proxied device

`salt.proxy.fx2.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.fx2.host()`

`salt.proxy.fx2.init(opts)`

This function gets called when the proxy starts up. We check `opts` to see if a fallback user and password are supplied. If they are present, and the primary credentials don't work, then we try the backup before failing.

Whichever set of credentials works is placed in the persistent `DETAILS` dictionary and will be used for further communication with the chassis.

`salt.proxy.fx2.ping()`

Is the chassis responding?

Returns Returns `False` if the chassis didn't respond, `True` otherwise.

`salt.proxy.fx2.shutdown(opts)`

Shutdown the connection to the proxied device. For this proxy shutdown is a no-op.

20.13.7 salt.proxy.junos

Interface with a Junos device via proxy-minion. To connect to a junos device via junos proxy, specify the host information in the pillar in `'/srv/pillar/details.sls'`

```
proxy:
  proxytype: junos
  host: <ip or dns name of host>
  username: <username>
  port: 830
  password: <secret>
```

In `'/srv/pillar/top.sls'` map the device details with the proxy name.

```
base:
  'vmx':
    - details
```

After storing the device information in the pillar, configure the proxy in `'/etc/salt/proxy'`

```
master: <ip or hostname of salt-master>
```

Run the salt proxy via the following command:

```
salt-proxy --proxyid=vmx
```

`salt.proxy.junos.alive(opts)`

Validate and return the connection status with the remote device.

New in version 2018.3.0.

`salt.proxy.junos.conn()`

`salt.proxy.junos.get_serialized_facts()`

`salt.proxy.junos.init(opts)`

Open the connection to the Junos device, login, and bind to the Resource class

`salt.proxy.junos.initialized()`

`salt.proxy.junos.ping()`

Ping? Pong!

`salt.proxy.junos.proxytype()`

Returns the name of this proxy

`salt.proxy.junos.shutdown(opts)`

This is called when the proxy-minion is exiting to make sure the connection to the device is closed cleanly.

20.13.8 salt.proxy.marathon module

Marathon

Proxy minion for managing a Marathon cluster.

Dependencies

- *marathon execution module (salt.modules.marathon)*

Pillar

The marathon proxy configuration requires a `'base_url'` property that points to the marathon endpoint:

```
proxy:
  proxytype: marathon
  base_url: http://my-marathon-master.mydomain.com:8080
```

New in version 2015.8.2.

`salt.proxy.marathon.init(opts)`

Perform any needed setup.

`salt.proxy.marathon.ping()`

Is the marathon api responding?

`salt.proxy.marathon.shutdown(opts)`

For this proxy shutdown is a no-op

20.13.9 salt.proxy.napalm

NAPALM: Network Automation and Programmability Abstraction Layer with Multivendor support

Proxy minion for managing network devices via [NAPALM](#) library.

codeauthor Mircea Ulinic <mircea@cloudflare.com> & Jerome Fleury <jf@cloudflare.com>

maturity new

depends napalm

platform unix

Dependencies

The `napalm` proxy module requires [NAPALM](#) library to be installed: `pip install napalm` Please check [Installation](#) for complete details.

Note: Beginning with Salt release 2017.7.3, it is recommended to use `napalm >= 2.0.0`. The library has been unified into a monolithic package, as in opposite to separate packages per driver. For more details you can check [this document](#). While it will still work with the old packages, bear in mind that the NAPALM core team will maintain only the main `napalm` package.

Moreover, for additional capabilities, the users can always define a library that extends NAPALM's base capabilities and configure the `provider` option (see below).

Pillar

The `napalm` proxy configuration requires the following parameters in order to connect to the network device:

driver Specifies the network device operating system. For a complete list of the supported operating systems please refer to the [NAPALM Read the Docs page](#).

host The IP Address or FQDN to use when connecting to the device. Alternatively, the following field names can be used instead: `hostname`, `fqdn`, `ip`.

username The username to be used when connecting to the device.

passwd The password needed to establish the connection.

Note: This field may not be mandatory when working with SSH-based drivers, and the username has a SSH key properly configured on the device targeted to be managed.

optional_args Dictionary with the optional arguments. Check the complete list of supported [optional arguments](#).

always_alive: True In certain less dynamic environments, maintaining the remote connection permanently open with the network device is not always beneficial. In that case, the user can select to initialize the connection only when needed, by specifying this field to `false`. Default: `true` (maintains the connection with the remote network device).

New in version 2017.7.0.

provider: napalm_base The library that provides the `get_network_device` function. This option is useful when the user has more specific needs and requires to extend the NAPALM capabilities using a private library implementation. The only constraint is that the alternative library needs to have the `get_network_device` function available.

New in version 2017.7.1.

multiprocessing: False Overrides the `multiprocessing` option, per proxy minion. The `multiprocessing` option must be turned off for SSH-based proxies. However, some NAPALM drivers (e.g. Arista, NX-OS) are not SSH-based. As multiple proxy minions may share the same configuration file, this option permits the configuration of the `multiprocessing` option more specifically, for some proxy minions.

New in version 2017.7.2.

Proxy pillar file example:

```
proxy:
  proxytype: napalm
  driver: junos
  host: core05.nrt02
  username: my_username
  passwd: my_password
  optional_args:
    port: 12201
```

Example using a user-specific library, extending NAPALM's capabilities, e.g. `custom_napalm_base`:

```
proxy:
  proxytype: napalm
  driver: ios
  fqdn: cr1.th2.par.as1234.net
  username: salt
  password: ''
  provider: custom_napalm_base
```

- *Network config state: Manage the configuration using arbitrary templates*
- *NAPALM YANG state: Manage the configuration according to the YANG models (OpenConfig/IETF)*
- *Network ACL module: Generate and load ACL (firewall) configuration*
- *Network ACL state: Manage the firewall configuration*
- *NTP operational and configuration management module*
- *BGP operational and configuration management module*
- *Routes details*
- *SNMP configuration module*

- *Users configuration management*

New in version 2016.11.0.

`salt.proxy.napalm.alive(opts)`

Return the connection status with the remote device.

New in version 2017.7.0.

`salt.proxy.napalm.call(method, *args, **kwargs)`

Calls a specific method from the network driver instance. Please check the [readthedocs](#) page for the updated list of getters.

Parameters

- **method** – specifies the name of the method to be called
- **params** – contains the mapping between the name and the values of the parameters needed to call the method

Returns A dictionary with three keys:

- **result** (True/False): if the operation succeeded
- **out** (object): returns the object as-is from the call
- **comment** (string): provides more details in case the call failed
- **traceback** (string): complete traceback in case of exception. Please submit an issue including this traceback on the [correct driver repo](#) and make sure to read the [FAQ](#)

Example:

```
__proxy__['napalm.call']('cli'  
    **{  
        'commands': [  
            'show version',  
            'show chassis fan'  
        ]  
    })
```

`salt.proxy.napalm.fns()`

Method called by NAPALM grains module.

`salt.proxy.napalm.get_device()`

Returns the network device object.

`salt.proxy.napalm.get_grains()`

Retrieve facts from the network device.

`salt.proxy.napalm.grains_refresh()`

Refresh the grains.

`salt.proxy.napalm.init(opts)`

Opens the connection with the network device.

`salt.proxy.napalm.initialized()`

Connection finished initializing?

`salt.proxy.napalm.ping()`

Connection open successfully?

`salt.proxy.napalm.shutdown(opts)`

Closes connection with the device.

20.13.10 salt.proxy.nxos module

Proxy Minion for Cisco NX OS Switches

The Cisco NX OS Proxy Minion uses the built in SSHConnection module in `salt.utils.vt_helper`

To configure the proxy minion:

```
proxy:
  proxytype: nxos
  host: 192.168.187.100
  username: admin
  password: admin
  prompt_name: switch
  ssh_args: '-o PubkeyAuthentication=no'
  key_accept: True
```

proxytype (REQUIRED) Use this proxy minion *nxos*

host (REQUIRED) ip address or hostname to connect to

username (REQUIRED) username to login with

password (REQUIRED) password to use to login with

prompt_name (REQUIRED) The name in the prompt on the switch. By default, use your devices hostname.

ssh_args Any extra args to use to connect to the switch.

key_accept Whether or not to accept a the host key of the switch on initial login. Defaults to False.

The functions from the proxy minion can be run from the salt commandline using the `salt.modules.nxos` execution module.

salt.proxy.nxos.add_config(*lines*)

Add one or more config lines to the switch running config

```
salt '*' nxos.cmd add_config 'snmp-server community TESTSTRINGHERE group network-
↪operator'
```

Note: For more than one config added per command, lines should be a list.

salt.proxy.nxos.check_password(*username, password, encrypted=False*)

Check if passed password is the one assigned to user

salt.proxy.nxos.check_role(*username, role*)

Check if user is assigned a specific role on switch

```
salt '*' nxos.cmd check_role username=admin role=network-admin
```

salt.proxy.nxos.delete_config(*lines*)

Delete one or more config lines to the switch running config

```
salt '*' nxos.cmd delete_config 'snmp-server community TESTSTRINGHERE group
↪network-operator'
```

Note: For more than one config deleted per command, lines should be a list.

`salt.proxy.nxos.find(pattern)`
Find all instances where the pattern is in the running command

```
salt '*' nxos.cmd find '^snmp-server.*$'
```

Note: This uses the *re.MULTILINE* regex format for python, and runs the regex against the whole `show_run` output.

`salt.proxy.nxos.get_roles(username)`
Get roles that the username is assigned from switch

`salt.proxy.nxos.get_user(username)`
Get username line from switch

`salt.proxy.nxos.grains()`
Get grains for proxy minion

`salt.proxy.nxos.grains_refresh()`
Refresh the grains from the proxy device.

`salt.proxy.nxos.init(opts=None)`
Required. Can be used to initialize the server connection.

`salt.proxy.nxos.initialized()`

`salt.proxy.nxos.ping()`
Ping the device on the other end of the connection

`salt.proxy.nxos.remove_user(username)`
Remove user from switch

```
salt '*' nxos.cmd remove_user username=daniel
```

`salt.proxy.nxos.replace(old_value, new_value, full_match=False)`
Replace string or full line matches in switch's running config

If `full_match` is set to `True`, then the whole line will need to be matched as part of the old value.

```
salt '*' nxos.cmd replace 'TESTSTRINGHERE' 'NEWTTESTSTRINGHERE'
```

`salt.proxy.nxos.sendline(command)`
Run command through switch's cli

`salt.proxy.nxos.set_password(username, password, encrypted=False, role=None, crypt_salt=None, algorithm='sha256')`

Set users password on switch

```
salt '*' nxos.cmd set_password admin TestPass
salt '*' nxos.cmd set_password admin \
    password='$5$2fWw02vK$s7.Hr3YltMNHuhywQQ3nf0d.gAPHgs3S0BYyDGT3E.A' \
    encrypted=True
```

`salt.proxy.nxos.set_role(username, role)`
Assign role to username

```
salt '*' nxos.cmd set_role username=daniel role=vdc-admin
```

`salt.proxy.nxos.show_run()`
Shortcut to run `show run` on switch

```
salt '*' nxos.cmd show_run
```

`salt.proxy.nxos.show_ver()`
Shortcut to run `show ver` on switch

```
salt '*' nxos.cmd show_ver
```

`salt.proxy.nxos.shutdown(opts)`
Disconnect

`salt.proxy.nxos.system_info()`
Return system information for grains of the NX OS proxy minion

```
salt '*' nxos.system_info
```

`salt.proxy.nxos.unset_role(username, role)`
Remove role from username

```
salt '*' nxos.cmd unset_role username=daniel role=vdc-admin
```

20.13.11 salt.proxy.panos module

Proxy Minion interface module for managing Palo Alto firewall devices

New in version 2018.3.0.

codeauthor Spencer Ervin <spencer_ervin@hotmail.com>

maturity new

depends none

platform unix

This proxy minion enables Palo Alto firewalls (hereafter referred to as simply 'panos') to be treated individually like a Salt Minion.

The panos proxy leverages the XML API functionality on the Palo Alto firewall. The Salt proxy must have access to the Palo Alto firewall on HTTPS (tcp/443).

More in-depth conceptual reading on Proxy Minions can be found in the [Proxy Minion](#) section of Salt's documentation.

Configuration

To use this integration proxy module, please configure the following:

Pillar

Proxy minions get their configuration from Salt's Pillar. Every proxy must have a stanza in Pillar and a reference in the Pillar top-file that matches the ID. There are four connection options available for the panos proxy module.

- Direct Device (Password)
- Direct Device (API Key)
- Panorama Pass-Through (Password)

- Panorama Pass-Through (API Key)

Direct Device (Password)

The direct device configuration configures the proxy to connect directly to the device with username and password.

```
proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  username: <panos username>
  password: <panos password>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

host

The location, or ip/dns, of the panos host. Required.

username

The username used to login to the panos host. Required.

password

The password used to login to the panos host. Required.

Direct Device (API Key)

Palo Alto devices allow for access to the XML API with a generated 'API key' _ instead of username and password.

```
proxy:
  proxytype: panos
  host: <ip or dns name of panos host>
  apikey: <panos generated api key>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

host

The location, or ip/dns, of the panos host. Required.

apikey

The generated XML API key for the panos host. Required.

Panorama Pass-Through (Password)

The Panorama pass-through method sends all connections through the Panorama management system. It passes the connections to the appropriate device using the serial number of the Palo Alto firewall.

This option will reduce the number of connections that must be present for the proxy server. It will only require a connection to the Panorama server.

The username and password will be for authentication to the Panorama server, not the panos device.

```
proxy:  
  proxytype: panos  
  serial: <serial number of panos host>  
  host: <ip or dns name of the panorama server>  
  username: <panorama server username>  
  password: <panorama server password>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

serial

The serial number of the panos host. Required.

host

The location, or ip/dns, of the Panorama server. Required.

username

The username used to login to the Panorama server. Required.

password

The password used to login to the Panorama server. Required.

Panorama Pass-Through (API Key)

The Panorama server can also utilize a generated 'API key' for authentication.

```
proxy:  
  proxytype: panos  
  serial: <serial number of panos host>  
  host: <ip or dns name of the panorama server>  
  apikey: <panos generated api key>
```

proxytype

The `proxytype` key and value pair is critical, as it tells Salt which interface to load from the `proxy` directory in Salt's install hierarchy, or from `/srv/salt/_proxy` on the Salt Master (if you have created your own proxy module, for example). To use this panos Proxy Module, set this to `panos`.

serial

The serial number of the panos host. Required.

host

The location, or ip/dns, of the Panorama server. Required.

apikey

The generated XML API key for the Panorama server. Required.

`salt.proxy.panos.call(payload=None)`

This function captures the query string and sends it to the Palo Alto device.

`salt.proxy.panos.grains()`

Get the grains from the proxied device

`salt.proxy.panos.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.panos.init(opts)`

This function gets called when the proxy starts up. For panos devices, a determination is made on the connection type and the appropriate connection details that must be cached.

`salt.proxy.panos.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.panos.is_required_version(required_version='0.0.0')`

Because different versions of Palo Alto support different command sets, this function will return true if the current version of Palo Alto supports the required command.

`salt.proxy.panos.ping()`

Returns true if the device is reachable, else false.

`salt.proxy.panos.shutdown()`

Shutdown the connection to the proxy device. For this proxy, shutdown is a no-op.

20.13.12 salt.proxy.philips_hue module

Philips HUE lamps module for proxy.

New in version 2015.8.3.

First create a new user on the Hue bridge by following the [Meet hue](#) instructions.

To configure the proxy minion:

```
proxy:
  proxytype: philips_hue
  host: [hostname or ip]
  user: [username]
```

class salt.proxy.philips_hue.Const

Constants for the lamp operations.

```
COLOR_BLUE = {'hue': 46920, 'sat': 254}
COLOR_DAYLIGHT = {'xy': [0.3806, 0.3576]}
COLOR_GREEN = {'hue': 25500, 'sat': 254}
COLOR_ORANGE = {'hue': 12000, 'sat': 254}
COLOR_PINK = {'xy': [0.3688, 0.2095]}
COLOR_PURPLE = {'xy': [0.3787, 0.1724]}
COLOR_RED = {'hue': 0, 'sat': 254}
COLOR_WHITE = {'xy': [0.3227, 0.329]}
COLOR_YELLOW = {'xy': [0.4432, 0.5154]}
LAMP_OFF = {'on': False, 'transitiontime': 0}
LAMP_ON = {'on': True, 'transitiontime': 0}
```

salt.proxy.philips_hue.call_alert(*args, **kwargs)

Lamp alert

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: Turns on or off an alert. Default is True.

CLI Example:

```
salt '*' hue.alert
salt '*' hue.alert id=1
salt '*' hue.alert id=1,2,3 on=false
```

salt.proxy.philips_hue.call_blink(*args, **kwargs)

Blink a lamp. If lamp is ON, then blink ON-OFF-ON, otherwise OFF-ON-OFF.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **pause**: Time in seconds. Can be less than 1, i.e. 0.7, 0.5 sec.

CLI Example:

```
salt '*' hue.blink id=1
salt '*' hue.blink id=1,2,3
```

`salt.proxy.philips_hue.call_brightness(*args, **kwargs)`

Set an effect to the lamp.

Arguments:

- **value:** 0~255 brightness of the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **transition:** Transition 0~200. Default 0.

CLI Example:

```
salt '*' hue.brightness value=100
salt '*' hue.brightness id=1 value=150
salt '*' hue.brightness id=1,2,3 value=255
```

`salt.proxy.philips_hue.call_color(*args, **kwargs)`

Set a color to the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **color:** Fixed color. Values are: **red, green, blue, orange, pink, white**, yellow, daylight, purple. Default white.
- **transition:** Transition 0~200.

Advanced:

- **gamut:** XY coordinates. Use gamut according to the Philips HUE devices documentation. More: <http://www.developers.meethue.com/documentation/hue-xy-values>

CLI Example:

```
salt '*' hue.color
salt '*' hue.color id=1
salt '*' hue.color id=1,2,3 color=red transition=30
salt '*' hue.color id=1 gamut=0.3,0.5
```

`salt.proxy.philips_hue.call_effect(*args, **kwargs)`

Set an effect to the lamp.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **type:** Type of the effect. Possible values are "none" or "colorloop". Default "none".

CLI Example:

```
salt '*' hue.effect
salt '*' hue.effect id=1
salt '*' hue.effect id=1,2,3 type=colorloop
```

`salt.proxy.philips_hue.call_lights(*args, **kwargs)`

Get info about all available lamps.

Options:

- **id:** Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.lights
salt '*' hue.lights id=1
salt '*' hue.lights id=1,2,3
```

`salt.proxy.philips_hue.call_ping(*args, **kwargs)`

Ping the lamps by issuing a short inversion blink to all available devices.

CLI Example:

```
salt '*' hue.ping
```

`salt.proxy.philips_hue.call_rename(*args, **kwargs)`

Rename a device.

Options:

- **id**: Specifies a device ID. Only one device at a time.
- **title**: Title of the device.

CLI Example:

```
salt '*' hue.rename id=1 title='WC for cats'
```

`salt.proxy.philips_hue.call_status(*args, **kwargs)`

Return the status of the lamps.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.status
salt '*' hue.status id=1
salt '*' hue.status id=1,2,3
```

`salt.proxy.philips_hue.call_switch(*args, **kwargs)`

Switch lamp ON/OFF.

If no particular state is passed, then lamp will be switched to the opposite state.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.
- **on**: True or False. Inverted current, if omitted

CLI Example:

```
salt '*' hue.switch
salt '*' hue.switch id=1
salt '*' hue.switch id=1,2,3 on=True
```

`salt.proxy.philips_hue.call_temperature(*args, **kwargs)`

Set the mired color temperature. More: <http://en.wikipedia.org/wiki/Mired>

Arguments:

- **value**: 150~500.

Options:

- **id**: Specifies a device ID. Can be a comma-separated values. All, if omitted.

CLI Example:

```
salt '*' hue.temperature value=150
salt '*' hue.temperature value=150 id=1
salt '*' hue.temperature value=150 id=1,2,3
```

`salt.proxy.philips_hue.init(cnf)`

Initialize the module.

`salt.proxy.philips_hue.ping(*args, **kw)`

Ping the lamps.

`salt.proxy.philips_hue.shutdown(opts, *args, **kw)`

Shuts down the service.

20.13.13 salt.proxy.rest_sample

This is a simple proxy-minion designed to connect to and communicate with the bottle-based web service contained in https://github.com/saltstack/salt-contrib/tree/master/proxyminion_rest_example

`salt.proxy.rest_sample.alive(opts)`

`salt.proxy.rest_sample.fix_outage()`

`salt.proxy.rest_sample.fns()`

`salt.proxy.rest_sample.grains()`

Get the grains from the proxied device

`salt.proxy.rest_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.rest_sample.id(opts)`

Return a unique ID for this proxy minion. This ID MUST NOT CHANGE. If it changes while the proxy is running the salt-master will get really confused and may stop talking to this minion

`salt.proxy.rest_sample.init(opts)`

`salt.proxy.rest_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our init() function has been called

`salt.proxy.rest_sample.package_install(name, **kwargs)`

Install a "package" on the REST server

`salt.proxy.rest_sample.package_list()`

List "packages" installed on the REST server

`salt.proxy.rest_sample.package_remove(name)`

Remove a "package" on the REST server

`salt.proxy.rest_sample.package_status(name)`

Check the installation status of a package on the REST server

`salt.proxy.rest_sample.ping()`

Is the REST server up?

`salt.proxy.rest_sample.service_list()`

List "services" on the REST server

`salt.proxy.rest_sample.service_restart(name)`

Restart a "service" on the REST server

`salt.proxy.rest_sample.service_start(name)`

Start a "service" on the REST server

`salt.proxy.rest_sample.service_status(name)`

Check if a service is running on the REST server

`salt.proxy.rest_sample.service_stop(name)`

Stop a "service" on the REST server

`salt.proxy.rest_sample.shutdown(opts)`

For this proxy shutdown is a no-op

`salt.proxy.rest_sample.test_from_state()`

Test function so we have something to call from a state :return:

`salt.proxy.rest_sample.uptodate(name)`

Call the REST endpoint to see if the packages on the "server" are up to date.

20.13.14 salt.proxy.ssh_sample

This is a simple proxy-minion designed to connect to and communicate with a server that exposes functionality via SSH. This can be used as an option when the device does not provide an api over HTTP and doesn't have the python stack to run a minion.

`salt.proxy.ssh_sample.fns()`

`salt.proxy.ssh_sample.grains()`

Get the grains from the proxied device

`salt.proxy.ssh_sample.grains_refresh()`

Refresh the grains from the proxied device

`salt.proxy.ssh_sample.init(opts)`

Required. Can be used to initialize the server connection.

`salt.proxy.ssh_sample.initialized()`

Since grains are loaded in many different places and some of those places occur before the proxy can be initialized, return whether our `init()` function has been called

`salt.proxy.ssh_sample.package_install(name, **kwargs)`

Install a "package" on the ssh server

`salt.proxy.ssh_sample.package_list()`

List "packages" by executing a command via ssh This function is called in response to the salt command
`..code-block::bash salt target_minion pkg.list_pkgs`

`salt.proxy.ssh_sample.package_remove(name)`

Remove a "package" on the ssh server

`salt.proxy.ssh_sample.parse(out)`

Extract json from out.

Parameter out: Type string. The data returned by the ssh command.

`salt.proxy.ssh_sample.ping()`

Required. Ping the device on the other end of the connection

`salt.proxy.ssh_sample.service_list()`

Start a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_restart(name)`

Restart a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_start(name)`

Start a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.service_stop(name)`

Stop a "service" on the ssh server

New in version 2015.8.2.

`salt.proxy.ssh_sample.shutdown(opts)`

Disconnect

20.14 queue modules

pgjsonb_queue

New in version 2016.3.0.

sqlite_queue

New in version 2014.7.0.

20.14.1 salt.queues.pgjsonb_queue module

New in version 2016.3.0.

This is a queue with postgres as the backend. It uses the jsonb store to store information for queues.

depends python-psycopg2

To enable this queue, the following needs to be configured in your master config. These are the defaults:

```
queue.pgjsonb.host: 'salt'
queue.pgjsonb.user: 'salt'
queue.pgjsonb.pass: 'salt'
queue.pgjsonb.db: 'salt'
queue.pgjsonb.port: 5432
```

Use the following Pg database schema:

```
CREATE DATABASE salt WITH ENCODING 'utf-8';
--
-- Table structure for table `salt`
--
DROP TABLE IF EXISTS salt;
CREATE OR REPLACE TABLE salt(
  id SERIAL PRIMARY KEY,
  data jsonb NOT NULL
);
```

```
salt-run queue.insert test '{"name": "redis", "host": "172.16.0.8", "port": 6379}'!
↪ backend=pgjsonb
salt-run queue.process_queue test all backend=pgjsonb
```

salt.queues.pgjsonb_queue.delete(*queue*, *items*)

Delete an item or items from a queue

salt.queues.pgjsonb_queue.handle_queue_creation(*queue*)

salt.queues.pgjsonb_queue.insert(*queue*, *items*)

Add an item or items to a queue

salt.queues.pgjsonb_queue.list_items(*queue*)

List contents of a queue

salt.queues.pgjsonb_queue.list_length(*queue*)

Provide the number of items in a queue

salt.queues.pgjsonb_queue.list_queues()

Return a list of Salt Queues on the Salt Master

`salt.queues.pgjsonb_queue.pop(queue, quantity=1, is_runner=False)`

Pop one or more or all items from the queue return them.

20.14.2 salt.queues.sqlite_queue module

New in version 2014.7.0.

This is the default local master event queue built on sqlite. By default, an sqlite3 database file is created in the `sqlite_queue_dir` which is found at:

```
/var/cache/salt/master/queues
```

It's possible to store the sqlite3 database files by setting `sqlite_queue_dir` to another location:

```
sqlite_queue_dir: /home/myuser/salt/master/queues
```

`salt.queues.sqlite_queue.delete(queue, items)`

Delete an item or items from a queue

`salt.queues.sqlite_queue.insert(queue, items)`

Add an item or items to a queue

`salt.queues.sqlite_queue.list_items(queue)`

List contents of a queue

`salt.queues.sqlite_queue.list_length(queue)`

Provide the number of items in a queue

`salt.queues.sqlite_queue.list_queues()`

Return a list of Salt Queues on the Salt Master

`salt.queues.sqlite_queue.pop(queue, quantity=1, is_runner=False)`

Pop one or more or all items from the queue return them.

20.15 roster modules

<code>ansible</code>	Read in an Ansible inventory file or script
<code>cache</code>	The <code>cache</code> roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over <code>salt-ssh</code> .
<code>cloud</code>	Use the cloud cache on the master to derive IPv4 addresses based on minion ID.
<code>clustershell</code>	This roster resolves hostname in a <code>pdsh/clustershell</code> style.
<code>flat</code>	Read in the roster from a flat file using the <code>renderer</code> system
<code>range</code>	This roster resolves targets from a range server.
<code>scan</code>	Scan a netmask or <code>ipaddr</code> for open ssh ports
<code>sshconfig</code>	Parses roster entries out of Host directives from SSH config

20.15.1 salt.roster.ansible

Read in an Ansible inventory file or script

Flat inventory files should be in the regular ansible inventory format.

```
[servers]
salt.gtmanfred.com ansible_ssh_user=gtmanfred ansible_ssh_host=127.0.0.1 ansible_ssh_
↪port=22 ansible_ssh_pass='password'

[desktop]
home ansible_ssh_user=gtmanfred ansible_ssh_host=12.34.56.78 ansible_ssh_port=23↪
↪ansible_ssh_pass='password'

[computers:children]
desktop
servers

[names:vars]
http_port=80
```

then salt-ssh can be used to hit any of them

```
[~]# salt-ssh all test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh desktop test.ping
home:
  True
[~]# salt-ssh computers test.ping
salt.gtmanfred.com:
  True
home:
  True
[~]# salt-ssh salt.gtmanfred.com test.ping
salt.gtmanfred.com:
  True
```

There is also the option of specifying a dynamic inventory, and generating it on the fly

```
#!/bin/bash
echo '{
  "servers": [
    "salt.gtmanfred.com"
  ],
  "desktop": [
    "home"
  ],
  "computers": {
    "hosts": [],
    "children": [
      "desktop",
      "servers"
    ]
  },
  "_meta": {
```

(continues on next page)

(continued from previous page)

```
"hostvars": {
  "salt.gtmanfred.com": {
    "ansible_ssh_user": "gtmanfred",
    "ansible_ssh_host": "127.0.0.1",
    "ansible_sudo_pass": "password",
    "ansible_ssh_port": 22
  },
  "home": {
    "ansible_ssh_user": "gtmanfred",
    "ansible_ssh_host": "12.34.56.78",
    "ansible_sudo_pass": "password",
    "ansible_ssh_port": 23
  }
}
}'
```

This is the format that an inventory script needs to output to work with ansible, and thus here.

```
[~]# salt-ssh --roster-file /etc/salt/hosts salt.gtmanfred.com test.ping
salt.gtmanfred.com:
    True
```

Any of the [groups] or direct hostnames will return. The 'all' is special, and returns everything.

class salt.roster.ansible.Inventory(*tgt*, *tgt_type='glob'*, *inventory_file='/etc/salt/roster'*)
 Matcher for static inventory files

class salt.roster.ansible.Script(*tgt*, *tgt_type='glob'*, *inventory_file='/etc/salt/roster'*)
 Matcher for Inventory scripts

class salt.roster.ansible.Target

get_glob()
 Return minions that match via glob

targets()
 Execute the correct *tgt_type* routine and return

salt.roster.ansible.targets(*tgt*, *tgt_type='glob'*, ***kwargs*)
 Return the targets from the ansible *inventory_file* Default: /etc/salt/roster

20.15.2 salt.roster.cache

The cache roster provides a flexible interface to the Salt Masters' minion cache to access regular minions over salt-ssh.

New in version 2017.7.0: grains, pillar, mine data matching SDB URLs IPv6 support roster_order per config key default order changed to industry-wide best practices CIDR range selection

Targeting

This roster supports all matching and targeting of the Salt Master. The matching will be done using only the Salt Master's cache.

The Roster Order

The roster's composition can be configured using `roster_order`. In the `roster_order` you can define *any* roster key and fill it with a parameter overriding the one in `roster_defaults`:

```
roster_order:
  host: id           # use the minion id as hostname
```

You can define lists of parameters as well, the first result from the list will become the value.

Selecting a host

```
# default
roster_order:
  host:
    - ipv6-private # IPv6 addresses in private ranges
    - ipv6-global  # IPv6 addresses in global ranges
    - ipv4-private # IPv4 addresses in private ranges
    - ipv4-public  # IPv4 addresses in public ranges
    - ipv4-local   # loopback addresses
```

This is the default `roster_order`. It prefers IPv6 over IPv4 addresses and private addresses over public ones. The relevant data will be fetched from the cache in-order, and the first match will fill the `host` key.

Other address selection parameters are also possible:

```
roster_order:
  host:
    - global|public|private|local # Both IPv6 and IPv4 addresses in that range
    - 2000::/3                    # CIDR networks, both IPv4 and IPv6 are supported
```

Using cached data

Several cached libraries can be selected using the `library: ``` prefix, followed by the library key. This can be referenced using the same ```` syntax as e.g. `pillar.get`. Lists of references are also supported during the lookup, as are Salt SDB URLs.

This should be especially useful for the other roster keys:

```
roster_order:
  host:
    - grain: fqdn_ip4           # Lookup this grain
    - mine: network.ip_addrs    # Mine data lookup works the same

  password: sdb://vault/ssh_pass # Salt SDB URLs are also supported

  user:
    - pillar: ssh:auth:user     # Lookup this pillar key
    - sdb://osenv/USER            # Lookup this env var through sdb

  priv:
    - pillar:                  # Lists are also supported
      - salt:ssh:private_key
      - ssh:auth:private_key
```

`salt.roster.cache.targets` (*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the Salt Masters' minion cache. All targets and matchers are supported.

The resulting roster can be configured using `roster_order` and `roster_default`.

20.15.3 salt.roster.cloud

Use the cloud cache on the master to derive IPv4 addresses based on minion ID.

This roster requires that the minion in question was created using at least the 2015.5.0 version of Salt Cloud. Starting with the 2015.5.0 release, Salt Cloud maintains an index of minions that it creates and deletes. This index tracks the provider and profile configuration used to provision the minion, including authentication information. So long as this configuration remains current, it can be used by Salt SSH to log into any minion in the index.

To connect as a user other than root, modify the cloud configuration file usually located at `/etc/salt/cloud`. For example, add the following:

```
ssh_username: my_user
sudo: True
```

`salt.roster.cloud.extract_ipv4` (*roster_order*, *ipv4*)

Extract the preferred IP address from the `ipv4` grain

`salt.roster.cloud.targets` (*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets from the flat yaml file, checks opts for location but defaults to `/etc/salt/roster`

20.15.4 salt.roster.clustershell

This roster resolves hostname in a `pdsh/clustershell` style.

depends `clustershell`, <https://github.com/cea-hpc/clustershell>

When you want to use host globs for target matching, use `--roster clustershell`. For example:

```
salt-ssh --roster clustershell 'server_[1-10,21-30],test_server[5,7,9]' test.ping
```

`salt.roster.clustershell.targets` (*tgt*, *tgt_type='glob'*, ***kwargs*)

Return the targets

20.15.5 salt.roster.flat

Read in the roster from a flat file using the renderer system

class `salt.roster.flat.RosterMatcher` (*raw*, *tgt*, *tgt_type*, *ipv='ipv4'*)

Matcher for the roster data structure

get_data (*minion*)

Return the configured ip

ret_glob_minions ()

Return minions that match via glob

ret_list_minions ()

Return minions that match via list

ret_nodegroup_minions ()

Return minions which match the special list-only groups defined by `ssh_list_nodegroups`

ret_pcre_minions()
Return minions that match via pcre

ret_range_minions()
Return minions that are returned by a range query

targets()
Execute the correct tgt_type routine and return

`salt.roster.flat.targets(tgt, tgt_type='glob', **kwargs)`
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

20.15.6 salt.roster.range module

This roster resolves targets from a range server.

depends seco.range, <https://github.com/ytoolshed/range>

When you want to use a range query for target matching, use `--roster range`. For example:

```
salt-ssh --roster range '%%example.range.cluster' test.ping
```

`salt.roster.range.target_glob(tgt, hosts)`

`salt.roster.range.target_range(tgt, hosts)`

`salt.roster.range.targets(tgt, tgt_type='range', **kwargs)`
Return the targets from a range query

20.15.7 salt.roster.scan

Scan a netmask or ipaddr for open ssh ports

class `salt.roster.scan.RosterMatcher(tgt, tgt_type)`
Matcher for the roster data structure

targets()
Return ip addrs based on netmask, sitting in the "glob" spot because it is the default

`salt.roster.scan.targets(tgt, tgt_type='glob', **kwargs)`
Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

20.15.8 salt.roster.sshconfig

Parses roster entries out of Host directives from SSH config

```
salt-ssh --roster sshconfig '*' -r "echo hi"
```

class `salt.roster.sshconfig.RosterMatcher(raw, tgt, tgt_type)`
Matcher for the roster data structure

get_data(minion)
Return the configured ip

ret_glob_minions()
Return minions that match via glob

targets()

Execute the correct tgt_type routine and return

`salt.roster.sshconfig.parse_ssh_config(lines)`

Parses lines from the SSH config to create roster targets.

Parameters **lines** – Individual lines from the ssh config file

Returns Dictionary of targets in similar style to the flat roster

`salt.roster.sshconfig.targets(tgt, tgt_type='glob', **kwargs)`

Return the targets from the flat yaml file, checks opts for location but defaults to /etc/salt/roster

20.16 runner modules

<i>asam</i>	Novell ASAM Runner
<i>auth</i>	Authentication runner for creating, deleting, and managing eauth tokens.
<i>bgp</i>	BGP Finder
<i>cache</i>	Return cached data from minions
<i>cloud</i>	The Salt Cloud Runner
<i>ddns</i>	Dynamic DNS Runner
<i>digicertapi</i>	Support for Digicert.
<i>doc</i>	A runner module to collect and display the inline documentation from the various module types
<i>drac</i>	Manage Dell DRAC from the Master
<i>error</i>	Error generator to enable integration testing of salt runner error handling
<i>event</i>	Module for sending events using the runner system.
<i>f5</i>	Runner to provide F5 Load Balancer functionality
<i>filesERVER</i>	Directly manage the Salt filesERVER plugins
<i>git_pillar</i>	Runner module to directly manage the git external pillar
<i>http</i>	Module for making various web calls.
<i>jobs</i>	A convenience system to manage jobs, both active and already run
<i>launchd</i>	Manage launchd plist files
<i>lxc</i>	Control Linux Containers via Salt
<i>manage</i>	General management functions for salt, tools like seeing what hosts are up and what hosts are down
<i>mattermost</i>	Module for sending messages to Mattermost
<i>mine</i>	A runner to access data from the salt mine
<i>nacl</i>	This module helps include encrypted passwords in pillars, grains and salt state files.
<i>net</i>	NET Finder
<i>network</i>	Network tools to run from the Master
<i>pagerduty</i>	Runner Module for Firing Events via PagerDuty
<i>pillar</i>	Functions to interact with the pillar compiler on the master
<i>pkg</i>	Package helper functions using <code>salt.modules.pkg</code>
<i>queue</i>	General management and processing of queues.
<i>reactor</i>	A convenience system to manage reactors

Continued on next page

Table 16 – continued from previous page

<i>salt</i>	This runner makes Salt's execution modules available on the salt master.
<i>saltutil</i>	The Saltutil runner is used to sync custom types to the Master.
<i>sdb</i>	Runner for setting and querying data via the sdb API on the master
<i>smartos_vmadm</i>	Runner for SmartOS minions control vmadm
<i>spacewalk</i>	Spacewalk Runner
<i>ssh</i>	A Runner module interface on top of the salt-ssh Python API.
<i>state</i>	Execute orchestration functions
<i>survey</i>	A general map/reduce style salt runner for aggregating results returned by several different minions.
<i>test</i>	This runner is used only for test purposes and servers no production purpose
<i>thin</i>	The thin runner is used to manage the salt thin systems.
<i>vault</i>	
	maintainer SaltStack
<i>venafiapi</i>	Support for Venafi
<i>virt</i>	Control virtual machines via Salt
<i>vistara</i>	Vistara Runner
<i>winrepo</i>	Runner to manage Windows software repo

20.16.1 salt.runners.asam

Novell ASAM Runner

New in version Beryllium.

Runner to interact with Novell ASAM Fan-Out Driver

codeauthor Nitin Madhok <nmadhok@clemson.edu>

To use this runner, set up the Novell Fan-Out Driver URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/asam.conf`:

```
asam:
  prov1.domain.com
    username: "testuser"
    password: "verybadpass"
  prov2.domain.com
    username: "testuser"
    password: "verybadpass"
```

Note: Optionally, `protocol` and `port` can be specified if the Fan-Out Driver server is not using the defaults. Default is `protocol: https` and `port: 3451`.

`salt.runners.asam.add_platform(name, platform_set, server_url)`

To add an ASAM platform using the specified ASAM platform set on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.add_platform my-test-vm test-platform-set prov1.domain.com
```

`salt.runners.asam.list_platform_sets`(*server_url*)

To list all ASAM platform sets present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platform_sets prov1.domain.com
```

`salt.runners.asam.list_platforms`(*server_url*)

To list all ASAM platforms present on the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.list_platforms prov1.domain.com
```

`salt.runners.asam.remove_platform`(*name*, *server_url*)

To remove specified ASAM platform from the Novell Fan-Out Driver

CLI Example:

```
salt-run asam.remove_platform my-test-vm prov1.domain.com
```

20.16.2 salt.runners.auth

Authentication runner for creating, deleting, and managing eauth tokens.

New in version 2016.11.0.

`salt.runners.auth.del_token`(*token*)

Delete an eauth token by name

CLI Example:

```
salt-run auth.del_token 6556760736e4077daa601baec2b67c24
```

`salt.runners.auth.mk_token`(***load*)

Create an eauth token using provided credentials

Non-root users may specify an expiration date – if allowed via the `token_expire_user_override` setting – by passing an additional `token_expire` param. This overrides the `token_expire` setting of the same name in the Master config and is how long a token should live in seconds.

CLI Example:

```
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto

# Create a token valid for three years.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=94670856

# Calculate the number of seconds using expr.
salt-run auth.mk_token username=saltdev password=saltdev eauth=auto \
    token_expire=$(expr \( 365 \* 24 \* 60 \* 60 \) \* 3)
```

20.16.3 salt.runners.bgp

BGP Finder

New in version 2017.7.0.

Runner to search BGP neighbors details.

Configuration

- Minion (proxy) config

The `bgp.neighbors` function must be appened in the list of `mine_functions`:

```
mine_functions:
  bgp.neighbors: []
```

Which instructs Salt to cache the data returned by the `neighbors` function from the *NAPALM BGP module*.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not mandatory, but available in case the user has different requirements.

tgt: * From what minions will collect the mine data. Default: * (collect mine data from all minions)

tgt_type: **glob** Minion matching expression form. Default: `glob`.

return_fields What fields to return in the output. It can display all the fields from the `neighbors` function from the *NAPALM BGP module*.

Some fields cannot be removed:

- `as_number`: the AS number of the neighbor
- `device`: the minion ID
- `neighbor_address`: the neighbor remote IP address

By default, the following extra fields are returned (displayed):

- `connection_stats`: connection stats, as described below
- `import_policy`: the name of the import policy
- `export_policy`: the name of the export policy

Special fields:

- `vrf`: return the name of the VRF.
- `connection_stats`: returning an output of the form `<State> <Active>/<Received>/<Accepted>/<Damped>`, e.g. `Established 398/399/399/0` similar to the usual output from network devices.

- `interface_description`: matches the neighbor details with the corresponding interface and returns its description. This will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.
- `interface_name`: matches the neighbor details with the corresponding interface and returns the name. Similar to `interface_description`, this will reuse functionality from the `net runner`, so the user needs to enable the mines as specified in the documentation.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

outputter: table Specify the outputter name when displaying on the CLI. Default: `table`.

Configuration example:

```
runners:
  bgp:
    tgt: 'edge*'
    tgt_type: 'glob'
    return_fields:
      - up
      - connection_state
      - previous_connection_state
      - suppress_4byte_as
      - holdtime
      - flap_count
    outputter: yaml
```

`salt.runners.bgp.neighbors(*asns, **kwargs)`

Search for BGP neighbors details in the mines of the `bgp.neighbors` function.

Arguments:

asns A list of AS numbers to search for. The runner will return only the neighbors of these AS numbers.

device Filter by device name (minion ID).

ip Search BGP neighbor using the IP address. In multi-VRF environments, the same IP address could be used by more than one neighbors, in different routing tables.

network Search neighbors within a certain IP network.

title Custom title.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

outputter: table Specify the outputter name when displaying on the CLI. Default: `table`.

In addition, any field from the output of the `neighbors` function from the `NAPALM BGP module` can be used as a filter.

CLI Example:

```
salt-run bgp.neighbors 13335 15169
salt-run bgp.neighbors 13335 ip=172.17.19.1
salt-run bgp.neighbors multipath=True
salt-run bgp.neighbors up=False export_policy=my-export-policy multihop=False
salt-run bgp.neighbors network=192.168.0.0/16
```

Output example:

```
BGP Neighbors for 13335, 15169
-----
↩ | Device | AS Number | Neighbor Address | State|#Active/
↩ |-----|-----|-----|-----|-----|
↩ |Received/Accepted/Damped | Policy IN | Policy OUT |
```

20.16.4 salt.runners.cache

Return cached data from minions

`salt.runners.cache.clear_all`(*tgt=None*, *tgt_type='glob'*, *expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar, grains, and mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_all
```

`salt.runners.cache.clear_git_lock`(*role*, *remote=None*, ***kwargs*)

New in version 2015.8.2.

Remove the update locks for Salt components (`gitfs`, `git_pillar`, `winrepo`) which use `gitfs` backend code from `salt.utils.gitfs`.

Note: Running `cache.clear_all` will not include this function as it does for pillar, grains, and mine.

Additionally, executing this function with a role of `gitfs` is equivalent to running `salt-run fileservers.clear_lock backend=git`.

role Which type of lock to remove (`gitfs`, `git_pillar`, or `winrepo`)

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a `remote` value of `github` will remove the lock from all `github.com` remotes.

type [`update`,`checkout`,`mountpoint`] The types of lock to clear. Can be one or more of `update`, `checkout`, and `mountpoint`, and can be passed either as a comma-separated or Python list.

New in version 2015.8.8.

Changed in version 2018.3.0: `mountpoint` lock type added

CLI Examples:

```
salt-run cache.clear_git_lock gitfs
salt-run cache.clear_git_lock git_pillar
salt-run cache.clear_git_lock git_pillar type=update
salt-run cache.clear_git_lock git_pillar type=update,checkout
salt-run cache.clear_git_lock git_pillar type='["update", "mountpoint"]'
```

`salt.runners.cache.clear_grains` (*tgt=None, tgt_type='glob', expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached grains data of the targeted minions

CLI Example:

```
salt-run cache.clear_grains
```

`salt.runners.cache.clear_mine` (*tgt=None, tgt_type='glob', expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine
```

`salt.runners.cache.clear_mine_func` (*tgt=None, tgt_type='glob', clear_mine_func_flag=None, expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached mine function data of the targeted minions

CLI Example:

```
salt-run cache.clear_mine_func tgt='*' clear_mine_func_flag='network.interfaces'
```

`salt.runners.cache.clear_pillar` (*tgt=None, tgt_type='glob', expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Clear the cached pillar data of the targeted minions

CLI Example:

```
salt-run cache.clear_pillar
```

`salt.runners.cache.cloud`(*tgt*, *provider=None*)

Return cloud cache data for target.

Note: Only works with glob matching

tgt Glob Target to match minion ids

provider Cloud Provider

CLI Example:

```
salt-run cache.cloud 'salt*'
salt-run cache.cloud glance.example.org provider=openstack
```

`salt.runners.cache.fetch`(*bank*, *key*, *cachedir=None*)

Fetch data from a salt.cache bank.

CLI Example:

```
salt-run cache.fetch cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.flush`(*bank*, *key=None*, *cachedir=None*)

Remove the key from the cache bank with all the key content. If no key is specified remove the entire bank with all keys and sub-banks inside.

CLI Examples:

```
salt-run cache.flush cloud/active/ec2/myec2 cachedir=/var/cache/salt/
salt-run cache.flush cloud/active/ec2/myec2 myminion cachedir=/var/cache/salt/
```

`salt.runners.cache.grains`(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached grains of the targeted minions.

tgt Target to match minion ids.

Changed in version 2017.7.5,2018.3.0: The `tgt` argument is now required to display cached grains. If not used, the function will not return grains. This optional argument will become mandatory in the Salt Sodium release.

tgt_type The type of targeting to use for matching, such as `glob`, `list`, etc.

CLI Example:

```
salt-run cache.grains '*'
```

`salt.runners.cache.list_`(*bank*, *cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.list cloud/active/ec2/myec2 cachedir=/var/cache/salt/
```

`salt.runners.cache.mine`(*tgt=None*, *tgt_type='glob'*, ***kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached mine data of the targeted minions

CLI Example:

```
salt-run cache.mine
```

`salt.runners.cache.pillar` (*tgt=None, tgt_type='glob', **kwargs*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Return cached pillars of the targeted minions

CLI Example:

```
salt-run cache.pillar
```

`salt.runners.cache.store` (*bank, key, data, cachedir=None*)

Lists entries stored in the specified bank.

CLI Example:

```
salt-run cache.store mycache mykey 'The time has come the walrus said'
```

20.16.5 salt.runners.cloud

The Salt Cloud Runner

This runner wraps the functionality of salt cloud making salt cloud routines available to all internal apis via the runner system

`salt.runners.cloud.action` (*func=None, cloudmap=None, instances=None, provider=None, instance=None, opts=None, **kwargs*)

Execute a single action on the given map/provider/instance

CLI Example:

```
salt-run cloud.action start my-salt-vm
```

`salt.runners.cloud.create` (*provider, instances, opts=None, **kwargs*)

Create an instance using Salt Cloud

CLI Example:

```
salt-run cloud.create my-ec2-config myinstance           image=ami-1624987f
↪size='t1.micro'  ssh_username=ec2-user                 securitygroup=default delvol_
↪on_destroy=True
```

`salt.runners.cloud.destroy` (*instances, opts=None*)

Destroy the named vm(s)

`salt.runners.cloud.full_query` (*query_type='list_nodes_full'*)

List all available cloud provider data

`salt.runners.cloud.list_images` (*provider='all'*)

List cloud provider images for the given providers

`salt.runners.cloud.list_locations` (*provider='all'*)

List cloud provider sizes for the given providers

`salt.runners.cloud.list_sizes` (*provider='all'*)

List cloud provider sizes for the given providers

`salt.runners.cloud.map_run`(*path=None, opts=None, **kwargs*)
Execute a salt cloud map file

`salt.runners.cloud.profile`(*prof=None, instances=None, opts=None, **kwargs*)
Create a cloud vm with the given profile and instances, instances can be a list or comma-delimited string

CLI Example:

```
salt-run cloud.profile prof=my-ec2 instances=node1,node2,node3
```

`salt.runners.cloud.query`(*query_type='list_nodes'*)
List cloud provider data for all providers

`salt.runners.cloud.select_query`(*query_type='list_nodes_select'*)
List selected nodes

20.16.6 salt.runners.ddns

Dynamic DNS Runner

New in version Beryllium.

Runner to interact with DNS server and create/delete/update DNS records

codeauthor Nitin Madhok <nmadhok@clemson.edu>

`salt.runners.ddns.add_host`(*zone, name, ttl, ip, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)
Create both A and PTR (reverse) records for a host.

CLI Example:

```
salt-run ddns.add_host domain.com my-test-vm 3600 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.create`(*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)
Create a DNS record. The nameserver must be an IP address and the master running this runner must have create privileges on that server.

CLI Example:

```
salt-run ddns.create domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

`salt.runners.ddns.delete`(*zone, name, keyname, keyfile, nameserver, timeout, rdtype=None, data=None, port=53, keyalgorithm='hmac-md5'*)

Delete a DNS record.

CLI Example:

```
salt-run ddns.delete domain.com my-test-vm my-tsig-key /etc/salt/tsig.keyring 10.
↳0.0.1 5 A
```

`salt.runners.ddns.delete_host`(*zone, name, keyname, keyfile, nameserver, timeout, port=53, keyalgorithm='hmac-md5'*)

Delete both forward (A) and reverse (PTR) records for a host only if the forward (A) record exists.

CLI Example:

```
salt-run ddns.delete_host domain.com my-test-vm my-tsig-key /etc/salt/tsig.
↳keyring 10.0.0.1 5
```

`salt.runners.ddns.update` (*zone, name, ttl, rdtype, data, keyname, keyfile, nameserver, timeout, replace=False, port=53, keyalgorithm='hmac-md5'*)

Replace, or update a DNS record. The nameserver must be an IP address and the master running this runner must have update privileges on that server.

Note: If `replace` is set to `True`, all records for this name and type will first be deleted and then recreated. Default is `replace=False`.

CLI Example:

```
salt-run ddns.update domain.com my-test-vm 3600 A 10.20.30.40 my-tsig-key /etc/
↳salt/tsig.keyring 10.0.0.1 5
```

20.16.7 salt.runners.digicertapi

Support for Digicert. Heavily based on the Venafi runner by Joseph Hall (jphall@saltstack.com).

Before using this module you need to register an account with Digicert's CertCentral.

Login to CertCentral, ensure you have a payment method configured and/or there are adequate funds attached to your account. Click the `Account` item in the left sidebar, and select `Account Access`. The right hand pane should show "Account Access" and a link to create an API key. Create a new API key and assign it to the user that should be attached to requests coming from Salt.

NOTE CertCentral will not show the API key again after revealing it the first time. Make sure you copy it right away or you will have to revoke it and generate a new one.

Now open `/etc/salt/master` and add the API key as shown below.

```
digicert:
  api_key: ✖
↳ABCDEFGHIJKLMNQPQRSTUVWXYZABCDEFGHIJKLMNQPQRSTUVWXYZABCDEFGHIJKLMNQPQRSTUVWXYZABC
```

Restart your Salt Master.

You can also include default values of the following variables to help with creating CSRs:

```
digicert:
  api_key: ✖
↳ABCDEFGHIJKLMNQPQRSTUVWXYZABCDEFGHIJKLMNQPQRSTUVWXYZABCDEFGHIJKLMNQPQRSTUVWXYZABC
  shatype: sha256
```

This API currently only supports RSA key types. Support for other key types will be added if interest warrants.

`salt.runners.digicertapi.del_cached_domain` (*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run digicert.del_cached_domain domain1.example.com, domain2.example.com
```

`salt.runners.digicertapi.gen_csr` (*minion_id, dns_name, organization_id, ou_name=None, key_len=2048, shatype='sha256', password=None*)

CLI Example:

```
salt-run digicert.gen_csr <minion_id> <dns_name>
```

`salt.runners.digicertapi.gen_key`(*minion_id*, *dns_name=None*, *password=None*, *key_len=2048*)
Generate and return a private_key. If a dns_name is passed in, the private_key will be cached under that name.

CLI Example:

```
salt-run digicert.gen_key <minion_id> [dns_name] [password]
```

`salt.runners.digicertapi.get_certificate`(*order_id=None*, *certificate_id=None*, *minion_id=None*, *cert_format='pem_all'*, *filename=None*)

Retrieve a certificate by order_id or certificate_id and write it to stdout or a filename.

A list of permissible cert_formats is here: <https://www.digicert.com/services/v2/documentation/appendix-certificate-formats>

CLI Example:

```
salt-run digicert.get_certificate order_id=48929454 cert_format=apache
```

Including a 'filename' will write the certificate to the desired file. Note that some cert formats are zipped files, and some are binary.

If the certificate has not been issued, this function will return the order details inside of which will be a status (one of pending, rejected, processing, issued, revoked, canceled, needs_csr, and needs_approval)

If for some reason you want to pipe the output of this command to a file or other command you will want to leave off the filename argument and make sure to include `--no-color` so there will be no terminal ANSI escape sequences.

`salt.runners.digicertapi.get_org_details`(*organization_id*)

Return the details for an organization

CLI Example:

```
salt-run digicert.get_org_details 34
```

Returns a dictionary with the org details, or with 'error' and 'status' keys.

`salt.runners.digicertapi.list_domain_cache`()

List domains that have been cached

CLI Example:

```
salt-run digicert.list_domain_cache
```

`salt.runners.digicertapi.list_domains`(*container_id=None*)

List domains that CertCentral knows about. You can filter by container_id (also known as "Division") by passing a container_id.

CLI Example:

```
salt-run digicert.list_domains
```

`salt.runners.digicertapi.list_orders`(*status=None*)

List certificate orders made to CertCentral.

CLI Example:

```
salt-run digicert.list_orders
```

`salt.runners.digicertapi.list_organizations`(*container_id=None*, *include_validation=True*)

List organizations that CertCentral knows about. You can filter by `container_id` (also known as "Division") by passing a `container_id`. This function returns validation information by default; pass `include_validation=False` to turn it off.

CLI Example:

```
salt-run digicert.list_organizations
```

`salt.runners.digicertapi.list_requests`(*status=None*)

List certificate requests made to CertCentral. You can filter by status: pending, approved, rejected

CLI Example:

```
salt-run digicert.list_requests pending
```

`salt.runners.digicertapi.order_certificate`(*minion_id*, *common_name*, *organization_id*, *validity_years*, *cert_key_passphrase=None*, *signature_hash=None*, *key_len=2048*, *dns_names=None*, *organization_units=None*, *server_platform=None*, *custom_expiration_date=None*, *comments=None*, *disable_renewal_notifications=False*, *product_type_hint=None*, *renewal_of_order_id=None*)

Order a certificate. Requires that an Organization has been created inside Digicert's CertCentral.

See here for API documentation: <https://www.digicert.com/services/v2/documentation/order/order-ssl-determinator>

CLI Example:

```
salt-run digicert.order_certificate my_minionid my.domain.com 10 3
→signature_hash=sha256 dns_names=['this.domain.com', 'that.domain.com
→'] organization_units='My Domain Org Unit' comments=
→'Comment goes here for the approver'
```

This runner can also be used to renew a certificate by passing `renewal_of_order_id`. Previous order details can be retrieved with `digicertapi.list_orders`.

`salt.runners.digicertapi.show_csrs`()

Show certificate requests for this API key

CLI Example:

```
salt-run digicert.show_csrs
```

`salt.runners.digicertapi.show_organization`(*domain*)

Show organization information, especially the company id

CLI Example:

```
salt-run digicert.show_company example.com
```

`salt.runners.digicertapi.show_rsa`(*minion_id*, *dns_name*)

Show a private RSA key

CLI Example:

```
salt-run digicert.show_rsa myminion domain.example.com
```

20.16.8 salt.runners.doc

A runner module to collect and display the inline documentation from the various module types

`salt.runners.doc.execution()`

Collect all the `sys.doc` output from each minion and return the aggregate

CLI Example:

```
salt-run doc.execution
```

`salt.runners.doc.runner()`

Return all inline documentation for runner modules

CLI Example:

```
salt-run doc.runner
```

`salt.runners.doc.wheel()`

Return all inline documentation for wheel modules

CLI Example:

```
salt-run doc.wheel
```

20.16.9 salt.runners.drac

Manage Dell DRAC from the Master

The login credentials need to be configured in the Salt master configuration file.

`salt.runners.drac.poweroff(hostname, timeout=20, username=None, password=None)`

Power server off

CLI Example:

```
salt-run drac.poweroff example.com
```

`salt.runners.drac.poweron(hostname, timeout=20, username=None, password=None)`

Power server on

CLI Example:

```
salt-run drac.poweron example.com
```

`salt.runners.drac.pxe(hostname, timeout=20, username=None, password=None)`

Connect to the Dell DRAC and have the boot order set to PXE and power cycle the system to PXE boot

CLI Example:

```
salt-run drac.pxe example.com
```

`salt.runners.drac.reboot` (*hostname, timeout=20, username=None, password=None*)

Reboot a server using the Dell DRAC

CLI Example:

```
salt-run drac.reboot example.com
```

`salt.runners.drac.version` (*hostname, timeout=20, username=None, password=None*)

Display the version of DRAC

CLI Example:

```
salt-run drac.version example.com
```

20.16.10 salt.runners.error

Error generator to enable integration testing of salt runner error handling

`salt.runners.error.error` (*name=None, message=""*)

If name is None Then return empty dict

Otherwise raise an exception with `__name__` from name, message from message

CLI Example:

```
salt-run error
salt-run error.error name="Exception" message="This is an error."
```

20.16.11 salt.runners.event

Module for sending events using the runner system.

New in version 2016.11.0.

`salt.runners.event.send` (*tag, data=None*)

Send an event with the given tag and data.

This is useful for sending events directly to the master from the shell with salt-run. It is also quite useful for sending events in orchestration states where the `fire_event` requisite isn't sufficient because it does not support sending custom data with the event.

Note that event tags will *not* be namespaced like events sent with the `fire_event` requisite! Whereas events produced from `fire_event` are prefixed with `salt/state_result/<jid>/<minion_id>/<name>`, events sent using this runner module will have no such prefix. Make sure your reactors don't expect a prefix!

Parameters

- **tag** – the tag to send with the event
- **data** – an optional dictionary of data to send with the event

CLI Example:

```
salt-run event.send my/custom/event '{"foo": "bar"}'
```

Orchestration Example:

```
# orch/command.sls

run_a_command:
  salt.function:
    - name: cmd.run
    - tgt: my_minion
    - arg:
      - exit {{ pillar['exit_code'] }}

send_success_event:
  salt.runner:
    - name: event.send
    - tag: my_event/success
    - data:
      foo: bar
    - require:
      - salt: run_a_command

send_failure_event:
  salt.runner:
    - name: event.send
    - tag: my_event/failure
    - data:
      baz: qux
    - onfail:
      - salt: run_a_command
```

```
salt-run state.orchestrate orch.command pillar='{"exit_code": 0}'
salt-run state.orchestrate orch.command pillar='{"exit_code": 1}'
```

20.16.12 salt.runners.f5

Runner to provide F5 Load Balancer functionality

depends

- pycontrol Python module

configuration In order to connect to a F5 Load Balancer, you must specify in the Salt master configuration the currently available load balancers

```
load_balancers:
  bigip1.example.com
    username: admin
    password: secret
  bigip2.example.com:
    username: admin
    password: secret
```

class salt.runners.f5.F5Mgmt(*lb, username, password*)

add_pool_member (*name, port, pool_name*)

Add a node to a pool

check_member_pool (*member, pool_name*)

Check a pool member exists in a specific pool

check_pool (*name*)

Check to see if a pool exists

check_virtualserver (*name*)

Check to see if a virtual server exists

create_pool (*name, method='ROUND_ROBIN'*)

Create a pool on the F5 load balancer

create_vs (*name, ip, port, protocol, profile, pool_name*)

Create a virtual server

lbmethods ()

List all the load balancer methods

salt.runners.f5.add_pool_member (*lb, name, port, pool_name*)

Add a node to a pool

CLI Examples:

```
salt-run f5.add_pool_member load_balancer 10.0.0.1 80 my_pool
```

salt.runners.f5.check_member_pool (*lb, member, pool_name*)

Check a pool member exists in a specific pool

CLI Examples:

```
salt-run f5.check_member_pool load_balancer 10.0.0.1 my_pool
```

salt.runners.f5.check_pool (*lb, name*)

Check to see if a pool exists

CLI Examples:

```
salt-run f5.check_pool load_balancer pool_name
```

salt.runners.f5.check_virtualserver (*lb, name*)

Check to see if a virtual server exists

CLI Examples:

```
salt-run f5.check_virtualserver load_balancer virtual_server
```

salt.runners.f5.create_pool (*lb, name, method='ROUND_ROBIN'*)

Create a pool on the F5 load balancer

CLI Examples:

```
salt-run f5.create_pool load_balancer pool_name loadbalance_method
salt-run f5.create_pool load_balancer my_pool ROUND_ROBIN
```

salt.runners.f5.create_vs (*lb, name, ip, port, protocol, profile, pool_name*)

Create a virtual server

CLI Examples:

```
salt-run f5.create_vs lbalancer vs_name 10.0.0.1 80 tcp http poolname
```

20.16.13 salt.runners.fileserver

Directly manage the Salt fileserver plugins

`salt.runners.fileserver.clear_cache` (*backend=None*)

New in version 2015.5.0.

Clear the fileserver cache from VCS fileserver backends (*git*, *hg*, *svn*). Executing this runner with no arguments will clear the cache for all enabled VCS fileserver backends, but this can be narrowed using the *backend* argument.

backend Only clear the update lock for the specified backend(s). If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

CLI Example:

```
salt-run fileserver.clear_cache
salt-run fileserver.clear_cache backend=git,hg
salt-run fileserver.clear_cache hg
salt-run fileserver.clear_cache -roots
```

`salt.runners.fileserver.clear_file_list_cache` (*saltenv=None*, *backend=None*)

New in version 2016.11.0.

The Salt fileserver caches the files/directories/symlinks for each fileserver backend and environment as they are requested. This is done to help the fileserver scale better. Without this caching, when hundreds/thousands of minions simultaneously ask the master what files are available, this would cause the master's CPU load to spike as it obtains the same information separately for each minion.

saltenv By default, this runner will clear the file list caches for all environments. This argument allows for a list of environments to be passed, to clear more selectively. This list can be passed either as a comma-separated string, or a Python list.

backend Similar to the *saltenv* parameter, this argument will restrict the cache clearing to specific fileserver backends (the default behavior is to clear from all enabled fileserver backends). This list can be passed either as a comma-separated string, or a Python list.

Since the ability to clear these caches is often required by users writing custom runners which add/remove files, this runner can easily be called from within a custom runner using any of the following examples:

```
# Clear all file list caches
__salt__['fileserver.clear_file_list_cache]()
# Clear just the 'base' saltenv file list caches
__salt__['fileserver.clear_file_list_cache'](saltenv='base')
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
__salt__['fileserver.clear_file_list_cache'](saltenv='base', backend='roots')
# Clear all file list caches from the 'roots' fileserver backend
__salt__['fileserver.clear_file_list_cache'](backend='roots')
```

Note: In runners, the `__salt__` dictionary will likely be renamed to `__runner__` in a future Salt release to distinguish runner functions from remote execution functions. See [this GitHub issue](#) for discussion/updates on this.

If using Salt's Python API (not a runner), the following examples are equivalent to the ones above:

```
import salt.config
import salt.runner
```

(continues on next page)

(continued from previous page)

```

opts = salt.config.master_config('/etc/salt/master')
opts['fun'] = 'filesserver.clear_file_list_cache'

# Clear all file list_caches
opts['arg'] = [] # No arguments
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches
opts['arg'] = ['base', None]
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
opts['arg'] = ['base', 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

# Clear all file list caches from the 'roots' fileserver backend
opts['arg'] = [None, 'roots']
runner = salt.runner.Runner(opts)
cleared = runner.run()

```

This function will return a dictionary showing a list of environments which were cleared for each backend. An empty return dictionary means that no changes were made.

CLI Examples:

```

# Clear all file list caches
salt-run filesserver.clear_file_list_cache
# Clear just the 'base' saltenv file list caches
salt-run filesserver.clear_file_list_cache saltenv=base
# Clear just the 'base' saltenv file list caches from just the 'roots'
# fileserver backend
salt-run filesserver.clear_file_list_cache saltenv=base backend=roots
# Clear all file list caches from the 'roots' fileserver backend
salt-run filesserver.clear_file_list_cache backend=roots

```

`salt.runners.filesserver.clear_lock`(*backend=None, remote=None*)

New in version 2015.5.0.

Clear the fileserver update lock from VCS fileserver backends (*git, hg, svn*). This should only need to be done if a fileserver update was interrupted and a remote is not updating (generating a warning in the Master's log file). Executing this runner with no arguments will remove all update locks from all enabled VCS fileserver backends, but this can be narrowed by using the following arguments:

backend Only clear the update lock for the specified backend(s).

remote If specified, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of `github` will remove the lock from all `github.com` remotes.

CLI Example:

```

salt-run filesserver.clear_lock
salt-run filesserver.clear_lock backend=git,hg
salt-run filesserver.clear_lock backend=git remote=github
salt-run filesserver.clear_lock remote=bitbucket

```

`salt.runners.fileserver.dir_list` (*saltenv='base', backend=None*)

Return a list of directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.dir_list
salt-run fileserver.dir_list saltenv=prod
salt-run fileserver.dir_list saltenv=dev backend=git
salt-run fileserver.dir_list base hg,roots
salt-run fileserver.dir_list -git
```

`salt.runners.fileserver.empty_dir_list` (*saltenv='base', backend=None*)

New in version 2015.5.0.

Return a list of empty directories in the given environment

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Note: Some backends (such as `git` and `hg`) do not support empty directories. So, passing `backend=git` or `backend=hg` will result in an empty list being returned.

CLI Example:

```
salt-run fileserver.empty_dir_list
salt-run fileserver.empty_dir_list saltenv=prod
salt-run fileserver.empty_dir_list backend=roots
```

`salt.runners.fileserver.envs` (*backend=None, sources=False*)

Return the available fileserver environments. If no backend is provided, then the environments for all configured backends will be returned.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=["'roots', 'git']"`)

CLI Example:

```
salt-run fileserver.envs
salt-run fileserver.envs backend=roots,git
salt-run fileserver.envs git
```

`salt.runners.fileserver.file_list` (*saltenv='base', backend=None*)

Return a list of files from the salt fileserver

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Examples:

```
salt-run fileserver.file_list
salt-run fileserver.file_list saltenv=prod
salt-run fileserver.file_list saltenv=dev backend=git
salt-run fileserver.file_list base hg,roots
salt-run fileserver.file_list -git
```

`salt.runners.fileserver.lock` (*backend=None, remote=None*)

New in version 2015.5.0.

Set a fileserver update lock for VCS fileserver backends (*git, hg, svn*).

Note: This will only operate on enabled backends (those configured in *fileserver_backend*).

backend Only set the update lock for the specified backend(s).

remote If not None, then any remotes which contain the passed string will have their lock cleared. For example, a remote value of `*github.com*` will remove the lock from all github.com remotes.

CLI Example:

```
salt-run fileserver.lock
salt-run fileserver.lock backend=git,hg
salt-run fileserver.lock backend=git remote='*github.com*'
salt-run fileserver.lock remote=bitbucket
```

`salt.runners.fileserver.symlink_list` (*saltenv='base', backend=None*)

Return a list of symlinked files and dirs

saltenv [base] The salt fileserver environment to be listed

backend Narrow fileserver backends to a subset of the enabled ones. If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

New in version 2015.5.0.

CLI Example:

```
salt-run fileserver.symlink_list
salt-run fileserver.symlink_list saltenv=prod
salt-run fileserver.symlink_list saltenv=dev backend=git
salt-run fileserver.symlink_list base hg,roots
salt-run fileserver.symlink_list -git
```

`salt.runners.fileserver.update` (*backend=None*)

Update the fileserver cache. If no backend is provided, then the cache for all configured backends will be updated.

backend Narrow fileserver backends to a subset of the enabled ones.

Changed in version 2015.5.0: If all passed backends start with a minus sign (-), then these backends will be excluded from the enabled backends. However, if there is a mix of backends with and without a minus sign (ex: `backend=-roots,git`) then the ones starting with a minus sign will be disregarded.

Additionally, fileserver backends can now be passed as a comma-separated list. In earlier versions, they needed to be passed as a python list (ex: `backend=['roots', 'git']`)

CLI Example:

```
salt-run fileserver.update
salt-run fileserver.update backend=roots,git
```

20.16.14 salt.runners.git_pillar

Runner module to directly manage the git external pillar

`salt.runners.git_pillar.update` (*branch=None, repo=None*)

New in version 2014.1.0.

Changed in version 2015.8.4: This runner function now supports the *git_pillar configuration schema* introduced in 2015.8.0. Additionally, the `branch` and `repo` can now be omitted to update all `git_pillar` remotes. The return data has also changed to a dictionary. The values will be `True` only if new commits were fetched, and `False` if there were errors or no new commits were fetched.

Changed in version 2018.3.0: The return for a given `git_pillar` remote will now be `None` when no changes were fetched. `False` now is reserved only for instances in which there were errors.

Fetch one or all configured `git_pillar` remotes.

Note: This will *not* fast-forward the `git_pillar` cachedir on the master. All it does is perform a `git fetch`. If this runner is executed with `-l debug`, you may see a log message that says that the repo is up-to-date. Keep in mind that Salt automatically fetches `git_pillar` repos roughly every 60 seconds (or whatever *loop_interval* is set to). So, it is possible that the repo was fetched automatically in the time between when changes were pushed to the repo, and when this runner was executed. When in doubt, simply refresh pillar data using *saltutil.refresh_pillar* and then use *pillar.item* to check if the pillar data has changed as expected.

CLI Example:

```
# Update specific branch and repo
salt-run git_pillar.update branch='branch' repo='https://foo.com/bar.git'
# Update all repos
salt-run git_pillar.update
# Run with debug logging
salt-run git_pillar.update -l debug
```

20.16.15 salt.runners.http

Module for making various web calls. Primarily designed for webhooks and the like, but also useful for basic http testing.

New in version 2015.5.0.

`salt.runners.http.query` (*url, output=True, **kwargs*)

Query a resource, and decode the return data

New in version 2015.5.0.

CLI Example:

```

salt-run http.query http://somelink.com/
salt-run http.query http://somelink.com/ method=POST          params=
↳ 'key1=val1&key2=val2'
salt-run http.query http://somelink.com/ method=POST          data='<xml>'
↳ somecontent</xml>'

```

salt.runners.http.update_ca_bundle (*target=None, source=None, merge_files=None*)

Update the local CA bundle file from a URL

New in version 2015.5.0.

CLI Example:

```

salt-run http.update_ca_bundle
salt-run http.update_ca_bundle target=/path/to/cacerts.pem
salt-run http.update_ca_bundle source=https://example.com/cacerts.pem

```

If the `target` is not specified, it will be pulled from the `ca_cert` configuration variable available to the master. If it cannot be found there, it will be placed at `<<FILE_ROOTS>>/cacerts.pem`.

If the `source` is not specified, it will be pulled from the `ca_cert_url` configuration variable available to the master. If it cannot be found, it will be downloaded from the cURL website, using an http (not https) URL. USING THE DEFAULT URL SHOULD BE AVOIDED!

`merge_files` may also be specified, which includes a string or list of strings representing a file or files to be appended to the end of the CA bundle, once it is downloaded.

CLI Example:

```

salt-run http.update_ca_bundle merge_files=/path/to/mycert.pem

```

20.16.16 salt.runners.jobs

A convenience system to manage jobs, both active and already run

salt.runners.jobs.active (*display_progress=False*)

Return a report on all actively running jobs from a job id centric perspective

CLI Example:

```

salt-run jobs.active

```

salt.runners.jobs.exit_success (*jid, ext_source=None*)

Check if a job has been executed and exit successfully

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

CLI Example:

```

salt-run jobs.exit_success 20160520145827701627

```

salt.runners.jobs.last_run (*ext_source=None, outputter=None, metadata=None, function=None, target=None, display_progress=False*)

New in version 2015.8.0.

List all detectable jobs and associated functions

CLI Example:

```
salt-run jobs.last_run
salt-run jobs.last_run target=nodename
salt-run jobs.last_run function='cmd.run'
salt-run jobs.last_run metadata="{ 'foo': 'bar' }"
```

`salt.runners.jobs.list_job(jid, ext_source=None, display_progress=False)`

List a specific job given by its `jid`

`ext_source` If provided, specifies which external job cache to use.

`display_progress` [False] If True, fire progress events.

New in version 2015.8.8.

CLI Example:

```
salt-run jobs.list_job 20130916125524463507
salt-run jobs.list_job 20130916125524463507 --out=pprint
```

`salt.runners.jobs.list_jobs(ext_source=None, outputter=None, search_metadata=None, search_function=None, search_target=None, start_time=None, end_time=None, display_progress=False)`

List all detectable jobs and associated functions

`ext_source` If provided, specifies which external job cache to use.

FILTER OPTIONS

Note: If more than one of the below options are used, only jobs which match *all* of the filters will be returned.

`search_metadata` Specify a dictionary to match to the job's metadata. If any of the key-value pairs in this dictionary match, the job will be returned. Example:

```
salt-run jobs.list_jobs search_metadata='{ "foo": "bar", "baz": "qux" }'
```

`search_function` Can be passed as a string or a list. Returns jobs which match the specified function. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_function='test.*'
salt-run jobs.list_jobs search_function=['test.*', 'pkg.install']
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_function='test.*,pkg.install'
```

`search_target` Can be passed as a string or a list. Returns jobs which match the specified minion name. Globbing is allowed. Example:

```
salt-run jobs.list_jobs search_target='*.mydomain.tld'
salt-run jobs.list_jobs search_target=['db*', "myminion"]
```

Changed in version 2015.8.8: Multiple targets can now also be passed as a comma-separated list. For example:

```
salt-run jobs.list_jobs search_target='db*,myminion'
```

`start_time` Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started after this timestamp.

`end_time` Accepts any timestamp supported by the `dateutil` Python module (if this module is not installed, this argument will be ignored). Returns jobs which started before this timestamp.

CLI Example:

```
salt-run jobs.list_jobs
salt-run jobs.list_jobs search_function='test.*' search_target='localhost' search_
↳metadata='{"bar": "foo"}'
salt-run jobs.list_jobs start_time='2015, Mar 16 19:00' end_time='2015, Mar 18
↳22:00'
```

salt.runners.jobs.list_jobs_filter(*count*, *filter_find_job=True*, *ext_source=None*, *output-ter=None*, *display_progress=False*)

List all detectable jobs and associated functions

ext_source The external job cache to use. Default: *None*.

CLI Example:

```
salt-run jobs.list_jobs_filter 50
salt-run jobs.list_jobs_filter 100 filter_find_job=False
```

salt.runners.jobs.lookup_jid(*jid*, *ext_source=None*, *returned=True*, *missing=False*, *display_progress=False*)

Return the printout from a previously executed job

jid The jid to look up.

ext_source The external job cache to use. Default: *None*.

returned [True] If True, include the minions that did return from the command.

New in version 2015.8.0.

missing [False] If True, include the minions that did *not* return from the command.

display_progress [False] If True, fire progress events.

New in version 2015.5.0.

CLI Example:

```
salt-run jobs.lookup_jid 20130916125524463507
salt-run jobs.lookup_jid 20130916125524463507 --out=highstate
```

salt.runners.jobs.print_job(*jid*, *ext_source=None*)

Print a specific job's detail given by it's jid, including the return data.

CLI Example:

```
salt-run jobs.print_job 20130916125524463507
```

20.16.17 salt.runners.launchd

Manage launchd plist files

salt.runners.launchd.write_launchd_plist(*program*)

Write a launchd plist for managing salt-master or salt-minion

CLI Example:

```
salt-run launchd.write_launchd_plist salt-master
```

20.16.18 salt.runners.lxc

Control Linux Containers via Salt

depends lxc execution module

salt.runners.lxc.cloud_init(*names, host=None, quiet=False, **kwargs*)

Wrapper for using lxc.init in saltcloud compatibility mode

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion to start the container on. Required.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead

salt.runners.lxc.find_guest(*name, quiet=False, path=None*)

Returns the host for a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.find_guest name
```

salt.runners.lxc.find_guests(*names, path=None*)

Return a dict of hosts and named guests

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

salt.runners.lxc.freeze(*name, quiet=False, path=None*)

Freeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.freeze name
```

salt.runners.lxc.info(*name, quiet=False, path=None*)

Returns information about a container.

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.info name
```

salt.runners.lxc.init(*names, host=None, saltcloud_mode=False, quiet=False, **kwargs*)

Initialize a new container

```
salt-run lxc.init name host=minion_id [cpuset=cgroups_cpuset] \
  [cpushare=cgroups_cpushare] [memory=cgroups_memory] \
  [template=lxc_template_name] [clone=original name] \
  [profile=lxc_profile] [network_profile=network_profile] \
  [nic=network_profile] [nic_opts=nic_opts] \
  [start=(true|false)] [seed=(true|false)] \
  [install=(true|false)] [config=minion_config] \
  [snapshot=(true|false)]
```

names Name of the containers, supports a single name or a comma delimited list of names.

host Minion on which to initialize the container (**required**)

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

saltcloud_mode init the container with the saltcloud opts format instead See lxc.init_interface module documentation

cpuset cgroups cpuset.
cpushare cgroups cpu shares.
memory cgroups memory limit, in MB

Changed in version 2015.5.0: If no value is passed, no limit is set. In earlier Salt versions, not passing this value causes a 1024MB memory limit to be set, and it was necessary to pass `memory=0` to set no limit.

template Name of LXC template on which to base this container
clone Clone this container from an existing container
profile A LXC profile (defined in config or pillar).
network_profile Network profile to use for the container

New in version 2015.5.2.

nic Deprecated since version 2015.5.0: Use `network_profile` instead

nic_opts Extra options for network interfaces. E.g.:

```
{"eth0": {"mac": "aa:bb:cc:dd:ee:ff", "ipv4": "10.1.1.1", "ipv6":
"2001:db8::ff00:42:8329"}}
```

start Start the newly created container.
seed Seed the container with the minion config and autosign its key. Default: true
install If salt-minion is not already installed, install it. Default: true
config Optional config parameters. By default, the id is set to the name of the container.

`salt.runners.lxc.list_` (*host=None, quiet=False, path=None*)
 List defined containers (running, stopped, and frozen) for the named (or all) host(s).
path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.list [host=minion_id]
```

`salt.runners.lxc.purge` (*name, delete_key=True, quiet=False, path=None*)
 Purge the named container and delete its minion key if present. WARNING: Destroys all data associated with the container.
path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.purge name
```

`salt.runners.lxc.start` (*name, quiet=False, path=None*)
 Start the named container.
path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.start name
```

`salt.runners.lxc.stop` (*name, quiet=False, path=None*)
 Stop the named container.
path path to the container parent default: `/var/lib/lxc` (system default)

New in version 2015.8.0.

```
salt-run lxc.stop name
```

`salt.runners.lxc.unfreeze` (*name, quiet=False, path=None*)
 Unfreeze the named container

path path to the container parent default: /var/lib/lxc (system default)

New in version 2015.8.0.

```
salt-run lxc.unfreeze name
```

20.16.19 salt.runners.manage

General management functions for salt, tools like seeing what hosts are up and what hosts are down

salt.runners.manage.alived (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.alived
```

salt.runners.manage.allowed (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.allowed
```

salt.runners.manage.bootstrap (*version='develop', script=None, hosts="", script_args="", roster='flat', ssh_user=None, ssh_password=None, ssh_priv_key=None, tmp_dir='/tmp/.bootstrap', http_backend='tornado'*)

Bootstrap minions with salt-bootstrap

version [develop] Git tag of version to install

script [<https://bootstrap.saltstack.com>] URL containing the script to execute

hosts Comma-separated hosts [example: hosts='host1.local,host2.local']. These hosts need to exist in the specified roster.

script_args Any additional arguments that you want to pass to the script.

New in version 2016.11.0.

roster [flat] The roster to use for Salt SSH. More information about roster files can be found in [Salt's Roster Documentation](#).

A full list of roster types, see the [builtin roster modules](#) documentation.

New in version 2016.11.0.

ssh_user If `user` isn't found in the roster, a default SSH user can be set here. Keep in mind that `ssh_user` will not override the roster `user` value if it is already defined.

New in version 2016.11.0.

ssh_password If `passwd` isn't found in the roster, a default SSH password can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

ssh_privkey If `priv` isn't found in the roster, a default SSH private key can be set here. Keep in mind that `ssh_password` will not override the roster `passwd` value if it is already defined.

New in version 2016.11.0.

tmp_dir [/tmp/bootstrap] The temporary directory to download the bootstrap script in. This directory will have `-<uuid4>` appended to it. For example: `/tmp/bootstrap-a19a728e-d40a-4801-aba9-d00655c143a7/`

New in version 2016.11.0.

http_backend [tornado] The backend library to use to download the script. If you need to use a `file:///` URL, then you should set this to `urllib2`.

New in version 2016.11.0.

CLI Example:

```
salt-run manage.bootstrap hosts='host1,host2'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17'
salt-run manage.bootstrap hosts='host1,host2' version='v0.17' script=
↳ 'https://bootstrap.saltstack.com/develop'
```

salt.runners.manage.bootstrap_psexec (*hosts=""*, *master=None*, *version=None*, *arch='win32'*, *installer_url=None*, *username=None*, *password=None*)

Bootstrap Windows minions via PsExec.

hosts Comma separated list of hosts to deploy the Windows Salt minion.

master Address of the Salt master passed as an argument to the installer.

version Point release of installer to download. Defaults to the most recent.

arch Architecture of installer to download. Defaults to win32.

installer_url URL of minion installer executable. Defaults to the latest version from <https://repo.saltstack.com/windows/>

username Optional user name for login on remote computer.

password Password for optional username. If omitted, PsExec will prompt for one to be entered for each host.

CLI Example:

```
salt-run manage.bootstrap_psexec hosts='host1,host2'
salt-run manage.bootstrap_psexec hosts='host1,host2' version='0.17' username=
↳ 'DOMAIN\Administrator'
salt-run manage.bootstrap_psexec hosts='host1,host2' installer_url='http://
↳ exampledomain/salt-installer.exe'
```

salt.runners.manage.down (*removekeys=False*, *tgt=""*, *tgt_type='glob'*, *expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all the down or unresponsive salt minions Optionally remove keys of down minions

CLI Example:

```
salt-run manage.down
salt-run manage.down removekeys=True
salt-run manage.down tgt="webservers" tgt_type="nodegroup"
```

salt.runners.manage.get_stats (*estate=None*, *stack='road'*)

Print the stack stats

estate [None] The name of the target estate. Master stats would be requested by default

stack ['road'] Show stats on either road or lane stack Allowed values are 'road' or 'lane'.

CLI Example:

```
salt-run manage.get_stats [estate=alpha_minion] [stack=lane]
```

`salt.runners.manage.joined` (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.joined
```

`salt.runners.manage.key_regen` ()

This routine is used to regenerate all keys in an environment. This is invasive! ALL KEYS IN THE SALT ENVIRONMENT WILL BE REGENERATED!!

The `key_regen` routine sends a command out to minions to revoke the master key and remove all minion keys, it then removes all keys from the master and prompts the user to restart the master. The minions will all reconnect and keys will be placed in pending.

After the master is restarted and minion keys are in the pending directory execute a `salt-key -A` command to accept the regenerated minion keys.

The master *must* be restarted within 60 seconds of running this command or the minions will think there is something wrong with the keys and abort.

Only Execute this runner after upgrading minions and master to 0.15.1 or higher!

CLI Example:

```
salt-run manage.key_regen
```

`salt.runners.manage.lane_stats` (*estate=None*)

Print the estate manor lane stack stats

estate [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.lane_stats [estate=alpha_minion]
```

`salt.runners.manage.list_not_state` (*subset=None, show_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.

CLI Example:

```
salt-run manage.list_not_state
```

`salt.runners.manage.list_state` (*subset=None, show_ipv4=False, state=None*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.
state ['available'] Show minions being in specific state that is one of 'available', 'joined', 'allowed', 'alived' or 'reaped'.

CLI Example:

```
salt-run manage.list_state
```

salt.runners.manage.not_alived(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_alived
```

salt.runners.manage.not_allowed(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_allowed
```

salt.runners.manage.not_joined(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_joined
```

salt.runners.manage.not_present(*subset=None, show_ipv4=False*)

New in version 2015.5.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_present
```

salt.runners.manage.not_reaped(*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are NOT up according to Salt's presence detection (no commands will be sent)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.not_reaped
```

`salt.runners.manage.present` (*subset=None, show_ipv4=False*)

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.present
```

`salt.runners.manage.reaped` (*subset=None, show_ipv4=False*)

New in version 2015.8.0.

Print a list of all minions that are up according to Salt's presence detection (no commands will be sent to minions)

subset [None] Pass in a CIDR range to filter minions by IP address.

show_ipv4 [False] Also show the IP address each minion is connecting from.

CLI Example:

```
salt-run manage.reaped
```

`salt.runners.manage.road_stats` (*estate=None*)

Print the estate road stack stats

estate [None] The name of the target estate. Master stats would be requested by default

CLI Example:

```
salt-run manage.road_stats [estate=alpha_minion]
```

`salt.runners.manage.safe_accept` (*target, tgt_type='glob', expr_form=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Accept a minion's public key after checking the fingerprint over salt-ssh

CLI Example:

```
salt-run manage.safe_accept my_minion
salt-run manage.safe_accept minion1,minion2 tgt_type=list
```

`salt.runners.manage.status` (*output=True, tgt='*', tgt_type='glob', expr_form=None, timeout=None, gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print the status of all known salt minions

CLI Example:

```
salt-run manage.status
salt-run manage.status tgt="webservers" tgt_type="nodegroup"
salt-run manage.status timeout=5 gather_job_timeout=10
```

`salt.runners.manage.up` (*tgt='*', tgt_type='glob', expr_form=None, timeout=None, gather_job_timeout=None*)

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Print a list of all of the minions that are up

CLI Example:

```
salt-run manage.up
salt-run manage.up tgt="webservers" tgt_type="nodegroup"
salt-run manage.up timeout=5 gather_job_timeout=10
```

`salt.runners.manage.versions()`

Check the version of active minions

CLI Example:

```
salt-run manage.versions
```

20.16.20 salt.runners.mattermost

Note for 2017.7 releases!

Due to the `salt.runners.config` module not being available in this release series, importing the `salt.runners.config` module from the develop branch is required to make this module work.

Ref: [Mattermost runner failing to retrieve config values due to unavailable config runner #43479](#)

Module for sending messages to Mattermost

New in version 2017.7.0.

configuration This module can be used by either passing an `api_url` and `hook` directly or by specifying both in a configuration profile in the salt master/minion config. For example:

```
mattermost:
  hook: peWcBiMOS9HrZG15peWcBiMOS9HrZG15
  api_url: https://example.com
```

`salt.runners.mattermost.post_event(event, channel=None, username=None, api_url=None, hook=None)`

Send an event to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param event: The event to send to the Mattermost channel. :param api_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

`salt.runners.mattermost.post_message(message, channel=None, username=None, api_url=None, hook=None)`

Send a message to a Mattermost channel. :param channel: The channel name, either will work. :param username: The username of the poster. :param message: The message to send to the Mattermost channel. :param api_url: The Mattermost api url, if not specified in the configuration. :param hook: The Mattermost hook, if not specified in the configuration. :return: Boolean if message was sent successfully.

CLI Example:

```
salt-run mattermost.post_message message='Build is done'
```

20.16.21 salt.runners.mine

A runner to access data from the salt mine

`salt.runners.mine.get(tgt, fun, tgt_type='glob')`

Gathers the data from the specified minions' mine, pass in the target, function to look up and the target type

CLI Example:

```
salt-run mine.get '*' network.interfaces
```

`salt.runners.mine.update` (*tgt*, *tgt_type*='glob', *clear*=False, *mine_functions*=None)

New in version 2017.7.0.

Update the mine data on a certain group of minions.

tgt Which minions to target for the execution.

tgt_type: **glob** The type of *tgt*.

clear: **False** Boolean flag specifying whether updating will clear the existing mines, or will update. Default: False (update).

mine_functions Update the mine data on certain functions only. This feature can be used when updating the mine for functions that require refresh at different intervals than the rest of the functions specified under *mine_functions* in the minion/master config or pillar.

CLI Example:

```
salt-run mine.update '*'
salt-run mine.update 'juniper-edges' tgt_type='nodegroup'
```

20.16.22 salt.runners.nacl

This module helps include encrypted passwords in pillars, grains and salt state files.

depends libnacl, <https://github.com/saltstack/libnacl>

This is often useful if you wish to store your pillars in source control or share your pillar data with others that you trust. I don't advise making your pillars public regardless if they are encrypted or not.

configuration The following configuration defaults can be define (pillar or config files) Avoid storing private keys in pillars! Ensure master does not have *pillar_opts=True*:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  # NOTE: `key` and `key_file` have been renamed to `sk`, `sk_file`
  # also `box_type` default changed from secretbox to sealedbox.
  box_type: sealedbox                (default)
  sk_file: /etc/salt/pki/master/nacl  (default)
  pk_file: /etc/salt/pki/master/nacl.pub (default)
  sk: None
  pk: None
```

Usage can override the config defaults:

```
salt-run nacl.enc sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/
↳pki/master/nacl.pub
```

The nacl lib uses 32byte keys, these keys are base64 encoded to make your life more simple. To generate your *sk_file* and *pk_file* use:

```
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
# or if you want to work without files.
salt-run nacl.keygen
local:
-----
pk:
    /kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
```

(continues on next page)

(continued from previous page)

```
sk:
SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow=
```

Now with your keypair, you can encrypt data:

You have two options, *sealedbox* or *secretbox*.

SecretBox is data encrypted using private key *pk*. Sealedbox is encrypted using public key *pk*.

Recommend using Sealedbox because the one way encryption permits developers to encrypt data for source control but not decrypt. Sealedbox only has one key that is for both encryption and decryption.

```
salt-run nacl.enc asecretpass pk=/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0=
tqXzeIJnTAM9Xf0mdLcpEdkLmbfBGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/+cYsk6m5WhGdk58=
```

To decrypt the data:

```
salt-run nacl.dec data=
↪ 'tqXzeIJnTAM9Xf0mdLcpEdkLmbfBGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/+cYsk6m5WhGdk58=' ❌
↪      sk='SVWut5SqNpuPeNzb1b9y6b2eXg2PLIog43GBzp48Sow='
```

When the keys are defined in the master config you can use them from the nacl runner without extra parameters:

```
# cat /etc/salt/master.d/nacl.conf
nacl.config:
  sk_file: /etc/salt/pki/master/nacl
  pk: 'cTIqXwnUiD1uIlg4kXsbeCE7/NoeKEzd4nLeYcCFpd9k='
```

```
salt-run nacl.enc 'asecretpass'
salt-run nacl.dec 'tqXzeIJnTAM9Xf0mdLcpEdkLmbfBGPj2oTKmlgrm3S1DTVHNNh9h8mU1GKllGq/
↪+cYsk6m5WhGdk58='
```

```
# a salt developers minion could have pillar data that includes a nacl public key
nacl.config:
  pk: '/kfGX7PbWeu099702PBbKWLpG/9p06IQRswkdWHCDk0='
```

The developer can then use a less-secure system to encrypt data.

```
salt-run nacl.enc apassword
```

Pillar files can include protected data that the salt master decrypts:

```
pillarexample:
  user: root
  password1: {{salt.nacl.dec('DRB7Q6/X5gGSRCTpZyxS6h1bWj0llUA+uaVyvou3vJ4=')}|json}}
  cert_key: {{salt.nacl.dec_file('/srv/salt/certs/example.com/key.nacl')}|json}}
  cert_key2: {{salt.nacl.dec_file('salt:///certs/example.com/key.nacl')}|json}}
```

Larger files like certificates can be encrypted with:

```
salt-run nacl.enc_file /tmp/cert.crt out=/tmp/cert.nacl
```

`salt.runners.nacl.dec(data, **kwargs)`

Alias to `{box_type}_decrypt`

`box_type`: secretbox, sealedbox(default)

`salt.runners.nacl.dec_file`(*name*, *out=None*, ***kwargs*)

This is a helper function to decrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.dec_file name=/tmp/id_rsa.nacl
salt-run nacl.dec_file name=/tmp/id_rsa.nacl box_type=secretbox sk_
↪file=/etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.enc`(*data*, ***kwargs*)

Alias to `{box_type}_encrypt`

box_type: secretbox, sealedbox(default)

`salt.runners.nacl.enc_file`(*name*, *out=None*, ***kwargs*)

This is a helper function to encrypt a file and return its contents.

You can provide an optional output file using *out*

name can be a local file or when not using *salt-run* can be a url like *salt://*, *https://* etc.

CLI Examples:

```
salt-run nacl.enc_file name=/tmp/id_rsa
salt-run nacl.enc_file name=/tmp/id_rsa box_type=secretbox sk_file=/
↪etc/salt/pki/master/nacl.pub
```

`salt.runners.nacl.keygen`(*sk_file=None*, *pk_file=None*, ***kwargs*)

Use libnacl to generate a keypair.

If no *sk_file* is defined return a keypair.

If only the *sk_file* is defined *pk_file* will use the same name with a postfix *.pub*.

When the *sk_file* is already existing, but *pk_file* is not. The *pk_file* will be generated using the *sk_file*.

CLI Examples:

```
salt-run nacl.keygen
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl
salt-run nacl.keygen sk_file=/etc/salt/pki/master/nacl pk_file=/etc/salt/pki/
↪master/nacl.pub
salt-run nacl.keygen
```

`salt.runners.nacl.sealedbox_decrypt`(*data*, ***kwargs*)

Decrypt data using a secret key that was encrypted using a public key with `nacl.sealedbox_encrypt`.

CLI Examples:

```
salt-run nacl.sealedbox_decrypt pEXHQm6cuaF7A=
salt-run nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk_file=/etc/salt/pki/
↪master/nacl
salt-run nacl.sealedbox_decrypt data='pEXHQm6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.sealedbox_encrypt`(*data*, ***kwargs*)

Encrypt data using a public key generated from `nacl.keygen`. The encrypted data can be decrypted using `nacl.sealedbox_decrypt` only with the secret key.

CLI Examples:

```
salt-run nacl.sealedbox_encrypt datatoenc
```

`salt.runners.nacl.secretbox_decrypt`(*data*, ***kwargs*)

Decrypt data that was encrypted using `nacl.secretbox_encrypt` using the secret key that was generated from `nacl.keygen`.

CLI Examples:

```
salt-run nacl.secretbox_decrypt pEXHQM6cuaF7A=
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk_file=/etc/salt/pki/
↳master/nacl
salt-run nacl.secretbox_decrypt data='pEXHQM6cuaF7A=' sk='YmFkcGFzcwo='
```

`salt.runners.nacl.secretbox_encrypt`(*data*, ***kwargs*)

Encrypt data using a secret key generated from `nacl.keygen`. The same secret key can be used to decrypt the data using `nacl.secretbox_decrypt`.

CLI Examples:

```
salt-run nacl.secretbox_encrypt datatoenc
salt-run nacl.secretbox_encrypt datatoenc sk_file=/etc/salt/pki/master/nacl
salt-run nacl.secretbox_encrypt datatoenc sk='YmFkcGFzcwo='
```

20.16.23 salt.runners.net

NET Finder

New in version 2017.7.0.

A runner to find network details easily and fast. It's smart enough to know what you are looking for.

Configuration

- Minion (proxy) config

To have the complete features, one needs to add the following mine configuration in the minion (proxy) config file:

```
mine_functions:
  net.ipaddr: []
  net.lldp: []
  net.mac: []
  net.arp: []
  net.interfaces: []
```

Which instructs Salt to cache the data returned by the NAPALM-functions. While they are not mandatory, the less functions configured, the less details will be found by the runner.

How often the mines are refreshed, can be specified using:

```
mine_interval: <X minutes>
```

- Master config

By default the following options can be configured on the master. They are not necessary, but available in case the user has different requirements.

target: ***** From what minions will collect the mine data. Default: ***** (collect from all minions).

expr_form: **glob** Minion matching expression form. Default: **glob**.

ignore_interfaces A list of interfaces name to ignore. By default will consider all interfaces.

display: **True** Display on the screen or return structured object? Default: **True** (return on the CLI).

outputter: **table** Specify the outputter name when displaying on the CLI. Default: **table**.

Configuration example:

```
runners:
  net.find:
    target: 'edge*'
    expr_form: 'glob'
    ignore_interfaces:
      - lo0
      - em1
      - jsrv
      - fxp0
    outputter: yaml
```

`salt.runners.net.find(addr, best=True, display=True)`

Search in all possible entities (Interfaces, MAC tables, ARP tables, LLDP neighbors), using the following mine functions:

- net.mac
- net.arp
- net.lldp
- net.ipaddrs
- net.interfaces

This function has the advantage that it knows where to look, but the output might become quite long as returns all possible matches.

Optional arguments:

best: **True** Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

display: **True** Display on the screen or return structured object? Default: **True** (return on the CLI).

CLI Example:

```
$ sudo salt-run net.find 10.10.10.7
```

Output Example:

```
Details for all interfaces that include network 10.10.10.7/32 - only best match
↳ returned
-----
↳ -----
| Device | Interface | Interface Description | UP | Enabled | Speed
↳ [Mbps] | MAC Address | IP Addresses |
-----
↳ -----
| edge01.flw01 | irb | | True | True | -1
↳ | 5C:5E:AB:AC:52:B4 | 10.10.10.1/22 |
-----
↳ -----
ARP Entries for IP 10.10.10.7
```

(continues on next page)

(continued from previous page)

Device	Interface	MAC	IP	Age
edge01.flw01	irb.349 [ae0.349]	2C:60:0C:2A:4C:0A	10.10.10.7	832.0

`salt.runners.net.findarp` (*device=None, interface=None, mac=None, ip=None, display=True*)

Search for entries in the ARP tables using the following mine functions:

- net.arp

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

mac Search using a specific MAC Address.

ip Search using a specific IP Address.

display: True Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findarp mac=8C:60:0F:78:EC:41
```

Output Example:

ARP Entries for MAC 8C:60:0F:78:EC:41

Device	Interface	MAC	IP	Age
edge01.bjm01	irb.171 [ae0.171]	8C:60:0F:78:EC:41	172.172.17.19	956.0

`salt.runners.net.findmac` (*device=None, mac=None, interface=None, vlan=None, display=True*)

Search in the MAC Address tables, using the following mine functions:

- net.mac

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

mac Search using a specific MAC Address.

vlan Search using a VLAN ID.

display: True Display on the screen or return structured object? Default: True, will return on the CLI.

CLI Example:

```
$ sudo salt-run net.findmac mac=8C:60:0F:78:EC:41
```

Output Example:

MAC Address(es)

Device	Interface	MAC	VLAN	Static	Active	Moves	
edge01.bjm01	ae0.171	8C:60:0F:78:EC:41	171	False	True	0	☒

`salt.runners.net.interfaces` (*device=None, interface=None, title=None, pattern=None, ipnet=None, best=True, display=True*)

Search for interfaces details in the following mine functions:

- `net.interfaces`
- `net.ipaddr`

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return interfaces that contain a certain pattern in their description.

ipnet Return interfaces whose IP networks associated include this IP network.

best: True When `ipnet` is specified, this argument says if the runner should return only the best match (the output will contain at most one row). Default: `True` (return only the best match).

display: True Display on the screen or return structured object? Default: `True` (return on the CLI).

title Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.interfaces interface=vt-0/0/10
```

Output Example:

```
Details for interface xe-0/0/0
```

Device	Interface	Interface Description	UP	Enabled	Speed
[Mbps]	MAC Address	IP Addresses			
edge01.bjm01	vt-0/0/10		True	True	1000
edge01.flw01	vt-0/0/10		True	True	1000
edge01.pos01	vt-0/0/10		True	True	1000
edge01.oua01	vt-0/0/10		True	True	1000

`salt.runners.net.lldp` (*device=None, interface=None, title=None, pattern=None, chassis=None, display=True*)

Search in the LLDP neighbors, using the following mine functions:

- `net.lldp`

Optional arguments:

device Return interface data from a certain device only.

interface Return data selecting by interface name.

pattern Return LLDP neighbors that have contain this pattern in one of the following fields:

- Remote Port ID
- Remote Port Description
- Remote System Name
- Remote System Description

chassis Search using a specific Chassis ID.

display: True Display on the screen or return structured object? Default: True (return on the CLI).

display: True Display on the screen or return structured object? Default: True (return on the CLI).

title Display a custom title for the table.

CLI Example:

```
$ sudo salt-run net.lldp pattern=Ethernet1/48
```

Output Example:

```
Pattern "Ethernet1/48" found in one of the following LLDP details

`salt.runners.net.multi_find(*patterns, **kwargs)`

Execute multiple search tasks. This function is based on the `find` function. Depending on the search items, some information might overlap.

Optional arguments:

best: True Return only the best match with the interfaces IP networks when the searching pattern is a valid IP Address or Network.

display: True Display on the screen or return structured object? Default: `True` (return on the CLI).

CLI Example:

```
$ sudo salt-run net.multi_find Ethernet1/49 xe-0/1/2
```

Output Example:

```

20.16.24 salt.runners.network

Network tools to run from the Master

salt.runners.network.wol(*mac*, *bcast*='255.255.255.255', *destport*=9)

Send a "Magic Packet" to wake up a Minion

CLI Example:

```
salt-run network.wol 08-00-27-13-69-77
salt-run network.wol 080027136977 255.255.255.255 7
salt-run network.wol 08:00:27:13:69:77 255.255.255.255 7
```

salt.runners.network.wolllist(*maclist*, *bcast*='255.255.255.255', *destport*=9)

Send a "Magic Packet" to wake up a list of Minions. This list must contain one MAC hardware address per line

CLI Example:

```
salt-run network.wolllist '/path/to/maclist'
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
salt-run network.wolllist '/path/to/maclist' 255.255.255.255 7
```

salt.runners.network.wolmatch(*tgt*, *tgt_type*='glob', *bcast*='255.255.255.255', *destport*=9)

Send a "Magic Packet" to wake up Minions that are matched in the grains cache

CLI Example:

```
salt-run network.wolmatch minion_id
salt-run network.wolmatch 192.168.0.0/16 tgt_type='ipcidr' bcast=255.255.255.255
↪destport=7
```

20.16.25 salt.runners.pagerduty

Runner Module for Firing Events via PagerDuty

New in version 2014.1.0.

configuration This module can be used by specifying the name of a configuration profile in the master config.

For example:

```

my-pagerduty-account:
  pagerduty.api_key: F3Rbyjbve43rfFWf2214
  pagerduty.subdomain: mysubdomain

```

`salt.runners.pagerduty.create_event` (*service_key=None, description=None, details=None, incident_key=None, profile=None*)

Create an event in PagerDuty. Designed for use in states.

CLI Example:

```

salt-run pagerduty.create_event <service_key> <description> <details>
↳profile=my-pagerduty-account

```

The following parameters are required:

service_key This key can be found by using `pagerduty.list_services`.

description This is a short description of the event.

details This can be a more detailed description of the event.

profile This refers to the configuration profile to use to connect to the PagerDuty service.

`salt.runners.pagerduty.list_escalation_policies` (*profile=None, api_key=None*)

This function is an alias of `list_policies`.

List escalation policies belonging to this account

CLI Example:

```

salt-run pagerduty.list_policies my-pagerduty-account salt-run pager-
duty.list_escalation_policies my-pagerduty-account

```

`salt.runners.pagerduty.list_incidents` (*profile=None, api_key=None*)

List incidents belonging to this account

CLI Example:

```

salt-run pagerduty.list_incidents my-pagerduty-account

```

`salt.runners.pagerduty.list_maintenance_windows` (*profile=None, api_key=None*)

This function is an alias of `list_windows`.

List maintenance windows belonging to this account

CLI Example:

```

salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account

```

`salt.runners.pagerduty.list_policies` (*profile=None, api_key=None*)

List escalation policies belonging to this account

CLI Example:

```

salt-run pagerduty.list_policies my-pagerduty-account salt-run pagerduty.list_escalation_policies
my-pagerduty-account

```

`salt.runners.pagerduty.list_schedules` (*profile=None, api_key=None*)

List schedules belonging to this account

CLI Example:

```

salt-run pagerduty.list_schedules my-pagerduty-account

```

`salt.runners.pagerduty.list_services` (*profile=None, api_key=None*)

List services belonging to this account

CLI Example:

```

salt-run pagerduty.list_services my-pagerduty-account

```

`salt.runners.pagerduty.list_users` (*profile=None, api_key=None*)
List users belonging to this account

CLI Example:

```
salt-run pagerduty.list_users my-pagerduty-account
```

`salt.runners.pagerduty.list_windows` (*profile=None, api_key=None*)
List maintenance windows belonging to this account

CLI Example:

```
salt-run pagerduty.list_windows my-pagerduty-account salt-run pager-
duty.list_maintenance_windows my-pagerduty-account
```

20.16.26 salt.runners.pillar

Functions to interact with the pillar compiler on the master

`salt.runners.pillar.show_pillar` (*minion='*', **kwargs*)

Returns the compiled pillar either of a specific minion or just the global available pillars. This function assumes that no minion has the id *. Function also accepts pillarenv as attribute in order to limit to a specific pillar branch of git

CLI Example:

shows minion specific pillar:

```
salt-run pillar.show_pillar 'www.example.com'
```

shows global pillar:

```
salt-run pillar.show_pillar
```

shows global pillar for 'dev' pillar environment: (note that not specifying pillarenv will merge all pillar environments using the master config option `pillar_source_merging_strategy`.)

```
salt-run pillar.show_pillar 'pillarenv=dev'
```

shows global pillar for 'dev' pillar environment and specific pillarenv = dev:

```
salt-run pillar.show_pillar 'saltenv=dev' 'pillarenv=dev'
```

API Example:

```
import salt.config
import salt.runner
opts = salt.config.master_config('/etc/salt/master')
runner = salt.runner.RunnerClient(opts)
pillar = runner.cmd('pillar.show_pillar', [])
print(pillar)
```

`salt.runners.pillar.show_top` (*minion=None, saltenv='base'*)

Returns the compiled top data for pillar for a specific minion. If no minion is specified, we use the first minion we find.

CLI Example:

```
salt-run pillar.show_top
```

20.16.27 salt.runners.pkg

Package helper functions using `salt.modules.pkg`

New in version 2015.8.0.

`salt.runners.pkg.list_upgrades(jid, style='group', outputter='nested', ext_source=None)`

Show list of available pkg upgrades using a specified format style

CLI Example:

```
salt-run pkg.list_upgrades jid=20141120114114417719 style=group
```

20.16.28 salt.runners.queue

General management and processing of queues.

This runner facilitates interacting with various queue backends such as the included `sqlite3` queue or the planned `AWS SQS` and `Redis` queues

The queue functions such as `insert`, `delete`, and `pop` can be used for typical management of the queue.

The `process_queue` function pops the requested number of items from the queue and creates a Salt Event that can then be processed by a Reactor. The `process_queue` function can be called manually, or can be configured to run on a schedule with the Salt Scheduler or regular system cron. It is also possible to use the peer system to allow a minion to call the runner.

This runner, as well as the Queues system, is not api stable at this time.

There are many things that could potentially be done with queues within Salt. For the time being the focus will be on queueing infrastructure actions on specific minions. The queues generally will be populated with minion IDs. When the `process_queue` runner function is called events are created on the Salt Event bus that indicate the queue and a list of one or more minion IDs. The reactor is set up to match on event tags for a specific queue and then take infrastructure actions on those minion IDs. These actions might be to delete the minion's key from the master, use `salt-cloud` to destroy the vm, or some other custom action.

Queued runners

Using the Salt Queues, references to the commandline arguments of other runners can be saved to be processed later. The queue runners require a queue backend that can store json data (default: `pgjsonb`).

Once the queue is setup, the `runner_queue` will need to be configured.

```
runner_queue:  
  queue: runners  
  backend: pgjsonb
```

Note: only the queue is required, this defaults to using `pgjsonb`

Once this is set, then the following can be added to the scheduler on the master and it will run the specified amount of commands per time period.

```

schedule:
  runner queue:
    schedule:
      function: queue.process_runner
      minutes: 1
      kwargs:
        quantity: 2

```

The above configuration will pop 2 runner jobs off the runner queue, and then run them. And it will do this every minute, unless there are any jobs that are still running from the last time the process_runner task was executed.

`salt.runners.queue.delete` (*queue, items, backend='sqlite'*)

Delete an item or items from a queue

CLI Example:

```

salt-run queue.delete myqueue myitem
salt-run queue.delete myqueue myitem backend=sqlite
salt-run queue.delete myqueue ["item1', 'item2', 'item3']"

```

`salt.runners.queue.insert` (*queue, items, backend='sqlite'*)

Add an item or items to a queue

CLI Example:

```

salt-run queue.insert myqueue myitem
salt-run queue.insert myqueue ["item1', 'item2', 'item3']"
salt-run queue.insert myqueue myitem backend=sqlite
salt-run queue.insert myqueue ["item1', 'item2', 'item3']" backend=sqlite

```

`salt.runners.queue.insert_runner` (*fun, args=None, kwargs=None, queue=None, backend=None*)

Insert a reference to a runner into the queue so that it can be run later.

fun The runner function that is going to be run

args list or comma-separated string of args to send to fun

kwargs dictionary of keyword arguments to send to fun

queue queue to insert the runner reference into

backend backend that to use for the queue

CLI Example:

```

salt-run queue.insert_runner test.stdout_print
salt-run queue.insert_runner event.send test_insert_runner kwargs='{"data": {"foo
↪": "bar"}}}'

```

`salt.runners.queue.list_items` (*queue, backend='sqlite'*)

List contents of a queue

CLI Example:

```

salt-run queue.list_items myqueue
salt-run queue.list_items myqueue backend=sqlite

```

`salt.runners.queue.list_length` (*queue, backend='sqlite'*)

Provide the number of items in a queue

CLI Example:

```

salt-run queue.list_length myqueue
salt-run queue.list_length myqueue backend=sqlite

```

`salt.runners.queue.list_queues` (*backend='sqlite'*)

Return a list of Salt Queues on the backend

CLI Example:

```
salt-run queue.list_queues
salt-run queue.list_queues backend=sqlite
```

`salt.runners.queue.pop` (*queue, quantity=1, backend='sqlite', is_runner=False*)

Pop one or more or all items from a queue

CLI Example:

```
salt-run queue.pop myqueue
salt-run queue.pop myqueue 6
salt-run queue.pop myqueue all
salt-run queue.pop myqueue 6 backend=sqlite
salt-run queue.pop myqueue all backend=sqlite
```

`salt.runners.queue.process_queue` (*queue, quantity=1, backend='sqlite', is_runner=False*)

Pop items off a queue and create an event on the Salt event bus to be processed by a Reactor.

CLI Example:

```
salt-run queue.process_queue myqueue
salt-run queue.process_queue myqueue 6
salt-run queue.process_queue myqueue all backend=sqlite
```

`salt.runners.queue.process_runner` (*quantity=1, queue=None, backend=None*)

Process queued runners

quantity number of runners to process

queue queue to insert the runner reference into

backend backend that to use for the queue

CLI Example:

```
salt-run queue.process_runner
salt-run queue.process_runner 5
```

20.16.29 salt.runners.reactor

A convenience system to manage reactors

Beginning in the 2017.7 release, the reactor runner requires that the reactor system is running. This is accomplished one of two ways, either by having reactors configured or by including `reactor` in the engine configuration for the Salt master.

```
engines:
```

- reactor

`salt.runners.reactor.add` (*event, reactors, saltenv='base', test=None*)

Add a new reactor

CLI Example:

```
salt-run reactor.add 'salt/cloud/*/destroyed' reactors='/srv/reactor/destroy/*.sls
↳'
```

`salt.runners.reactor.delete` (*event*, *saltenv*='base', *test*=None)

Delete a reactor

CLI Example:

```
salt-run reactor.delete 'salt/cloud/*/destroyed'
```

`salt.runners.reactor.list_` (*saltenv*='base', *test*=None)

List currently configured reactors

CLI Example:

```
salt-run reactor.list
```

20.16.30 salt.runners.salt

This runner makes Salt's execution modules available on the salt master.

New in version 2016.11.0. Salt's execution modules are normally available on the salt minion. Use this runner to call execution modules on the salt master. Salt *execution modules* are the functions called by the `salt` command.

Execution modules can be called with `salt-run`:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 key=value a=1
```

Execution modules are also available to salt runners:

```
__salt__['salt.cmd'](fun=fun, args=args, kwargs=kwargs)
```

`salt.runners.salt.cmd` (*fun*, **args*, ***kwargs*)

Changed in version 2018.3.0: Added `with_pillar` argument

Execute *fun* with the given *args* and *kwargs*. Parameter *fun* should be the string *name* of the execution module to call.

Note: Execution modules will be loaded *every time* this function is called. Additionally, keep in mind that since runners execute on the master, custom execution modules will need to be synced to the master using `salt-run saltutil.sync_modules`, otherwise they will not be available.

with_pillar [False] If True, pillar data will be compiled for the master

Note: To target the master in the pillar top file, keep in mind that the default `id` for the master is `<hostname>_master`. This can be overridden by setting an `id` configuration parameter in the master config file.

CLI example:

```
salt-run salt.cmd test.ping
# call functions with arguments and keyword arguments
salt-run salt.cmd test.arg 1 2 3 a=1
salt-run salt.cmd mymod.myfunc with_pillar=True
```

`salt.runners.salt.execute`(*tgt*, *fun*, *arg=()*, *timeout=None*, *tgt_type='glob'*, *ret=""*, *jid=""*, *kwarg=None*, ***kwargs*)

New in version 2017.7.0.

Execute *fun* on all minions matched by *tgt* and *tgt_type*. Parameter *fun* is the name of execution module function to call.

This function should mainly be used as a helper for runner modules, in order to avoid redundant code. For example, when inside a runner one needs to execute a certain function on arbitrary groups of minions, only has to:

```
ret1 = __salt__['salt.execute']('*', 'mod.fun')
ret2 = __salt__['salt.execute']('my_nodegroup', 'mod2.fun2', tgt_type='nodegroup')
```

It can also be used to schedule jobs directly on the master, for example:

```
schedule:
  collect_bgp_stats:
    function: salt.execute
    args:
      - edge-routers
      - bgp.neighbors
    kwargs:
      tgt_type: nodegroup
    days: 1
    returner: redis
```

20.16.31 salt.runners.saltutil

The Saltutil runner is used to sync custom types to the Master. See the *saltutil module* for documentation on managing updates to minions.

New in version 2016.3.0.

`salt.runners.saltutil.sync_all`(*saltenv='base'*, *extmod_whitelist=None*, *extmod_blacklist=None*)

Sync all custom types

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] dictionary of modules to sync based on type

extmod_blacklist [None] dictionary of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_all
salt-run saltutil.sync_all extmod_whitelist={'runners': ['custom_runner'], 'grains
↪': []}
```

`salt.runners.saltutil.sync_cache`(*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

New in version 2017.7.0.

Sync cache modules from `salt://_cache` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_cache
```

salt.runners.saltutil.sync_clouds (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

New in version 2017.7.0.

Sync cloud modules from `salt://_clouds` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_clouds
```

salt.runners.saltutil.sync_eauth_tokens (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

New in version 2018.3.0.

Sync eauth token modules from `salt://_tokens` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_eauth_tokens
```

salt.runners.saltutil.sync_engines (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

Sync engines from `salt://_engines` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_engines
```

salt.runners.saltutil.sync_fileserver (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

New in version 2018.3.0.

Sync fileserver modules from `salt://_fileserver` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_fileserver
```

`salt.runners.saltutil.sync_grains` (*saltenv='base'*, *extmod_whitelist=None*,
extmod_blacklist=None)
 Sync grains modules from `salt://_grains` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
 CLI Example:

```
salt-run saltutil.sync_grains
```

`salt.runners.saltutil.sync_modules` (*saltenv='base'*, *extmod_whitelist=None*,
extmod_blacklist=None)
 Sync execution modules from `salt://_modules` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
 CLI Example:

```
salt-run saltutil.sync_modules
```

`salt.runners.saltutil.sync_output` (*saltenv='base'*, *extmod_whitelist=None*,
extmod_blacklist=None)
 Sync output modules from `salt://_output` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
 CLI Example:

```
salt-run saltutil.sync_output
```

`salt.runners.saltutil.sync_pillar` (*saltenv='base'*, *extmod_whitelist=None*,
extmod_blacklist=None)
 Sync pillar modules from `salt://_pillar` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
 CLI Example:

```
salt-run saltutil.sync_pillar
```

`salt.runners.saltutil.sync_proxymodules` (*saltenv='base'*, *extmod_whitelist=None*,
extmod_blacklist=None)
 Sync proxy modules from `salt://_proxy` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
 CLI Example:

```
salt-run saltutil.sync_proxy
```

`salt.runners.saltutil.sync_queues` (*saltenv='base'*, *extmod_whitelist=None*,
extmod_blacklist=None)

Sync queue modules from `salt://_queues` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_queues
```

`salt.runners.saltutil.sync_renderers` (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

Sync renderer modules from `salt://_renderers` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_renderers
```

`salt.runners.saltutil.sync_returners` (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

Sync returner modules from `salt://_returners` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_returners
```

`salt.runners.saltutil.sync_roster` (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

New in version 2017.7.0.

Sync roster modules from `salt://_roster` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_roster
```

`salt.runners.saltutil.sync_runners` (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

Sync runners from `salt://_runners` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_runners
```

`salt.runners.saltutil.sync_sdb` (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)

New in version 2017.7.0.

Sync sdb modules from `salt://_sdb` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_sdb
```

`salt.runners.saltutil.sync_states` (*saltenv='base',* *extmod_blacklist=None,* *extmod_whitelist=None,*)

Sync state modules from `salt://_states` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_states
```

`salt.runners.saltutil.sync_thorium` (*saltenv='base',* *extmod_blacklist=None,* *extmod_whitelist=None,*)

New in version 2018.3.0.

Sync Thorium from `salt://_thorium` to the master

saltenv: base The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist comma-separated list of modules to sync

extmod_blacklist comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_thorium
```

`salt.runners.saltutil.sync_tops` (*saltenv='base',* *extmod_blacklist=None,* *extmod_whitelist=None,*)

New in version 2016.3.7,2016.11.4,2017.7.0.

Sync master_tops modules from `salt://_tops` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

CLI Example:

```
salt-run saltutil.sync_tops
```

`salt.runners.saltutil.sync_utils` (*saltenv='base',* *extmod_blacklist=None,* *extmod_whitelist=None,*)

New in version 2016.11.0.

Sync utils modules from `salt://_utils` to the master

saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.

extmod_whitelist [None] comma-separated list of modules to sync

extmod_blacklist [None] comma-separated list of modules to blacklist based on type

CLI Example:

```
salt-run saltutil.sync_utils
```

`salt.runners.saltutil.sync_wheel` (*saltenv='base'*, *extmod_blacklist=None*, *extmod_whitelist=None*)
 Sync wheel modules from `salt://_wheel` to the master
saltenv [base] The fileserver environment from which to sync. To sync from more than one environment, pass a comma-separated list.
extmod_whitelist [None] comma-separated list of modules to sync
extmod_blacklist [None] comma-separated list of modules to blacklist based on type
 CLI Example:

```
salt-run saltutil.sync_wheel
```

20.16.32 salt.runners.sdb

Runner for setting and querying data via the sdb API on the master

`salt.runners.sdb.delete` (*uri*)

Delete a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully deleted, return `False`.

CLI Example:

```
salt-run sdb.delete sdb://mymemcached/foo
```

`salt.runners.sdb.get` (*uri*)

Get a value from a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://`, then it will be returned as-is.

CLI Example:

```
salt-run sdb.get sdb://mymemcached/foo
```

`salt.runners.sdb.get_or_set_hash` (*uri*, *length=8*, *chars='abcdefghijklmnopqrstuvwxyz0123456789!@#\$\$%^&*(_=+)'*)

Perform a one-time generation of a hash and write it to sdb. If that value has already been set return the value instead.

This is useful for generating passwords or keys that are specific to multiple minions that need to be stored somewhere centrally.

CLI Example:

```
salt-run sdb.get_or_set_hash 'SECRET_KEY' 50
```

Warning: This function could return strings which may contain characters which are reserved as directives by the YAML parser, such as strings beginning with `%`. To avoid issues when using the output of this function in an SLS file containing YAML+Jinja, surround the call with single quotes.

`salt.runners.sdb.set` (*uri*, *value*)

Set a value in a db, using a uri in the form of `sdb://<profile>/<key>`. If the uri provided does not start with `sdb://` or the value is not successfully set, return `False`.

CLI Example:

```
salt-run sdb.set sdb://mymemcached/foo bar
```

20.16.33 salt.runners.smartos_vmadm

Runner for SmartOS minions control vmadm

`salt.runners.smartos_vmadm.get` (*search*, *one=True*)

Return information for vms

search [string] filter vms, see the execution module.

one [boolean] return only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.get 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.get search='alias=saskia'
```

`salt.runners.smartos_vmadm.is_running` (*search*)

Return true if vm is running

search [string] filter vms, see the execution module.

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

Note: If multiple vms are matched, the result will be true of ALL vms are running

CLI Example:

```
salt-run vmadm.is_running 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.is_running search='alias=julia'
```

`salt.runners.smartos_vmadm.list_vms` (*search=None*, *verbose=False*)

List all vms

search [string] filter vms, see the execution module

verbose [boolean] print additional information about the vm

CLI Example:

```
salt-run vmadm.list
salt-run vmadm.list search='type=KVM'
salt-run vmadm.list verbose=True
```

`salt.runners.smartos_vmadm.nodes` (*verbose=False*)

List all compute nodes

verbose [boolean] print additional information about the node e.g. platform version, hvm capable, ...

CLI Example:

```
salt-run vmadm.nodes
salt-run vmadm.nodes verbose=True
```

`salt.runners.smartos_vmadm.reboot` (*search*, *one=True*, *force=False*)

Reboot one or more vms

search [string] filter vms, see the execution module.

one [boolean] reboot only one vm

force [boolean] force reboot, faster but no graceful shutdown

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.reboot 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.reboot search='alias=marije'
salt-run vmadm.reboot search='type=KVM' one=False
```

salt.runners.smartos_vmadm.start (*search*, *one=True*)

Start one or more vms

search [string] filter vms, see the execution module.

one [boolean] start only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.start 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.start search='alias=jiska'
salt-run vmadm.start search='type=KVM' one=False
```

salt.runners.smartos_vmadm.stop (*search*, *one=True*)

Stop one or more vms

search [string] filter vms, see the execution module.

one [boolean] stop only one vm

Note: If the search parameter does not contain an equal (=) symbol it will be assumed it will be tried as uuid, hostname, and alias.

CLI Example:

```
salt-run vmadm.stop 91244bba-1146-e4ec-c07e-e825e0223aa9
salt-run vmadm.stop search='alias=jody'
salt-run vmadm.stop search='type=KVM' one=False
```

20.16.34 salt.runners.spacewalk

Spacewalk Runner

New in version 2016.3.0.

Runner to interact with Spacewalk using Spacewalk API

codeauthor Nitin Madhok <nmadhok@clemson.edu>, Joachim Werner <joe@suse.com>, Benedikt Werner <1benedikt Werner@gmail.com>

maintainer Benedikt Werner <1benedikt Werner@gmail.com>

To use this runner, set up the Spacewalk URL, username and password in the master configuration at `/etc/salt/master` or `/etc/salt/master.d/spacewalk.conf`:

```
spacewalk:
  spacewalk01.domain.com:
    username: 'testuser'
    password: 'verybadpass'
  spacewalk02.domain.com:
    username: 'testuser'
    password: 'verybadpass'
```

Note: Optionally, `protocol` can be specified if the spacewalk server is not using the defaults. Default is `protocol: https`.

`salt.runners.spacewalk.addGroupsToKey` (*server*, *activation_key*, *groups*)

Add server groups to a activation key

CLI Example:

```
salt-run spacewalk.addGroupsToKey spacewalk01.domain.com 1-my-key '[group1,
↪group2]'
```

`salt.runners.spacewalk.api` (*server*, *command*, **args*, ***kwargs*)

Call the Spacewalk xmlrpc api.

CLI Example:

```
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create MyGroup
↪Description
salt-run spacewalk.api spacewalk01.domain.com systemgroup.create arguments='[
↪"MyGroup", "Description"]'
```

State Example:

```
create_group:
  salt.runner:
    - name: spacewalk.api
    - server: spacewalk01.domain.com
    - command: systemgroup.create
    - arguments:
      - MyGroup
      - Description
```

`salt.runners.spacewalk.deleteAllActivationKeys` (*server*)

Delete all activation keys from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllActivationKeys spacewalk01.domain.com
```

`salt.runners.spacewalk.deleteAllGroups` (*server*)

Delete all server groups from Spacewalk

`salt.runners.spacewalk.deleteAllSystems` (*server*)

Delete all systems from Spacewalk

CLI Example:

```
salt-run spacewalk.deleteAllSystems spacewalk01.domain.com
```

`salt.runners.spacewalk.unregister`(*name, server_url*)
Unregister specified server from Spacewalk

CLI Example:

```
salt-run spacewalk.unregister my-test-vm spacewalk01.domain.com
```

20.16.35 salt.runners.ssh

A Runner module interface on top of the salt-ssh Python API.

This allows for programmatic use from salt-api, the Reactor, Orchestrate, etc.

`salt.runners.ssh.cmd`(*tgt, fun, arg=(), timeout=None, tgt_type='glob', kwarg=None, expr_form=None*)
New in version 2015.5.0.

Changed in version 2017.7.0: The `expr_form` argument has been renamed to `tgt_type`, earlier releases must use `expr_form`.

Execute a single command via the salt-ssh subsystem and return all routines at once

A wrapper around the `SSHClient.cmd` method.

20.16.36 salt.runners.state

Execute orchestration functions

`salt.runners.state.event`(*tagmatch='**', count=-1, quiet=False, sock_dir=None, pretty=False, node='master'*)

Watch Salt's event bus and block until the given tag is matched

New in version 2014.7.0.

This is useful for utilizing Salt's event bus from shell scripts or for taking simple actions directly from the CLI.

Enable debug logging to see ignored events.

Parameters

- **tagmatch** – the event is written to stdout for each tag that matches this pattern; uses the same matching semantics as Salt's Reactor.
- **count** – this number is decremented for each event that matches the `tagmatch` parameter; pass `-1` to listen forever.
- **quiet** – do not print to stdout; just block
- **sock_dir** – path to the Salt master's event socket file.
- **pretty** – Output the JSON all on a single line if `False` (useful for shell tools); pretty-print the JSON output if `True`.
- **node** – Watch the minion-side or master-side event bus. .. versionadded:: 2016.3.0

CLI Examples:

```
# Reboot a minion and run highstate when it comes back online
salt 'jerry' system.reboot && \\\
  salt-run state.event 'salt/minion/jerry/start' count=1 quiet=True && \\\
  salt 'jerry' state.highstate

# Reboot multiple minions and run highstate when all are back online
salt -L 'kevin,stewart,dave' system.reboot && \\\
  salt-run state.event 'salt/minion/*/start' count=3 quiet=True && \\\
  salt -L 'kevin,stewart,dave' state.highstate
```

(continues on next page)

(continued from previous page)

```
# Watch the event bus forever in a shell while-loop.
salt-run state.event | while read -r tag data; do
    echo $tag
    echo $data | jq --color-output .
done
```

See also:

See <https://github.com/saltstack/salt/blob/master/tests/eventlisten.sh> for an example of usage within a shell script.

`salt.runners.state.orchestrate` (*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *pillar_enc*=None, *orchestration_jid*=None)

New in version 0.17.0.

Execute a state run from the master, used as a powerful orchestration system.

See also:

More Orchestrate documentation

- [Full Orchestrate Tutorial](#)
- [Docs for the master-side state module](#)

CLI Examples:

```
salt-run state.orchestrate webserver
salt-run state.orchestrate webserver saltenv=dev test=True
salt-run state.orchestrate webserver saltenv=dev pillarenv=aws
```

Changed in version 2014.1.1: Runner renamed from `state.sls` to `state.orchestrate`

Changed in version 2014.7.0: Runner uses the pillar variable

Changed in version develop: Runner uses the `pillar_enc` variable that allows renderers to render the pillar. This is usable when supplying the contents of a file as pillar, and the file contains gpg-encrypted entries.

See also:

GPG renderer documentation

CLI Examples:

```
salt-run state.orchestrate webserver pillar_enc=gpg pillar="$(cat somefile.json)"
```

`salt.runners.state.orchestrate_high` (*data*, *test*=None, *queue*=False, *pillar*=None, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_high '{
    stage_one:
        {salt.state: [{tgt: "db*"}, {sls: postgres_setup}]},
    stage_two:
        {salt.state: [{tgt: "web*"}, {sls: apache_setup}, {
            require: [{salt: stage_one}],
        }]},
}'
```

`salt.runners.state.orchestrate_show_sls` (*mods*, *saltenv*='base', *test*=None, *exclude*=None, *pillar*=None, *pillarenv*=None, *pillar_enc*=None)

Display the state data from a specific sls, or list of sls files, after being render using the master minion.

Note, the master minion adds a "_master" suffix to it's minion id.

See also:

The `state.show_sls` module function

CLI Example: .. code-block:: bash

```
salt-run state.orch_show_sls my-orch-formula.my-orch-state 'pillar={ nodegroup: ng1 }'
```

`salt.runners.state.orchestrate_single` (*fun*, *name*, *test*=None, *queue*=False, *pillar*=None, ***kwargs*)

Execute a single state orchestration routine

New in version 2015.5.0.

CLI Example:

```
salt-run state.orchestrate_single fun=salt.wheel name=key.list_all
```

`salt.runners.state.pause` (*jid*, *state_id*=None, *duration*=None)

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.resume` (*jid*, *state_id*=None)

Remove a pause from a jid, allowing it to continue

`salt.runners.state.rm_pause` (*jid*, *state_id*=None)

This function is an alias of `resume`.

Remove a pause from a jid, allowing it to continue

`salt.runners.state.set_pause` (*jid*, *state_id*=None, *duration*=None)

This function is an alias of `pause`.

Set up a state id pause, this instructs a running state to pause at a given state id. This needs to pass in the jid of the running state and can optionally pass in a duration in seconds.

`salt.runners.state.soft_kill` (*jid*, *state_id*=None)

Set up a state run to die before executing the given state id, this instructs a running state to safely exit at a given state id. This needs to pass in the jid of the running state. If a `state_id` is not passed then the jid referenced will be safely exited at the beginning of the next state run.

20.16.37 salt.runners.survey

A general map/reduce style salt runner for aggregating results returned by several different minions.

New in version 2014.7.0.

Aggregated results are sorted by the size of the minion pools which returned matching results.

Useful for playing the game: "*some of these things are not like the others...*" when identifying discrepancies in a large infrastructure managed by salt.

`salt.runners.survey.diff` (**args*, ***kwargs*)

Return the DIFFERENCE of the result sets returned by each matching minion pool

New in version 2014.7.0.

These pools are determined from the aggregated and sorted results of a salt command.

This command displays the "diffs" as a series of 2-way differences – namely the difference between the FIRST displayed minion pool (according to sort order) and EACH SUBSEQUENT minion pool result set.

Differences are displayed according to the Python `difflib.unified_diff()` as in the case of the salt execution module `file.get_diff`.

This command is submitted via a salt runner using the general form:

```
salt-run survey.diff [survey_sort=up/down] <target>
                  <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (Example to display the "differences of files")

```
salt-run survey.diff survey_sort=up "*" cp.get_file_str file:///etc/hosts
```

`salt.runners.survey.hash(*args, **kwargs)`

Return the MATCHING minion pools from the aggregated and sorted results of a salt command

New in version 2014.7.0.

This command is submitted via a salt runner using the general form:

```
salt-run survey.hash [survey_sort=up/down] <target>
                  <salt-execution-module> <salt-execution-module parameters>
```

Optionally accept a `survey_sort=` parameter. Default: `survey_sort=down`

CLI Example #1: (functionally equivalent to `salt-run manage.up`)

```
salt-run survey.hash "*" test.ping
```

CLI Example #2: (find an "outlier" minion config file)

```
salt-run survey.hash "*" file.get_hash /etc/salt/minion survey_sort=up
```

20.16.38 salt.runners.test

This runner is used only for test purposes and servers no production purpose

`salt.runners.test.arg(*args, **kwargs)`

Output the given args and kwargs

Kwargs will be filtered for 'private' keynames.

`salt.runners.test.get_opts()`

New in version 2018.3.0.

Return the configuration options of the master.

CLI Example:

```
salt-run test.get_opts
```

`salt.runners.test.metasyntactic(locality='us')`

Return common metasyntactic variables for the given locality

`salt.runners.test.raw_arg(*args, **kwargs)`

Output the given args and kwargs

`salt.runners.test.sleep(s_time=10)`
Sleep t seconds, then return True

`salt.runners.test.stdout_print()`
Print 'foo' and return 'bar'

`salt.runners.test.stream()`
Return True

20.16.39 salt.runners.thin

The thin runner is used to manage the salt thin systems.

Salt Thin is a transport-less version of Salt that can be used to run routines in a standalone way. This runner has tools which generate the standalone salt system for easy consumption.

`salt.runners.thin.generate(extra_mods=",", overwrite=False, so_mods=",", python2_bin='python2', python3_bin='python3', absonly=True, compress='gzip')`
Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate
salt-run thin.generate mako
salt-run thin.generate mako,wempy 1
salt-run thin.generate overwrite=1
```

`salt.runners.thin.generate_min(extra_mods=",", overwrite=False, so_mods=",", python2_bin='python2', python3_bin='python3')`
Generate the salt-thin tarball and print the location of the tarball Optional additional mods to include (e.g. mako) can be supplied as a comma delimited string. Permits forcing an overwrite of the output file as well.

CLI Example:

```
salt-run thin.generate_min
```

20.16.40 salt.runners.vault

maintainer SaltStack

maturity new

platform all

Runner functions supporting the Vault modules. Configuration instructions are documented in the execution module docs.

`salt.runners.vault.generate_token(minion_id, signature, impersonated_by_master=False)`
Generate a Vault token for minion `minion_id`
minion_id The id of the minion that requests a token
signature Cryptographic signature which validates that the request is indeed sent by the minion (or the master, see `impersonated_by_master`).
impersonated_by_master If the master needs to create a token on behalf of the minion, this is True. This happens when the master generates minion pillars.

`salt.runners.vault.show_policies(minion_id)`
Show the Vault policies that are applied to tokens for the given minion

minion_id The minions id

CLI Example:

```
salt-run vault.show_policies myminion
```

20.16.41 salt.runners.venafiapi

Support for Venafi

Before using this module you need to register an account with Venafi, and configure it in your `master` configuration file.

First, you need to add a placeholder to the `master` file. This is because the module will not load unless it finds an `api_key` setting, valid or not. Open up `/etc/salt/master` and add:

```
venafi:  
  api_key: None
```

Then register your email address with Venafi using the following command:

```
salt-run venafi.register <youremail@yourdomain.com>
```

This command will not return an `api_key` to you; that will be sent to you via email from Venafi. Once you have received that key, open up your `master` file and set the `api_key` to it:

```
venafi:  
  api_key: abcdef01-2345-6789-abcd-ef0123456789
```

salt.runners.venafiapi.del_cached_domain(*domains*)

Delete cached domains from the master

CLI Example:

```
salt-run venafi.del_cached_domain domain1.example.com, domain2.example.com
```

salt.runners.venafiapi.gen_csr(*minion_id*, *dns_name*, *zone='default'*, *country=None*, *state=None*, *loc=None*, *org=None*, *org_unit=None*, *password=None*)

Generate a csr using the host's private_key. Analogous to:

```
VCert gencsr -cn [CN Value] -o "Beta Organization" -ou "Beta Group" -  
->l "Palo Alto" -st "California" -c US
```

CLI Example:

```
salt-run venafi.gen_csr <minion_id> <dns_name>
```

salt.runners.venafiapi.gen_key(*minion_id*, *dns_name=None*, *zone='default'*, *password=None*)

Generate and return an private_key. If a `dns_name` is passed in, the private_key will be cached under that name. The type of key and the parameters used to generate the key are based on the default certificate use policy associated with the specified zone.

CLI Example:

```
salt-run venafi.gen_key <minion_id> [dns_name] [zone] [password]
```

salt.runners.venafiapi.get_zone_id(*zone_name*)

Get the zone ID for the given zone name

CLI Example:

```
salt-run venafi.get_zone_id default
```

`salt.runners.venafiapi.list_domain_cache()`

List domains that have been cached

CLI Example:

```
salt-run venafi.list_domain_cache
```

`salt.runners.venafiapi.pickup(id_)`

Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

`salt.runners.venafiapi.register(email)`

Register a new user account

CLI Example:

```
salt-run venafi.register email@example.com
```

`salt.runners.venafiapi.renew(minion_id, dns_name=None, zone='default', request_id=None, country='US', state='California', loc='Palo Alto', org='Beta Organization', org_unit='Beta Group', password=None, zone_id=None)`

Request a new certificate

Uses the following command:

```
VCert enroll -z <zone> -k <api key> -cn <domain name>
```

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

`salt.runners.venafiapi.request(minion_id, dns_name=None, zone='default', request_id=None, country='US', state='California', loc='Palo Alto', org='Beta Organization', org_unit='Beta Group', password=None, zone_id=None)`

Request a new certificate

Uses the following command:

```
VCert enroll -z <zone> -k <api key> -cn <domain name>
```

CLI Example:

```
salt-run venafi.request <minion_id> <dns_name>
```

`salt.runners.venafiapi.show_cert(id_)`

Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_cert 01234567-89ab-cdef-0123-456789abcdef
```

`salt.runners.venafiapi.show_company(domain)`
Show company information, especially the company id

CLI Example:

```
salt-run venafi.show_company example.com
```

`salt.runners.venafiapi.show_csrs()`
Show certificate requests for this API key

CLI Example:

```
salt-run venafi.show_csrs
```

`salt.runners.venafiapi.show_policies()`
Show zone details for the API key owner's company

CLI Example:

```
salt-run venafi.show_zones
```

`salt.runners.venafiapi.show_rsa(minion_id, dns_name)`
Show a private RSA key

CLI Example:

```
salt-run venafi.show_rsa myminion domain.example.com
```

`salt.runners.venafiapi.show_zones()`
Show zone details for the API key owner's company

CLI Example:

```
salt-run venafi.show_zones
```

20.16.42 salt.runners.virt

Control virtual machines via Salt

`salt.runners.virt.force_off(name)`
Force power down the named virtual machine

`salt.runners.virt.host_info(host=None)`
Return information about the host connected to this master

`salt.runners.virt.init(name, cpu, mem, image, hypervisor='kvm', host=None, seed=True, nic='default', install=True, start=True, disk='default', saltenv='base', enable_vnc=False, seed_cmd='seed.apply', enable_qcow=False)`

This routine is used to create a new virtual machine. This routines takes a number of options to determine what the newly created virtual machine will look like.

name The mandatory name of the new virtual machine. The name option is also the minion id, all minions must have an id.

cpu The number of cpus to allocate to this new virtual machine.

mem The amount of memory to allocate to this virtual machine. The number is interpreted in megabytes.

image The network location of the virtual machine image, commonly a location on the salt fileserver, but http, https and ftp can also be used.

hypervisor The hypervisor to use for the new virtual machine. Default is *kvm*.

host The host to use for the new virtual machine, if this is omitted Salt will automatically detect what host to use.

seed Set to *False* to prevent Salt from seeding the new virtual machine.

nic The nic profile to use, defaults to the "default" nic profile which assumes a single network interface per VM associated with the "br0" bridge on the master.

install Set to *False* to prevent Salt from installing a minion on the new VM before it spins up.

disk The disk profile to use

saltenv The Salt environment to use

enable_vnc Whether a VNC screen is attached to resulting VM. Default is *False*.

seed_cmd If seed is *True*, use this execution module function to seed new VM. Default is *seed.apply*.

enable_qcow Clone disk image as a copy-on-write qcow2 image, using downloaded *image* as backing file.

salt.runners.virt.list (*host=None, quiet=False, hyper=None*)

List the virtual machines on each host, this is a simplified query, showing only the virtual machine names belonging to each host. A single host can be passed in to specify an individual host to list.

salt.runners.virt.migrate (*name, target=""*)

Migrate a VM from one host to another. This routine will just start the migration and display information on how to look up the progress.

salt.runners.virt.next_host ()

Return the host to use for the next autodeployed VM. This queries the available host and executes some math to determine the most "available" next host.

salt.runners.virt.pause (*name*)

Pause the named VM

salt.runners.virt.purge (*name, delete_key=True*)

Destroy the named VM

salt.runners.virt.query (*host=None, quiet=False*)

Query the virtual machines. When called without options all hosts are detected and a full query is returned. A single host can be passed in to specify an individual host to query.

salt.runners.virt.reset (*name*)

Force power down and restart an existing VM

salt.runners.virt.resume (*name*)

Resume a paused VM

salt.runners.virt.start (*name*)

Start a named virtual machine

salt.runners.virt.vm_info (*name, quiet=False*)

Return the information on the named VM

20.16.43 salt.runners.vistara

Vistara Runner

Runner to interact with the Vistara (<http://www.vistarait.com/>) REST API

codeauthor Brad Thurber <brad.thurber@gmail.com>

To use this runner, the Vistara *client_id* and Vistara *oauth2 client_key* and *client_secret* must be set in the master config.

For example `/etc/salt/master.d/_vistara.conf`:

vistara:

```

client_id: client_012345
client_key: N0tReallyR3alKeyButShouldB12345
client_secret: ThisI5AreallyLongsecretKeyIwonderwhyTheyMakethemSoBigTheseDays00

```

salt.runners.vistara.delete_device(*name*, *safety_on=True*)

Deletes a device from Vistara based on DNS name or partial name. By default, `delete_device` will only perform the delete if a single host is returned. Set `safety_on=False` to delete all matches (up to default API search page size)

CLI Example:

```

salt-run vistara.delete_device 'hostname-101.mycompany.com'
salt-run vistara.delete_device 'hostname-101'
salt-run vistara.delete_device 'hostname-1' safety_on=False

```

20.16.44 salt.runners.winrepo

Runner to manage Windows software repo

salt.runners.winrepo.genrepo(*opts=None*, *fire_event=True*)

Generate `winrepo_cachefile` based on `sls` files in the `winrepo_dir`

opts Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

fire_event [True] Fire an event on failure. Only supported on the master.

CLI Example:

```

salt-run winrepo.genrepo

```

salt.runners.winrepo.update_git_repos(*opts=None*, *clean=False*, *masterless=False*)

Checkout git repos containing Windows Software Package Definitions

opts Specify an alternate `opts` dict. Should not be used unless this function is imported into an execution module.

clean [False] Clean repo cachedirs which are not configured under `winrepo_remotes`.

Warning: This argument should not be set to `True` if a mix of git and non-git repo definitions are being used, as it will result in the non-git repo definitions being removed.

New in version 2015.8.0.

CLI Examples:

```

salt-run winrepo.update_git_repos
salt-run winrepo.update_git_repos clean=True

```

20.17 sdb modules

<code>cache</code>	cache Module
<code>confidant</code>	An SDB module for getting credentials from confidant.
<code>consul</code>	Consul sdb Module

Continued on next page

Table 17 – continued from previous page

<i>couchdb</i>	CouchDB sdb Module
<i>env</i>	Environment sdb Module
<i>etcd_db</i>	etcd Database Module
<i>keyring_db</i>	Keyring Database Module
<i>memcached</i>	Memcached sdb Module
<i>rest</i>	Generic REST API SDB Module
<i>sqlite3</i>	SQLite sdb Module
<i>tism</i>	tISM - the Immutable Secrets Manager SDB Module
<i>vault</i>	Vault SDB Module
<i>yaml</i>	Pull sdb values from a YAML file

20.17.1 salt.sdb.cache module

cache Module

maintainer SaltStack

maturity New

platform all

New in version 2017.7.0.

This module provides access to Salt's cache subsystem.

Like all sdb modules, the cache module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mastercloudcache:
driver: cache
bank: cloud/active/ec2/my-ec2-conf/saltmaster
cachedir: /var/cache/salt
```

The `driver` refers to the cache module, `bank` refers to the cache bank that contains the data and `cachedir` (optional), if used, points to an alternate directory for cache data storage.

```
master_ip: sdb://mastercloudcache/public_ips
```

It is also possible to override both the `bank` and `cachedir` options inside the SDB URI:

```
master_ip: sdb://mastercloudcache/public_ips?cachedir=/var/cache/salt
```

For this reason, both the `bank` and the `cachedir` options can be omitted from the SDB profile. However, if the `bank` option is omitted, it must be specified in the URI:

```
master_ip: sdb://mastercloudcache/public_ips?bank=cloud/active/ec2/my-ec2-conf/
↪saltmaster
```

`salt.sdb.cache.delete` (*key*, *service=None*, *profile=None*)
Get a value from the cache service

`salt.sdb.cache.get` (*key*, *service=None*, *profile=None*)
Get a value from the cache service

`salt.sdb.cache.set_` (*key*, *value*, *service=None*, *profile=None*)
Set a key/value pair in the cache service

20.17.2 salt.sdb.confidant

An SDB module for getting credentials from confidant.

Configuring the Confidant module

The module can be configured via sdb in the minion config:

```
confidant:
  driver: confidant
  # The URL of the confidant web service
  url: 'https://confidant-production.example.com'
  # The context to use for KMS authentication
  auth_context:
    from: example-production-iad
    to: confidant-production-iad
    user_type: service
  # The KMS master key to use for authentication
  auth_key: "alias/authnz"
  # Cache file for KMS auth token
  token_cache_file: /run/confidant/confidant_token
  # The duration of the validity of a token, in minutes
  token_duration: 60
  # key, keyid and region can be defined in the profile, but it's generally
  # best to use IAM roles or environment variables for AWS auth.
  keyid: 98nh9h9h908h09kjjk
  key: jhf908gyeghehe0he0g8h9u0j0n0n09hj09h0
  region: us-east-1
```

depends confidant-common, confidant-client

Module Documentation

`salt.sdb.confidant.get`(key, profile=None)

Read pillar data from Confidant via its API.

CLI Example:

```
salt myminion sdb.get 'sdb://confidant/credentials'
```

Valid keys are: credentials, credentials_metadata, result. credentials returns a dict of joined credential_pairs, credentials_metadata returns a dict of metadata relevant to the credentials mapped to the confidant service, and result returns a bool that can be used to determine if the sdb call succeeded or failed to fetch credentials from confidant (or from local cache). If result is false, the data in credentials or credentials_metadata can't be trusted.

20.17.3 salt.sdb.consul module

Consul sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to Consul using an `sdb://` URI

Like all sdb modules, the Consul module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
myconsul:
  driver: consul
  host: 127.0.0.1
  port: 8500
  token: b6376760-a8bb-edd5-fcda-33bc13bfc556
  scheme: http
  consistency: default
  dc: dev
  verify: True
```

The driver refers to the Consul module, all other options are optional. For option details see: <https://python-consul.readthedocs.io/en/latest/#consul>

```
salt.sdb.consul.get(key, profile=None)
```

```
salt.sdb.consul.get_conn(profile)
```

Return a client object for accessing consul

```
salt.sdb.consul.set_(key, value, profile=None)
```

20.17.4 salt.sdb.couchdb

CouchDB sdb Module

maintainer SaltStack

maturity New

depends python2-couchdb

platform all

This allow interaction between Salt and a CouchDB [couchdb.apache.org] database. It uses salt's *sdb* system to allow for inserts and retrievals using the *sdb://* prefix in salt configuration files.

To use the couchbase sdb module, it must first be configured in the salt master or minion config. The following arguments are required:

```
couchdb_sdb:
  driver: couchdb
  host: localhost
  port: 5984
  database: salt_sdb
```

One could then query the CouchDB instance via an *sdb://* URI such as the following:

```
password: sdb://couchdb_sdb/mykey
```

To use this interface, you must track IDs on your own or have another source to do the map-reduce logic necessary to calculate the ID you wish to fetch.

Additional contributions to build true map-reduce functionality into this module would be welcome.

```
salt.sdb.couchdb.get(key, profile=None)
```

Get a value from couchdb by id

```
salt.sdb.couchdb.set_(key, value, profile=None)
```

Set a key/value pair in couchdb

20.17.5 salt.sdb.env module

Environment sdb Module

maintainer SaltStack

maturity New

depends None

platform all

This module allows access to environment variables using an `sdb://` URI.

Example configuration for this module:

```
osenv:  
driver: env
```

WARNING:

OS environment variables will be available to read via SDB. Please make sure you don't have any sensitive data in your environment variables!!

Example usage of sdb env module:

```
set some env var:  
  cmd.run:  
    - name: echo {{ salt['sdb.set']('sdb://osenv/foo', 'bar') }}  
    - order: 1  
  
{% if salt['sdb.get']('sdb://osenv/foo') == 'bar' %}  
always-changes-and-succeeds:  
  test.succeed_with_changes:  
    - name: foo  
{% else %}  
always-changes-and-fails:  
  test.fail_with_changes:  
    - name: foo  
{% endif %}
```

The above example will return success.

The env sdb module can also be used with salt cloud. Assuming you have exported the environment variable named `compute` (and have `osenv` defined). The example below will look for the salt cloud config key `compute_name` in the environment:

```
my-openstack-config:  
compute_name: sdb://osenv/compute  
..snip
```

`salt.sdb.env.get`(*key*, *profile=None*)
Get a value

`salt.sdb.env.set_`(*key*, *value*, *profile=None*)
Set a key/value pair

20.17.6 salt.sdb.etcd_db

etcd Database Module

maintainer SaltStack

maturity New

depends python-etcd

platform all

New in version 2015.5.0.

This module allows access to the etcd database using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-etcd>.

Like all sdb modules, the etcd module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
myetcd:
  driver: etcd
  etcd.host: 127.0.0.1
  etcd.port: 4001
```

The `driver` refers to the etcd module, `etcd.host` refers to the host that is hosting the etcd database and `etcd.port` refers to the port on that host.

```
password: sdb://myetcd/mypassword
```

`salt.sdb.etcd_db.delete` (*key, service=None, profile=None*)

Get a value from the etcd service

`salt.sdb.etcd_db.get` (*key, service=None, profile=None*)

Get a value from the etcd service

`salt.sdb.etcd_db.set_` (*key, value, service=None, profile=None*)

Set a key/value pair in the etcd service

20.17.7 salt.sdb.keyring_db

Keyring Database Module

maintainer SaltStack

maturity New

depends keyring

platform all

This module allows access to the keyring package using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/keyring>.

Care must be taken when using keyring. Not all keyend backends are supported on all operating systems. Also, many backends require an agent to be running in order to work. For instance, the "Secret Service" backend requires a compatible agent such as `gnome-keyring-daemon` or `kwallet` to be running. The `keyczar` backend does not seem to enjoy the benefits of an agent, and so using it will require either that the password is typed in manually (which is unreasonable for the salt-minion and salt-master daemons, especially in production) or an agent is written for it.

Like all sdb modules, the keyring module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mykeyring:
  driver: keyring
  service: system
```

The `driver` refers to the keyring module, `service` refers to the service that will be used inside of keyring (which may be likened unto a database table) and `mykeyring` refers to the name that will appear in the URI:

```
password: sdb://mykeyring/mypassword
```

The underlying backend configuration must be configured via keyring itself. For examples and documentation, see keyring:

<https://pypi.python.org/pypi/keyring>

New in version 2014.1.4.

```
salt.sdb.keyring_db.get(key, service=None, profile=None)
    Get a value from a keyring service
```

```
salt.sdb.keyring_db.set_(key, value, service=None, profile=None)
    Set a key/value pair in a keyring service
```

20.17.8 salt.sdb.memcached

Memcached sdb Module

maintainer SaltStack

maturity New

depends python-memcached

platform all

This module allows access to memcached using an `sdb://` URI. This package is located at <https://pypi.python.org/pypi/python-memcached>.

Like all sdb modules, the memcached module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
mymemcache:
  driver: memcached
  host: localhost
  port: 11211
```

The `driver` refers to the memcached module, `host` and `port` the memcached server to connect to (defaults to `localhost` and `11211`, and `mymemcached` refers to the name that will appear in the URI:

```
password: sdb://mymemcached/mykey
```

```
salt.sdb.memcached.get(key, profile=None)
    Get a value from memcached
```

```
salt.sdb.memcached.set_(key, value, profile=None)
    Set a key/value pair in memcached
```

20.17.9 salt.sdb.rest module

Generic REST API SDB Module

maintainer SaltStack

maturity New

platform all

New in version 2015.8.0.

This module allows access to a REST interface using an `sdb://` URL.

Like all REST modules, the REST module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. In the example:

```
my-rest-api:
  driver: rest
  urls:
    url: https://api.github.com/
  keys:
    url: https://api.github.com/users/{{user}}/keys
  backend: requests
```

The `driver` refers to the REST module, and must be set to `rest` in order to use this driver. Each of the other items inside this block refers to a separate set of HTTP items, including a URL and any options associated with it. The options used here should match the options available in `salt.utils.http.query()`.

In order to call the `urls` item in the example, the following reference can be made inside a configuration file:

```
github_urls: sdb://my-rest-api/urls
```

Key/Value pairs may also be used with this driver, and merged into the URL using the configured renderer (`jinja`, by default). For instance, in order to use the `keys` item in the example, the following reference can be made:

```
github_urls: sdb://my-rest-api/keys?user=myuser
```

This will cause the following URL to actually be called:

```
https://api.github.com/users/myuser/keys
```

Key/Value pairs will NOT be passed through as GET data. If GET data needs to be sent to the URL, then it should be configured in the SDB configuration block. For instance:

```
another-rest-api:
  driver: rest
  user_data:
    url: https://api.example.com/users/
  params:
    user: myuser
```

`salt.sdb.rest.get`(*key*, *service=None*, *profile=None*)

Get a value from the REST interface

`salt.sdb.rest.query`(*key*, *value=None*, *service=None*, *profile=None*)

Get a value from the REST interface

`salt.sdb.rest.set_`(*key*, *value*, *service=None*, *profile=None*)

Set a key/value pair in the REST interface

20.17.10 salt.sdb.sqlite3

SQLite sdb Module

maintainer SaltStack

maturity New

platform all

This module allows access to sqlite3 using an `sdb://` URI

Like all sdb modules, the `sqlite3` module requires a configuration profile to be configured in either the minion or master configuration file. This profile requires very little. For example:

```
mysqlite:
  driver: sqlite3
  database: /tmp/sdb.sqlite
  table: sdb
  create_table: True
```

The `driver` refers to the `sqlite3` module, `database` refers to the `sqlite3` database file. `table` is the table within the db that will hold keys and values (defaults to `sdb`). The database and table will be created if they do not exist.

Advanced Usage:

Instead of a table name, it is possible to provide custom SQL statements to create the table(s) and get and set values.

`salt.sdb.sqlite3.get` (*key, profile=None*)

Get a value from `sqlite3`

`salt.sdb.sqlite3.set_` (*key, value, profile=None*)

Set a key/value pair in `sqlite3`

20.17.11 salt.sdb.tism module

tISM - the Immutable Secrets Manager SDB Module

maintainer tISM

maturity New

platform all

New in version 2017.7.0.

This module will decrypt PGP encrypted secrets against a tISM server.

```
sdb://<profile>/<encrypted secret>
```

```
sdb://tism/
```

```
→hQEMAZJ+GfdAB3KqAQf9E3cyvrPEWR1sf1tMvH0nrJ0bZa9kDFLPxvtwA0qlRiNp0F7IpiivRF+h+sw5Mb4ffB1TE1MzQ+/
→G5ptd6CjmgBfBsuGeajWmvLEi4lC6/
→9v1rYGjjLeOCCcN4Dl5AHlxUUaSrXb8akTDvSANPvGhtRTZqd1l1tL5UEHsyYXM8RaeCrBw50r1yvC9Ctx2saVp3xmALQvyhzkU
→H30L/r50+CBkuI/u4M2pXDcMYsvvt4ajCbJn91qaQ7BDI=
```

A profile must be setup in the minion configuration or pillar. If you want to use `sdb` in a runner or pillar you must also place a profile in the master configuration.

```

tism:
  driver: tism
  url: https://my.tismd:8080/decrypt
  token: eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9.
  ↳eyJhZG1pb2I6ImSwiXhwIjoxNTg1MTExNDYwLCJqdGkiOiI3NnA5cWwiMwtdm4Iiwia2V5cyI6WyJBTEwiXX0.
  ↳RtAhG6Uorf5xnSf4Ya_GwJnoHkCsql4r1_hi0eDSLzo

```

`salt.sdb.tism.get`(*key*, *service=None*, *profile=None*)
Get a decrypted secret from the tISMd API

20.17.12 salt.sdb.vault module

Vault SDB Module

```

maintainer SaltStack
maturity New
platform all

```

New in version 2016.11.0.

This module allows access to Hashicorp Vault using an `sdb://` URI.

Base configuration instructions are documented in the execution module docs. Below are noted extra configuration required for the `sdb` module, but the base configuration must also be completed.

Like all `sdb` modules, the `vault` module requires a configuration profile to be configured in either the minion configuration file or a pillar. This profile requires only setting the `driver` parameter to `vault`:

```

myvault:
  driver: vault

```

Once configured you can access data using a URL such as:

```

password: sdb://myvault/secret/passwords/mypassword

```

In this URL, `myvault` refers to the configuration profile, `secret/passwords` is the path where the data resides, and `mypassword` is the key of the data to return.

The above URI is analogous to running the following vault command:

```

$ vault read -field=mypassword secret/passwords

```

`salt.sdb.vault.get`(*key*, *profile=None*)
Get a value from the vault service

`salt.sdb.vault.set_`(*key*, *value*, *profile=None*)
Set a key/value pair in the vault service

20.17.13 salt.sdb.yaml module

Pull `sdb` values from a YAML file

```

maintainer SaltStack
maturity New
platform all

```

New in version 2017.7.0.

Configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
```

The files are merged together and the result is searched using the same mechanism Salt uses for searching Grains and Pillar data structures.

Optional configuration:

```
my-yaml-file:
  driver: yaml
  files:
    - /path/to/foo.yaml
    - /path/to/bar.yaml
  merge:
    strategy: smart
    merge_list: false
  gpg: true
```

Setting the `gpg` option to `true` (default is `false`) will decrypt embedded GPG-encrypted data using the *GPG renderer*.

`salt.sdb.yaml.get(key, profile=None)`
Get a value from the dictionary

`salt.sdb.yaml.set>(*args, **kwargs)`
Setting a value is not supported; edit the YAML files directly

20.18 serializer modules

<i>configparser</i>	<code>salt.serializers.configparser</code>
<i>json</i>	<code>salt.serializers.json</code>
<i>msgpack</i>	<code>salt.serializers.msgpack</code>
<i>python</i>	<code>salt.serializers.python</code>
<i>yaml</i>	<code>salt.serializers.yaml</code>
<i>yamlex</i>	<code>salt.serializers.yamlex</code>

20.18.1 salt.serializers.configparser module

`salt.serializers.configparser`

New in version 2016.3.0.

Implements a configparser serializer.

`salt.serializers.configparser.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream_or_string** – stream or string to deserialize.

- **options** – options given to lower configparser module.

`salt.serializers.configparser.serialize(obj, **options)`

Serialize Python data to a configparser formatted string or file.

Parameters

- **obj** – the data structure to serialize
- **options** – options given to lower configparser module.

20.18.2 salt.serializers.json

salt.serializers.json

Implements JSON serializer.

It's just a wrapper around json (or simplejson if available).

`salt.serializers.json.deserialize(stream_or_string, **options)`

Deserialize any string or stream like object into a Python data structure.

Parameters

- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower json/simplejson module.

`salt.serializers.json.serialize(obj, **options)`

Serialize Python data to JSON.

Parameters

- **obj** – the data structure to serialize
- **options** – options given to lower json/simplejson module.

20.18.3 salt.serializers.msgpack

salt.serializers.msgpack

Implements MsgPack serializer.

`salt.serializers.msgpack.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower msgpack module.

`salt.serializers.msgpack.serialize(obj, **options)`

Serialize Python data to MsgPack.

Parameters

- **obj** – the data structure to serialize
- **options** – options given to lower msgpack module.

20.18.4 salt.serializers.python module

salt.serializers.python

New in version 2016.3.0.

Implements a Python serializer (via pprint.format)

`salt.serializers.python.serialize(obj, **options)`
Serialize Python data to a Python string representation (via `pprint.format`)

Parameters

- **obj** – the data structure to serialize
- **options** – options given to `pprint.format`

20.18.5 salt.serializers.yaml

`salt.serializers.yaml`

Implements YAML serializer.

Underneath, it is based on `pyyaml` and use the safe dumper and loader. It also use C bindings if they are available.

`salt.serializers.yaml.deserialize(stream_or_string, **options)`
Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower `yaml` module.

`salt.serializers.yaml.serialize(obj, **options)`
Serialize Python data to YAML.

Parameters

- **obj** – the data structure to serialize
- **options** – options given to lower `yaml` module.

20.18.6 salt.serializers.yamlex

`salt.serializers.yamlex`

YAMLEX is a format that allows for things like `sls` files to be more intuitive.

It's an extension of YAML that implements all the salt magic: - it implies `omap` for any dict like. - it implies that string like data are `str`, not `unicode` - ...

For example, the file `states.sls` has this contents:

```
foo:
  bar: 42
  baz: [1, 2, 3]
```

The file can be parsed into Python like this

```
from salt.serializers import yamlex

with open('state.sls', 'r') as stream:
    obj = yamlex.deserialize(stream)
```

Check that `obj` is an `OrderedDict`

```
from salt.utils.odict import OrderedDict

assert isinstance(obj, dict)
assert isinstance(obj, OrderedDict)
```

yamlex `__repr__` and `__str__` objects' methods render YAML understandable string. It means that they are template friendly.

```
print '{0}'.format(obj)
```

returns:

```
{foo: {bar: 42, baz: [1, 2, 3]}}
```

and they are still valid YAML:

```
from salt.serializers import yaml
yaml_obj = yaml.deserialize(str(obj))
assert yaml_obj == obj
```

yamlex implements also custom tags:

`!aggregate`

this tag allows structures aggregation.

For example:

```
placeholder: !aggregate foo
placeholder: !aggregate bar
placeholder: !aggregate baz
```

is rendered as

```
placeholder: [foo, bar, baz]
```

`!reset`

this tag flushes the computing value.

```
placeholder: {!aggregate foo: {foo: 42}}
placeholder: {!aggregate foo: {bar: null}}
!reset placeholder: {!aggregate foo: {baz: inga}}
```

is roughly equivalent to

```
placeholder: {!aggregate foo: {baz: inga}}
```

Document is defacto an aggregate mapping.

`salt.serializers.yamlex.deserialize(stream_or_string, **options)`

Deserialize any string of stream like object into a Python data structure.

Parameters

- **stream_or_string** – stream or string to deserialize.
- **options** – options given to lower yaml module.

`salt.serializers.yamlex.serialize(obj, **options)`

Serialize Python data to YAML.

Parameters

- **obj** – the data structure to serialize
- **options** – options given to lower yaml module.

20.19 state modules

<i>acme</i>	ACME / Let's Encrypt certificate management state
<i>alias</i>	Configuration of email aliases
<i>alternatives</i>	Configuration of the alternatives system
<i>ansiblegate</i>	Execution of Ansible modules from within states
<i>apache</i>	Apache state
<i>apache_conf</i>	Manage Apache Confs
<i>apache_module</i>	Manage Apache Modules
<i>apache_site</i>	Manage Apache Sites
<i>aptpkg</i>	Package management operations specific to APT- and DEB-based systems
<i>archive</i>	Extract an archive
<i>artifactory</i>	This state downloads artifacts from artifactory.
<i>at</i>	Configuration disposable regularly scheduled tasks for at.
<i>augeas</i>	Configuration management using Augeas
<i>aws_sqs</i>	Manage SQS Queues
<i>beacon</i>	Management of the Salt beacons
<i>bigip</i>	A state module designed to enforce load-balancing configurations for F5 Big-IP entities.
<i>blockdev</i>	Management of Block Devices
<i>boto3_elasticache</i>	Manage Elasticache with boto3
<i>boto3_route53</i>	Manage Route53 records with Boto 3
<i>boto_apigateway</i>	Manage Apigateway Rest APIs
<i>boto_asg</i>	Manage Autoscale Groups
<i>boto_cfn</i>	Connection module for Amazon Cloud Formation
<i>boto_cloudfront</i>	Manage CloudFront distributions
<i>boto_cloudtrail</i>	Manage CloudTrail Objects
<i>boto_cloudwatch_alarm</i>	Manage Cloudwatch alarms
<i>boto_cloudwatch_event</i>	Manage CloudTrail Objects
<i>boto_cognitoidentity</i>	Manage CognitoIdentity Functions
<i>boto_datapipeline</i>	Manage Data Pipelines
<i>boto_dynamodb</i>	Manage DynamoDB Tables
<i>boto_ec2</i>	Manage EC2
<i>boto_elasticache</i>	Manage Elasticache
<i>boto_elasticsearch_domain</i>	Manage Elasticsearch Domains
<i>boto_elb</i>	Manage ELBs
<i>boto_elbv2</i>	Manage AWS Application Load Balancer
<i>boto_iam</i>	Manage IAM objects
<i>boto_iam_role</i>	Manage IAM roles
<i>boto_iot</i>	Manage IoT Objects
<i>boto_kinesis</i>	Manage Kinesis Streams
<i>boto_kms</i>	Manage KMS keys, key policies and grants.
<i>boto_lambda</i>	Manage Lambda Functions
<i>boto_lc</i>	Manage Launch Configurations
<i>boto_rds</i>	Manage RDSs
<i>boto_route53</i>	Manage Route53 records
<i>boto_s3_bucket</i>	Manage S3 Buckets
<i>boto_secgroup</i>	Manage Security Groups

Continued on next page

Table 19 – continued from previous page

<i>boto_sns</i>	Manage SNS Topics
<i>boto_sqs</i>	Manage SQS Queues
<i>boto_vpc</i>	Manage VPCs
<i>bower</i>	Installation of Bower Packages
<i>cabal</i>	Installation of Cabal Packages
<i>ceph</i>	Manage ceph with salt.
<i>chef</i>	Execute Chef client runs
<i>chocolatey</i>	Manage Chocolatey package installs ..
<i>chronos_job</i>	Configure Chronos jobs via a salt proxy.
<i>cisconso</i>	State module for Cisco NSO Proxy minions
<i>cloud</i>	Using states instead of maps to deploy clouds
<i>cmd</i>	Execution of arbitrary commands
<i>composer</i>	Installation of Composer Packages
<i>cron</i>	Management of cron, the Unix command scheduler
<i>csf</i>	CSF Ip tables management
<i>cyg</i>	Installation of Cygwin packages.
<i>ddns</i>	Dynamic DNS updates
<i>debconfmod</i>	Management of debconf selections
<i>dellchassis</i>	Manage chassis via Salt Proxies.
<i>disk</i>	Disk monitoring state
<i>docker</i>	States to manage Docker containers, images, volumes, and networks
<i>docker_container</i>	Management of Docker containers
<i>docker_image</i>	Management of Docker images
<i>docker_network</i>	Management of Docker networks
<i>docker_volume</i>	Management of Docker volumes
<i>drac</i>	Management of Dell DRAC
<i>elasticsearch</i>	State module to manage Elasticsearch.
<i>elasticsearch_index</i>	State module to manage Elasticsearch indices
<i>elasticsearch_index_template</i>	State module to manage Elasticsearch index templates
<i>environ</i>	Support for getting and setting the environment variables of the current salt process.
<i>eselect</i>	Management of Gentoo configuration using eselect
<i>etcd_mod</i>	Manage etcd Keys
<i>ethtool</i>	Configuration of network device
<i>esxi</i>	Manage VMware ESXi Hosts.
<i>event</i>	Send events through Salt's event system during state runs
<i>file</i>	Operations on regular files, special files, directories, and symlinks
<i>firewall</i>	State to check firewall configurations
<i>firewalld</i>	Management of firewalld
<i>gem</i>	Installation of Ruby modules packaged as gems
<i>git</i>	States to manage git repositories and git configuration
<i>github</i>	Github User State Module
<i>glance</i>	Managing Images in OpenStack Glance
<i>glance_image</i>	Management of OpenStack Glance Images
<i>glusterfs</i>	Manage GlusterFS pool.
<i>gnomedesktop</i>	Configuration of the GNOME desktop
<i>gpg</i>	Management of the GPG keychains

Table 19 – continued from previous page

<i>grafana</i>	Manage Grafana Dashboards
<i>grafana4_dashboard</i>	Manage Grafana v4.0 Dashboards
<i>grafana4_datasource</i>	Manage Grafana v4.0 data sources
<i>grafana4_org</i>	Manage Grafana v4.0 orgs
<i>grafana4_user</i>	Manage Grafana v4.0 users
<i>grafana_dashboard</i>	Manage Grafana v2.0 Dashboards
<i>grafana_datasource</i>	Manage Grafana v2.0 data sources
<i>grains</i>	Manage grains on the minion
<i>group</i>	Management of user groups
<i>heat</i>	Management of Heat
<i>hg</i>	Interaction with Mercurial repositories
<i>hipchat</i>	Send a message to Hipchat
<i>host</i>	Management of addresses and names in hosts file
<i>htpasswd</i>	Support for htpasswd module.
<i>http</i>	HTTP monitoring states
<i>icinga2</i>	Icinga2 state
<i>ifttt</i>	Trigger an event in IFTTT
<i>incron</i>	Management of incron, the inotify cron
<i>influxdb08_database</i>	Management of Influxdb 0.8 databases
<i>influxdb08_user</i>	Management of InfluxDB 0.8 users
<i>influxdb_continuous_query</i>	Management of Influxdb continuous queries
<i>influxdb_database</i>	Management of Influxdb databases
<i>influxdb_retention_policy</i>	Management of Influxdb retention policies
<i>influxdb_user</i>	Management of InfluxDB users
<i>infoblox_a</i>	Infoblox A record management.
<i>infoblox_cname</i>	Infoblox CNAME management.
<i>infoblox_host_record</i>	Infoblox host record management.
<i>infoblox_range</i>	Infoblox host record management.
<i>ini_manage</i>	Manage ini files
<i>ipmi</i>	Manage IPMI devices over LAN
<i>ipset</i>	Management of ipsets
<i>iptables</i>	Management of iptables
<i>jboss7</i>	Manage JBoss 7 Application Server via CLI interface
<i>jenkins</i>	Management of Jenkins
<i>junos</i>	State modules to interact with Junos devices.
<i>k8s</i>	Manage Kubernetes
<i>kapacitor</i>	Kapacitor state module.
<i>kernelpkg</i>	Manage kernel packages and active kernel version
<i>keyboard</i>	Management of keyboard layouts
<i>keystone</i>	Management of Keystone users
<i>keystone_domain</i>	Management of OpenStack Keystone Domains
<i>keystone_endpoint</i>	Management of OpenStack Keystone Endpoints
<i>keystone_group</i>	Management of OpenStack Keystone Groups
<i>keystone_project</i>	Management of OpenStack Keystone Projects
<i>keystone_role</i>	Management of OpenStack Keystone Roles
<i>keystone_role_grant</i>	Management of OpenStack Keystone Role Grants
<i>keystone_service</i>	Management of OpenStack Keystone Services
<i>keystone_user</i>	Management of OpenStack Keystone Users
<i>kmod</i>	Loading and unloading of kernel modules
<i>kubernetes</i>	Manage kubernetes resources as salt states

Table 19 – continued from previous page

<i>layman</i>	Management of Gentoo Overlays using layman
<i>ldap</i>	Manage entries in an LDAP database
<i>libcloud_dns</i>	Manage DNS records and zones using libcloud
<i>libcloud_loadbalancer</i>	Apache Libcloud Load Balancer State
<i>libcloud_storage</i>	Apache Libcloud Storage State
<i>linux_acl</i>	Linux File Access Control Lists
<i>locale</i>	Management of languages/locales
<i>logadm</i>	Management of logs using Solaris logadm.
<i>logrotate</i>	Module for managing logrotate.
<i>loop</i>	Loop state
<i>lvm</i>	Management of Linux logical volumes
<i>lvs_server</i>	Management of LVS (Linux Virtual Server) Real Server
<i>lvs_service</i>	Management of LVS (Linux Virtual Server) Service
<i>lxc</i>	Manage Linux Containers
<i>mac_assistive</i>	Allows you to manage assistive access on macOS minions with 10.9+
<i>mac_defaults</i>	Writing/reading defaults from a macOS minion
<i>mac_keychain</i>	Installing of certificates to the keychain
<i>mac_package</i>	Installing of mac pkg files
<i>mac_xattr</i>	Allows you to manage extended attributes on files or directories
<i>makeconf</i>	Management of Gentoo make.conf
<i>marathon_app</i>	Configure Marathon apps via a salt proxy.
<i>mdadm</i>	Managing software RAID with mdadm
<i>memcached</i>	States for Management of Memcached Keys
<i>modjk</i>	State to control Apache modjk
<i>modjk_worker</i>	Manage modjk workers
<i>module</i>	Execution of Salt modules from within states
<i>mongodb_database</i>	Management of MongoDB Databases
<i>mongodb_user</i>	Management of MongoDB Users
<i>monit</i>	Monit state
<i>mount</i>	Mounting of filesystems
<i>msteams</i>	Send a message card to Microsoft Teams
<i>mysql_database</i>	Management of MySQL databases (schemas)
<i>mysql_grants</i>	Management of MySQL grants (user permissions)
<i>mysql_query</i>	Execution of MySQL queries
<i>mysql_user</i>	Management of MySQL users
<i>netacl</i>	Network ACL
<i>netconfig</i>	Network Config
<i>netntp</i>	Network NTP
<i>netsnmp</i>	Network SNMP
<i>netusers</i>	Network Users
<i>network</i>	Configuration of network interfaces
<i>netyang</i>	NAPALM YANG state
<i>neutron_network</i>	Management of OpenStack Neutron Networks
<i>neutron_secgroup</i>	Management of OpenStack Neutron Security Groups
<i>neutron_secgroup_rule</i>	Management of OpenStack Neutron Security Group Rules
<i>neutron_subnet</i>	Management of OpenStack Neutron Subnets
<i>nfs_export</i>	Management of NFS exports

Table 19 – continued from previous page

<i>nftables</i>	Management of nftables
<i>npm</i>	Installation of NPM Packages
<i>ntp</i>	Management of NTP servers
<i>nxos</i>	State module for Cisco NX OS Switches Proxy minions
<i>openstack_config</i>	Manage OpenStack configuration file settings.
<i>openvswitch_bridge</i>	Management of Open vSwitch bridges.
<i>openvswitch_port</i>	Management of Open vSwitch ports.
<i>opsgenie</i>	Create/Close an alert in OpsGenie
<i>pagerduty</i>	Create an Event in PagerDuty
<i>pagerduty_escalation_policy</i>	Manage PagerDuty escalation policies.
<i>pagerduty_schedule</i>	Manage PagerDuty schedules.
<i>pagerduty_service</i>	Manage PagerDuty services
<i>pagerduty_user</i>	Manage PagerDuty users.
<i>pcs</i>	Management of Pacemaker/Corosync clusters with PCS
<i>pecl</i>	Installation of PHP Extensions Using pecl
<i>pdbedit</i>	Manage accounts in Samba's passdb using pdbedit
<i>pip_state</i>	Installation of Python Packages Using pip
<i>pkg</i>	Installation of packages using OS package managers such as yum or apt-get
<i>pkgbuild</i>	The pkgbuild state is the front of Salt package building backend.
<i>pkgng</i>	Manage package remote repo using FreeBSD pkgng
<i>pkgrepo</i>	Management of APT/DNF/YUM/Zypper package repos
<i>portage_config</i>	Management of Portage package configuration on Gentoo
<i>ports</i>	Manage software from FreeBSD ports
<i>postgres_cluster</i>	Management of PostgreSQL clusters
<i>postgres_database</i>	Management of PostgreSQL databases
<i>postgres_extension</i>	Management of PostgreSQL extensions
<i>postgres_group</i>	Management of PostgreSQL groups (roles)
<i>postgres_initdb</i>	Initialization of PostgreSQL data directory
<i>postgres_language</i>	Management of PostgreSQL languages
<i>postgres_privileges</i>	Management of PostgreSQL Privileges
<i>postgres_schema</i>	Management of PostgreSQL schemas
<i>postgres_tablespace</i>	Management of PostgreSQL tablespace
<i>postgres_user</i>	Management of PostgreSQL users (roles)
<i>powerpath</i>	Powerpath configuration support
<i>probes</i>	Network Probes
<i>process</i>	Process Management
<i>proxy</i>	Allows you to manage proxy settings on minions
<i>pushover</i>	Send a message to PushOver
<i>pyenv</i>	Managing python installations with pyenv
<i>pyrax_queues</i>	Manage Rackspace Queues
<i>quota</i>	Management of POSIX Quotas
<i>rabbitmq_cluster</i>	Manage RabbitMQ Clusters
<i>rabbitmq_plugin</i>	Manage RabbitMQ Plugins
<i>rabbitmq_policy</i>	Manage RabbitMQ Policies
<i>rabbitmq_user</i>	Manage RabbitMQ Users
<i>rabbitmq_vhost</i>	Manage RabbitMQ Virtual Hosts

<i>rbac_solaris</i>	Management of Solaris RBAC
<i>rbenv</i>	Managing Ruby installations with rbenv
<i>rdp</i>	Manage RDP Service on Windows servers
<i>redismod</i>	Management of Redis server
<i>reg</i>	Manage the Windows registry
<i>rsync</i>	State to synchronize files and directories with rsync.
<i>rvm</i>	Managing Ruby installations and gemsets with Ruby Version Manager (RVM)
<i>salt_proxy</i>	Salt proxy state
<i>saltmod</i>	Control the Salt command interface
<i>schedule</i>	Management of the Salt scheduler
<i>selinux</i>	Management of SELinux rules
<i>serverdensity_device</i>	Monitor Server with Server Density
<i>service</i>	Starting or restarting of services and daemons
<i>slack</i>	Send a message to Slack
<i>smartos</i>	Management of SmartOS Standalone Compute Nodes
<i>smtp</i>	Sending Messages via SMTP
<i>snapper</i>	Managing implicit state and baselines using snapshots
<i>solrcloud</i>	States for solrcloud alias and collection configuration
<i>splunk</i>	Splunk User State Module
<i>splunk_search</i>	Splunk Search State Module
<i>sqlite3</i>	Management of SQLite3 databases
<i>ssh_auth</i>	Control of entries in SSH authorized_key files
<i>ssh_known_hosts</i>	Control of SSH known_hosts entries
<i>stateconf</i>	Stateconf System
<i>status</i>	Minion status monitoring
<i>statuspage</i>	StatusPage
<i>supervisord</i>	Interaction with the Supervisor daemon
<i>svn</i>	Manage SVN repositories
<i>sysctl</i>	Configuration of the Linux kernel using sysctl
<i>syslog_ng</i>	State module for syslog_ng
<i>sysrc</i>	State to work with sysrc
<i>telemetry_alert</i>	Manage Telemetry alert configurations
<i>test</i>	Test States
<i>testinframod</i>	
<i>timezone</i>	Management of timezones
<i>tls</i>	Enforce state for SSL/TLS
<i>tomcat</i>	Manage Apache Tomcat web applications
<i>trafficserver</i>	Control Apache Traffic Server
<i>tuned</i>	Interface to Red Hat tuned-adm module
<i>uptime</i>	Monitor Web Server with Uptime
<i>user</i>	Management of user accounts
<i>vagrant</i>	Manage Vagrant VMs
<i>vault</i>	States for managing Hashicorp Vault.
<i>vbox_guest</i>	VirtualBox Guest Additions installer state
<i>victorops</i>	Create an Event in VictorOps
<i>virt</i>	Manage virt
<i>virtualenv_mod</i>	Setup of Python virtualenv sandboxes.
<i>win_certutil</i>	Installing of certificates to the Windows Certificate Manager

<i>win_dacl</i>	Windows Object Access Control Lists
<i>win_dism</i>	Installing of Windows features using DISM
<i>win_dns_client</i>	Module for configuring DNS Client on Windows systems
<i>win_firewall</i>	State for configuring Windows Firewall
<i>win_iis</i>	Microsoft IIS site management
<i>win_lgpo</i>	Manage Windows Local Group Policy
<i>win_license</i>	Installation and activation of windows licenses
<i>win_network</i>	Configuration of network interfaces on Windows hosts
<i>win_path</i>	Manage the Windows System PATH
<i>win_pki</i>	Microsoft certificate management via the Pki PowerShell module.
<i>win_powercfg</i>	This module allows you to control the power settings of a windows minion via powercfg.
<i>win_servermanager</i>	Manage Windows features via the ServerManager powershell module.
<i>win_smtp_server</i>	Module for managing IIS SMTP server configuration on Windows servers.
<i>win_snmp</i>	Module for managing SNMP service settings on Windows servers.
<i>win_system</i>	Management of Windows system information
<i>win_update</i>	Management of the windows update agent
<i>win_wua</i>	Installation of Windows Updates using the Windows Update Agent
<i>winrepo</i>	Manage Windows Package Repository
<i>x509</i>	Manage X509 Certificates
<i>xmpp</i>	Sending Messages over XMPP
<i>zabbix_host</i>	Management of Zabbix hosts.
<i>zabbix_hostgroup</i>	Management of Zabbix host groups.
<i>zabbix_mediatype</i>	Management of Zabbix mediatypes.
<i>zabbix_user</i>	Management of Zabbix users.
<i>zabbix_usergroup</i>	Management of Zabbix user groups.
<i>zcbuildout</i>	Management of zc.buildout
<i>zenoss</i>	State to manage monitoring in Zenoss.
<i>zk_concurrency</i>	Control concurrency of steps within state execution using zookeeper
<i>zfs</i>	States for managing zfs datasets
<i>zone</i>	Management of Solaris Zones
<i>zookeeper</i>	depends kazoo
<i>zpool</i>	States for managing zpools

20.19.1 salt.states.acme module

ACME / Let's Encrypt certificate management state

See also the module documentation

```
reload-gitlab:
  cmd.run:
```

(continues on next page)

(continued from previous page)

```

- name: gitlab-ctl hup

dev.example.com:
  acme.cert:
    - aliases:
      - gitlab.example.com
    - email: acmemaster@example.com
    - webroot: /opt/gitlab/embedded/service/gitlab-rails/public
    - renew: 14
    - fire_event: acme/dev.example.com
    - onchanges_in:
      - cmd: reload-gitlab

```

`salt.states.acme.cert` (*name, aliases=None, email=None, webroot=None, test_cert=False, renew=None, keysize=None, server=None, owner='root', group='root', mode='0640', certname=None*)

Obtain/renew a certificate from an ACME CA, probably Let's Encrypt.

Parameters

- **name** – Common Name of the certificate (DNS name of certificate)
- **aliases** – subjectAltNames (Additional DNS names on certificate)
- **email** – e-mail address for interaction with ACME provider
- **webroot** – True or a full path to webroot. Otherwise use standalone mode
- **test_cert** – Request a certificate from the Happy Hacker Fake CA (mutually exclusive with 'server')
- **renew** – True/'force' to force a renewal, or a window of renewal before expiry in days
- **keysize** – RSA key bits
- **server** – API endpoint to talk to
- **owner** – owner of the private key file
- **group** – group of the private key file
- **mode** – mode of the private key file
- **certname** – Name of the certificate to save

20.19.2 salt.states.alias

Configuration of email aliases

The mail aliases file can be managed to contain definitions for specific email aliases:

```

username:
  alias.present:
    - target: user@example.com

```

```

thomas:
  alias.present:
    - target: thomas@example.com

```

The default alias file is set to `/etc/aliases`, as defined in Salt's *config execution module*. To change the alias file from the default location, set the following in your minion config:

```

aliases.file: /my/alias/file

```

`salt.states.alias.absent` (*name*)

Ensure that the named alias is absent

name The alias to remove

`salt.states.alias.present`(*name*, *target*)

Ensures that the named alias is present with the given target or list of targets. If the alias exists but the target differs from the previous entry, the target(s) will be overwritten. If the alias does not exist, the alias will be created.

name The local user/address to assign an alias to

target The forwarding address

20.19.3 salt.states.alternatives

Configuration of the alternatives system

Control the alternatives system

```
{% set my_hadoop_conf = '/opt/hadoop/conf' %}

{{ my_hadoop_conf }}:
  file.directory

hadoop-0.20-conf:
  alternatives.install:
    - name: hadoop-0.20-conf
    - link: /etc/hadoop-0.20/conf
    - path: {{ my_hadoop_conf }}
    - priority: 30
    - require:
      - file: {{ my_hadoop_conf }}

hadoop-0.20-conf:
  alternatives.remove:
    - name: hadoop-0.20-conf
    - path: {{ my_hadoop_conf }}
```

`salt.states.alternatives.auto`(*name*)

New in version 0.17.0.

Instruct alternatives to use the highest priority path for <name>

name is the master name for this link group (e.g. pager)

`salt.states.alternatives.install`(*name*, *link*, *path*, *priority*)

Install new alternative for defined <name>

name is the master name for this link group (e.g. pager)

link is the symlink pointing to /etc/alternatives/<name>. (e.g. /usr/bin/pager)

path is the location of the new alternative target. NB: This file / directory must already exist. (e.g. /usr/bin/less)

priority is an integer; options with higher numbers have higher priority in automatic mode.

`salt.states.alternatives.remove`(*name*, *path*)

Removes installed alternative for defined <name> and <path> or fallback to default alternative, if some defined before.

name is the master name for this link group (e.g. pager)

path is the location of one of the alternative target files. (e.g. /usr/bin/less)

`salt.states.alternatives.set_`(*name*, *path*)

New in version 0.17.0.

Sets alternative for <name> to <path>, if <path> is defined as an alternative for <name>.

name is the master name for this link group (e.g. pager)
path is the location of one of the alternative target files. (e.g. /usr/bin/less)

```
foo:
  alternatives.set:
    - path: /usr/bin/foo-2.0
```

20.19.4 salt.states.ansiblegate

Execution of Ansible modules from within states

With *ansible.call* these states allow individual Ansible module calls to be made via states. To call an Ansible module function use a `module.run` state:

```
some_set_of_tasks:
  ansible:
    - system.ping
    - packaging.os.zypper
      - name: emacs
      - state: installed
```

class salt.states.ansiblegate.AnsibleState

Ansible state caller.

get_args(argset)

Get args and kwargs from the argset.

Parameters **argset** -

Returns

20.19.5 salt.states.apache

Apache state

New in version 2014.7.0.

Allows for inputting a yaml dictionary into a file for apache configuration files.

The variable `this` is special and signifies what should be included with the above word between angle brackets (<>).

```
/etc/httpd/conf.d/website.com.conf:
  apache.configfile:
    - config:
      - VirtualHost:
          this: '*:80'
          ServerName:
            - website.com
          ServerAlias:
            - www.website.com
            - dev.website.com
          ErrorLog: logs/website.com-error_log
          CustomLog: logs/website.com-access_log combined
          DocumentRoot: /var/www/vhosts/website.com
          Directory:
            this: /var/www/vhosts/website.com
          Order: Deny,Allow
```

(continues on next page)

(continued from previous page)

```
Deny from: all
Allow from:
- 127.0.0.1
- 192.168.100.0/24
Options:
- Indexes
- FollowSymLinks
AllowOverride: All
```

`salt.states.apache.configfile`(*name, config*)

20.19.6 salt.states.apache_conf module

Manage Apache Confs

New in version 2016.3.0.

Enable and disable apache confs.

```
Enable security conf:
  apache_conf.enabled:
    - name: security

Disable security conf:
  apache_conf.disabled:
    - name: security
```

`salt.states.apache_conf.disabled`(*name*)

Ensure an Apache conf is disabled.

name Name of the Apache conf

`salt.states.apache_conf.enabled`(*name*)

Ensure an Apache conf is enabled.

name Name of the Apache conf

20.19.7 salt.states.apache_module

Manage Apache Modules

New in version 2014.7.0.

Enable and disable apache modules.

```
Enable cgi module:
  apache_module.enabled:
    - name: cgi

Disable cgi module:
  apache_module.disabled:
    - name: cgi
```

`salt.states.apache_module.disabled`(*name*)

Ensure an Apache module is disabled.

New in version 2016.3.0.

name Name of the Apache module

`salt.states.apache_module.enabled(name)`

Ensure an Apache module is enabled.

New in version 2016.3.0.

name Name of the Apache module

20.19.8 salt.states.apache_site module

Manage Apache Sites

New in version 2016.3.0.

Enable and disable apache sites.

```
Enable default site:
  apache_site.enabled:
    - name: default

Disable default site:
  apache_site.disabled:
    - name: default
```

`salt.states.apache_site.disabled(name)`

Ensure an Apache site is disabled.

name Name of the Apache site

`salt.states.apache_site.enabled(name)`

Ensure an Apache site is enabled.

name Name of the Apache site

20.19.9 salt.states.aptpkg

Package management operations specific to APT- and DEB-based systems

`salt.states.aptpkg.held(name)`

Set package in 'hold' state, meaning it will not be upgraded.

name The name of the package, e.g., 'tmux'

20.19.10 salt.states.archive

Extract an archive

New in version 2014.1.0.

`salt.states.archive.extracted(name, source, source_hash=None, source_hash_name=None, source_hash_update=False, skip_verify=False, password=None, options=None, list_options=None, force=False, overwrite=False, clean=False, user=None, group=None, if_missing=None, trim_output=False, use_cmd_unzip=None, extract_perms=True, enforce_toplevel=True, enforce_ownership_on=None, archive_format=None, **kwargs)`

New in version 2014.1.0.

Changed in version 2016.11.0: This state has been rewritten. Some arguments are new to this release and will not be available in the 2016.3 release cycle (and earlier). Additionally, the **ZIP Archive Handling** section below applies specifically to the 2016.11.0 release (and newer).

Ensure that an archive is extracted to a specific directory.

Important: Changes for 2016.11.0

In earlier releases, this state would rely on the `if_missing` argument to determine whether or not the archive needed to be extracted. When this argument was not passed, then the state would just assume `if_missing` is the same as the `name` argument (i.e. the parent directory into which the archive would be extracted).

This caused a number of annoyances. One such annoyance was the need to know beforehand a path that would result from the extraction of the archive, and setting `if_missing` to that directory, like so:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
    - if_missing: /var/www/myapp-16.2.4
```

If `/var/www` already existed, this would effectively make `if_missing` a required argument, just to get Salt to extract the archive.

Some users worked around this by adding the top-level directory of the archive to the end of the `name` argument, and then used `--strip` or `--strip-components` to remove that top-level dir when extracting:

```
extract_myapp:
  archive.extracted:
    - name: /var/www/myapp-16.2.4
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

With the rewrite for 2016.11.0, these workarounds are no longer necessary. `if_missing` is still a supported argument, but it is no longer required. The equivalent SLS in 2016.11.0 would be:

```
extract_myapp:
  archive.extracted:
    - name: /var/www
    - source: salt://apps/src/myapp-16.2.4.tar.gz
    - user: www
    - group: www
```

Salt now uses a function called `archive.list` to get a list of files/directories in the archive. Using this information, the state can now check the minion to see if any paths are missing, and know whether or not the archive needs to be extracted. This makes the `if_missing` argument unnecessary in most use cases.

Important: ZIP Archive Handling

Note: this information applies to 2016.11.0 and later.

Salt has two different functions for extracting ZIP archives:

1. `archive.unzip`, which uses Python's `zipfile` module to extract ZIP files.
2. `archive.cmd_unzip`, which uses the `unzip` CLI command to extract ZIP files.

Salt will prefer the use of `archive.cmd_unzip` when CLI options are specified (via the `options` argument), and will otherwise prefer the `archive.unzip` function. Use of `archive.cmd_unzip` can be

forced however by setting the `use_cmd_unzip` argument to `True`. By contrast, setting this argument to `False` will force usage of `archive.unzip`. For example:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - use_cmd_unzip: True
```

When `use_cmd_unzip` is omitted, Salt will choose which extraction function to use based on the source archive and the arguments passed to the state. When in doubt, simply do not set this argument; it is provided as a means of overriding the logic Salt uses to decide which function to use.

There are differences in the features available in both extraction functions. These are detailed below.

- *Command-line options* (only supported by `archive.cmd_unzip`) - When the `options` argument is used, `archive.cmd_unzip` is the only function that can be used to extract the archive. Therefore, if `use_cmd_unzip` is specified and set to `False`, and `options` is also set, the state will not proceed.
- *Permissions* - Due to an [upstream bug in Python](#), permissions are not preserved when the `zipfile` module is used to extract an archive. As of the 2016.11.0 release, `archive.unzip` (as well as this state) has an `extract_perms` argument which, when set to `True` (the default), will attempt to match the permissions of the extracted files/directories to those defined within the archive. To disable this functionality and have the state not attempt to preserve the permissions from the ZIP archive, set `extract_perms` to `False`:

```
/var/www:
  archive.extracted:
    - source: salt://foo/bar/myapp.zip
    - extract_perms: False
```

name Directory into which the archive should be extracted

source Archive to be extracted

Note: This argument uses the same syntax as its counterpart in the `file.managed` state.

source_hash Hash of source file, or file with list of hash-to-file mappings

Note: This argument uses the same syntax as its counterpart in the `file.managed` state.

Changed in version 2016.11.0: If this argument specifies the hash itself, instead of a URI to a file containing hashes, the hash type can now be omitted and Salt will determine the hash type based on the length of the hash. For example, both of the below states are now valid, while before only the second one would be:

```
foo_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/foo.tar.gz
    - source_hash: 3360db35e682f1c5f9c58aa307de16d41361618c

bar_app:
  archive.extracted:
    - name: /var/www
    - source: https://mydomain.tld/bar.tar.gz
    - source_hash: sha1=5edb7d584b82ddcbf76e311601f5d4442974aaa5
```

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename part of the source URI. When managing a file with a source of `salt://files/foo.tar.gz`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.tar.gz
```

This line would also match:

```
acbd18db4cc2f85cedef654fccc4a4d8    ./dir1/foo.tar.gz
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
/var/www:
archive.extracted:
- source: https://mydomain.tld/dir2/foo.tar.gz
- source_hash: https://mydomain.tld/ashes
- source_hash_name: ./dir2/foo.tar.gz
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.11.0.

source_hash_update [False] Set this to `True` if archive should be extracted if `source_hash` has changed. This would extract regardless of the `if_missing` parameter.

New in version 2016.3.0.

skip_verify [False] If `True`, hash verification of remote file sources (`http://`, `https://`, `ftp://`) will be skipped, and the `source_hash` argument will be ignored.

New in version 2016.3.4.

keep_source [True] For source archives not local to the minion (i.e. from the Salt fileserver or a remote source such as `http(s)` or `ftp`), Salt will need to download the archive to the minion cache before they can be extracted. To remove the downloaded archive after extraction, set this argument to `False`.

New in version 2017.7.3.

keep [True] Same as `keep_source`, kept for backward-compatibility.

Note: If both `keep_source` and `keep` are used, `keep` will be ignored.

password For ZIP archives only. Password used for extraction.

New in version 2016.3.0.

Changed in version 2016.11.0: The newly-added `archive.is_encrypted` function will be used to determine if the archive is password-protected. If it is, then the `password` argument will be required for the state to proceed.

options For tar and zip archives only. This option can be used to specify a string of additional arguments to pass to the tar/zip command.

If this argument is not used, then the minion will attempt to use Python's native `tarfile/zipfile` support to extract it. For zip archives, this argument is mostly used to overwrite existing files with `o`.

Using this argument means that the `tar` or `unzip` command will be used, which is less platform-independent, so keep this in mind when using this option; the CLI options must be valid options for the `tar/unzip` implementation on the minion's OS.

New in version 2016.11.0.

Changed in version 2015.8.11,2016.3.2: XZ-compressed tar archives no longer require `J` to manually be set in the `options`, they are now detected automatically and decompressed using the `xz` CLI command and extracted using `tar xvzf`. This is a more platform-independent solution, as not all tar implementations support the `J` argument for extracting archives.

Note: For tar archives, main operators like `-x`, `--extract`, `--get`, `-c` and `-f/--file` should *not* be used here.

list_options For tar archives only. This state uses `archive.list` to discover the contents of the source archive so that it knows which file paths should exist on the minion if the archive has already been extracted. For the vast majority of tar archives, `archive.list` "just works". Archives compressed using `gzip`, `bzip2`, and `xz/lzma` (with the help of the `xz` CLI command) are supported automatically. However, for archives compressed using other compression types, CLI options must be passed to `archive.list`.

This argument will be passed through to `archive.list` as its `options` argument, to allow it to successfully list the archive's contents. For the vast majority of archives, this argument should not need to be used, it should only be needed in cases where the state fails with an error stating that the archive's contents could not be listed.

New in version 2016.11.0.

force [False] If a path that should be occupied by a file in the extracted result is instead a directory (or vice-versa), the state will fail. Set this argument to `True` to force these paths to be removed in order to allow the archive to be extracted.

Warning: Use this option *very* carefully.

New in version 2016.11.0.

overwrite [False] Set this to `True` to force the archive to be extracted. This is useful for cases where the filenames/directories have not changed, but the content of the files have.

New in version 2016.11.1.

clean [False] Set this to `True` to remove any top-level files and recursively remove any top-level directory paths before extracting.

Note: Files will only be cleaned first if extracting the archive is deemed necessary, either by paths missing on the minion, or if `overwrite` is set to `True`.

New in version 2016.11.1.

user The user to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

group The group to own each extracted file. Not available on Windows.

New in version 2015.8.0.

Changed in version 2016.3.0: When used in combination with `if_missing`, ownership will only be enforced if `if_missing` is a directory.

Changed in version 2016.11.0: Ownership will be enforced only on the file/directory paths found by running `archive.list` on the source archive. An alternative root directory on which to enforce ownership can be specified using the `enforce_ownership_on` argument.

if_missing If specified, this path will be checked, and if it exists then the archive will not be extracted. This path can be either a directory or a file, so this option can also be used to check for a semaphore file and conditionally skip extraction.

Changed in version 2016.3.0: When used in combination with either `user` or `group`, ownership will only be enforced when `if_missing` is a directory.

Changed in version 2016.11.0: Ownership enforcement is no longer tied to this argument, it is simply checked for existence and extraction will be skipped if it is present.

trim_output [False] Useful for archives with many files in them. This can either be set to `True` (in which case only the first 100 files extracted will be in the state results), or it can be set to an integer for more exact control over the max number of files to include in the state results.

New in version 2016.3.0.

use_cmd_unzip [False] Set to `True` for zip files to force usage of the `archive.cmd_unzip` function to extract.

New in version 2016.11.0.

extract_perms [True] **For ZIP archives only.** When using `archive.unzip` to extract ZIP archives, Salt works around an [upstream bug in Python](#) to set the permissions on extracted files/directories to match those encoded into the ZIP archive. Set this argument to `False` to skip this workaround.

New in version 2016.11.0.

enforce_toplevel [True] This option will enforce a single directory at the top level of the source archive, to prevent extracting a 'tar-bomb'. Set this argument to `False` to allow archives with files (or multiple directories) at the top level to be extracted.

New in version 2016.11.0.

enforce_ownership_on When `user` or `group` is specified, Salt will default to enforcing permissions on the file/directory paths detected by running `archive.list` on the source archive. Use this argument to specify an alternate directory on which ownership should be enforced.

Note: This path must be within the path specified by the `name` argument.

New in version 2016.11.0.

archive_format One of `tar`, `zip`, or `rar`.

Changed in version 2016.11.0: If omitted, the archive format will be guessed based on the value of the `source` argument. If the minion is running a release older than 2016.11.0, this option is required.

Examples

1. tar with `lmza` (i.e. `xz`) compression:

```
graylog2-server:
  archive.extracted:
```

(continues on next page)

(continued from previous page)

```

- name: /opt/
- source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
- source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6

```

- tar archive with flag for verbose output, and enforcement of user/group ownership:

```

graylog2-server:
archive.extracted:
- name: /opt/
- source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.gz
- source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
- options: v
- user: foo
- group: foo

```

- tar archive, with `source_hash_update` set to `True` to prevent state from attempting extraction unless the `source_hash` differs from the previous time the archive was extracted:

```

graylog2-server:
archive.extracted:
- name: /opt/
- source: https://github.com/downloads/Graylog2/graylog2-server/graylog2-
↪server-0.9.6p1.tar.lzma
- source_hash: md5=499ae16dcae71eeb7c3a30c75ea7a1a6
- source_hash_update: True

```

20.19.11 salt.states.artifactory

This state downloads artifacts from artifactory.

`salt.states.artifactory.downloaded`(*name*, *artifact*, *target_dir*='tmp', *target_file*=None, *use_literal_group_id*=False)

Ensures that the artifact from artifactory exists at given location. If it doesn't exist, then it will be downloaded. If it already exists then the checksum of existing file is checked against checksum in artifactory. If it is different then the step will fail.

artifact Details of the artifact to be downloaded from artifactory. Various options are:

- `artifactory_url`: URL of the artifactory instance
- `repository`: Repository in artifactory
- `artifact_id`: Artifact ID
- `group_id`: Group ID
- `packaging`: Packaging
- `classifier`: Classifier .. `versionadded:: 2015.8.0`
- **version**: **Version** One of the following: - `Version` to download - `latest` - Download the latest release of this artifact - `latest_snapshot` - Download the latest snapshot for this artifact
- `username`: Artifactory username .. `versionadded:: 2015.8.0`
- `password`: Artifactory password .. `versionadded:: 2015.8.0`

target_dir Directory where the artifact should be downloaded. By default it is downloaded to /tmp directory.

target_file Target file to download artifact to. By default file name is resolved by artifactory.

An example to download an artifact to a specific file:

```

jboss_module_downloaded:
artifactory.downloaded:
- artifact:

```

(continues on next page)

(continued from previous page)

```

artifactory_url: http://artifactory.intranet.example.com/artifactory
repository: 'libs-release-local'
artifact_id: 'module'
group_id: 'com.company.module'
packaging: 'jar'
classifier: 'sources'
version: '1.0'
- target_file: /opt/jboss7/modules/com/company/lib/module.jar

```

Download artifact to the folder (automatically resolves file name):

```

jboss_module_downloaded:
artifactory.downloaded:
- artifact:
  artifactory_url: http://artifactory.intranet.example.com/artifactory
  repository: 'libs-release-local'
  artifact_id: 'module'
  group_id: 'com.company.module'
  packaging: 'jar'
  classifier: 'sources'
  version: '1.0'
- target_dir: /opt/jboss7/modules/com/company/lib

```

20.19.12 salt.states.at

Configuration disposable regularly scheduled tasks for at.

The at state can be add disposable regularly scheduled tasks for your system.

`salt.states.at.absent` (*name*, *jobid=None*, ***kwargs*)

Changed in version 2017.7.0.

Remove a job from queue

jobid: `string|int` Specific jobid to remove

tag [`string`] Job's tag

runas [`string`] Runs user-specified jobs

kwargs Addition kwargs can be provided to filter jobs. See output of `at.jobcheck` for more.

```

example1:
at.absent:

```

Warning: this will remove all jobs!

```

example2:
at.absent:
- year: 13

```

```

example3:
at.absent:
- tag: rose

```

```

example4:
at.absent:
- tag: rose
- day: 13
- hour: 16

```

```

example5:
at.absent:
- jobid: 4

```

`salt.states.at.mod_watch`(*name*, ***kwargs*)

The at watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly. Parameters for this function should be set by the state being triggered.

name The name of the atjob

`salt.states.at.present`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*)

Changed in version 2017.7.0.

Add a job to queue.

job [string] Command to run.

timespec [string] The 'timespec' follows the format documented in the at(1) manpage.

tag [string] Make a tag for the job.

user [string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```

rose:
at.present:
- job: 'echo "I love saltstack" > love'
- timespec: '9:09 11/09/13'
- tag: love
- user: jam

```

`salt.states.at.watch`(*name*, *timespec*, *tag=None*, *user=None*, *job=None*, *unique_tag=False*)

New in version 2017.7.0.

Add an at job if trigger by watch

job [string] Command to run.

timespec [string] The 'timespec' follows the format documented in the at(1) manpage.

tag [string] Make a tag for the job.

user [string] The user to run the at job .. versionadded:: 2014.1.4

unique_tag [boolean] If set to True job will not be added if a job with the tag exists. .. versionadded:: 2017.7.0

```

minion_restart:
at.watch:
- job: 'salt-call --local service.restart salt-minion'
- timespec: 'now +1 min'
- tag: minion_restart
- unique_tag: trye
- watch:
  - file: /etc/salt/minion

```

20.19.13 salt.states.augeas

Configuration management using Augeas

New in version 0.17.0.

This state requires the `augeas` Python module.

`Augeas` can be used to manage configuration files.

Warning: Minimal installations of Debian and Ubuntu have been seen to have packaging bugs with `python-augeas`, causing the `augeas` module to fail to import. If the minion has the `augeas` module installed, and the state fails with a comment saying that the state is unavailable, first restart the `salt-minion` service. If the problem persists past that, the following command can be run from the master to determine what is causing the import to fail:

```
salt minion-id cmd.run 'python -c "from augeas import Augeas"'
```

For affected Debian/Ubuntu hosts, installing `libpython2.7` has been known to resolve the issue.

`salt.states.augeas.change`(*name*, *context=None*, *changes=None*, *lens=None*, *load_path=None*, ***kwargs*)

New in version 2014.7.0.

This state replaces `setvalue()`.

Issue changes to Augeas, optionally for a specific context, with a specific lens.

name State name

context A file path, prefixed by `/files`. Should resolve to an actual file (not an arbitrary `augeas` path). This is used to avoid duplicating the file name for each item in the `changes` list (for example, `set bind 0.0.0.0` in the example below operates on the file specified by `context`). If `context` is not specified, a file path prefixed by `/files` should be included with the `set` command.

The file path is examined to determine if the specified changes are already present.

```
redis-conf:
augeas.change:
- context: /files/etc/redis/redis.conf
- changes:
- set bind 0.0.0.0
- set maxmemory 1G
```

changes List of changes that are issued to Augeas. Available commands are `set`, `setm`, `mv/move`, `ins/insert`, and `rm/remove`.

lens The lens to use, needs to be suffixed with `.lens`, e.g.: `Nginx.lens`. See the [list of stock lenses](#) shipped with Augeas.

New in version 2016.3.0.

load_path A list of directories that modules should be searched in. This is in addition to the standard `load` path and the directories in `AUGEAS_LENS_LIB`.

Usage examples:

Set the `bind` parameter in `/etc/redis/redis.conf`:

```
redis-conf:
augeas.change:
- changes:
- set /files/etc/redis/redis.conf/bind 0.0.0.0
```

Note: Use the `context` parameter to specify the file you want to manipulate. This way you don't have to include this in the changes every time:

```
redis-conf:
  augeas.change:
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
      - set databases 4
      - set maxmemory 1G
```

Augeas is aware of a lot of common configuration files and their syntax. It knows the difference between for example ini and yaml files, but also files with very specific syntax, like the hosts file. This is done with *lenses*, which provide mappings between the Augeas tree and the file.

There are many [preconfigured lenses](#) that come with Augeas by default, and they specify the common locations for configuration files. So most of the time Augeas will know how to manipulate a file. In the event that you need to manipulate a file that Augeas doesn't know about, you can specify the lens to use like this:

```
redis-conf:
  augeas.change:
    - lens: redis.lns
    - context: /files/etc/redis/redis.conf
    - changes:
      - set bind 0.0.0.0
```

Note: Even though Augeas knows that `/etc/redis/redis.conf` is a Redis configuration file and knows how to parse it, it is recommended to specify the lens anyway. This is because by default, Augeas loads all known lenses and their associated file paths. All these files are parsed when Augeas is loaded, which can take some time. When specifying a lens, Augeas is loaded with only that lens, which speeds things up quite a bit.

A more complex example, this adds an entry to the services file for Zabbix, and removes an obsolete service:

```
zabbix-service:
  augeas.change:
    - lens: services.lns
    - context: /files/etc/services
    - changes:
      - ins service-name after service-name[last()]
      - set service-name[last()] "zabbix-agent"
      - set "service-name[. = 'zabbix-agent']/port" 10050
      - set "service-name[. = 'zabbix-agent']/protocol" tcp
      - set "service-name[. = 'zabbix-agent']/#comment" "Zabbix Agent service"
      - rm "service-name[. = 'im-obsolete']"
    - unless: grep "zabbix-agent" /etc/services
```

Warning: Don't forget the `unless` here, otherwise it will fail on next runs because the service is already defined. Additionally you have to quote lines containing `service-name[. = 'zabbix-agent']` otherwise `augeas_cfg` execute will fail because it will receive more parameters than expected.

Note: Order is important when defining a service with Augeas, in this case it's `port`, `protocol` and

#comment. For more info about the lens check *services lens documentation*.

<http://augeas.net/docs/references/lenses/files/services-aug.html#Services.record>

20.19.14 salt.states.aws_sqs

Manage SQS Queues

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses the awscli tool provided by Amazon. This can be downloaded from pip. Also check the documentation for awscli for configuration information.

```
myqueue:
  aws_sqs.exists:
    - region: eu-west-1
```

`salt.states.aws_sqs.absent` (*name, region, user=None, opts=False*)
Remove the named SQS queue if it exists.
name Name of the SQS queue.
region Region to remove the queue from
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

`salt.states.aws_sqs.exists` (*name, region, user=None, opts=False*)
Ensure the SQS queue exists.
name Name of the SQS queue.
region Region to create the queue
user Name of the user performing the SQS operations
opts Include additional arguments and options to the aws command line

20.19.15 salt.states.beacon

Management of the Salt beacons

New in version 2015.8.0.

```
ps:
  beacon.present:
    - save: True
    - enable: False
    - services:
      salt-master: running
      apache2: stopped

sh:
  beacon.present: []

load:
  beacon.present:
    - averages:
      1m:
        - 0.0
        - 2.0
```

(continues on next page)

(continued from previous page)

```

5m:
  - 0.0
  - 1.5
15m:
  - 0.1
  - 1.0

```

`salt.states.beacon.absent`(*name*, *save=False*, ***kwargs*)

Ensure beacon is absent.

name The name of the beacon ensured absent.

save True/False, if True the beacons.conf file be updated too. Default is False.

`salt.states.beacon.disabled`(*name*, ***kwargs*)

Disable a beacon.

name The name of the beacon to disable.

`salt.states.beacon.enabled`(*name*, ***kwargs*)

Enable a beacon.

name The name of the beacon to enable.

`salt.states.beacon.present`(*name*, *save=False*, ***kwargs*)

Ensure beacon is configured with the included beacon data.

name The name of the beacon ensure is configured.

save True/False, if True the beacons.conf file be updated too. Default is False.

20.19.16 salt.states.bigip

A state module designed to enforce load-balancing configurations for F5 Big-IP entities.

maturity develop

platform f5_bigip_11.6

`salt.states.bigip.add_pool_member`(*hostname*, *username*, *password*, *name*, *member*)

A function to connect to a bigip device and add a new member to an existing pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to modify

member The member to add to the pool

`salt.states.bigip.create_monitor`(*hostname*, *username*, *password*, *monitor_type*, *name*, ***kwargs*)

A function to connect to a bigip device and create a monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

`salt.states.bigip.create_node`(*hostname*, *username*, *password*, *name*, *address*)

Create a new node if it does not already exist.

hostname The host/address of the bigip device

username The iControl REST username
password The iControl REST password
name The name of the node to create
address The address of the node

`salt.states.bigip.create_pool`(*hostname, username, password, name, members=None, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None*)

Create a new node if it does not already exist.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to create
members List of members to be added to the pool
allow_nat [yes | no]

`salt.states.bigip.create_profile`(*hostname, username, password, profile_type, name, **kwargs*)

A function to connect to a bigip device and create a profile.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create

name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

Special Characters |, , and : must be escaped using \ when used within strings.

```

salt.states.bigip.create_virtual(hostname, username, password, name, destination,
                                pool=None, address_status=None, auto_lasthop=None,

salt.states.bigip.delete_monitor (*hostname, username, password, monitor_type, name*)

Modify an existing monitor. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

salt.states.bigip.delete_node (*hostname, username, password, name*)

Delete an existing node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node which will be deleted.

salt.states.bigip.delete_pool (*hostname, username, password, name*)

Delete an existing pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool which will be deleted

salt.states.bigip.delete_pool_member (*hostname, username, password, name, member*)

Delete an existing pool member.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to be modified

member The name of the member to delete from the pool

salt.states.bigip.delete_profile (*hostname, username, password, profile_type, name*)

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to create

name The name of the profile to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

`salt.states.bigip.delete_virtual` (*hostname, username, password, name*)

Delete an existing virtual.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the virtual which will be deleted

`salt.states.bigip.list_monitor` (*hostname, username, password, monitor_type, name*)

A function to list an existing monitor.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to list

name The name of the monitor to list

`salt.states.bigip.list_node` (*hostname, username, password, name*)

A function to connect to a bigip device and list a specific node.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node to list.

`salt.states.bigip.list_pool` (*hostname, username, password, name*)

A function to connect to a bigip device and list a specific pool.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to list.

`salt.states.bigip.list_profile` (*hostname, username, password, profile_type, name*)

A function to list an existing profile.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

profile_type The type of profile to list

name The name of the profile to list

`salt.states.bigip.list_virtual` (*hostname, username, password, name*)

A function to list a specific virtual.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the virtual to list

`salt.states.bigip.manage_monitor` (*hostname, username, password, monitor_type, name, **kwargs*)

Create a new monitor if a monitor of this type and name does not already exist. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

monitor_type The type of monitor to create

name The name of the monitor to create

kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```
salt.states.bigip.manage_node(hostname, username, password, name, address, connection_limit=None, description=None, dynamic_ratio=None, logging=None, monitor=None, rate_limit=None, ratio=None, session=None, node_state=None)
```

Manages a node of a given bigip device. If the node does not exist it will be created, otherwise, only the properties which are different than the existing will be updated.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the node to manage.

address The address of the node

connection_limit [integer]

description [string]

dynamic_ratio: [integer]

logging [enabled | disabled]

monitor [[name] | none | default]

rate_limit [integer]

ratio [integer]

session [user-enabled | user-disabled]

node_state (state) [user-down | user-up]

```
salt.states.bigip.manage_pool(hostname, username, password, name, allow_nat=None, allow_snat=None, description=None, gateway_failsafe_device=None, ignore_persisted_weight=None, ip_tos_to_client=None, ip_tos_to_server=None, link_qos_to_client=None, link_qos_to_server=None, load_balancing_mode=None, min_active_members=None, min_up_members=None, min_up_members_action=None, min_up_members_checking=None, monitor=None, profiles=None, queue_depth_limit=None, queue_on_connection_limit=None, queue_time_limit=None, reselect_tries=None, service_down_action=None, slow_ramp_time=None)
```

Create a new pool if it does not already exist. Pool members are managed separately. Only the parameters specified are enforced.

hostname The host/address of the bigip device

username The iControl REST username

password The iControl REST password

name The name of the pool to create

salt.states.bigip.manage_pool_members(*hostname, username, password, name, members*)

Manage the members of an existing pool. This function replaces all current pool members. Only the parameters specified are enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
name The name of the pool to modify
members list of pool members to manage.

salt.states.bigip.manage_profile(*hostname, username, password, profile_type, name, **kwargs*)

Create a new profile if a monitor of this type and name does not already exists. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each profile type. Typically, tmsh arg names are used.

ratio [integer]
session [user-enabled | user-disabled]
member_state (state) [user-up | user-down]

salt.states.bigip.modify_profile(*hostname, username, password, profile_type, name, **kwargs*)

Modify an existing profile. If it does exist, only the parameters specified will be enforced.

hostname The host/address of the bigip device
username The iControl REST username
password The iControl REST password
profile_type The type of profile to create
name The name of the profile to create
kwargs [arg=val] ...

Consult F5 BIGIP user guide for specific options for each monitor type. Typically, tmsh arg names are used.

```

salt.states.bigip.modify_virtual(hostname, username, password, name, destination,
                                pool=None, address_status=None, auto_lasthop=None,
                                bwc_policy=None, cmp_enabled=None, connec-
                                tion_limit=None, dhcp_relay=None, description=None,
                                fallback_persistence=None, flow_eviction_policy=None,
                                gtm_score=None, ip_forward=None, ip_protocol=None, in-
                                ternal=None, twelve_forward=None, last_hop_pool=None,

```

20.19.17 salt.states.blockdev

Management of Block Devices

A state module to manage blockdevices

```
/dev/sda:
  blockdev.tuned:
    - read-only: True

master-data:
  blockdev.tuned:
    - name: /dev/vg/master-data
    - read-only: True
    - read-ahead: 1024
```

New in version 2014.7.0.

`salt.states.blockdev.formatted`(*name*, *fs_type*='ext4', *force*=False, ***kwargs*)

Manage filesystems of partitions.

name The name of the block device

fs_type The filesystem it should be formatted as

force Force mke2fs to create a filesystem, even if the specified device is not a partition on a block special device. This option is only enabled for ext and xfs filesystems

This option is dangerous, use it with caution.

New in version 2016.11.0.

`salt.states.blockdev.tuned`(*name*, ***kwargs*)

Manage options of block device

name The name of the block device

opts:

- **read-ahead** Read-ahead buffer size
- **filesystem-read-ahead** Filesystem Read-ahead buffer size
- **read-only** Set Read-Only
- **read-write** Set Read-Write

20.19.18 salt.states.boto3_elasticache module

Manage Elasticache with boto3

New in version 2017.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3 behind the scenes - as a result it inherits any limitations it boto3's implementation of the AWS API. It is also designed to as directly as possible leverage boto3's parameter naming and semantics. This allows one to use <http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html> as an excellent source for details too involved to reiterate here.

Note: This module is designed to be transparent ("intentionally ignorant" is the phrase I used to describe it to my boss) to new AWS / boto options - since all AWS API params are passed directly through both the state and executions modules, any new args to existing functions which become available after this documentation is written should work immediately.

Brand new API calls, of course, would still require new functions to be added :)

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information is available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKRB08H
elasticache.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKRB08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKRB08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

```
# Using a profile from pillars
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile
```

```
# Passing in a profile
Ensure myelasticache exists:
  boto3_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
```

(continues on next page)

(continued from previous page)

```

- num_cache_nodes: 1
- notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs

```

```

salt.states.boto3_elasticache.cache_cluster_absent(name, wait=600, region=None,
                                                    key=None, keyid=None, profile=None, **args)

```

Ensure a given cache cluster is deleted.

name Name of the cache cluster.

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

CacheClusterId The node group (shard) identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

FinalSnapshotIdentifier The user-supplied name of a final cache cluster snapshot. This is the unique name that identifies the snapshot. ElastiCache creates the snapshot, and then deletes the cache cluster immediately afterward.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto3_elasticache.cache_cluster_present(name, wait=900, security_groups=None, region=None,
                                                    key=None, keyid=None, profile=None, **args)

```

Ensure a given cache cluster exists.

name Name of the cache cluster (cache cluster id).

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

CacheClusterId The node group (shard) identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as 'name' is used if it's not provided.

ReplicationGroupId The ID of the replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster is added to the specified replication group as a read replica; otherwise, the cache cluster is a standalone primary that is not part of any replication group. If the specified repli-

cation group is Multi-AZ enabled and the Availability Zone is not specified, the cache cluster is created in Availability Zones that provide the best spread of read replicas across Availability Zones.

AZMode Specifies whether the nodes in this Memcached cluster are created in a single Availability Zone or created across multiple Availability Zones in the cluster's region. If the AZMode and PreferredAvailabilityZones are not specified, ElastiCache assumes single-az mode.

Note: This parameter is ONLY supported for Memcached cache clusters.

PreferredAvailabilityZone The EC2 Availability Zone in which the cache cluster is created. All nodes belonging to this Memcached cache cluster are placed in the preferred Availability Zone. If you want to create your nodes across multiple Availability Zones, use PreferredAvailabilityZones.

Default: System chosen Availability Zone.

PreferredAvailabilityZones A list of the Availability Zones in which cache nodes are created. The order of the zones in the list is not important. The number of Availability Zones listed must equal the value of NumCacheNodes. If you want all the nodes in the same Availability Zone, use PreferredAvailabilityZone instead, or repeat the Availability Zone multiple times in the list.

Default: System chosen Availability Zones.

Note: This option is ONLY supported on Memcached.

If you are creating your cache cluster in an Amazon VPC (recommended) you can only locate nodes in Availability Zones that are associated with the subnets in the selected subnet group.

NumCacheNodes The initial (integer) number of cache nodes that the cache cluster has.

Note: For clusters running Redis, this value must be 1.

For clusters running Memcached, this value must be between 1 and 20.

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). Valid node types (and pricing for them) are exhaustively described at <https://aws.amazon.com/elasticache/pricing/>

Note:

All T2 instances must be created in a VPC

Redis backup/restore is not supported for Redis (cluster mode disabled) T1 and T2 instances. Backup/restore is supported on Redis (cluster mode enabled) T2 instances.

Redis Append-only files (AOF) functionality is not supported for T1 or T2 instances.

Engine The name of the cache engine to be used for this cache cluster. Valid values for this parameter are: memcached | redis

EngineVersion The version number of the cache engine to be used for this cache cluster. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this cache cluster. If this argument is omitted, the default parameter group for the specified engine is used. You cannot use any parameter group which has cluster-enabled='yes' when creating a cluster.

CacheSubnetGroupName The name of the Cache Subnet Group to be used for the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a subnet group before you start creating a cluster.

CacheSecurityGroupNames A list of Cache Security Group names to associate with this cache cluster. Use this parameter ONLY when you are creating a cache cluster outside of a VPC.

SecurityGroupIds One or more VPC security groups associated with the cache cluster. Use this parameter ONLY when you are creating a cache cluster within a VPC.

Tags A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns A single-element string list containing an Amazon Resource Name (ARN) that uniquely identifies a Redis RDB snapshot file stored in Amazon S3. The snapshot file is used to populate the node group (shard). The Amazon S3 object name in the ARN cannot contain any commas.

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotName The name of a Redis snapshot from which to restore data into the new node group (shard). The snapshot status changes to restoring while the new node group (shard) is being created.

Note: This parameter is ONLY valid if the Engine parameter is redis.

PreferredMaintenanceWindow Specifies the weekly time range during which maintenance on the cache cluster is permitted. It is specified as a range in the format ddd:hh24:mi-ddd:hh24:mi (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for ddd are: sun, mon, tue, wed, thu, fri, sat

Example: sun:23:00-mon:01:30

Port The port number on which each of the cache nodes accepts connections.

Default: 6379

NotificationTopicArn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications are sent.

Note: The Amazon SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade This (boolean) parameter is currently disabled.

SnapshotRetentionLimit The number of days for which ElastiCache retains automatic snapshots before deleting them.

Default: 0 (i.e., automatic backups are disabled for this cache cluster).

Note: This parameter is ONLY valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: 05:00-09:00

Note: This parameter is ONLY valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server.

Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

CacheNodeIdsToRemove A list of cache node IDs to be removed. A node ID is a numeric identifier (0001, 0002, etc.). This parameter is only valid when NumCacheNodes is less than the existing number of cache nodes. The number of cache node IDs supplied in this parameter must match the difference between the existing number of cache nodes in the cluster or pending cache nodes, whichever is greater, and the value of NumCacheNodes in the request.

NewAvailabilityZones The list of Availability Zones where the new Memcached cache nodes are created. This parameter is only valid when NumCacheNodes in the request is greater than the sum of the number of active cache nodes and the number of cache nodes pending creation (which may be zero). The number of Availability Zones supplied in this list must match the cache nodes being added in this request. Note: This option is only supported on Memcached clusters.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active.

Valid values: active | inactive

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto3_elasticache.cache_subnet_group_absent(name, region=None,
                                                         key=None, keyid=None,
                                                         profile=None, **args)

```

Ensure a given cache subnet group is deleted.

name Name of the cache subnet group.

CacheSubnetGroupName A name for the cache subnet group. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto3_elasticache.cache_subnet_group_present(name, subnets=None,
                                                         region=None, key=None,
                                                         keyid=None, profile=None, **args)

```

Ensure cache subnet group exists.

name A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens.

subnets A list of VPC subnets (IDs, Names, or a mix) for the cache subnet group.

CacheSubnetGroupName A name for the cache subnet group. This value is stored as a lowercase string. Constraints: Must contain no more than 255 alphanumeric characters or hyphens. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

CacheSubnetGroupDescription A description for the cache subnet group.

SubnetIds A list of VPC subnet IDs for the cache subnet group. This is ADDITIVE with 'subnets' above.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

keyid.

```
salt.states.boto3_elasticache.replication_group_absent(name, wait=600, re-
                                                       gion=None, key=None,
                                                       keyid=None, profile=None,
                                                       **args)
```

Ensure a given replication group is deleted.

name Name of the replication group.

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

ReplicationGroupId The replication group identifier. Note: In general this parameter is not needed, as 'name' is used if it's not provided.

RetainPrimaryCluster If set to true, all of the read replicas are deleted, but the primary node is retained.

FinalSnapshotIdentifier The name of a final node group (shard) snapshot. ElastiCache creates the snapshot from the primary node in the cluster, rather than one of the replicas; this is to ensure that it captures the freshest data. After the final snapshot is taken, the replication group is immediately deleted.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto3_elasticache.replication_group_present(name, wait=900, se-
                                                       curity_groups=None,
                                                       region=None, key=None,
                                                       keyid=None, profile=None,
                                                       **args)
```

Ensure a replication group exists and is in the given state.

name Name of replication group

wait Integer describing how long, in seconds, to wait for confirmation from AWS that the resource is in the desired state. Zero meaning to return success or failure immediately of course. Note that waiting for the cluster to become available is generally the better course, as failure to do so will often lead to subsequent failures when managing dependent resources.

security_groups One or more VPC security groups (names and/or IDs) associated with the cache cluster.

Note: This is additive with any sec groups provided via the SecurityGroupIds parameter below. Use this parameter ONLY when you are creating a cluster in a VPC.

ReplicationGroupId The replication group identifier. This parameter is stored as a lowercase string.

Constraints:

- A name must contain from 1 to 20 alphanumeric characters or hyphens.
- The first character must be a letter.
- A name cannot end with a hyphen or contain two consecutive hyphens.

Note: In general this parameter is not needed, as 'name' is used if it's not provided.

ReplicationGroupDescription A user-created description for the replication group.

PrimaryClusterId The identifier of the cache cluster that serves as the primary for this replication group. This cache cluster must already exist and have a status of available. This parameter is not required if NumCacheClusters, NumNodeGroups, or ReplicasPerNodeGroup is specified.

AutomaticFailoverEnabled Specifies whether a read-only replica is automatically promoted to read/write primary if the existing primary fails. If true, Multi-AZ is enabled for this replication group. If false,

Multi-AZ is disabled for this replication group.

Default: False

Note: AutomaticFailoverEnabled must be enabled for Redis (cluster mode enabled) replication groups.

ElastiCache Multi-AZ replication groups is not supported on:

- Redis versions earlier than 2.8.6.
 - Redis (cluster mode disabled): T1 and T2 node types.
 - Redis (cluster mode enabled): T2 node types.
-

NumCacheClusters The number of clusters this replication group initially has. This parameter is not used if there is more than one node group (shard). You should use ReplicasPerNodeGroup instead. If Multi-AZ is enabled, the value of this parameter must be at least 2. The maximum permitted value for NumCacheClusters is 6 (primary plus 5 replicas).

PreferredCacheClusterAZs A list of EC2 Availability Zones in which the replication group's cache clusters are created. The order of the Availability Zones in the list is the order in which clusters are allocated. The primary cluster is created in the first AZ in the list. This parameter is not used if there is more than one node group (shard). You should use NodeGroupConfiguration instead. The number of Availability Zones listed must equal the value of NumCacheClusters.

Default: System chosen Availability Zones.

Note: If you are creating your replication group in an Amazon VPC (recommended), you can only locate cache clusters in Availability Zones associated with the subnets in the selected subnet group.

NumNodeGroups An optional parameter that specifies the number of node groups (shards) for this Redis (cluster mode enabled) replication group. For Redis (cluster mode disabled) either omit this parameter or set it to 1.

Default: 1

ReplicasPerNodeGroup An optional parameter that specifies the number of replica nodes in each node group (shard). Valid values are: 0 to 5

NodeGroupConfiguration A list of node group (shard) configuration options. Each node group (shard) configuration has the following: Slots, PrimaryAvailabilityZone, ReplicaAvailabilityZones, ReplicaCount. If you're creating a Redis (cluster mode disabled) or a Redis (cluster mode enabled) replication group, you can use this parameter to configure one node group (shard) or you can omit this parameter. For fiddly details of the expected data layout of this param, see http://boto3.readthedocs.io/en/latest/reference/services/elasticache.html?#ElastiCache.Client.create_replication_group

CacheNodeType The compute and memory capacity of the nodes in the node group (shard). See <https://aws.amazon.com/elasticache/pricing/> for current sizing, prices, and constraints.

Engine The name of the cache engine to be used for the cache clusters in this replication group.

EngineVersion The version number of the cache engine to be used for the cache clusters in this replication group. To view the supported cache engine versions, use the DescribeCacheEngineVersions operation.

Note: You can upgrade to a newer engine version but you cannot downgrade to an earlier engine version. If you want to use an earlier engine version, you must delete the existing cache cluster or replication group and create it anew with the earlier engine version.

CacheParameterGroupName The name of the parameter group to associate with this replication group. If this argument is omitted, the default cache parameter group for the specified engine is used.

Note: If you are running Redis version 3.2.4 or later, only one node group (shard), and want to use a default parameter group, we recommend that you specify the parameter group by name.

To create a Redis (cluster mode disabled) replication group, use `CacheParameterGroupName=default.redis3.2`

To create a Redis (cluster mode enabled) replication group, use `CacheParameterGroupName=default.redis3.2.cluster.on`

CacheSubnetGroupName The name of the cache subnet group to be used for the replication group.

Note: If you're going to launch your cluster in an Amazon VPC, you need to create a s group before you start creating a cluster. For more information, see Subnets and Subnet Groups.

CacheSecurityGroupNames A list of cache security group names to associate with this replication group.

SecurityGroupIds One or more Amazon VPC security groups associated with this replication group. Use this parameter only when you are creating a replication group in an VPC.

Tags A list of tags to be added to this resource. Note that due to shortcomings in the AWS API for ElastiCache, these can only be set during resource creation - later modification is not (currently) supported.

SnapshotArns A list of ARNs that uniquely identify the Redis RDB snapshot files stored in Amazon S3. These snapshot files are used to populate the replication group. The Amazon S3 object name in the ARN cannot contain any commas. The list must match the number of node groups (shards) in the replication group, which means you cannot repartition.

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotName The name of a snapshot from which to restore data into the new replication group. The snapshot status changes to restoring while the new replication group is being created. Note: This parameter is only valid if the Engine parameter is redis.

PreferredMaintenanceWindow Specifies the weekly time range during which maintenance on the cluster is performed. It is specified as a range in the format `ddd:hh24:mi-ddd:hh24:mi` (24H Clock UTC). The minimum maintenance window is a 60 minute period. Valid values for `ddd` are: sun, mon, tue, wed, thu, fri, sat

Example: `sun:23:00-mon:01:30`

Port The port number on which each member of the replication group accepts connections.

NotificationTopicArn The ARN of an SNS topic to which notifications are sent.

Note: The SNS topic owner must be the same as the cache cluster owner.

AutoMinorVersionUpgrade This parameter is currently disabled.

SnapshotRetentionLimit The number of days for which ElastiCache will retain automatic snapshots before deleting them.

Default: 0 (that is, automatic backups are disabled for this cache cluster).

Note: This parameter is only valid if the Engine parameter is redis.

SnapshotWindow The daily time range (in UTC) during which ElastiCache begins taking a daily snapshot of your node group (shard). If you do not specify this parameter, ElastiCache automatically chooses an appropriate time range.

Example: `05:00-09:00`

Note: This parameter is only valid if the Engine parameter is redis.

AuthToken The password used to access a password protected server. Password constraints:

- Must be only printable ASCII characters.
- Must be at least 16 characters and no more than 128 characters in length.
- Cannot contain any of the following characters: '/', '"', or '@'.

SnapshottingClusterId The cache cluster ID that is used as the daily snapshot source for the replication group.

NotificationTopicStatus The status of the SNS notification topic. Notifications are sent only if the status is active. Valid values: active | inactive

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.19 salt.states.boto3_route53 module

Manage Route53 records with Boto 3

New in version 2017.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKRB08H
route53.key: askdjghsdfjkghWupUjasdfklkdflkjglsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKRB08H
  key: askdjghsdfjkghWupUjasdfklkdflkjglsdfjajkghs
  region: us-east-1
```

An exciting new AWS Route 53 Hosted Zone:

```
boto_route53.hosted_zone_present:
- Name: example.com.
- PrivateZone: true
- VPCs:
  - VPCName: MyLittleVPC
    VPCRegion: us-east-1
  - VPCId: vpc-12345678
- region: us-east-1
- keyid: GKTADJGHEIQSXMKRB08H
- key: askdjghsdfjkghWupUjasdfklkdflkjglsdfjajkghs
```

mycnamerecord:

```
boto_route53.rr_present:
- Name: test.example.com.
- ResourceRecords:
  - my-elb.us-east-1.elb.amazonaws.com.
```

(continues on next page)

(continued from previous page)

```

- DomainName: example.com.
- TTL: 60
- Type: CNAME
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkjlsdfjajkghs

```

`salt.states.boto3_route53.hosted_zone_absent` (*name, Name=None, PrivateZone=False, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 Hosted Zone described is absent

name The name of the state definition.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. If not provided, the value of `name` will be used.

PrivateZone Set True if deleting a private hosted zone.

`salt.states.boto3_route53.hosted_zone_present` (*name, Name=None, PrivateZone=False, CallerReference=None, Comment=None, VPCs=None, region=None, key=None, keyid=None, profile=None*)

Ensure a hosted zone exists with the given attributes.

name The name of the state definition.

Name The name of the domain. This should be a fully-specified domain, and should terminate with a period. This is the name you have registered with your DNS registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. If not provided, the value of `name` will be used.

PrivateZone Set True if creating a private hosted zone. If true, then 'VPCs' is also required.

Comment Any comments you want to include about the hosted zone.

CallerReference A unique string that identifies the request and that allows `create_hosted_zone()` calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same `CallerReference`. If not provided, a unique UUID will be generated at each state run, which can potentially lead to duplicate zones being created if the state is run again while the previous zone creation is still in PENDING status (which can occasionally take several minutes to clear). Maximum length of 128.

VPCs A list of dicts, each dict composed of a `VPCRegion`, and either a `VPCId` or a `VPCName`. Note that this param is ONLY used if `PrivateZone == True`

VPCId When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `VPCName`.

VPCName When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with `VPCId`.

VPCRegion When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from `VPCId` or `VPCName`, if possible. This will fail if a given `VPCName` exists in multiple regions visible to the bound account, in which case you'll need to provide an explicit value for `VPCRegion`.

`salt.states.boto3_route53.rr_absent` (*name, HostedZoneId=None, DomainName=None, PrivateZone=False, Name=None, Type=None, SetIdentifier=None, region=None, key=None, keyid=None, profile=None*)

Ensure the Route53 record is deleted.

name The name of the state definition. This will be used for `Name` if the latter is not provided.

HostedZoneId The ID of the zone to delete the record from. Exclusive with `DomainName`.

DomainName The domain name of the zone to delete the record from. Exclusive with `HostedZoneId`.

PrivateZone Set to True if the RR to be removed is in a private zone, False if public.

Name Name of the resource record.

Type The record type (A, NS, MX, TXT, etc.)

SetIdentifier Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

```
salt.states.boto3_route53.rr_present(name, HostedZoneId=None, DomainName=None,
PrivateZone=False, Name=None, Type=None, SetIdentifier=None, Weight=None, Region=None, GeoLocation=None, Failover=None, TTL=None, ResourceRecords=None, AliasTarget=None, HealthCheckId=None, TrafficPolicyInstanceId=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the Route53 record is present.

name The name of the state definition. This will be used for Name if the latter is not provided.

HostedZoneId The ID of a zone to create the record in. Exclusive with DomainName.

DomainName The domain name of a zone to create the record in. Exclusive with HostedZoneId.

PrivateZone Set to True if the resource record should be in a private zone, False if public.

Name Name of the Route 53 resource record being managed.

Type The record type (A, NS, MX, TXT, etc.)

SetIdentifier Valid for Weighted, Latency, Geolocation, and Failover resource record sets only. An identifier that differentiates among multiple resource record sets that have the same combination of DNS name and type. The value of SetIdentifier must be unique for each resource record set that has the same combination of DNS name and type. Omit SetIdentifier for any other types of record sets.

Weight Valid for Weighted resource record sets only. Among resource record sets that have the same combination of DNS name and type, a value that determines the proportion of DNS queries that Amazon Route 53 responds to using the current resource record set. Amazon Route 53 calculates the sum of the weights for the resource record sets that have the same combination of DNS name and type. Amazon Route 53 then responds to queries based on the ratio of a resource's weight to the total.

Note the following:

- You must specify a value for the Weight element for every weighted resource record set.
- You can only specify one ResourceRecord per weighted resource record set.
- You can't create latency, failover, or geolocation resource record sets that have the same values for the Name and Type elements as weighted resource record sets.
- You can create a maximum of 100 weighted resource record sets that have the same values for the Name and Type elements.
- For weighted (but not weighted alias) resource record sets, if you set Weight to 0 for a resource record set, Amazon Route 53 never responds to queries with the applicable value for that resource record set. However, if you set Weight to 0 for all resource record sets that have the same combination of DNS name and type, traffic is routed to all resources with equal probability. The effect of setting Weight to 0 is different when you associate health checks with weighted resource record sets. For more information, see [Options for Configuring Amazon Route 53 Active-Active and Active-Passive Failover](#) in the Amazon Route 53 Developer Guide.

Region Valid for Latency-based resource record sets only. The Amazon EC2 Region where the resource that is specified in this resource record set resides. The resource typically is an AWS resource, such as an EC2 instance or an ELB load balancer, and is referred to by an IP address or a DNS domain name, depending on the record type.

GeoLocation Geo location resource record sets only. A dict that lets you control how Route 53 responds to DNS queries based on the geographic origin of the query. For example, if you want all queries from Africa to be routed to a web server with an IP address of 192.0.2.111, create a resource record set with a

Type of A and a ContinentCode of AF.

```
ContinentCode
  The two-letter code for the continent.
  Valid values: AF | AN | AS | EU | OC | NA | SA
  Constraint: Specifying ContinentCode with either CountryCode or
↳SubdivisionCode
      returns an InvalidInput error.
CountryCode
  The two-letter code for the country.
SubdivisionCode
  The code for the subdivision, for example, a state in the United States
↳or a
  province in Canada.
```

Notes

- Creating geolocation and geolocation alias resource record sets in private hosted zones is not supported.
- If you create separate resource record sets for overlapping geographic regions (for example, one resource record set for a continent and one for a country on the same continent), priority goes to the smallest geographic region. This allows you to route most queries for a continent to one resource and to route queries for a country on that continent to a different resource.
- You can't create two geolocation resource record sets that specify the same geographic location.
- The value * in the CountryCode element matches all geographic locations that aren't specified in other geolocation resource record sets that have the same values for the Name and Type elements.
- Geolocation works by mapping IP addresses to locations. However, some IP addresses aren't mapped to geographic locations, so even if you create geolocation resource record sets that cover all seven continents, Amazon Route 53 will receive some DNS queries from locations that it can't identify. We recommend that you create a resource record set for which the value of CountryCode is *, which handles both queries that come from locations for which you haven't created geolocation resource record sets and queries from IP addresses that aren't mapped to a location. If you don't create a * resource record set, Amazon Route 53 returns a "no answer" response for queries from those locations.
- You can't create non-geolocation resource record sets that have the same values for the Name and Type elements as geolocation resource record sets.

TTL The resource record cache time to live (TTL), in seconds. Note the following:

- If you're creating an alias resource record set, omit TTL. Amazon Route 53 uses the value of TTL for the alias target.
- If you're associating this resource record set with a health check (if you're adding a HealthCheckId element), we recommend that you specify a TTL of 60 seconds or less so clients respond quickly to changes in health status.
- All of the resource record sets in a group of weighted, latency, geolocation, or failover resource record sets must have the same value for TTL.
- If a group of weighted resource record sets includes one or more weighted alias resource record sets for which the alias target is an ELB load balancer, we recommend that you specify a TTL of 60 seconds for all of the non-alias weighted resource record sets that have the same name and type. Values other than 60 seconds (the TTL for load balancers) will change the effect of the values that you specify for Weight.

ResourceRecords A list, containing one or more values for the resource record. No single value can exceed 4,000 characters. For details on how to format values for different record types, see [Supported DNS Resource Record Types](#) in the Amazon Route 53 Developer Guide.

Note: You can specify more than one value for all record types except CNAME and SOA.

It is also possible to pass "magic" strings as resource record values. This functionality can easily be extended, but for the moment supports the following:

```
'magic:ec2_instance_tag:some_tag_name:some_string:some_instance_attr'
```

This tells salt to lookup an EC2 instance with a tag 'some_tag_name' which has the value 'some_string' and substitute the 'some_instance_attr' attribute of that instance as the resource record value being evaluated.

This should work generally for any EC2 instance tags, as long as the instance attribute being fetched is available to `getattr(instance, 'attribute')` as seen in the code below. Anything else will most likely require this function to be extended to handle it.

The canonical use-case for this (at least at our site) is to query the Name tag (which we always populate with the host's FQDN) to lookup the public or private IPs bound to the instance, so we can then automatically create Route 53 records for them.

AliasTarget The rules governing how to define an AliasTarget for the various supported use-cases are obtuse beyond reason and attempting to paraphrase them (or even worse, cut-and-paste them in their entirety) would be silly and counterproductive. If you need this feature, then Read The Fine Materials at the [Boto 3 Route 53 page](#) and/or the [AWS Route 53 docs](#) and suss them for yourself - I sure won't claim to understand them particularly well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile Dict, or pillar key pointing to a dict, containing AWS region/key/keyid.

20.19.20 salt.states.boto_apigateway module

Manage Apigateway Rest APIs

New in version 2016.11.0.

Create and destroy rest apis depending on a swagger version 2 definition file. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
region: us-east-1
```

```
Ensure Apigateway API exists:
boto_apigateway.present:
- name: myfunction
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

```
salt.states.boto_apigateway.absent(name, api_name, stage_name, nuke_api=False, re-
                                     gion=None, key=None, keyid=None, profile=None)
```

Ensure the stage_name associated with the given api_name deployed by boto_apigateway's present state is removed. If the currently associated deployment to the given stage_name has no other stages associated with it, the deployment will also be removed.

name Name of the swagger file in YAML format

api_name Name of the rest api on AWS ApiGateway to ensure is absent.

stage_name Name of the stage to be removed irrespective of the swagger file content. If the current deployment associated with the stage_name has no other stages associated with it, the deployment will also be removed.

nuke_api If True, removes the API itself only if there are no other stages associated with any other deployments once the given stage_name is removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_apigateway.present(name, api_name, swagger_file, stage_name,
                                       api_key_required, lambda_integration_role,
                                       lambda_region=None, stage_variables=None, re-
                                       gion=None, key=None, keyid=None, profile=None,
                                       lambda_funcname_format='{stage}_{api}_{resource}_{method}',
                                       authorization_type='NONE', er-
                                       ror_response_template=None, response_template=None)
```

Ensure the specified api_name with the corresponding swaggerfile is deployed to the given stage_name in AWS ApiGateway.

this state currently only supports ApiGateway integration with AWS Lambda, and CORS support is handled through a Mock integration.

There may be multiple deployments for the API object, each deployment is tagged with a description (i.e. unique label) in pretty printed json format consisting of the following key/values.

```
{
  "api_name": api_name,
  "swagger_file": basename_of_swagger_file
  "swagger_file_md5sum": md5sum_of_swagger_file,
  "swagger_info_object": info_object_content_in_swagger_file
}
```

Please note that the name of the lambda function to be integrated will be derived via the provided lambda_funcname_format parameters:

- the default lambda_funcname_format is a string with the following substitutable keys: "{stage}_{api}_{resource}_{method}". The user can choose to reorder the known keys.
- the stage key corresponds to the stage_name passed in.
- the api key corresponds to the api_name passed in.
- the resource corresponds to the resource path defined in the passed swagger file.
- the method corresponds to the method for a resource path defined in the passed swagger file.

For the default lambda_funcname_format, given the following input:

```
api_name = ' Test Service'
stage_name = 'alpha'
basePath = '/api'
path = '/a/{b}/c'
method = 'POST'
```

We will end up with the following Lambda Function Name that will be looked up: 'test_service_alpha_a_b_c_post'

The canonicalization of these input parameters is done in the following order:

1. lambda_funcname_format is formatted with the input parameters as passed,
2. resulting string is stripped for leading/trailing spaces,
3. path parameter's curly braces are removed from the resource path,
4. consecutive spaces and forward slashes in the paths are replaced with '_'
5. consecutive '_' are replaced with ' _ '

Please note that for error response handling, the swagger file must have an error response model with the following schema. The lambda functions should throw exceptions for any non successful responses. An optional pattern field can be specified in errorMessage field to aid the response mapping from Lambda to the proper error return status codes.

```

Error:
  type: object
  properties:
    stackTrace:
      type: array
      items:
        type: array
        items:
          type: string
        description: call stack
    errorType:
      type: string
      description: error type
    errorMessage:
      type: string
      description: |
        Error message, will be matched based on pattern.
        If no pattern is specified, the default pattern used for response mapping
        ↪ will be +*.

```

name The name of the state definition

api_name The name of the rest api that we want to ensure exists in AWS API Gateway

swagger_file Name of the location of the swagger rest api definition file in YAML format.

stage_name Name of the stage we want to be associated with the given api_name and swagger_file definition

api_key_required True or False - whether the API Key is required to call API methods

lambda_integration_role The name or ARN of the IAM role that the AWS ApiGateway assumes when it executes your lambda function to handle incoming requests

lambda_region The region where we expect to find the lambda functions. This is used to determine the region where we should look for the Lambda Function for integration purposes. The region determination is based on the following priority:

1. lambda_region as passed in (is not None)
2. if lambda_region is None, use the region as if a boto_lambda function were executed without explicitly specifying lambda region.
3. if region determined in (2) is different than the region used by boto_apigateway functions, a final lookup will be attempted using the boto_apigateway region.

stage_variables A dict with variables and their values, or a pillar key (string) that contains a dict with variables and their values. key and values in the dict must be strings. {'string': 'string'}

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

lambda_funcname_format Please review the earlier example for the usage. The only substituable keys in the funcname format are {stage}, {api}, {resource}, {method}. Any other keys or positional substitution parameters will be flagged as an invalid input.

authorization_type This field can be either 'NONE', or 'AWS_IAM'. This will be applied to all methods in the given swagger spec file. Default is set to 'NONE'

error_response_template String value that defines the response template mapping that should be applied in cases error occurs. Refer to AWS documentation for details: <http://docs.aws.amazon.com/apigateway/latest/developerguide/api-gateway-mapping-template-reference.html>

If set to None, the following default value is used:

```
'#set($inputRoot = $input.path('$'))\n'
'{\n'
'  "errorMessage" : "$inputRoot.errorMessage",\n'
'  "errorType" : "$inputRoot.errorType",\n'
'  "stackTrace" : [\n'
'#foreach($stackTrace in $inputRoot.stackTrace)\n'
'    [\n'
'#foreach($elem in $stackTrace)\n'
'      "$elem"\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'    ]\n'
'#if($foreach.hasNext),#end\n'
'#end\n'
'  ]\n'
```

New in version 2017.7.0.

response_template String value that defines the response template mapping applied in case of success (including OPTIONS method) If set to None, empty ({}) template is assumed, which will transfer response from the lambda function as is.

New in version 2017.7.0.

`salt.states.boto_apigateway.usage_plan_absent` (*name*, *plan_name*, *region=None*,
key=None, *keyid=None*, *profile=None*)

Ensures usage plan identified by name is no longer present

New in version 2017.7.0.

name name of the state

plan_name name of the plan to remove

```
usage plan absent:
boto_apigateway.usage_plan_absent:
- plan_name: my_usage_plan
- profile: my_profile
```

`salt.states.boto_apigateway.usage_plan_association_absent` (*name*, *plan_name*,
api_stages, *re-*
gion=None, *key=None*,
keyid=None, *pro-*
file=None)

Ensures usage plan identified by name is removed from provided api_stages If a plan is associated to stages not listed in api_stages parameter, those associations remain intact.

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

apiId apiId of the api to detach usage plan from
stage stage name of the api to detach usage plan from

```
UsagePlanAssociationAbsent:
boto_apigateway.usage_plan_association_absent:
- plan_name: my_plan
- api_stages:
  - apiId: 9kb0404ec0
    stage: my_stage
  - apiId: l9v7o2aj90
    stage: my_stage
- profile: my_profile
```

```
salt.states.boto_apigateway.usage_plan_association_present(name, plan_name,
                                                           api_stages, region=None, key=None,
                                                           keyid=None, profile=None)
```

Ensures usage plan identified by name is added to provided api_stages

New in version 2017.7.0.

name name of the state

plan_name name of the plan to use

api_stages list of dictionaries, where each dictionary consists of the following keys:

apiId apiId of the api to attach usage plan to

stage stage name of the api to attach usage plan to

```
UsagePlanAssociationPresent:
boto_apigateway.usage_plan_association_present:
- plan_name: my_plan
- api_stages:
  - apiId: 9kb0404ec0
    stage: my_stage
  - apiId: l9v7o2aj90
    stage: my_stage
- profile: my_profile
```

```
salt.states.boto_apigateway.usage_plan_present(name, plan_name, description=None,
                                                throttle=None, quota=None, re-
                                                gion=None, key=None, keyid=None,
                                                profile=None)
```

Ensure the specified usage plan with the corresponding metrics is deployed

New in version 2017.7.0.

name name of the state

plan_name [Required] name of the usage plan

throttle [Optional] throttling parameters expressed as a dictionary. If provided, at least one of the throttling parameters must be present

rateLimit rate per second at which capacity bucket is populated

burstLimit maximum rate allowed

quota [Optional] quota on the number of api calls permitted by the plan. If provided, limit and period must be present

limit [Required] number of calls permitted per quota period

offset [Optional] number of calls to be subtracted from the limit at the beginning of the period

period [Required] period to which quota applies. Must be DAY, WEEK or MONTH

```

UsagePlanPresent:
  boto_apigateway.usage_plan_present:
    - plan_name: my_usage_plan
    - throttle:
        rateLimit: 70
        burstLimit: 100
    - quota:
        limit: 1000
        offset: 0
        period: DAY
    - profile: my_profile

```

20.19.21 salt.states.boto_asg

Manage Autoscale Groups

New in version 2014.7.0.

Create and destroy autoscale groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```

asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs

```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1

```

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
        - us-east-1a
        - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
        - myelb
    - suspended_processes:
        - AddToLoadBalancer
        - AlarmNotification

```

(continues on next page)

(continued from previous page)

```

- scaling_policies
  - adjustment_type: ChangeInCapacity
  - as_name: api-production-iad
  - cooldown: 1800
  - min_adjustment_step: None
  - name: ScaleDown
  - scaling_adjustment: -1
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgghs

# Using a profile from pillars.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile: myprofile

# Passing in a profile.
Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc
    - availability_zones:
      - us-east-1a
      - us-east-1b
    - min_size: 1
    - max_size: 1
    - desired_capacity: 1
    - load_balancers:
      - myelb
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkgghs
      region: us-east-1

# Deleting an autoscale group with running instances.
Ensure myasg is deleted:
  boto_asg.absent:
    - name: myasg
    # If instances exist, we must force the deletion of the asg.
    - force: True

```

It's possible to specify cloudwatch alarms that will be setup along with the ASG. Note the alarm name will be the name attribute defined, plus the ASG resource name.

```

Ensure myasg exists:
  boto_asg.present:

```

(continues on next page)

(continued from previous page)

```

- name: myasg
- launch_config_name: mylc
- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- profile: myprofile
- alarms:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_asg_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for an ASG resource.

Setting the alarms in a pillar:

```

my_asg_alarm:
  CPU:
    name: 'ASG CPU **MANAGED BY SALT**'
    attributes:
      metric: CPUUtilization
      namespace: AWS/EC2
      statistic: Average
      comparison: '>='
      threshold: 65.0
      period: 60
      evaluation_periods: 30
      unit: null
      description: 'ASG CPU'
      alarm_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:12345:myalarm' ]

```

Overriding the alarm values on the resource:

```

Ensure myasg exists:
  boto_asg.present:
    - name: myasg
    - launch_config_name: mylc

```

(continues on next page)

(continued from previous page)

```

- availability_zones:
  - us-east-1a
  - us-east-1b
- min_size: 1
- max_size: 1
- desired_capacity: 1
- load_balancers:
  - myelb
- profile: myprofile
- alarms_from_pillar: my_asg_alarm
# override CPU:attributes:threshold
- alarms:
  CPU:
    attributes:
      threshold: 50.0

```

`salt.states.boto_asg.absent` (*name, force=False, region=None, key=None, keyid=None, profile=None, remove_lc=False*)

Ensure the named autoscale group is deleted.

name Name of the autoscale group.

force Force deletion of autoscale group.

remove_lc Delete the launch config as well.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_asg.present` (*name, launch_config_name, availability_zones, min_size, max_size, launch_config=None, desired_capacity=None, load_balancers=None, default_cooldown=None, health_check_type=None, health_check_period=None, placement_group=None, vpc_zone_identifier=None, subnet_names=None, tags=None, termination_policies=None, termination_policies_from_pillar='boto_asg_termination_policies', suspended_processes=None, scaling_policies=None, scaling_policies_from_pillar='boto_asg_scaling_policies', scheduled_actions=None, scheduled_actions_from_pillar='boto_asg_scheduled_actions', alarms=None, alarms_from_pillar='boto_asg_alarms', region=None, key=None, keyid=None, profile=None, notification_arn=None, notification_arn_from_pillar='boto_asg_notification_arn', notification_types=None, notification_types_from_pillar='boto_asg_notification_types'*)

Ensure the autoscale group exists.

name Name of the autoscale group.

launch_config_name Name of the launch config to use for the group. Or, if `launch_config` is specified, this will be the launch config name's prefix. (see below)

launch_config A dictionary of launch config attributes. If specified, a launch config will be used or created, matching this set of attributes, and the autoscale group will be set to use that launch config. The launch config name will be the `launch_config_name` followed by a hyphen followed by a hash of the `launch_config` dict contents. Example:

```

my_asg:
  boto_asg.present:

```

(continues on next page)

(continued from previous page)

```

- launch_config:
  - ebs_optimized: false
  - instance_profile_name: my_iam_profile
  - kernel_id: ''
  - ramdisk_id: ''
  - key_name: my_ssh_key
  - image_name: aws2015091-hvm
  - instance_type: c3.xlarge
  - instance_monitoring: false
  - security_groups:
    - my_sec_group_01
    - my_sec_group_02

```

availability_zones List of availability zones for the group.

min_size Minimum size of the group.

max_size Maximum size of the group.

desired_capacity The desired capacity of the group.

load_balancers List of load balancers for the group. Once set this can not be updated (Amazon restriction).

default_cooldown Number of seconds after a Scaling Activity completes before any further scaling activities can start.

health_check_type The service you want the health status from, Amazon EC2 or Elastic Load Balancer (EC2 or ELB).

health_check_period Length of time in seconds after a new EC2 instance comes into service that Auto Scaling starts checking its health.

placement_group Physical location of your cluster placement group created in Amazon EC2. Once set this can not be updated (Amazon restriction).

vpc_zone_identifier A list of the subnet identifiers of the Virtual Private Cloud.

subnet_names For VPC, a list of subnet names (NOT subnet IDs) to deploy into. Exclusive with **vpc_zone_identifier**.

tags A list of tags. Example:

```

- key: 'key'
  value: 'value'
  propagate_at_launch: true

```

termination_policies A list of termination policies. Valid values are:

- OldestInstance
- NewestInstance
- OldestLaunchConfiguration
- ClosestToNextInstanceHour
- Default

If no value is specified, the Default value is used.

termination_policies_from_pillar: name of pillar dict that contains termination policy settings. Termination policies defined for this specific state will override those from pillar.

suspended_processes List of processes to be suspended. see http://docs.aws.amazon.com/AutoScaling/latest/DeveloperGuide/US_SuspendResume.html

scaling_policies List of scaling policies. Each policy is a dict of key-values described by <https://boto.readthedocs.io/en/latest/ref/autoscale.html#boto.ec2.autoscale.policy.ScalingPolicy>

scaling_policies_from_pillar: name of pillar dict that contains scaling policy settings. Scaling policies defined for this specific state will override those from pillar.

scheduled_actions: a dictionary of scheduled actions. Each key is the name of scheduled action and each value is dictionary of options. For example:

```

- scheduled_actions:
  scale_up_at_10:

```

(continues on next page)

(continued from previous page)

```

desired_capacity: 4
min_size: 3
max_size: 5
recurrence: "0 9 * * 1-5"
scale_down_at_7:
  desired_capacity: 1
  min_size: 1
  max_size: 1
  recurrence: "0 19 * * 1-5"

```

scheduled_actions_from_pillar: name of pillar dict that contains `scheduled_actions` settings. Scheduled actions for this specific state will override those from pillar.

alarms: a dictionary of name->boto_cloudwatch_alarm sections to be associated with this ASG. All attributes should be specified except for dimension which will be automatically set to this ASG.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

If any alarm actions include `self:` this will be replaced with the asg name. For example, `alarm_actions` reading `"[scaling_policy:self:ScaleUp]"` will map to the arn for this asg's scaling policy named `"ScaleUp"`. In addition, any alarms that have only `scaling_policy` as actions will be ignored if `min_size` is equal to `max_size` for this ASG.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

notification_arn The AWS arn that notifications will be sent to

notification_arn_from_pillar name of the pillar dict that contains `notification_arn` settings. A `notification_arn` defined for this specific state will override the one from pillar.

notification_types A list of event names that will trigger a notification. The list of valid notification types is:

- `autoscaling:EC2_INSTANCE_LAUNCH`
- `autoscaling:EC2_INSTANCE_LAUNCH_ERROR`
- `autoscaling:EC2_INSTANCE_TERMINATE`
- `autoscaling:EC2_INSTANCE_TERMINATE_ERROR`
- `autoscaling:TEST_NOTIFICATION`

notification_types_from_pillar name of the pillar dict that contains `notification_types` settings. `notification_types` defined for this specific state will override those from the pillar.

20.19.22 salt.states.boto_cfn

Connection module for Amazon Cloud Formation

New in version 2015.8.0.

depends boto

configuration This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```

keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkgsh

```

```

stack-present:
  boto_cfn.present:
    - name: mystack
    - template_body: salt://base/mytemplate.json
    - disable_rollback: true
    - region: eu-west-1
    - keyid: 'AKIAJHTMIQ2ASDFLASDF'
    - key: 'fdkjsafkljsASSADfalkfjasdf'

```

```

stack-absent:
  boto_cfn.absent:
    - name: mystack

```

`salt.states.boto_cfn.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)
Ensure cloud formation stack is absent.

name (string) – The name of the stack to delete.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (dict) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cfn.present` (*name*, *template_body=None*, *template_url=None*,
parameters=None, *notification_arns=None*, *dis-*
able_rollback=None, *timeout_in_minutes=None*, *capabili-*
ties=None, *tags=None*, *on_failure=None*, *stack_policy_body=None*,
stack_policy_url=None, *use_previous_template=None*,
stack_policy_during_update_body=None,
stack_policy_during_update_url=None, *region=None*, *key=None*,
keyid=None, *profile=None*)

Ensure cloud formation stack is present.

name (string) - Name of the stack.

template_body (string) – Structure containing the template body. Can also be loaded from a file by using `salt://`.

template_url (string) – Location of file containing the template body. The URL must point to a template located in an S3 bucket in the same region as the stack.

parameters (list) – A list of key/value tuples that specify input parameters for the stack. A 3-tuple (key, value, bool) may be used to specify the UsePreviousValue option.

notification_arns (list) – The Simple Notification Service (SNS) topic ARNs to publish stack related events. You can find your SNS topic ARNs using the `SNS_console` or your Command Line Interface (CLI).

disable_rollback (bool) – Indicates whether or not to rollback on failure.

timeout_in_minutes (integer) – The amount of time that can pass before the stack status becomes CREATE_FAILED; if DisableRollback is not set or is set to False, the stack will be rolled back.

capabilities (list) – The list of capabilities you want to allow in the stack. Currently, the only valid capability is 'CAPABILITY_IAM'.

`tags` (dict) – A set of user-defined Tags to associate with this stack, represented by key/value pairs. Tags defined for the stack are propagated to EC2 resources that are created as part of the stack. A maximum number of 10 tags can be specified.

`on_failure` (string) – Determines what action will be taken if stack creation fails. This must be one of: `DO_NOTHING`, `ROLLBACK`, or `DELETE`. You can specify either `OnFailure` or `DisableRollback`, but not both.

`stack_policy_body` (string) – Structure containing the stack policy body. Can also be loaded from a file by using `salt://`.

`stack_policy_url` (string) – Location of a file containing the stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyBody` and `StackPolicyURL`, only `StackPolicyBody` is used.

`use_previous_template` (boolean) – Used only when templates are not the same. Set to `True` to use the previous template instead of uploading a new one via `TemplateBody` or `TemplateURL`.

`stack_policy_during_update_body` (string) – Used only when templates are not the same. Structure containing the temporary overriding stack policy body. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used. Can also be loaded from a file by using `salt://`.

`stack_policy_during_update_url` (string) – Used only when templates are not the same. Location of a file containing the temporary overriding stack policy. The URL must point to a policy (max size: 16KB) located in an S3 bucket in the same region as the stack. If you pass `StackPolicyDuringUpdateBody` and `StackPolicyDuringUpdateURL`, only `StackPolicyDuringUpdateBody` is used.

`region` (string) - Region to connect to.

`key` (string) - Secret key to be used.

`keyid` (string) - Access key to be used.

`profile` (dict) - A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

20.19.23 salt.states.boto_cloudfront

Manage CloudFront distributions

New in version 2018.3.0.

Create, update and destroy CloudFront distributions.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them, either in a pillar file or in the minion's config file:

```
cloudfront.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudfront.key: askdjghsdfjkghWupUjasdfkldfkldgjsdfjajkgsh
```

It's also possible to specify `key`, `keyid`, and `region` via a profile, either passed in as a dict, or a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfkldfkldgjsdfjajkgsh
region: us-east-1
```

```
aws:
  region:
    us-east-1:
      profile:
        keyid: GKTADJGHEIQSXMKKRBJ08H
        key: askdjghsdfjkgHWupUjasdfldkflgjsdfjajkgHs
        region: us-east-1
```

depends boto3

salt.states.boto_cloudfront.present(*name, config, tags, region=None, key=None, keyid=None, profile=None*)

Ensure the CloudFront distribution is present.

name (string) Name of the CloudFront distribution

config (dict) Configuration for the distribution

tags (dict) Tags to associate with the distribution

region (string) Region to connect to

key (string) Secret key to use

keyid (string) Access key to use

profile (dict or string) A dict with region, key, and keyid, or a pillar key (string) that contains such a dict.

Example:

```
Manage my_distribution CloudFront distribution:
  boto_cloudfront.present:
    - name: my_distribution
    - config:
        Comment: 'partial config shown, most parameters elided'
        Enabled: True
    - tags:
        testing_key: testing_value
```

20.19.24 salt.states.boto_cloudtrail module

Manage CloudTrail Objects

New in version 2016.3.0.

Create and destroy CloudTrail objects. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkgHWupUjasdfldkflgjsdfjajkgHs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
    region: us-east-1

```

```

Ensure trail exists:
  boto_cloudtrail.present:
    - Name: mytrail
    - S3BucketName: mybucket
    - S3KeyPrefix: prefix
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

`salt.states.boto_cloudtrail.absent`(*name*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail with passed properties is absent.

name The name of the state definition.

Name Name of the trail.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudtrail.present`(*name*, *Name*, *S3BucketName*, *S3KeyPrefix=None*, *SnsTopicName=None*, *IncludeGlobalServiceEvents=True*, *IsMultiRegionTrail=None*, *EnableLogFileValidation=False*, *CloudWatchLogsLogGroupArn=None*, *CloudWatchLogsRoleArn=None*, *KmsKeyId=None*, *LoggingEnabled=True*, *Tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

name The name of the state definition

Name Name of the trail.

S3BucketName Specifies the name of the Amazon S3 bucket designated for publishing log files.

S3KeyPrefix Specifies the Amazon S3 key prefix that comes after the name of the bucket you have designated for log file delivery.

SnsTopicName Specifies the name of the Amazon SNS topic defined for notification of log file delivery. The maximum length is 256 characters.

IncludeGlobalServiceEvents Specifies whether the trail is publishing events from global services such as IAM to the log files.

EnableLogFileValidation Specifies whether log file integrity validation is enabled. The default is false.

CloudWatchLogsLogGroupArn Specifies a log group name using an Amazon Resource Name (ARN), a unique identifier that represents the log group to which CloudTrail logs will be delivered. Not required unless you specify `CloudWatchLogsRoleArn`.

CloudWatchLogsRoleArn Specifies the role for the CloudWatch Logs endpoint to assume to write to a user's log group.

KmsKeyId Specifies the KMS key ID to use to encrypt the logs delivered by CloudTrail. The value can be an alias name prefixed by "alias/", a fully specified ARN to an alias, a fully specified ARN to a key, or a globally unique identifier.

LoggingEnabled Whether logging should be enabled for the trail

Tags A dictionary of tags that should be set on the trail

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.25 salt.states.boto_cloudwatch_alarm

Manage Cloudwatch alarms

New in version 2014.7.0.

Create and destroy cloudwatch alarms. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto, which can be installed via package, or pip.

This module accepts explicit credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More Information available at:

<http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/iam-roles-for-amazon-ec2.html>

If IAM roles are not used you need to specify them either in a pillar or in the minion's config file:

```
cloudwatch.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch.key: askdjghsdfjkghWupUjasdfkdkflgjsdfjakghs
```

It's also possible to specify key, keyid and region via a profile, either as a passed in dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkdkflgjsdfjakghs
  region: us-east-1
```

```
my test alarm:
  boto_cloudwatch_alarm.present:
    - name: my test alarm
    - attributes:
      metric: ApproximateNumberOfMessagesVisible
      namespace: AWS/SQS
      statistic: Average
      comparison: ">="
      threshold: 20000.0
      period: 60
      evaluation_periods: 1
      description: test alarm via salt
      dimensions:
        QueueName:
          - the-sqs-queue-name
      alarm_actions:
        - arn:aws:sns:us-east-1:111111:myalerting-action
```

salt.states.boto_cloudwatch_alarm.absent (*name, region=None, key=None, keyid=None, profile=None*)

Ensure the named cloudwatch alarm is deleted.

name Name of the alarm.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_alarm.present`(*name*, *attributes*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the cloudwatch alarm exists.

name Name of the alarm

attributes A dict of key/value cloudwatch alarm attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.26 salt.states.boto_cloudwatch_event module

Manage CloudTrail Objects

New in version 2016.11.0.

Create and destroy CloudWatch event rules. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
cloudwatch_event.keyid: GKTADJGHEIQSXMKKRBJ08H
cloudwatch_event.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
  region: us-east-1
```

```
Ensure event rule exists:
  boto_cloudwatch_event.present:
    - Name: mytrail
    - ScheduleExpression: 'rate(120 minutes)'
    - State: 'DISABLED'
    - Targets:
      - Id: "target1"
        Arn: "arn:aws:lambda:us-west-1:124456715622:function:my_function"
        Input: '{"arbitrary": "json"}'
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkghs
```

`salt.states.boto_cloudwatch_event.absent`(*name*, *Name=None*, *region=None*, *key=None*,
keyid=None, *profile=None*)

Ensure CloudWatch event rule with passed properties is absent.

name The name of the state definition.

Name Name of the event rule. Defaults to the value of the 'name' param if not provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_cloudwatch_event.present`(*name*, *Name=None*, *ScheduleExpression=None*,
EventPattern=None, *Description=None*,
RoleArn=None, *State=None*, *Targets=None*,
region=None, *key=None*, *keyid=None*, *profile=None*)

Ensure trail exists.

name The name of the state definition

Name Name of the event rule. Defaults to the value of the 'name' param if not provided.

ScheduleExpression The scheduling expression. For example, `cron(0 20 * * ? *)`, "rate(5 minutes)"

EventPattern The event pattern.

Description A description of the rule

State Indicates whether the rule is ENABLED or DISABLED.

RoleArn The Amazon Resource Name (ARN) of the IAM role associated with the rule.

Targets A list of rresources to be invoked when the rule is triggered.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.27 salt.states.boto_cognitoidentity module

Manage CognitoIdentity Functions

New in version 2016.11.0.

Create and destroy CognitoIdentity identity pools. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
```

(continues on next page)

(continued from previous page)

```
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

Ensure function exists:**boto_cognitoidentity.pool_present:**

- **PoolName:** my_identity_pool
- **region:** us-east-1
- **keyid:** GKTADJGHEIQSXMKKRBJ08H
- **key:** askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```
salt.states.boto_cognitoidentity.pool_absent(name, IdentityPoolName, RemoveAll-
                                             Matched=False, region=None, key=None,
                                             keyid=None, profile=None)
```

Ensure cognito identity pool with passed properties is absent.

name The name of the state definition.

IdentityPoolName Name of the Cognito Identity Pool. Please note that this may match multiple pools with the same given name, in which case, all will be removed.

RemoveAllMatched If True, all identity pools with the matching IdentityPoolName will be removed. If False and there are more than one identity pool with the matching IdentityPoolName, no action will be taken. If False and there is only one identity pool with the matching IdentityPoolName, the identity pool will be removed.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_cognitoidentity.pool_present(name, IdentityPoolName, Authenticat-
                                             edRole, AllowUnauthenticatedIdenti-
                                             ties=False, UnauthenticatedRole=None,
                                             SupportedLoginProviders=None, Devel-
                                             operProviderName=None, OpenIdCon-
                                             nectProviderARNs=None, region=None,
                                             key=None, keyid=None, profile=None)
```

Ensure Cognito Identity Pool exists.

name The name of the state definition

IdentityPoolName Name of the Cognito Identity Pool

AuthenticatedRole An IAM role name or ARN that will be associated with temporary AWS credentials for an authenticated cognito identity.

AllowUnauthenticatedIdentities Whether to allow anonymous user identities

UnauthenticatedRole An IAM role name or ARN that will be associated with anonymous user identities

SupportedLoginProviders A dictionary or pillar that contains key:value pairs mapping provider names to provider app IDs.

DeveloperProviderName A string which is the domain by which Cognito will refer to your users. This name acts as a placeholder that allows your backend and the Cognito service to communicate about the developer provider. Once you have set a developer provider name, you cannot change it. Please take care in setting this parameter.

OpenIdConnectProviderARNs A list or pillar name that contains a list of OpenID Connect provider ARNs.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.28 salt.states.boto_datapipeline module

Manage Data Pipelines

New in version 2016.3.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses boto3, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
datapipeline.keyid: GKTADJGHEIQSXMKKRBJ08H
datapipeline.key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfklgsdfjajkgghs
region: us-east-1
```

```
Ensure daily data pipeline exists:
boto_datapipeline.present:
- name: my-datapipeline
- pipeline_objects:
  DefaultSchedule:
  name: Every 1 day
  fields:
  period: 1 Day
  type: Schedule
  startAt: FIRST_ACTIVATION_DATE_TIME
- parameter_values:
  myDDBTableName: my-dynamo-table
```

`salt.states.boto_datapipeline.absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure a pipeline with the service_name does not exist

name Name of the service to ensure a data pipeline does not exist for.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_datapipeline.present`(*name*, *pipeline_objects=None*, *pipeline_objects_from_pillars='boto_datapipeline_pipeline_objects'*, *parameter_objects=None*, *parameter_objects_from_pillars='boto_datapipeline_parameter_objects'*, *parameter_values=None*, *parameter_values_from_pillars='boto_datapipeline_parameter_values'*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the data pipeline exists with matching definition.

name Name of the service to ensure a data pipeline exists for.

pipeline_objects Pipeline objects to use. Will override objects read from pillars.
pipeline_objects_from_pillars The pillar key to use for lookup.
parameter_objects Parameter objects to use. Will override objects read from pillars.
parameter_objects_from_pillars The pillar key to use for lookup.
parameter_values Parameter values to use. Will override values read from pillars.
parameter_values_from_pillars The pillar key to use for lookup.
region Region to connect to.
key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.29 salt.states.boto_dynamodb

Manage DynamoDB Tables

New in version 2015.5.0.

Create and destroy DynamoDB tables. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit DynamoDB credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkgghs
region: us-east-1
  
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkgghs
  region: us-east-1
  
```

```

Ensure DynamoDB table does not exist:
boto_dynamodb.absent:
  - table_name: new_table
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkgghs
  - region: us-east-1
  
```

```

Ensure DynamoDB table exists:
boto_dynamodb.present:
  - table_name: new_table
  - read_capacity_units: 1
  - write_capacity_units: 2
  - hash_key: primary_id
  - hash_key_data_type: N
  - range_key: start_timestamp
  - range_key_data_type: N
  
```

(continues on next page)

(continued from previous page)

```

- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
- region: us-east-1
- local_indexes:
  - index:
    - name: "primary_id_end_timestamp_index"
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: end_timestamp
    - range_key_data_type: N
- global_indexes:
  - index:
    - name: "name_end_timestamp_index"
    - hash_key: name
    - hash_key_data_type: S
    - range_key: end_timestamp
    - range_key_data_type: N
    - read_capacity_units: 3
    - write_capacity_units: 4

```

It's possible to specify cloudwatch alarms that will be setup along with the DynamoDB table. Note the alarm name will be defined by the name attribute provided, plus the DynamoDB resource name.

```

Ensure DynamoDB table exists:
boto_dynamodb.present:
- name: new_table
- read_capacity_units: 1
- write_capacity_units: 2
- hash_key: primary_id
- hash_key_data_type: N
- range_key: start_timestamp
- range_key_data_type: N
- alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: []
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
- region: us-east-1

```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_dynamodb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```

boto_dynamodb_alarms:
  ConsumedWriteCapacityUnits:
    name: 'DynamoDB ConsumedWriteCapacityUnits **MANAGED BY SALT**'
    attributes:
      metric: ConsumedWriteCapacityUnits
      namespace: AWS/DynamoDB
      statistic: Sum
      comparison: '>='
      # threshold_percent is used to calculate the actual threshold
      # based on the provisioned capacity for the table.
      threshold_percent: 0.75
      period: 300
      evaluation_periods: 2
      unit: Count
      description: 'DynamoDB ConsumedWriteCapacityUnits'
      alarm_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]
      insufficient_data_actions: [ ]
      ok_actions: [ 'arn:aws:sns:us-east-1:1234:my-alarm' ]

Ensure DynamoDB table exists:
  boto_dynamodb.present:
    - name: new_table
    - read_capacity_units: 1
    - write_capacity_units: 2
    - hash_key: primary_id
    - hash_key_data_type: N
    - range_key: start_timestamp
    - range_key_data_type: N
    - alarms:
      ConsumedWriteCapacityUnits:
        attributes:
          threshold_percent: 0.90
          period: 900
  
```

exception salt.states.boto_dynamodb.GsiNotUpdatableError

Raised when a global secondary index cannot be updated.

salt.states.boto_dynamodb.**absent**(name, region=None, key=None, keyid=None, profile=None)

Ensure the DynamoDB table does not exist.

name Name of the DynamoDB table.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_dynamodb.**present**(name=None, table_name=None, region=None, key=None, keyid=None, profile=None, read_capacity_units=None, write_capacity_units=None, alarms=None, alarms_from_pillar='boto_dynamodb_alarms', hash_key=None, hash_key_data_type=None, range_key=None, range_key_data_type=None, local_indexes=None, global_indexes=None, backup_configs_from_pillars='boto_dynamodb_backup_configs')

Ensure the DynamoDB table exists. Table throughput can be updated after table creation.

Global secondary indexes (GSIs) are managed with some exceptions:

- If a GSI deletion is detected, a failure will occur (deletes should be done manually in the AWS console).
- If multiple GSIs are added in a single Salt call, a failure will occur (boto supports one creation at a time). Note that this only applies after table creation; multiple GSIs can be created during table creation.
- Updates to existing GSIs are limited to read/write capacity only (DynamoDB limitation).

name Name of the DynamoDB table

table_name Name of the DynamoDB table (deprecated)

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

read_capacity_units The read throughput for this table

write_capacity_units The write throughput for this table

hash_key The name of the attribute that will be used as the hash key for this table

hash_key_data_type The DynamoDB datatype of the hash key

range_key The name of the attribute that will be used as the range key for this table

range_key_data_type The DynamoDB datatype of the range key

local_indexes The local indexes you would like to create

global_indexes The global indexes you would like to create

backup_configs_from_pillars Pillars to use to configure DataPipeline backups

20.19.30 salt.states.boto_ec2

Manage EC2

New in version 2015.8.0.

This module provides an interface to the Elastic Compute Cloud (EC2) service from AWS.

The below code creates a key pair:

```
create-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - save_private: /root/
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
```

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: 'ssh-rsa AAAA'
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
```

You can also use salt:// in order to define the public key.

```
import-key-pair:
  boto_ec2.key_present:
    - name: mykeypair
    - upload_public: salt://mybase/public_key.pub
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdflkjgsdfjajkghs
```

The below code deletes a key pair:

```

delete-key-pair:
  boto_ec2.key_absent:
    - name: mykeypair
    - region: eu-west-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs

```

`salt.states.boto_ec2.eni_absent` (*name, release_eip=False, region=None, key=None, keyid=None, profile=None*)

Ensure the EC2 ENI is absent.

New in version 2016.3.0.

name Name tag associated with the ENI.

release_eip True/False - release any EIP associated with the ENI

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.eni_present` (*name, subnet_id=None, subnet_name=None, private_ip_address=None, description=None, groups=None, source_dest_check=True, allocate_eip=None, arecords=None, region=None, key=None, keyid=None, profile=None*)

Ensure the EC2 ENI exists.

New in version 2016.3.0.

name Name tag associated with the ENI.

subnet_id The VPC subnet ID the ENI will exist within.

subnet_name The VPC subnet name the ENI will exist within.

private_ip_address The private ip address to use for this ENI. If this is not specified AWS will automatically assign a private IP address to the ENI. Must be specified at creation time; will be ignored afterward.

description Description of the key.

groups A list of security groups to apply to the ENI.

source_dest_check Boolean specifying whether source/destination checking is enabled on the ENI.

allocate_eip allocate and associate an EIP to the ENI. Could be 'standard' to allocate Elastic IP to EC2 region or 'vpc' to get it for a particular VPC

Changed in version 2016.11.0.

arecords A list of arecord dicts with attributes needed for the DNS add_record state. By default the boto_route53.add_record state will be used, which requires: name, zone, ttl, and identifier. See the boto_route53 state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. By default, the private ENI IP address will be used, set 'public: True' in the arecord dict to use the ENI's public IP address

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.instance_absent` (*name, instance_name=None, instance_id=None, release_eip=False, region=None, key=None, keyid=None, profile=None, filters=None*)

Ensure an EC2 instance does not exist (is stopped and removed).

Changed in version 2016.11.0.

name (string) - The name of the state definition.
instance_name (string) - The name of the instance.
instance_id (string) - The ID of the instance.
release_eip (bool) - Release any associated EIPs during termination.
region (string) - Region to connect to.
key (string) - Secret key to be used.
keyid (string) - Access key to be used.
profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
filters (dict) - A dict of additional filters to use in matching the instance to delete.
 YAML example fragment:

```
- filters:
  vpc-id: vpc-abcdef12
```

```
salt.states.boto_ec2.instance_present(name, instance_name=None, instance_id=None,
                                     image_id=None, image_name=None,
                                     tags=None, key_name=None, security_groups=None,
                                     user_data=None, instance_type=None, placement=None,
                                     kernel_id=None, ramdisk_id=None, vpc_id=None,
                                     vpc_name=None, monitoring_enabled=None,
                                     subnet_id=None, subnet_name=None, private_ip_address=None,
                                     block_device_map=None, disable_api_termination=None,
                                     instance_initiated_shutdown_behavior=None,
                                     placement_group=None, client_token=None,
                                     security_group_ids=None, security_group_names=None,
                                     additional_info=None, tenancy=None, instance_profile_arn=None,
                                     instance_profile_name=None, ebs_optimized=None,
                                     network_interfaces=None, network_interface_name=None,
                                     network_interface_id=None, attributes=None, target_state=None,
                                     public_ip=None, allocation_id=None, allocate_eip=False,
                                     region=None, key=None, keyid=None, profile=None)
```

Ensure an EC2 instance is running with the given attributes and state.

name (string) - The name of the state definition. Recommended that this match the `instance_name` attribute (generally the FQDN of the instance).

instance_name (string) - The name of the instance, generally its FQDN. Exclusive with `'instance_id'`.

instance_id (string) - The ID of the instance (if known). Exclusive with `'instance_name'`.

image_id (string) - The ID of the AMI image to run.

image_name (string) - The name of the AMI image to run.

tags (dict) - Tags to apply to the instance.

key_name (string) - The name of the key pair with which to launch instances.

security_groups (list of strings) - The names of the EC2 classic security groups with which to associate instances

user_data (string) - The Base64-encoded MIME user data to be made available to the instance(s) in this reservation.

instance_type (string) - The EC2 instance size/type. Note that only certain types are compatible with HVM based AMIs.

placement (string) - The Availability Zone to launch the instance into.

kernel_id (string) - The ID of the kernel with which to launch the instances.

- ramdisk_id** (string) – The ID of the RAM disk with which to launch the instances.
- vpc_id** (string) – The ID of a VPC to attach the instance to.
- vpc_name** (string) – The name of a VPC to attach the instance to.
- monitoring_enabled** (bool) – Enable detailed CloudWatch monitoring on the instance.
- subnet_id** (string) – The ID of the subnet within which to launch the instances for VPC.
- subnet_name** (string) – The name of the subnet within which to launch the instances for VPC.
- private_ip_address** (string) – If you’re using VPC, you can optionally use this parameter to assign the instance a specific available IP address from the subnet (e.g., 10.0.0.25).
- block_device_map** (boto.ec2.blockdevicemapping.BlockDeviceMapping) – A BlockDeviceMapping data structure describing the EBS volumes associated with the Image.
- disable_api_termination** (bool) – If True, the instances will be locked and will not be able to be terminated via the API.
- instance_initiated_shutdown_behavior** (string) – Specifies whether the instance stops or terminates on instance-initiated shutdown. Valid values are:
- 'stop'
 - 'terminate'
- placement_group** (string) – If specified, this is the name of the placement group in which the instance(s) will be launched.
- client_token** (string) – Unique, case-sensitive identifier you provide to ensure idempotency of the request. Maximum 64 ASCII characters.
- security_group_ids** (list of strings) – The IDs of the VPC security groups with which to associate instances.
- security_group_names** (list of strings) – The names of the VPC security groups with which to associate instances.
- additional_info** (string) – Specifies additional information to make available to the instance(s).
- tenancy** (string) – The tenancy of the instance you want to launch. An instance with a tenancy of 'dedicated' runs on single-tenant hardware and can only be launched into a VPC. Valid values are: "default" or "dedicated". NOTE: To use dedicated tenancy you MUST specify a VPC subnet-ID as well.
- instance_profile_arn** (string) – The Amazon resource name (ARN) of the IAM Instance Profile (IIP) to associate with the instances.
- instance_profile_name** (string) – The name of the IAM Instance Profile (IIP) to associate with the instances.
- ebs_optimized** (bool) – Whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and a tuned configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types.
- network_interfaces** (boto.ec2.networkinterface.NetworkInterfaceCollection) – A NetworkInterfaceCollection data structure containing the ENI specifications for the instance.
- network_interface_name**
(string) – The name of Elastic Network Interface to attach
New in version 2016.11.0.
- network_interface_id**
(string) – The id of Elastic Network Interface to attach
New in version 2016.11.0.
- attributes** (dict) – Instance attributes and value to be applied to the instance. Available options are:
- instanceType – A valid instance type (m1.small)
 - kernel – Kernel ID (None)
 - ramdisk – Ramdisk ID (None)
 - userData – Base64 encoded String (None)
 - disableApiTermination – Boolean (true)
 - instanceInitiatedShutdownBehavior – stop|terminate
 - blockDeviceMapping – List of strings - ie: ['/dev/sda=false']
 - sourceDestCheck – Boolean (true)
 - groupSet – Set of Security Groups or IDs
 - ebsOptimized – Boolean (false)
 - sriovNetSupport – String - ie: 'simple'
- target_state** (string) – The desired target state of the instance. Available options are:

- running
- stopped

Note that this option is currently UNIMPLEMENTED.

public_ip: (string) - The IP of a previously allocated EIP address, which will be attached to the instance. EC2 Classic instances ONLY - for VCP pass in an allocation_id instead.

allocation_id: (string) - The ID of a previously allocated EIP address, which will be attached to the instance. VPC instances ONLY - for Classic pass in a public_ip instead.

allocate_eip: (bool) - Allocate and attach an EIP on-the-fly for this instance. Note you'll want to release this address when terminating the instance, either manually or via the 'release_eip' flag to 'instance_absent'.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_ec2.key_absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Deletes a key pair

`salt.states.boto_ec2.key_present` (*name*, *save_private=None*, *upload_public=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure key pair is present.

`salt.states.boto_ec2.private_ips_absent` (*name*, *network_interface_name=None*, *network_interface_id=None*, *private_ip_addresses=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an ENI does not have secondary private ip addresses associated with it

name (String) - State definition name

network_interface_id (String) - The EC2 network interface id, example eni-123456789

private_ip_addresses (List or String) - The secondary private ip address(es) that should be absent on the ENI.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.private_ips_present` (*name*, *network_interface_name=None*, *network_interface_id=None*, *private_ip_addresses=None*, *allow_reassignment=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure an ENI has secondary private ip addresses associated with it

name (String) - State definition name

network_interface_id (String) - The EC2 network interface id, example eni-123456789

private_ip_addresses (List or String) - The secondary private ip address(es) that should be present on the ENI.

allow_reassignment (Boolean) - If true, will reassign a secondary private ip address associated with another ENI. If false, state will fail if the secondary private ip address is associated with another ENI.

region (string) - Region to connect to.

key (string) - Secret key to be used.

keyid (string) - Access key to be used.

profile (variable) - A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.snapshot_created` (*name*, *ami_name*, *instance_name*, *wait_until_available=True*, *wait_timeout_seconds=300*, ***kwargs*)

Create a snapshot from the given instance

New in version 2016.3.0.

```

salt.states.boto_ec2.volume_absent(name, volume_name=None, volume_id=None, in-
                                  stance_name=None, instance_id=None, device=None,
                                  region=None, key=None, keyid=None, profile=None)

```

Ensure the EC2 volume is detached and absent.

New in version 2016.11.0.

name State definition name.

volume_name Name tag associated with the volume. For safety, if this matches more than one volume, the state will refuse to apply.

volume_id Resource ID of the volume.

instance_name Only remove volume if it is attached to instance with this Name tag. Exclusive with 'instance_id'. Requires 'device'.

instance_id Only remove volume if it is attached to this instance. Exclusive with 'instance_name'. Requires 'device'.

device Match by device rather than ID. Requires one of 'instance_name' or 'instance_id'.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_ec2.volume_present(name, volume_name=None, volume_id=None, in-
                                   stance_name=None, instance_id=None, device=None,
                                   size=None, snapshot_id=None, volume_type=None,
                                   iops=None, encrypted=False, kms_key_id=None, re-
                                   gion=None, key=None, keyid=None, profile=None)

```

Ensure the EC2 volume is present and attached.

name State definition name.

volume_name The Name tag value for the volume. If no volume with that matching name tag is found, a new volume will be created. If multiple volumes are matched, the state will fail.

volume_id Resource ID of the volume. Exclusive with 'volume_name'.

instance_name Attach volume to instance with this Name tag. Exclusive with 'instance_id'.

instance_id Attach volume to instance with this ID. Exclusive with 'instance_name'.

device The device on the instance through which the volume is exposed (e.g. /dev/sdh)

size The size of the new volume, in GiB. If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

snapshot_id The snapshot ID from which the new Volume will be created. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

volume_type The type of the volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'. Valid volume types for AWS can be found here: <http://docs.aws.amazon.com/AWSEC2/latest/UserGuide/EBSVolumeTypes.html>

iops The provisioned IOPS you want to associate with this volume. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

encrypted Specifies whether the volume should be encrypted. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'.

kms_key_id If encrypted is True, this KMS Key ID may be specified to encrypt volume with this key. Optionally specified at volume creation time; will be ignored afterward. Requires 'volume_name'. e.g.: arn:aws:kms:us-east-1:012345678910:key/abcd1234-a123-456a-a12b-a123b4cd56ef

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_ec2.volumes_tagged`(*name*, *tag_maps*, *authoritative=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure EC2 volume(s) matching the given filters have the defined tags.

New in version 2016.11.0.

name State definition name.

tag_maps List of dicts of filters and tags, where 'filters' is a dict suitable for passing to the 'filters' argument of `boto_ec2.get_all_volumes()`, and 'tags' is a dict of tags to be set on volumes as matched by the given filters. The filter syntax is extended to permit passing either a list of `volume_ids` or an `instance_name` (with `instance_name` being the Name tag of the instance to which the desired volumes are mapped). Each mapping in the list is applied separately, so multiple sets of volumes can be all tagged differently with one call to this function.

YAML example fragment:

```
- filters:
  attachment.instance_id: i-abcdef12
  tags:
    Name: dev-int-abcdef12.aws-foo.com
- filters:
  attachment.device: /dev/sdf
  tags:
    ManagedSnapshots: true
    BillingGroup: bubba.hotep@aws-foo.com
- filters:
  instance_name: prd-foo-01.aws-foo.com
  tags:
    Name: prd-foo-01.aws-foo.com
    BillingGroup: infra-team@aws-foo.com
- filters:
  volume_ids: [ vol-12345689, vol-abcdef12 ]
  tags:
    BillingGroup: infra-team@aws-foo.com
```

authoritative Should un-declared tags currently set on matched volumes be deleted? Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.31 salt.states.boto_elasticache

Manage Elasticache

New in version 2014.7.0.

Create, destroy and update Elasticache clusters. Be aware that this interacts with Amazon's services, and so may incur charges.

Note: This module currently only supports creation and deletion of elasticache resources and will not modify clusters when their configuration changes in your state files.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit elasticache credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elasticache.keyid: GKTADJGHEIQSXMKKRBJ08H
elasticache.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

Using a profile from pillars

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile: myprofile
```

Passing in a profile

```
Ensure myelasticache exists:
  boto_elasticache.present:
    - name: myelasticache
    - engine: redis
    - cache_node_type: cache.t1.micro
    - num_cache_nodes: 1
    - notification_topic_arn: arn:aws:sns:us-east-1:879879:my-sns-topic
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

`salt.states.boto_elasticache.absent` (*name*, *wait=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named elasticache cluster is deleted.

name Name of the cache cluster.

wait Boolean. Wait for confirmation from boto that the cluster is in the deleting state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.cache_cluster_absent(*args, **kwargs)
```

```
salt.states.boto_elasticache.cache_cluster_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.creategroup(name, primary_cluster_id, replication_group_description, wait=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the a replication group is create.

name Name of replication group

wait Waits for the group to be available

primary_cluster_id Name of the master cache node

replication_group_description Description for the group

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.present(name, engine=None, cache_node_type=None, num_cache_nodes=None, preferred_availability_zone=None, cache_parameter_group_name=None, cache_security_group_names=None, replication_group_id=None, auto_minor_version_upgrade=True, security_group_ids=None, cache_subnet_group_name=None, engine_version=None, notification_topic_arn=None, preferred_maintenance_window=None, wait=None, region=None, key=None, keyid=None, profile=None)
```

Ensure the cache cluster exists.

name Name of the cache cluster (cache cluster id).

engine The name of the cache engine to be used for this cache cluster. Valid values are memcached or redis.

cache_node_type The compute and memory capacity of the nodes in the cache cluster. cache.t1.micro, cache.m1.small, etc. See: https://boto.readthedocs.io/en/latest/ref/elasticache.html#boto.elasticache.layer1.ElastiCacheConnection.create_cache_cluster

num_cache_nodes The number of cache nodes that the cache cluster will have.

preferred_availability_zone The EC2 Availability Zone in which the cache cluster will be created. All cache nodes belonging to a cache cluster are placed in the preferred availability zone.

port The port number on which each of the cache nodes will accept connections.

cache_parameter_group_name The name of the cache parameter group to associate with this cache cluster. If this argument is omitted, the default cache parameter group for the specified engine will be used.

cache_security_group_names A list of cache security group names to associate with this cache cluster. Use this parameter only when you are creating a cluster outside of a VPC.

replication_group_id The replication group to which this cache cluster should belong. If this parameter is specified, the cache cluster will be added to the specified replication group as a read replica; otherwise, the cache cluster will be a standalone primary that is not part of any replication group.

auto_minor_version_upgrade Determines whether minor engine upgrades will be applied automatically to the cache cluster during the maintenance window. A value of True allows these upgrades to occur; False disables automatic upgrades.

security_group_ids One or more VPC security groups associated with the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

cache_subnet_group_name The name of the cache subnet group to be used for the cache cluster. Use this parameter only when you are creating a cluster in a VPC.

engine_version The version number of the cache engine to be used for this cluster.

notification_topic_arn The Amazon Resource Name (ARN) of the Amazon Simple Notification Service (SNS) topic to which notifications will be sent. The Amazon SNS topic owner must be the same as the cache cluster owner.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur. Example: sun:05:00-sun:09:00

wait Boolean. Wait for confirmation from boto that the cluster is in the available state.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_elasticache.replication_group_absent(name, tags=None, re-
                                                    gion=None, key=None,
                                                    keyid=None, profile=None)
```

```
salt.states.boto_elasticache.replication_group_present(*args, **kwargs)
```

```
salt.states.boto_elasticache.subnet_group_absent(name, tags=None, region=None,
                                                  key=None, keyid=None, pro-
                                                  file=None)
```

```
salt.states.boto_elasticache.subnet_group_present(name, subnet_ids=None, sub-
                                                  net_names=None, description=None,
                                                  tags=None, region=None, key=None,
                                                  keyid=None, profile=None)
```

Ensure ElastiCache subnet group exists.

New in version 2015.8.0.

name The name for the ElastiCache subnet group. This value is stored as a lowercase string.

subnet_ids A list of VPC subnet IDs for the cache subnet group. Exclusive with `subnet_names`.

subnet_names A list of VPC subnet names for the cache subnet group. Exclusive with `subnet_ids`.

description Subnet group description.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.32 salt.states.boto_elasticsearch_domain module

Manage Elasticsearch Domains

New in version 2016.11.0.

Create and destroy Elasticsearch domains. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
region: us-east-1
```

```
Ensure domain exists:
  boto_elasticsearch_domain.present:
    - DomainName: mydomain
    - profile='user-credentials'
    - ElasticsearchVersion: "2.3"
    - ElasticsearchClusterConfig:
      InstanceType": "t2.micro.elasticsearch"
      InstanceCount: 1
      DedicatedMasterEnabled: False
      ZoneAwarenessEnabled: False
    - EBSOptions:
      EBSEnabled: True
      VolumeType: "gp2"
      VolumeSize: 10
      Iops: 0
    - AccessPolicies:
      Version: "2012-10-17"
      Statement:
        - Effect: "Allow"
        - Principal:
          AWS: "*"
        - Action:
          - "es:*"
        - Resource: "arn:aws:es:*:111111111111:domain/mydomain/*"
        - Condition:
          IPAddress:
            "aws:SourceIp":
              - "127.0.0.1"
              - "127.0.0.2"
    - SnapshotOptions:
      AutomatedSnapshotStartHour: 0
    - AdvancedOptions:
      rest.action.multi.allow_explicit_index": "true"
    - Tags:
      a: "b"
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkdfklgjsdfjajkghs
```

```
salt.states.boto_elasticsearch_domain.absent(name, DomainName, region=None,
                                              key=None, keyid=None, profile=None)
```

Ensure domain with passed properties is absent.

name The name of the state definition.

DomainName Name of the domain.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_elasticsearch_domain.present`(*name, DomainName, ElasticsearchClusterConfig=None, EBSOptions=None, AccessPolicies=None, SnapshotOptions=None, AdvancedOptions=None, Tags=None, region=None, key=None, keyid=None, profile=None, ElasticsearchVersion='1.5'*)

Ensure domain exists.

name The name of the state definition

DomainName Name of the domain.

ElasticsearchClusterConfig Configuration options for an Elasticsearch domain. Specifies the instance type and number of instances in the domain cluster.

InstanceType (string) – The instance type for an Elasticsearch cluster.

InstanceCount (integer) – The number of instances in the specified domain cluster.

DedicatedMasterEnabled (boolean) – A boolean value to indicate whether a dedicated master node is enabled. See About Dedicated Master Nodes for more information.

ZoneAwarenessEnabled (boolean) – A boolean value to indicate whether zone awareness is enabled. See About Zone Awareness for more information.

DedicatedMasterType (string) – The instance type for a dedicated master node.

DedicatedMasterCount (integer) – Total number of dedicated master nodes, active and on standby, for the cluster.

EBSOptions Options to enable, disable and specify the type and size of EBS storage volumes.

EBSEnabled (boolean) – Specifies whether EBS-based storage is enabled.

VolumeType (string) – Specifies the volume type for EBS-based storage.

VolumeSize (integer) – Integer to specify the size of an EBS volume.

Iops (integer) – Specifies the IOPD for a Provisioned IOPS EBS volume (SSD).

AccessPolicies IAM access policy

SnapshotOptions Option to set time, in UTC format, of the daily automated snapshot. Default value is 0 hours.

AutomatedSnapshotStartHour (integer) – Specifies the time, in UTC format, when the service takes a daily automated snapshot of the specified Elasticsearch domain. Default value is 0 hours.

AdvancedOptions Option to allow references to indices in an HTTP request body. Must be false when configuring access to individual sub-resources. By default, the value is true .

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

ElasticsearchVersion String of format X.Y to specify version for the Elasticsearch domain eg. "1.5" or "2.3".

20.19.33 salt.states.boto_elb

Manage ELBs

New in version 2014.7.0.

Create and destroy ELBs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit elb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdjfkghWupUjasdfldkdfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdjfkghWupUjasdfldkdfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - availability_zones:
      - us-east-1a
      - us-east-1c
      - us-east-1d
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdjfkghWupUjasdfldkdfklgjsdfjajkghs
    - listeners:
      - elb_port: 443
        instance_port: 80
        elb_protocol: HTTPS
        instance_protocol: HTTP
        certificate: 'arn:aws:iam::1111111:server-certificate/mycert'
        policies:
          - my-ssl-policy
          - cookie-policy
      - elb_port: 8210
        instance_port: 8210
        elb_protocol: TCP
    - backends:
      - instance_port: 80
        policies:
          - enable-proxy-protocol
    - health_check:
      target: 'HTTP:80/'
    - attributes:
      cross_zone_load_balancing:
        enabled: true
      access_log:
        enabled: true
        s3_bucket_name: 'mybucket'
        s3_bucket_prefix: 'my-logs'
        emit_interval: 5
      connecting_settings:
```

(continues on next page)

(continued from previous page)

```

        idle_timeout: 60
    - cnames:
      - name: mycname.example.com.
        zone: example.com.
        ttl: 60
      - name: myothercname.example.com.
        zone: example.com.
    - security_groups:
      - my-security-group
    - policies:
      - policy_name: my-ssl-policy
        policy_type: SSLNegotiationPolicyType
        policy:
          Protocol-TLSv1.2: true
          Protocol-SSLv3: false
          Server-Defined-Cipher-Order: true
          ECDHE-ECDSA-AES128-GCM-SHA256: true
      - policy_name: cookie-policy
        policy_type: LBCookieStickinessPolicyType
        policy: {} # no policy means this is a session cookie
      - policy_name: enable-proxy-protocol
        policy_type: ProxyProtocolPolicyType
        policy:
          ProxyProtocol: true

# Using a profile from pillars
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile

# Passing in a profile
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

It's possible to specify attributes from pillars by specifying a pillar. You can override the values defined in the pillar by setting the attributes on the resource. The module will use the default pillar key 'boto_elb_attributes', which allows you to set default attributes for all ELB resources.

Setting the attributes pillar:

```

my_elb_attributes:
  cross_zone_load_balancing:
    enabled: true
  connection_draining:
    enabled: true
    timeout: 20
  access_log:
    enabled: true
    s3_bucket_name: 'mybucket'
    s3_bucket_prefix: 'my-logs'

```

(continues on next page)

(continued from previous page)

```
emit_interval: 5
```

Overriding the attribute values on the resource:

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - attributes_from_pillar: my_elb_attributes
    # override cross_zone_load_balancing:enabled
    - attributes:
      cross_zone_load_balancing:
        enabled: false
    - profile: myelbprofile
```

It's possible to specify cloudwatch alarms that will be setup along with the ELB. Note the alarm name will be defined by the name attribute provided, plus the ELB resource name.

```
Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms:
      UnHealthyHostCount:
        name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
        attributes:
          metric: UnHealthyHostCount
          namespace: AWS/ELB
          statistic: Average
          comparison: '>='
          threshold: 1.0
          period: 600
          evaluation_periods: 6
          unit: null
          description: ELB UnHealthyHostCount
          alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
          insufficient_data_actions: []
          ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
```

You can also use alarms from pillars, and override values from the pillar alarms by setting overrides on the resource. Note that 'boto_elb_alarms' will be used as a default value for all resources, if defined and can be used to ensure alarms are always set for a resource.

Setting the alarms in a pillar:

```
my_elb_alarm:
  UnHealthyHostCount:
    name: 'ELB UnHealthyHostCount **MANAGED BY SALT**'
    attributes:
      metric: UnHealthyHostCount
      namespace: AWS/ELB
      statistic: Average
      comparison: '>='
      threshold: 1.0
      period: 600
      evaluation_periods: 6
```

(continues on next page)

(continued from previous page)

```

unit: null
description: ELB UnHealthyHostCount
alarm_actions: ['arn:aws:sns:us-east-1:12345:myalarm']
insufficient_data_actions: []
ok_actions: ['arn:aws:sns:us-east-1:12345:myalarm']

```

Overriding the alarm values on the resource:

```

Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - alarms_from_pillar: my_elb_alarm
    # override UnHealthyHostCount:attributes:threshold
    - alarms:
      UnHealthyHostCount:
        attributes:
          threshold: 2.0

```

Tags can also be set:

New in version 2016.3.0.

```

Ensure myelb ELB exists:
  boto_elb.present:
    - name: myelb
    - region: us-east-1
    - profile: myelbprofile
    - tags:
      MyTag: 'My Tag Value'
      OtherTag: 'My Other Value'

```

salt.states.boto_elb.absent(*name, region=None, key=None, keyid=None, profile=None*)

Ensure an ELB does not exist

name name of the ELB

salt.states.boto_elb.present(*name, listeners, availability_zones=None, subnets=None, subnet_names=None, security_groups=None, scheme='internet-facing', health_check=None, attributes=None, attributes_from_pillar='boto_elb_attributes', cnames=None, alarms=None, alarms_from_pillar='boto_elb_alarms', policies=None, policies_from_pillar='boto_elb_policies', backends=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, tags=None, instance_ids=None, instance_names=None*)

Ensure the ELB exists.

name Name of the ELB.

availability_zones A list of availability zones for this ELB.

listeners A list of listener lists; example:

```

[
  [
    ['443', 'HTTPS', 'arn:aws:iam::1111111:server-certificate/mycert'],
    ['8443', '80', 'HTTPS', 'HTTP', 'arn:aws:iam::1111111:server-certificate/↪mycert']
  ]
]

```

subnets A list of subnet IDs in your VPC to attach to your LoadBalancer.

subnet_names A list of subnet names in your VPC to attach to your LoadBalancer.

security_groups The security groups assigned to your LoadBalancer within your VPC. Must be passed either as a list or a comma-separated string.

For example, a list:

```
- security_groups:
  - secgroup-one
  - secgroup-two
```

Or as a comma-separated string:

```
- security_groups: secgroup-one,secgroup-two
```

scheme The type of a LoadBalancer, `internet-facing` or `internal`. Once set, can not be modified.

health_check A dict defining the health check for this ELB.

attributes A dict defining the attributes to set on this ELB. Unknown keys will be silently ignored.

See the `salt.modules.boto_elb.set_attributes` function for recognized attributes.

attributes_from_pillar name of pillar dict that contains attributes. Attributes defined for this specific state will override those from pillar.

cnames A list of cname dicts with attributes needed for the DNS `add_record` state. By default the `boto_route53.add_record` state will be used, which requires: `name`, `zone`, `ttl`, and `identifier`. See the `boto_route53` state for information about these attributes. Other DNS modules can be called by specifying the provider keyword. the cnames dict will be passed to the state as `kwargs`.

See the `salt.states.boto_route53` state for information about these attributes.

alarms: a dictionary of `name->boto_cloudwatch_alarm` sections to be associated with this ELB. All attributes should be specified except for `dimension` which will be automatically set to this ELB.

See the `salt.states.boto_cloudwatch_alarm` state for information about these attributes.

alarms_from_pillar: name of pillar dict that contains alarm settings. Alarms defined for this specific state will override those from pillar.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

wait_for_sync Wait for an `INSYNC` change status from Route53.

tags dict of tags

instance_ids list of instance ids. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_names`.

instance_names list of instance names. The state will ensure that these, and ONLY these, instances are registered with the ELB. This is additive with `instance_ids`.

```
salt.states.boto_elb.register_instances(name, instances, region=None, key=None,
                                       keyid=None, profile=None)
```

Add EC2 instance(s) to an Elastic Load Balancer. Removing an instance from the `instances` list does not remove it from the ELB.

name The name of the Elastic Load Balancer to add EC2 instances to.

instances A list of EC2 instance IDs that this Elastic Load Balancer should distribute traffic to. This state will only ever append new instances to the ELB. EC2 instances already associated with this ELB will not be removed if they are not in the `instances` list.

New in version 2015.8.0.

```

add-instances:
  boto_elb.register_instances:
    - name: myloadbalancer
    - instances:
      - instance-id1
      - instance-id2

```

20.19.34 salt.states.boto_elbv2 module

Manage AWS Application Load Balancer

New in version 2017.7.0.

Add and remove targets from an ALB target group.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit alb credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```

elbv2.keyid: GKTADJGHEIQSXMKKRBJ08H
elbv2.key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
elbv2.region: us-west-2

```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfjlsdfjajkghs
  region: us-east-1

```

```

salt.states.boto_elbv2.create_target_group(name, protocol, port, vpc_id, re-
                                             gion=None, key=None, keyid=None, pro-
                                             file=None, health_check_protocol='HTTP',
                                             health_check_port='traffic-
                                             port', health_check_path='/',
                                             health_check_interval_seconds=30,
                                             health_check_timeout_seconds=5,
                                             healthy_threshold_count=5,          un-
                                             healthy_threshold_count=2, **kwargs)

```

New in version 2017.11.0.

Create target group if not present.

name (string) - The name of the target group.

protocol (string) - The protocol to use for routing traffic to the targets

port (int) - The port on which the targets receive traffic. This port is used unless you specify a port override when registering the traffic.

vpc_id (string) - The identifier of the virtual private cloud (VPC).

health_check_protocol (string) - The protocol the load balancer uses when performing health check on targets. The default is the HTTP protocol.

health_check_port (string) - The port the load balancer uses when performing health checks on targets. The default is 'traffic-port', which indicates the port on which each target receives traffic from the load balancer.

health_check_path (string) - The ping path that is the destination on the targets for health checks. The default is /.

health_check_interval_seconds (integer) - The approximate amount of time, in seconds, between health checks of an individual target. The default is 30 seconds.

health_check_timeout_seconds (integer) - The amount of time, in seconds, during which no response from a target means a failed health check. The default is 5 seconds.

healthy_threshold_count (integer) - The number of consecutive health checks successes required before considering an unhealthy target healthy. The default is 5.

unhealthy_threshold_count (integer) - The number of consecutive health check failures required before considering a target unhealthy. The default is 2.

returns (bool) - True on success, False on failure.

CLI example: .. code-block:: yaml

```
create-target:
  boto_elb2.create_targets_group:
    - name: myALB
    - protocol: https
    - port: 443
    - vpc_id: myVPC
```

salt.states.boto_elbv2.delete_target_group(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete target group.

name (string) - The Amazon Resource Name (ARN) of the resource.

returns (bool) - True on success, False on failure.

CLI example:

```
check-target:
  boto_elb2.delete_targets_group:
    - name: myALB
    - protocol: https
    - port: 443
    - vpc_id: myVPC
```

salt.states.boto_elbv2.targets_deregistered(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

Remove targets to an Application Load Balancer target group.

name The ARN of the Application Load Balancer Target Group to remove targets from.

targets A list of target IDs or a string of a single target registered to the target group to be removed

New in version Unknown.

```
remove-targets:
  boto_elb.targets_deregistered:
    - name: arn:myloadbalancer
    - targets:
      - instance-id1
      - instance-id2
```

salt.states.boto_elbv2.targets_registered(*name*, *targets*, *region=None*, *key=None*, *keyid=None*, *profile=None*, ***kwargs*)

New in version 2017.7.0.

Add targets to an Application Load Balancer target group. This state will not remove targets.

name The ARN of the Application Load Balancer Target Group to add targets to.

targets A list of target IDs or a string of a single target that this target group should distribute traffic to.

```
add-targets:
```

(continues on next page)

(continued from previous page)

```

boto_elb.targets_registered:
- name: arn:myloadbalancer
- targets:
  - instance-id1
  - instance-id2

```

20.19.35 salt.states.boto_iam

Manage IAM objects

New in version 2015.8.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```

delete-user:
boto_iam.user_absent:
- name: myuser
- delete_keys: true

```

```

delete-keys:
boto_iam.keys_absent:
- access_keys:
  - 'AKIAJHTMIQ2ASDFLASDF'
  - 'PQIAJHTMIQ2ASRTLASFR'
- user_name: myuser

```

```

create-user:
boto_iam.user_present:
- name: myuser
- policies:
  mypolicy: |
    {
      "Version": "2012-10-17",
      "Statement": [{
        "Effect": "Allow",
        "Action": "*",
        "Resource": "*"
      }]
    }
- password: NewPassword$$1
- region: eu-west-1
- keyid: 'AKIAJHTMIQ2ASDFLASDF'
- key: 'fdkjsafkljsASSADfalkfjasdf'

```

```

create-group:
boto_iam.group_present:

```

```

salt.states.boto_iam.account_policy(name=None, allow_users_to_change_password=None,
                                     hard_expiry=None, max_password_age=None,
                                     minimum_password_length=None, password_reuse_prevention=None,
                                     require_lowercase_characters=None, require_numbers=None,
                                     require_symbols=None, require_uppercase_characters=None,
                                     region=None, key=None, keyid=None, profile=None)

```

Change account policy.

New in version 2015.8.0.

name (string) The name of the account policy

allow_users_to_change_password (bool) Allows all IAM users in your account to use the AWS Management Console to change their own passwords.

hard_expiry (bool) Prevents IAM users from setting a new password after their password has expired.

max_password_age (int) The number of days that an IAM user password is valid.

minimum_password_length (int) The minimum number of characters allowed in an IAM user password.

password_reuse_prevention (int) Specifies the number of previous passwords that IAM users are prevented from reusing.

require_lowercase_characters (bool) Specifies whether IAM user passwords must contain at least one lowercase character from the ISO basic Latin alphabet (a to z).

require_numbers (bool) Specifies whether IAM user passwords must contain at least one numeric character (0 to 9).

require_symbols (bool) Specifies whether IAM user passwords must contain at least one of the following non-alphanumeric characters: `!@#$%^&*()_+-=[]{}|'`

require_uppercase_characters (bool) Specifies whether IAM user passwords must contain at least one uppercase character from the ISO basic Latin alphabet (A to Z).

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string)

```

salt.states.boto_iam.group_absent(name, region=None, key=None, keyid=None, profile=None)

```

New in version 2015.8.0.

Ensure the IAM group is absent.

name (string) The name of the group.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```

salt.states.boto_iam.group_present(name, policies=None, policies_from_pillars=None,
                                   managed_policies=None, users=None, path='/',
                                   region=None, key=None, keyid=None, profile=None,
                                   delete_policies=True)

```

New in version 2015.8.0.

Ensure the IAM group is present

name (string) The name of the new group.
path (string) The path for the group, defaults to '/'
policies (dict) A dict of IAM group policy documents.
policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument. If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.
managed_policies (list) A list of policy names or ARNs that should be attached to this group.
users (list) A list of users to be added to the group.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
delete_policies (boolean) Delete or detach existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted or detached allowing manual modifications on the IAM group to be persistent.

`salt.states.boto_iam.keys_absent` (*access_keys, user_name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM user access_key_id is absent.

access_key_id (list) A list of access key ids
user_name (string) The username of the user
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iam.keys_present` (*name, number, save_dir, region=None, key=None, keyid=None, profile=None, save_format='{2}\n{0}\n{3}\n{1}\n'*)

New in version 2015.8.0.

Ensure the IAM access keys are present.

name (string) The name of the new user.
number (int) Number of keys that user should have.
save_dir (string) The directory that the key/keys will be saved. Keys are saved to a file named according to the username provided.
region (string) Region to connect to.
key (string) Secret key to be used.
keyid (string) Access key to be used.
profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.
save_format (dict) Save format is repeated for each key. Default format is "{2}{n0}{n3}{n1}{n}", where {0} and {1} are placeholders for new key_id and key respectively, whereas {2} and {3} are "key_id-{number}" and 'key-{number}' strings kept for compatibility.

`salt.states.boto_iam.policy_absent` (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy with the specified name is absent

name (string) The name of the new policy.
region (string) Region to connect to.
key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.policy_present (*name, policy_document, path=None, description=None, region=None, key=None, keyid=None, profile=None*)

New in version 2015.8.0.

Ensure the IAM managed policy is present

name (string) The name of the new policy.

policy_document (dict) The document of the new policy

path (string) The path in which the policy will be created. Default is '/'.

description (string) Description

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.saml_provider_absent (*name, region=None, key=None, keyid=None, profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is absent.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.saml_provider_present (*name, saml_metadata_document, region=None, key=None, keyid=None, profile=None*)

New in version 2016.11.0.

Ensure the SAML provider with the specified name is present.

name (string) The name of the SAML provider.

saml_metadata_document (string) The xml document of the SAML provider.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.server_cert_absent (*name, region=None, key=None, keyid=None, profile=None*)

Deletes a server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.

region (string) The name of the region to connect to.

key (string) The key to be used in order to connect

keyid (string) The keyid to be used in order to connect

profile (string) The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.server_cert_present(name, public_key, private_key, cert_chain=None,
                                         path=None, region=None, key=None, keyid=None,
                                         profile=None)
```

Create server certificate.

New in version 2015.8.0.

name (string) The name for the server certificate. Do not include the path in this value.

public_key (string) The contents of the public key certificate in PEM-encoded format.

private_key (string) The contents of the private key in PEM-encoded format.

cert_chain (string) The contents of the certificate chain. This is typically a concatenation of the PEM-encoded public key certificates of the chain.

path (string) The path for the server certificate.

region (string) The name of the region to connect to.

key (string) The key to be used in order to connect

keyid (string) The keyid to be used in order to connect

profile (string) The profile that contains a dict of region, key, keyid

```
salt.states.boto_iam.user_absent(name, delete_keys=True, delete_mfa_devices=True,
                                  delete_profile=True, region=None, key=None, keyid=None,
                                  profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is absent. User cannot be deleted if it has keys.

name (string) The name of the new user.

delete_keys (bool) Delete all keys from user.

delete_mfa_devices (bool) Delete all mfa devices from user.

New in version 2016.3.0.

delete_profile (bool) Delete profile from user.

New in version 2016.3.0.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_iam.user_present(name, policies=None, policies_from_pillars=None, managed_policies=None,
                                   password=None, path=None, region=None, key=None, keyid=None, profile=None)
```

New in version 2015.8.0.

Ensure the IAM user is present

name (string) The name of the new user.

policies (dict) A dict of IAM group policy documents.

policies_from_pillars (list) A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the policies argument.

If keys conflict, the keys in the policies argument will override the keys defined in policies_from_pillars.

managed_policies (list) A list of managed policy names or ARNs that should be attached to this user.

password (string) The password for the new user. Must comply with account policy.

path (string) The path of the user. Default is '/'.

New in version 2015.8.2.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.36 salt.states.boto_iam_role

Manage IAM roles

New in version 2014.7.0.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit IAM credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
iam.keyid: GKTADJGHEIQSXMKKRBJ08H
iam.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

Creating a role will automatically create an instance profile and associate it with the role. This is the default behavior of the AWS console.

```
myrole:
  boto_iam_role.present:
    - region: us-east-1
    - key: GKTADJGHEIQSXMKKRBJ08H
    - keyid: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
    - policies_from_pillars:
      - shared_iam_bootstrap_policy
    - policies:
      MySQLSPolicy:
        Statement:
          - Action:
              - sqs:*
            Effect: Allow
            Resource:
              - arn:aws:sqs:*:*:*
            Sid: MyPolicySQS1
      MyS3Policy:
        Statement:
          - Action:
              - s3:GetObject
            Effect: Allow
            Resource:
              - arn:aws:s3:*:*:mybucket/*

# Using a credentials profile from pillars
myrole:
```

(continues on next page)

(continued from previous page)

```

boto_iam_role.present:
  - profile: myiamprofile

# Passing in a credentials profile
myrole:
  boto_iam_role.present:
    - profile:
      key: GKTADJGHEIQSXMKKRBJ08H
      keyid: askdjghsdfjkghWupUjasdfklkdflkgjsdfjajkghs
      region: us-east-1

```

If `delete_policies: False` is specified, existing policies that are not in the given list of policies will not be deleted. This allows manual modifications on the IAM role to be persistent. This functionality was added in 2015.8.0.

Note: When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the `profile` data set, `us-east-1` will be used as the default region.

`salt.states.boto_iam_role.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the IAM role is deleted.

name Name of the IAM role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_iam_role.present` (*name*, *policy_document=None*, *policy_document_from_pillars=None*, *path=None*, *policies=None*, *policies_from_pillars=None*, *managed_policies=None*, *create_instance_profile=True*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *delete_policies=True*)

Ensure the IAM role exists.

name Name of the IAM role.

policy_document The policy that grants an entity permission to assume the role. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policy_document_from_pillars A pillar key that contains a role policy document. The statements defined here will be appended with the policy document statements defined in the `policy_document` argument.

New in version 2017.7.0.

path The path to the role/instance profile. (See https://boto.readthedocs.io/en/latest/ref/iam.html#boto.iam.connection.IAMConnection.create_role)

policies A dict of IAM role policies.

policies_from_pillars A list of pillars that contain role policy dicts. Policies in the pillars will be merged in the order defined in the list and key conflicts will be handled by later defined keys overriding earlier defined keys. The policies defined here will be merged with the policies defined in the `policies` argument. If keys conflict, the keys in the `policies` argument will override the keys defined in `policies_from_pillars`.

managed_policies A list of (AWS or Customer) managed policies to be attached to the role.

create_instance_profile A boolean of whether or not to create an instance profile and associate it with this role.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

delete_policies Deletes existing policies that are not in the given list of policies. Default value is True. If False is specified, existing policies will not be deleted allowing manual modifications on the IAM role to be persistent.

New in version 2015.8.0.

20.19.37 salt.states.boto_iot module

Manage IoT Objects

New in version 2016.3.0.

Create and destroy IoT objects. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdjkghWupUjasdfldkfdklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdjkghWupUjasdfldkfdklgjsdfjajkghs
  region: us-east-1
```

```
Ensure policy exists:
boto_iot.policy_present:
  - policyName: mypolicy
  - policyDocument:
    Version: "2012-10-17"
    Statement:
      Action:
        - iot:Publish
      Resource:
        - "*"
      Effect: "Allow"
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdjkghWupUjasdfldkfdklgjsdfjajkghs
```

Ensure topic rule exists:

(continues on next page)

(continued from previous page)

```

boto_iam.topic_rule_present:
  - ruleName: myrule
  - sql: "SELECT * FROM 'iot/test'"
  - description: 'test rule'
  - ruleDisabled: false
  - actions:
    - lambda:
      functionArn: "arn:aws:us-east-1:1234:function/functionname"
  - region: us-east-1
  - keyid: GKTADJGHEIQSXMKKRBJ08H
  - key: askdjghsdfjkghWupUjasdfklkdflkgjsdfjakghs

```

salt.states.boto_iam.policy_absent(*name, policyName, region=None, key=None, keyid=None, profile=None*)

Ensure policy with passed properties is absent.

name The name of the state definition.

policyName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.policy_attached(*name, policyName, principal, region=None, key=None, keyid=None, profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.policy_detached(*name, policyName, principal, region=None, key=None, keyid=None, profile=None*)

Ensure policy is attached to the given principal.

name The name of the state definition.

policyName Name of the policy.

principal The principal which can be a certificate ARN or a Cognito ID.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

salt.states.boto_iam.policy_present(*name, policyName, policyDocument, region=None, key=None, keyid=None, profile=None*)

Ensure policy exists.

name The name of the state definition

policyName Name of the policy.

policyDocument The JSON document that describes the policy. The length of the policyDocument must be a minimum length of 1, with a maximum length of 2048, excluding whitespace.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.thing_type_absent`(*name*, *thingTypeName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure thing type with passed properties is absent.

New in version 2016.11.0.

name The name of the state definition.

thingTypeName Name of the thing type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.thing_type_present`(*name*, *thingTypeName*, *thingTypeDescription*, *searchableAttributesList*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure thing type exists.

New in version 2016.11.0.

name The name of the state definition

thingTypeName Name of the thing type

thingTypeDescription Description of the thing type

searchableAttributesList List of string attributes that are searchable for the thing type

region Region to connect to.

key Secret key to be used.

keyid Access key to be used

profile A dict with region, key, keyid, or a pillar key (string) that contains a dict with region, key, and keyid

`salt.states.boto_iot.topic_rule_absent`(*name*, *ruleName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure topic rule with passed properties is absent.

name The name of the state definition.

ruleName Name of the policy.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_iot.topic_rule_present`(*name*, *ruleName*, *sql*, *actions*, *description=""*, *ruleDisabled=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure topic rule exists.

name The name of the state definition

ruleName Name of the rule.

sql The SQL statement used to query the topic.

actions The actions associated with the rule.

description The description of the rule.

ruleDisable Specifies whether the rule is disabled.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and

keyid.

20.19.38 salt.states.boto_kinesis module

Manage Kinesis Streams

New in version 2017.7.0.

Create and destroy Kinesis streams. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto3`, which can be installed via package, or pip.

This module accepts explicit Kinesis credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
region: us-east-1
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
Ensure Kinesis stream does not exist:
boto_kinesis.absent:
- name: new_stream
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
- region: us-east-1

Ensure Kinesis stream exists:
boto_kinesis.present:
- name: new_stream
- retention_hours: 168
- enhanced_monitoring: ['ALL']
- num_shards: 2
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
- region: us-east-1
```

`salt.states.boto_kinesis.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Delete the kinesis stream, if it exists.

name (string) Stream name

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_kinesis.present(name, retention_hours=None, enhanced_monitoring=None,
                                   num_shards=None, do_reshard=True, region=None, key=None,
                                   keyid=None, profile=None)
```

Ensure the kinesis stream is properly configured and scaled.

name (string) Stream name

retention_hours (int) Retain data for this many hours. AWS allows minimum 24 hours, maximum 168 hours.

enhanced_monitoring (list of string) Turn on enhanced monitoring for the specified shard-level metrics. Pass in ['ALL'] or True for all metrics, [] or False for no metrics. Turn on individual metrics by passing in a list: ['IncomingBytes', 'OutgoingBytes'] Note that if only some metrics are supplied, the remaining metrics will be turned off.

num_shards (int) Reshard stream (if necessary) to this number of shards !!!!! Resharding is expensive! Each split or merge can take up to 30 seconds, and the reshard method balances the partition space evenly. Resharding from N to N+1 can require 2N operations. Resharding is much faster with powers of 2 (e.g. 2^N to 2^{N+1}) !!!!!

do_reshard (boolean) If set to False, this script will NEVER reshard the stream, regardless of other input. Useful for testing.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (dict) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.39 salt.states.boto_kms

Manage KMS keys, key policies and grants.

New in version 2015.8.0.

Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit kms credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
elb.keyid: GKTADJGHEIQSXMKKRBJ08H
elb.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure mykey key exists:
```

```
  boto_kms.key_present:
```

- **name:** mykey
- **region:** us-east-1

```
# Using a profile from pillars
```

```
Ensure mykey key exists:
```

(continues on next page)

(continued from previous page)

```

boto_kms.key_present:
- name: mykey
- region: us-east-1
- profile: myprofile

# Passing in a profile
Ensure mykey key exists:
boto_key.key_present:
- name: mykey
- region: us-east-1
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkdflkjgjsdfjajkghs

```

```

salt.states.boto_kms.key_present(name, policy, description=None, key_usage=None,
                                grants=None, manage_grants=False, key_rotation=False,
                                enabled=True, region=None, key=None, keyid=None, profile=None)

```

Ensure the KMS key exists. KMS keys can not be deleted, so this function must be used to ensure the key is enabled or disabled.

name Name of the key.

policy Key usage policy.

description Description of the key.

key_usage Specifies the intended use of the key. Can only be set on creation, defaults to ENCRYPT_DECRYPT, which is also the only supported option.

grants A list of grants to apply to the key. Not currently implemented.

manage_grants Whether or not to manage grants. False by default, which will not manage any grants.

key_rotation Whether or not key rotation is enabled for the key. False by default.

enabled Whether or not the key is enabled. True by default.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.40 salt.states.boto_lambda module

Manage Lambda Functions

New in version 2016.3.0.

Create and destroy Lambda Functions. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure function exists:
  boto_lambda.function_present:
    - FunctionName: myfunction
    - Runtime: python2.7
    - Role: iam_role_name
    - Handler: entry_function
    - ZipFile: code.zip
    - S3Bucket: bucketname
    - S3Key: keyname
    - S3ObjectVersion: version
    - Description: "My Lambda Function"
    - Timeout: 3
    - MemorySize: 128
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_lambda.alias_absent`(*name*, *FunctionName*, *Name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

Name Name of the alias.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.alias_present`(*name*, *FunctionName*, *Name*, *FunctionVersion*, *Description=""*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure alias exists.

name The name of the state definition.

FunctionName Name of the function for which you want to create an alias.

Name The name of the alias to be created.

FunctionVersion Function version for which you are creating the alias.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_absent`(*name*, *EventSourceArn*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping with passed properties is absent.

name The name of the state definition.

EventSourceArn ARN of the event source.

FunctionName Name of the lambda function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.event_source_mapping_present`(*name*, *EventSourceArn*, *FunctionName*, *StartingPosition*, *Enabled=True*, *BatchSize=100*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure event source mapping exists.

name The name of the state definition.

EventSourceArn The Amazon Resource Name (ARN) of the Amazon Kinesis or the Amazon DynamoDB stream that is the event source.

FunctionName The Lambda function to invoke when AWS Lambda detects an event on the stream.

You can specify an unqualified function name (for example, "Thumbnail") or you can specify Amazon Resource Name (ARN) of the function (for example, "arn:aws:lambda:us-west-2:account-id:function:ThumbNail"). AWS Lambda also allows you to specify only the account ID qualifier (for example, "account-id:Thumbnail"). Note that the length constraint applies only to the ARN. If you specify only the function name, it is limited to 64 character in length.

StartingPosition The position in the stream where AWS Lambda should start reading. (TRIM_HORIZON | LATEST)

Enabled Indicates whether AWS Lambda should begin polling the event source. By default, Enabled is true.

BatchSize The largest number of records that AWS Lambda will retrieve from your event source at the time of invoking your function. Your function receives an event with all the retrieved records. The default is 100 records.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_lambda.function_absent`(*name*, *FunctionName*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure function with passed properties is absent.

name The name of the state definition.

FunctionName Name of the function.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lambda.function_present(name, FunctionName, Runtime, Role, Handler,
                                        ZipFile=None, S3Bucket=None, S3Key=None,
                                        S3ObjectVersion=None, Description="", Timeout=3,
                                        MemorySize=128, Permissions=None, RoleRe-
                                        tries=5, region=None, key=None, keyid=None, pro-
                                        file=None, VpcConfig=None, Environment=None)
```

Ensure function exists.

name The name of the state definition

FunctionName Name of the Function.

Runtime The Runtime environment for the function. One of 'nodejs', 'java8', or 'python2.7'

Role The name or ARN of the IAM role that the function assumes when it executes your function to access any other AWS resources.

Handler The function within your code that Lambda calls to begin execution. For Node.js it is the module-name.*export* value in your function. For Java, it can be package.classname::handler or package.class-name.

ZipFile A path to a .zip file containing your deployment package. If this is specified, S3Bucket and S3Key must not be specified.

S3Bucket Amazon S3 bucket name where the .zip file containing your package is stored. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3Key The Amazon S3 object (the deployment package) key name you want to upload. If this is specified, S3Key must be specified and ZipFile must NOT be specified.

S3ObjectVersion The version of S3 object to use. Optional, should only be specified if S3Bucket and S3Key are specified.

Description A short, user-defined function description. Lambda does not use this value. Assign a meaningful description as you see fit.

Timeout The function execution time at which Lambda should terminate this function. Because the execution time has cost implications, we recommend you set this value based on your expected execution time. The default is 3 seconds.

MemorySize The amount of memory, in MB, your function is given. Lambda uses this memory size to infer the amount of CPU and memory allocated to your function. Your function use-case determines your CPU and memory requirements. For example, a database operation might need less memory compared to an image processing function. The default value is 128 MB. The value must be a multiple of 64 MB.

VpcConfig If your Lambda function accesses resources in a VPC, you must provide this parameter identifying the list of security group IDs/Names and subnet IDs/Name. These must all belong to the same VPC. This is a dict of the form:

```
VpcConfig:
  SecurityGroupNames:
    - mysecgroup1
    - mysecgroup2
  SecurityGroupIds:
    - sg-abcdef1234
  SubnetNames:
    - mysubnet1
  SubnetIds:
    - subnet-1234abcd
    - subnet-abcd1234
```

If VpcConfig is provided at all, you MUST pass at least one security group and one subnet.

Permissions A list of permission definitions to be added to the function's policy

RoleRetries IAM Roles may take some time to propagate to all regions once created. During that time function creation may fail; this state will automatically retry this number of times. The default is 5.

Environment The parent object that contains your environment's configuration settings. This is a dictionary of the form:

```
{
  'Variables': {
    'VariableName': 'VariableValue'
  }
}
```

New in version 2017.7.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.41 salt.states.boto_lc

Manage Launch Configurations

New in version 2014.7.0.

Create and destroy Launch Configurations. Be aware that this interacts with Amazon's services, and so may incur charges.

A limitation of this module is that you can not modify launch configurations once they have been created. If a launch configuration with the specified name exists, this module will always report success, even if the specified configuration doesn't match. This is due to a limitation in Amazon's launch configuration API, as it only allows launch configurations to be created and deleted.

Also note that a launch configuration that's in use by an autoscale group can not be deleted until the autoscale group is no longer using it. This may affect the way in which you want to order your states.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit autoscale credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
asg.keyid: GKTADJGHEIQSXMKKRBJ08H
asg.key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsd fjkghWupUjasdf lkd fklgjsdfjajkghs
  region: us-east-1
```

Credential information is shared with autoscale groups as launch configurations and autoscale groups are completely dependent on each other.

```
Ensure mylc exists:
  boto_lc.present:
    - name: mylc
    - image_id: ami-0b9c9f62
    - key_name: mykey
```

(continues on next page)

(continued from previous page)

```

- security_groups:
  - mygroup
- instance_type: m1.small
- instance_monitoring: true
- block_device_mappings:
  - '/dev/sda1':
    size: 20
    volume_type: 'io1'
    iops: 220
    delete_on_termination: true
- cloud_init:
  boothooks:
    'disable-master.sh': |
      #!/bin/bash
      echo "manual" > /etc/init/salt-master.override
  scripts:
    'run_salt.sh': |
      #!/bin/bash

      add-apt-repository -y ppa:saltstack/salt
      apt-get update
      apt-get install -y salt-minion
      salt-call state.highstate
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkgHs

# Using a profile from pillars.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile: myprofile

# Passing in a profile.
Ensure mylc exists:
boto_lc.present:
- name: mylc
- image_id: ami-0b9c9f62
- profile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkgHs
  region: us-east-1

```

`salt.states.boto_lc.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named launch configuration is deleted.

name Name of the launch configuration.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_lc.present(name, image_id, key_name=None, vpc_id=None, vpc_name=None,
                             security_groups=None, user_data=None, cloud_init=None, in-
                             stance_type='m1.small', kernel_id=None, ramdisk_id=None,
                             block_device_mappings=None, delete_on_termination=None,
                             instance_monitoring=False, spot_price=None, in-
                             stance_profile_name=None, ebs_optimized=False, asso-
                             ciate_public_ip_address=None, region=None, key=None, keyid=None,
                             profile=None)
```

Ensure the launch configuration exists.

name Name of the launch configuration.

image_id AMI to use for instances. AMI must exist or creation of the launch configuration will fail.

key_name Name of the EC2 key pair to use for instances. Key must exist or creation of the launch configuration will fail.

vpc_id The VPC id where the security groups are defined. Only necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with `vpc_name`.

vpc_name Name of the VPC where the security groups are defined. Only Necessary when using named security groups that exist outside of the default VPC. Mutually exclusive with `vpc_id`.

security_groups List of Names or security group id's of the security groups with which to associate the EC2 instances or VPC instances, respectively. Security groups must exist, or creation of the launch configuration will fail.

user_data The user data available to launched EC2 instances.

cloud_init A dict of cloud_init configuration. Currently supported values: scripts, cloud-config. Mutually exclusive with `user_data`.

instance_type The instance type. ex: m1.small.

kernel_id The kernel id for the instance.

ramdisk_id The RAM disk ID for the instance.

block_device_mappings A dict of block device mappings that contains a dict with `volume_type`, `delete_on_termination`, `iops`, `size`, `encrypted`, `snapshot_id`.

volume_type Indicates what volume type to use. Valid values are standard, io1, gp2. Default is standard.

delete_on_termination Whether the volume should be explicitly marked for deletion when its instance is terminated (True), or left around (False). If not provided, or None is explicitly passed, the default AWS behaviour is used, which is True for ROOT volumes of instances, and False for all others.

iops For Provisioned IOPS (SSD) volumes only. The number of I/O operations per second (IOPS) to provision for the volume.

size Desired volume size (in GiB).

encrypted Indicates whether the volume should be encrypted. Encrypted EBS volumes must be attached to instances that support Amazon EBS encryption. Volumes that are created from encrypted snapshots are automatically encrypted. There is no way to create an encrypted volume from an unencrypted snapshot or an unencrypted volume from an encrypted snapshot.

instance_monitoring Whether instances in group are launched with detailed monitoring.

spot_price The spot price you are bidding. Only applies if you are building an autoscaling group with spot instances.

instance_profile_name The name or the Amazon Resource Name (ARN) of the instance profile associated with the IAM role for the instance. Instance profile must exist or the creation of the launch configuration will fail.

ebs_optimized Specifies whether the instance is optimized for EBS I/O (true) or not (false).

associate_public_ip_address Used for Auto Scaling groups that launch instances into an Amazon Virtual Private Cloud. Specifies whether to assign a public IP address to each instance launched in a Amazon VPC.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.42 salt.states.boto_rds

Manage RDSs

New in version 2015.8.0.

Create and destroy RDS instances. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via `package`, or `pip`.

This module accepts explicit `rds` credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
rds.keyid: GKTADJGHEIQSXMKKRBJ08H
rds.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
Ensure myrds RDS exists:
boto_rds.present:
- name: myrds
- allocated_storage: 5
- storage_type: standard
- db_instance_class: db.t2.micro
- engine: MySQL
- master_username: myuser
- master_user_password: mypass
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
- tags:
  key: value
```

```
Ensure parameter group exists:
create-parameter-group:
  boto_rds.parameter_present:
  - name: myparametergroup
  - db_parameter_group_family: mysql5.6
  - description: "parameter group family"
  - parameters:
    - binlog_cache_size: 32768
    - binlog_checksum: CRC32
  - region: eu-west-1
```

`depends` boto3

`salt.states.boto_rds.absent` (*name*, *skip_final_snapshot=None*, *final_db_snapshot_identifier=None*, *tags=None*, *wait_for_deletion=True*, *timeout=180*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure RDS instance is absent.

name Name of the RDS instance.

skip_final_snapshot Whether a final db snapshot is created before the instance is deleted. If True, no snapshot is created. If False, a snapshot is created before deleting the instance.

final_db_snapshot_identifier If a final snapshot is requested, this is the identifier used for that snapshot.

tags A dict of tags.

wait_for_deletion (bool) Wait for the RDS instance to be deleted completely before finishing the state.

timeout (in seconds) The amount of time that can pass before raising an Exception.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.parameter_present(name, db_parameter_group_family, description,
                                       parameters=None, apply_method='pending-reboot',
                                       tags=None, region=None, key=None, keyid=None,
                                       profile=None)
```

Ensure DB parameter group exists and update parameters.

name The name for the parameter group.

db_parameter_group_family The DB parameter group family name. A DB parameter group can be associated with one and only one DB parameter group family, and can be applied only to a DB instance running a database engine and engine version compatible with that DB parameter group family.

description Parameter group description.

parameters The DB parameters that need to be changed of type dictionary.

apply_method The *apply-immediate* method can be used only for dynamic parameters; the *pending-reboot* method can be used with MySQL and Oracle DB instances for either dynamic or static parameters. For Microsoft SQL Server DB instances, the *pending-reboot* method can be used only for static parameters.

tags A dict of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.present(name, allocated_storage, db_instance_class, engine, master_username,
                             master_user_password, db_name=None, storage_type=None, db_security_groups=None,
                             vpc_security_group_ids=None, vpc_security_groups=None, availability_zone=None,
                             db_subnet_group_name=None, preferred_maintenance_window=None,
                             db_parameter_group_name=None, db_cluster_identifier=None, tde_credential_arn=None,
                             tde_credential_password=None, storage_encrypted=None, kms_keyid=None,
                             backup_retention_period=None, preferred_backup_window=None, port=None,
                             multi_az=None, engine_version=None, auto_minor_version_upgrade=None,
                             license_model=None, iops=None, option_group_name=None, character_set_name=None,
                             publicly_accessible=None, wait_status=None, tags=None, copy_tags_to_snapshot=None,
                             region=None, domain=None, key=None, keyid=None, monitoring_interval=None,
                             monitoring_role_arn=None, domain_iam_role_name=None, promotion_tier=None, profile=None)
```

Ensure RDS instance exists.

name Name of the RDS state definition.

allocated_storage The amount of storage (in gigabytes) to be initially allocated for the database instance.

db_instance_class The compute and memory capacity of the Amazon RDS DB instance.

engine The name of the database engine to be used for this instance. Supported engine types are: MySQL, mariadb, oracle-se1, oracle-se, oracle-ee, sqlserver-ee, sqlserver-se, sqlserver-ex, sqlserver-web, postgres and aurora. For more information, please see the `engine` argument in the Boto3 RDS `create_db_instance` documentation.

master_username The name of master user for the client DB instance.

master_user_password The password for the master database user. Can be any printable ASCII character except `"/", "'",` or `"@"`.

db_name The meaning of this parameter differs according to the database engine you use. See the Boto3 RDS documentation to determine the appropriate value for your configuration. https://boto3.readthedocs.io/en/latest/reference/services/rds.html#RDS.Client.create_db_instance

storage_type Specifies the storage type to be associated with the DB instance. Options are standard, gp2 and io1. If you specify io1, you must also include a value for the `Iops` parameter.

db_security_groups A list of DB security groups to associate with this DB instance.

vpc_security_group_ids A list of EC2 VPC security group IDs to associate with this DB instance.

vpc_security_groups A list of EC2 VPC security groups (IDs or Name tags) to associate with this DB instance.

availability_zone The EC2 Availability Zone that the database instance will be created in.

db_subnet_group_name A DB subnet group to associate with this DB instance.

preferred_maintenance_window The weekly time range (in UTC) during which system maintenance can occur.

db_parameter_group_name A DB parameter group to associate with this DB instance.

db_cluster_identifier If the DB instance is a member of a DB cluster, contains the name of the DB cluster that the DB instance is a member of.

tde_credential_arn The ARN from the Key Store with which the instance is associated for TDE encryption.

tde_credential_password The password to use for TDE encryption if an encryption key is not used.

storage_encrypted Specifies whether the DB instance is encrypted.

kms_keyid If `storage_encrypted` is true, the KMS key identifier for the encrypted DB instance.

backup_retention_period The number of days for which automated backups are retained.

preferred_backup_window The daily time range during which automated backups are created if automated backups are enabled.

port The port number on which the database accepts connections.

multi_az Specifies if the DB instance is a Multi-AZ deployment. You cannot set the `AvailabilityZone` parameter if the `MultiAZ` parameter is set to true.

engine_version The version number of the database engine to use.

auto_minor_version_upgrade Indicates that minor engine upgrades will be applied automatically to the DB instance during the maintenance window.

license_model License model information for this DB instance.

iops The amount of Provisioned IOPS (input/output operations per second) to be initially allocated for the DB instance.

option_group_name Indicates that the DB instance should be associated with the specified option group.

character_set_name For supported engines, indicates that the DB instance should be associated with the specified `CharacterSet`.

publicly_accessible Specifies the accessibility options for the DB instance. A value of true specifies an Internet-facing instance with a publicly resolvable DNS name, which resolves to a public IP address. A value of false specifies an internal instance with a DNS name that resolves to a private IP address.

wait_status Wait for the RDS instance to reach a desired status before finishing the state. Available states: available, modifying, backing-up

tags A dict of tags.

copy_tags_to_snapshot Specifies whether tags are copied from the DB instance to snapshots of the DB instance.

region Region to connect to.

domain The identifier of the Active Directory Domain.

key AWS secret key to be used.

keyid AWS access key to be used.

monitoring_interval The interval, in seconds, between points when Enhanced Monitoring metrics are collected for the DB instance.

monitoring_role_arn The ARN for the IAM role that permits RDS to send Enhanced Monitoring metrics to CloudWatch Logs.

domain_iam_role_name Specify the name of the IAM role to be used when making API calls to the Directory Service.

promotion_tier A value that specifies the order in which an Aurora Replica is promoted to the primary instance after a failure of the existing primary instance. For more information, see Fault Tolerance for an Aurora DB Cluster .

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_rds.replica_present(name, source, db_instance_class=None,
                                     availability_zone=None, port=None,
                                     auto_minor_version_upgrade=None, iops=None, option_group_name=None,
                                     publicly_accessible=None, tags=None, region=None, key=None, keyid=None,
                                     profile=None, db_parameter_group_name=None)
```

Ensure RDS replica exists.

```
Ensure myrds replica RDS exists:
boto_rds.create_replica:
- name: myreplica
- source: mydb
```

```
salt.states.boto_rds.subnet_group_absent(name, tags=None, region=None, key=None,
                                          keyid=None, profile=None)
```

```
salt.states.boto_rds.subnet_group_present(name, description, subnet_ids=None, subnet_names=None,
                                           tags=None, region=None, key=None, keyid=None, profile=None)
```

Ensure DB subnet group exists.

name The name for the DB subnet group. This value is stored as a lowercase string.

subnet_ids A list of the EC2 Subnet IDs for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

subnet_names A list of The EC2 Subnet names for the DB subnet group. Either `subnet_ids` or `subnet_names` must be provided.

description Subnet group description.

tags A dict of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.43 salt.states.boto_route53

Manage Route53 records

New in version 2014.7.0.

Create and delete Route53 records. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit route53 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration

is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
route53.keyid: GKTADJGHEIQSXMKKRBJ08H
route53.key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkgHs
```

It's also possible to specify key, keyid and region via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkgHs
  region: us-east-1
```

```
mycnamerecord:
  boto_route53.present:
    - name: test.example.com.
    - value: my-elb.us-east-1.elb.amazonaws.com.
    - zone: example.com.
    - ttl: 60
    - record_type: CNAME
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkgHs
```

Using a profile from pillars

```
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile: myprofile
```

Passing in a profile

```
myarecord:
  boto_route53.present:
    - name: test.example.com.
    - value: 1.1.1.1
    - zone: example.com.
    - ttl: 60
    - record_type: A
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkgHs
```

```
salt.states.boto_route53.absent(name, zone, record_type, identifier=None, region=None,
                                key=None, keyid=None, profile=None, wait_for_sync=True,
                                split_dns=False, private_zone=False)
```

Ensure the Route53 record is deleted.

name Name of the record.

zone The zone to delete the record from.

record_type The record type (A, NS, MX, TXT, etc.)

identifier An identifier to match for deletion.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53.

split_dns Route53 supports a public and private DNS zone with the same names.

private_zone If using split_dns, specify if this is the private zone.

```
salt.states.boto_route53.hosted_zone_absent(name, domain_name=None, region=None,
                                             key=None, keyid=None, profile=None)
```

Ensure the Route53 Hostes Zone described is absent

name The name of the state definition.

domain_name The FQDN (including final period) of the zone you wish absent. If not provided, the value of name will be used.

```
salt.states.boto_route53.hosted_zone_present(name, domain_name=None, private_zone=False, caller_ref=None, comment="", vpc_id=None, vpc_name=None, vpc_region=None, region=None, key=None, keyid=None, profile=None)
```

Ensure a hosted zone exists with the given attributes. Note that most things cannot be modified once a zone is created - it must be deleted and re-spun to update these attributes:

- private_zone (AWS API limitation).
- comment (the appropriate call exists in the AWS API and in boto3, but has not, as of this writing, been added to boto2).
- vpc_id (same story - we really need to rewrite this module with boto3)
- vpc_name (really just a pointer to vpc_id anyway).
- vpc_region (again, supported in boto3 but not boto2).

If you need the ability to update these attributes, please use the newer boto3_route53 module instead.

name The name of the state definition.

domain_name The name of the domain. This must be fully-qualified, terminating with a period. This is the name you have registered with your domain registrar. It is also the name you will delegate from your registrar to the Amazon Route 53 delegation servers returned in response to this request. Defaults to the value of name if not provided.

private_zone Set True if creating a private hosted zone.

caller_ref A unique string that identifies the request and that allows create_hosted_zone() calls to be retried without the risk of executing the operation twice. This helps ensure idempotency across state calls, but can cause issues if a zone is deleted and then an attempt is made to recreate it with the same caller_ref. If not provided, a unique UUID will be generated at each state run, which avoids the risk of the above (transient) error. This option is generally not needed. Maximum length of 128.

comment Any comments you want to include about the hosted zone.

vpc_id When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_name. Ignored when creating a non-private zone.

vpc_name When creating a private hosted zone, either the VPC ID or VPC Name to associate with is required. Exclusive with vpc_id. Ignored when creating a non-private zone.

vpc_region When creating a private hosted zone, the region of the associated VPC is required. If not provided, an effort will be made to determine it from vpc_id or vpc_name, where possible. If this fails, you'll need to provide an explicit value for this option. Ignored when creating a non-private zone.

```
salt.states.boto_route53.present(name, value, zone, record_type, ttl=None, identifier=None, region=None, key=None, keyid=None, profile=None, wait_for_sync=True, split_dns=False, private_zone=False)
```

Ensure the Route53 record is present.

name Name of the record.

value

Value of the record. As a special case, you can pass in: *private:<Name tag>* to have the function autodetermine the private IP *public:<Name tag>* to have the function autodetermine the public IP

zone The zone to create the record in.

record_type The record type (A, NS, MX, TXT, etc.)

ttl The time to live for the record.

identifier The unique identifier to use for this record.

region The region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_sync Wait for an INSYNC change status from Route53 before returning success.

split_dns Route53 supports parallel public and private DNS zones with the same name.

private_zone If using `split_dns`, specify if this is the private zone.

```
salt.states.boto_route53.rr_absent(*args, **kwargs)
```

```
salt.states.boto_route53.rr_present(*args, **kwargs)
```

20.19.44 salt.states.boto_s3_bucket module

Manage S3 Buckets

New in version 2016.3.0.

Create and destroy S3 buckets. Be aware that this interacts with Amazon's services, and so may incur charges.

depends

- boto
- boto3

The dependencies listed above can be installed via package or pip.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
region: us-east-1
```

```
Ensure bucket exists:
boto_s3_bucket.present:
- Bucket: mybucket
- LocationConstraint: EU
- ACL:
  - GrantRead: "uri=http://acs.amazonaws.com/groups/global/AllUsers"
```

`salt.states.boto_s3_bucket.absent`(*name*, *Bucket*, *Force=False*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket with passed properties is absent.

name The name of the state definition.

Bucket Name of the bucket.

Force Empty the bucket first if necessary - Boolean.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_s3_bucket.present`(*name*, *Bucket*, *LocationConstraint=None*, *ACL=None*, *CORSRules=None*, *LifecycleConfiguration=None*, *Logging=None*, *NotificationConfiguration=None*, *Policy=None*, *Replication=None*, *RequestPayment=None*, *Tagging=None*, *Versioning=None*, *Website=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure bucket exists.

name The name of the state definition

Bucket Name of the bucket.

LocationConstraint 'EU'|'eu-west-1'|'us-west-1'|'us-west-2'|'ap-southeast-1'|'ap-southeast-2'|'ap-northeast-1'|'sa-east-1'|'cn-north-1'|'eu-central-1'

ACL The permissions on a bucket using access control lists (ACL).

CORSRules The cors configuration for a bucket.

LifecycleConfiguration Lifecycle configuration for your bucket

Logging The logging parameters for a bucket and to specify permissions for who can view and modify the logging parameters.

NotificationConfiguration notifications of specified events for a bucket

Policy Policy on the bucket

Replication Replication rules. You can add as many as 1,000 rules. Total replication configuration size can be up to 2 MB

RequestPayment The request payment configuration for a bucket. By default, the bucket owner pays for downloads from the bucket. This configuration parameter enables the bucket owner (only) to specify that the person requesting the download will be charged for the download

Tagging A dictionary of tags that should be set on the bucket

Versioning The versioning state of the bucket

Website The website configuration of the bucket

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.45 salt.states.boto_secgroup

Manage Security Groups

New in version 2014.7.0.

Create and destroy Security Groups. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit EC2 credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
secgroup.keyid: GKTADJGHEIQSXMKKRBJ08H
secgroup.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
  region: us-east-1
```

```
Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - vpc_name: myvpc
    - rules:
      - ip_protocol: tcp
```

(continues on next page)

(continued from previous page)

```

    from_port: 80
    to_port: 80
    cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
  - ip_protocol: tcp
    from_port: 8080
    to_port: 8090
    cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
  - ip_protocol: icmp
    from_port: -1
    to_port: -1
    source_group_name: mysecgroup
- rules_egress:
  - ip_protocol: all
    from_port: -1
    to_port: -1
    cidr_ip:
      - 10.0.0.0/8
      - 192.168.0.0/16
- tags:
  SomeTag: 'My Tag Value'
  SomeOtherTag: 'Other Tag Value'
- region: us-east-1
- keyid: GKTADJGHEIQSXMKKRBJ08H
- key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

```

Using a profile from pillars

```

Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile: myprofile

```

Passing in a profile

```

Ensure mysecgroup exists:
  boto_secgroup.present:
    - name: mysecgroup
    - description: My security group
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
      region: us-east-1

```

Note: When using the `profile` parameter and `region` is set outside of the profile group, `region` is ignored and a default region will be used.

If `region` is missing from the profile data set, `us-east-1` will be used as the default region.

```

salt.states.boto_secgroup.absent(name, vpc_id=None, vpc_name=None, region=None,
                                   key=None, keyid=None, profile=None)

```

Ensure a security group with the specified name does not exist.

name Name of the security group.

vpc_id The ID of the VPC to remove the security group from, if any. Exclusive with **vpc_name**.

vpc_name The name of the VPC to remove the security group from, if any. Exclusive with **vpc_id**.

New in version 2016.3.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```
salt.states.boto_secgroup.present(name, description, vpc_id=None, vpc_name=None,
                                   rules=None, rules_egress=None, delete_ingress_rules=True,
                                   delete_egress_rules=True, region=None, key=None,
                                   keyid=None, profile=None, tags=None)
```

Ensure the security group exists with the specified rules.

name Name of the security group.

description A description of this security group.

vpc_id The ID of the VPC to create the security group in, if any. Exclusive with **vpc_name**.

vpc_name The name of the VPC to create the security group in, if any. Exclusive with **vpc_id**.

New in version 2016.3.0.

New in version 2015.8.2.

rules A list of ingress rule dicts. If not specified, **rules=None**, the ingress rules will be unmanaged. If set to an empty list, [], then all ingress rules will be removed.

rules_egress A list of egress rule dicts. If not specified, **rules_egress=None**, the egress rules will be unmanaged. If set to an empty list, [], then all egress rules will be removed.

delete_ingress_rules Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

delete_egress_rules Some tools (EMR comes to mind) insist on adding rules on-the-fly, which salt will happily remove on the next run. Set this param to False to avoid deleting rules which were added outside of salt.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key, and keyid.

tags List of key:value pairs of tags to set on the security group

New in version 2016.3.0.

20.19.46 salt.states.boto_sns

Manage SNS Topics

Create and destroy SNS topics. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit AWS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sns.keyid: GKTADJGHEIQSXMKKRBJ08H
sns.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
  region: us-east-1
```

```
mytopic:
  boto_sns.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs

# Using a profile from pillars
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile: mysnsprofile

# Passing in a profile
mytopic:
  boto_sns.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkghs
```

`salt.states.boto_sns.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*, *unsubscribe=False*)

Ensure the named sns topic is deleted.

name Name of the SNS topic.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

unsubscribe If True, unsubscribe all subscriptions to the SNS topic before deleting the SNS topic

New in version 2016.11.0.

`salt.states.boto_sns.present` (*name*, *subscriptions=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SNS topic exists.

name Name of the SNS topic.

subscriptions List of SNS subscriptions.

Each subscription is a dictionary with a protocol and endpoint key:

```
[
  {'protocol': 'https', 'endpoint': 'https://www.example.com/sns-endpoint'},
  {'protocol': 'sqs', 'endpoint': 'arn:aws:sqs:us-west-2:123456789012:MyQueue'}
]
```

region Region to connect to.

key Secret key to be used.
keyid Access key to be used.
profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.47 salt.states.boto_sqs

Manage SQS Queues

New in version 2014.7.0.

Create and destroy SQS queues. Be aware that this interacts with Amazon's services, and so may incur charges.

This module uses `boto`, which can be installed via package, or pip.

This module accepts explicit SQS credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
sqs.keyid: GKTADJGHEIQSXMKKRBJ08H
sqs.key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
  keyid: GKTADJGHEIQSXMKKRBJ08H
  key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
  region: us-east-1
```

```
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
    - attributes:
      ReceiveMessageWaitTimeSeconds: 20

# Using a profile from pillars
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile: mysqsprofile

# Passing in a profile
myqueue:
  boto_sqs.present:
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkghWupUjasdfklkfkgjsdfjajkgghs
```

`salt.states.boto_sqs.absent` (*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named sqs queue is deleted.

name Name of the SQS queue.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_sqs.present`(*name*, *attributes=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the SQS queue exists.

name Name of the SQS queue.

attributes A dict of key/value SQS attributes.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

20.19.48 salt.states.boto_vpc

Manage VPCs

New in version 2015.8.0.

depends

- boto >= 2.8.0
- boto3 >= 1.2.6

Create and destroy VPCs. Be aware that this interacts with Amazon's services, and so may incur charges.

This module accepts explicit vpc credentials but can also utilize IAM roles assigned to the instance through Instance Profiles. Dynamic credentials are then automatically obtained from AWS API and no further configuration is necessary. More information available [here](#).

If IAM roles are not used you need to specify them either in a pillar file or in the minion's config file:

```
vpc.keyid: GKTADJGHEIQSXMKKRBJ08H
vpc.key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
```

It's also possible to specify `key`, `keyid` and `region` via a profile, either passed in as a dict, or as a string to pull from pillars or minion config:

```
myprofile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
region: us-east-1
```

```
aws:
region:
us-east-1:
profile:
keyid: GKTADJGHEIQSXMKKRBJ08H
key: askdjghsdfjkghWupUjasdfkldfklgjsdfjajkghs
region: us-east-1
```

```

Ensure VPC exists:
  boto_vpc.present:
    - name: myvpc
    - cidr_block: 10.10.11.0/24
    - dns_hostnames: True
    - region: us-east-1
    - keyid: GKTADJGHEIQSXMKKRBJ08H
    - key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkghs

Ensure subnet exists:
  boto_vpc.subnet_present:
    - name: mysubnet
    - vpc_id: vpc-123456
    - cidr_block: 10.0.0.0/16
    - region: us-east-1
    - profile: myprofile

{% set profile = salt['pillar.get']('aws:region:us-east-1:profile' ) %}
Ensure internet gateway exists:
  boto_vpc.internet_gateway_present:
    - name: myigw
    - vpc_name: myvpc
    - profile: {{ profile }}

Ensure route table exists:
  boto_vpc.route_table_present:
    - name: my_route_table
    - vpc_id: vpc-123456
    - routes:
      - destination_cidr_block: 0.0.0.0/0
        instance_id: i-123456
    - subnet_names:
      - subnet1
      - subnet2
    - region: us-east-1
    - profile:
      keyid: GKTADJGHEIQSXMKKRBJ08H
      key: askdjghsdfjkgHwupUjasdfldkdfklgjsdfjajkghs

```

New in version 2016.11.0.

Request, accept and delete VPC peering connections. VPC peering connections can be named allowing the name to be used throughout the state file. Following example shows how to request and accept a VPC peering connection.

```

accept the vpc peering connection:
  boto_vpc.accept_vpc_peering_connection:
    - conn_name: salt_vpc_peering
    - region: us-west-2
    - require:
      - boto_vpc: request a vpc peering connection

request a vpc peering connection:
  boto_vpc.request_vpc_peering_connection:
    - requester_vpc_id: vpc-4a3d522e
    - peer_vpc_id: vpc-ae81e9ca
    - region: us-west-2
    - conn_name: salt_vpc_peering

```

VPC peering connections need not be named. In this case the VPC peering connection ID should be used in the state file.

```
accept the vpc peering connection:
boto_vpc.accept_vpc_peering_connection:
- conn_id: pcx-1873c371
- region: us-west-2
```

VPC peering connections can be deleted, as shown below.

```
delete a named vpc peering connection:
boto_vpc.delete_vpc_peering_connection:
- conn_name: salt_vpc_peering
```

Delete also accepts a VPC peering connection id.

```
delete a vpc peering connection by id:
boto_vpc.delete_vpc_peering_connection:
- conn_id: pcx-1873c371
```

`salt.states.boto_vpc.absent`(*name*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure VPC with passed properties is absent.

name Name of the VPC.

tags A list of tags. All tags must match.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.accept_vpc_peering_connection`(*name=None*, *conn_id=None*, *conn_name=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Accept a VPC pending requested peering connection between two VPCs.

name Name of this state

conn_id The connection ID to accept. Exclusive with `conn_name`. String type.

conn_name The name of the VPC peering connection to accept. Exclusive with `conn_id`. String type.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
boto_vpc.accept_vpc_peering_connection:
- conn_name: salt_peering_connection

# usage with vpc peering connection id and region
boto_vpc.accept_vpc_peering_connection:
- conn_id: pbx-1873d472
- region: us-west-2
```

```
salt.states.boto_vpc.delete_vpc_peering_connection(name, conn_id=None,
                                                    conn_name=None, region=None,
                                                    key=None, keyid=None, profile=None,
                                                    file=None)
```

name Name of the state

conn_id ID of the peering connection to delete. Exclusive with conn_name.

conn_name The name of the peering connection to delete. Exclusive with conn_id.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - region: us-west-2
    - conn_id: pcx-4613b12e
```

Connection name can be specified (instead of ID). Specifying both conn_name and conn_id will result in an error.

```
delete a vpc peering connection:
  boto_vpc.delete_vpc_peering_connection:
    - conn_name: salt_vpc_peering
```

```
salt.states.boto_vpc.dhcp_options_absent(name=None, dhcp_options_id=None, region=None,
                                          key=None, keyid=None, profile=None)
```

Ensure a set of DHCP options with the given settings exist.

name (string) Name of the DHCP options set.

dhcp_options_id (string) Id of the DHCP options set.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

```
salt.states.boto_vpc.dhcp_options_present(name, dhcp_options_id=None, vpc_name=None,
                                          vpc_id=None, domain_name=None, domain_name_servers=None, ntp_servers=None,
                                          netbios_name_servers=None, netbios_node_type=None, tags=None, region=None,
                                          key=None, keyid=None, profile=None)
```

Ensure a set of DHCP options with the given settings exist. Note that the current implementation only SETS values during option set creation. It is unable to update option sets in place, and thus merely verifies the set exists via the given name and/or dhcp_options_id param.

name (string) Name of the DHCP options.

vpc_name (string) Name of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.

vpc_id (string) Id of a VPC to which the options should be associated. Either vpc_name or vpc_id must be provided.

domain_name (string) Domain name to be associated with this option set.

domain_name_servers (list of strings) The IP address(es) of up to four domain name servers.

ntp_servers (list of strings) The IP address(es) of up to four desired NTP servers.

netbios_name_servers (list of strings) The IP address(es) of up to four NetBIOS name servers.

netbios_node_type (string) The NetBIOS node type (1, 2, 4, or 8). For more information about the allowed values, see RFC 2132. The recommended is 2 at this time (broadcast and multicast are currently not supported).

tags (dict of key:value pairs) A set of tags to be added.

region (string) Region to connect to.

key (string) Secret key to be used.

keyid (string) Access key to be used.

profile (various) A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.3.0.

`salt.states.boto_vpc.internet_gateway_absent` (*name*, *detach=False*, *region=None*,
key=None, *keyid=None*, *profile=None*)

Ensure the named internet gateway is absent.

name Name of the internet gateway.

detach First detach the internet gateway from a VPC, if attached.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.internet_gateway_present` (*name*, *vpc_name=None*, *vpc_id=None*,
tags=None, *region=None*, *key=None*,
keyid=None, *profile=None*)

Ensure an internet gateway exists.

name Name of the internet gateway.

vpc_name Name of the VPC to which the internet gateway should be attached.

vpc_id Id of the VPC to which the internet_gateway should be attached. Only one of vpc_name or vpc_id may be provided.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.nat_gateway_absent` (*name=None*, *subnet_name=None*, *subnet_id=None*,
region=None, *key=None*, *keyid=None*, *profile=None*,
wait_for_delete_retries=0)

Ensure the nat gateway in the named subnet is absent.

This function requires boto3.

New in version 2016.11.0.

name Name of the state.

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either subnet_name or subnet_id must be provided.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

wait_for_delete_retries NAT gateway may take some time to be go into deleted or failed state. During the

deletion process, subsequent release of elastic IPs may fail; this state will automatically retry this number of times to ensure the NAT gateway is in deleted or failed state before proceeding. Default is set to 0 for backward compatibility.

```
salt.states.boto_vpc.nat_gateway_present(name, subnet_name=None, subnet_id=None, re-
                                         gion=None, key=None, keyid=None, profile=None,
                                         allocation_id=None)
```

Ensure a nat gateway exists within the specified subnet

This function requires boto3.

New in version 2016.11.0.

Example:

```
boto_vpc.nat_gateway_present:
- subnet_name: my-subnet
```

name Name of the state

subnet_name Name of the subnet within which the nat gateway should exist

subnet_id Id of the subnet within which the nat gateway should exist. Either `subnet_name` or `subnet_id` must be provided.

allocation_id If specified, the elastic IP address referenced by the ID is associated with the gateway. Otherwise, a new `allocation_id` is created and used.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.present(name, cidr_block, instance_tenancy=None, dns_support=None,
                              dns_hostnames=None, tags=None, region=None, key=None,
                              keyid=None, profile=None)
```

Ensure VPC exists.

name Name of the VPC.

cidr_block The range of IPs in CIDR format, for example: 10.0.0.0/24. Block size must be between /16 and /28 netmask.

instance_tenancy Instances launched in this VPC will be single-tenant or dedicated hardware.

dns_support Indicates whether the DNS resolution is supported for the VPC.

dns_hostnames Indicates whether the instances launched in the VPC get DNS hostnames.

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

```
salt.states.boto_vpc.request_vpc_peering_connection(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None,
                                                    region=None,
                                                    key=None,
                                                    keyid=None,
                                                    profile=None)
```

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with `requester_vpc_name`. String type.

requester_vpc_name Name tag of the requesting VPC. Exclusive with `requester_vpc_id`. String type.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with **peer_vpc_name**. String type.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account. Exclusive with **peer_vpc_id**. String type.

conn_name The (optional) name to use for this VPC peering connection. String type.

peer_owner_id ID of the owner of the peer VPC. String type. If this isn't supplied AWS uses your account ID. Required if peering to a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```
request a vpc peering connection:
boto_vpc.request_vpc_peering_connection:
- requester_vpc_id: vpc-4b3522e
- peer_vpc_id: vpc-ae83f9ca
- conn_name: salt_peering_connection
```

`salt.states.boto_vpc.route_table_absent`(*name*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure the named route table is absent.

name Name of the route table.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

`salt.states.boto_vpc.route_table_present`(*name*, *vpc_name=None*, *vpc_id=None*, *routes=None*, *subnet_ids=None*, *subnet_names=None*, *tags=None*, *region=None*, *key=None*, *keyid=None*, *profile=None*)

Ensure route table with routes exists and is associated to a VPC.

This function requires boto3 to be installed if nat gateways are specified.

Example:

```
boto_vpc.route_table_present:
- name: my_route_table
- vpc_id: vpc-123456
- routes:
  - destination_cidr_block: 0.0.0.0/0
    internet_gateway_name: InternetGateway
  - destination_cidr_block: 10.10.11.0/24
    instance_id: i-123456
  - destination_cidr_block: 10.10.12.0/24
    interface_id: eni-123456
  - destination_cidr_block: 10.10.13.0/24
    instance_name: mygatewayserver
- subnet_names:
  - subnet1
  - subnet2
```

name Name of the route table.

vpc_name Name of the VPC with which the route table should be associated.

vpc_id Id of the VPC with which the route table should be associated. Either `vpc_name` or `vpc_id` must be provided.

routes A list of routes. Each route has a `cidr` and a `target`.

subnet_ids A list of subnet ids to associate

subnet_names A list of subnet names to associate

tags A list of tags.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_vpc.subnet_absent`(*name=None, subnet_id=None, region=None, key=None, keyid=None, profile=None*)

Ensure subnet with passed properties is absent.

name Name of the subnet.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_vpc.subnet_present`(*name, cidr_block, vpc_name=None, vpc_id=None, availability_zone=None, tags=None, region=None, key=None, keyid=None, profile=None, route_table_id=None, route_table_name=None*)

Ensure a subnet exists.

name Name of the subnet.

cidr_block The range of IPs for the subnet, in CIDR format. For example: `10.0.0.0/24`. Block size must be between `/16` and `/28` netmask.

vpc_name Name of the VPC in which the subnet should be placed. Either `vpc_name` or `vpc_id` must be provided.

vpc_id Id of the VPC in which the subnet should be placed. Either `vpc_name` or `vpc_id` must be provided.

availability_zone AZ in which the subnet should be placed.

tags A list of tags.

route_table_id A route table ID to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

route_table_name A route table name to explicitly associate the subnet with. If both `route_table_id` and `route_table_name` are specified, `route_table_id` will take precedence.

New in version 2016.11.0.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with `region`, `key` and `keyid`, or a pillar key (string) that contains a dict with `region`, `key` and `keyid`.

`salt.states.boto_vpc.vpc_peering_connection_absent`(*name, conn_id=None, conn_name=None, region=None, key=None, keyid=None, profile=None*)

```

salt.states.boto_vpc.vpc_peering_connection_present(name, requester_vpc_id=None,
                                                    requester_vpc_name=None,
                                                    peer_vpc_id=None,
                                                    peer_vpc_name=None,
                                                    conn_name=None,
                                                    peer_owner_id=None, region=None,
                                                    key=None,
                                                    keyid=None, profile=None)

```

name Name of the state

requester_vpc_id ID of the requesting VPC. Exclusive with requester_vpc_name.

requester_vpc_name Name tag of the requesting VPC. Exclusive with requester_vpc_id.

peer_vpc_id ID of the VPC to create VPC peering connection with. This can be a VPC in another account. Exclusive with peer_vpc_name.

peer_vpc_name Name tag of the VPC to create VPC peering connection with. This can only be a VPC in the same account, else resolving it into a vpc ID will fail. Exclusive with peer_vpc_id.

conn_name The name to use for this VPC peering connection.

peer_owner_id ID of the owner of the peer VPC. Defaults to your account ID, so a value is required if peering with a VPC in a different account.

region Region to connect to.

key Secret key to be used.

keyid Access key to be used.

profile A dict with region, key and keyid, or a pillar key (string) that contains a dict with region, key and keyid.

New in version 2016.11.0.

Example:

```

ensure peering twixt local vpc and the other guys:
  boto_vpc.vpc_peering_connection_present:
    - requester_vpc_name: my_local_vpc
    - peer_vpc_name: some_other_guys_vpc
    - conn_name: peering_from_here_to_there
    - peer_owner_id: 012345654321

```

20.19.49 salt.states.bower

Installation of Bower Packages

These states manage the installed packages using Bower. Note that npm, git and bower must be installed for these states to be available, so bower states should include requisites to pkg.installed states for the packages which provide npm and git (simply npm and git in most cases), and npm.installed state for the package which provides bower.

Example:

```

npm:
  pkg.installed
git:
  pkg.installed
bower:
  npm.installed
  require:
    - pkg: npm
    - pkg: git

```

(continues on next page)

(continued from previous page)

```

underscore:
  bower.installed:
    - dir: /path/to/project
    - require:
      - npm: bower

```

`salt.states.bower.bootstrap`(*name*, *user=None*)
 Bootstraps a frontend distribution.

Will execute 'bower install' on the specified directory.
user The user to run Bower with

`salt.states.bower.installed`(*name*, *dir*, *pkgs=None*, *user=None*, *env=None*)
 Verify that the given package is installed and is at the correct version (if specified).

```

underscore:
  bower.installed:
    - dir: /path/to/project
    - user: someuser

  jquery#2.0:
    bower.installed:
      - dir: /path/to/project

```

name The package to install

dir The target directory in which to install the package

pkgs A list of packages to install with a single Bower invocation; specifying this argument will ignore the **name** argument

user The user to run Bower with

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.bower.pruned`(*name*, *user=None*, *env=None*)
 New in version 2017.7.0.

Cleans up local bower_components directory.

Will execute 'bower prune' on the specified directory (param: name)

user The user to run Bower with

`salt.states.bower.removed`(*name*, *dir*, *user=None*)
 Verify that the given package is not installed.

dir The target directory in which to install the package

user The user to run Bower with

20.19.50 salt.states.cabal

Installation of Cabal Packages

New in version 2015.8.0.

These states manage the installed packages for Haskell using cabal. Note that cabal-install must be installed for these states to be available, so cabal states should include a requisite to a pkg.installed state for the package which provides cabal (`cabal-install` in case of Debian based distributions). Example:

```
.. code-block:: yaml
```

cabal-install: pkg.installed

ShellCheck:

cabal.installed:

- require: - pkg: cabal-install

`salt.states.cabal.installed`(*name*, *pkgs=None*, *user=None*, *install_global=False*, *env=None*)

Verify that the given package is installed and is at the correct version (if specified).

ShellCheck-0.3.5:

```
cabal:
- installed:
```

name The package to install

user The user to run cabal install with

install_global Install package globally instead of locally

env A list of environment variables to be set prior to execution. The format is the same as the `cmd.run` state function.

`salt.states.cabal.removed`(*name*, *user=None*, *env=None*)

Verify that given package is not installed.

20.19.51 salt.states.ceph module

Manage ceph with salt.

New in version 2016.11.0.

`salt.states.ceph.quorum`(*name*, ***kwargs*)

Quorum state

This state checks the mon daemons are in quorum. It does not alter the cluster but can be used in formula as a dependency for many cluster operations.

Example usage in sls file:

```
quorum:
  sesceph.quorum:
    - require:
      - sesceph: mon_running
```

20.19.52 salt.states.chef

Execute Chef client runs

Run chef-client or chef-solo

```
my-chef-run:
  chef.client:
    - override-runlist: 'demo1,demo2'
    - server: 'https://chef.domain.com'

default-chef-run:
  chef.client: []
```

(continues on next page)

```
my-solo-run:
  chef.solo:
    - environment: dev
```

`salt.states.chef.client`(*name*, ***kwargs*)

name Unique identifier for the state. Does not affect the Chef run.
server The chef server URL
client_key Set the client key file location
config The configuration file to use
config-file-jail Directory under which config files are allowed to be loaded (no client.rb or knife.rb outside this path will be loaded).
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
localmode Point chef-client at local repository if True
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
pid Set the PID file location, defaults to /tmp/chef-client.pid
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
runlist Permanently replace current run list with specified items
user User to set privilege to
validation_key Set the validation key file location, used for registering new clients

`salt.states.chef.solo`(*name*, ***kwargs*)

name Unique identifier for the state. Does not affect the Chef run.
config The configuration file to use
environment Set the Chef Environment on the node
group Group to set privilege to
json-attributes Load attributes from a JSON file or URL
log_level Set the log level (debug, info, warn, error, fatal)
logfile Set the log file location
node-name The node name for this client
override-runlist Replace current run list with specified items for a single run
recipe-url Pull down a remote gzipped tarball of recipes and untar it to the cookbook cache
run-lock-timeout Set maximum duration to wait for another client run to finish, default is indefinitely.
user User to set privilege to

20.19.53 salt.states.chocolatey module

Manage Chocolatey package installs .. versionadded:: 2016.3.0

Note: Chocolatey pulls data from the Chocolatey internet database to determine current versions, find available versions, etc. This is normally a slow operation and may be optimized by specifying a local, smaller chocolatey repo.

`salt.states.chocolatey.installed`(*name*, *version=None*, *source=None*, *force=False*,
pre_versions=False, *install_args=None*, *override_args=False*,
force_x86=False, *package_args=None*, *allow_multiple=False*)

Installs a package if not already installed

Parameters

- **name** (*str*) – The name of the package to be installed. Required.

- **version** (*str*) – Install a specific version of the package. Defaults to latest version. If the version is different to the one installed then the specified version will be installed. Default is None.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) – Reinstall the current version of an existing package. Do not use with `allow_multiple`. Default is False.
- **pre_versions** (*bool*) – Include pre-release packages. Default is False.
- **install_args** (*str*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override_args** (*bool*) – Set to True if you want to override the original install arguments (for the native installer) in the package and use your own. When this is set to False `install_args` will be appended to the end of the default arguments. Default is False.
- **force_x86** (*bool*) – Force x86 (32bit) installation on 64 bit systems. Default is False.
- **package_args** (*str*) – Arguments you want to pass to the package. Default is None.
- **allow_multiple** (*bool*) – Allow multiple versions of the package to be installed. Do not use with `force`. Does not work with all packages. Default is False.

New in version 2017.7.0.

```

Installsomepackage:
  chocolatey.installed:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
    - force: True

```

```

salt.states.chocolatey.uninstalled(name, version=None, uninstall_args=None,
                                   override_args=False)

```

Uninstalls a package

name The name of the package to be uninstalled

version Uninstalls a specific version of the package. Defaults to latest version installed.

uninstall_args A list of uninstall arguments you want to pass to the uninstallation process i.e product key or feature list

override_args Set to true if you want to override the original uninstall arguments (for the native uninstaller)in the package and use your own. When this is set to False `uninstall_args` will be appended to the end of the default arguments

```

salt.states.chocolatey.upgraded(name, version=None, source=None, force=False,
                                 pre_versions=False, install_args=None, override_args=False,
                                 force_x86=False, package_args=None)

```

Upgrades a package. Will install the package if not installed.

New in version 2018.3.0.

Parameters

- **name** (*str*) – The name of the package to be installed. Required.
- **version** (*str*) – Install a specific version of the package. Defaults to latest version. If the version is greater than the one installed then the specified version will be installed. Default is None.
- **source** (*str*) – Chocolatey repository (directory, share or remote URL, feed). Defaults to the official Chocolatey feed. Default is None.
- **force** (*bool*) – True will reinstall an existing package with the same version. Default is False.

- **pre_versions** (*bool*) – True will include pre-release packages. Default is False.
- **install_args** (*str*) – Install arguments you want to pass to the installation process, i.e product key or feature list. Default is None.
- **override_args** (*bool*) – True will override the original install arguments (for the native installer) in the package and use those specified in `install_args`. False will append `install_args` to the end of the default arguments. Default is False.
- **force_x86** (*bool*) – True forces 32bit installation on 64 bit systems. Default is False.
- **package_args** (*str*) – Arguments you want to pass to the package. Default is None.

```
upgrade_some_package:
  chocolatey.upgraded:
    - name: packagename
    - version: '12.04'
    - source: 'mychocolatey/source'
```

20.19.54 salt.states.chronos_job module

Configure Chronos jobs via a salt proxy.

```
my_job:
  chronos_job.config:
    - config:
      schedule: "R//PT2S"
      command: "echo 'hi'"
      owner: "me@example.com"
```

New in version 2015.8.2.

`salt.states.chronos_job.absent`(*name*)

Ensure that the chronos job with the given name is not present.

Parameters **name** – The app name

Returns A standard Salt changes dictionary

`salt.states.chronos_job.config`(*name*, *config*)

Ensure that the chronos job with the given name is present and is configured to match the given config values.

Parameters

- **name** – The job name
- **config** – The configuration to apply (dict)

Returns A standard Salt changes dictionary

20.19.55 salt.states.cisconso

State module for Cisco NSO Proxy minions

For documentation on setting up the cisconso proxy minion look in the documentation for [salt.proxy.cisconso](#).

`salt.states.cisconso.value_present`(*name*, *datastore*, *path*, *config*)

Ensure a specific value exists at a given path

Parameters

- **name** (*str*) – The name for this rule

- **datastore** (DatastoreType (str enum).) – The datastore, e.g. running, operational. One of the NETCONF store IETF types
- **path** (List, str OR tuple) – The device path to set the value at, a list of element names in order, / separated
- **config** (dict) – The new value at the given path

Examples:

```
enable pap auth:
  cisco.config_present:
    - name: enable_pap_auth
    - datastore: running
    - path: devices/device/ex0/config/sys/interfaces/serial/ppp0/authentication
    - config:
        authentication:
          method: pap
          "list-name": foobar
```

20.19.56 salt.states.cloud

Using states instead of maps to deploy clouds

New in version 2014.1.0.

Use this minion to spin up a cloud instance:

```
my-ec2-instance:
  cloud.profile:
    my-ec2-config
```

`salt.states.cloud.absent` (*name*, *onlyif=None*, *unless=None*)

Ensure that no instances with the specified names exist.

CAUTION: This is a destructive state, which will search all configured cloud providers for the named instance, and destroy it.

name The name of the instance to destroy

onlyif Do run the state only if is unless succeed

unless Do not run the state at least unless succeed

`salt.states.cloud.present` (*name*, *cloud_provider*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Spin up a single instance on a cloud provider, using salt-cloud. This state does not take a profile argument; rather, it takes the arguments that would normally be configured as part of the state.

Note that while this function does take any configuration argument that would normally be used to create an instance, it will not verify the state of any of those arguments on an existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

name The name of the instance to create

cloud_provider The name of the cloud provider to use

onlyif Do run the state only if is unless succeed

unless Do not run the state at least unless succeed

opts Any extra opts that need to be used

`salt.states.cloud.profile` (*name*, *profile*, *onlyif=None*, *unless=None*, *opts=None*, ***kwargs*)

Create a single instance on a cloud provider, using a salt-cloud profile.

Note that while profiles used this function do take any configuration argument that would normally be used to create an instance using a profile, this state will not verify the state of any of those arguments on an

existing instance. Stateful properties of an instance should be configured using their own individual state (i.e., `cloud.tagged`, `cloud.untagged`, etc).

name The name of the instance to create

profile The name of the cloud profile to use

onlyif Do run the state only if is unless succeed

unless Do not run the state at least unless succeed

kwargs Any profile override or addition

opts Any extra opts that need to be used

`salt.states.cloud.volume_absent` (*name*, *provider=None*, ***kwargs*)

Check that a block volume exists.

`salt.states.cloud.volume_attached` (*name*, *server_name*, *provider=None*, ***kwargs*)

Check if a block volume is attached.

`salt.states.cloud.volume_detached` (*name*, *server_name=None*, *provider=None*, ***kwargs*)

Check if a block volume is attached.

Returns True if server or Volume do not exist.

`salt.states.cloud.volume_present` (*name*, *provider=None*, ***kwargs*)

Check that a block volume exists.

20.19.57 salt.states.cmd

Execution of arbitrary commands

The `cmd` state module manages the enforcement of executed commands, this state can tell a command to run under certain circumstances.

A simple example to execute a command:

```
# Store the current date in a file
'date > /tmp/salt-run':
  cmd.run
```

Only run if another execution failed, in this case truncate syslog if there is no disk space:

```
'> /var/log/messages/:
  cmd.run:
    - unless: echo 'foo' > /tmp/.test && rm -f /tmp/.test
```

Only run if the file specified by `creates` does not exist, in this case touch `/tmp/foo` if it does not exist:

```
touch /tmp/foo:
  cmd.run:
    - creates: /tmp/foo
```

`creates` also accepts a list of files:

```
"echo 'foo' | tee /tmp/bar > /tmp/baz":
  cmd.run:
    - creates:
      - /tmp/bar
      - /tmp/baz
```

Note: The `creates` option was added to version 2014.7.0

Sometimes when running a command that starts up a daemon, the init script doesn't return properly which causes Salt to wait indefinitely for a response. In situations like this try the following:

```
run_installer:
  cmd.run:
    - name: /tmp/installer.bin > /dev/null 2>&1
```

Salt determines whether the `cmd` state is successfully enforced based on the exit code returned by the command. If the command returns a zero exit code, then salt determines that the state was successfully enforced. If the script returns a non-zero exit code, then salt determines that it failed to successfully enforce the state. If a command returns a non-zero exit code but you wish to treat this as a success, then you must place the command in a script and explicitly set the exit code of the script to zero.

Please note that the success or failure of the state is not affected by whether a state change occurred nor the `stateful` argument.

When executing a command or script, the state (i.e., changed or not) of the command is unknown to Salt's state system. Therefore, by default, the `cmd` state assumes that any command execution results in a changed state.

This means that if a `cmd` state is watched by another state then the state that's watching will always be executed due to the *changed* state in the `cmd` state.

Using the "Stateful" Argument

Many state functions in this module now also accept a `stateful` argument. If `stateful` is specified to be true then it is assumed that the command or script will determine its own state and communicate it back by following a simple protocol described below:

1. **If there's nothing in the stdout of the command, then assume no changes.** Otherwise, the stdout must be either in JSON or its *last* non-empty line must be a string of key=value pairs delimited by spaces (no spaces on either side of =).
2. **If it's JSON then it must be a JSON object (e.g., {}).** If it's key=value pairs then quoting may be used to include spaces. (Python's `shlex` module is used to parse the key=value string)

Two special keys or attributes are recognized in the output:

```
changed: bool (i.e., 'yes', 'no', 'true', 'false', case-insensitive)
comment: str (i.e., any string)
```

So, only if `changed` is `True` then assume the command execution has changed the state, and any other key values or attributes in the output will be set as part of the changes.

3. **If there's a comment then it will be used as the comment of the state.**

Here's an example of how one might write a shell script for use with a `stateful` command:

```
#!/bin/bash
#
echo "Working hard..."

# writing the state line
echo # an empty line here so the next line will be the last.
echo "changed=yes comment='something has changed' whatever=123"
```

And an example SLS file using this module:

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful: True

Run only if myscript changed something:
  cmd.run:
    - name: echo hello
    - cwd: /
    - onchanges:
      - cmd: Run myscript
```

Note that if the second `cmd.run` state also specifies `stateful: True` it can then be watched by some other states as well.

4. The `stateful` argument can optionally include a `test_name` parameter.

This is used to specify a command to run in test mode. This command should return stateful data for changes that would be made by the command in the name parameter.

New in version 2015.2.0.

```
Run myscript:
  cmd.run:
    - name: /path/to/myscript
    - cwd: /
    - stateful:
      - test_name: /path/to/myscript test

Run masterscript:
  cmd.script:
    - name: masterscript
    - source: salt://path/to/masterscript
    - cwd: /
    - stateful:
      - test_name: masterscript test
```

Should I use `cmd.run` or `cmd.wait`?

Note: Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

These two states are often confused. The important thing to remember about them is that `cmd.run` states are run each time the SLS file that contains them is applied. If it is more desirable to have a command that only runs after some other state changes, then `cmd.wait` does just that. `cmd.wait` is designed to *watch* other states, and is executed when the state it is watching changes. Example:

```
/usr/local/bin/postinstall.sh:
  cmd.wait:
    - watch:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh
```

(continues on next page)

(continued from previous page)

```
mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

`cmd.wait` itself does not do anything; all functionality is inside its `mod_watch` function, which is called by `watch` on changes.

The preferred format is using the *onchanges Requisite*, which works on `cmd.run` as well as on any other state. The example would then look as follows:

```
/usr/local/bin/postinstall.sh:
  cmd.run:
    - onchanges:
      - pkg: mycustompkg
  file.managed:
    - source: salt://utils/scripts/postinstall.sh

mycustompkg:
  pkg.installed:
    - require:
      - file: /usr/local/bin/postinstall.sh
```

How do I create an environment from a pillar map?

The map that comes from a pillar can be directly consumed by the `env` option! To use it, one may pass it like this. Example:

```
printenv:
  cmd.run:
    - env: {{ salt['pillar.get']('example:key', {}) }}
```

`salt.states.cmd.call`(*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, out-put_loglevel='debug', hide_output=False, use_vt=False, **kwargs*)

Invoke a pre-defined Python function with arguments specified in the state declaration. This function is mainly used by the `salt.renderers.pydsl` renderer.

The interpretation of `onlyif` and `unless` arguments are identical to those of `cmd.run`, and all other arguments (`cwd`, `runas`, ...) allowed by `cmd.run` are allowed here, except that their effects apply only to the commands specified in `onlyif` and `unless` rather than to the function to be invoked.

In addition, the `stateful` argument has no effects here.

The return value of the invoked function will be interpreted as follows.

If it's a dictionary then it will be passed through to the state system, which expects it to have the usual structure returned by any salt state function.

Otherwise, the return value (denoted as `result` in the code below) is expected to be a JSON serializable object, and this dictionary is returned:

```
{
  'name': name
  'changes': {'retval': result},
  'result': True if result is None else bool(result),
```

(continues on next page)

(continued from previous page)

```
'comment': result if isinstance(result, six.string_types) else ''
}
```

`salt.states.cmd.mod_run_check`(*cmd_kwargs*, *onlyif*, *unless*, *creates*)

Execute the *onlyif* and *unless* logic. Return a result dict if: * *onlyif* failed (*onlyif* != 0) * *unless* succeeded (*unless* == 0) else return True

`salt.states.cmd.mod_watch`(*name*, ***kwargs*)

Execute a `cmd` function based on a watch call

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.cmd.run`(*name*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *prepend_path=None*, *stateful=False*, *umask=None*, *output_loglevel='debug'*, *hide_output=False*, *timeout=None*, *ignore_timeout=False*, *use_vt=False*, ***kwargs*)

Run a command if certain circumstances are met. Use `cmd.wait` if you want to use the `watch` requisite.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns a zero exit status

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns a non-zero exit status

cwd The current working directory to execute the command in, defaults to `/root`

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.run:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
  cmd.run:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
```

(continues on next page)

(continued from previous page)

```
- env:
  - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

prepend_path \$PATH segment to prepend (trailing ':' not necessary) to \$PATH. This is an easier alternative to the Jinja workaround.

New in version 2018.3.0.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

umask The umask (in octal) to use when running the command.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

quiet This option no longer has any functionality and will be removed, please set `output_loglevel` to `quiet` to suppress logging of the command.

Deprecated since version 2014.1.0.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

ignore_timeout Ignore the timeout of commands, which is useful for running nohup processes.

New in version 2015.8.0.

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

use_vt [False] Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

bg [False] If `True`, run command in background and do not await or deliver its results.

New in version 2016.3.6.

Note: `cmd.run` supports the usage of `reload_modules`. This functionality allows you to force Salt to reload all modules. You should only use `reload_modules` if your `cmd.run` does some sort of installation (such as `pip`), if you do not reload the modules future items in your state which rely on the software being installed will fail.

```
getpip:
  cmd.run:
    - name: /usr/bin/python /usr/local/sbin/get-pip.py
    - unless: which pip
    - require:
      - pkg: python
      - file: /usr/local/sbin/get-pip.py
    - reload_modules: True
```

`salt.states.cmd.script` (*name*, *source=None*, *template=None*, *onlyif=None*, *unless=None*, *creates=None*, *cwd=None*, *runas=None*, *shell=None*, *env=None*, *stateful=False*, *umask=None*, *timeout=None*, *use_vt=False*, *output_loglevel='debug'*, *hide_output=False*, *defaults=None*, *context=None*, ***kwargs*)

Download a script and execute it with specified arguments.

source The location of the script to download. If the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently jinja, mako, and wempy are supported

name Either `"cmd arg1 arg2 arg3..."` (cmd is not used) or a source `"salt://..."`.

onlyif Run the named command only if the command passed to the `onlyif` option returns true

unless Run the named command only if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to `/root`

runas The name of the user to run the command as

shell The shell to use for execution. The default is set in `grains['shell']`

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
salt://scripts/bar.sh:
  cmd.script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

saltenv [base] The Salt environment to use

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

timeout If the command has not terminated after timeout seconds, send the subprocess sigterm, and if sigterm is ignored, follow up with sigkill

args String of command line args to pass to the script. Only used if no args are specified as part of the *name* argument. To pass a string containing spaces in YAML, you will need to doubly-quote it: `"arg1 'arg two' arg3"`

creates Only run if the file or files specified by `creates` do not exist.

New in version 2014.7.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

context New in version 2016.3.0.

Overrides default context variables passed to the template.

defaults New in version 2016.3.0.

Default context passed to the template.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the `debug` loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

```
salt.states.cmd.wait(name, onlyif=None, unless=None, creates=None, cwd=None, runas=None,
                    shell=None, env=(), stateful=False, umask=None, output_loglevel='debug',
                    hide_output=False, use_vt=False, **kwargs)
```

Run the given command only if the watch statement calls it.

Note: Use `cmd.run` together with `onchanges` instead of `cmd.wait`.

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the `onlyif` option returns true

unless A command to run as a check, only run the named command if the command passed to the `unless` option returns false

cwd The current working directory to execute the command in, defaults to `/root`

runas The user name to run the command as

shell The shell to use for execution, defaults to `/bin/sh`

env A list of environment variables to be set prior to execution. Example:

```
script-foo:
  cmd.wait:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that `yes`, `no`, `on`, `off`, `true`, and `false` are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
script-bar:
  cmd.wait:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing \$PATH by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

creates Only run if the file or files specified by **creates** do not exist.

New in version 2014.7.0.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the debug loglevel regardless, unless **quiet** is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from **output_loglevel**, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

salt.states.cmd.wait_call (*name, func, args=(), kws=None, onlyif=None, unless=None, creates=None, stateful=False, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs*)

salt.states.cmd.wait_script (*name, source=None, template=None, onlyif=None, unless=None, cwd=None, runas=None, shell=None, env=None, stateful=False, umask=None, use_vt=False, output_loglevel='debug', hide_output=False, **kwargs*)

Download a script from a remote source and execute it only if a watch statement calls it.

source The source script being downloaded to the minion, this source script is hosted on the salt master server. If the file is located on the master in the directory named **spam**, and is called **eggs**, the source string is `salt://spam/eggs`

template If this setting is applied then the named templating engine will be used to render the downloaded file, currently `jinja`, `mako`, and `wempy` are supported

name The command to execute, remember that the command will execute with the path and permissions of the salt-minion.

onlyif A command to run as a check, run the named command only if the command passed to the **onlyif** option returns true

unless A command to run as a check, only run the named command if the command passed to the **unless** option returns false

cwd The current working directory to execute the command in, defaults to `/root`

runas The user name to run the command as

shell The shell to use for execution, defaults to the shell grain

env A list of environment variables to be set prior to execution. Example:

```
salt://scripts/foo.sh:
  cmd.wait_script:
    - env:
      - BATCH: 'yes'
```

Warning: The above illustrates a common PyYAML pitfall, that **yes**, **no**, **on**, **off**, **true**, and **false** are all loaded as boolean `True` and `False` values, and must be enclosed in quotes to be used as strings. More info on this (and other) PyYAML idiosyncrasies can be found [here](#).

Variables as values are not evaluated. So `$PATH` in the following example is a literal `'$PATH'`:

```
salt://scripts/bar.sh:
  cmd.wait_script:
    - env: "PATH=/some/path:$PATH"
```

One can still use the existing `$PATH` by using a bit of Jinja:

```
{% set current_path = salt['environ.get']('PATH', '/bin:/usr/bin') %}

mycommand:
  cmd.run:
    - name: ls -l /
    - env:
      - PATH: {{ [current_path, '/my/special/bin']|join(':') }}
```

umask The umask (in octal) to use when running the command.

stateful The command being executed is expected to return data about executing a state. For more information, see the *Using the "Stateful" Argument* section.

use_vt Use VT utils (saltstack) to stream the command output more interactively to the console and the logs. This is experimental.

output_loglevel [debug] Control the loglevel at which the output from the command is logged to the minion log.

Note: The command being run will still be logged at the debug loglevel regardless, unless `quiet` is used for this value.

hide_output [False] Suppress stdout and stderr in the state's results.

Note: This is separate from `output_loglevel`, which only handles how Salt logs to the minion log.

New in version 2018.3.0.

20.19.58 salt.states.composer

Installation of Composer Packages

These states manage the installed packages for composer for PHP. Note that either composer is installed and accessible via a bin directory or you can pass the location of composer in the state.

```

get-composer:
  cmd.run:
  - name: 'CURL=`which curl`; $CURL -sS https://getcomposer.org/installer | php'
  - unless: test -f /usr/local/bin/composer
  - cwd: /root/

install-composer:
  cmd.wait:
  - name: mv /root/composer.phar /usr/local/bin/composer
  - cwd: /root/
  - watch:
    - cmd: get-composer

/path/to/project:
  composer.installed:
  - no_dev: true
  - require:
    - cmd: install-composer

# Without composer installed in your PATH
# Note: composer.phar must be executable for state to work properly
/path/to/project:
  composer.installed:
  - composer: /path/to/composer.phar
  - php: /usr/local/bin/php
  - no_dev: true

```

```

salt.states.composer.installed(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root', always_check=True)

```

Verify that the correct versions of composer dependencies are present.

name Directory location of the `composer.json` file.

composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is installed globally. (i.e. `/path/to/composer.phar`)

php Location of the php executable to use with composer. (i.e. `/usr/bin/php`)

user Which system user to run composer as.

New in version 2014.1.4.

prefer_source `--prefer-source` option of composer.

prefer_dist `--prefer-dist` option of composer.

no_scripts `--no-scripts` option of composer.

no_plugins `--no-plugins` option of composer.

optimize `--optimize-autoloader` option of composer. Recommended for production.

no_dev `--no-dev` option for composer. Recommended for production.

quiet `--quiet` option for composer. Whether or not to return output from composer.

composer_home `$COMPOSER_HOME` environment variable

always_check If True, *always* run `composer install` in the directory. This is the default behavior. If False, only run `composer install` if there is no vendor directory present.

```

salt.states.composer.update(name, composer=None, php=None, user=None, prefer_source=None, prefer_dist=None, no_scripts=None, no_plugins=None, optimize=None, no_dev=None, quiet=False, composer_home='/root')

```

Composer update the directory to ensure we have the latest versions of all project dependencies.

name Directory location of the `composer.json` file.

composer Location of the `composer.phar` file. If not set composer will just execute `composer` as if it is

installed globally. (i.e. /path/to/composer.phar)
php Location of the php executable to use with composer. (i.e. /usr/bin/php)
user Which system user to run composer as.

New in version 2014.1.4.

prefer_source --prefer-source option of composer.
prefer_dist --prefer-dist option of composer.
no_scripts --no-scripts option of composer.
no_plugins --no-plugins option of composer.
optimize --optimize-autoloader option of composer. Recommended for production.
no_dev --no-dev option for composer. Recommended for production.
quiet --quiet option for composer. Whether or not to return output from composer.
composer_home \$COMPOSER_HOME environment variable

20.19.59 salt.states.cron

Management of cron, the Unix command scheduler

Cron declarations require a number of parameters. The following are the parameters used by Salt to define the various timing values for a cron job:

- minute
- hour
- daymonth
- month
- dayweek (0 to 6 are Sunday through Saturday, 7 can also be used for Sunday)

Warning: Any timing arguments not specified take a value of *. This means that setting `hour` to 5, while not defining the `minute` param, will result in Salt adding a job that will execute every minute between 5 and 6 A.M.!

Additionally, the default user for these states is `root`. Therefore, if the cron job is for another user, it is necessary to specify that user with the `user` parameter.

A long time ago (before 2014.2), when making changes to an existing cron job, the name declaration is the parameter used to uniquely identify the job, so if an existing cron that looks like this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 5
```

Is changed to this:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: 7
- hour: 2
```

Then the existing cron will be updated, but if the cron command is changed, then a new cron job will be added to the user's crontab.

The current behavior is still relying on that mechanism, but you can also specify an identifier to identify your crontabs:

```
date > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 7
- hour: 2
```

New in version 2014.1.2.

And, some months later, you modify it:

```
superscript > /tmp/crontest:
cron.present:
- identifier: SUPERCRON
- user: root
- minute: 3
- hour: 4
```

New in version 2014.1.2.

The old `date > /tmp/crontest` will be replaced by `superscript > /tmp/crontest`.

Additionally, Salt also supports running a cron every `x minutes` very similarly to the Unix convention of using `* / 5` to have a job run every five minutes. In Salt, this looks like:

```
date > /tmp/crontest:
cron.present:
- user: root
- minute: '* / 5'
```

The job will now run every 5 minutes.

Additionally, the temporal parameters (minute, hour, etc.) can be randomized by using `random` instead of using a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
cron.present:
- user: root
- minute: random
- hour: 2
```

New in version 0.16.0.

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

Added the opportunity to set a job with a special keyword like `'@reboot'` or `'@hourly'`. Quotes must be used, otherwise PyYAML will strip the `'@'` sign.

```
/path/to/cron/script:
cron.present:
- user: root
- special: '@hourly'
```

The script will be executed every reboot if cron daemon support this option.

```
/path/to/cron/otherscript:
cron.absent:
- user: root
- special: '@daily'
```

This counter part definition will ensure than a job with a special keyword is not set.

`salt.states.cron.absent` (*name*, *user='root'*, *identifier=False*, *special=None*, ***kwargs*)

Verifies that the specified cron job is absent for the specified user; only the name is matched when removing a cron job.

name The command that should be absent in the user crontab.

user The name of the user whose crontab needs to be modified, defaults to the root user

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special The special keyword used in the job (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

`salt.states.cron.env_absent` (*name*, *user='root'*)

Verifies that the specified environment variable is absent from the crontab for the specified user

name The name of the environment variable to remove from the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

`salt.states.cron.env_present` (*name*, *value=None*, *user='root'*)

Verifies that the specified environment variable is present in the crontab for the specified user.

name The name of the environment variable to set in the user crontab

user The name of the user whose crontab needs to be modified, defaults to the root user

value The value to set for the given environment variable

`salt.states.cron.file` (*name*, *source_hash=""*, *source_hash_name=None*, *user='root'*, *template=None*, *context=None*, *replace=True*, *defaults=None*, *backup=""*, ***kwargs*)

Provides file.managed-like functionality (templating, etc.) for a pre-made crontab file, to be assigned to a given user.

name The source file to be used as the crontab. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. For files hosted on the salt file server, if the file is located on the master in the directory named spam, and is called eggs, the source string is `salt://spam/eggs`

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required

source_hash This can be either a file which contains a source hash string for the source, or a source hash string. The source hash string is the hash algorithm followed by the hash of the file: `md5=e138491e9d5b97023cea823fe17bac22`

source_hash_name When `source_hash` refers to a hash file, Salt will try to find the correct hash by matching the filename/URI associated with that hash. By default, Salt will look for the filename being managed. When managing a file at path `/tmp/foo.txt`, then the following line in a hash file would match:

```
acbd18db4cc2f85cedef654fccc4a4d8    foo.txt
```

However, sometimes a hash file will include multiple similar paths:

```
37b51d194a7513e45b56f6524f2d51f2    ./dir1/foo.txt
acbd18db4cc2f85cedef654fccc4a4d8    ./dir2/foo.txt
73feffa4b7f6bb68e44cf984c85f6e88    ./dir3/foo.txt
```

In cases like this, Salt may match the incorrect hash. This argument can be used to tell Salt which filename to match, to ensure that the correct hash is identified. For example:

```
foo_crontab:
  cron.file:
    - name: https://mydomain.tld/dir2/foo.txt
    - source_hash: https://mydomain.tld/hashes
    - source_hash_name: ./dir2/foo.txt
```

Note: This argument must contain the full filename entry from the checksum file, as this argument is meant to disambiguate matches for multiple files that have the same basename. So, in the example above, simply using `foo.txt` would not match.

New in version 2016.3.5.

user The user to whom the crontab should be assigned. This defaults to root.

template If this setting is applied then the named templating engine will be used to render the downloaded file. Currently, jinja and mako are supported.

context Overrides default context variables passed to the template.

replace If the crontab should be replaced, if False then this command will be ignored if a crontab exists for the specified user. Default is True.

defaults Default context passed to the template.

backup Overrides the default backup mode for the user's crontab.

salt.states.cron.present (*name*, *user*='root', *minute*='*', *hour*='*', *daymonth*='*', *month*='*', *dayweek*='*', *comment*=None, *commented*=False, *identifier*=False, *special*=None)

Verifies that the specified cron job is present for the specified user. For more advanced information about what exactly can be set in the cron timing parameters, check your cron system's documentation. Most Unix-like systems' cron documentation can be found via the crontab man page: `man 5 crontab`.

name The command that should be executed by the cron job.

user The name of the user whose crontab needs to be modified, defaults to the root user

minute The information to be set into the minute section, this can be any string supported by your cron system's the minute field. Default is *

hour The information to be set in the hour section. Default is *

daymonth The information to be set in the day of month section. Default is *

month The information to be set in the month section. Default is *

dayweek The information to be set in the day of week section. Default is *

comment User comment to be added on line previous the cron job

commented The cron job is set commented (prefixed with #DISABLED#). Defaults to False.

New in version 2016.3.0.

identifier Custom-defined identifier for tracking the cron line for future crontab edits. This defaults to the state name

special A special keyword to specify periodicity (eg. @reboot, @hourly...). Quotes must be used, otherwise PyYAML will strip the '@' sign.

New in version 2016.3.0.

20.19.60 salt.states.csf module

CSF Ip tables management

depends

- csf utility

configuration See <http://download.configserver.com/csf/install.txt> for setup instructions.

Simply allow/deny rules:**csf.rule_present:**

ip: 1.2.3.4
method: allow

`salt.states.csf.nics_skip`(*name, nics, ipv6*)

Alias for `csf.nics_skipped`

`salt.states.csf.nics_skipped`(*name, nics, ipv6=False*)

name Meaningless arg, but required for state.

nics A list of nics to skip.

ipv6 Boolean. Set to true if you want to skip the ipv6 interface. Default false (ipv4).

`salt.states.csf.option_present`(*name, value, reload=False*)

Ensure the state of a particular option/setting in csf.

name The option name in csf.conf

value The value it should be set to.

reload Boolean. If set to true, csf will be reloaded after.

`salt.states.csf.ports_open`(*name, ports, proto='tcp', direction='in'*)

Ensure ports are open for a protocol, in a direction. e.g. - `proto='tcp', direction='in'` would set the values for TCP_IN in the csf.conf file.

ports A list of ports that should be open.

proto The protocol. May be one of 'tcp', 'udp', 'tcp6', or 'udp6'.

direction Choose 'in', 'out', or both to indicate the port should be opened for inbound traffic, outbound traffic, or both.

`salt.states.csf.rule_absent`(*name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, reload=False*)

Ensure iptable is not present.

name The ip address or CIDR for the rule.

method The type of rule. Either 'allow' or 'deny'.

port Optional port to be open or closed for the iptables rule.

proto The protocol. Either 'tcp', 'udp'. Only applicable if port is specified.

direction The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

ttl How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.

reload Reload the csf service after applying this rule. Default false.

`salt.states.csf.rule_present`(*name, method, port=None, proto='tcp', direction='in', port_origin='d', ip_origin='s', ttl=None, comment="", reload=False*)

Ensure iptable rule exists.

name The ip address or CIDR for the rule.

method The type of rule. Either 'allow' or 'deny'.

port Optional port to be open or closed for the iptables rule.

proto The protocol. Either 'tcp', or 'udp'. Only applicable if port is specified.

direction The direction of traffic to apply the rule to. Either 'in', or 'out'. Only applicable if port is specified.

port_origin Specifies either the source or destination port is relevant for this rule. Only applicable if port is specified. Either 's', or 'd'.

ip_origin Specifies whether the ip in this rule refers to the source or destination ip. Either 's', or 'd'. Only applicable if port is specified.

ttl How long the rule should exist. If supplied, `csf.tempallow()` or `csf.tempdeny()` are used.

comment An optional comment to appear after the rule as a `#comment` .

reload Reload the csf service after applying this rule. Default false.

`salt.states.csf.testing_off(name, reload=False)`

Ensure testing mode is enabled in csf.

reload Reload CSF after changing the testing status. Default false.

`salt.states.csf.testing_on(name, reload=False)`

Ensure testing mode is enabled in csf.

reload Reload CSF after changing the testing status. Default false.

20.19.61 salt.states.cyg

Installation of Cygwin packages.

A state module to manage cygwin packages. Packages can be installed or removed.

```
dos2unix:
  cyg.installed
```

class `salt.states.cyg.DictDiffer(current_dict, past_dict)`

Calculate the difference between two dictionaries.

- (1) items added
- (2) items removed
- (3) keys same in both but changed values
- (4) keys same in both and unchanged values

added()

Return a set of additions to past_dict.

changed()

Return a set of the keys with changed values.

removed()

Return a set of things removed from past_dict.

same()

True if the two dicts are the same.

unchanged()

Return a set of the keys with unchanged values.

`salt.states.cyg.installed(name, cyg_arch='x86_64', mirrors=None)`

Make sure that a package is installed.

name The name of the package to install

cyg_arch [x86_64] The cygwin architecture to install the package into. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.installed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.removed(name, cyg_arch='x86_64', mirrors=None)`

Make sure that a package is not installed.

name The name of the package to uninstall

cyg_arch [x86_64] The cygwin architecture to remove the package from. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.removed:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

`salt.states.cyg.updated`(*name=None, cyg_arch='x86_64', mirrors=None*)

Make sure all packages are up to date.

name [None] No affect, salt fails poorly without the arg available

cyg_arch [x86_64] The cygwin architecture to update. Current options are x86 and x86_64

mirrors [None] List of mirrors to check. None will use a default mirror (kernel.org)

CLI Example:

```
rsync:
  cyg.updated:
    - mirrors:
      - http://mirror/without/public/key: ""
      - http://mirror/with/public/key: http://url/of/public/key
```

20.19.62 salt.states.ddns

Dynamic DNS updates

Ensure a DNS record is present or absent utilizing RFC 2136 type dynamic updates.

depends

- `dnspython`

Note: The `dnspython` module is required when managing DDNS using a TSIG key. If you are not using a TSIG key, DDNS is allowed by ACLs based on IP address and the `dnspython` module is not required.

Example:

```
webserver:
  ddns.present:
    - zone: example.com
    - ttl: 60
    - data: 111.222.333.444
    - nameserver: 123.234.345.456
    - keyfile: /srv/salt/dnspsy_tsig_key.txt
```

`salt.states.ddns.absent`(*name, zone, data=None, rdtype=None, **kwargs*)

Ensures that the named DNS record is absent.

name The host portion of the DNS record, e.g., 'webserver'. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check

data Data for the DNS record. E.g., the IP address for an A record. If omitted, all records matching name (and rdtype, if provided) will be purged.

rdtype DNS resource type. If omitted, all types will be purged.

****kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

`salt.states.ddns.present` (*name*, *zone*, *ttl*, *data*, *rdtype='A'*, ***kwargs*)

Ensures that the named DNS record is present with the given `ttl`.

name The host portion of the DNS record, e.g., `'webservers'`. Name and zone are concatenated when the entry is created unless name includes a trailing dot, so make sure that information is not duplicated in these two arguments.

zone The zone to check/update

ttl TTL for the record

data Data for the DNS record. E.g., the IP address for an A record.

rdtype DNS resource type. Default `'A'`.

****kwargs** Additional arguments the `ddns.update` function may need (e.g. `nameserver`, `keyfile`, `keyname`). Note that the `nsupdate` key file can't be reused by this function, the `keyfile` and other arguments must follow the `dnspython` spec.

20.19.63 salt.states.debconfmod

Management of debconf selections

depends

- `debconf-utils` package

The `debconfmod` state module manages the enforcement of `debconf` selections, this state can set those selections prior to package installation.

Available Functions

The `debconfmod` state has two functions, the `set` and `set_file` functions

set Set `debconf` selections from the state itself

set_file Set `debconf` selections from a file

```
nullmailer-debconf:
  debconf.set:
    - name: nullmailer
    - data:
      'shared/mailname': {'type': 'string', 'value': 'server.domain.tld'}
      'nullmailer/relayhost': {'type': 'string', 'value': 'mail.domain.tld'}
ferm-debconf:
  debconf.set:
    - name: ferm
    - data:
      'ferm/enable': {'type': 'boolean', 'value': True}
```

Note: Due to how PyYAML imports nested dicts (see [here](#)), the values in the `data` dict must be indented four spaces instead of two.

`salt.states.debconfmod.set` (*name*, *data*, ***kwargs*)
Set `debconf` selections

```

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

<state_id>:
  debconf.set:
    - name: <name>
    - data:
      <question>: {'type': <type>, 'value': <value>}
      <question>: {'type': <type>, 'value': <value>}

```

name: The package name to set answers for.

data: A set of questions/answers for debconf. Note that everything under this must be indented twice.

question: The question the is being pre-answered

type: The type of question that is being asked (string, boolean, select, etc.)

value: The answer to the question

`salt.states.debconfmod.set_file`(*name*, *source*, *template=None*, *context=None*, *defaults=None*, ***kwargs*)

Set debconf selections from a file or a template

```

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections?saltenv=myenvironment

<state_id>:
  debconf.set_file:
    - source: salt://pathto/pkg.selections.jinja2
    - template: jinja
    - context:
      some_value: "false"

```

source: The location of the file containing the package selections

template If this setting is applied then the named templating engine will be used to render the package selections file, currently jinja, mako, and wempy are supported

context Overrides default context variables passed to the template.

defaults Default context passed to the template.

20.19.64 salt.states.dellchassis

Manage chassis via Salt Proxies.

New in version 2015.8.2.

Below is an example state that sets basic parameters:

```

my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis

```

(continues on next page)

(continued from previous page)

```

- datacenter: dc-1-us
- location: my-location
- mode: 2
- idrac_launch: 1
- slot_names:
  - server-1: my-slot-name
  - server-2: my-other-slot-name
- blade_power_states:
  - server-1: on
  - server-2: off
  - server-3: powercycle

```

However, it is possible to place the entire set of chassis configuration data in pillar. Here's an example pillar structure:

```

proxy:
  host: 10.27.20.18
  admin_username: root
  fallback_admin_username: root
  passwords:
    - super-secret
    - old-secret
  proxytype: fx2

chassis:
  name: fx2-1
  username: root
  password: saltstack1
  datacenter: london
  location: rack-1-shelf-3
  management_mode: 2
  idrac_launch: 0
  slot_names:
    - 'server-1': blade1
    - 'server-2': blade2

servers:
  server-1:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.132
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-2:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.2
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-3:
    idrac_password: saltstack1
    ipmi_over_lan: True
    ip: 172.17.17.20
    netmask: 255.255.0.0
    gateway: 172.17.17.1
  server-4:
    idrac_password: saltstack1

```

(continues on next page)

(continued from previous page)

```

ipmi_over_lan: True
ip: 172.17.17.2
netmask: 255.255.0.0
gateway: 172.17.17.1

switches:
  switch-1:
    ip: 192.168.1.2
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1
  switch-2:
    ip: 192.168.1.3
    netmask: 255.255.255.0
    gateway: 192.168.1.1
    snmp: nonpublic
    password: saltstack1

```

And to go with it, here's an example state that pulls the data from the pillar stated above:

```

{% set details = pillar.get('proxy:chassis', {}) %}
standup-step1:
  dellchassis.chassis:
    - name: {{ details['name'] }}
    - location: {{ details['location'] }}
    - mode: {{ details['management_mode'] }}
    - idrac_launch: {{ details['idrac_launch'] }}
    - slot_names:
      {% for entry in details['slot_names'] %}
        - {{ entry.keys()[0] }}: {{ entry[entry.keys()[0]] }}
      {% endfor %}

blade_powercycle:
  dellchassis.chassis:
    - blade_power_states:
      - server-1: powercycle
      - server-2: powercycle
      - server-3: powercycle
      - server-4: powercycle

# Set idrac_passwords for blades. racadm needs them to be called 'server-x'
{% for k, v in details['servers'].iteritems() %}
  {{ k }}:
    dellchassis.blade_idrac:
      - idrac_password: {{ v['idrac_password'] }}
{% endfor %}

# Set management ip addresses, passwords, and snmp strings for switches
{% for k, v in details['switches'].iteritems() %}
  {{ k }}-switch-setup:
    dellchassis.switch:
      - name: {{ k }}
      - ip: {{ v['ip'] }}
      - netmask: {{ v['netmask'] }}
      - gateway: {{ v['gateway'] }}

```

(continues on next page)

(continued from previous page)

```

- password: {{ v['password'] }}
- snmp: {{ v['snmp'] }}
{% endfor %}

```

Note: This state module relies on the dracr.py execution module, which runs racadm commands on the chassis, blades, etc. The racadm command runs very slowly and, depending on your state, the proxy minion return might timeout before the racadm commands have completed. If you are repeatedly seeing minions timeout after state calls, please use the `-t` CLI argument to increase the timeout variable.

For example:

```
salt '*' state.sls my-dell-chassis-state-name -t 60
```

Note: The Dell CMC units perform adequately but many iDRACs are **excruciatingly** slow. Some functions can take minutes to execute.

```

salt.states.dellchassis.blade_idrac(name, idrac_password=None, idrac_ipmi=None,
                                   idrac_ip=None, idrac_netmask=None,
                                   idrac_gateway=None, idrac_dnsname=None,
                                   idrac_dhcp=None)

```

Set parameters for iDRAC in a blade.

Parameters

- **idrac_password** – Password to use to connect to the iDRACs directly (idrac_ipmi and idrac_dnsname must be set directly on the iDRAC. They can't be set through the CMC. If this password is present, use it instead of the CMC password)
- **idrac_ipmi** – Enable/Disable IPMI over LAN
- **idrac_ip** – Set IP address for iDRAC
- **idrac_netmask** – Set netmask for iDRAC
- **idrac_gateway** – Set gateway for iDRAC
- **idrac_dhcp** – Turn on DHCP for iDRAC (True turns on, False does nothing because setting a static IP will disable DHCP).

Returns A standard Salt changes dictionary

NOTE: If any of the IP address settings is configured, all of ip, netmask, and gateway must be present

```

salt.states.dellchassis.chassis(name, chassis_name=None, password=None, datacenter=None,
                                location=None, mode=None, idrac_launch=None,
                                slot_names=None, blade_power_states=None)

```

Manage a Dell Chassis.

chassis_name The name of the chassis.

datacenter The datacenter in which the chassis is located

location The location of the chassis.

password Password for the chassis. Note: If this password is set for the chassis, the current implementation of this state will set this password both on the chassis and the iDrac passwords on any configured blades. If the password for the blades should be distinct, they should be set separately with the blade_idrac function.

mode The management mode of the chassis. Viable options are:

- 0: None
- 1: Monitor
- 2: Manage and Monitor

idrac_launch The iDRAC launch method of the chassis. Viable options are:

- 0: Disabled (launch iDRAC using IP address)

- 1: Enabled (launch iDRAC using DNS name)

slot_names The names of the slots, provided as a list identified by their slot numbers.

blade_power_states The power states of a blade server, provided as a list and identified by their server numbers. Viable options are:

- on: Ensure the blade server is powered on.
- off: Ensure the blade server is powered off.
- powercycle: Power cycle the blade server.

Example:

```
my-dell-chassis:
  dellchassis.chassis:
    - chassis_name: my-dell-chassis
    - location: my-location
    - datacenter: london
    - mode: 2
    - idrac_launch: 1
    - slot_names:
      - 1: my-slot-name
      - 2: my-other-slot-name
    - blade_power_states:
      - server-1: on
      - server-2: off
      - server-3: powercycle
```

salt.states.dellchassis.firmware_update (*hosts=None, directory=""*)

State to update the firmware on host using the `racadm` command

firmwarefile filename (string) starting with `salt://`

host string representing the hostname supplied to the `racadm` command

directory Directory name where firmwarefile will be downloaded

```
dell-chassis-firmware-update:
  dellchassis.firmware_update:
    hosts:
      cmc:
        salt://firmware_cmc.exe
      server-1:
        salt://firmware.exe
    directory: /opt/firmwares
```

salt.states.dellchassis.switch (*name, ip=None, netmask=None, gateway=None, dhcp=None, password=None, snmp=None*)

Manage switches in a Dell Chassis.

name The switch designation (e.g. switch-1, switch-2)

ip The Static IP Address of the switch

netmask The netmask for the static IP

gateway The gateway for the static IP

dhcp True: Enable DHCP False: Do not change DHCP setup (disabling DHCP is automatic when a static IP is set)

password The access (root) password for the switch

snmp The SNMP community string for the switch

Example:

```
my-dell-chassis:
  dellchassis.switch:
    - switch: switch-1
    - ip: 192.168.1.1
```

(continues on next page)

(continued from previous page)

```

- netmask: 255.255.255.0
- gateway: 192.168.1.254
- dhcp: True
- password: secret
- snmp: public

```

20.19.65 salt.states.disk

Disk monitoring state

Monitor the state of disk resources.

The `disk.status` function can be used to report that the used space of a filesystem is within the specified limits.

```

used_space:
  disk.status:
    - name: /dev/xda1
    - maximum: 79%
    - minimum: 11%

```

It can be used with an `onfail` requisite, for example, to take additional action in response to or in preparation for other states.

```

storage_threshold:
  disk.status:
    - name: /dev/xda1
    - maximum: 97%

clear_cache:
  cmd.run:
    - name: rm -r /var/cache/app
    - onfail:
      - disk: storage_threshold

```

To use kilobytes (KB) for `minimum` and `maximum` rather than percents, specify the `absolute` flag:

```

used_space:
  disk.status:
    - name: /dev/xda1
    - minimum: 1024 KB
    - maximum: 1048576 KB
    - absolute: True

```

`salt.states.disk.status` (*name*, *maximum=None*, *minimum=None*, *absolute=False*)

Return the current disk usage stats for the named mount point

name Disk mount with which to check used space

maximum The maximum disk utilization

minimum The minimum disk utilization

absolute By default, the utilization is measured in percentage. Set the *absolute* flag to use kilobytes.

New in version 2016.11.0.

20.19.66 salt.states.docker

States to manage Docker containers, images, volumes, and networks

Changed in version 2017.7.0: The legacy Docker state and execution module have been removed, and the new modules (formerly called `dockerng` have taken their places).

Important: As of the 2017.7.0 release, the states in this module have been separated into the following four state modules:

- `docker_container` - States to manage Docker containers
- `docker_image` - States to manage Docker images
- `docker_volume` - States to manage Docker volumes
- `docker_network` - States to manage Docker networks

The reason for this change was to make states and requisites more clear. For example, imagine this SLS:

```
myuser/appimage:
  docker.image_present:
    - sls: docker.images.appimage

myapp:
  docker.running:
    - image: myuser/appimage
    - require:
      - docker: myuser/appimage
```

The new syntax would be:

```
myuser/appimage:
  docker_image.present:
    - sls: docker.images.appimage

myapp:
  docker_container.running:
    - image: myuser/appimage
    - require:
      - docker_image: myuser/appimage
```

This is similar to how Salt handles MySQL, MongoDB, Zabbix, and other cases where the same execution module is used to manage several different kinds of objects (users, databases, roles, etc.).

The old syntax will continue to work until the **Fluorine** release of Salt.

`salt.states.docker.absent(name, **kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_container.absent`.

`salt.states.docker.image_absent(**kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_image.absent`.

`salt.states.docker.image_present(name, **kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_image.present`.

`salt.states.docker.mod_watch(name, sfun=None, **kwargs)`

`salt.states.docker.network_absent(name, **kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_network.absent`.

`salt.states.docker.network_present(name, **kwargs)`

Deprecated since version 2017.7.0: This state has been moved to `docker_network.present`.

`salt.states.docker.running`(*name*, ***kwargs*)

Deprecated since version 2017.7.0: This state has been moved to `docker_container.running`.

`salt.states.docker.stopped`(***kwargs*)

Deprecated since version 2017.7.0: This state has been moved to `docker_container.stopped`.

`salt.states.docker.volume_absent`(*name*, *driver=None*)

Deprecated since version 2017.7.0: This state has been moved to `docker_volume.absent`.

`salt.states.docker.volume_present`(*name*, *driver=None*, *driver_opts=None*, *force=False*)

Deprecated since version 2017.7.0: This state has been moved to `docker_volume.present`.

20.19.67 salt.states.docker_container

Management of Docker containers

New in version 2017.7.0.

depends `docker` Python module

Note: Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` \geq 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release. When running the `docker_container.running` state for the first time after upgrading to 2017.7.0, your container(s) may be replaced. The changes may show diffs for certain parameters which say that the old value was an empty string, and the new value is `None`. This is due to the fact that in prior releases Salt was passing empty strings for these values when creating the container if they were undefined in the SLS file, where now Salt simply does not pass any arguments not explicitly defined in the SLS file. Subsequent runs of the state should not replace the container if the configuration remains unchanged.

Note: To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_container.absent`(*name*, *force=False*)

Ensure that a container is absent

name Name of the container

force [False] Set to True to remove the container even if it is running

Usage Examples:

```
mycontainer:
  docker_container.absent

multiple_containers:
  docker_container.absent:
    - names:
      - foo
```

(continues on next page)

(continued from previous page)

```
- bar
- baz
```

`salt.states.docker_container.mod_run_check` (*onlyif*, *unless*, *creates*)

Execute the *onlyif*/*unless*/*creates* logic. Returns a result dict if any of the checks fail, otherwise returns True

`salt.states.docker_container.mod_watch` (*name*, *sfun=None*, ***kwargs*)

The `docker_container` watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_container.run` (*name*, *image=None*, *onlyif=None*, *unless=None*, *creates=None*, *bg=False*, *failhard=True*, *replace=False*, *force=False*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *client_timeout=60*, ***kwargs*)

New in version 2018.3.0.

Note: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is not implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

Like the `cmd.run` state, only for Docker. Does the equivalent of a `docker run` and returns information about the container that was created, as well as its output.

This state accepts the same arguments as `docker_container.running`, with the exception of `watch_action`, `start`, and `shutdown_timeout` (though the `force` argument has a different meaning in this state).

In addition, this state accepts the arguments from `docker.logs`, with the exception of `follow`, to control how logs are returned.

Additionally, the following arguments are supported:

onlyif A command or list of commands to run as a check. The container will only run if any of the specified commands returns a zero exit status.

unless A command or list of commands to run as a check. The container will only run if any of the specified commands returns a non-zero exit status.

creates A path or list of paths. Only run if one or more of the specified paths do not exist on the minion.

bg [False] If True, run container in background and do not await or deliver its results.

Note: This may not be useful in cases where other states depend on the results of this state. Also, the logs will be inaccessible once the container exits if `auto_remove` is set to True, so keep this in mind.

failhard [True] If True, the state will return a False result if the exit code of the container is non-zero. When this argument is set to False, the state will return a True result regardless of the container's exit code.

Note: This has no effect if `bg` is set to True.

replace [False] If True, and if the named container already exists, this will remove the existing container. The default behavior is to return a False result when the container already exists.

force [False] If True, and the named container already exists, *and* **replace** is also set to True, then the container will be forcibly removed. Otherwise, the state will not proceed and will return a `False` result.

CLI Examples:

```
salt myminion docker.run_container myuser/myimage command=/usr/local/bin/myscript.
↪sh
```

USAGE EXAMPLE

```
{% set pkg_version = salt.pillar.get('pkg_version', '1.0-1') %}
build_package:
  docker_container.run:
    - image: myuser/builder:latest
    - binds: /home/myuser/builds:/build_dir
    - command: /scripts/build.sh {{ pkg_version }}
    - creates: /home/myuser/builds/myapp-{{ pkg_version }}.noarch.rpm
    - replace: True
    - networks:
      - mynet
    - require:
      - docker_network: mynet
```

`salt.states.docker_container.running`(*name*, *image=None*, *skip_translate=None*, *ignore_collisions=False*, *validate_ip_addrs=True*, *force=False*, *watch_action='force'*, *start=True*, *shutdown_timeout=None*, *client_timeout=60*, *networks=None*, ***kwargs*)

Ensure that a container with a specific configuration is present and running

name Name of the container

image Image to use for the container

Note: This state will pull the image if it is not present. However, if the image needs to be built from a Dockerfile or loaded from a saved image, or if you would like to use requisites to trigger a replacement of the container when the image is updated, then the `docker_image.present` state should be used to manage the image.

Changed in version 2018.3.0: If no tag is specified in the image name, and nothing matching the specified image is pulled on the minion, the `docker_pull` that retrieves the image will pull *all tags* for the image. A tag of `latest` is no longer implicit for the pull. For this reason, it is recommended to specify the image in `repo:tag` notation.

skip_translate This function translates Salt CLI or SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. An example of using this option to skip translation would be:

For example, imagine that there is an issue with processing the `port_bindings` argument, and the following configuration no longer works as expected:

```

mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - port_bindings:
      - 10.2.9.10:8080:80

```

By using `skip_translate`, you can forego the input translation and configure the port binding in the format `docker-py` needs:

```

mycontainer:
  docker_container.running:
    - image: 7.3.1611
    - skip_translate: port_bindings
    - port_bindings: {8080: [('10.2.9.10', 80)], '4193/udp': 9314}

```

See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

ignore_collisions [False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument so that both CLI and API versions of a given argument are supported. However, if both the alias and the `docker-py` version of the same argument (e.g. `env` and `environment`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

validate_ip_addrs [True] For parameters which accept IP addresses as input, IP address validation will be performed. To disable, set this to `False`

force [False] Set this parameter to `True` to force Salt to re-create the container irrespective of whether or not it is configured as desired.

watch_action [force] Control what type of action is taken when this state *watches* another state that has changes. The default action is `force`, which runs the state with `force` set to `True`, triggering a rebuild of the container.

If any other value is passed, it will be assumed to be a kill signal. If the container matches the specified configuration, and is running, then the action will be to send that signal to the container. Kill signals can be either strings or numbers, and are defined in the **Standard Signals** section of the `signal(7)` manpage. Run `man 7 signal` on a Linux host to browse this manpage. For example:

```

mycontainer:
  docker_container.running:
    - image: busybox
    - watch_action: SIGHUP
    - watch:
      - file: some_file

```

Note: If the container differs from the specified configuration, or is not running, then instead of sending a signal to the container, the container will be re-created/started and no signal will be sent.

start [True] Set to `False` to suppress starting of the container if it exists, matches the desired configuration, but is not running. This is useful for data-only containers, or for non-daemonized container processes, such as the Django `migrate` and `collectstatic` commands. In instances such as this, the container only needs to be started the first time.

shutdown_timeout If the container needs to be replaced, the container will be stopped using `docker.stop`. If a `shutdown_timeout` is not set, and the container was created using `stop_timeout`, that timeout will be used. If neither of these values were set, then a timeout of 10 seconds will be used.

Changed in version 2017.7.0: This option was renamed from `stop_timeout` to `shutdown_timeout` to accommodate the `stop_timeout` container configuration setting.

client_timeout [60] Timeout in seconds for the Docker client. This is not a timeout for this function, but for receiving a response from the API.

Note: This is only used if Salt needs to pull the requested image.

NETWORK MANAGEMENT

New in version 2018.3.0.

The `networks` argument can be used to ensure that a container is attached to one or more networks. Optionally, arguments can be passed to the networks. In the example below, `net1` is being configured with arguments, while `net2` is being configured *without* arguments:

```
foo:
  docker_container.running:
    - image: myuser/myimage:foo
    - networks:
      - net1:
          - aliases:
              - bar
              - baz
          - ipv4_address: 10.0.20.50
      - net2
    - require:
      - docker_network: net1
      - docker_network: net2
```

The supported arguments are the ones from the `docker-py`'s `connect_container_to_network` function (other than `container` and `net_id`).

Important: Unlike with the arguments described in the **CONTAINER CONFIGURATION PARAMETERS** section below, these network configuration parameters are not translated at all. Consult the `connect_container_to_network` documentation for the correct type/format of data to pass.

CONTAINER CONFIGURATION PARAMETERS

auto_remove (or *rm*) [False] Enable auto-removal of the container on daemon side when the container's process exits (analogous to running a docker container with `--rm` on the CLI).

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - auto_remove: True
```

binds Files/directories to bind mount. Each bind mount should be passed in one of the following formats:

- `<host_path>:<container_path>` - `host_path` is mounted within the container as `container_path` with read-write access.
- `<host_path>:<container_path>:<selinux_context>` - `host_path` is mounted within the container as `container_path` with read-write access. Additionally, the specified selinux context will be set within the container.
- `<host_path>:<container_path>:<read_only>` - `host_path` is mounted within the container as `container_path`, with the read-only or read-write setting explicitly defined.
- `<host_path>:<container_path>:<read_only>,<selinux_context>` - `host_path` is mounted within the container as `container_path`, with the read-only

or read-write setting explicitly defined. Additionally, the specified selinux context will be set within the container.

<read_only> can be either `rw` for read-write access, or `ro` for read-only access. When omitted, it is assumed to be read-write.

<selinux_context> can be `z` if the volume is shared between multiple containers, or `Z` if the volume should be private.

Note: When both <read_only> and <selinux_context> are specified, there must be a comma before <selinux_context>.

Binds can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds: /srv/www:/var/www:ro,/etc/foo.conf:/usr/local/etc/foo.conf:rw
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw
```

However, in cases where both ro/rw and an selinux context are combined, the only option is to use a YAML list, like so:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:rw,Z
```

Since the second bind in the previous example is mounted read-write, the `rw` and comma can be dropped. For example:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - binds:
      - /srv/www:/var/www:ro,Z
      - /home/myuser/conf/foo.conf:/etc/foo.conf:Z
```

blkio_weight Block IO weight (relative weight), accepts a weight value between 10 and 1000.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - blkio_weight: 100
```

blkio_weight_device Block IO weight (relative device weight), specified as a list of expressions in the format `PATH:RATE`

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```
- image: bar/baz:latest
- blkio_weight_device: /dev/sda:100
```

cap_add List of capabilities to add within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
docker_container.running:
- image: bar/baz:latest
- cap_add: SYS_ADMIN,MKNOD
```

```
foo:
docker_container.running:
- image: bar/baz:latest
- cap_add:
- SYS_ADMIN
- MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

cap_drop List of capabilities to drop within the container. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
docker_container.running:
- image: bar/baz:latest
- cap_drop: SYS_ADMIN,MKNOD
```

```
foo:
docker_container.running:
- image: bar/baz:latest
- cap_drop:
- SYS_ADMIN
- MKNOD
```

Note: This option requires Docker 1.2.0 or newer.

command (or *cmd*) Command to run in the container

```
foo:
docker_container.running:
- image: bar/baz:latest
- command: bash
```

cpuset_cpus (or *cpuset*) CPUs on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of CPUs (e.g. 0, 1).

```
foo:
docker_container.running:
- image: bar/baz:latest
- cpuset_cpus: "0,1"
```

cpuset_mems Memory nodes on which which to allow execution, specified as a string containing a range (e.g. 0-3) or a comma-separated list of MEMs (e.g. 0, 1). Only effective on NUMA systems.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpuset_mems: "0,1"
```

cpu_group The length of a CPU period in microseconds

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_group: 100000
```

cpu_period Microseconds of CPU time that the container can get in a CPU period

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_period: 50000
```

cpu_shares CPU shares (relative weight), specified as an integer between 2 and 1024.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - cpu_shares: 512
```

detach [False] If True, run the container's command in the background (daemon mode)

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - detach: True
```

devices List of host devices to expose within the container. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices: /dev/net/tun,/dev/xvda1:/dev/xvda1,/dev/xvdb1:/dev/xvdb1:r
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices:
      - /dev/net/tun
      - /dev/xvda1:/dev/xvda1
      - /dev/xvdb1:/dev/xvdb1:r
```

device_read_bps Limit read rate (bytes per second) from a device, specified as a list of expressions in the format PATH:RATE, where RATE is either an integer number of bytes, or a string ending in kb, mb, or gb. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

- **image:** bar/baz:latest
- **devices_read_bps:**
 - /dev/sda:1mb
 - /dev/sdb:5mb

device_read_iops Limit read rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

device_write_bps Limit write rate (bytes per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is either an integer number of bytes, or a string ending in `kb`, `mb`, or `gb`. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps: /dev/sda:1mb,/dev/sdb:5mb
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_write_bps:
      - /dev/sda:1mb
      - /dev/sdb:5mb
```

device_read_iops Limit write rate (I/O per second) from a device, specified as a list of expressions in the format `PATH:RATE`, where `RATE` is a number of I/O operations. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops: /dev/sda:1000,/dev/sdb:500
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - devices_read_iops:
      - /dev/sda:1000
      - /dev/sdb:500
```

dns List of DNS nameservers. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns: 8.8.8.8,8.8.4.4
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns:
      - 8.8.8.8
      - 8.8.4.4
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

dns_opt Additional options to be added to the container's `resolv.conf` file. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt: ndots:9
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_opt:
      - ndots:9
```

dns_search List of DNS search domains. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search: foo1.domain.tld,foo2.domain.tld
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - dns_search:
      - foo1.domain.tld
      - foo2.domain.tld
```

domainname The domain name to use for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - domainname: domain.tld
```

entrypoint Entrypoint for the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint: "mycmd --arg1 --arg2"
```

This argument can also be specified as a list:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - entrypoint:
      - mycmd
      - --arg1
      - --arg2
```

environment Either a list of variable/value mappings, or a list of strings in the format `VARNAME=value`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1: value
      - VAR2: value
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment: 'VAR1=value,VAR2=value'
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - environment:
      - VAR1=value
      - VAR2=value
```

extra_hosts Additional hosts to add to the container's `/etc/hosts` file. Can be expressed as a comma-separated list or a Python list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts: web1:10.9.8.7,web2:10.9.8.8
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - extra_hosts:
      - web1:10.9.8.7
      - web2:10.9.8.8
```

Note: To skip IP address validation, use `validate_ip_addrs=False`

Note: This option requires Docker 1.3.0 or newer.

group_add List of additional group names and/or IDs that the container process will run as. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add: web,network
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - group_add:
      - web
      - network
```

hostname Hostname of the container. If not provided, the value passed as the container's "name" will be used for the hostname.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
```

Warning: hostname cannot be set if network_mode is set to host. The below example will result in an error:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - hostname: web1
    - network_mode: host
```

interactive (or *stdin_open*) [False] Leave stdin open, even if not attached

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - interactive: True
```

ipc_mode (or *ipc*) Set the IPC mode for the container. The default behavior is to create a private IPC namespace for the container, but this option can be used to change that behavior:

- **container:**<container_name_or_id> reuses another container shared memory, semaphores and message queues
- **host:** use the host's shared memory, semaphores and message queues

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: container:foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ipc_mode: host
```

Warning: Using host gives the container full access to local shared memory and is therefore considered insecure.

isolation Specifies the type of isolation technology used by containers

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - isolation: hyperv
```

Note: The default value on Windows server is `process`, while the default value on Windows client is `hyperv`. On Linux, only `default` is supported.

labels Add metadata to the container. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```
mynet:
  docker_network.present:
    - labels:
      - foo
      - bar=baz
      - hello: world
```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```
foo:
  docker_network.present:
    - labels:
      foo: ''
      bar: baz
      hello: world
```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

links Link this container to another. Links can be specified as a list of mappings or a comma-separated or Python list of expressions in the format `<container_name_or_id>:<link_alias>`. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1: link1
      - web2: link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links: web1:link1,web2:link2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - links:
      - web1:link1
      - web2:link2
```

log_driver and **log_opt** Set container's logging driver and options to configure that driver. Requires Docker 1.6 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address: tcp://192.168.0.42
      - syslog-facility: daemon
```

The **log_opt** can also be expressed as a comma-separated or YAML list of **key=value** pairs. The below two examples are equivalent to the above one:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt: "syslog-address=tcp://192.168.0.42,syslog-facility=daemon"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - log_driver: syslog
    - log_opt:
      - syslog-address=tcp://192.168.0.42
      - syslog-facility=daemon
```

Note: The logging driver feature was improved in Docker 1.13 introducing option name changes. Please see Docker's [Configure logging drivers](#) documentation for more information.

lxc_conf Additional LXC configuration parameters to set before starting the container. Either a list of variable/value mappings, or a list of strings in the format **VARNAME=value**. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname: docker
      - lxc.arch: x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf: lxc.utsname=docker,lxc.arch=x86_64
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - lxc_conf:
      - lxc.utsname=docker
      - lxc.arch=x86_64
```

Note: These LXC configuration parameters will only have the desired effect if the container is using

the LXC execution driver, which has been deprecated for some time.

mac_address MAC address to use for the container. If not specified, a random MAC address will be used.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mac_address: 01:23:45:67:89:0a
```

mem_limit (or *memory*) [0] Memory limit. Can be specified in bytes or using single-letter units (i.e. 512M, 2G, etc.). A value of 0 (the default) means no memory limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_limit: 512M
```

mem_swappiness Tune a container's memory swappiness behavior. Accepts an integer between 0 and 100.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - mem_swappiness: 60
```

memswap_limit (or *memory_swap*) [-1] Total memory limit (memory plus swap). Set to -1 to disable swap. A value of 0 means no swap limit.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - memswap_limit: 1G
```

network_disabled [False] If True, networking will be disabled within the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_disabled: True
```

network_mode [bridge] One of the following:

- `bridge` - Creates a new network stack for the container on the docker bridge
- `none` - No networking (equivalent of the Docker CLI argument `--net=none`). Not to be confused with Python's `None`.
- `container:<name_or_id>` - Reuses another container's network stack
- `host` - Use the host's network stack inside the container
- Any name that identifies an existing network that might be created with `docker.network_present`.

Warning: Using `host` mode gives the container full access to the hosts system's services (such as D-bus), and is therefore considered insecure.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: "none"
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - network_mode: container:web1
```

oom_kill_disable Whether to disable OOM killer

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_kill_disable: False
```

oom_score_adj An integer value containing the score given to the container in order to tune OOM killer preferences

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - oom_score_adj: 500
```

pid_mode Set to `host` to use the host container's PID namespace within the container. Requires Docker 1.5.0 or newer.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pid_mode: host
```

Note: This option requires Docker 1.5.0 or newer.

pids_limit Set the container's PID limit. Set to `-1` for unlimited.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - pids_limit: 2000
```

port_bindings (or *publish*) Bind exposed ports. Port bindings should be passed in the same way as the `--publish` argument to the `docker run` CLI command:

- `ip:hostPort:containerPort` - Bind a specific IP and port on the host to a specific port within the container.
- `ip::containerPort` - Bind a specific IP and an ephemeral port to a specific port within the container.
- `hostPort:containerPort` - Bind a specific port on all of the host's interfaces to a specific port within the container.
- `containerPort` - Bind an ephemeral port on all of the host's interfaces to a specific port within the container.

Multiple bindings can be separated by commas, or expressed as a YAML list, and port ranges can be defined using dashes. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - port_bindings: "4505-4506:14505-14506,2123:2123/udp,8080"
```

```
foo:
  docker_container.running:
```

(continues on next page)

(continued from previous page)

```

- image: bar/baz:latest
- port_bindings:
  - 4505-4506:14505-14506
  - 2123:2123/udp
  - 8080

```

Note: When specifying a protocol, it must be passed in the `containerPort` value, as seen in the examples above.

ports A list of ports to expose on the container. Can either be a comma-separated list or a YAML list. If the protocol is omitted, the port will be assumed to be a TCP port. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 1111,2222/udp

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports:
      - 1111
      - 2222/udp

```

privileged [False] If True, runs the exec process with extended privileges

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - privileged: True

```

publish_all_ports (or *publish_all*) [False] Publish all ports to the host

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - ports: 8080
    - publish_all_ports: True

```

read_only [False] If True, mount the container's root filesystem as read only

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - read_only: True

```

restart_policy (or *restart*) Set a restart policy for the container. Must be passed as a string in the format `policy[:retry_count]` where `policy` is one of `always`, `unless-stopped`, or `on-failure`, and `retry_count` is an optional limit to the number of retries. The retry count is ignored when using the `always` or `unless-stopped` restart policy.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - restart_policy: on-failure:5
bar:

```

(continues on next page)

(continued from previous page)

```

docker_container.running:
  - image: bar/baz:latest
  - restart_policy: always

```

security_opt (or **security_opts**): Security configuration for MLS systems such as SELinux and AppArmor. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt: apparmor:unconfined

```

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - security_opt:
      - apparmor:unconfined

```

Important: Some security options can contain commas. In these cases, this argument *must* be passed as a Python list, as splitting by comma will result in an invalid configuration.

Note: See the documentation for **security_opt** at <https://docs.docker.com/engine/reference/run/#security-configuration>

shm_size Size of /dev/shm

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - shm_size: 128M

```

stop_signal Specify the signal docker will send to the container when stopping. Useful when running systemd as PID 1 inside the container.

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_signal: SIGRTMIN+3

```

Note: This option requires Docker 1.9.0 or newer and docker-py 1.7.0 or newer.

New in version 2016.11.0.

stop_timeout Timeout to stop the container, in seconds

```

foo:
  docker_container.running:
    - image: bar/baz:latest
    - stop_timeout: 5

```

Note: In releases prior to 2017.7.0, this option was not set in the container configuration, but rather this timeout was enforced only when shutting down an existing container to replace it. To remove the

ambiguity, and to allow for the container to have a stop timeout set for it, the old `stop_timeout` argument has been renamed to `shutdown_timeout`, while `stop_timeout` now refers to the container's configured stop timeout.

storage_opt Storage driver options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize: 40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt: dm.basesize=40G
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - storage_opt:
      - dm.basesize=40G
```

sysctls (or *sysctl*) Set sysctl options for the container. Can be either a list of strings in the format `option=value`, or a list of mappings between option and value. The below three examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open: 1048576
      - kernel.pid_max: 32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls: fs.nr_open=1048576, kernel.pid_max=32768
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - sysctls:
      - fs.nr_open=1048576
      - kernel.pid_max=32768
```

tmpfs A map of container directories which should be replaced by tmpfs mounts and their corresponding mount options.

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tmpfs:
      - /run: rw,noexec,nosuid,size=65536k
```

tty [False] Attach TTYS

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - tty: True
```

ulimits List of ulimits. These limits should be passed in the format `<ulimit_name>:<soft_limit>:<hard_limit>`, with the hard limit being optional. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits: nofile=1024:1024,nproc=60
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - ulimits:
      - nofile=1024:1024
      - nproc=60
```

user User under which to run exec process

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - user: foo
```

userns_mode (or *user_ns_mode*) Sets the user namespace mode, when the user namespace remapping option is enabled

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - userns_mode: host
```

volumes (or *volume*) List of directories to expose as volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes: /mnt/vol1,/mnt/vol2
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes:
      - /mnt/vol1
      - /mnt/vol2
```

volumes_from Container names or IDs from which the container will get volumes. Can be expressed as a comma-separated list or a YAML list. The below two examples are equivalent:

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from: foo
```

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volumes_from:
      - foo
```

`volume_driver` sets the container's volume driver

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - volume_driver: foobar
```

`working_dir` (or *workdir*) Working directory inside the container

```
foo:
  docker_container.running:
    - image: bar/baz:latest
    - working_dir: /var/log/nginx
```

```
salt.states.docker_container.stopped(name=None, containers=None, shutdown_timeout=None, unpause=False, error_on_absent=True, **kwargs)
```

Ensure that a container (or containers) is stopped

name Name or ID of the container

containers Run this state on more than one container at a time. The following two examples accomplish the same thing:

```
stopped_containers:
  docker_container.stopped:
    - names:
      - foo
      - bar
      - baz
```

```
stopped_containers:
  docker_container.stopped:
    - containers:
      - foo
      - bar
      - baz
```

However, the second example will be a bit quicker since Salt will stop all specified containers in a single run, rather than executing the state separately on each image (as it would in the first example).

shutdown_timeout Timeout for graceful shutdown of the container. If this timeout is exceeded, the container will be killed. If this value is not passed, then the container's configured `stop_timeout` will be observed. If `stop_timeout` was also unset on the container, then a timeout of 10 seconds will be used.

unpause [False] Set to `True` to unpause any paused containers before stopping. If unset, then an error will be raised for any container that was paused.

error_on_absent [True] By default, this state will return an error if any of the specified containers are absent. Set this to `False` to suppress that error.

20.19.68 salt.states.docker_image

Management of Docker images

New in version 2017.7.0.

depends `docker` Python module

Note: Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` \geq 1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

Note: To pull from a Docker registry, authentication must be configured. See [here](#) for more information on how to configure access to docker registries in *Pillar* data.

`salt.states.docker_image.absent` (*name=None, images=None, force=False*)

Ensure that an image is absent from the Minion. Image names can be specified either using `repo:tag` notation, or just the repo name (in which case a tag of `latest` is assumed).

images Run this state on more than one image at a time. The following two examples accomplish the same thing:

```
remove_images:
  docker_image.absent:
    - names:
      - busybox
      - centos:6
      - nginx
```

```
remove_images:
  docker_image.absent:
    - images:
      - busybox
      - centos:6
      - nginx
```

However, the second example will be a bit quicker since Salt will do all the deletions in a single run, rather than executing the state separately on each image (as it would in the first example).

force [False] Salt will fail to remove any images currently in use by a container. Set this option to true to remove the image even if it is already present.

Note: This option can also be overridden by Pillar data. If the Minion has a pillar variable named `docker.running.force` which is set to `True`, it will turn on this option. This pillar variable can even be set at runtime. For example:

```
salt myminion state.sls docker_stuff pillar="{docker.force: True}"
```

If this pillar variable is present and set to `False`, then it will turn off this option.

For more granular control, setting a pillar variable named `docker.force.image_name` will affect only the named image.

`salt.states.docker_image.mod_watch`(*name*, *sfun=None*, ***kwargs*)

The `docker_image` watcher, called to invoke the watch command.

Note: This state exists to support special handling of the `watch requisite`. It should not be called directly.

Parameters for this function should be set by the state being triggered.

`salt.states.docker_image.present`(*name*, *tag=None*, *build=None*, *load=None*, *force=False*, *insecure_registry=False*, *client_timeout=60*, *dockerfile=None*, *sls=None*, *base='opensuse/python'*, *saltenv='base'*, *pillarenv=None*, *pillar=None*, ***kwargs*)

Changed in version 2018.3.0: The `tag` argument has been added. It is now required unless pulling from a registry.

Ensure that an image is present. The image can either be pulled from a Docker registry, built from a Dockerfile, loaded from a saved image, or built by running SLS files against a base image.

If none of the `build`, `load`, or `sls` arguments are used, then Salt will pull from the *configured registries*. If the specified image already exists, it will not be pulled unless `force` is set to `True`. Here is an example of a state that will pull an image from the Docker Hub:

```
myuser/myimage:
  docker_image.present:
    - tag: mytag
```

tag Tag name for the image. Required when using `build`, `load`, or `sls` to create the image, but optional if pulling from a repository.

New in version 2018.3.0.

build Path to directory on the Minion containing a Dockerfile

```
myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag

myuser/myimage:
  docker_image.present:
    - build: /home/myuser/docker/myimage
    - tag: mytag
    - dockerfile: Dockerfile.alternative
```

The image will be built using `docker.build` and the specified image name and tag will be applied to it.

New in version 2016.11.0.

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

load Loads a tar archive created with `docker.load` (or the `docker load` Docker CLI command), and assigns it the specified repo and tag.

```
myuser/myimage:
  docker_image.present:
```

(continues on next page)

(continued from previous page)

- ```
- load: salt://path/to/image.tar
- tag: mytag
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**force** [False] Set this parameter to `True` to force Salt to pull/build/load the image even if it is already present.

**client\_timeout** Timeout in seconds for the Docker client. This is not a timeout for the state, but for receiving a response from the API.

**dockerfile** Allows for an alternative Dockerfile to be specified. Path to alternative Dockerfile is relative to the build path for the Docker container.

New in version 2016.11.0.

**sls** Allow for building of image with `docker.sls_build` by specifying the SLS files with which to build. This can be a list or comma-separated string.

```
myuser/myimage:
 docker_image.present:
 - tag: latest
 - sls:
 - webapp1
 - webapp2
 - base: centos
 - saltenv: base
```

Changed in version 2018.3.0: The `tag` must be manually specified using the `tag` argument.

**base** Base image with which to start `docker.sls_build`

New in version 2017.7.0.

**saltenv** Specify the environment from which to retrieve the SLS indicated by the `mods` parameter.

New in version 2017.7.0.

Changed in version 2018.3.0: Now uses the effective saltenv if not explicitly passed. In earlier versions, `base` was assumed as a default.

**pillarenv** Specify a Pillar environment to be used when applying states. This can also be set in the minion config file using the `pillarenv` option. When neither the `pillarenv` minion config option nor this CLI argument is used, all Pillar environments will be merged together.

New in version 2018.3.0.

**pillar** Custom Pillar values, passed as a dictionary of key-value pairs

---

**Note:** Values passed this way will override Pillar values set via `pillar_roots` or an external Pillar source.

---

New in version 2018.3.0.

## 20.19.69 salt.states.docker\_network

Management of Docker networks

New in version 2017.7.0.

**depends** `docker` Python module

---

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py` `>= 1.6.0` are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

---

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_network.absent` (*name*, *driver=None*)

Ensure that a network is absent.

**name** Name of the network

Usage Example:

```
network_foo:
 docker_network.absent
```

`salt.states.docker_network.present` (*name*, *skip\_translate=None*, *ignore\_collisions=False*, *validate\_ip\_addrs=True*, *containers=None*, *reconnect=True*, *\*\*kwargs*)

Changed in version 2018.3.0: Support added for network configuration options other than `driver` and `driver_opts`, as well as IPAM configuration.

Ensure that a network is present

---

**Note:** This state supports all arguments for network and IPAM pool configuration which are available for the release of `docker-py` installed on the minion. For that reason, the arguments described below in the [NETWORK CONFIGURATION](#) and [IP ADDRESS MANAGEMENT \(IPAM\)](#) sections may not accurately reflect what is available on the minion. The `docker.get_client_args` function can be used to check the available arguments for the installed version of `docker-py` (they are found in the `network_config` and `ipam_config` sections of the return data), but Salt will not prevent a user from attempting to use an argument which is unsupported in the release of Docker which is installed. In those cases, network creation be attempted but will fail.

---

**name** Network name

**skip\_translate** This function translates Salt SLS input into the format which `docker-py` expects. However, in the event that Salt's translation logic fails (due to potential changes in the Docker Remote API, or to bugs in the translation code), this argument can be used to exert granular control over which arguments are translated and which are not.

Pass this argument as a comma-separated list (or Python list) of arguments, and translation for each passed argument name will be skipped. Alternatively, pass `True` and *all* translation will be skipped.

Skipping translation allows for arguments to be formatted directly in the format which `docker-py` expects. This allows for API changes and other issues to be more easily worked around. See the following links for more information:

- [docker-py Low-level API](#)
- [Docker Engine API](#)

New in version 2018.3.0.

**ignore\_collisions** [False] Since many of `docker-py`'s arguments differ in name from their CLI counterparts (with which most Docker users are more familiar), Salt detects usage of these and aliases them to the `docker-py` version of that argument. However, if both the alias and the `docker-py` version of the same argument (e.g. `options` and `driver_opts`) are used, an error will be raised. Set this argument to `True` to suppress these errors and keep the `docker-py` version of the argument.

New in version 2018.3.0.

**validate\_ip\_addrs** [True] For parameters which accept IP addresses/subnets as input, validation will be performed. To disable, set this to `False`.

New in version 2018.3.0.

**containers** A list of containers which should be connected to this network.

---

**Note:** As of the 2018.3.0 release, this is not the recommended way of managing a container's membership in a network, for a couple reasons:

1. It does not support setting static IPs, aliases, or links in the container's IP configuration.
2. If a `docker_container.running` state replaces a container, it will not be reconnected to the network until the `docker_network.present` state is run again. Since containers often have `require` requisites to ensure that the network is present, this means that the `docker_network.present` state ends up being run *before* the `docker_container.running`, leaving the container unattached at the end of the Salt run.

For these reasons, it is recommended to use *docker\_container.running's network management support*.

---

**reconnect** [True] If `containers` is not used, and the network is replaced, then Salt will keep track of the containers which were connected to the network and reconnect them to the network after it is replaced. Salt will first attempt to reconnect using the same IP the container had before the network was replaced. If that fails (for instance, if the network was replaced because the subnet was modified), then the container will be reconnected without an explicit IP address, and its IP will be assigned by Docker.

Set this option to `False` to keep Salt from trying to reconnect containers. This can be useful in some cases when *managing static IPs in docker\_container.running*. For instance, if a network's subnet is modified, it is likely that the static IP will need to be updated in the `docker_container.running` state as well. When the network is replaced, the initial reconnect attempt would fail, and the container would be reconnected with an automatically-assigned IP address. Then, when the `docker_container.running` state executes, it would disconnect the network *again* and reconnect using the new static IP. Disabling the reconnect behavior in these cases would prevent the unnecessary extra reconnection.

New in version 2018.3.0.

## NETWORK CONFIGURATION ARGUMENTS

**driver** Network driver

```
mynet:
 docker_network.present:
 - driver: macvlan
```

**driver\_opts** (or *driver\_opt*, or *options*) Options for the network driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```
mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts: macvlan_mode=bridge,parent=eth0
```

```
mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts:
 - macvlan_mode=bridge
 - parent=eth0
```

```

mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts:
 - macvlan_mode: bridge
 - parent: eth0

```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

mynet:
 docker_network.present:
 - driver: macvlan
 - driver_opts:
 macvlan_mode: bridge
 parent: eth0

```

**check\_duplicate** [True] If True, checks for networks with duplicate names. Since networks are primarily keyed based on a random ID and not on the name, and network name is strictly a user-friendly alias to the network which is uniquely identified using ID, there is no guaranteed way to check for duplicates. This option provides a best effort, checking for any networks which have the same name, but it is not guaranteed to catch all name collisions.

```

mynet:
 docker_network.present:
 - check_duplicate: False

```

**internal** [False] If True, restricts external access to the network

```

mynet:
 docker_network.present:
 - internal: True

```

**labels** Add metadata to the network. Labels can be set both with and without values, and labels with values can be passed either as `key=value` or `key: value` pairs. For example, while the below would be very confusing to read, it is technically valid, and demonstrates the different ways in which labels can be passed:

```

mynet:
 docker_network.present:
 - labels:
 - foo
 - bar=baz
 - hello: world

```

The labels can also simply be passed as a YAML dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

foo:
 docker_network.present:
 - labels:
 foo: ''
 bar: baz
 hello: world

```

Changed in version 2018.3.0: Methods for specifying labels can now be mixed. Earlier releases required either labels with or without values.

**enable\_ipv6 (or *ipv6*)** [False] Enable IPv6 on the network

```

mynet:
 docker_network.present:
 - enable_ipv6: True

```

**Note:** While it should go without saying, this argument must be set to `True` to *configure an IPv6 subnet*. Also, if this option is turned on without an IPv6 subnet explicitly configured, you will get an error unless you have set up a fixed IPv6 subnet. Consult the [Docker IPv6 docs](#) for information on how to do this.

**attachable** [False] If `True`, and the network is in the global scope, non-service containers on worker nodes will be able to connect to the network.

```

mynet:
 docker_network.present:
 - attachable: True

```

**Note:** This option cannot be reliably managed on CentOS 7. This is because while support for this option was added in API version 1.24, its value was not added to the inspect results until API version 1.26. The version of Docker which is available for CentOS 7 runs API version 1.24, meaning that while Salt can pass this argument to the API, it has no way of knowing the value of this config option in an existing Docker network.

**scope** Specify the network's scope (`local`, `global` or `swarm`)

```

mynet:
 docker_network.present:
 - scope: local

```

**ingress** [False] If `True`, create an ingress network which provides the routing-mesh in swarm mode

```

mynet:
 docker_network.present:
 - ingress: True

```

## IP ADDRESS MANAGEMENT (IPAM)

This state supports networks with either IPv4, or both IPv4 and IPv6. If configuring IPv4, then you can pass the *IPAM pool arguments* below as individual arguments. However, if configuring IPv4 and IPv6, the arguments must be passed as a list of dictionaries, in the `ipam_pools` argument (click [here](#) for some examples). [These docs](#) also have more information on these arguments.

### IPAM ARGUMENTS

**ipam\_driver** IPAM driver to use, if different from the default one

```

mynet:
 docker_network.present:
 - ipam_driver: foo

```

**ipam\_opts** Options for the IPAM driver. Either a dictionary of option names and values or a Python list of strings in the format `varname=value`. The below three examples are equivalent:

```

mynet:
 docker_network.present:
 - ipam_driver: foo
 - ipam_opts: foo=bar ,baz=qux

```

```

mynet:
 docker_network.present:
 - ipam_driver: foo
 - ipam_opts:
 - foo=bar
 - baz=qux

```

```

mynet:
 docker_network.present:
 - ipam_driver: foo
 - ipam_opts:
 - foo: bar
 - baz: qux

```

The options can also simply be passed as a dictionary, though this can be error-prone due to some *idiosyncrasies* with how PyYAML loads nested data structures:

```

mynet:
 docker_network.present:
 - ipam_driver: macvlan
 - ipam_opts:
 foo: bar
 baz: qux

```

#### IPAM POOL ARGUMENTS

**subnet** Subnet in CIDR format that represents a network segment

**iprange (or *ip\_range*)** Allocate container IP from a sub-range within the subnet

Subnet in CIDR format that represents a network segment

**gateway** IPv4 or IPv6 gateway for the master subnet

**aux\_addresses (or *aux\_address*)** A dictionary of mapping container names to IP addresses which should be allocated for them should they connect to the network. Either a dictionary of option names and values or a Python list of strings in the format `host=ipaddr`.

#### IPAM CONFIGURATION EXAMPLES

Below is an example of an IPv4-only network (keep in mind that `subnet` is the only required argument).

```

mynet:
 docker_network.present:
 - subnet: 10.0.20.0/24
 - iprange: 10.0.20.128/25
 - gateway: 10.0.20.254
 - aux_addresses:
 - foo.bar.tld: 10.0.20.50
 - hello.world.tld: 10.0.20.51

```

---

**Note:** The `aux_addresses` can be passed differently, in the same way that `driver_opts` and `ipam_opts` can.

---

This same network could also be configured this way:

```

mynet:
 docker_network.present:
 - ipam_pools:
 - subnet: 10.0.20.0/24

```

(continues on next page)

(continued from previous page)

```

iprange: 10.0.20.128/25
gateway: 10.0.20.254
aux_addresses:
 foo.bar.tld: 10.0.20.50
 hello.world.tld: 10.0.20.51

```

Here is an example of a mixed IPv4/IPv6 subnet.

```

mynet:
 docker_network.present:
 - ipam_pools:
 - subnet: 10.0.20.0/24
 gateway: 10.0.20.1
 - subnet: fe3f:2180:26:1::/123
 gateway: fe3f:2180:26:1::1

```

### 20.19.70 salt.states.docker\_volume

Management of Docker volumes

New in version 2017.7.0.

**depends** `docker` Python module

**Note:** Older releases of the Python bindings for Docker were called `docker-py` in PyPI. All releases of `docker`, and releases of `docker-py`  $\geq$  1.6.0 are supported. These python bindings can easily be installed using `pip.install`:

```
salt myminion pip.install docker
```

To upgrade from `docker-py` to `docker`, you must first uninstall `docker-py`, and then install `docker`:

```
salt myminion pip.uninstall docker-py
salt myminion pip.install docker
```

These states were moved from the `docker` state module (formerly called `dockerng`) in the 2017.7.0 release.

`salt.states.docker_volume.absent` (*name*, *driver=None*)

Ensure that a volume is absent.

New in version 2015.8.4.

Changed in version 2017.7.0: This state was renamed from `docker.volume_absent` to `docker_volume.absent`

**name** Name of the volume

Usage Examples:

```

volume_foo:
 docker_volume.absent

```

`salt.states.docker_volume.present` (*name*, *driver=None*, *driver\_opts=None*, *force=False*)

Ensure that a volume is present.

New in version 2015.8.4.

Changed in version 2015.8.6: This state no longer deletes and re-creates a volume if the existing volume's driver does not match the `driver` parameter (unless the `force` parameter is set to `True`).

Changed in version 2017.7.0: This state was renamed from `docker.volume_present` to `docker_volume.present`

**name** Name of the volume

**driver** Type of driver for that volume. If `None` and the volume does not yet exist, the volume will be created using Docker's default driver. If `None` and the volume does exist, this function does nothing, even if the existing volume's driver is not the Docker default driver. (To ensure that an existing volume's driver matches the Docker default, you must explicitly name Docker's default driver here.)

**driver\_opts** Options for the volume driver

**force** [False] If the volume already exists but the existing volume's driver does not match the driver specified by the `driver` parameter, this parameter controls whether the function errors out (if `False`) or deletes and re-creates the volume (if `True`).

New in version 2015.8.6.

Usage Examples:

```
volume_foo:
 docker_volume.present
```

```
volume_bar:
 docker_volume.present
 - name: bar
 - driver: local
 - driver_opts:
 foo: bar
```

```
volume_bar:
 docker_volume.present
 - name: bar
 - driver: local
 - driver_opts:
 - foo: bar
 - option: value
```

### 20.19.71 salt.states.drac

Management of Dell DRAC

The DRAC module is used to create and manage DRAC cards on Dell servers

Ensure the user damian is present

```
damian:
 drac.present:
 - name: damian
 - password: secret
 - permission: login,test_alerts,clear_logs
```

Ensure the user damian does not exist

```
damian:
 drac.absent:
 - name: damian
```

Ensure DRAC network is in a consistent state

```

my_network:
 drac.network:
 - ip: 10.225.108.29
 - netmask: 255.255.255.224
 - gateway: 10.225.108.1

```

`salt.states.drac.absent`(*name*)

Ensure a user does not exist on the Dell DRAC

**name:** The users username

`salt.states.drac.network`(*ip, netmask, gateway*)

Ensure the DRAC network settings are consistent

`salt.states.drac.present`(*name, password, permission*)

Ensure the user exists on the Dell DRAC

**name:** The users username

**password** The password used to authenticate

**permission** The permissions that should be assigned to a user

## 20.19.72 salt.states.elasticsearch

State module to manage Elasticsearch.

New in version 2017.7.0.

`salt.states.elasticsearch.alias_absent`(*name, index*)

Ensure that the index alias is absent.

**name** Name of the index alias to remove

**index** Name of the index for the alias

`salt.states.elasticsearch.alias_present`(*name, index, definition=None*)

Ensure that the named index alias is present.

**name** Name of the alias

**index** Name of the index

**definition** Optional dict for filters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-aliases.html>

**Example:**

```

mytestalias:
 elasticsearch.alias_present:
 - index: testindex
 - definition:
 filter:
 term:
 user: kimchy

```

`salt.states.elasticsearch.index_absent`(*name*)

Ensure that the named index is absent.

**name** Name of the index to remove

`salt.states.elasticsearch.index_present`(*name, definition=None*)

Ensure that the named index is present.

**name** Name of the index to add

**definition** Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

**Example:**

```
Default settings
mytestindex:
 elasticsearch_index.present

Extra settings
mytestindex2:
 elasticsearch_index.present:
 - definition:
 settings:
 index:
 number_of_shards: 10
```

`salt.states.elasticsearch.index_template_absent`(*name*)

Ensure that the named index template is absent.

**name** Name of the index to remove

`salt.states.elasticsearch.index_template_present`(*name*, *definition*,  
*check\_definition=False*)

Ensure that the named index template is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**check\_definition** If the template already exists and the definition is up to date

Example:

```
mytestindex2_template:
 elasticsearch_index_template_present:
 - definition:
 template: logstash-*
 order: 1
 settings:
 number_of_shards: 1
```

`salt.states.elasticsearch.pipeline_absent`(*name*)

Ensure that the named pipeline is absent

**name** Name of the pipeline to remove

`salt.states.elasticsearch.pipeline_present`(*name*, *definition*)

Ensure that the named pipeline is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/master/pipeline.html>

Example:

```
test_pipeline:
 elasticsearch_pipeline.present:
 - definition:
 description: example pipeline
 processors:
 - set:
 field: collector_timestamp_millis
 value: '{{ '{{' }}_ingest.timestamp{{ '}}' }}'
```

`salt.states.elasticsearch.search_template_absent`(*name*)

Ensure that the search template is absent

**name** Name of the search template to remove

`salt.states.elasticsearch.search_template_present` (*name*, *definition*)

Ensure that the named search template is present.

**name** Name of the search template to add

**definition** Required dict for creation parameters as per <http://www.elastic.co/guide/en/elasticsearch/reference/current/search-template.html>

**Example:**

```
test_pipeline:
 elasticsearch.search_template_present:
 - definition:
 inline:
 size: 10
```

### 20.19.73 salt.states.elasticsearch\_index

State module to manage Elasticsearch indices

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use `elasticsearch` state instead

`salt.states.elasticsearch_index.absent` (*name*)

Ensure that the named index is absent.

**name** Name of the index to remove

`salt.states.elasticsearch_index.present` (*name*, *definition=None*)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked `definition` as optional.

Ensure that the named index is present.

**name** Name of the index to add

**definition** Optional dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-create-index.html>

**Example:**

```
Default settings
mytestindex:
 elasticsearch_index.present

Extra settings
mytestindex2:
 elasticsearch_index.present:
 - definition:
 settings:
 index:
 number_of_shards: 10
```

### 20.19.74 salt.states.elasticsearch\_index\_template

State module to manage Elasticsearch index templates

New in version 2015.8.0.

Deprecated since version 2017.7.0: Use `elasticsearch` state instead

`salt.states.elasticsearch_index_template.absent` (*name*)

Ensure that the named index template is absent.

**name** Name of the index to remove

`salt.states.elasticsearch_index_template.present` (*name*, *definition*)

New in version 2015.8.0.

Changed in version 2017.3.0: Marked definition as required.

Ensure that the named index template is present.

**name** Name of the index to add

**definition** Required dict for creation parameters as per <https://www.elastic.co/guide/en/elasticsearch/reference/current/indices-templates.html>

**Example:**

```
mytestindex2_template:
 elasticsearch_index_template.present:
 - definition:
 template: logstash-*
 order: 1
 settings:
 number_of_shards: 1
```

### 20.19.75 salt.states.environ

Support for getting and setting the environment variables of the current salt process.

`salt.states.environ.setenv` (*name*, *value*, *false\_unsets=False*, *clear\_all=False*, *update\_minion=False*, *permanent=False*)

Set the salt process environment variables.

**name** The environment key to set. Must be a string.

**value** Either a string or dict. When string, it will be the value set for the environment key of 'name' above. When a dict, each key/value pair represents an environment variable to set.

**false\_unsets** If a key's value is False and false\_unsets is True, then the key will be removed from the salt processes environment dict entirely. If a key's value is False and false\_unsets is not True, then the key's value will be set to an empty string. Default: False

**clear\_all** USE WITH CAUTION! This option can unset environment variables needed for salt to function properly. If clear\_all is True, then any environment variables not defined in the environ dict will be deleted. Default: False

**update\_minion** If True, apply these environ changes to the main salt-minion process. If False, the environ changes will only affect the current salt subprocess. Default: False

**permanent** On Windows minions this will set the environment variable in the registry so that it is always added as an environment variable when applications open. If you want to set the variable to HKLM instead of HKCU just pass in "HKLM" for this parameter. On all other minion types this will be ignored.

Note: This will only take affect on applications opened after this has been set.

**Example:**

```
a_string_env:
 environ.setenv:
 - name: foo
 - value: bar
 - update_minion: True

a_dict_env:
 environ.setenv:
 - name: does_not_matter
 - value:
```

(continues on next page)

(continued from previous page)

```
foo: bar
baz: quux
```

### 20.19.76 salt.states.eselect

#### Management of Gentoo configuration using eselect

A state module to manage Gentoo configuration via eselect

`salt.states.eselect.set_`(*name*, *target*, *module\_parameter=None*, *action\_parameter=None*)

Verify that the given module is set to the given target

**name** The name of the module

**target** The target to be set for this module

**module\_parameter** additional params passed to the defined module

**action\_parameter** additional params passed to the defined action

```
profile:
 eselect.set:
 - target: hardened/linux/amd64
```

### 20.19.77 salt.states.etcd\_mod

#### Manage etcd Keys

New in version 2015.8.0.

**depends**

- python-etcd

This state module supports setting and removing keys from etcd.

#### Configuration

To work with an etcd server you must configure an etcd profile. The etcd config can be set in either the Salt Minion configuration file or in pillar:

```
my_etd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

It is technically possible to configure etcd without using a profile, but this is not considered to be a best practice, especially when multiple etcd servers or clusters are available.

```
etcd.host: 127.0.0.1
etcd.port: 4001
```

**Note:** The etcd configuration can also be set in the Salt Master config file, but in order to use any etcd configurations defined in the Salt Master config, the `pillar_opts` must be set to `True`.

Be aware that setting `pillar_opts` to `True` has security implications as this makes all master configuration settings available in all minion's pillars.

---

Etdc profile configuration can be overridden using following arguments: `host`, `port`, `username`, `password`, `ca`, `client_key` and `client_cert`.

```
my-value:
 etcd.set:
 - name: /path/to/key
 - value: value
 - host: 127.0.0.1
 - port: 2379
 - username: user
 - password: pass
```

### Available Functions

- `set`

This will set a value to a key in etcd. Changes will be returned if the key has been created or the value of the key has been updated. This means you can watch these states for changes.

```
/foo/bar/baz:
 etcd.set:
 - value: foo
 - profile: my_etcd_config
```

- `wait_set`

Performs the same functionality as `set` but only if a watch requisite is `True`.

```
/some/file.txt:
 file.managed:
 - source: salt://file.txt

/foo/bar/baz:
 etcd.wait_set:
 - value: foo
 - profile: my_etcd_config
 - watch:
 - file: /some/file.txt
```

- `rm`

This will delete a key from etcd. If the key exists then changes will be returned and thus you can watch for changes on the state, if the key does not exist then no changes will occur.

```
/foo/bar/baz:
 etcd.rm:
 - profile: my_etcd_config
```

- `wait_rm`

Performs the same functionality as `rm` but only if a watch requisite is `True`.

```

/some/file.txt:
 file.managed:
 - source: salt://file.txt

/foo/bar/baz:
 etcd.wait_rm:
 - profile: my_etcd_config
 - watch:
 - file: /some/file.txt

```

`salt.states.etcd_mod.directory`(*name*, *profile=None*, *\*\*kwargs*)

Create a directory in etcd.

**name** The etcd directory name, for example: `/foo/bar/baz`.

**profile** Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

```

my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001

```

`salt.states.etcd_mod.mod_watch`(*name*, *\*\*kwargs*)

The etcd watcher, called to invoke the watch command. When called, execute a etcd function based on a watch call requisite.

---

**Note:** This state exists to support special handling of the `watch` *requisite*. It should not be called directly.

Parameters for this function should be set by the state being triggered.

---

`salt.states.etcd_mod.rm`(*name*, *recurse=False*, *profile=None*, *\*\*kwargs*)

Deletes a key from etcd

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete.

**profile** Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

```

my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001

```

`salt.states.etcd_mod.set_`(*name*, *value*, *profile=None*, *\*\*kwargs*)

Set a key in etcd

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** Optional, defaults to `NONE`. Sets the etcd profile to use which has been defined in the Salt Master config.

```

my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001

```

`salt.states.etcd_mod.wait_rm`(*name*, *recurse=False*, *profile=None*, *\*\*kwargs*)

Deletes a key from etcd only if the watch statement calls it. This function is also aliased as `wait_rm`.

**name** The etcd key name to remove, for example `/foo/bar/baz`.

**recurse** Optional, defaults to `False`. If `True` performs a recursive delete, see: <https://python-etcd.readthedocs.io/en/latest/#delete-a-key>.

**profile** Optional, defaults to None. Sets the etcd profile to use which has been defined in the Salt Master config.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

`salt.states.etcd_mod.wait_set` (*name*, *value*, *profile=None*, *\*\*kwargs*)

Set a key in etcd only if the watch statement calls it. This function is also aliased as `wait_set`.

**name** The etcd key name, for example: `/foo/bar/baz`.

**value** The value the key should contain.

**profile** The etcd profile to use that has been configured on the Salt Master, this is optional and defaults to None.

```
my_etcd_config:
 etcd.host: 127.0.0.1
 etcd.port: 4001
```

### 20.19.78 salt.states.ethtool module

Configuration of network device

New in version 2016.11.0.

**codeauthor** Krzysztof Pawlowski <[msciciel@msciciel.eu](mailto:msciciel@msciciel.eu)>

**maturity** new

**depends** python-ethtool

**platform** linux

```
eth0:
 ethtool.coalesce:
 - name: eth0
 - rx_usecs: 24
 - tx_usecs: 48

eth0:
 ethtool.ring:
 - name: eth0
 - rx: 1024
 - tx: 1024

eth0:
 ethtool.offload:
 - name: eth0
 - tcp_segmentation_offload: on
```

`salt.states.ethtool.coalesce` (*name*, *\*\*kwargs*)

Manage coalescing settings of network device

**name** Interface name to apply coalescing settings

```
eth0:
 ethtool.coalesce:
 - name: eth0
 - adaptive_rx: on
```

(continues on next page)

(continued from previous page)

```

- adaptive_tx: on
- rx_usecs: 24
- rx_frame: 0
- rx_usecs_irq: 0
- rx_frames_irq: 0
- tx_usecs: 48
- tx_frames: 0
- tx_usecs_irq: 0
- tx_frames_irq: 0
- stats_block_usecs: 0
- pkt_rate_low: 0
- rx_usecs_low: 0
- rx_frames_low: 0
- tx_usecs_low: 0
- tx_frames_low: 0
- pkt_rate_high: 0
- rx_usecs_high: 0
- rx_frames_high: 0
- tx_usecs_high: 0
- tx_frames_high: 0
- sample_interval: 0

```

`salt.states.ethtool.offload(name, **kwargs)`

Manage protocol offload and other features of network device

**name** Interface name to apply coalescing settings

```

eth0:
 ethtool.offload:
 - name: eth0
 - tcp_segmentation_offload: on

```

`salt.states.ethtool.ring(name, **kwargs)`

Manage rx/tx ring parameters of network device

Use 'max' word to set with factory maximum

**name** Interface name to apply ring parameters

```

eth0:
 ethtool.ring:
 - name: eth0
 - rx: 1024
 - rx_mini: 0
 - rx_jumbo: 0
 - tx: max

```

## 20.19.79 salt.states.esxi

Manage VMware ESXi Hosts.

New in version 2015.8.4.

### Dependencies

- pyVmomi Python Module

- ESXCLI

## pyVmomi

PyVmomi can be installed via pip:

```
pip install pyVmomi
```

---

**Note:** Version 6.0 of pyVmomi has some problems with SSL error handling on certain versions of Python. If using version 6.0 of pyVmomi, Python 2.6, Python 2.7.9, or newer must be present. This is due to an upstream dependency in pyVmomi 6.0 that is not supported in Python versions 2.7 to 2.7.8. If the version of Python is not in the supported range, you will need to install an earlier version of pyVmomi. See [Issue #29537](#) for more information.

---

Based on the note above, to install an earlier version of pyVmomi than the version currently listed in PyPi, run the following:

```
pip install pyVmomi==5.5.0.2014.1.1
```

The 5.5.0.2014.1.1 is a known stable version that this original ESXi State Module was developed against.

## ESXCLI

Currently, about a third of the functions used in the vSphere Execution Module require the ESXCLI package be installed on the machine running the Proxy Minion process.

The ESXCLI package is also referred to as the VMware vSphere CLI, or vCLI. VMware provides vCLI package installation instructions for [vSphere 5.5](#) and [vSphere 6.0](#).

Once all of the required dependencies are in place and the vCLI package is installed, you can check to see if you can connect to your ESXi host or vCenter server by running the following command:

```
esxcli -s <host-location> -u <username> -p <password> system syslog config get
```

If the connection was successful, ESXCLI was successfully installed on your system. You should see output related to the ESXi host's syslog configuration.

---

**Note:** Be aware that some functionality in this state module may depend on the type of license attached to the ESXi host.

For example, certain services are only available to manipulate service state or policies with a VMware vSphere Enterprise or Enterprise Plus license, while others are available with a Standard license. The `ntpd` service is restricted to an Enterprise Plus license, while `ssh` is available via the Standard license.

Please see the [vSphere Comparison](#) page for more information.

---

## About

This state module was written to be used in conjunction with Salt's *ESXi Proxy Minion*. For a tutorial on how to use Salt's ESXi Proxy Minion, please refer to the [ESXi Proxy Minion Tutorial](#) for configuration examples, dependency installation instructions, how to run remote execution functions against ESXi hosts via a Salt Proxy Minion, and a larger state example.

```
salt.states.esxi.coredump_configured(name, enabled, dump_ip, host_vnic='vmk0',
 dump_port=6500)
```

Ensures a host's core dump configuration.

**name** Name of the state.

**enabled** Sets whether or not ESXi core dump collection should be enabled. This is a boolean value set to `True` or `False` to enable or disable core dumps.

Note that ESXi requires that the core dump must be enabled before any other parameters may be set. This also affects the `changes` results in the state return dictionary. If `enabled` is `False`, we can't obtain any previous settings to compare other state variables, resulting in many old references returning `None`.

Once `enabled` is `True` the `changes` dictionary comparisons will be more accurate. This is due to the way the system `coredump` network configuration command returns data.

**dump\_ip** The IP address of host that will accept the dump.

**host\_vnic** Host VNIC port through which to communicate. Defaults to `vmk0`.

**dump\_port** TCP port to use for the dump. Defaults to `6500`.

Example:

```
configure-host-coredump:
 esxi.coredump_configured:
 - enabled: True
 - dump_ip: 'my-coredump-ip.example.com'
```

```
salt.states.esxi.diskgroups_configured(name, diskgroups, erase_disks=False)
```

Configures the disk groups to use for vsan.

This function will do the following:

1. Check whether or not all disks in the diskgroup spec exist, and raises an error if they do not.
2. Create diskgroups with the correct disk configurations if diskgroup (identified by the cache disk canonical name) doesn't exist
3. Adds extra capacity disks to the existing diskgroup

Example:

```
{
 'cache_scsi_addr': 'vmhba1:C0:T0:L0',
 'capacity_scsi_addrs': [
 'vmhba2:C0:T0:L0',
 'vmhba3:C0:T0:L0',
 'vmhba4:C0:T0:L0',
]
}
```

**name** Mandatory state name

**diskgroups** Disk group representation containing scsi disk addresses. Scsi addresses are expected for disks in the diskgroup:

**erase\_disks** Specifies whether to erase all partitions on all disks member of the disk group before the disk group is created. Default value is `False`.

```
salt.states.esxi.host_cache_configured(name, enabled, datastore, swap_size='100%',
 dedicated_backing_disk=False,
 erase_backing_disk=False)
```

Configures the host cache used for swapping.

It will do the following:

1. Checks if backing disk exists
2. Creates the VMFS datastore if doesn't exist (datastore partition will be created and use the entire disk)

3. Raises an error if `dedicated_backing_disk` is `True` and partitions already exist on the backing disk
4. Configures `host_cache` to use a portion of the datastore for caching (either a specific size or a percentage of the datastore)

#### Examples

Percentage swap size (can't be 100%)

```
{
 'enabled': true,
 'datastore': {
 'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
 'vmfs_version': 5,
 'name': 'hostcache'
 }
 'dedicated_backing_disk': false
 'swap_size': '98%',
}
```

Fixed sized swap size

```
{
 'enabled': true,
 'datastore': {
 'backing_disk_scsi_addr': 'vmhba0:C0:T0:L0',
 'vmfs_version': 5,
 'name': 'hostcache'
 }
 'dedicated_backing_disk': true
 'swap_size': '10GiB',
}
```

**name** Mandatory state name.

**enabled** Specifies whether the host cache is enabled.

**datastore** Specifies the host cache datastore.

**swap\_size** Specifies the size of the host cache swap. Can be a percentage or a value in GiB. Default value is 100%.

**dedicated\_backing\_disk** Specifies whether the backing disk is dedicated to the host cache which means it must have no other partitions. Default is `False`

**erase\_backing\_disk** Specifies whether to erase all partitions on the backing disk before the datastore is created. Default value is `False`.

**salt.states.esxi.ntp\_configured**(*name, service\_running, ntp\_servers=None, service\_policy=None, service\_restart=False, update\_datetime=False*)

Ensures a host's NTP server configuration such as setting NTP servers, ensuring the NTP daemon is running or stopped, or restarting the NTP daemon for the ESXi host.

**name** Name of the state.

**service\_running** Ensures the running state of the ntp daemon for the host. Boolean value where `True` indicates that ntpd should be running and `False` indicates that it should be stopped.

**ntp\_servers** A list of servers that should be added to the ESXi host's NTP configuration.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yaml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to `True`, the ntp daemon will be restarted, regardless of its previous running state. Default is `False`.

**update\_datetime** If set to `True`, the date/time on the given host will be updated to UTC. Default setting is `False`. This option should be used with caution since network delays and execution delays can result in time skews.

Example:

```
configure-host-ntp:
 esxi.ntp_configured:
 - service_running: True
 - ntp_servers:
 - 192.174.1.100
 - 192.174.1.200
 - service_policy: 'on'
 - service_restart: True
```

`salt.states.esxi.password_present` (*name, password*)

Ensures the given password is set on the ESXi host. Passwords cannot be obtained from host, so if a password is set in this state, the `vsphere.update_host_password` function will always run (except when using `test=True` functionality) and the state's changes dictionary will always be populated.

The username for which the password will change is the same username that is used to authenticate against the ESXi host via the Proxy Minion. For example, if the pillar definition for the proxy username is defined as `root`, then the username that the password will be updated for via this state is `root`.

**name** Name of the state.

**password** The new password to change on the host.

Example:

```
configure-host-password:
 esxi.password_present:
 - password: 'new-bad-password'
```

`salt.states.esxi.ssh_configured` (*name, service\_running, ssh\_key=None, ssh\_key\_file=None, service\_policy=None, service\_restart=False, certificate\_verify=False*)

Manage the SSH configuration for a host including whether or not SSH is running or the presence of a given SSH key. Note: Only one ssh key can be uploaded for root. Uploading a second key will replace any existing key.

**name** Name of the state.

**service\_running** Ensures whether or not the SSH service should be running on a host. Represented as a boolean value where `True` indicates that SSH should be running and `False` indicates that SSH should be stopped.

In order to update SSH keys, the SSH service must be running.

**ssh\_key** Public SSH key to added to the `authorized_keys` file on the ESXi host. You can use `ssh_key` or `ssh_key_file`, but not both.

**ssh\_key\_file** File containing the public SSH key to be added to the `authorized_keys` file on the ESXi host. You can use `ssh_key_file` or `ssh_key`, but not both.

**service\_policy** The policy to set for the NTP service.

---

**Note:** When setting the service policy to `off` or `on`, you *must* quote the setting. If you don't, the yml parser will set the string to a boolean, which will cause trouble checking for stateful changes and will error when trying to set the policy on the ESXi host.

---

**service\_restart** If set to `True`, the SSH service will be restarted, regardless of its previous running state. Default is `False`.

`certificate_verify` If set to `True`, the SSL connection must present a valid certificate. Default is `False`.

Example:

```

configure-host-ssh:
 esxi.ssh_configured:
 - service_running: True
 - ssh_key_file: /etc/salt/ssh_keys/my_key.pub
 - service_policy: 'on'
 - service_restart: True
 - certificate_verify: True

```

`salt.states.esxi.syslog_configured`(*name, syslog\_configs, firewall=True, reset\_service=True, reset\_syslog\_config=False, reset\_configs=None*)

Ensures the specified syslog configuration parameters. By default, this state will reset the syslog service after any new or changed parameters are set successfully.

**name** Name of the state.

**syslog\_configs** Name of parameter to set (corresponds to the command line switch for `esxcli` without the double dashes (-))

Valid `syslog_config` values are `logdir`, `loghost`, `logdir-unique`, `default-rotate`, `default-size`, and `default-timeout`.

Each `syslog_config` option also needs a configuration value to set. For example, `loghost` requires URLs or IP addresses to use for logging. Multiple log servers can be specified by listing them, comma-separated, but without spaces before or after commas

(reference: <https://blogs.vmware.com/vsphere/2012/04/configuring-multiple-syslog-servers-for-esxi-5.html>)

**firewall** Enable the firewall rule set for syslog. Defaults to `True`.

**reset\_service** After a successful parameter set, reset the service. Defaults to `True`.

**reset\_syslog\_config** Resets the syslog service to its default settings. Defaults to `False`. If set to `True`, default settings defined by the list of syslog configs in `reset_configs` will be reset before running any other syslog settings.

**reset\_configs** A comma-delimited list of parameters to reset. Only runs if `reset_syslog_config` is set to `True`. If `reset_syslog_config` is set to `True`, but no syslog configs are listed in `reset_configs`, then `reset_configs` will be set to `all` by default.

See `syslog_configs` parameter above for a list of valid options.

Example:

```

configure-host-syslog:
 esxi.syslog_configured:
 - syslog_configs:
 loghost: ssl://localhost:5432,tcp://10.1.0.1:1514
 default-timeout: 120
 - firewall: True
 - reset_service: True
 - reset_syslog_config: True
 - reset_configs: loghost,default-timeout

```

`salt.states.esxi.vmotion_configured`(*name, enabled, device='vmk0'*)

Configures a host's VMotion properties such as enabling VMotion and setting the device VirtualNic that VMotion will use.

**name** Name of the state.

**enabled** Ensures whether or not VMotion should be enabled on a host as a boolean value where `True` indicates that VMotion should be enabled and `False` indicates that VMotion should be disabled.

**device** The device that uniquely identifies the VirtualNic that will be used for VMotion for the host. Defaults to `vmk0`.

Example:

```

configure-vmotion:
 esxi.vmotion_configured:
 - enabled: True
 - device: sample-device

```

`salt.states.esxi.vsan_configured(name, enabled, add_disks_to_vsan=False)`

Configures a host's VSAN properties such as enabling or disabling VSAN, or adding VSAN-eligible disks to the VSAN system for the host.

**name** Name of the state.

**enabled** Ensures whether or not VSAN should be enabled on a host as a boolean value where `True` indicates that VSAN should be enabled and `False` indicates that VSAN should be disabled.

**add\_disks\_to\_vsan** If set to `True`, any VSAN-eligible disks for the given host will be added to the host's VSAN system. Default is `False`.

Example:

```

configure-host-vsan:
 esxi.vsan_configured:
 - enabled: True
 - add_disks_to_vsan: True

```

## 20.19.80 salt.states.event

Send events through Salt's event system during state runs

`salt.states.event.send(name, data=None, preload=None, with_env=False, with_grains=False, with_pillar=False, **kwargs)`

Send an event to the Salt Master

New in version 2014.7.0.

Accepts the same arguments as the `event.send` execution module of the same name.

Example:

```

...snip bunch of states above

mycompany/mystaterun/status/update:
 event.send:
 - data:
 status: "Half-way through the state run!"

...snip bunch of states below

```

`salt.states.event.wait(name, sfun=None)`

Fire an event on the Salt master event bus if called from a watch statement

New in version 2014.7.0.

Example:

```

Stand up a new web server.
apache:
 pkg:
 - installed
 - name: httpd

```

(continues on next page)

(continued from previous page)

```

service:
 - running
 - enable: True
 - name: httpd

Notify the load balancer to update the pool once Apache is running.
refresh_pool:
 event:
 - wait
 - name: mycompany/loadbalancer/pool/update
 - data:
 new_web_server_ip: {{ grains['ipv4'] | first() }}
 - watch:
 - pkg: apache

```

### 20.19.81 salt.states.file

#### Operations on regular files, special files, directories, and symlinks

Salt States can aggressively manipulate files on a system. There are a number of ways in which files can be managed.

Regular files can be enforced with the *file.managed* state. This state downloads files from the salt master and places them on the target system. Managed files can be rendered as a jinja, mako, or wempy template, adding a dynamic component to file management. An example of *file.managed* which makes use of the jinja templating system would look like this:

```

/etc/http/conf/http.conf:
 file.managed:
 - source: salt://apache/http.conf
 - user: root
 - group: root
 - mode: 644
 - attrs: ai
 - template: jinja
 - defaults:
 custom_var: "default value"
 other_var: 123
 {% if grains['os'] == 'Ubuntu' %}
 - context:
 custom_var: "override"
 {% endif %}

```

It is also possible to use the *py renderer* as a templating option. The template would be a Python script which would need to contain a function called `run()`, which returns a string. All arguments to the state will be made available to the Python script as globals. The returned string will be the contents of the managed file. For example:

```

def run():
 lines = ['foo', 'bar', 'baz']
 lines.extend([source, name, user, context]) # Arguments as globals
 return '\n\n'.join(lines)

```

---

**Note:** The `defaults` and `context` arguments require extra indentation (four spaces instead of the normal two) in order to create a nested dictionary. *More information.*

---

If using a template, any user-defined template variables in the file defined in `source` must be passed in using the `defaults` and/or `context` arguments. The general best practice is to place default values in `defaults`, with conditional overrides going into `context`, as seen above.

The template will receive a variable `custom_var`, which would be accessed in the template using `{{ custom_var }}`. If the operating system is Ubuntu, the value of the variable `custom_var` would be *override*, otherwise it is the default *default value*

The `source` parameter can be specified as a list. If this is done, then the first file to be matched will be the one that is used. This allows you to have a default file on which to fall back if the desired file does not exist on the salt fileserver. Here's an example:

```
/etc/foo.conf:
 file.managed:
 - source:
 - salt://foo.conf.{{ grains['fqdn'] }}
 - salt://foo.conf.fallback
 - user: foo
 - group: users
 - mode: 644
 - attrs: i
 - backup: minion
```

**Note:** Salt supports backing up managed files via the `backup` option. For more details on this functionality please review the [backup\\_mode documentation](#).

The `source` parameter can also specify a file in another Salt environment. In this example `foo.conf` in the `dev` environment will be used instead.

```
/etc/foo.conf:
 file.managed:
 - source:
 - 'salt://foo.conf?saltenv=dev'
 - user: foo
 - group: users
 - mode: '0644'
 - attrs: i
```

**Warning:** When using a mode that includes a leading zero you must wrap the value in single quotes. If the value is not wrapped in quotes it will be read by YAML as an integer and evaluated as an octal.

The `names` parameter, which is part of the state compiler, can be used to expand the contents of a single state declaration into multiple, single state declarations. Each item in the `names` list receives its own individual state name and is converted into its own low-data structure. This is a convenient way to manage several files with similar attributes.

There is more documentation about this feature in the [Names declaration](#) section of the [Highstate docs](#).

Special files can be managed via the `mknod` function. This function will create and enforce the permissions on a special file. The function supports the creation of character devices, block devices, and FIFO pipes. The function will create the directory structure up to the special file if it is needed on the minion. The function will not overwrite or operate on (change major/minor numbers) existing special files with the exception of user, group, and permissions. In most cases the creation of some special files require root permissions on the minion. This would require that the minion to be run as the root user. Here is an example of a character device:

```
/var/named/chroot/dev/random:
file.mknod:
- ntype: c
- major: 1
- minor: 8
- user: named
- group: named
- mode: 660
```

Here is an example of a block device:

```
/var/named/chroot/dev/loop0:
file.mknod:
- ntype: b
- major: 7
- minor: 0
- user: named
- group: named
- mode: 660
```

Here is an example of a fifo pipe:

```
/var/named/chroot/var/log/logfifo:
file.mknod:
- ntype: p
- user: named
- group: named
- mode: 660
```

Directories can be managed via the `directory` function. This function can create and enforce the permissions on a directory. A directory statement will look like this:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
```

If you need to enforce user and/or group ownership or permissions recursively on the directory's contents, you can do so by adding a `recurse` directive:

```
/srv/stuff/substuf:
file.directory:
- user: fred
- group: users
- mode: 755
- makedirs: True
- recurse:
- user
- group
- mode
```

As a default, mode will resolve to `dir_mode` and `file_mode`, to specify both directory and file permissions, use this form:

```

/srv/stuff/substuf:
 file.directory:
 - user: fred
 - group: users
 - file_mode: 744
 - dir_mode: 755
 - makedirs: True
 - recurse:
 - user
 - group
 - mode

```

Symlinks can be easily created; the `symlink` function is very simple and only takes a few arguments:

```

/etc/grub.conf:
 file.symlink:
 - target: /boot/grub/grub.conf

```

Recursive directory management can also be set via the `recurse` function. Recursive directory management allows for a directory on the salt master to be recursively copied down to the minion. This is a great tool for deploying large code and configuration systems. A state using `recurse` would look something like this:

```

/opt/code/flask:
 file.recurse:
 - source: salt://code/flask
 - include_empty: True

```

A more complex `recurse` example:

```

{% set site_user = 'testuser' %}
{% set site_name = 'test_site' %}
{% set project_name = 'test_proj' %}
{% set sites_dir = 'test_dir' %}

django-project:
 file.recurse:
 - name: {{ sites_dir }}/{{ site_name }}/{{ project_name }}
 - user: {{ site_user }}
 - dir_mode: 2775
 - file_mode: '0644'
 - template: jinja
 - source: salt://project/templates_dir
 - include_empty: True

```

Retention scheduling can be applied to manage contents of backup directories. For example:

```

/var/backups/example_directory:
 file.retention_schedule:
 - strptime_format: example_name_%Y%m%dT%H%M%S.tar.bz2
 - retain:
 most_recent: 5
 first_of_hour: 4
 first_of_day: 14
 first_of_week: 6
 first_of_month: 6
 first_of_year: all

```

`salt.states.file.absent(name, **kwargs)`

Make sure that the named file or directory is absent. If it exists, it will be deleted. This will work to reverse any of the functions in the file state module. If a directory is supplied, it will be recursively deleted.

**name** The path which should be deleted

`salt.states.file.accumulated`(*name, filename, text, \*\*kwargs*)

Prepare accumulator which can be used in template in file.managed state. Accumulator dictionary becomes available in template. It can also be used in file.blockreplace.

**name** Accumulator name

**filename** Filename which would receive this accumulator (see file.managed state documentation about name)

**text** String or list for adding in accumulator

**require\_in / watch\_in** One of them required for sure we fill up accumulator before we manage the file. Probably the same as filename

Example:

Given the following:

```
animals_doing_things:
 file.accumulated:
 - filename: /tmp/animal_file.txt
 - text: 'jumps over the lazy dog.'
 - require_in:
 - file: animal_file

animal_file:
 file.managed:
 - name: /tmp/animal_file.txt
 - source: salt://animal_file.txt
 - template: jinja
```

One might write a template for `animal_file.txt` like the following:

```
The quick brown fox{% for animal in accumulator['animals_doing_things'] %}{{
↪animal }}{% endfor %}
```

Collectively, the above states and template file will produce:

```
The quick brown fox jumps over the lazy dog.
```

Multiple accumulators can be "chained" together.

---

**Note:** The 'accumulator' data structure is a Python dictionary. Do not expect any loop over the keys in a deterministic order!

---

`salt.states.file.append`(*name, text=None, makedirs=False, source=None, source\_hash=None, template='jinja', sources=None, source\_hashes=None, defaults=None, context=None, ignore\_whitespace=True*)

Ensure that some text appears at the end of a file.

The text will not be appended if it already exists in the file. A single string of text or a list of strings may be appended.

**name** The location of the file to append to.

**text** The text to be appended, which can be a single string or a list of strings.

**makedirs** If the file is located in a path without a parent directory, then the state will fail. If makedirs is set to True, then the parent directories will be created to facilitate the creation of the named file. Defaults to False.

**source** A single source file to append. This source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials (see `s3.get` state documentation). File retrieval from Openstack Swift object storage is supported via `swift://container/object_path` URLs (see `swift.get` documentation).

For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`.

If the file is hosted on an HTTP or FTP server, the `source_hash` argument is also required.

#### **source\_hash**

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** The named templating engine will be used to render the appended-to file. Defaults to `jinja`. The following templates are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**sources** A list of source files to append. If the files are hosted on an HTTP or FTP server, the `source_hashes` argument is also required.

**source\_hashes** A list of `source_hashes` corresponding to the `sources` list specified in the `sources` argument.

**defaults** Default context passed to the template.

**context** Overrides default context variables passed to the template.

**ignore\_whitespace** New in version 2015.8.4.

Spaces and Tabs in text are ignored by default, when searching for the appending content, one space or multiple tabs are the same for salt. Set this option to `False` if you want to change this behavior.

Multi-line example:

```
/etc/motd:
file.append:
- text: |
 Thou hadst better eat salt with the Philosophers of Greece,
 than sugar with the Courtiers of Italy.
 - Benjamin Franklin
```

Multiple lines of text:

```

/etc/motd:
file.append:
- text:
 - Trust no one unless you have eaten much salt with him.
 - "Salt is born of the purest of parents: the sun and the sea."

```

Gather text from multiple template files:

```

/etc/motd:
file:
- append
- template: jinja
- sources:
 - salt://motd/devops-messages.tpl
 - salt://motd/hr-messages.tpl
 - salt://motd/general-messages.tpl

```

New in version 0.9.5.

`salt.states.file.blockreplace` (*name*, *marker\_start*='#- start managed zone -', *marker\_end*='#- end managed zone -', *source*=None, *source\_hash*=None, *template*='jinja', *sources*=None, *source\_hashes*=None, *defaults*=None, *context*=None, *content*="", *append\_if\_not\_found*=False, *prepend\_if\_not\_found*=False, *backup*='.bak', *show\_changes*=True, *append\_newline*=None)

Maintain an edit in a file in a zone delimited by two line markers

New in version 2014.1.0.

Changed in version 2017.7.5,2018.3.1: `append_newline` argument added. Additionally, to improve idempotence, if the string represented by `marker_end` is found in the middle of the line, the content preceding the marker will be removed when the block is replaced. This allows one to remove `append_newline: False` from the SLS and have the block properly replaced if the end of the content block is immediately followed by the `marker_end` (i.e. no newline before the marker).

A block of content delimited by comments can help you manage several lines entries without worrying about old entries removal. This can help you maintaining an un-managed file containing manual edits.

---

**Note:** This function will store two copies of the file in-memory (the original version and the edited version) in order to detect changes and only edit the targeted file if necessary.

Additionally, you can use `file.accumulated` and target this state. All accumulated data dictionaries' content will be added in the content block.

---

**name** Filesystem path to the file to be edited

**marker\_start** The line content identifying a line as the start of the content block. Note that the whole line containing this marker will be considered, so whitespace or extra content before or after the marker is included in final output

**marker\_end** The line content identifying the end of the content block. As of versions 2017.7.5 and 2018.3.1, everything up to the text matching the marker will be replaced, so it's important to ensure that your marker includes the beginning of the text you wish to replace.

**content** The content to be used between the two lines identified by `marker_start` and `marker_end`

**source** The source file to download to the minion, this source file can be hosted on either the salt master server, or on an HTTP or FTP server. Both HTTPS and HTTP are supported as well as downloading directly from Amazon S3 compatible URLs with both pre-configured and automatic IAM credentials. (see `s3.get` state documentation) File retrieval from Openstack Swift object storage is supported

via `swift://container/object_path` URLs, see `swift.get` documentation. For files hosted on the salt file server, if the file is located on the master in the directory named `spam`, and is called `eggs`, the source string is `salt://spam/eggs`. If source is left blank or `None` (use `~` in YAML), the file will be created as an empty file and the content will not be managed. This is also the case when a file already exists and the source is undefined; the contents of the file will not be changed or managed.

If the file is hosted on a HTTP or FTP server then the `source_hash` argument is also required.

A list of sources can also be passed in to provide a default source and a set of fallbacks. The first source in the list that is found to exist will be used and subsequent entries in the list will be ignored.

```
file_override_example:
 file.blockreplace:
 - name: /etc/example.conf
 - source:
 - salt://file_that_does_not_exist
 - salt://file_that_exists
```

#### source\_hash

This can be one of the following:

1. a source hash string
2. the URI of a file that contains source hash strings

The function accepts the first encountered long unbroken alphanumeric string of correct length as a valid hash, in order from most secure to least secure:

| Type   | Length |
|--------|--------|
| sha512 | 128    |
| sha384 | 96     |
| sha256 | 64     |
| sha224 | 56     |
| sha1   | 40     |
| md5    | 32     |

See the `source_hash` parameter description for `file.managed` function for more details and examples.

**template** [jinja] Templating engine to be used to render the downloaded file. The following engines are supported:

- `cheetah`
- `genshi`
- `jinja`
- `mako`
- `py`
- `wempy`

**context** Overrides default context variables passed to the template

**defaults** Default context passed to the template

**append\_if\_not\_found** [False] If markers are not found and this option is set to `True`, the content block will be appended to the file.

**prepend\_if\_not\_found** [False] If markers are not found and this option is set to `True`, the content block will be prepended to the file.

**backup** The file extension to use for a backup of the file if any edit is made. Set this to `False` to skip making a backup.

**dry\_run** [False] If `True`, do not make any edits to the file and simply return the changes that *would* be made.

**show\_changes** [True] Controls how changes are presented. If `True`, the `Changes` section of the state return will contain a unified diff of the changes made. If `False`, then it will contain a boolean (`True` if any changes were made, otherwise `False`).

**append\_newline** Controls whether or not a newline is appended to the content block. If the value of this

argument is `True` then a newline will be added to the content block. If it is `False`, then a newline will *not* be added to the content block. If it is unspecified, then a newline will only be added to the content block if it does not already end in a newline.

New in version 2017.7.5,2018.3.1.

Example of usage with an accumulator and with a variable:

```
{% set myvar = 42 %}
hosts-config-block-{{ myvar }}:
 file.blockreplace:
 - name: /etc/hosts
 - marker_start: "# START managed zone {{ myvar }} -DO-NOT-EDIT-"
 - marker_end: "# END managed zone {{ myvar }} --"
 - content: 'First line of content'
 - append_if_not_found: True
 - backup: '.bak'
 - show_changes: True

hosts-config-block-{{ myvar }}-accumulated1:
 file.accumulated:
 - filename: /etc/hosts
 - name: my-accumulator-{{ myvar }}
 - text: "text 2"
 - require_in:
 - file: hosts-config-block-{{ myvar }}

hosts-config-block-{{ myvar }}-accumulated2:
 file.accumulated:
 - filename: /etc/hosts
 - name: my-accumulator-{{ myvar }}
 - text: |
 text 3
 text 4
 - require_in:
 - file: hosts-config-block-{{ myvar }}
```

will generate and maintain a block of content in `/etc/hosts`:

```
START managed zone 42 -DO-NOT-EDIT-
First line of content
text 2
text 3
text 4
END managed zone 42 --
```

```
salt.states.file.cached(name, source_hash="", source_hash_name=None, skip_verify=False,
 saltenv='base')
```

New in version 2017.7.3.

Ensures that a file is saved to the minion's cache. This state is primarily invoked by other states to ensure that we do not re-download a source file if we do not need to.

**name** The URL of the file to be cached. To cache a file from an environment other than `base`, either use the `saltenv` argument or include the `saltenv` in the URL (e.g. `salt://path/to/file.conf?saltenv=dev`).

**Note:** A list of URLs is not supported, this must be a single URL. If a local file is passed here, then the

state will obviously not try to download anything, but it will compare a hash if one is specified.

**source\_hash** See the documentation for this same argument in the *file.managed* state.
