    'conf': '/etc/httpd/httpd.conf',
  },
}, merge=salt['pillar.get']('apache:lookup')) %}
```

/srv/pillar/apache.sls:

```
apache:
  lookup:
    config:
      tmpl: salt://apache/files/httpd.conf
```

/srv/salt/apache/init.sls:

```
{% from "apache/map.jinja" import apache with context %}

apache:
  pkg.installed:
    - name: {{ apache.server }}
  service.running:
    - name: {{ apache.service }}
    - enable: True

apache_conf:
  file.managed:
    - name: {{ apache.conf }}
    - source: {{ salt['pillar.get']('apache:lookup:config:tmpl') }}
    - template: jinja
    - user: root
    - watch_in:
      - service: apache
```

The changes to this state now allow us to easily identify the location of the variables, as well as ensuring they are flexible and easy to modify. While this takes another step in the right direction, it is not yet complete. Suppose the user did not want to use the provided conf file, or even their own configuration file, but the default apache conf. With the current state setup this is not possible. To attain this level of modularity this state will need to be broken into two states.

/srv/salt/apache/map.jinja:

```
{% set apache = salt['grains.filter_by']({
  'Debian': {
    'server': 'apache2',
    'service': 'apache2',
    'conf': '/etc/apache2/apache.conf',
  },
  'RedHat': {
    'server': 'httpd',
    'service': 'httpd',
    'conf': '/etc/httpd/httpd.conf',
  },
}, merge=salt['pillar.get']('apache:lookup')) %}
```

/srv/pillar/apache.sls:

```
apache:
  lookup:
    config:
      tmpl: salt://apache/files/httpd.conf
```

/srv/salt/apache/init.sls:

```
{% from "apache/map.jinja" import apache with context %}

apache:
  pkg.installed:
    - name: {{ apache.server }}
  service.running:
    - name: {{ apache.service }}
    - enable: True
```

/srv/salt/apache/conf.sls:

```
{% from "apache/map.jinja" import apache with context %}

include:
  - apache

apache_conf:
  file.managed:
    - name: {{ apache.conf }}
    - source: {{ salt['pillar.get']('apache:lookup:config:tmpl') }}
    - template: jinja
    - user: root
    - watch_in:
      - service: apache
```

This new structure now allows users to choose whether they only wish to install the default Apache, or if they wish, overwrite the default package, service, configuration file location, or the configuration file itself. In addition to this the data has been broken between multiple files allowing for users to identify where they need to change the associated data.

## 33.6 Storing Secure Data

Secure data refers to any information that you would not wish to share with anyone accessing a server. This could include data such as passwords, keys, or other information.

As all data within a state is accessible by EVERY server that is connected it is important to store secure data within pillar. This will ensure that only those servers which require this secure data have access to it. In this example a use can go from an insecure configuration to one which is only accessible by the appropriate hosts:

/srv/salt/mysql/testerdb.sls:

```
testdb:
  mysql_database.present:
    - name: testerdb
```

/srv/salt/mysql/user.sls:

```
include:
  - mysql.testerd

testdb_user:
  mysql_user.present:
    - name: frank
    - password: "test3rdb"
    - host: localhost
    - require:
      - sls: mysql.testerd
```

Many users would review this state and see that the password is there in plain text, which is quite problematic. It results in several issues which may not be immediately visible.

The first of these issues is clear to most users -- the password being visible in this state. This means that any minion will have a copy of this, and therefore the password which is a major security concern as minions may not be locked down as tightly as the master server.

The other issue that can be encountered is access by users on the master. If everyone has access to the states (or their repository), then they are able to review this password. Keeping your password data accessible by only a few users is critical for both security and peace of mind.

There is also the issue of portability. When a state is configured this way it results in multiple changes needing to be made. This was discussed in the sections above but it is a critical idea to drive home. If states are not portable it may result in more work later!

Fixing this issue is relatively simple, the content just needs to be moved to the associated pillar:

/srv/pillar/mysql.sls:

```
mysql:
  lookup:
    name: testerd
    password: test3rdb
    user: frank
    host: localhost
```

/srv/salt/mysql/testerd.sls:

```
testdb:
  mysql_database.present:
    - name: {{ salt['pillar.get']('mysql:lookup:name') }}
```

/srv/salt/mysql/user.sls:

```
include:
  - mysql.testerd

testdb_user:
  mysql_user.present:
    - name: {{ salt['pillar.get']('mysql:lookup:user') }}
    - password: {{ salt['pillar.get']('mysql:lookup:password') }}
    - host: {{ salt['pillar.get']('mysql:lookup:host') }}
    - require:
      - sls: mysql.testerd
```

Now that the database details have been moved to the associated pillar file, only machines which are targeted via pillar will have access to these details. Access to users who should not be able to review these details can also be prevented while ensuring that they are still able to write states which take advantage of this information.

---

## Hardening Salt

---

This topic contains tips you can use to secure and harden your Salt environment. How you best secure and harden your Salt environment depends heavily on how you use Salt, where you use Salt, how your team is structured, where you get data from, and what kinds of access (internal and external) you require.

### 34.1 General hardening tips

- Restrict who can directly log into your Salt master system.
- Use SSH keys secured with a passphrase to gain access to the Salt master system.
- Track and secure SSH keys and any other login credentials you and your team need to gain access to the Salt master system.
- Use a hardened bastion server or a VPN to restrict direct access to the Salt master from the internet.
- Don't expose the Salt master any more than what is required.
- Harden the system as you would with any high-priority target.
- Keep the system patched and up-to-date.
- Use tight firewall rules.

### 34.2 Salt hardening tips

- Subscribe to [salt-users](#) or [salt-announce](#) so you know when new Salt releases are available. Keep your systems up-to-date with the latest patches.
- Use Salt's Client *ACL system* to avoid having to give out root access in order to run Salt commands.
- Use Salt's Client *ACL system* to restrict which users can run what commands.
- Use *external Pillar* to pull data into Salt from external sources so that non-sysadmins (other teams, junior admins, developers, etc) can provide configuration data without needing access to the Salt master.
- Make heavy use of SLS files that are version-controlled and go through a peer-review/code-review process before they're deployed and run in production. This is good advice even for ``one-off" CLI commands because it helps mitigate typos and mistakes.
- Use salt-api, SSL, and restrict authentication with the *external auth* system if you need to expose your Salt master to external services.

- Make use of Salt's event system and *reactor* to allow minions to signal the Salt master without requiring direct access.
- Run the `salt-master` daemon as non-root.
- Disable which modules are loaded onto minions with the *disable\_modules* setting. (for example, disable the `cmd` module if it makes sense in your environment.)
- Look through the fully-commented sample *master* and *minion* config files. There are many options for securing an installation.
- Run *masterless-mode* minions on particularly sensitive minions. There is also *Salt SSH* or the *modules.sudo* if you need to further restrict a minion.

---

## Troubleshooting

---

The intent of the troubleshooting section is to introduce solutions to a number of common issues encountered by users and the tools that are available to aid in developing States and Salt code.

### 35.1 Troubleshooting the Salt Master

If your Salt master is having issues such as minions not returning data, slow execution times, or a variety of other issues, the following links contain details on troubleshooting the most common issues encountered:

#### 35.1.1 Troubleshooting the Salt Master

##### Running in the Foreground

A great deal of information is available via the debug logging system, if you are having issues with minions connecting or not starting run the master in the foreground:

```
# salt-master -l debug
```

Anyone wanting to run Salt daemons via a process supervisor such as [monit](#), [runit](#), or [supervisord](#), should omit the `-d` argument to the daemons and run them in the foreground.

##### What Ports does the Master Need Open?

For the master, TCP ports 4505 and 4506 need to be open. If you've put both your Salt master and minion in debug mode and don't see an acknowledgment that your minion has connected, it could very well be a firewall interfering with the connection. See our [firewall configuration](#) page for help opening the firewall on various platforms.

If you've opened the correct TCP ports and still aren't seeing connections, check that no additional access control system such as [SELinux](#) or [AppArmor](#) is blocking Salt.

##### Too many open files

The salt-master needs at least 2 sockets per host that connects to it, one for the Publisher and one for response port. Thus, large installations may, upon scaling up the number of minions accessing a given master, encounter:

```
12:45:29,289 [salt.master    ][INFO    ] Starting Salt worker process 38
Too many open files
sock != -1 (tcp_listener.cpp:335)
```

The solution to this would be to check the number of files allowed to be opened by the user running salt-master (root by default):

```
[root@salt-master ~]# ulimit -n
1024
```

If this value is not equal to at least twice the number of minions, then it will need to be raised. For example, in an environment with 1800 minions, the `nofile` limit should be set to no less than 3600. This can be done by creating the file `/etc/security/limits.d/99-salt.conf`, with the following contents:

```
root        hard    nofile   4096
root        soft    nofile   4096
```

Replace `root` with the user under which the master runs, if different.

If your master does not have an `/etc/security/limits.d` directory, the lines can simply be appended to `/etc/security/limits.conf`.

As with any change to resource limits, it is best to stay logged into your current shell and open another shell to run `ulimit -n` again and verify that the changes were applied correctly. Additionally, if your master is running `upstart`, it may be necessary to specify the `nofile` limit in `/etc/default/salt-master` if `upstart` isn't respecting your resource limits:

```
limit nofile 4096 4096
```

---

**Note:** The above is simply an example of how to set these values, and you may wish to increase them even further if your Salt master is doing more than just running Salt.

---

## Salt Master Stops Responding

There are known bugs with ZeroMQ versions less than 2.1.11 which can cause the Salt master to not respond properly. If you're running a ZeroMQ version greater than or equal to 2.1.9, you can work around the bug by setting the `sysctl net.core.rmem_max` and `net.core.wmem_max` to 16777216. Next, set the third field in `net.ipv4.tcp_rmem` and `net.ipv4.tcp_wmem` to at least 16777216.

You can do it manually with something like:

```
# echo 16777216 > /proc/sys/net/core/rmem_max
# echo 16777216 > /proc/sys/net/core/wmem_max
# echo "4096 87380 16777216" > /proc/sys/net/ipv4/tcp_rmem
# echo "4096 87380 16777216" > /proc/sys/net/ipv4/tcp_wmem
```

Or with the following Salt state:

```
1 net.core.rmem_max:
2   sysctl:
3     - present
4     - value: 16777216
5
6 net.core.wmem_max:
7   sysctl:
```

```

8     - present
9     - value: 16777216
10
11 net.ipv4.tcp_rmem:
12   sysctl:
13     - present
14     - value: 4096 87380 16777216
15
16 net.ipv4.tcp_wmem:
17   sysctl:
18     - present
19     - value: 4096 87380 16777216

```

### Live Python Debug Output

If the master seems to be unresponsive, a SIGUSR1 can be passed to the salt-master threads to display what piece of code is executing. This debug information can be invaluable in tracking down bugs.

To pass a SIGUSR1 to the master, first make sure the minion is running in the foreground. Stop the service if it is running as a daemon, and start it in the foreground like so:

```
# salt-master -l debug
```

Then pass the signal to the master when it seems to be unresponsive:

```
# killall -SIGUSR1 salt-master
```

When filing an issue or sending questions to the mailing list for a problem with an unresponsive daemon, be sure to include this information if possible.

### Live Salt-Master Profiling

When faced with performance problems one can turn on master process profiling by sending it SIGUSR2.

```
# killall -SIGUSR2 salt-master
```

This will activate `yappi` profiler inside salt-master code, then after some time one must send SIGUSR2 again to stop profiling and save results to file. If run in foreground salt-master will report filename for the results, which are usually located under `/tmp` on Unix-based OSes and `c:\temp` on windows.

Results can then be analyzed with `kcachegrind` or similar tool.

### Commands Time Out or Do Not Return Output

Depending on your OS (this is most common on Ubuntu due to `apt-get`) you may sometimes encounter times where a `state.apply`, or other long running commands do not return output.

By default the timeout is set to 5 seconds. The timeout value can easily be increased by modifying the `timeout` line within your `/etc/salt/master` configuration file.

Having keys accepted for Salt minions that no longer exist or are not reachable also increases the possibility of timeouts, since the Salt master waits for those systems to return command results.

### Passing the `-c` Option to Salt Returns a Permissions Error

Using the `-c` option with the Salt command modifies the configuration directory. When the configuration file is read it will still base data off of the `root_dir` setting. This can result in unintended behavior if you are expecting files such as `/etc/salt/pki` to be pulled from the location specified with `-c`. Modify the `root_dir` setting to address this behavior.

### Salt Master Doesn't Return Anything While Running jobs

When a command being run via Salt takes a very long time to return (package installations, certain scripts, etc.) the master may drop you back to the shell. In most situations the job is still running but Salt has exceeded the set timeout before returning. Querying the job queue will provide the data of the job but is inconvenient. This can be resolved by either manually using the `-t` option to set a longer timeout when running commands (by default it is 5 seconds) or by modifying the master configuration file: `/etc/salt/master` and setting the `timeout` value to change the default timeout for all commands, and then restarting the salt-master service.

### Salt Master Auth Flooding

In large installations, care must be taken not to overwhelm the master with authentication requests. Several options can be set on the master which mitigate the chances of an authentication flood from causing an interruption in service.

---

**Note:** `recon_default`:

The average number of seconds to wait between reconnection attempts.

`recon_max`: The maximum number of seconds to wait between reconnection attempts.

`recon_randomize`: A flag to indicate whether the `recon_default` value should be randomized.

`acceptance_wait_time`: The number of seconds to wait for a reply to each authentication request.

`random_reauth_delay`: The range of seconds across which the minions should attempt to randomize authentication attempts.

`auth_timeout`: The total time to wait for the authentication process to complete, regardless of the number of attempts.

---

## 35.1.2 Running state locally

To debug the states, you can use call locally.

```
salt-call -l trace --local state.highstate
```

The `top.sls` file is used to map what SLS modules get loaded onto what minions via the state system.

It is located in the file defined in the `file_roots` variable of the salt master configuration file which is defined by found in `CONFIG_DIR/master`, normally `/etc/salt/master`

The default configuration for the `file_roots` is:

```
file_roots:
  base:
    - /srv/salt
```

So the top file is defaulted to the location `/srv/salt/top.sls`

## Salt Master Umask

The salt master uses a cache to track jobs as they are published and returns come back. The recommended umask for a salt-master is `022`, which is the default for most users on a system. Incorrect umasks can result in permission-denied errors when the master tries to access files in its cache.

## 35.2 Troubleshooting the Salt Minion

In the event that your Salt minion is having issues, a variety of solutions and suggestions are available. Please refer to the following links for more information:

### 35.2.1 Troubleshooting the Salt Minion

#### Running in the Foreground

A great deal of information is available via the debug logging system, if you are having issues with minions connecting or not starting run the minion in the foreground:

```
# salt-minion -l debug
```

Anyone wanting to run Salt daemons via a process supervisor such as `monit`, `runit`, or `supervisord`, should omit the `-d` argument to the daemons and run them in the foreground.

#### What Ports does the Minion Need Open?

No ports need to be opened on the minion, as it makes outbound connections to the master. If you've put both your Salt master and minion in debug mode and don't see an acknowledgment that your minion has connected, it could very well be a firewall interfering with the connection. See our [firewall configuration](#) page for help opening the firewall on various platforms.

If you have netcat installed, you can check port connectivity from the minion with the `nc` command:

```
$ nc -v -z salt.master.ip.addr 4505
Connection to salt.master.ip.addr 4505 port [tcp/unknown] succeeded!
$ nc -v -z salt.master.ip.addr 4506
Connection to salt.master.ip.addr 4506 port [tcp/unknown] succeeded!
```

The `Nmap` utility can also be used to check if these ports are open:

```
# nmap -sS -q -p 4505-4506 salt.master.ip.addr

Starting Nmap 6.40 ( http://nmap.org ) at 2013-12-29 19:44 CST
Nmap scan report for salt.master.ip.addr (10.0.0.10)
Host is up (0.0026s latency).
PORT      STATE SERVICE
4505/tcp  open  unknown
4506/tcp  open  unknown
MAC Address: 00:11:22:AA:BB:CC (Intel)

Nmap done: 1 IP address (1 host up) scanned in 1.64 seconds
```

If you've opened the correct TCP ports and still aren't seeing connections, check that no additional access control system such as SELinux or AppArmor is blocking Salt.

### Using salt-call

The `salt-call` command was originally developed for aiding in the development of new Salt modules. Since then, many applications have been developed for running any Salt module locally on a minion. These range from the original intent of salt-call (development assistance), to gathering more verbose output from calls like `state.apply`.

When initially creating your state tree, it is generally recommended to invoke highstates by running `state.apply` directly from the minion with `salt-call`, rather than remotely from the master. This displays far more information about the execution than calling it remotely. For even more verbosity, increase the loglevel using the `-l` argument:

```
# salt-call -l debug state.apply
```

The main difference between using `salt` and using `salt-call` is that `salt-call` is run from the minion, and it only runs the selected function on that minion. By contrast, `salt` is run from the master, and requires you to specify the minions on which to run the command using salt's [targeting system](#).

### Live Python Debug Output

If the minion seems to be unresponsive, a SIGUSR1 can be passed to the process to display what piece of code is executing. This debug information can be invaluable in tracking down bugs.

To pass a SIGUSR1 to the minion, first make sure the minion is running in the foreground. Stop the service if it is running as a daemon, and start it in the foreground like so:

```
# salt-minion -l debug
```

Then pass the signal to the minion when it seems to be unresponsive:

```
# killall -SIGUSR1 salt-minion
```

When filing an issue or sending questions to the mailing list for a problem with an unresponsive daemon, be sure to include this information if possible.

### Multiprocessing in Execution Modules

As is outlined in [github issue #6300](#), Salt cannot use python's multiprocessing pipes and queues from execution modules. Multiprocessing from the execution modules is perfectly viable, it is just necessary to use Salt's event system to communicate back with the process.

The reason for this difficulty is that python attempts to pickle all objects in memory when communicating, and it cannot pickle function objects. Since the Salt loader system creates and manages function objects this causes the pickle operation to fail.

### Salt Minion Doesn't Return Anything While Running Jobs Locally

When a command being run via Salt takes a very long time to return (package installations, certain scripts, etc.) the minion may drop you back to the shell. In most situations the job is still running but Salt has exceeded the set timeout before returning. Querying the job queue will provide the data of the job but is inconvenient. This can be resolved by either manually using the `-t` option to set a longer timeout when running commands (by default it is 5

seconds) or by modifying the minion configuration file: `/etc/salt/minion` and setting the `timeout` value to change the default timeout for all commands, and then restarting the salt-minion service.

**Note:** Modifying the minion timeout value is not required when running commands from a Salt Master. It is only required when running commands locally on the minion.

## 35.3 Running in the Foreground

A great deal of information is available via the debug logging system, if you are having issues with minions connecting or not starting run the minion and/or master in the foreground:

```
salt-master -l debug
salt-minion -l debug
```

Anyone wanting to run Salt daemons via a process supervisor such as `monit`, `runit`, or `supervisord`, should omit the `-d` argument to the daemons and run them in the foreground.

## 35.4 What Ports do the Master and Minion Need Open?

No ports need to be opened up on each minion. For the master, TCP ports 4505 and 4506 need to be open. If you've put both your Salt master and minion in debug mode and don't see an acknowledgment that your minion has connected, it could very well be a firewall.

You can check port connectivity from the minion with the `nc` command:

```
nc -v -z salt.master.ip 4505
nc -v -z salt.master.ip 4506
```

There is also a [firewall configuration](#) document that might help as well.

If you've enabled the right TCP ports on your operating system or Linux distribution's firewall and still aren't seeing connections, check that no additional access control system such as [SELinux](#) or [AppArmor](#) is blocking Salt.

## 35.5 Using salt-call

The `salt-call` command was originally developed for aiding in the development of new Salt modules. Since then, many applications have been developed for running any Salt module locally on a minion. These range from the original intent of `salt-call`, development assistance, to gathering more verbose output from calls like `state.apply`.

When initially creating your state tree, it is generally recommended to invoke `state.apply` directly from the minion with `salt-call`, rather than remotely from the master. This displays far more information about the execution than calling it remotely. For even more verbosity, increase the loglevel using the `-l` argument:

```
salt-call -l debug state.apply
```

The main difference between using `salt` and using `salt-call` is that `salt-call` is run from the minion, and it only runs the selected function on that minion. By contrast, `salt` is run from the master, and requires you to specify the minions on which to run the command using salt's [targeting system](#).

## 35.6 Too many open files

The salt-master needs at least 2 sockets per host that connects to it, one for the Publisher and one for response port. Thus, large installations may, upon scaling up the number of minions accessing a given master, encounter:

```
12:45:29,289 [salt.master    ][INFO    ] Starting Salt worker process 38
Too many open files
sock != -1 (tcp_listener.cpp:335)
```

The solution to this would be to check the number of files allowed to be opened by the user running salt-master (root by default):

```
[root@salt-master ~]# ulimit -n
1024
```

And modify that value to be at least equal to the number of minions x 2. This setting can be changed in limits.conf as the nofile value(s), and activated upon new a login of the specified user.

So, an environment with 1800 minions, would need  $1800 \times 2 = 3600$  as a minimum.

## 35.7 Salt Master Stops Responding

There are known bugs with ZeroMQ versions less than 2.1.11 which can cause the Salt master to not respond properly. If you're running a ZeroMQ version greater than or equal to 2.1.9, you can work around the bug by setting the sysctls `net.core.rmem_max` and `net.core.wmem_max` to 16777216. Next, set the third field in `net.ipv4.tcp_rmem` and `net.ipv4.tcp_wmem` to at least 16777216.

You can do it manually with something like:

```
# echo 16777216 > /proc/sys/net/core/rmem_max
# echo 16777216 > /proc/sys/net/core/wmem_max
# echo "4096 87380 16777216" > /proc/sys/net/ipv4/tcp_rmem
# echo "4096 87380 16777216" > /proc/sys/net/ipv4/tcp_wmem
```

Or with the following Salt state:

```
1 net.core.rmem_max:
2   sysctl:
3     - present
4     - value: 16777216
5
6 net.core.wmem_max:
7   sysctl:
8     - present
9     - value: 16777216
10
11 net.ipv4.tcp_rmem:
12   sysctl:
13     - present
14     - value: 4096 87380 16777216
15
16 net.ipv4.tcp_wmem:
17   sysctl:
18     - present
19     - value: 4096 87380 16777216
```

## 35.8 Salt and SELinux

Currently there are no SELinux policies for Salt. For the most part Salt runs without issue when SELinux is running in Enforcing mode. This is because when the minion executes as a daemon the type context is changed to `initrc_t`. The problem with SELinux arises when using `salt-call` or running the minion in the foreground, since the type context stays `unconfined_t`.

This problem is generally manifest in the `rpm` install scripts when using the `pkg` module. Until a full SELinux Policy is available for Salt the solution to this issue is to set the execution context of `salt-call` and `salt-minion` to `rpm_exec_t`:

```
# CentOS 5 and RHEL 5:
chcon -t system_u:system_r:rpm_exec_t:s0 /usr/bin/salt-minion
chcon -t system_u:system_r:rpm_exec_t:s0 /usr/bin/salt-call

# CentOS 6 and RHEL 6:
chcon system_u:object_r:rpm_exec_t:s0 /usr/bin/salt-minion
chcon system_u:object_r:rpm_exec_t:s0 /usr/bin/salt-call
```

This works well, because the `rpm_exec_t` context has very broad control over other types.

## 35.9 Red Hat Enterprise Linux 5

Salt requires Python 2.6 or 2.7. Red Hat Enterprise Linux 5 and its variants come with Python 2.4 installed by default. When installing on RHEL 5 from the [EPEL repository](#) this is handled for you. But, if you run Salt from git, be advised that its dependencies need to be installed from EPEL and that Salt needs to be run with the `python26` executable.

## 35.10 Common YAML Gotchas

An extensive list of YAML idiosyncrasies has been compiled:

### 35.10.1 YAML Idiosyncrasies

One of Salt's strengths, the use of existing serialization systems for representing SLS data, can also backfire. [YAML](#) is a general purpose system and there are a number of things that would seem to make sense in an `sls` file that cause [YAML](#) issues. It is wise to be aware of these issues. While reports or running into them are generally rare they can still crop up at unexpected times.

#### Spaces vs Tabs

[YAML](#) uses spaces, period. Do not use tabs in your SLS files! If strange errors are coming up in rendering SLS files, make sure to check that no tabs have crept in! In Vim, after enabling search highlighting with: `:set hlsearch`, you can check with the following key sequence in normal mode(you can hit `ESC` twice to be sure): `/`, `Ctrl-v`, `Tab`, then hit `Enter`. Also, you can convert tabs to 2 spaces by these commands in Vim: `:set tabstop=2 expandtab` and then `:retab`.

## Indentation

The suggested syntax for YAML files is to use 2 spaces for indentation, but YAML will follow whatever indentation system that the individual file uses. Indentation of two spaces works very well for SLS files given the fact that the data is uniform and not deeply nested.

## Nested Dictionaries

When `dicts` are nested within other data structures (particularly lists), the indentation logic sometimes changes. Examples of where this might happen include `context` and `defaults` options from the `file.managed` state:

```
/etc/http/conf/http.conf:
  file:
    - managed
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - template: jinja
    - context:
      custom_var: "override"
    - defaults:
      custom_var: "default value"
      other_var: 123
```

Notice that while the indentation is two spaces per level, for the values under the `context` and `defaults` options there is a four-space indent. If only two spaces are used to indent, then those keys will be considered part of the same dictionary that contains the `context` key, and so the data will not be loaded correctly. If using a double indent is not desirable, then a deeply-nested dict can be declared with curly braces:

```
/etc/http/conf/http.conf:
  file:
    - managed
    - source: salt://apache/http.conf
    - user: root
    - group: root
    - mode: 644
    - template: jinja
    - context: {
      custom_var: "override" }
    - defaults: {
      custom_var: "default value",
      other_var: 123 }
```

Here is a more concrete example of how YAML actually handles these indentations, using the Python interpreter on the command line:

```
>>> import yaml
>>> yaml.safe_load('''mystate:
...   file.managed:
...     - context:
...       some: var''')
{'mystate': {'file.managed': [{'context': {'some': 'var'}}]}}
>>> yaml.safe_load('''mystate:
...   file.managed:
...     - context:
...       some: var''')
{'mystate': {'file.managed': [{'context': {'some': 'var'}}]}}
```

```

...     - context:
...       some: var''')
{'mystate': {'file.managed': [{'some': 'var', 'context': None}]}}
```

Note that in the second example, `some` is added as another key in the same dictionary, whereas in the first example, it's the start of a new dictionary. That's the distinction. `context` is a common example because it is a keyword arg for many functions, and should contain a dictionary.

### True/False, Yes/No, On/Off

PyYAML will load these values as boolean `True` or `False`. Un-capitalized versions will also be loaded as booleans (`true`, `false`, `yes`, `no`, `on`, and `off`). This can be especially problematic when constructing Pillar data. Make sure that your Pillars which need to use the string versions of these values are enclosed in quotes.

### Integers are Parsed as Integers

NOTE: This has been fixed in salt 0.10.0, as of this release passing an integer that is preceded by a 0 will be correctly parsed

When passing `integers` into an SLS file, they are passed as integers. This means that if a state accepts a string value and an integer is passed, that an integer will be sent. The solution here is to send the integer as a string.

This is best explained when setting the mode for a file:

```

/etc/vimrc:
  file:
    - managed
    - source: salt://edit/vimrc
    - user: root
    - group: root
    - mode: 644
```

Salt manages this well, since the mode is passed as 644, but if the mode is zero padded as 0644, then it is read by YAML as an integer and evaluated as an octal value, 0644 becomes 420. Therefore, if the file mode is preceded by a 0 then it needs to be passed as a string:

```

/etc/vimrc:
  file:
    - managed
    - source: salt://edit/vimrc
    - user: root
    - group: root
    - mode: '0644'
```

### YAML does not like ``Double Short Decs``

If I can find a way to make YAML accept ``Double Short Decs`` then I will, since I think that double short decs would be awesome. So what is a ``Double Short Dec``? It is when you declare a multiple short decs in one ID. Here is a standard short dec, it works great:

```

vim:
  pkg.installed
```

The short dec means that there are no arguments to pass, so it is not required to add any arguments, and it can save space.

YAML though, gets upset when declaring multiple short decs, for the record...

THIS DOES NOT WORK:

```
vim:
  pkg.installed
  user.present
```

Similarly declaring a short dec in the same ID dec as a standard dec does not work either...

ALSO DOES NOT WORK:

```
fred:
  user.present
  ssh_auth.present:
    - name: AAAAB3NzaC...
    - user: fred
    - enc: ssh-dss
    - require:
      - user: fred
```

The correct way is to define them like this:

```
vim:
  pkg.installed: []
  user.present: []

fred:
  user.present: []
  ssh_auth.present:
    - name: AAAAB3NzaC...
    - user: fred
    - enc: ssh-dss
    - require:
      - user: fred
```

Alternatively, they can be defined the ``old way'', or with multiple ``full decs'':

```
vim:
  pkg:
    - installed
  user:
    - present

fred:
  user:
    - present
  ssh_auth:
    - present
    - name: AAAAB3NzaC...
    - user: fred
    - enc: ssh-dss
    - require:
      - user: fred
```

## YAML support only plain ASCII

According to YAML specification, only ASCII characters can be used.

Within double-quotes, special characters may be represented with C-style escape sequences starting with a backslash (\).

Examples:

```
- micro: "\u00b5"
- copyright: "\u00A9"
- A: "\x41"
- alpha: "\u0251"
- Alef: "\u05d0"
```

List of usable [Unicode characters](#) will help you to identify correct numbers.

Python can also be used to discover the Unicode number for a character:

```
repr(u"Text with wrong characters i need to figure out")
```

This shell command can find wrong characters in your SLS files:

```
find . -name '*.sls' -exec grep --color='auto' -P -n '[^\x00-\x7F]' \{} \;
```

Alternatively you can toggle the `yaml_utf8` setting in your master configuration file. This is still an experimental setting but it should manage the right encoding conversion in salt after yaml states compilations.

## Underscores stripped in Integer Definitions

If a definition only includes numbers and underscores, it is parsed by YAML as an integer and all underscores are stripped. To ensure the object becomes a string, it should be surrounded by quotes. [More information here](#).

Here's an example:

```
>>> import yaml
>>> yaml.safe_load('2013_05_10')
20130510
>>> yaml.safe_load('"2013_05_10"')
'2013_05_10'
```

## Automatic datetime conversion

If there is a value in a YAML file formatted `2014-01-20 14:23:23` or similar, YAML will automatically convert this to a Python `datetime` object. These objects are not msgpack serializable, and so may break core salt functionality. If values such as these are needed in a salt YAML file (specifically a configuration file), they should be formatted with surrounding strings to force YAML to serialize them as strings:

```
>>> import yaml
>>> yaml.safe_load('2014-01-20 14:23:23')
datetime.datetime(2014, 1, 20, 14, 23, 23)
>>> yaml.safe_load('"2014-01-20 14:23:23"')
'2014-01-20 14:23:23'
```

Additionally, numbers formatted like XXXX-XX-XX will also be converted (or YAML will attempt to convert them, and error out if it doesn't think the date is a real one). Thus, for example, if a minion were to have an ID of 4017-16-20 the minion would not start because YAML would complain that the date was out of range. The workaround is the same, surround the offending string with quotes:

```
>>> import yaml
>>> yaml.safe_load('4017-16-20')
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "/usr/local/lib/python2.7/site-packages/yaml/__init__.py", line 93, in safe_load
    return load(stream, SafeLoader)
  File "/usr/local/lib/python2.7/site-packages/yaml/__init__.py", line 71, in load
    return loader.get_single_data()
  File "/usr/local/lib/python2.7/site-packages/yaml/constructor.py", line 39, in get_single_data
    return self.construct_document(node)
  File "/usr/local/lib/python2.7/site-packages/yaml/constructor.py", line 43, in construct_document
    data = self.construct_object(node)
  File "/usr/local/lib/python2.7/site-packages/yaml/constructor.py", line 88, in construct_object
    data = constructor(self, node)
  File "/usr/local/lib/python2.7/site-packages/yaml/constructor.py", line 312, in construct_yaml_time
    return datetime.date(year, month, day)
ValueError: month must be in 1..12
>>> yaml.safe_load('"4017-16-20"')
'4017-16-20'
```

## 35.11 Live Python Debug Output

If the minion or master seems to be unresponsive, a SIGUSR1 can be passed to the processes to display where in the code they are running. If encountering a situation like this, this debug information can be invaluable. First make sure the master or minion are running in the foreground:

```
salt-master -l debug
salt-minion -l debug
```

Then pass the signal to the master or minion when it seems to be unresponsive:

```
killall -SIGUSR1 salt-master
killall -SIGUSR1 salt-minion
```

Also under BSD and Mac OS X in addition to SIGUSR1 signal, debug subroutine set up for SIGINFO which has an advantage of being sent by Ctrl+T shortcut.

When filing an issue or sending questions to the mailing list for a problem with an unresponsive daemon this information can be invaluable.

## 35.12 Salt 0.16.x minions cannot communicate with a 0.17.x master

As of release 0.17.1 you can no longer run different versions of Salt on your Master and Minion servers. This is due to a protocol change for security purposes. The Salt team will continue to attempt to ensure versions are as backwards compatible as possible.

## 35.13 Debugging the Master and Minion

A list of common `master` and `minion` troubleshooting steps provide a starting point for resolving issues you may encounter.

---

## Developing Salt

---

### 36.1 Overview

In its most typical use, Salt is a software application in which clients, called ``minions" can be commanded and controlled from a central command server called a ``master".

Commands are normally issued to the minions (via the master) by calling a client script simply called, `salt'.

Salt features a pluggable transport system to issue commands from a master to minions. The default transport is ZeroMQ.

### 36.2 Salt Client

#### 36.2.1 Overview

The salt client is run on the same machine as the Salt Master and communicates with the salt-master to issue commands and to receive the results and display them to the user.

The primary abstraction for the salt client is called `LocalClient'.

When LocalClient wants to publish a command to minions, it connects to the master by issuing a request to the master's ReqServer (TCP: 4506)

The LocalClient system listens to responses for its requests by listening to the master event bus publisher (master\_event\_pub.ipc).

### 36.3 Salt Master

#### 36.3.1 Overview

The salt-master daemon runs on the designated Salt master and performs functions such as authenticating minions, sending, and receiving requests from connected minions and sending and receiving requests and replies to the `salt' CLI.

### 36.3.2 Moving Pieces

When a Salt master starts up, a number of processes are started, all of which are called `salt-master' in a process-list but have various role categories.

Among those categories are:

- Publisher
- EventPublisher
- MWorker

### 36.3.3 Publisher

The Publisher process is responsible for sending commands over the designated transport to connected minions. The Publisher is bound to the following:

- TCP: port 4505
- IPC: publish\_pull.ipc

Each salt minion establishes a connection to the master Publisher.

### 36.3.4 EventPublisher

The EventPublisher publishes events onto the event bus. It is bound to the following:

- IPC: master\_event\_pull.ipc
- IPC: master\_event\_pub.ipc

### 36.3.5 MWorker

Worker processes manage the back-end operations for the Salt Master.

The number of workers is equivalent to the number of `worker\_threads' specified in the master configuration and is always at least one.

Workers are bound to the following:

- IPC: workers.ipc

### 36.3.6 ReqServer

The Salt request server takes requests and distributes them to available MWorker processes for processing. It also receives replies back from minions.

**The ReqServer is bound to the following:**

- TCP: 4506
- IPC: workers.ipc

Each salt minion establishes a connection to the master ReqServer.

### 36.3.7 Job Flow

The Salt master works by always publishing commands to all connected minions and the minions decide if the command is meant for them by checking themselves against the command target.

The typical lifecycle of a salt job from the perspective of the master might be as follows:

1. A command is issued on the CLI. For example, ``salt my_minion test.ping``.
- 2) The ``salt`` command uses LocalClient to generate a request to the salt master by connecting to the ReqServer on TCP:4506 and issuing the job.
- 3) The salt-master ReqServer sees the request and passes it to an available MWorker over workers.ipc.
- 4) A worker picks up the request and handles it. First, it checks to ensure that the requested user has permissions to issue the command. Then, it sends the publish command to all connected minions. For the curious, this happens in `ClearFuncs.publish()`.
- 5) The worker announces on the master event bus that it is about to publish a job to connected minions. This happens by placing the event on the master event bus (`master_event_pull.ipc`) where the EventPublisher picks it up and distributes it to all connected event listeners on `master_event_pub.ipc`.
- 6) The message to the minions is encrypted and sent to the Publisher via IPC on `publish_pull.ipc`.
- 7) Connected minions have a TCP session established with the Publisher on TCP port 4505 where they await commands. When the Publisher receives the job over `publish_pull`, it sends the jobs across the wire to the minions for processing.
- 8) After the minions receive the request, they decrypt it and perform any requested work, if they determine that they are targeted to do so.
- 9) When the minion is ready to respond, it publishes the result of its job back to the master by sending the encrypted result back to the master on TCP 4506 where it is again picked up by the ReqServer and forwarded to an available MWorker for processing. (Again, this happens by passing this message across `workers.ipc` to an available worker.)
- 10) When the MWorker receives the job it decrypts it and fires an event onto the master event bus (`master_event_pull.ipc`). (Again for the curious, this happens in `AESFuncs._return()`.)
- 11) The EventPublisher sees this event and re-publishes it on the bus to all connected listeners of the master event bus (on `master_event_pub.ipc`). This is where the LocalClient has been waiting, listening to the event bus for minion replies. It gathers the job and stores the result.
- 12) When all targeted minions have replied or the timeout has been exceeded, the salt client displays the results of the job to the user on the CLI.

## 36.4 Salt Minion

### 36.4.1 Overview

The salt-minion is a single process that sits on machines to be managed by Salt. It can either operate as a stand-alone daemon which accepts commands locally via ``salt-call`` or it can connect back to a master and receive commands remotely.

When starting up, salt minions connect `_back_` to a master defined in the minion config file. The connect to two ports on the master:

- **TCP: 4505** This is the connection to the master Publisher. It is on this port that the minion receives jobs from the master.

- **TCP: 4506** This is the connection to the master ReqServer. It is on this port that the minion sends job results back to the master.

### 36.4.2 Event System

Similar to the master, a salt-minion has its own event system that operates over IPC by default. The minion event system operates on a push/pull system with IPC files at `minion_event_<unique_id>_pub.ipc` and `minion_event_<unique_id>_pull.ipc`.

The astute reader might ask why have an event bus at all with a single-process daemon. The answer is that the salt-minion may fork other processes as required to do the work without blocking the main salt-minion process and this necessitates a mechanism by which those processes can communicate with each other. Secondly, this provides a bus by which any user with sufficient permissions can read or write to the bus as a common interface with the salt minion.

### 36.4.3 Job Flow

When a salt minion starts up, it attempts to connect to the Publisher and the ReqServer on the salt master. It then attempts to authenticate and once the minion has successfully authenticated, it simply listens for jobs.

Jobs normally come either come from the `'salt-call'` script run by a local user on the salt minion or they can come directly from a master.

### 36.4.4 Master Job Flow

- 1) A master publishes a job that is received by a minion as outlined by the master's job flow above.
- 2) The minion is polling its receive socket that's connected to the master Publisher (TCP 4505 on master). When it detects an incoming message, it picks it up from the socket and decrypts it.
- 3) A new minion process or thread is created and provided with the contents of the decrypted message. The `_thread_return()` method is provided with the contents of the received message.
- 4) The new minion thread is created. The `_thread_return()` function starts up and actually calls out to the requested function contained in the job.
  5. The requested function runs and returns a result. [Still in thread.]
- 6) The result of the function that's run is encrypted and returned to the master's ReqServer (TCP 4506 on master). [Still in thread.]
- 7) Thread exits. Because the main thread was only blocked for the time that it took to initialize the worker thread, many other requests could have been received and processed during this time.

## 36.5 A Note on ClearFuncs vs. AESFuncs

A common source of confusion is determining when messages are passed in the clear and when they are passed using encryption. There are two rules governing this behaviour:

- 1) ClearFuncs is used for intra-master communication and during the initial authentication handshake between a minion and master during the key exchange.
  2. AESFuncs is used everywhere else.

## 36.6 Contributing

There is a great need for contributions to Salt and patches are welcome! The goal here is to make contributions clear, make sure there is a trail for where the code has come from, and most importantly, to give credit where credit is due!

There are a number of ways to contribute to Salt development.

For details on how to contribute documentation improvements please review *Writing Salt Documentation*.

### 36.6.1 Salt Coding Style

SaltStack has its own coding style guide that informs contributors on various coding approaches. Please review the [:ref:`Salt Coding Style<coding-style>`](#) documentation for information about Salt's particular coding patterns.

Within the [:ref:`Salt Coding Style<coding-style>`](#) documentation, there is a section about running Salt's `.pylintrc` file. SaltStack recommends running the `.pylintrc` file on any files you are changing with your code contribution before submitting a pull request to Salt's repository. Please see the [:ref:`Linting<pylint-instructions>`](#) documentation for more information.

#### Sending a GitHub pull request

Sending pull requests on GitHub is the preferred method for receiving contributions. The workflow advice below mirrors GitHub's own [guide](#) and is well worth reading.

1. Fork `saltstack/salt` on GitHub.
2. Make a local clone of your fork.

```
git clone git@github.com:my-account/salt.git
cd salt
```

3. Add `saltstack/salt` as a git remote.

```
git remote add upstream https://github.com/saltstack/salt.git
```

4. Create a new branch in your clone.

**Note:** A branch should have one purpose. For example, ``Fix bug X,`` or ``Add feature Y``. Multiple unrelated fixes and/or features should be isolated into separate branches.

If you're working on a bug or documentation fix, create your branch from the oldest release branch that contains the bug or requires the documentation update. See *Which Salt Branch?*

```
git fetch upstream
git checkout -b fix-broken-thing upstream/2015.5
```

If you're working on a feature, create your branch from the develop branch.

```
git fetch upstream
git checkout -b add-cool-feature upstream/develop
```

5. Edit and commit changes to your branch.

```
vim path/to/file1 path/to/file2
git diff
git add path/to/file1 path/to/file2
git commit
```

Write a short, descriptive commit title and a longer commit message if necessary.

---

**Note:** If your change fixes a bug or implements a feature already filed in the issue tracker, be sure to reference the issue number in the commit message body.

---

```
fix broken things in file1 and file2

Fixes #31337. The issue is now eradicated from file1 and file2.

# Please enter the commit message for your changes. Lines starting
# with '#' will be ignored, and an empty message aborts the commit.
# On branch fix-broken-thing
# Changes to be committed:
#   modified:   path/to/file1
#   modified:   path/to/file2
```

If you get stuck, there are many introductory Git resources on <http://help.github.com>.

6. Push your locally-committed changes to your GitHub fork,

---

**Note:** You may want to rebase before pushing to work out any potential conflicts.

---

```
git fetch upstream
git rebase upstream/2015.5 fix-broken-thing
git push --set-upstream origin fix-broken-thing
```

or,

```
git fetch upstream
git rebase upstream/develop add-cool-feature
git push --set-upstream origin add-cool-feature
```

7. Find the branch on your GitHub salt fork.

<https://github.com/my-account/salt/branches/fix-broken-thing>

8. Open a new pull request.

Click on **Pull Request** on the right near the top of the page,

<https://github.com/my-account/salt/pull/new/fix-broken-thing>

- (a) If your branch is a fix for a release branch, choose that as the base branch (e.g. 2015.5),

<https://github.com/my-account/salt/compare/saltstack:2015.5...fix-broken-thing>

If your branch is a feature, choose `develop` as the base branch,

<https://github.com/my-account/salt/compare/saltstack:develop...add-cool-feature>

- (b) Review that the proposed changes are what you expect.

- (c) Write a descriptive comment. Include links to related issues (e.g. `Fixes #31337!`) in the comment field.
  - (d) Click `Create pull request`.
9. Salt project members will review your pull request and automated tests will run on it.

If you recognize any test failures as being related to your proposed changes or if a reviewer asks for modifications:

- (a) Make the new changes in your local clone on the same local branch.
- (b) Push the branch to GitHub again using the same commands as before.
- (c) New and updated commits will be added to the pull request automatically.
- (d) Feel free to add a comment to the discussion.

---

**Note:** Jenkins

Pull request against `saltstack/salt` are automatically tested on a variety of operating systems and configurations. On average these tests take 30 minutes. Depending on your GitHub notification settings you may also receive an email message about the test results.

Test progress and results can be found at <http://jenkins.saltstack.com/>.

---

### Which Salt branch?

GitHub will open pull requests against Salt's main branch, `develop`, by default. Ideally, features should go into `develop` and bug fixes and documentation changes should go into the oldest supported release branch affected by the bug or documentation update. See *[Sending a GitHub pull request](#)*.

If you have a bug fix or doc change and have already forked your working branch from `develop` and do not know how to rebase your commits against another branch, then submit it to `develop` anyway and we'll be sure to back-port it to the correct place.

### 36.6.2 The current release branch

The current release branch is the most recent stable release. Pull requests containing bug fixes should be made against the release branch.

The branch name will be a date-based name such as `2015.5`.

Bug fixes are made on this branch so that minor releases can be cut from this branch without introducing surprises and new features. This approach maximizes stability.

The Salt development team will "`merge-forward" any fixes made on the release branch to the `develop` branch once the pull request has been accepted. This keeps the fix in isolation on the release branch and also keeps the `develop` branch up-to-date.

---

**Note:** Closing GitHub issues from commits

This "`merge-forward" strategy requires that [the magic keywords to close a GitHub issue](#) appear in the commit message text directly. Only including the text in a pull request will not close the issue.

GitHub will close the referenced issue once the *commit* containing the magic text is merged into the default branch (`develop`). Any magic text input only into the pull request description will not be seen at the Git-level when those commits are merged-forward. In other words, only the commits are merged-forward and not the pull request.

---

### 36.6.3 The `develop` branch

The `develop` branch is unstable and bleeding-edge. Pull requests containing feature additions or non-bug-fix changes should be made against the `develop` branch.

The Salt development team will back-port bug fixes made to `develop` to the current release branch if the contributor cannot create the pull request against that branch.

#### Keeping Salt Forks in Sync

Salt is advancing quickly. It is therefore critical to pull upstream changes from upstream into your fork on a regular basis. Nothing is worse than putting hard work into a pull request only to see bunches of merge conflicts because it has diverged too far from upstream.

See also:

[GitHub Fork a Repo Guide](#)

The following assumes `origin` is the name of your fork and `upstream` is the name of the main `saltstack/salt` repository.

1. View existing remotes.

```
git remote -v
```

2. Add the upstream remote.

```
# For ssh github
git remote add upstream git@github.com:saltstack/salt.git

# For https github
git remote add upstream https://github.com/saltstack/salt.git
```

3. Pull upstream changes into your clone.

```
git fetch upstream
```

4. Update your copy of the `develop` branch.

```
git checkout develop
git merge --ff-only upstream/develop
```

If Git complains that a fast-forward merge is not possible, you have local commits.

- Run `git pull --rebase origin develop` to rebase your changes on top of the upstream changes.
- Or, run `git branch <branch-name>` to create a new branch with your commits. You will then need to reset your `develop` branch before updating it with the changes from upstream.

If Git complains that local files will be overwritten, you have changes to files in your working directory. Run `git status` to see the files in question.

5. Update your fork.

```
git push origin develop
```

- Repeat the previous two steps for any other branches you work with, such as the current release branch.

### Posting patches to the mailing list

Patches will also be accepted by email. Format patches using `git format-patch` and send them to the [salt-users](#) mailing list. The contributor will then get credit for the patch, and the Salt community will have an archive of the patch and a place for discussion.

### Backporting Pull Requests

If a bug is fixed on `develop` and the bug is also present on a currently-supported release branch it will need to be back-ported to all applicable branches.

---

**Note:** Most Salt contributors can skip these instructions

These instructions do not need to be read in order to contribute to the Salt project! The SaltStack team will back-port fixes on behalf of contributors in order to keep the contribution process easy.

These instructions are intended for frequent Salt contributors, advanced Git users, SaltStack employees, or independent souls who wish to back-port changes themselves.

---

It is often easiest to fix a bug on the oldest supported release branch and then merge that branch forward into `develop` (as described earlier in this document). When that is not possible the fix must be back-ported, or copied, into any other affected branches.

These steps assume a pull request #1234 has been merged into `develop`. And `upstream` is the name of the remote pointing to the main Salt repo.

- Identify the oldest supported release branch that is affected by the bug.
- Create a new branch for the back-port by reusing the same branch from the original pull request.

Name the branch `bp-<NNNN>` and use the number of the original pull request.

```
git fetch upstream refs/pull/1234/head:bp-1234
git checkout bp-1234
```

- Find the parent commit of the original pull request.

The parent commit of the original pull request must be known in order to rebase onto a release branch. The easiest way to find this is on GitHub.

Open the original pull request on GitHub and find the first commit in the list of commits. Select and copy the SHA for that commit. The parent of that commit can be specified by appending `~1` to the end.

- Rebase the new branch on top of the release branch.
  - `<release-branch>` is the branch identified in step #1.
  - `<orig-base>` is the SHA identified in step #3 -- don't forget to add `~1` to the end!

```
git rebase --onto <release-branch> <orig-base> bp-1234
```

Note, release branches prior to 2015.5 will not be able to make use of rebase and must use cherry-picking instead.

5. Push the back-port branch to GitHub and open a new pull request.

Opening a pull request for the back-port allows for the test suite and normal code-review process.

```
git push -u origin bp-1234
```

## Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the [Labels and Milestones](#) documentation for more information.

## 36.7 Deprecating Code

Salt should remain backwards compatible, though sometimes, this backwards compatibility needs to be broken because a specific feature and/or solution is no longer necessary or required. At first one might think, let me change this code, it seems that it's not used anywhere else so it should be safe to remove. Then, once there's a new release, users complain about functionality which was removed and they were using it, etc. This should, at all costs, be avoided, and, in these cases, *that* specific code should be deprecated.

In order to give users enough time to migrate from the old code behavior to the new behavior, the deprecation time frame should be carefully determined based on the significance and complexity of the changes required by the user.

Salt feature releases are based on the Periodic Table. Any new features going into the develop branch will be named after the next element in the Periodic Table. For example, Beryllium was the feature release name of the develop branch before the 2015.8 branch was tagged. At that point in time, any new features going into the develop branch after 2015.8 was branched were part of the Boron feature release.

A deprecation warning should be in place for at least two major releases before the deprecated code and its accompanying deprecation warning are removed. More time should be given for more complex changes. For example, if the current release under development is Sodium, the deprecated code and associated warnings should remain in place and warn for at least Aluminum.

To help in this deprecation task, salt provides `salt.utils.warn_until`. The idea behind this helper function is to show the deprecation warning to the user until salt reaches the provided version. Once that provided version is equaled `salt.utils.warn_until` will raise a `RuntimeError` making salt stop its execution. This stoppage is unpleasant and will remind the developer that the deprecation limit has been reached and that the code can then be safely removed.

Consider the following example:

```
def some_function(bar=False, foo=None):
    if foo is not None:
        salt.utils.warn_until(
            'Aluminum',
            'The \'foo\' argument has been deprecated and its '
            'functionality removed, as such, its usage is no longer '
            'required.'
        )
```

Development begins on the Aluminum release when the Magnesium branch is forked from the develop branch. Once this occurs, all uses of the `warn_until` function targeting Aluminum, along with the code they are warning about should be removed from the code.

## 36.8 Dunder Dictionaries

Salt provides several special ``dunder" dictionaries as a convenience for Salt development. These include `__opts__`, `__context__`, `__salt__`, and others. This document will describe each dictionary and detail where they exist and what information and/or functionality they provide.

### 36.8.1 `__opts__`

#### Available in

- All loader modules

The `__opts__` dictionary contains all of the options passed in the configuration file for the master or minion.

---

**Note:** In many places in salt, instead of pulling raw data from the `__opts__` dict, configuration data should be pulled from the salt *get* functions such as `config.get`, aka - `__salt__['config.get']('foo:bar')` The *get* functions also allow for dict traversal via the `:` delimiter. Consider using *get* functions whenever using `__opts__` or `__pillar__` and `__grains__` (when using grains for configuration data)

---

The configuration file data made available in the `__opts__` dictionary is the configuration data relative to the running daemon. If the modules are loaded and executed by the master, then the master configuration data is available, if the modules are executed by the minion, then the minion configuration is available. Any additional information passed into the respective configuration files is made available

### 36.8.2 `__salt__`

#### Available in

- Execution Modules
- State Modules
- Returners
- Runners

`__salt__` contains the execution module functions. This allows for all functions to be called as they have been set up by the salt loader.

```
__salt__['cmd.run']('fdisk -l')
__salt__['network.ip_addrs']()
```

---

**Note:** When used in runners, `__salt__` references other runner modules, and not execution modules.

---

### 36.8.3 `__grains__`

#### Available in

- Execution Modules
- State Modules

- Returners
- External Pillar

The `__grains__` dictionary contains the grains data generated by the minion that is currently being worked with. In execution modules, state modules and returners this is the grains of the minion running the calls, when generating the external pillar the `__grains__` is the grains data from the minion that the pillar is being generated for.

### 36.8.4 `__pillar__`

#### Available in

- Execution Modules
- State Modules
- Returners

The `__pillar__` dictionary contains the pillar for the respective minion.

### 36.8.5 `__context__`

`__context__` exists in state modules and execution modules.

During a state run the `__context__` dictionary persists across all states that are run and then is destroyed when the state ends.

When running an execution module `__context__` persists across all module executions until the modules are refreshed; such as when `saltutil.sync_all` or `state.apply` are executed.

A great place to see how to use `__context__` is in the `cp.py` module in `salt/modules/cp.py`. The fileclient authenticates with the master when it is instantiated and then is used to copy files to the minion. Rather than create a new fileclient for each file that is to be copied down, one instance of the fileclient is instantiated in the `__context__` dictionary and is reused for each file. Here is an example from `salt/modules/cp.py`:

```
if not 'cp.fileclient' in __context__:
    __context__['cp.fileclient'] = salt.fileclient.get_file_client(__opts__)
```

---

**Note:** Because `__context__` may or may not have been destroyed, always be sure to check for the existence of the key in `__context__` and generate the key before using it.

---

## 36.9 External Pillars

Salt provides a mechanism for generating pillar data by calling external pillar interfaces. This document will describe an outline of an `ext_pillar` module.

### 36.9.1 Location

Salt expects to find your `ext_pillar` module in the same location where it looks for other python modules. If the `extension_modules` option in your Salt master configuration is set, Salt will look for a `pillar` directory under there and load all the modules it finds. Otherwise, it will look in your Python site-packages `salt/pillar` directory.

## 36.9.2 Configuration

The external pillars that are called when a minion refreshes its pillars is controlled by the `ext_pillar` option in the Salt master configuration. You can pass a single argument, a list of arguments or a dictionary of arguments to your pillar:

```
ext_pillar:
- example_a: some argument
- example_b:
  - argumentA
  - argumentB
- example_c:
  keyA: valueA
  keyB: valueB
```

## 36.9.3 The Module

### 36.9.4 Imports and Logging

Import modules your external pillar module needs. You should first include generic modules that come with stock Python:

```
import logging
```

And then start logging. This is an idiomatic way of setting up logging in Salt:

```
log = logging.getLogger(__name__)
```

Finally, load modules that are specific to what you are doing. You should catch import errors and set a flag that the `__virtual__` function can use later.

```
try:
    import weird_thing
    EXAMPLE_A_LOADED = True
except ImportError:
    EXAMPLE_A_LOADED = False
```

## 36.9.5 Options

If you define an `__opts__` dictionary, it will be merged into the `__opts__` dictionary handed to the `ext_pillar` function later. This is a good place to put default configuration items. The convention is to name things `module-name.option`.

```
__opts__ = { 'example_a.someconfig': 137 }
```

## 36.9.6 Initialization

If you define an `__init__` function, it will be called with the following signature:

```
def __init__( __opts__ ):
    # Do init work here
```

**Note:** The `__init__` function is ran every time a particular minion causes the external pillar to be called, so don't put heavy initialization code here. The `__init__` functionality is a side-effect of the Salt loader, so it may not be as useful in pillars as it is in other Salt items.

### 36.9.7 `__virtual__`

If you define a `__virtual__` function, you can control whether or not this module is visible. If it returns `False` then Salt ignores this module. If it returns a string, then that string will be how Salt identifies this external pillar in its `ext_pillar` configuration. If you're not renaming the module, simply return `True` in the `__virtual__` function, which is the same as if this function did not exist, then, the name Salt's `ext_pillar` will use to identify this module is its conventional name in Python.

This is useful to write modules that can be installed on all Salt masters, but will only be visible if a particular piece of software your module requires is installed.

```
# This external pillar will be known as `example_a`
def __virtual__():
    if EXAMPLE_A_LOADED:
        return True
    return False
```

```
# This external pillar will be known as `something_else`
__virtualname__ = 'something_else'

def __virtual__():
    if EXAMPLE_A_LOADED:
        return __virtualname__
    return False
```

### 36.9.8 `ext_pillar`

This is where the real work of an external pillar is done. If this module is active and has a function called `ext_pillar`, whenever a minion updates its pillar this function is called.

How it is called depends on how it is configured in the Salt master configuration. The first argument is always the current pillar dictionary, this contains pillar items that have already been added, starting with the data from `pillar_roots`, and then from any already-ran external pillars.

Using our example above:

```
ext_pillar( id, pillar, 'some argument' )           # example_a
ext_pillar( id, pillar, 'argumentA', 'argumentB' ) # example_b
ext_pillar( id, pillar, keyA='valueA', keyB='valueB' } ) # example_c
```

In the `example_a` case, `pillar` will contain the items from the `pillar_roots`, in `example_b` `pillar` will contain that plus the items added by `example_a`, and in `example_c` `pillar` will contain that plus the items added by `example_b`. In all three cases, `id` will contain the ID of the minion making the pillar request.

This function should return a dictionary, the contents of which are merged in with all of the other pillars and returned to the minion. **Note:** this function is called once for each minion that fetches its pillar data.

```
def ext_pillar( minion_id, pillar, *args, **kwargs ):
    my_pillar = {}
    # Do stuff
    return my_pillar
```

You shouldn't just add items to `pillar` and return that, since that will cause Salt to merge data that already exists. Rather, just return the items you are adding or changing. You could, however, use `pillar` in your module to make some decision based on pillar data that already exists.

This function has access to some useful globals:

- `__opts__` A dictionary of mostly Salt configuration options. If you had an `__opts__` dictionary defined in your module, those values will be included.
- `__salt__` A dictionary of Salt module functions, useful so you don't have to duplicate functions that already exist. E.g. `__salt__['cmd.run']( 'ls -l' )` *Note*, runs on the *master*
- `__grains__` A dictionary of the grains of the minion making this pillar call.

### 36.9.9 Example configuration

As an example, if you wanted to add external pillar via the `cmd_json` external pillar, add something like this to your master config:

```
ext_pillar:
  - cmd_json: 'echo {"arg":"value"}'
```

#### 36.9.10 Reminder

Just as with traditional pillars, external pillars must be refreshed in order for minions to see any fresh data:

```
salt '*' saltutil.refresh_pillar
```

## 36.10 Installing Salt for development

Clone the repository using:

```
git clone https://github.com/saltstack/salt
```

**Note:** tags

Just cloning the repository is enough to work with Salt and make contributions. However, fetching additional tags from git is required to have Salt report the correct version for itself. To do this, first add the git repository as an upstream source:

```
git remote add upstream https://github.com/saltstack/salt
```

Fetching tags is done with the git `fetch` utility:

```
git fetch --tags upstream
```

---

Create a new `virtualenv`:

```
virtualenv /path/to/your/virtualenv
```

---

Avoid making your `virtualenv path too long`. On Arch Linux, where Python 3 is the default installation of Python, use the `virtualenv2` command instead of `virtualenv`.

---

**Note:** Using system Python modules in the `virtualenv`

To use already-installed python modules in `virtualenv` (instead of having pip download and compile new ones), run `virtualenv --system-site-packages` Using this method eliminates the requirement to install the salt dependencies again, although it does assume that the listed modules are all installed in the system `PYTHONPATH` at the time of `virtualenv` creation.

---

Activate the `virtualenv`:

```
source /path/to/your/virtualenv/bin/activate
```

---

Install Salt (and dependencies) into the `virtualenv`:

```
pip install M2Crypto      # Don't install on Debian/Ubuntu (see below)
pip install pyzmq PyYAML pycrypto msgpack-python jinja2 psutil
pip install -e ./salt    # the path to the salt git clone from above
```

---

**Note:** Installing M2Crypto

`swig` and `libssl-dev` are required to build M2Crypto. To fix the error command `'swig' failed with exit status 1` while installing M2Crypto, try installing it with the following command:

```
env SWIG_FEATURES="-cpperraswarn -includeall -D__uname -m`__ -I/usr/include/openssl" pip install M2Crypto
```

---

Debian and Ubuntu systems have modified openssl libraries and mandate that a patched version of M2Crypto be installed. This means that M2Crypto needs to be installed via `apt`:

```
apt-get install python-m2crypto
```

---

This also means that pulling in the M2Crypto installed using `apt` requires using `--system-site-packages` when creating the `virtualenv`.

If you're using a platform other than Debian or Ubuntu, and you are installing M2Crypto via `pip` instead of a system package, then you will also need the `gcc` compiler.

---

**Note:** Installing `psutil`

Python header files are required to build this module, otherwise the `pip` install will fail. If your distribution separates binaries and headers into separate packages, make sure that you have the headers installed. In most Linux distributions which split the headers into their own package, this can be done by installing the `python-dev` or `python-devel` package. For other platforms, the package will likely be similarly named.

---

**Note:** Installing dependencies on OS X.

---

You can install needed dependencies on OS X using homebrew or macports. See [OS X Installation](#)

**Warning:** Installing on RedHat-based Distros

If installing from pip (or from source using `setup.py install`), be advised that the `yum-utils` package is needed for Salt to manage packages on RedHat-based systems.

### 36.10.1 Running a self-contained development version

During development it is easiest to be able to run the Salt master and minion that are installed in the virtualenv you created above, and also to have all the configuration, log, and cache files contained in the virtualenv as well.

Copy the master and minion config files into your virtualenv:

```
mkdir -p /path/to/your/virtualenv/etc/salt
cp ./salt/conf/master ./salt/conf/minion /path/to/your/virtualenv/etc/salt/
```

Edit the master config file:

1. Uncomment and change the `user: root` value to your own user.
2. Uncomment and change the `root_dir: /` value to point to `/path/to/your/virtualenv`.
3. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-master.pid` value to point to `/path/to/your/virtualenv/salt-master.pid`.
4. If you are also running a non-development version of Salt you will have to change the `publish_port` and `ret_port` values as well.

Edit the minion config file:

1. Repeat the edits you made in the master config for the `user` and `root_dir` values as well as any port changes.
2. If you are running version 0.11.1 or older, uncomment, and change the `pidfile: /var/run/salt-minion.pid` value to point to `/path/to/your/virtualenv/salt-minion.pid`.
3. Uncomment and change the `master: salt` value to point at localhost.
4. Uncomment and change the `id:` value to something descriptive like ```saltdev```. This isn't strictly necessary but it will serve as a reminder of which Salt installation you are working with.
5. If you changed the `ret_port` value in the master config because you are also running a non-development version of Salt, then you will have to change the `master_port` value in the minion config to match.

**Note:** Using `salt-call` with a [Standalone Minion](#)

If you plan to run `salt-call` with this self-contained development environment in a masterless setup, you should invoke `salt-call` with `-c /path/to/your/virtualenv/etc/salt` so that salt can find the minion config file. Without the `-c` option, Salt finds its config files in `/etc/salt`.

Start the master and minion, accept the minion's key, and verify your local Salt installation is working:

```
cd /path/to/your/virtualenv
salt-master -c ./etc/salt -d
salt-minion -c ./etc/salt -d
salt-key -c ./etc/salt -L
salt-key -c ./etc/salt -A
salt -c ./etc/salt '*' test.ping
```

Running the master and minion in debug mode can be helpful when developing. To do this, add `-l debug` to the calls to `salt-master` and `salt-minion`. If you would like to log to the console instead of to the log file, remove the `-d`.

---

**Note:** Too long socket path?

Once the minion starts, you may see an error like the following:

```
zmq.core.error.ZMQError: ipc path "/path/to/your/virtualenv/
var/run/salt/minion/minion_event_7824dcbcf7a8f6755939af70b96249f_pub.ipc"
is longer than 107 characters (sizeof(sockaddr_un.sun_path)).
```

This means that the path to the socket the minion is using is too long. This is a system limitation, so the only workaround is to reduce the length of this path. This can be done in a couple different ways:

1. Create your virtualenv in a path that is short enough.
2. Edit the `sock_dir` minion config variable and reduce its length. Remember that this path is relative to the value you set in `root_dir`.

**NOTE:** The socket path is limited to 107 characters on Solaris and Linux, and 103 characters on BSD-based systems.

---

**Note:** File descriptor limits

Ensure that the system open file limit is raised to at least 2047:

```
# check your current limit
ulimit -n

# raise the limit. persists only until reboot
# use 'limit descriptors 2047' for c-shell
ulimit -n 2047
```

To set file descriptors on OSX, refer to the [OS X Installation](#) instructions.

---

## Changing Default Paths

Instead of updating your configuration files to point to the new root directory and having to pass the new configuration directory path to all of Salt's CLI tools, you can explicitly tweak the default system paths that Salt expects:

```
GENERATE_SALT_SYSPATHS=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
-e ./salt # the path to the salt git clone from above
```

You can now call all of Salt's CLI tools without explicitly passing the configuration directory.

## Additional Options

In case you want to distribute your virtualenv, you probably don't want to include Salt's clone `.git/` directory, and, without it, Salt won't report the accurate version. You can tell `setup.py` to generate the hardcoded version information which is distributable:

```
GENERATE_SALT_SYSPATHS=1 WRITE_SALT_VERSION=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
-e ./salt # the path to the salt git clone from above
```

Instead of passing those two environmental variables, you can just pass a single one which will trigger the other two:

```
MIMIC_SALT_INSTALL=1 pip install --global-option='--salt-root-dir=/path/to/your/virtualenv/' \
  -e ./salt # the path to the salt git clone from above
```

This last one will grant you an editable salt installation with hardcoded system paths and version information.

### 36.10.2 Installing Salt from the Python Package Index

If you are installing using `easy_install`, you will need to define a `USE_SETUPTOOLS` environment variable, otherwise dependencies will not be installed:

```
USE_SETUPTOOLS=1 easy_install salt
```

### 36.10.3 Editing and previewing the documentation

You need `sphinx-build` command to build the docs. In Debian/Ubuntu this is provided in the `python-sphinx` package. Sphinx can also be installed to a `virtualenv` using `pip`:

```
pip install Sphinx==1.3b2
```

Change to salt documentation directory, then:

```
cd doc; make html
```

- This will build the HTML docs. Run `make` without any arguments to see the available make targets, which include `html`, `man`, and `text`.
- The docs then are built within the `docs/_build/` folder. To update the docs after making changes, run `make` again.
- The docs use `reStructuredText` for markup. See a live demo at <http://rst.ninjs.org/>.
- The help information on each module or state is culled from the python code that runs for that piece. Find them in `salt/modules/` or `salt/states/`.
- To build the docs on Arch Linux, the `python2-sphinx` package is required. Additionally, it is necessary to tell `make` where to find the proper `sphinx-build` binary, like so:

```
make SPHINXBUILD=sphinx-build2 html
```

- To build the docs on RHEL/CentOS 6, the `python-sphinx10` package must be installed from EPEL, and the following make command must be used:

```
make SPHINXBUILD=sphinx-1.0-build html
```

Once you've updated the documentation, you can run the following command to launch a simple Python HTTP server to see your changes:

```
cd _build/html; python -m SimpleHTTPServer
```

### 36.10.4 Running unit and integration tests

Run the test suite with following command:

```
./setup.py test
```

See [here](#) for more information regarding the test suite.

### 36.10.5 Issue and Pull Request Labeling System

SaltStack uses several labeling schemes to help facilitate code contributions and bug resolution. See the *Labels and Milestones* documentation for more information.

## 36.11 GitHub Labels and Milestones

SaltStack uses several label categories, as well as milestones, to triage incoming issues and pull requests in the GitHub issue tracker. Labels are used to sort issues by type, priority, severity, status, functional area, functional group, and targeted release and pull requests by status, functional area, functional group, type of change, and test status. Milestones are used to indicate whether an issue is fully triaged or is scheduled to be fixed by SaltStack in an upcoming sprint.

### 36.11.1 Milestones

All issues are assigned to a milestone, whereas pull requests are almost never assigned to a milestone as the mean lifetime of pull requests is short enough that there is no need to track them temporally.

SaltStack uses milestones to indicate which issues are blocked on submitter or upstream actions, are approved, or are scheduled to be fixed or implemented in an upcoming sprint. If an issue is not attached to a sprint milestone, you are welcome to work on it at your own desire and convenience. If it is attached to a sprint milestone and you have already begun working on it or have a solution in mind or have other ideas related to the issue, you are encouraged to coordinate with the assignee via the GitHub issue tracker to create the best possible solution or implementation.

**Approved** The issue has been validated and has all necessary information.

**Blocked** The issue is waiting on actions by parties outside of SaltStack, such as receiving more information from the submitter or resolution of an upstream issue. This milestone is usually applied in conjunction with the labels `Info Needed`, `Question`, `Expected Behavior`, `Won't Fix For Now`, or `Upstream Bug`.

**Under Review** The issue is having further validation done by a SaltStack engineer.

**<Sprint>** The issue is being actively worked on by a SaltStack engineer. Sprint milestones names are constructed from the chemical symbol of the next release's codename and the number of sprints until that release is made. For example, if the next release codename is `Neon` and there are five sprints until that release, the corresponding sprint milestone will be called `Ne 5`. See `<topics/releases/version_numbers>` for a discussion of Salt's release codenames.

### 36.11.2 Labels

Labels are used to sort and describe issues and pull requests. Some labels are usually reserved for one or the other, though most labels may be applied to both.

New issues will receive at least one label and a milestone, and new pull requests will receive at least one label. Except for the *functional area* and *functional group* label categories, issues will generally receive only up to one label per category.

## Type

Issues are categorized into one of several types. Type labels are almost never used for pull requests. GitHub treats pull requests like issues in many ways, so a pull request could be considered an issue with an implicit `Pull Request` type label applied.

**Feature** The issue is a request for new functionality including changes, enhancements, refactors, etc.

**Bug** The issue documents broken, incorrect, or confusing behavior. This label is always accompanied by a *severity label*.

**Duplicate** The issue is a duplicate of another feature request or bug report.

**Upstream Bug** The issue is a result of an upstream issue.

**Question** The issue is more of a question than a request for new features or a report of broken features, but can sometimes lead to further discussion or changes of confusing or incongruous behavior or documentation.

**Expected Behavior** The issue is a bug report of intended functionality.

## Priority

An issue's priority is relative to its *functional area*. If a bug report, for example, about `gitfs` indicates that all users of `gitfs` will encounter this bug, then a `P1` label will be applied, even though users who are not using `gitfs` will not encounter the bug. If a feature is requested by many users, it may be given a high priority.

**P1** The issue will be seen by all users.

**P2** The issue will be seen by most users.

**P3** The issue will be seen by about half of users.

**P4** The issue will not be seen by most users. Usually the issue is a very specific use case or corner case.

## Severity

Severity labels are almost always only applied to issues labeled `Bug`.

**Blocker** The issue is blocking an impending release.

**Critical** The issue causes data loss, crashes or hangs salt processes, makes the system unresponsive, etc.

**High Severity** The issue reports incorrect functionality, bad functionality, a confusing user experience, etc.

**Medium Severity** The issue reports cosmetic items, formatting, spelling, colors, etc.

## Functional Area

Many major components of Salt have corresponding GitHub labels. These labels are applied to all issues and pull requests as is reasonably appropriate. They are useful in organizing issues and pull requests according to the source code relevant to issues or the source code changed by pull requests.

- Execution Module
- File Servers

- Grains
- Multi-Master
- Packaging Related to packaging of Salt, not Salt's support for package management.
- Pillar
- RAET
- Returners
- Runners
- SPM
- Salt-API
- Salt-Cloud
- Salt-SSH
- Salt-Syndic
- State Module
- Tests
- Transport
- Windows
- ZMQ

## Functional Group

These labels sort issues and pull requests according to the internal SaltStack engineering teams.

**Core** The issue or pull request relates to code that is central or existential to Salt itself.

**Platform** The issue or pull request relates to support and integration with various platforms like traditional operating systems as well as containers, platform-based utilities like filesystems, command schedulers, etc., and system-based applications like webservers, databases, etc.

**RIoT** The issue or pull request relates to support and integration with various abstract systems like cloud providers, hypervisors, API-based services, etc.

**Console** The issue or pull request relates to the SaltStack enterprise console.

**Documentation** The issue or pull request relates to documentation.

## Status

Status labels are used to define and track the state of issues and pull requests. Not all potential statuses correspond to a label, but some statuses are common enough that labels have been created for them. If an issue has not been moved beyond the `Blocked` milestone, it is very likely that it will only have a status label.

**Bugfix - back-port** The pull request needs to be back-ported to an older release branch. This is done by *recreating the pull request* against that branch. Once the back-port is completed, this label is replaced with a `Bugfix - [Done] back-ported` label. Normally, new features should go into the `develop` and bug fixes into the oldest supported release branch, see `<which-salt-branch>`.

**Bugfix - [Done] back-ported** The pull request has been back-ported to an older branch.

**Cannot Reproduce** The issue is a bug and has been reviewed by a SaltStack engineer, but it cannot be replicated with the provided information and context. Those involved with the bug will need to work through additional ideas until the bug can be isolated and verified.

**Confirmed** The issue is a bug and has been confirmed by a SaltStack engineer, who often documents a minimal working example that reproduces the bug.

**Fixed Pending Verification** The issue is a bug and has been fixed by one or more pull requests, which should link to the issue. Closure of the issue is contingent upon confirmation of resolution from the submitter. If the submitter reports a negative confirmation, this label is removed. If no response is given after a few weeks, then the issue will be assumed fixed and closed.

**Info Needed** The issue needs more information before it can be verified and resolved. For a feature request this may include a description of the use cases. Almost all bug reports need to include at least the versions of salt and its dependencies, the system type and version, commands used, debug logs, error messages, and relevant configs.

**Pending Changes** The pull request needs additional changes before it can be merged.

**Pending Discussion** The issue or pull request needs more discussion before it can be closed or merged. The status of the issue or pull request is not clear or apparent enough for definite action to be taken, or additional input from SaltStack, the submitter, or another party has been requested.

If the issue is not a pull request, once the discussion has arrived at a cogent conclusion, this label will be removed and the issue will be accepted. If it is a pull request, the results of the discussion may require additional changes and thus, a Pending Changes label.

**Won't Fix for Now** The issue is legitimate, but it is not something the SaltStack team is currently able or willing to fix or implement. Issues having this label may be revisited in the future.

### Type of Change

Every pull request should receive a change label. These labels measure the quantity of change as well as the significance of the change. The amount of change and the importance of the code area changed are considered, but often the depth of secondary code review required and the potential repercussions of the change may also advise the label choice.

Core code areas include: state compiler, crypto engine, master and minion and syndic daemons, transport, pillar rendering, loader, transport layer, event system, salt.utils, client, cli, logging, netapi, runner engine, templating engine, top file compilation, file client, file server, mine, salt-ssh, test runner, etc.

Non-core code usually constitutes the specific set of plugins for each of the several plugin layers of Salt: execution modules, states, runners, returners, clouds, etc.

### Minor Change

- Less than 64 lines changed, or
- Less than 8 core lines changed

### Medium Change

- Less than 256 lines changed, or
- Less than 64 core lines changed

### Master Change

- More than 256 lines changed, or
- More than 64 core lines changed

## Expert Change

- Needs specialized, in-depth review

## Test Status

These labels relate to the status of the automated tests that run on pull requests. If the tests on a pull request fail and are not overridden by one of these labels, the pull request submitter needs to update the code and/or tests so that the tests pass and the pull request can be merged.

**Lint** The pull request has passed all tests except for the code lint checker.

**Tests Passed** The pull request has passed all tests even though some test results are negative. Sometimes the automated testing infrastructure will encounter internal errors unrelated to the code change in the pull request that cause test runs to fail. These errors can be caused by cloud host and network issues and also Jenkins issues like erroneously accumulating workspace artifacts, resource exhaustion, and bugs that arise from long running Jenkins processes.

## Other

These labels indicate miscellaneous issue types or statuses that are common or important enough to be tracked and sorted with labels.

**Awesome** The pull request implements an especially well crafted solution, or a very difficult but necessary change.

**Low Hanging Fruit** The issue is trivial or almost trivial to implement or fix. Issues having this label should be a good starting place for new contributors to Salt.

**Needs Testcase** The issue or pull request relates to a feature that needs test coverage. The pull request containing the tests should reference the issue or pull request having this label, whereupon the label should be removed.

**Regression** The issue is a bug that breaks functionality known to work in previous releases.

**Story** The issue is used by a SaltStack engineer to track progress on multiple related issues in a single place.

**Stretch** The issue is an optional goal for the current sprint but may not be delivered.

**ZD** The issue is related to a Zendesk customer support ticket.

**<Release>** The issue is scheduled to be implemented by <Release>. See <top-ics/releases/version\_numbers> for a discussion of Salt's release codenames.

## 36.12 Logging Internals

TODO

## 36.13 Modular Systems

When first working with Salt, it is not always clear where all of the modular components are and what they do. Salt comes loaded with more modular systems than many users are aware of, making Salt very easy to extend in many places.

The most commonly used modular systems are execution modules and states. But the modular systems extend well beyond the more easily exposed components and are often added to Salt to make the complete system more flexible.

### 36.13.1 Execution Modules

Execution modules make up the core of the functionality used by Salt to interact with client systems. The execution modules create the core system management library used by all Salt systems, including states, which interact with minion systems.

Execution modules are completely open ended in their execution. They can be used to do anything required on a minion, from installing packages to detecting information about the system. The only restraint in execution modules is that the defined functions always return a JSON serializable object.

For a list of all built in execution modules, click [here](#)

For information on writing execution modules, see [this page](#).

### 36.13.2 Interactive Debugging

Sometimes debugging with `print()` and extra logs sprinkled everywhere is not the best strategy.

IPython is a helpful debug tool that has an interactive python environment which can be embedded in python programs.

First the system will require IPython to be installed.

```
# Debian
apt-get install ipython

# Arch Linux
pacman -Syu ipython2

# RHEL/CentOS (via EPEL)
yum install python-ipython
```

Now, in the troubling python module, add the following line at a location where the debugger should be started:

```
test = 'test123'
import IPython; IPython.embed_kernel()
```

After running a Salt command that hits that line, the following will show up in the log file:

```
[CRITICAL] To connect another client to this kernel, use:
[IPKernelApp] --existing kernel-31271.json
```

Now on the system that invoked `embed_kernel`, run the following command from a shell:

```
# NOTE: use ipython2 instead of ipython for Arch Linux
ipython console --existing
```

This provides a console that has access to all the vars and functions, and even supports tab-completion.

```
print(test)
test123
```

To exit IPython and continue running Salt, press `Ctrl-d` to logout.

### 36.13.3 State Modules

State modules are used to define the state interfaces used by Salt States. These modules are restrictive in that they must follow a number of rules to function properly.

---

**Note:** State modules define the available routines in sls files. If calling an execution module directly is desired, take a look at the *module* state.

---

### 36.13.4 Auth

The auth module system allows for external authentication routines to be easily added into Salt. The *auth* function needs to be implemented to satisfy the requirements of an auth module. Use the *pam* module as an example.

### 36.13.5 Fileserver

The fileserver module system is used to create fileserver backends used by the Salt Master. These modules need to implement the functions used in the fileserver subsystem. Use the *gitfs* module as an example.

### 36.13.6 Grains

Grain modules define extra routines to populate grains data. All defined public functions will be executed and MUST return a Python dict object. The dict keys will be added to the grains made available to the minion.

### 36.13.7 Output

The output modules supply the outputter system with routines to display data in the terminal. These modules are very simple and only require the *output* function to execute. The default system outputter is the *nested* module.

### 36.13.8 Pillar

Used to define optional external pillar systems. The pillar generated via the filesystem pillar is passed into external pillars. This is commonly used as a bridge to database data for pillar, but is also the backend to the libvirt state used to generate and sign libvirt certificates on the fly.

### 36.13.9 Renderers

Renderers are the system used to render sls files into salt highdata for the state compiler. They can be as simple as the *py* renderer and as complex as *stateconf* and *pydsl*.

### 36.13.10 Returners

Returners are used to send data from minions to external sources, commonly databases. A full returner will implement all routines to be supported as an external job cache. Use the *redis* returner as an example.

### 36.13.11 Runners

Runners are purely master-side execution sequences.

### 36.13.12 Tops

Tops modules are used to convert external data sources into top file data for the state system.

### 36.13.13 Wheel

The wheel system is used to manage master side management routines. These routines are primarily intended for the API to enable master configuration.

## 36.14 Package Providers

This page contains guidelines for writing package providers.

### 36.14.1 Package Functions

One of the most important features of Salt is package management. There is no shortage of package managers, so in the interest of providing a consistent experience in *pkg* states, there are certain functions that should be present in a package provider. Note that these are subject to change as new features are added or existing features are enhanced.

#### list\_pkgs

This function should declare an empty dict, and then add packages to it by calling `pkg_resource.add_pkg`, like so:

```
__salt__['pkg_resource.add_pkg'](ret, name, version)
```

The last thing that should be done before returning is to execute `pkg_resource.sort_pkglist`. This function does not presently do anything to the return dict, but will be used in future versions of Salt.

```
__salt__['pkg_resource.sort_pkglist'](ret)
```

`list_pkgs` returns a dictionary of installed packages, with the keys being the package names and the values being the version installed. Example return data:

```
{'foo': '1.2.3-4',
 'bar': '5.6.7-8'}
```

#### latest\_version

Accepts an arbitrary number of arguments. Each argument is a package name. The return value for a package will be an empty string if the package is not found or if the package is up-to-date. The only case in which a non-empty string is returned is if the package is available for new installation (i.e. not already installed) or if there is an upgrade available.

If only one argument was passed, this function return a string, otherwise a dict of name/version pairs is returned.

This function must also accept `**kwargs`, in order to receive the `fromrepo` and `repo` keyword arguments from *pkg* states. Where supported, these arguments should be used to find the install/upgrade candidate in the specified repository. The `fromrepo` kwarg takes precedence over `repo`, so if both of those kwargs are present, the repository

specified in `fromrepo` should be used. However, if `repo` is used instead of `fromrepo`, it should still work, to preserve backwards compatibility with older versions of Salt.

### version

Like `latest_version`, accepts an arbitrary number of arguments and returns a string if a single package name was passed, or a dict of name/value pairs if more than one was passed. The only difference is that the return values are the currently-installed versions of whatever packages are passed. If the package is not installed, an empty string is returned for that package.

### upgrade\_available

Deprecated and destined to be removed. For now, should just do the following:

```
return __salt__['pkg.latest_version'](name) != ''
```

### install

The following arguments are required and should default to None:

1. `name` (for single-package pkg states)
2. `pkgs` (for multiple-package pkg states)
3. `sources` (for binary package file installation)

The first thing that this function should do is call `pkg_resource.parse_targets` (see below). This function will convert the SLS input into a more easily parsed data structure. `pkg_resource.parse_targets` may need to be modified to support your new package provider, as it does things like parsing package metadata which cannot be done for every package management system.

```
pkg_params, pkg_type = __salt__['pkg_resource.parse_targets'](name,  
  pkgs,  
  sources)
```

Two values will be returned to the `install` function. The first of them will be a dictionary. The keys of this dictionary will be package names, though the values will differ depending on what kind of installation is being done:

- If `name` was provided (and `pkgs` was not), then there will be a single key in the dictionary, and its value will be `None`. Once the data has been returned, if the `version` keyword argument was provided, then it should replace the `None` value in the dictionary.
- If `pkgs` was provided, then `name` is ignored, and the dictionary will contain one entry for each package in the `pkgs` list. The values in the dictionary will be `None` if a version was not specified for the package, and the desired version if specified. See the **Multiple Package Installation Options** section of the `pkg.installed` state for more info.
- If `sources` was provided, then `name` is ignored, and the dictionary values will be the path/URI for the package.

The second return value will be a string with two possible values: `repository` or `file`. The `install` function can use this value (if necessary) to build the proper command to install the targeted package(s).

Both before and after the installing the target(s), you should run `list_pkgs` to obtain a list of the installed packages. You should then return the output of `salt.utils.compare_dicts()`

```
return salt.utils.compare_dicts(old, new)
```

### remove

Removes the passed package and return a list of the packages removed.

## 36.14.2 Package Repo Functions

There are some functions provided by `pkg` which are specific to package repositories, and not to packages themselves. When writing modules for new package managers, these functions should be made available as stated below, in order to provide compatibility with the `pkgrepo` state.

All repo functions should accept a `basedir` option, which defines which directory repository configuration should be found in. The default for this is dictated by the repo manager that is being used, and rarely needs to be changed.

```
basedir = '/etc/yum.repos.d'
__salt__['pkg.list_repos'](basedir)
```

### list\_repos

Lists the repositories that are currently configured on this system.

```
__salt__['pkg.list_repos']()
```

Returns a dictionary, in the following format:

```
{'reponame': 'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

### get\_repo

Displays all local configuration for a specific repository.

```
__salt__['pkg.get_repo'](repo='myrepo')
```

The information is formatted in much the same way as `list_repos`, but is specific to only one repo.

```
{'config_key_1': 'config value 1',
  'config_key_2': 'config value 2',
  'config_key_3': ['list item 1 (when appropriate)',
                  'list item 2 (when appropriate)]}
```

### del\_repo

Removes the local configuration for a specific repository. Requires a *repo* argument, which must match the locally configured name. This function returns a string, which informs the user as to whether or not the operation was a success.

```
__salt__['pkg.del_repo'](repo='myrepo')
```

### mod\_repo

Modify the local configuration for one or more option for a configured repo. This is also the way to create new repository configuration on the local system; if a repo is specified which does not yet exist, it will be created.

The options specified for this function are specific to the system; please refer to the documentation for your specific repo manager for specifics.

```
__salt__['pkg.mod_repo'](repo='myrepo', url='http://myurl.com/repo')
```

## 36.14.3 Low-Package Functions

In general, the standard package functions as describes above will meet your needs. These functions use the system's native repo manager (for instance, yum or the apt tools). In most cases, the repo manager is actually separate from the package manager. For instance, yum is usually a front-end for rpm, and apt is usually a front-end for dpkg. When possible, the package functions that use those package managers directly should do so through the low package functions.

It is normal and sane for `pkg` to make calls to `lowpkg`, but `lowpkg` must never make calls to `pkg`. This affects functions which are required by both `pkg` and `lowpkg`, but the technique in `pkg` is more performant than what is available to `lowpkg`. When this is the case, the `lowpkg` function that requires that technique must still use the `lowpkg` version.

### list\_pkgs

Returns a dict of packages installed, including the package name and version. Can accept a list of packages; if none are specified, then all installed packages will be listed.

```
installed = __salt__['lowpkg.list_pkgs']('foo', 'bar')
```

Example output:

```
{'foo': '1.2.3-4',  
'bar': '5.6.7-8'}
```

### verify

Many (but not all) package management systems provide a way to verify that the files installed by the package manager have or have not changed. This function accepts a list of packages; if none are specified, all packages will be included.

```
installed = __salt__['lowpkg.verify']('httpd')
```

Example output:

```
{'/etc/httpd/conf/httpd.conf': {'mismatch': ['size', 'md5sum', 'mtime'],
                                'type': 'config'}}
```

### file\_list

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_list']('httpd', 'apache')
```

This function does not return which files belong to which packages; all files are returned as one giant list (hence the *file\_list* function name. However, This information is still returned inside of a dict, so that it can provide any errors to the user in a sane manner.

```
{'errors': ['package apache is not installed'],
 'files': ['/etc/httpd',
           '/etc/httpd/conf',
           '/etc/httpd/conf.d',
           '...SNIP...']}
```

### file\_dict

Lists all of the files installed by all packages specified. If not packages are specified, then all files for all known packages are returned.

```
installed = __salt__['lowpkg.file_dict']('httpd', 'apache', 'kernel')
```

Unlike *file\_list*, this function will break down which files belong to which packages. It will also return errors in the same manner as *file\_list*.

```
{'errors': ['package apache is not installed'],
 'packages': {'httpd': ['/etc/httpd',
                       '/etc/httpd/conf',
                       '...SNIP...'],
              'kernel': ['/boot/vmlinuz-2.6.32-279.el6.x86_64.hmac',
                        '/boot/System.map-2.6.32-279.el6.x86_64',
                        '...SNIP...']}}
```

## 36.15 Reporting Bugs

Salt uses GitHub to track open issues and feature requests.

To file a bug, please navigate to the [new issue page](#) for the Salt project.

In an issue report, please include the following information:

- The output of `salt --versions-report` from the relevant machines. This can also be gathered remotely by using `salt <my_tgt> test.versions_report`.

- A description of the problem including steps taken to cause the issue to occur and the expected behaviour.
- Any steps taken to attempt to remediate the problem.
- Any configuration options set in a configuration file that may be relevant.
- A reproduceable test case. This may be as simple as an SLS file that illustrates a problem or it may be a link to a repository that contains a number of SLS files that can be used together to re-produce a problem. If the problem is transitory, any information that can be used to try and reproduce the problem is helpful.
- [Optional] The output of each salt component (master/minion/CLI) running with the `-ldebug` flag set.

---

**Note:** Please be certain to scrub any logs or SLS files for sensitive data!

---

## 36.16 Community Projects That Use Salt

Below is a list of repositories that show real world Salt applications that you can use to get started. Please note that these projects do not adhere to any standards and express a wide variety of ideas and opinions on how an action can be completed with Salt.

<https://github.com/terminalmage/djangocon2013-sls>

<https://github.com/jesusaurus/hpcs-salt-state>

<https://github.com/gravyboat/hungryadmin-sls>

<https://github.com/wunki/django-salted>

## 36.17 Salt Topology

Salt is based on a powerful, asynchronous, network topology using ZeroMQ. Many ZeroMQ systems are in place to enable communication. The central idea is to have the fastest communication possible.

### 36.17.1 Servers

The Salt Master runs 2 network services. First is the ZeroMQ PUB system. This service by default runs on port 4505 and can be configured via the `publish_port` option in the master configuration.

Second is the ZeroMQ REP system. This is a separate interface used for all bi-directional communication with minions. By default this system binds to port 4506 and can be configured via the `ret_port` option in the master.

### 36.17.2 PUB/SUB

The commands sent out via the salt client are broadcast out to the minions via ZeroMQ PUB/SUB. This is done by allowing the minions to maintain a connection back to the Salt Master and then all connections are informed to download the command data at once. The command data is kept extremely small (usually less than 1K) so it is not a burden on the network.

### 36.17.3 Return

The PUB/SUB system is a one way communication, so once a publish is sent out the PUB interface on the master has no further communication with the minion. The minion, after running the command, then sends the command's return data back to the master via the `ret_port`.

## 36.18 Translating Documentation

If you wish to help translate the Salt documentation to your language, please head over to the [Transifex](#) website and [signup](#) for an account.

Once registered, head over to the [Salt Translation Project](#), and either click on [Request Language](#) if you can't find yours, or, select the language for which you wish to contribute and click [Join Team](#).

[Transifex](#) provides some useful reading resources on their [support domain](#), namely, some useful articles directed to translators.

### 36.18.1 Building A Localized Version of the Documentation

While you're working on your translation on [Transifex](#), you might want to have a look at how it's rendering.

#### Install The Transifex Client

To interact with the [Transifex](#) web service you will need to install the `transifex-client`:

```
pip install transifex-client
```

#### Configure The Transifex Client

Once installed, you will need to set it up on your computer. We created a script to help you with that:

```
./scripts/setup-transifex-config
```

#### Download Remote Translations

There's a little script which simplifies the download process of the translations(which isn't that complicated in the first place). So, let's assume you're translating `pt_PT`, Portuguese(Portugal). To download the translations, execute from the `doc/` directory of your Salt checkout:

```
make download-translations SPHINXLANG=pt_PT
```

To download `pt_PT`, Portuguese(Portugal), and `nL`, Dutch, you can use the helper script directly:

```
./scripts/download-translation-catalog pt_PT nL
```

### Build Localized Documentation

After the download process finishes, which might take a while, the next step is to build a localized version of the documentation. Following the `pt_PT` example above:

```
make html SPHINXLANG=pt_PT
```

### View Localized Documentation

Open your browser, point it to the local documentation path and check the localized output you've just build.

## 36.19 Developing Salt Tutorial

This tutorial assumes you have: \* a web browser \* a GitHub account (`<my_account>`) \* a command line (CLI) \* git \* a text editor

### 36.19.1 Fork

In your browser, navigate to the `saltstack/salt` GitHub repository.

Click on Fork (<https://github.com/saltstack/salt/#fork-destination-box>).

---

**Note:** If you have more than one GitHub presence, for example if you are a member of a team, GitHub will ask you into which area to clone Salt. If you don't know where, then select your personal GitHub account.

---

### 36.19.2 Clone

In your CLI, navigate to the directory into which you want clone the Salt codebase and submit the following command:

```
$ git clone https://github.com/<my_account>/salt.git
```

where `<my_account>` is the name of your GitHub account. After the clone has completed, add SaltStack as a second remote and fetch any changes from `upstream`.

```
$ cd salt
$ git remote add upstream https://github.com/saltstack/salt.git
$ git fetch upstream
```

For this tutorial, we will be working off from the `develop` branch, which is the default branch for the SaltStack GitHub project. This branch needs to track `upstream/develop` so that we will get all upstream changes when they happen.

```
$ git checkout develop
$ git branch --set-upstream-to upstream/develop
```

### 36.19.3 Fetch

Fetch any upstream changes on the `develop` branch and sync them to your local copy of the branch with a single command:

```
$ git pull --rebase
```

**Note:** For an explanation on `pull vs pull --rebase` and other excellent points, see [this article](#) by Mislav Marohnić.

### 36.19.4 Branch

Now we are ready to get to work. Consult the [sprint beginner bug list](#) and select an execution module whose `__virtual__` function needs to be updated. I'll select the `alternatives` module.

Create a new branch off from `develop`. Be sure to name it something short and descriptive.

```
$ git checkout -b virt_ret
```

### 36.19.5 Edit

Edit the file you have selected, and verify that the changes are correct.

```
$ vim salt/modules/alternatives.py
$ git diff
diff --git a/salt/modules/alternatives.py b/salt/modules/alternatives.py
index 1653e5f..30c0a59 100644
--- a/salt/modules/alternatives.py
+++ b/salt/modules/alternatives.py
@@ -30,7 +30,7 @@ def __virtual__():
     """
     if os.path.isdir('/etc/alternatives'):
         return True
-    return False
+    return (False, 'Cannot load alternatives module: /etc/alternatives dir not found')

def _get_cmd():
```

### 36.19.6 Commit

Stage and commit the changes. Write a descriptive commit summary, but try to keep it less than 50 characters. Review your commit.

```
$ git add salt/modules/alternatives.py
$ git commit -m 'modules.alternatives: __virtual__ return err msg'
$ git show
```

---

**Note:** If you need more room to describe the changes in your commit, run `git commit` (without the `-m`, message, option) and you will be presented with an editor. The first line is the commit summary and should still be 50 characters or less. The following paragraphs you create are free form and will be preserved as part of the commit.

---

### 36.19.7 Push

Push your branch to your GitHub account. You will likely need to enter your GitHub username and password.

```
$ git push origin virt_ret
Username for 'https://github.com': <my_account>
Password for 'https://<my_account>@github.com':
```

---

**Note:** If authentication over https does not work, you can alternatively setup [ssh keys](#). Once you have done this, you may need add the keys to your git repository configuration

```
$ git config ssh.key ~/.ssh/<key_name>
```

where `<key_name>` is the file name of the private key you created.

---

### 36.19.8 Merge

In your browser, navigate to the [new pull request](#) page on the `saltstack/salt` GitHub repository and click on `compare across forks`. Select `<my_account>` from the list of head forks and the branch you are wanting to merge into `develop` (`virt_ret` in this case).

When you have finished reviewing the changes, click `Create pull request`.

If your pull request contains only a single commit, the title and comment will be taken from that commit's summary and message, otherwise the branch name is used for the title. Edit these fields as necessary and click `Create pull request`.

---

**Note:** Although these instructions seem to be the official pull request procedure on github's website, here are two alternative methods that are simpler.

- If you navigate to your clone of salt, `https://github.com/<my_account>/salt`, depending on how old your branch is or how recently you pushed updates on it, you may be presented with a button to create a pull request with your branch.
  - I find it easiest to edit the following URL:  
`https://github.com/saltstack/salt/compare/develop...<my_account>:virt_ret`
- 

### 36.19.9 Resources

GitHub offers many great tutorials on various aspects of the git- and GitHub-centric development workflow:

<https://help.github.com/>

There are many topics covered by the Salt Developer documentation:

<https://docs.saltstack.com/en/latest/topics/development/index.html>

The contributing documentation presents more details on specific contributing topics:

<https://docs.saltstack.com/en/latest/topics/development/contributing.html>

## 36.20 Salt's Test Suite

Salt comes with a powerful integration and unit test suite allowing for the fully automated run of integration and/or unit tests from a single interface.

To learn the basics of how Salt's test suite works, be sure to check out the *Salt's Test Suite: An Introduction* tutorial.

### 36.20.1 Test Directory Structure

Salt's test suite is located in the `tests` directory in the root of Salt's codebase. The test suite is divided into two main groups:

- Integration Tests
- Unit Tests

Within each of these groups, the directory structure roughly mirrors the structure of Salt's own codebase. Notice that there are directories for `states`, `modules`, `runners`, `output`, and more in each testing group.

The files that are housed in the `modules` directory of either the unit or the integration testing factions contain respective integration or unit test files for Salt execution modules.

#### Integration Tests

The Integration section of Salt's test suite start up a number of Salt daemons to test functionality in a live environment. These daemons include two Salt Masters, one Syndic, and two Minions. This allows the Syndic interface to be tested and Master/Minion communication to be verified. All of the integration tests are executed as live Salt commands sent through the started daemons.

Integration tests are particularly good at testing modules, states, and shell commands, among other segments of Salt's ecosystem. By utilizing the integration test daemons, integration tests are easy to write. They are also SaltStack's gerneally preferred method of adding new tests.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is beneficial in learning why you might want to write integration tests vs. unit tests. Both testing arenas add value to Salt's test suite and you should consider adding both types of tests if possible and appropriate when contributing to Salt.

- Integration Test Documentation

#### Unit Tests

Unit tests do not spin up any Salt daemons, but instead find their value in testing singular implementations of individual functions. Instead of testing against specific interactions, unit tests should be used to test a function's logic as well as any `return` or `raises` statements. Unit tests also rely heavily on mocking external resources.

The discussion in the *Integration vs. Unit* section of the *testing tutorial* is useful in determining when you should consider writing unit tests instead of, or in addition to, integration tests when contributing to Salt.

- Unit Test Documentation

## 36.20.2 Running The Tests

There are requirements, in addition to Salt's requirements, which need to be installed in order to run the test suite. Install one of the lines below, depending on the relevant Python version:

```
pip install -r requirements/dev_python26.txt
pip install -r requirements/dev_python27.txt
```

**Note:** In Salt 0.17, testing libraries were migrated into their own repo. To install them:

```
pip install git+https://github.com/saltstack/salt-testing.git#egg=SaltTesting
```

Failure to install SaltTesting will result in import errors similar to the following:

```
ImportError: No module named salttesting
```

Once all requirements are installed, use `tests/runtests.py` to run all of the tests included in Salt's test suite:

```
python tests/runtests.py
```

For more information about options you can pass the test runner, see the `--help` option:

```
python tests/runtests.py --help
```

An alternative way of invoking the test suite is available in `setup.py`:

```
./setup.py test
```

### Running Test Subsections

Instead of running the entire test suite all at once, which can take a long time, there are several ways to run only specific groups of tests or individual tests:

- Run unit tests only: `./tests/runtests.py --unit-tests`
- Run unit and integration tests for states: `./tests/runtests.py --state`
- Run integration tests for an individual module: `./tests/runtests.py -n integration.modules.virt`
- Run unit tests for an individual module: `./tests/runtests.py -n unit.modules.virt_test`
- Run an individual test by using the class and test name (this example is for the `test_default_kvm_profile` test in the `integration.module.virt`): `./tests/runtests.py -n integration.module.virt.VirtTest.test_default_kvm_profile`

For more specific examples of how to run various test subsections or individual tests, please see the [Test Selection Options](#) documentation or the [Running Specific Tests](#) section of the *Salt's Test Suite: An Introduction* tutorial.

## Running Unit Tests Without Integration Test Daemons

Since the unit tests do not require a master or minion to execute, it is often useful to be able to run unit tests individually, or as a whole group, without having to start up the integration testing daemons. Starting up the master, minion, and syndic daemons takes a lot of time before the tests can even start running and is unnecessary to run unit tests. To run unit tests without invoking the integration test daemons, simply remove the `/tests` portion of the `runtests.py` command:

```
./runtests.py --unit
```

All of the other options to run individual tests, entire classes of tests, or entire test modules still apply.

## Running Destructive Integration Tests

Salt is used to change the settings and behavior of systems. In order to effectively test Salt's functionality, some integration tests are written to make actual changes to the underlying system. These tests are referred to as "destructive tests". Some examples of destructive tests are changes may be testing the addition of a user or installing packages. By default, destructive tests are disabled and will be skipped.

Generally, destructive tests should clean up after themselves by attempting to restore the system to its original state. For instance, if a new user is created during a test, the user should be deleted after the related test(s) have completed. However, no guarantees are made that test clean-up will complete successfully. Therefore, running destructive tests should be done with caution.

---

**Note:** Running destructive tests will change the underlying system. Use caution when running destructive tests.

---

To run tests marked as destructive, set the `--run-destructive` flag:

```
./tests/runtests.py --run-destructive
```

## Running Cloud Provider Tests

Salt's testing suite also includes integration tests to assess the successful creation and deletion of cloud instances using *Salt-Cloud* for providers supported by Salt-Cloud.

The cloud provider tests are off by default and run on sample configuration files provided in `tests/integration/files/conf/cloud.providers.d/`. In order to run the cloud provider tests, valid credentials, which differ per provider, must be supplied. Each credential item that must be supplied is indicated by an empty string value and should be edited by the user before running the tests. For example, DigitalOcean requires a client key and an api key to operate. Therefore, the default cloud provider configuration file for DigitalOcean looks like this:

```
digitalocean-config:
  driver: digital_ocean
  client_key: ''
  api_key: ''
  location: New York 1
```

As indicated by the empty string values, the `client_key` and the `api_key` must be provided:

```
digitalocean-config:
  driver: digital_ocean
  client_key: wFGEwgregeqw3435gDger
```

```
api_key: GDE43t43REGTrkilg43934t34qT43t4dgegerGEgg
location: New York 1
```

**Note:** When providing credential information in cloud provider configuration files, do not include the single quotes.

Once all of the valid credentials for the cloud provider have been supplied, the cloud provider tests can be run by setting the `--cloud-provider-tests` flag:

```
./tests/runtests.py --cloud-provider-tests
```

### Running The Tests In A Docker Container

The test suite can be executed under a `docker` container using the `--docked` option flag. The `docker` container must be properly configured on the system invoking the tests and the container must have access to the internet.

Here's a simple usage example:

```
tests/runtests.py --docked=ubuntu-12.04 -v
```

The full `docker` container repository can also be provided:

```
tests/runtests.py --docked=salttest/ubuntu-12.04 -v
```

The SaltStack team is creating some containers which will have the necessary dependencies pre-installed. Running the test suite on a container allows destructive tests to run without making changes to the main system. It also enables the test suite to run under a different distribution than the one the main system is currently using.

The current list of test suite images is on Salt's [docker repository](#).

Custom `docker` containers can be provided by submitting a pull request against Salt's [docker Salt test containers repository](#).

### 36.20.3 Automated Test Runs

SaltStack maintains a Jenkins server to allow for the execution of tests across supported platforms. The tests executed from Salt's Jenkins server create fresh virtual machines for each test run, then execute destructive tests on the new, clean virtual machine.

SaltStack's Jenkins server continuously runs the entire test suite, including destructive tests, on an array of various supported operating systems throughout the day. Each actively supported branch of Salt's repository runs the tests located in the respective branch's code. Each set of branch tests also includes a pylint run. These branch tests help ensure the viability of Salt code at any given point in time as pull requests are merged into branches throughout the day.

In addition to branch tests, SaltStack's Jenkins server also runs tests on pull requests. These pull request tests include a smaller set of virtual machines that run on the branch tests. The pull request tests, like the branch tests, include a pylint test as well.

When a pull request is submitted to Salt's repository on GitHub, the suite of pull request tests are started by Jenkins. These tests are used to gauge the pull request's viability to merge into Salt's codebase. If these initial tests pass, the pull request can then be merged into the Salt branch by one of Salt's core developers, pending their discretion. If the initial tests fail, core developers may request changes to the pull request. If the failure is unrelated to the changes in question, core developers may merge the pull request despite the initial failure.

As soon as the pull request is merged, the changes will be added to the next branch test run on Jenkins.

For a full list of currently running test environments, go to <http://jenkins.saltstack.com>.

### Using Salt-Cloud on Jenkins

For testing Salt on Jenkins, SaltStack uses *Salt-Cloud* to spin up virtual machines. The script using Salt-Cloud to accomplish this is open source and can be found here: <https://github.com/saltstack/salt/blob/develop/tests/jenkins.py>

### 36.20.4 Writing Tests

The salt testing infrastructure is divided into two classes of tests, integration tests and unit tests. These terms may be defined differently in other contexts, but for Salt they are defined this way:

- Unit Test: Tests which validate isolated code blocks and do not require external interfaces such as `salt-call` or any of the salt daemons.
- Integration Test: Tests which validate externally accessible features.

Salt testing uses unittest2 from the python standard library and MagicMock.

- Writing integration tests
- Writing unit tests

### Naming Conventions

Any function in either integration test files or unit test files that is doing the actual testing, such as functions containing assertions, must start with `test_`:

```
def test_user_present(self):
```

When functions in test files are not prepended with `test_`, the function acts as a normal, helper function and is not run as a test by the test suite.

### Submitting New Tests

Which branch of the Salt codebase should new tests be written against? The location of where new tests should be submitted depends largely on the reason you're writing the tests.

### Tests for New Features

If you are adding new functionality to Salt, please write the tests for this new feature in the same pull request as the new feature. New features should always be submitted to the `develop` branch.

If you have already submitted the new feature, but did not write tests in the original pull request that has already been merged, please feel free to submit a new pull request containing tests. If the feature was recently added to Salt's `develop` branch, then the tests should be added there as well. However, if the feature was added to `develop` some time ago and is already present in one or more release branches, please refer to the *Tests for Entire Files or Functions* section below for more details about where to submit tests for functions or files that do not already have tests.

### Tests to Accompany a Bugfix

If you are writing tests for code that fixes a bug in Salt, please write the test in the same pull request as the bugfix. If you're unsure of where to submit your bugfix and accompanying test, please review the *Which Salt Branch?* documentation in Salt's *Contributing* guide.

### Tests for Entire Files or Functions

Sometimes entire files in Salt are completely untested. If you are writing tests for a file that doesn't have any tests written for it, write your test against the earliest supported release branch that contains the file or function you're testing.

Once your tests are submitted in a pull request and is merged into the branch in question, the tests you wrote will be merged-forward by SaltStack core engineers and the new tests will propagate to the newer release branches. That way the tests you wrote will apply to all current and relevant release branches, and not just the `develop` branch, for example. This methodology will help protect against regressions on older files in Salt's codebase.

There may be times when the tests you write against an older branch fail in the merge-forward process because functionality has changed in newer release branches. In these cases, a Salt core developer may reach out to you for advice on the tests in question if the path forward is unclear.

---

**Note:** If tests are written against a file in an older release branch and then merged forward, there may be new functionality in the file that is present in the new release branch that is untested. It would be wise to see if new functionality could use additional testing once the test file has propagated to newer release branches.

---

## 36.21 raet

# RAET # Reliable Asynchronous Event Transport Protocol

See also:

[RAET Overview](#)

### 36.21.1 Protocol

Layering:

OSI Layers

7: Application: Format: Data (Stack to Application interface buffering etc) 6: Presentation: Format: Data (Encrypt-Decrypt convert to machine independent format) 5: Session: Format: Data (Interhost communications. Authentication. Groups) 4: Transport: Format: Segments (Reliable delivery of Message, Transactions, Segmentation, Error checking) 3: Network: Format: Packets/Datagrams (Addressing Routing) 2: Link: Format: Frames ( Reliable per frame communications connection, Media access controller ) 1: Physical: Bits (Transceiver communication connection not reliable)

Link is hidden from Raet Network is IP host address and Udp Port Transport is Raet transactions, service kind, tail error checking, Could include header signing as part of transport reliable delivery serialization of header Session is session id key exchange for signing. Grouping is Road (like 852 channel) Presentation is Encrypt Decrypt body Serialize Deserialize Body Application is body data dictionary

Header signing spans both the Transport and Session layers.

### 36.21.2 Header

JSON Header (Tradeoff some processing speed for extensibility, ease of use, readability)

Body initially JSON but support for ``packed" binary body

### 36.21.3 Packet

Header ASCII Safe JSON Header termination: Empty line given by double pair of carriage return linefeed /r/n/r/n  
10 13 10 13 ADAD 1010 1101 1010 1101

In json carriage return and newline characters cannot appear in a json encoded string unless they are escaped with backslash, so the 4 byte combination is illegal in valid json that does not have multi-byte unicode characters.

These means the header must be ascii safe so no multibyte utf-8 strings allowed in header.

Following Header Terminator is variable length signature block. This is binary and the length is provided in the header.

Following the signature block is the packet body or data. This may either be JSON or packed binary. The format is given in the json header

Finally is an optional tail block for error checking or encryption details

### 36.21.4 Header Fields

In UDP header

sh = source host sp = source port dh = destination host dp = destination port

In RAET Header

hk = header kind hl = header length

vn = version number

sd = Source Device ID dd = Destination Device ID cf = Corresponder Flag mf = Multicast Flag

si = Session ID ti = Transaction ID

sk = Service Kind pk = Packet Kind bf = Burst Flag (Send all Segments or Ordered packets without interleaved acks)

oi = Order Index dt = DateTime Stamp

sn = Segment Number sc = Segment Count

pf = Pending Segment Flag af = All Flag (Resent all Segments not just one)

nk = Auth header kind nl = Auth header length

bk = body kind bl = body length

tk = tail kind tl = tail length

**fg = flags packed (Flags) Default `00' hex string** 2 byte Hex string with bits (0, 0, af, pf, 0, bf, mf, cf) Zeros are TBD flags

### 36.21.5 Session Bootstrap

Minion sends packet with SID of Zero with public key of minions Public Private Key pair Master acks packet with SID of Zero to let minion know it received the request

Some time later Master sends packet with SID of zero that accepts the Minion

Minion

### 36.21.6 Session

Session is important for security. Want one session opened and then multiple transactions within session.

Session ID SID sid

GUID hash to guarantee uniqueness since no guarantee of nonvolatile storage or require file storage to keep last session ID used.

### 36.21.7 Service Types or Modular Services

Four Service Types

1. One or more maybe (unacknowledged repeat) maybe means no guarantee
2. **Exactly one at most (ack with retries) (duplicate detection idempotent)** at most means fixed number of retries has finite probability of failing B1) finite retries B2) infinite retries with exponential back-off up to a maximum delay
3. **Exactly one of sequence at most (sequence numbered)** Receiver requests retry of missing packet with same B1 or B2 retry type
4. **End to End (Application layer Request Response)** This is two B sub transactions

Initially unicast messaging Eventually support for Multicast

The use case for C) is to fragment large packets as once a UDP packet exceeds the frame size its reliability goes way down So its more reliable to fragment large packets.

Better approach might be to have more modularity. Services Levels

1. **Maybe one or more**
  - (a) **Fire and forget** no transaction either side
  - (b) **Repeat, no ack, no dupdet** repeat counter send side, no transaction on receive side
  - (c) **Repeat, no Ack, dupdet** repeat counter send side, dup detection transaction receive side
2. **More or Less Once**
  - (a) **retry finite, ack no dupdet** retry timer send side, finite number of retries ack receive side no dupdet
3. **At most Once**
  - (a) **retry finite, ack, dupdet** retry timer send side, finite number of retries ack receive side dupdet
4. **Exactly once**
  - (a) **ack retry** retry timer send side, ack and duplicate detection receive side Infinite retries with exponential backoff
5. **Sequential sequence number**

- (a) reorder escrow
- (b) Segmented packets

6. request response to application layer

#### Service Features

1. repeats
2. ack retry transaction id
3. sequence number duplicate detection out of order detection sequencing
4. rep-req

Always include transaction id since multiple transactions on same port So get duplicate detection for free if keep transaction alive but if use

A) Maybe one or more B1) At Least One B2) Exactly One C) One of sequence D) End to End

A) Sender creates transaction id for number of repeats but receiver does not keep transaction alive

B1) Sender creates transaction id keeps it for retries. Receiver keeps it to send ack then kills so retry could be duplicate not detected

B2) Sender creates transaction id keeps for retries Receiver keeps tid for acks on any retries so no duplicates.

C) Sender creates TID and Sequence Number. Receiver checks for out of order sequence and can request retry.

D) Application layer sends response. So question is do we keep transaction open or have response be new transaction. No because then we need a rep-req ID so might as well use the same transaction id. Just keep alive until get response.

Little advantage to B1 vs B2 not having duplicates.

So 4 service types

1. Maybe one or more (unacknowledged repeat)
2. Exactly One (At most one) (ack with retry) (duplicate detection idempotent)
3. One of Sequence (sequence numbered)
4. End to End

Also multicast or unicast

#### Modular Transaction Table

**Sender Side:** Transaction ID plus transaction source sender or receiver generated transaction id Repeat Counter Retry Timer Retry Counter (finite retries) Redo Timer (infinite redos with exponential backoff) Sequence number without acks (look for resend requests) Sequence with ack (wait for ack before sending next in sequence) Segmentation

**Receiver Side:** Nothing just accept packet Acknowledge (can delete transaction after acknowledge) No duplicate detection Transaction timeout (keep transaction until timeout) Duplicate detection save transaction id duplicate detection timeout Request resend of missing packet in sequence Sequence reordering with escrow timeout wait escrow before requesting resend Unsegmentation (request resends of missing segment)

## 36.22 SaltStack Git Policy

The SaltStack team follows a git policy to maintain stability and consistency with the repository.

The git policy has been developed to encourage contributions and make contributing to Salt as easy as possible. Code contributors to SaltStack projects DO NOT NEED TO READ THIS DOCUMENT, because all contributions come into SaltStack via a single gateway to make it as easy as possible for contributors to give us code.

The primary rule of git management in SaltStack is to make life easy on contributors and developers to send in code. Simplicity is always a goal!

### 36.22.1 New Code Entry

All new SaltStack code is posted to the *develop* branch, which is the single point of entry. The only exception is when a bugfix cannot be cleanly merged into a release branch and the bugfix needs to be rewritten for the release branch.

### 36.22.2 Release Branching

SaltStack maintains two types of releases, *Feature Releases* and *Point Releases*. A feature release is managed by incrementing the first or second release point number, so 0.10.5 -> 0.11.0 signifies a feature release and 0.11.0 -> 0.11.1 signifies a point release, also a hypothetical 0.42.7 -> 1.0.0 would also signify a feature release.

#### Feature Release Branching

Each feature release is maintained in a dedicated git branch derived from the last applicable release commit on develop. All file changes relevant to the feature release will be completed in the develop branch prior to the creation of the feature release branch. The feature release branch will be named after the relevant numbers to the feature release, which constitute the first two numbers. This means that the release branch for the 0.11.0 series is named 0.11.

A feature release branch is created with the following command:

```
# git checkout -b 0.11 # From the develop branch
# git push origin 0.11
```

#### Point Releases

Each point release is derived from its parent release branch. Constructing point releases is a critical aspect of Salt development and is managed by members of the core development team. Point releases comprise bug and security fixes which are cherry picked from develop onto the aforementioned release branch. At the time when a core developer accepts a pull request a determination needs to be made if the commits in the pull request need to be backported to the release branch. Some simple criteria are used to make this determination:

- Is this commit fixing a bug? Backport
- Does this commit change or add new features in any way? Don't backport
- Is this a PEP8 or code cleanup commit? Don't backport
- Does this commit fix a security issue? Backport

Determining when a point release is going to be made is up to the project leader (Thomas Hatch). Generally point releases are made every 1-2 weeks or if there is a security fix they can be made sooner.

The point release is only designated by tagging the commit on the release branch with release number using the existing convention (version 0.11.1 is tagged with v0.11.1). From the tag point a new source tarball is generated and published to PyPI, and a release announcement is made.

## 36.23 Salt Conventions

### 36.23.1 Writing Salt Documentation

Salt's documentation is built using the [Sphinx](#) documentation system. It can be built in a large variety of output formats including HTML, PDF, ePub, and manpage.

All the documentation is contained in the main Salt repository. Speaking broadly, most of the narrative documentation is contained within the <https://github.com/saltstack/salt/blob/develop/doc> subdirectory and most of the reference and API documentation is written inline with Salt's Python code and extracted using a Sphinx extension.

#### Style

The Salt project recommends the [IEEE style guide](#) as a general reference for writing guidelines. Those guidelines are not strictly enforced but rather serve as an excellent resource for technical writing questions. The [NCBI style guide](#) is another very approachable resource.

#### Point-of-view

Use third-person perspective and avoid ``I'', ``we'', ``you'' forms of address. Identify the addressee specifically e.g., ``users should'', ``the compiler does'', etc.

#### Active voice

Use active voice and present-tense. Avoid filler words.

#### Title capitalization

Document titles and section titles within a page should follow normal sentence capitalization rules. Words that are capitalized as part of a regular sentence should be capitalized in a title and otherwise left as lowercase. Punctuation can be omitted unless it aids the intent of the title (e.g., exclamation points or question marks).

For example:

**This is a main heading**

=====

Paragraph.

**This is an exciting sub-heading!**

-----

Paragraph.

#### Serial Commas

According to Wikipedia: In English punctuation, a serial comma or series comma (also called Oxford comma and Harvard comma) is a comma placed immediately before the coordinating conjunction (usually ``and'', ``or'', or ``nor'') in a series of three or more terms. For example, a list of three countries might be punctuated either as ``France, Italy, and Spain'' (with the serial comma), or as ``France, Italy and Spain'' (without the serial comma)."

When writing a list that includes three or more items, the serial comma should always be used.

## Documenting modules

Documentation for Salt's various module types is inline in the code. During the documentation build process it is extracted and formatted into the final HTML, PDF, etc format.

### Inline documentation

Python has special multi-line strings called docstrings as the first element in a function or class. These strings allow documentation to live alongside the code and can contain special formatting. For example:

```
def my_function(value):
    """
    Upper-case the given value

    Usage:

    .. code-block:: python

        val = 'a string'
        new_val = myfunction(val)
        print(new_val) # 'A STRING'

    :param value: a string
    :return: a copy of ``value`` that has been upper-cased
    """
    return value.upper()
```

### Specify a release for additions or changes

New functions or changes to existing functions should include a marker that denotes what Salt release will be affected. For example:

```
def my_function(value):
    """
    Upper-case the given value

    .. versionadded:: 2014.7.0

    <...snip...>
    """
    return value.upper()
```

For changes to a function:

```
def my_function(value, strip=False):
    """
    Upper-case the given value

    .. versionchanged:: Boron
       Added a flag to also strip whitespace from the string.
    """
```

```
<...snip...>
'''
if strip:
    return value.upper().strip()
return value.upper()
```

### Adding module documentation to the index

Each module type has an index listing all modules of that type. For example: `all-salt.modules`, *Full list of builtin state modules*, *Full list of builtin renderer modules*. New modules must be added to the index manually.

1. Edit the file for the module type: `execution modules`, `state modules`, `renderer modules`, etc.
2. Add the new module to the alphabetized list.
3. *Build the documentation* which will generate an `.rst` file for the new module in the same directory as the `index.rst`.
4. Commit the changes to `index.rst` and the new `.rst` file and send a pull request.

### Cross-references

The Sphinx documentation system contains a wide variety of cross-referencing capabilities.

#### Glossary entries

Link to [glossary entries](#) using the `term` role. A cross-reference should be added the first time a Salt-specific term is used in a document.

```
A common way to encapsulate master-side functionality is by writing a
custom :term:`Runner Function`. Custom Runner Functions are easy to write.
```

#### Index entries

Sphinx automatically generates many kinds of index entries, but it is occasionally useful to manually add items to the index.

One method is to use the `index directive` above the document or section that should appear in the index.

```
.. index:: ! Event, event bus, event system
   see: Reactor; Event
```

Another method is to use the `index role` inline with the text that should appear in the index. The index entry is created and the target text is left otherwise intact.

```
Information about the :index:`Salt Reactor`
-----
```

```
Paragraph.
```

## Documents and sections

Each document should contain a unique top-level label of the form:

```
.. _my-page:  
  
My page  
=====  
  
Paragraph.
```

Unique labels can be linked using the `ref` role. This allows cross-references to survive document renames or movement.

```
For more information see :ref:`my-page`.
```

Note, the `:doc:` role should *not* be used to link documents together.

## Modules

Cross-references to Salt modules can be added using Sphinx's Python domain roles. For example, to create a link to the `test.ping` function:

```
A useful execution module to test active communication with a minion is the  
:py:func:`test.ping <salt.modules.test.ping>` function.
```

Salt modules can be referenced as well:

```
The :py:mod:`test module <salt.modules.test>` contains many useful  
functions for inspecting an active Salt connection.
```

The same syntax works for all modules types:

```
One of the workhorse state module functions in Salt is the  
:py:func:`file.managed <salt.states.file.managed>` function.
```

## Settings

Individual settings in the Salt Master or Salt Minion configuration files are cross-referenced using two custom roles, `conf_master`, and `conf_minion`.

```
The :conf_minion:`minion ID <id>` setting is a unique identifier for a  
single minion.
```

## Documentation Changes and Fixes

Documentation changes and fixes should be made against the earliest supported release branch that the update applies to. The practice of updating a release branch instead of making all documentation changes against Salt's main, default branch, `develop`, is necessary in order for the docs to be as up-to-date as possible when the docs are built.

The workflow mentioned above is also in line with the recommendations outlined in Salt's *Contributing* page. You can read more about how to choose where to submit documentation fixes by reading the *Which Salt branch?* section.

For an explanation of how to submit changes against various branches, see the *Sending a GitHub pull request* section. Specifically, see the section describing how to Create a new branch and the steps that follow.

### Building the documentation

1. Install Sphinx using a system package manager or pip. The package name is often of the form `python-sphinx`. There are no other dependencies.
2. Build the documentation using the provided Makefile or `.bat` file on Windows.

```
cd /path/to/salt/doc
make html
```

3. The generated documentation will be written to the `doc/_build/<format>` directory.
4. A useful method of viewing the HTML documentation locally is to start Python's built-in HTTP server:

```
cd /path/to/salt/doc/_build/html
python -m SimpleHTTPServer
```

Then pull up the documentation in a web browser at <http://localhost:8000/>.

### 36.23.2 Salt Formulas

Formulas are pre-written Salt States. They are as open-ended as Salt States themselves and can be used for tasks such as installing a package, configuring, and starting a service, setting up users or permissions, and many other common tasks.

All official Salt Formulas are found as separate Git repositories in the ```saltstack-formulas``` organization on GitHub:

<https://github.com/saltstack-formulas>

As a simple example, to install the popular Apache web server (using the normal defaults for the underlying distro) simply include the `apache-formula` from a top file:

```
base:
  'web*':
    - apache
```

### Installation

Each Salt Formula is an individual Git repository designed as a drop-in addition to an existing Salt State tree. Formulas can be installed in the following ways.

#### Adding a Formula as a GitFS remote

One design goal of Salt's GitFS fileserver backend was to facilitate reusable States. GitFS is a quick and natural way to use Formulas.

1. *Install and configure GitFS.*

2. Add one or more Formula repository URLs as remotes in the `gitfs_remotes` list in the Salt Master configuration file:

```
gitfs_remotes:
- https://github.com/saltstack-formulas/apache-formula
- https://github.com/saltstack-formulas/memcached-formula
```

We strongly recommend forking a formula repository into your own GitHub account to avoid unexpected changes to your infrastructure.

Many Salt Formulas are highly active repositories so pull new changes with care. Plus any additions you make to your fork can be easily sent back upstream with a quick pull request!

3. Restart the Salt master.

### Adding a Formula directory manually

Formulas are simply directories that can be copied onto the local file system by using Git to clone the repository or by downloading and expanding a tarball or zip file of the repository. The directory structure is designed to work with `file_roots` in the Salt master configuration.

1. Clone or download the repository into a directory:

```
mkdir -p /srv/formulas
cd /srv/formulas
git clone https://github.com/saltstack-formulas/apache-formula.git

# or

mkdir -p /srv/formulas
cd /srv/formulas
wget https://github.com/saltstack-formulas/apache-formula/archive/master.tar.gz
tar xf apache-formula-master.tar.gz
```

2. Add the new directory to `file_roots`:

```
file_roots:
  base:
    - /srv/salt
    - /srv/formulas/apache-formula
```

3. Restart the Salt Master.

### Usage

Each Formula is intended to be immediately usable with sane defaults without any additional configuration. Many formulas are also configurable by including data in Pillar; see the `pillar.example` file in each Formula repository for available options.

### Including a Formula in an existing State tree

Formula may be included in an existing `sls` file. This is often useful when a state you are writing needs to require or extend a state defined in the formula.

Here is an example of a state that uses the `epel-formula` in a `require` declaration which directs Salt to not install the `python26` package until after the EPEL repository has also been installed:

```
include:
  - epel

python26:
  pkg.installed:
    - require:
      - pkg: epel
```

### Including a Formula from a Top File

Some Formula perform completely standalone installations that are not referenced from other state files. It is usually cleanest to include these Formula directly from a Top File.

For example the easiest way to set up an OpenStack deployment on a single machine is to include the `openstack-standalone-formula` directly from a `top.sls` file:

```
base:
  'myopenstackmaster':
    - openstack
```

Quickly deploying OpenStack across several dedicated machines could also be done directly from a Top File and may look something like this:

```
base:
  'controller':
    - openstack.horizon
    - openstack.keystone
  'hyper-*':
    - openstack.nova
    - openstack.glance
  'storage-*':
    - openstack.swift
```

### Configuring Formula using Pillar

Salt Formulas are designed to work out of the box with no additional configuration. However, many Formula support additional configuration and customization through *Pillar*. Examples of available options can be found in a file named `pillar.example` in the root directory of each Formula repository.

### Using Formula with your own states

Remember that Formula are regular Salt States and can be used with all Salt's normal state mechanisms. Formula can be required from other States with *require* declarations, they can be modified using *extend*, they can be made to watch other states with *The \_in versions of requisites*.

The following example uses the stock `apache-formula` alongside a custom state to create a vhost on a Debian/Ubuntu system and to reload the Apache service whenever the vhost is changed.

```
# Include the stock, upstream apache formula.
include:
  - apache

# Use the watch_in requisite to cause the apache service state to reload
# apache whenever the my-example-com-vhost state changes.
my-example-com-vhost:
  file:
    - managed
    - name: /etc/apache2/sites-available/my-example-com
    - watch_in:
      - service: apache
```

Don't be shy to read through the source for each Formula!

### Reporting problems & making additions

Each Formula is a separate repository on GitHub. If you encounter a bug with a Formula please file an issue in the respective repository! Send fixes and additions as a pull request. Add tips and tricks to the repository wiki.

### Writing Formulas

Each Formula is a separate repository in the [saltstack-formulas](#) organization on GitHub.

---

**Note:** Get involved creating new Formulas

The best way to create new Formula repositories for now is to create a repository in your own account on GitHub and notify a SaltStack employee when it is ready. We will add you to the contributors team on the [saltstack-formulas](#) organization and help you transfer the repository over. Ping a SaltStack employee on IRC ([#salt](#) on Freenode) or send an email to the [salt-users](#) mailing list.

There are a lot of repositories in that organization! Team members can manage which repositories they are subscribed to on GitHub's watching page: <https://github.com/watching>.

---

### Style

Maintainability, readability, and reusability are all marks of a good Salt sls file. This section contains several suggestions and examples.

```
# Deploy the stable master branch unless version overridden by passing
# Pillar at the CLI or via the Reactor.

deploy_myapp:
  git.latest:
    - name: git@github.com/myco/myapp.git
    - version: {{ salt.pillar.get('myapp:version', 'master') }}
```

**Use a descriptive State ID** The ID of a state is used as a unique identifier that may be referenced via other states in *requisites*. It must be unique across the whole state tree (*it is a key in a dictionary*, after all).

In addition a state ID should be descriptive and serve as a high-level hint of what it will do, or manage, or change. For example, `deploy_webapp`, or `apache`, or `reload_firewall`.

Use **module.function** notation So-called ``short-declaration" notation is preferred for referencing state modules and state functions. It provides a consistent pattern of `module.function` shared between Salt States, the Reactor, Salt Mine, the Scheduler, as well as with the CLI.

```
# Do
apache:
  pkg.installed:
    - name: httpd

# Don't
apache:
  pkg:
    - installed
    - name: httpd
```

Salt's state compiler will transform ``short-decs" into the longer format *when compiling the human-friendly highstate structure into the machine-friendly lowstate structure*.

**Specify the name parameter** Use a unique and permanent identifier for the state ID and reserve `name` for data with variability.

The *name declaration* is a required parameter for all state functions. The state ID will implicitly be used as name if it is not explicitly set in the state.

In many state functions the `name` parameter is used for data that varies such as OS-specific package names, OS-specific file system paths, repository addresses, etc. Any time the ID of a state changes all references to that ID must also be changed. Use a permanent ID when writing a state the first time to future-proof that state and allow for easier refactors down the road.

**Comment state files** YAML allows comments at varying indentation levels. It is a good practice to comment state files. Use vertical whitespace to visually separate different concepts or actions.

```
# Start with a high-level description of the current sls file.
# Explain the scope of what it will do or manage.

# Comment individual states as necessary.
update_a_config_file:
  # Provide details on why an unusual choice was made. For example:
  #
  # This template is fetched from a third-party and does not fit our
  # company norm of using Jinja. This must be processed using Mako.
  file.managed:
    - name: /path/to/file.cfg
    - source: salt://path/to/file.cfg.template
    - template: mako

  # Provide a description or explanation that did not fit within the state
  # ID. For example:
  #
  # Update the application's last-deployed timestamp.
  # This is a workaround until Bob configures Jenkins to automate RPM
  # builds of the app.
  cmd.run:
    # FIXME: Joe needs this to run on Windows by next quarter. Switch these
    # from shell commands to Salt's file.managed and file.replace state
    # modules.
```

```

- name: |
    touch /path/to/file_last_updated
    sed -e 's/foo/bar/g' /path/to/file_environment
- onchanges:
  - file: a_config_file

```

Be careful to use Jinja comments for commenting Jinja code and YAML comments for commenting YAML code.

```

# BAD EXAMPLE
# The Jinja in this YAML comment is still executed!
# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %}

# GOOD EXAMPLE
# The Jinja in this Jinja comment will not be executed.
{# {% set apache_is_installed = 'apache' in salt.pkg.list_pkgs() %} #}

```

### Easy on the Jinja!

Jinja templating provides vast flexibility and power when building Salt sls files. It can also create an unmaintainable tangle of logic and data. Speaking broadly, Jinja is best used when kept apart from the states (as much as is possible).

Below are guidelines and examples of how Jinja can be used effectively.

**Know the evaluation and execution order** High-level knowledge of how Salt states are compiled and run is useful when writing states.

The default *renderer* setting in Salt is Jinja piped to YAML. Each is a separate step. Each step is not aware of the previous or following step. Jinja is not YAML aware, YAML is not Jinja aware; they cannot share variables or interact.

- Whatever the Jinja step produces must be valid YAML.
- Whatever the YAML step produces must be a valid *highstate data structure*. (This is also true of the final step for *any of the alternate renderers* in Salt.)
- Highstate can be thought of as a human-friendly data structure; easy to write and easy to read.
- Salt's state compiler validates the *highstate* and compiles it to low state.
- Low state can be thought of as a machine-friendly data structure. It is a list of dictionaries that each map directly to a function call.
- Salt's state system finally starts and executes on each "chunk" in the low state. Remember that requisites are evaluated at runtime.
- The return for each function call is added to the "running" dictionary which is the final output at the end of the state run.

The full evaluation and execution order:

```
Jinja -> YAML -> Highstate -> low state -> execution
```

**Avoid changing the underlying system with Jinja** Avoid calling commands from Jinja that change the underlying system. Commands run via Jinja do not respect Salt's dry-run mode (`test=True`)! This is usually in conflict with the idempotent nature of Salt states unless the command being run is also idempotent.

**Inspect the local system** A common use for Jinja in Salt states is to gather information about the underlying system. The `grains` dictionary available in the Jinja context is a great example of common data points that Salt itself has already gathered. Less common values are often found by running commands. For example:

```
{% set is_selinux_enabled = salt.cmd.run('sestatus') == '1' %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

**Gather external data** One of the most common uses for Jinja is to pull external data into the state file. External data can come from anywhere like API calls or database queries, but it most commonly comes from flat files on the file system or Pillar data from the Salt Master. For example:

```
{% set some_data = salt.pillar.get('some_data', {'sane default': True}) %}
{# or #}
{% import_yaml 'path/to/file.yaml' as some_data %}
{# or #}
{% import_json 'path/to/file.json' as some_data %}
{# or #}
{% import_text 'path/to/ssh_key.pub' as ssh_pub_key %}
{# or #}
{% from 'path/to/other_file.jinja' import some_data with context %}
```

This is usually best done with a variable assignment in order to separate the data from the state that will make use of the data.

**Light conditionals and looping** Jinja is extremely powerful for programatically generating Salt states. It is also easy to overuse. As a rule of thumb, if it is hard to read it will be hard to maintain!

Separate Jinja control-flow statements from the states as much as is possible to create readable states. Limit Jinja within states to simple variable lookups.

Below is a simple example of a readable loop:

```
{% for user in salt.pillar.get('list_of_users', []) %}
{# Ensure unique state IDs when looping. #}
{{ user.name }}-{{ loop.index }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}
{% endfor %}
```

Avoid putting a Jinja conditionals within Salt states where possible. Readability suffers and the correct YAML indentation is difficult to see in the surrounding visual noise. Parameterization (discussed below) and variables are both useful techniques to avoid this. For example:

```

{# ---- Bad example ---- #}

apache:
  pkg.installed:
    {% if grains.os_family == 'RedHat' %}
    - name: httpd
    {% elif grains.os_family == 'Debian' %}
    - name: apache2
    {% endif %}

{# ---- Better example ---- #}

{% if grains.os_family == 'RedHat' %}
{% set name = 'httpd' %}
{% elif grains.os_family == 'Debian' %}
{% set name = 'apache2' %}
{% endif %}

apache:
  pkg.installed:
    - name: {{ name }}

{# ---- Good example ---- #}

{% set name = {
  'RedHat': 'httpd',
  'Debian': 'apache2',
}.get(grains.os_family) %}

apache:
  pkg.installed:
    - name: {{ name }}

```

Dictionaries are useful to effectively ``namespace'' a collection of variables. This is useful with parameterization (discussed below). Dictionaries are also easily combined and merged. And they can be directly serialized into YAML which is often easier than trying to create valid YAML through templating. For example:

```

{# ---- Bad example ---- #}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    {% if 'external_loadbalancer' in grains.roles %}
    - source: salt://haproxy/external_haproxy.cfg
    {% elif 'internal_loadbalancer' in grains.roles %}
    - source: salt://haproxy/internal_haproxy.cfg
    {% endif %}
    - context:
      {% if 'external_loadbalancer' in grains.roles %}
      ssl_termination: True
      {% elif 'internal_loadbalancer' in grains.roles %}
      ssl_termination: False
      {% endif %}

{# ---- Better example ---- #}

```

```

{% load_yaml as haproxy_defaults %}
common_settings:
  bind_port: 80

internal_loadbalancer:
  source: salt://haproxy/internal_haproxy.cfg
  settings:
    bind_port: 8080
    ssl_termination: False

external_loadbalancer:
  source: salt://haproxy/external_haproxy.cfg
  settings:
    ssl_termination: True
{% endload %}

{% if 'external_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['external_loadbalancer'] %}
{% elif 'internal_loadbalancer' in grains.roles %}
{% set haproxy = haproxy_defaults['internal_loadbalancer'] %}
{% endif %}

{% do haproxy.settings.update(haproxy_defaults.common_settings) %}

haproxy_conf:
  file.managed:
    - name: /etc/haproxy/haproxy.cfg
    - template: jinja
    - source: {{ haproxy.source }}
    - context: {{ haproxy.settings | yaml() }}

```

There is still room for improvement in the above example. For example, extracting into an external file or replacing the if-elif conditional with a function call to filter the correct data more succinctly. However, the state itself is simple and legible, the data is separate and also simple and legible. And those suggested improvements can be made at some future date without altering the state at all!

**Avoid heavy logic and programming** Jinja is not Python. It was made by Python programmers and shares many semantics and some syntax but it does not allow for arbitrary Python function calls or Python imports. Jinja is a fast and efficient templating language but the syntax can be verbose and visually noisy.

Once Jinja use within an sls file becomes slightly complicated -- long chains of if-elif-elif-else statements, nested conditionals, complicated dictionary merges, wanting to use sets -- instead consider using a different Salt renderer, such as the Python renderer. As a rule of thumb, if it is hard to read it will be hard to maintain -- switch to a format that is easier to read.

Using alternate renderers is very simple to do using Salt's ``she-bang" syntax at the top of the file. The Python renderer must simply return the correct *highstate data structure*. The following example is a state tree of two sls files, one simple and one complicated.

/srv/salt/top.sls:

```

base:
  '*':
    - common_configuration
    - roles_configuration

```

/srv/salt/common\_configuration.sls:

```
common_users:
  user.present:
    - names: [larry, curly, moe]
```

/srv/salt/roles\_configuration:

```
#!/py
def run():
    list_of_roles = set()

    # This example has the minion id in the form 'web-03-dev'.
    # Easily access the grains dictionary:
    try:
        app, instance_number, environment = __grains__['id'].split('-')
        instance_number = int(instance_number)
    except ValueError:
        app, instance_number, environment = ['Unknown', 0, 'dev']

    list_of_roles.add(app)

    if app == 'web' and environment == 'dev':
        list_of_roles.add('primary')
        list_of_roles.add('secondary')
    elif app == 'web' and environment == 'staging':
        if instance_number == 0:
            list_of_roles.add('primary')
        else:
            list_of_roles.add('secondary')

    # Easily cross-call Salt execution modules:
    if __salt__['myutils.query_valid_ec2_instance']():
        list_of_roles.add('is_ec2_instance')

    return {
        'set_roles_grains': {
            'grains.present': [
                {'name': 'roles'},
                {'value': list(list_of_roles)},
            ],
        },
    }
}
```

**Jinja Macros** In Salt sls files Jinja macros are useful for one thing and one thing only: creating mini templates that can be reused and rendered on demand. Do not fall into the trap of thinking of macros as functions; Jinja is not Python (see above).

Macros are useful for creating reusable, parameterized states. For example:

```
{% macro user_state(state_id, user_name, shell='/bin/bash', groups=[]) %}
{{ state_id }}:
  user.present:
    - name: {{ user_name }}
    - shell: {{ shell }}
    - groups: {{ groups | json() }}
{% endmacro %}
```

```
{% for user_info in salt.pillar.get('my_users', []) %}
{{ user_state('user_number_' ~ loop.index, **user_info) }}
{% endfor %}
```

Macros are also useful for creating one-off "serializers" that can accept a data structure and write that out as a domain-specific configuration file. For example, the following macro could be used to write a php.ini config file:

/srv/salt/php.sls:

```
php_ini:
  file.managed:
    - name: /etc/php.ini
    - source: salt://php.ini.tmpl
    - template: jinja
    - context:
      php_ini_settings: {{ salt.pillar.get('php_ini', {}) | json() }}
```

/srv/pillar/php.sls:

```
php_ini:
  PHP:
    engine: 'On'
    short_open_tag: 'Off'
    error_reporting: 'E_ALL & ~E_DEPRECATED & ~E_STRICT'
```

/srv/salt/php.ini.tmpl:

```
{% macro php_ini_serializer(data) %}
{% for section_name, name_val_pairs in data.items() %}
[{{ section_name }}]
{% for name, val in name_val_pairs.items() -%}
{{ name }} = "{{ val }}"
{% endfor %}
{% endfor %}
{% endmacro %}

; File managed by Salt at <{{ source }}>.
; Your changes will be overwritten.

{{ php_ini_serializer(php_ini_settings) }}
```

### Abstracting static defaults into a lookup table

Separate data that a state uses from the state itself to increase the flexibility and reusability of a state.

An obvious and common example of this is platform-specific package names and file system paths. Another example is sane defaults for an application, or common settings within a company or organization. Organizing such data as a dictionary (aka hash map, lookup table, associative array) often provides a lightweight namespacing and allows for quick and easy lookups. In addition, using a dictionary allows for easily merging and overriding static values within a lookup table with dynamic values fetched from Pillar.

A strong convention in Salt Formulas is to place platform-specific data, such as package names and file system paths, into a file named `map.jinja` that is placed alongside the state files.

The following is an example from the MySQL Formula. The `grains.filter_by` function performs a lookup on that table using the `os_family` grain (by default).

The result is that the `mysql` variable is assigned to a *subset* of the lookup table for the current platform. This allows states to reference, for example, the name of a package without worrying about the underlying OS. The syntax for referencing a value is a normal dictionary lookup in Jinja, such as `{{ mysql['service'] }}` or the shorthand `{{ mysql.service }}`.

map.jinja:

```
{% set mysql = salt['grains.filter_by']({
    'Debian': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'RedHat': {
        'server': 'mysql-server',
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'dev-python/mysql-python',
    },
}, merge=salt['pillar.get']('mysql:lookup')) %}
```

Values defined in the map file can be fetched for the current platform in any state file using the following syntax:

```
{% from "mysql/map.jinja" import mysql with context %}

mysql-server:
  pkg.installed:
    - name: {{ mysql.server }}
  service.running:
    - name: {{ mysql.service }}
```

**Collecting common values** Common values can be collected into a *base* dictionary. This minimizes repetition of identical values in each of the `lookup_dict` sub-dictionaries. Now only the values that are different from the base must be specified of the alternates:

map.jinja:

```
{% set mysql = salt['grains.filter_by']({
    'default': {
        'server': 'mysql-server',
        'client': 'mysql-client',
        'service': 'mysql',
        'config': '/etc/mysql/my.cnf',
        'python': 'python-mysqldb',
    },
    'Debian': {
```

```

    },
    'RedHat': {
        'client': 'mysql',
        'service': 'mysqld',
        'config': '/etc/my.cnf',
        'python': 'MySQL-python',
    },
    'Gentoo': {
        'server': 'dev-db/mysql',
        'client': 'dev-db/mysql',
        'python': 'dev-python/mysql-python',
    },
},
merge=salt['pillar.get']('mysql:lookup', default='default') %}

```

**Overriding values in the lookup table** Allow static values within lookup tables to be overridden. This is a simple pattern which once again increases flexibility and reusability for state files.

The `merge` argument in `filter_by` specifies the location of a dictionary in Pillar that can be used to override values returned from the lookup table. If the value exists in Pillar it will take precedence.

This is useful when software or configuration files is installed to non-standard locations or on unsupported platforms. For example, the following Pillar would replace the `config` value from the call above.

```

mysql:
  lookup:
    config: /usr/local/etc/mysql/my.cnf

```

#### Note: Protecting Expansion of Content with Special Characters

When templating keep in mind that YAML does have special characters for quoting, flows, and other special structure and content. When a Jinja substitution may have special characters that will be incorrectly parsed by YAML care must be taken. It is a good policy to use the `yaml_encode` or the `yaml_dquote` Jinja filters:

```

{%- set foo = 7.7 %}
{%- set bar = none %}
{%- set baz = true %}
{%- set zap = 'The word of the day is "salty".' %}
{%- set zip = '"The quick brown fox . . ."' %}

foo: {{ foo|yaml_encode }}
bar: {{ bar|yaml_encode }}
baz: {{ baz|yaml_encode }}
zap: {{ zap|yaml_encode }}
zip: {{ zip|yaml_dquote }}

```

The above will be rendered as below:

```

foo: 7.7
bar: null
baz: true
zap: "The word of the day is \"salty\"."
zip: "\"The quick brown fox . . .\""

```

The `filter_by` function performs a simple dictionary lookup but also allows for fetching data from Pillar and overriding data stored in the lookup table. That same workflow can be easily performed without using `filter_by`; other dictionaries besides data from Pillar can also be used.

```
{% set lookup_table = {...} %}
{% do lookup_table.update(salt.pillar.get('my:custom:data')) %}
```

**When to use lookup tables** The `map.jinja` file is only a convention within Salt Formulas. This greater pattern is useful for a wide variety of data in a wide variety of workflows. This pattern is not limited to pulling data from a single file or data source. This pattern is useful in States, Pillar and the Reactor, for example.

Working with a data structure instead of, say, a config file allows the data to be cobbled together from multiple sources (local files, remote Pillar, database queries, etc), combined, overridden, and searched.

Below are a few examples of what lookup tables may be useful for and how they may be used and represented.

**Platform-specific information** An obvious pattern and one used heavily in Salt Formulas is extracting platform-specific information such as package names and file system paths in a file named `map.jinja`. The pattern is explained in detail above.

**Sane defaults** Application settings can be a good fit for this pattern. Store default settings along with the states themselves and keep overrides and sensitive settings in Pillar. Combine both into a single dictionary and then write the application config or settings file.

The example below stores most of the Apache Tomcat `server.xml` file alongside the Tomcat states and then allows values to be updated or augmented via Pillar. (This example uses the BadgerFish format for transforming JSON to XML.)

`/srv/salt/tomcat/defaults.yaml:`

```
Server:
  '@port': '8005'
  '@shutdown': SHUTDOWN
  GlobalNamingResources:
    Resource:
      '@auth': Container
      '@description': User database that can be updated and saved
      '@factory': org.apache.catalina.users.MemoryUserDatabaseFactory
      '@name': UserDatabase
      '@pathname': conf/tomcat-users.xml
      '@type': org.apache.catalina.UserDatabase
  # <...snip...>
```

`/srv/pillar/tomcat.sls:`

```
appX:
  server_xml_overrides:
    Server:
      Service:
        '@name': Catalina
      Connector:
        '@port': '8009'
        '@protocol': AJP/1.3
        '@redirectPort': '8443'
  # <...snip...>
```

```
/srv/salt/tomcat/server_xml.sls:
```

```
{% import_yaml 'tomcat/defaults.yaml' as server_xml_defaults %}
{% set server_xml_final_values = salt.pillar.get(
    'appX:server_xml_overrides',
    default=server_xml_defaults,
    merge=True)
%}

appX_server_xml:
  file.serialize:
    - name: /etc/tomcat/server.xml
    - dataset: {{ server_xml_final_values | json() }}
    - formatter: xml_badgerfish
```

The `file.serialize` state can provide a shorthand for creating some files from data structures. There are also many examples within Salt Formulas of creating one-off “serializers” (often as Jinja macros) that reformat a data structure to a specific config file format. For example, ``Nginx vhosts`__` or the ``php.ini`__`

\_\_: [https://github.com/saltstack-formulas/nginx-formula/blob/5cad4512/nginx/ng/vhosts\\_config.sls](https://github.com/saltstack-formulas/nginx-formula/blob/5cad4512/nginx/ng/vhosts_config.sls) \_\_:  
<https://github.com/saltstack-formulas/php-formula/blob/82e2cd3a/php/ng/files/php.ini>

**Environment specific information** A single state can be reused when it is parameterized as described in the section below, by separating the data the state will use from the state that performs the work. This can be the difference between deploying *Application X* and *Application Y*, or the difference between production and development. For example:

```
/srv/salt/app/deploy.sls:
```

```
{# Load the map file. #}
{% import_yaml 'app/defaults.yaml' as app_defaults %}

{# Extract the relevant subset for the app configured on the current
  machine (configured via a grain in this example). #}
{% app = app_defaults.get(salt.grains.get('role')) %}

{# Allow values from Pillar to (optionally) update values from the lookup
  table. #}
{% do app_defaults.update(salt.pillar.get('myapp', {})) %}

deploy_application:
  git.latest:
    - name: {{ app.repo_url }}
    - version: {{ app.version }}
    - target: {{ app.deploy_dir }}

myco/myapp/deployed:
  event.send:
    - data:
        version: {{ app.version }}
    - onchanges:
        - git: deploy_application
```

```
/srv/salt/app/defaults.yaml:
```

```
appX:
  repo_url: git@github.com:myco/appX.git
```

```
target: /var/www/appX
version: master
appY:
  repo_url: git@github.com:myco/appY.git
  target: /var/www/appY
  version: v1.2.3.4
```

### Single-purpose SLS files

Each sls file in a Formula should strive to do a single thing. This increases the reusability of this file by keeping unrelated tasks from getting coupled together.

As an example, the base Apache formula should only install the Apache httpd server and start the httpd service. This is the basic, expected behavior when installing Apache. It should not perform additional changes such as set the Apache configuration file or create vhosts.

If a formula is single-purpose as in the example above, other formulas, and also other states can include and use that formula with *Requisites and Other Global State Arguments* without also including undesirable or unintended side-effects.

The following is a best-practice example for a reusable Apache formula. (This skips platform-specific options for brevity. See the full `apache-formula` for more.)

```
# apache/init.sls
apache:
  pkg.installed:
    [...]
  service.running:
    [...]

# apache/mod_wsgi.sls
include:
  - apache

mod_wsgi:
  pkg.installed:
    [...]
  - require:
    - pkg: apache

# apache/conf.sls
include:
  - apache

apache_conf:
  file.managed:
    [...]
  - watch_in:
    - service: apache
```

To illustrate a bad example, say the above Apache formula installed Apache and also created a default vhost. The `mod_wsgi` state would not be able to include the Apache formula to create that dependency tree without also installing the unneeded default vhost.

*Formulas should be reusable.* Avoid coupling unrelated actions together.

## Parameterization

*Parameterization is a key feature of Salt Formulas* and also for Salt States. Parameterization allows a single Formula to be reused across many operating systems; to be reused across production, development, or staging environments; and to be reused by many people all with varying goals.

Writing states, specifying ordering and dependencies is the part that takes the longest to write and to test. Filling those states out with data such as users or package names or file locations is the easy part. How many users, what those users are named, or where the files live are all implementation details that **should be parameterized**. This separation between a state and the data that populates a state creates a reusable formula.

In the example below the data that populates the state can come from anywhere -- it can be hard-coded at the top of the state, it can come from an external file, it can come from Pillar, it can come from an execution function call, or it can come from a database query. The state itself doesn't change regardless of where the data comes from. Production data will vary from development data will vary from data from one company to another, however the state itself stays the same.

```
{% set user_list = [
    {'name': 'larry', 'shell': 'bash'},
    {'name': 'curly', 'shell': 'bash'},
    {'name': 'moe', 'shell': 'zsh'},
] %}

{# or #}

{% set user_list = salt['pillar.get']('user_list') %}

{# or #}

{% load_json "default_users.json" as user_list %}

{# or #}

{% set user_list = salt['acme_utils.get_user_list']() %}

{% for user in list_list %}
  {{ user.name }}:
  user.present:
    - name: {{ user.name }}
    - shell: {{ user.shell }}
{% endfor %}
```

## Configuration

Formulas should strive to use the defaults of the underlying platform, followed by defaults from the upstream project, followed by sane defaults for the formula itself.

As an example, a formula to install Apache **should not** change the default Apache configuration file installed by the OS package. However, the Apache formula **should** include a state to change or override the default configuration file.

## Pillar overrides

Pillar lookups must use the safe `get()` and must provide a default value. Create local variables using the Jinja `set` construct to increase readability and to avoid potentially hundreds or thousands of function calls across a large state

tree.

```
{% from "apache/map.jinja" import apache with context %}
{% set settings = salt['pillar.get']('apache', {}) %}

mod_status:
  file.managed:
    - name: {{ apache.conf_dir }}
    - source: {{ settings.get('mod_status_conf', 'salt://apache/mod_status.conf') }}
    - template: {{ settings.get('template_engine', 'jinja') }}
```

Any default values used in the Formula must also be documented in the `pillar.example` file in the root of the repository. Comments should be used liberally to explain the intent of each configuration value. In addition, users should be able copy-and-paste the contents of this file into their own Pillar to make any desired changes.

### Scripting

Remember that both State files and Pillar files can easily call out to Salt execution modules and have access to all the system grains as well.

```
{% if '/storage' in salt['mount.active']() %}
/usr/local/etc/myfile.conf:
  file:
    - symlink
    - target: /storage/myfile.conf
{% endif %}
```

Jinja macros to encapsulate logic or conditionals are discouraged in favor of *writing custom execution modules* in Python.

### Repository structure

A basic Formula repository should have the following layout:

```
foo-formula
|-- foo/
|   |-- map.jinja
|   |-- init.sls
|   |-- bar.sls
|-- CHANGELOG.rst
|-- LICENSE
|-- pillar.example
|-- README.rst
`-- VERSION
```

See also:

[template-formula](#)

The `template-formula` repository has a pre-built layout that serves as the basic structure for a new formula repository. Just copy the files from there and edit them.

## README.rst

The README should detail each available `.sls` file by explaining what it does, whether it has any dependencies on other formulas, whether it has a target platform, and any other installation or usage instructions or tips.

A sample skeleton for the README.rst file:

```

===
foo
===

Install and configure the F00 service.

.. note::

    See the full `Salt Formulas installation and usage instructions
    <http://docs.saltstack.com/en/latest/topics/development/conventions/formulas.html>`.

Available states
=====

.. contents::
   :local:

``foo``
-----

Install the ``foo`` package and enable the service.

``foo.bar``
-----

Install the ``bar`` package.

```

## CHANGELOG.rst

The CHANGELOG.rst file should detail the individual versions, their release date and a set of bullet points for each version highlighting the overall changes in a given version of the formula.

A sample skeleton for the CHANGELOG.rst file:

CHANGELOG.rst:

```

foo formula
=====

0.0.2 (2013-01-01)

- Re-organized formula file layout
- Fixed filename used for upstart logger template
- Allow for pillar message to have default if none specified

```

## Versioning

Formula are versioned according to Semantic Versioning, <http://semver.org/>.

**Note:** Given a version number MAJOR.MINOR.PATCH, increment the:

1. MAJOR version when you make incompatible API changes,
2. MINOR version when you add functionality in a backwards-compatible manner, and
3. PATCH version when you make backwards-compatible bug fixes.

Additional labels for pre-release and build metadata are available as extensions to the MAJOR.MINOR.PATCH format.

---

Formula versions are tracked using Git tags as well as the VERSION file in the formula repository. The VERSION file should contain the currently released version of the particular formula.

### Testing Formulas

A smoke-test for invalid Jinja, invalid YAML, or an invalid Salt state structure can be performed by with the `state.show_sls` function:

```
salt '*' state.show_sls apache
```

Salt Formulas can then be tested by running each `.sls` file via `state.apply` and checking the output for the success or failure of each state in the Formula. This should be done for each supported platform.

### 36.23.3 SaltStack Packaging Guide

Since Salt provides a powerful toolkit for system management and automation, the package can be spit into a number of sub-tools. While packaging Salt as a single package containing all components is perfectly acceptable, the split packages should follow this convention.

#### Patching Salt For Distributions

The occasion may arise where Salt source and default configurations may need to be patched. It is preferable if Salt is only patched to include platform specific additions or to fix release time bugs. It is preferable that configuration settings and operations remain in the default state, as changes here lowers the user experience for users moving across distributions.

In the event where a packager finds a need to change the default configuration it is advised to add the files to the `master.d` or `minion.d` directories.

#### Source Files

Release packages should always be built from the source tarball distributed via pypi. Release packages should *NEVER* use a git checkout as the source for distribution.

#### Single Package

Shipping Salt as a single package, where the minion, master, and all tools are together is perfectly acceptable and practiced by distributions such as FreeBSD.

## Split Package

Salt should always be split in a standard way, with standard dependencies, this lowers cross distribution confusion about what components are going to be shipped with specific packages. These packages can be defined from the Salt Source as of Salt 2014.1.0:

### Salt Common

The *salt-common* or *salt* package should contain the files provided by the salt python package, or all files distributed from the `salt/` directory in the source distribution packages. The documentation contained under the `doc/` directory can be a part of this package but splitting out a doc package is preferred. Since `salt-call` is the entry point to utilize the libs and is useful for all salt packages it is included in the *salt-common* package.

#### Name

- *salt* OR *salt-common*

#### Files

- *salt/\**
- *man/salt.7*
- *scripts/salt-call*
- *tests/\**
- *man/salt-call.1*

#### Depends

- *Python 2.6-2.7*
- *PyYAML*
- *Jinja2*

### Salt Master

The *salt-master* package contains the applicable scripts, related man pages and init information for the given platform.

#### Name

- *salt-master*

#### Files

- *scripts/salt-master*
- *scripts/salt*
- *scripts/salt-run*
- *scripts/salt-key*
- *scripts/salt-cp*

- *pkg/<master init data>*
- *man/salt.1*
- *man/salt-master.1*
- *man/salt-run.1*
- *man/salt-key.1*
- *man/salt-cp.1*
- *conf/master*

### Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

### Salt Syndic

The Salt Syndic package can be rolled completely into the Salt Master package. Platforms which start services as part of the package deployment need to maintain a separate *salt-syndic* package (primarily Debian based platforms).

The Syndic may optionally not depend on anything more than the Salt Master since the master will bring in all needed dependencies, but fall back to the platform specific packaging guidelines.

### Name

- *salt-syndic*

### Files

- *scripts/salt-syndic*
- *pkg/<syndic init data>*
- *man/salt-syndic.1*

### Depends

- *Salt Common*
- *Salt Master*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*

- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

### Salt Minion

The Minion is a standalone package and should not be split beyond the *salt-minion* and *salt-common* packages.

#### Name

- *salt-minion*

#### Files

- *scripts/salt-minion*
- *pkg/<minion init data>*
- *man/salt-minion.1*
- *conf/minion*

#### Depends

- *Salt Common*
- *ZeroMQ* >= 3.2
- *PyZMQ* >= 2.10
- *PyCrypto*
- *M2Crypto*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

### Salt SSH

Since Salt SSH does not require the same dependencies as the minion and master, it should be split out.

#### Name

- *salt-ssh*

#### Files

- *scripts/salt-ssh*
- *man/salt-ssh.1*
- *conf/cloud\**

#### Depends

- *Salt Common*
- *Python MessagePack* (Messagepack C lib, or msgpack-pure)

## Salt Cloud

As of Salt 2014.1.0 Salt Cloud is included in the same repo as Salt. This can be split out into a separate package or it can be included in the salt-master package.

### Name

- *salt-cloud*

### Files

- *scripts/salt-cloud*
- *man/salt-cloud.1*

### Depends

- *Salt Common*
- *apache libcloud* >= 0.14.0

## Salt Doc

The documentation package is very distribution optional. A completely split package will split out the documentation, but some platform conventions do not prefer this. If the documentation is not split out, it should be included with the *Salt Common* package.

### Name

- *salt-doc*

### Files

- *doc/\**

### Optional Depends

- *Salt Common*
- *Python Sphinx*
- *Make*

## 36.23.4 Salt Release Process

The goal for Salt projects is to cut a new feature release every four to six weeks. This document outlines the process for these releases, and the subsequent bug fix releases which follow.

## Feature Release Process

When a new release is ready to be cut, the person responsible for cutting the release will follow the following steps (written using the 0.16 release as an example):

1. All open issues on the release milestone should be moved to the next release milestone. (e.g. from the 0.16 milestone to the 0.17 milestone)
2. Release notes should be created documenting the major new features and bugfixes in the release.
3. Create an annotated tag with only the major and minor version numbers, preceded by the letter v. (e.g. v0.16) This tag will reside on the `develop` branch.
4. Create a branch for the new release, using only the major and minor version numbers. (e.g. 0.16)
5. On this new branch, create an annotated tag for the first revision release, which is generally a release candidate. It should be preceded by the letter v. (e.g. v0.16.0RC)
6. The release should be packaged from this annotated tag and uploaded to PyPI as well as the GitHub releases page for this tag.
7. The packagers should be notified on the [salt-packagers](#) mailing list so they can create packages for all the major operating systems. (note that release candidates should go in the testing repositories)
8. After the packagers have been given a few days to compile the packages, the release is announced on the [salt-users](#) mailing list.
9. Log into RTD and add the new release there. (Have to do it manually)

## Maintenance and Bugfix Releases

Once a release has been cut, regular cherry-picking sessions should begin to cherry-pick any bugfixes from the `develop` branch to the release branch (e.g. 0.16). Once major bugs have been fixed and cherry-picked, a bugfix release can be cut:

1. On the release branch (i.e. 0.16), create an annotated tag for the revision release. It should be preceded by the letter v. (e.g. v0.16.2) Release candidates are unnecessary for bugfix releases.
2. The release should be packaged from this annotated tag and uploaded to PyPI.
3. The packagers should be notified on the [salt-packagers](#) mailing list so they can create packages for all the major operating systems.
4. After the packagers have been given a few days to compile the packages, the release is announced on the [salt-users](#) mailing list.

## Cherry-Picking Process for Bugfixes

Bugfixes should be made on the `develop` branch. If the bug also applies to the current release branch, then on the pull request against `develop`, the user should mention `@basepi` and ask for the pull request to be cherry-picked. If it is verified that the fix is a bugfix, then the `Bugfix -- Cherry-Pick` label will be applied to the pull request. When those commits are cherry-picked, the label will be switched to the `Bugfix -- [Done] Cherry-Pick` label. This allows easy recognition of which pull requests have been cherry-picked, and which are still pending to be cherry-picked. All cherry-picked commits will be present in the next release.

Features will not be cherry-picked, and will be present in the next feature release.

### 36.23.5 Salt Coding Style

Salt is developed with a certain coding style, while the style is dominantly PEP 8 it is not completely PEP 8. It is also noteworthy that a few development techniques are also employed which should be adhered to. In the end, the code is made to be ``Salty``.

Most importantly though, we will accept code that violates the coding style and KINDLY ask the contributor to fix it, or go ahead and fix the code on behalf of the contributor. Coding style is NEVER grounds to reject code contributions, and is never grounds to talk down to another member of the community (There are no grounds to treat others without respect, especially people working to improve Salt)!!

#### Linting

Most Salt style conventions are codified in Salt's `.pylintrc` file. Salt's pylint file has two dependencies: `pylint` and `saltpylint`. You can install these dependencies with `pip`:

```
pip install pylint
pip install saltpylint
```

The `.pylintrc` file is found in the root of the Salt project and can be passed as an argument to the `pylint` program as follows:

```
pylint --rcfile=/path/to/salt/.pylintrc salt/dir/to/lint
```

#### Variables

Variables should be a minimum of three characters and should provide an easy-to-understand name of the object being represented.

When keys and values are iterated over, descriptive names should be used to represent the temporary variables.

Multi-word variables should be separated by an underscore.

Variables which are two-letter words should have an underscore appended to them to pad them to three characters.

#### Strings

Salt follows a few rules when formatting strings:

##### Single Quotes

In Salt, all strings use single quotes unless there is a good reason not to. This means that docstrings use single quotes, standard strings use single quotes etc.:

```
def foo():
    """
    A function that does things
    """
    name = 'A name'
    return name
```

## Formatting Strings

All strings which require formatting should use the `.format` string method:

```
data = 'some text'
more = '{0} and then some'.format(data)
```

Make sure to use indices or identifiers in the format brackets, since empty brackets are not supported by python 2.6. Please do NOT use printf formatting.

## Docstring Conventions

Docstrings should always add a newline, docutils takes care of the new line and it makes the code cleaner and more vertical:

GOOD:

```
def bar():
    """
    Here lies a docstring with a newline after the quotes and is the salty
    way to handle it! Vertical code is the way to go!
    """
    return
```

BAD:

```
def baz():
    '''This is not ok!'''
    return
```

When adding a new function or state, where possible try to use a `versionadded` directive to denote when the function or state was added.

```
def new_func(msg=''):
    """
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed.
    """
    print msg
```

If you are uncertain what version should be used, either consult a core developer in IRC or bring this up when opening your [pull request](#) and a core developer will add the proper version once your pull request has been merged. Bugfixes will be available in a bugfix release (i.e. 0.17.1, the first bugfix release for 0.17.0), while new features are held for feature releases, and this will affect what version number should be used in the `versionadded` directive.

Similar to the above, when an existing function or state is modified (for example, when an argument is added), then under the explanation of that new argument a `versionadded` directive should be used to note the version in which the new argument was added. If an argument's function changes significantly, the `versionchanged` directive can be used to clarify this:

```
def new_func(msg='', signature=''):
    '''
    .. versionadded:: 0.16.0

    Prints what was passed to the function.

    msg : None
        The string to be printed. Will be prepended with 'Greetings! '.

    .. versionchanged:: 0.17.1

    signature : None
        An optional signature.

    .. versionadded 0.17.0
    '''
    print 'Greetings! {0}\n\n{1}'.format(msg, signature)
```

## Dictionaries

Dictionaries should be initialized using `{}` instead of `dict()`.

See [here](#) for an in-depth discussion of this topic.

## Imports

Salt code prefers importing modules and not explicit functions. This is both a style and functional preference. The functional preference originates around the fact that the module import system used by pluggable modules will include callable objects (functions) that exist in the direct module namespace. This is not only messy, but may unintentionally expose code python libs to the Salt interface and pose a security problem.

To say this more directly with an example, this is *GOOD*:

```
import os

def minion_path():
    path = os.path.join(self.opts['cachedir'], 'minions')
    return path
```

This on the other hand is *DISCOURAGED*:

```
from os.path import join

def minion_path():
    path = join(self.opts['cachedir'], 'minions')
    return path
```

The time when this is changed is for importing exceptions, generally directly importing exceptions is preferred:

This is a good way to import exceptions:

```
from salt.exceptions import CommandExecutionError
```

## Absolute Imports

Although `absolute imports` seems like an awesome idea, please do not use it. Extra care would be necessary all over salt's code in order for absolute imports to work as supposed. Believe it, it has been tried before and, as a tried example, by renaming `salt.modules.sysmod` to `salt.modules.sys`, all other salt modules which needed to import `sys` would have to also import `absolute_import`, which should be avoided.

## Vertical is Better

When writing Salt code, vertical code is generally preferred. This is not a hard rule but more of a guideline. As PEP 8 specifies, Salt code should not exceed 79 characters on a line, but it is preferred to separate code out into more newlines in some cases for better readability:

```
import os

os.chmod(
    os.path.join(self.opts['sock_dir'],
                  'minion_event_pub.ipc'),
    448
)
```

Where there are more line breaks, this is also apparent when constructing a function with many arguments, something very common in state functions for instance:

```
def managed(name,
            source=None,
            source_hash='',
            user=None,
            group=None,
            mode=None,
            template=None,
            makedirs=False,
            context=None,
            replace=True,
            defaults=None,
            env=None,
            backup='',
            **kwargs):
```

---

**Note:** Making function and class definitions vertical is only required if the arguments are longer than 80 characters. Otherwise, the formatting is optional and both are acceptable.

---

## Line Length

For function definitions and function calls, Salt adheres to the PEP-8 specification of at most 80 characters per line.

Non function definitions or function calls, please adopt a soft limit of 120 characters per line. If breaking the line reduces the code readability, don't break it. Still, try to avoid passing that 120 characters limit and remember, **vertical is better... unless it isn't**

## Indenting

Some confusion exists in the python world about indenting things like function calls, the above examples use 8 spaces when indenting comma-delimited constructs.

The confusion arises because the pep8 program INCORRECTLY flags this as wrong, where PEP 8, the document, cites only using 4 spaces here as wrong, as it doesn't differentiate from a new indent level.

Right:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

WRONG:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

Lining up the indent is also correct:

```
def managed(name,
            source=None,
            source_hash='',
            user=None)
```

This also applies to function calls and other hanging indents.

pep8 and Flake8 (and, by extension, the vim plugin Syntastic) will complain about the double indent for hanging indents. This is a **known conflict** between pep8 (the script) and the actual PEP 8 standard. It is recommended that this particular warning be ignored with the following lines in `~/.config/flake8`:

```
[flake8]
ignore = E226,E241,E242,E126
```

Make sure your Flake8/pep8 are up to date. The first three errors are ignored by default and are present here to keep the behavior the same. This will also work for pep8 without the Flake8 wrapper -- just replace all instances of ``flake8'` with ``pep8'`, including the filename.

## Code Churn

Many pull requests have been submitted that only churn code in the name of PEP 8. Code churn is a leading source of bugs and is strongly discouraged. While style fixes are encouraged they should be isolated to a single file per commit, and the changes should be legitimate, if there are any questions about whether a style change is legitimate please reference this document and the official PEP 8 (<http://legacy.python.org/dev/peps/pep-0008/>) document before changing code. Many claims that a change is PEP 8 have been invalid, please double check before committing fixes.

---

## Release notes

---

See the `version numbers` page for more information about the version numbering scheme.

### 37.1 Latest Branch Release

Salt 2015.8.8 Release Notes

### 37.2 Previous Releases

#### 37.2.1 Salt 2015.8.0 Release Notes - Codename Beryllium

##### 2015.8.0 Detailed Change List

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>)

*Generated at: 2015-09-09T18:15:43Z*

This list includes all pull requests merged into the 2015.8 branch between the forking of the branch from develop and the release of 2015.8.0.

Statistics:

- Total Merges: **682**
- Total Issue references: **342**
- Total PR references: **866**

Pull Requests:

- #26993: (*whiteinge*) Backport #26975
- #26970: (*cachedout*) Revert ``better path query parsing in fileserver''
- #26980: (*terminalmage*) Use human-readable cachedirs for gitfs-backed winrepo
- #26969: (*TheBigBear*) URL of salt windows downloads has changed
- #26968: (*TheBigBear*) URL of salt windows downloads has changed
- #26958: (*s0undt3ch*) Bradthurber bootstrap command line help doc update
- #26949: (*rallytime*) Back-port #25148 to 2015.8

- #26914: (*cro*) Add salt-proxy script and manpage to setup.py so they will get installed.
- #26909: (*terminalmage*) Don't try to git clone from /tmp on Windows
- #26910: (*s0undt3ch*) Sometimes the event system is just too fast
- #26905: (*s0undt3ch*) Exit the loop if run\_once is true
- #26897: (*msteed*) spm file hash part deux
- #26900: (*s0undt3ch*) If no tag is passed, don't actually subscribe to anything.
- #26880: (*s0undt3ch*) Restore backwards compatibility to *salt.utils.event*
- #26896: (*msteed*) spm remove: use pkgfiles to calculate file hashes
- #26891: (*jtand*) Fixed an unboundlocalerror
- #26892: (*cachedout*) Make the testing ioloop the current one
- #26886: (*jtand*) Gets the azure version correctly on python-azure 1.0.0
- #26870: (*rallytime*) Back-port #26834 to 2015.8
- #26865: (*dmurphy18*) Fix apt preferences for apts, repos for pbuilder building for Debian
- #26873: (*terminalmage*) Properly handle getting local config values in older git versions
- #26869: (*rallytime*) Fix provider --> driver change for salt-cloud lxc
- #26858: (*terminalmage*) Fix a couple version checks for git state and execution module
- #26853: (*UtahDave*) Fix salt-cloud on windows
- #26852: (*basepi*) [2015.8] Only reference msgpack if it imported successfully
- #26835: (*terminalmage*) Backport #26572 to 2015.8
- #26836: (*jacobhammons*) Added rst source for salt-proxy man page, added build and copy lines ...
- #26818: (*terminalmage*) Support empty repositories in git.latest
- #26819: (*rallytime*) Make sure we're calling `_validate_name` in the correct place in 2015.8 Linode driver
- #26841: (*l2ol33rt*) Fix reference before assignment in sqs engine
- #26822: (*terminalmage*) Add some missing imports for masterless winrepo
- #26831: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26826: (*techhat*) Pass a package name to `unregister_file()`
- #26757: (*cachedout*) Fix various filehandle leaks
- #26816: (*gtmanfred*) rev defaults to HEAD
- #26801: (*jacobhammons*) Added doc for dockerng minion configuration options
- #26808: (*anlutro*) Fix git init argument formatting
- #26807: (*terminalmage*) Move `salt.utils.itersplit()` to `salt.utils.itertools.split()`
- #26796: (*jacobhammons*) Add doc for `__states__`
- #26764: (*sjorge*) `salt.utils.is_proxy()` is no longer always true on SunOS/Illumos/SmartOS
- #26772: (*sjorge*) pull in smartos `virt` module from develop
- #26726: (*terminalmage*) Redact HTTPS Basic Auth in states/funcc which deal with git remotes
- #26769: (*terminalmage*) Use `--track` to set tracking branch on older git versions

- #26765: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26761: (*sjorge*) fix SPM paths on smartos/illumos esky
- #26751: (*terminalmage*) Fixes for masterless winrepo
- #26745: (*rallytime*) Make sure pyrax configs are in place before checking for deps
- #26746: (*rallytime*) Make sure nova configs are set before checking for dependencies
- #26750: (*basepi*) [2015.8] Add `__utils__` to state modules
- #26752: (*cro*) Fix typo in some diagram labels
- #26747: (*basepi*) [2015.8] Add `__states__` to state modules, for cross-calling states
- #26744: (*basepi*) [2015.8] Fix issue from #26717
- #26737: (*dmurphy18*) Fix to allow for package naming other than just salt
- #26742: (*rallytime*) Only warn about vsphere deprecation if vsphere is configured
- #26733: (*sjorge*) Refactor of smartos\_vmadm module
- #26735: (*s0undt3ch*) Add `.hg` and `.cvs` to `spm_build_exclude`
- #26720: (*UtahDave*) Updates for winrepo in 2015.8 to support jinja, while maintaining backwards compat
- #26719: (*jodv*) Backport 26532 to 2015.8
- #26721: (*rallytime*) Linode Driver Cleanup
- #26707: (*techhat*) Add `top_level_dir` to FORMULAs
- #26723: (*s0undt3ch*) Handle SPM paths in the setup script
- #26717: (*basepi*) [2015.8] Revert loader changes from #26645
- #26712: (*techhat*) Move SPM paths around
- #26680: (*TheBigBear*) add more python libs info in `'--versions-report'`
- #26716: (*terminalmage*) Allow git identity to be a list
- #26691: (*garthgreenaway*) Fixes to ipset module for 2015.8
- #26701: (*kev009*) Ignore the first element of `kern.disks` split, which is the `sysctl` name (new disks grain)
- #26678: (*terminalmage*) Restructure `git.latest` rewrite to work better when following HEAD
- #26679: (*rallytime*) Back-port #26661 to 2015.8
- #26684: (*techhat*) Add reactor formulas to `spm`
- #26682: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26671: (*rallytime*) Warn users if cloud driver dependencies are missing.
- #26674: (*rallytime*) Back-port #26583 to 2015.8
- #26670: (*techhat*) Set up SPM to install `-conf` packages
- #26657: (*jfindlay*) top file compilation fixes
- #26659: (*TheBigBear*) minor doc edits - spelling
- #26654: (*jfindlay*) merge `'#26650'`
- #26567: (*jtand*) Added git version check to git module
- #26649: (*twangboy*) Fixed Lint for real in `win_repo.py`

- #26608: (*jacobhammons*) 2015.8.0 release notes and doc/conf.py updates
- #26646: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26645: (*rallytime*) Back-port #26390 to 2015.8
- #26642: (*twangboy*) Added function to render winrepo Jinja
- #26625: (*twangboy*) Correctly detect packages with no version, docs
- #26575: (*msteed*) Update spm for integration into raas
- #26635: (*cro*) Don't report windows as a proxy.
- #26622: (*rallytime*) [2015.8] Also add -Z to script args for cloud tests
- #26619: (*rallytime*) Apply cloud test fixes from 2015.5 to 2015.8
- #26603: (*terminalmage*) Fixes for git.latest, git module integration tests, etc.
- #26577: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26534: (*cachedout*) Bump required Tornado version to 4.2.1
- #26566: (*cachedout*) Don't stacktrace trying to publish without a master
- #26541: (*terminalmage*) Make winrepo execution module use the same code as the runner
- #26530: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26570: (*cachedout*) Fix haproxy docs to be valid
- #26562: (*cachedout*) Fix suprious error message with systemd-detect
- #26557: (*jfindlay*) add docs to #26550
- #26544: (*nmadhok*) Do not raise KeyError when calling avail\_images if VM/template is in disconnected state
- #26501: (*terminalmage*) Update git\_pillar docs, add git.list\_worktrees function
- #26521: (*terminalmage*) Work around upstream git bug when cloning repo as root
- #26518: (*krak3n*) Fix for [`#25492`\\_](#)
- #26514: (*evverx*) Unmask a runtime masked services too
- #26529: (*mnalt*) bugfix: fix service.enable for missing rc.conf
- #26516: (*techhat*) Move more path operations into SPM loader
- #26533: (*cachedout*) Fix too aggressive even init check
- #26522: (*cro*) Do not load package provider if its not a proxy
- #26531: (*cachedout*) Fix failing event tests and modify event init
- #26433: (*cro*) Add support for default proxy config options, change default location of proxy config and log to /etc/salt/proxy and /var/log/proxy
- #26504: (*nmadhok*) [Backport] Adding ability to specify the virtual hardware version when creating VM
- #26517: (*cachedout*) Better fix for opensuse tornado httpclient
- #26479: (*rallytime*) Don't allow VMs with duplicate names to be created in EC2/AWS
- #26488: (*cachedout*) Don't pass unsupported kwarg to tornado
- #26451: (*terminalmage*) Use `rpm -qa` instead of repoquery to list installed packages
- #26491: (*jacobhammons*) doc site css fix for tiny fonts that appeared in code or pre tags in ...

- #26442: (*rallytime*) Hide API Key from debug logs for Linode Driver
- #26441: (*rallytime*) Refactor a few linode functions to be useful with salt-cloud command
- #26485: (*s0undt3ch*) One more missed typo
- #26495: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26492: (*cachedout*) Fix schedule test error on py26
- #26489: (*cachedout*) Fixing more tarfile tests on py2.6
- #26475: (*cachedout*) Better object checking on asyncreq cleanup
- #26477: (*cachedout*) Fix integration.modules.git.GitModuleTest.test\_archive on py26
- #26469: (*jtand*) --annotate and --message aren't valid options in older versions of git.
- #26439: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26464: (*rallytime*) Back-port #26456 to 2015.8
- #26463: (*rallytime*) Back-port #26455 to 2015.8
- #26449: (*s0undt3ch*) The CLI options are not meant to include underscores.
- #26270: (*sjorge*) salt.modules.network now supports SmartOS and SunOS < Solaris 11
- #26436: (*TheBigBear*) minor edits
- #26410: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26427: (*anlutro*) git.latest with no rev: fix concatenation error (NoneType and str)
- #26307: (*cachedout*) Fix bug in top file ordering
- #26428: (*cro*) Update docs to reflect new pillar structure
- #26429: (*cachedout*) Add release note regarding tcp transport on freebsd
- #26418: (*driskell*) Fix forward-merged caching from 2015.5 into 2015.8 to be compatible with the new match\_func
- #26252: (*DmitryKuzmenko*) Issues/24048 http client 2015.8
- #26413: (*evverx*) Fix service.{start,restart,reload,force-reload} for masked services
- #26393: (*dmurphy18*) Added option parameters to make\_repo to allow for configuration settings
- #26422: (*TheBigBear*) no dots in SLS filename \_\_AND\_\_ any directories (incl git repos)
- #26323: (*0xf10e*) Fix Credentials used in *glance* Exec Module
- #26341: (*terminalmage*) Rewrite git state and execution modules
- #26419: (*terminalmage*) Only use pygit2.errors if it exists
- #26423: (*eliasp*) doc - Correct function name for peer configuration
- #26401: (*cachedout*) Adapt proxy minion to tornado (w/lint)
- #26400: (*rallytime*) Back-port #26318 to 2015.8
- #26397: (*s0undt3ch*) A single *isinstance()* check for all types is enough
- #26385: (*gtmanfred*) don't require volume endpoint in nova driver
- #26287: (*techhat*) Break out SPM components into loaders
- #26384: (*TheBigBear*) Fix shell quoting for cmd.run

- #26391: (*rallytime*) Back-port #26367 to 2015.8
- #26383: (*rallytime*) Allow the creation of a VM without a profile
- #26375: (*s0undt3ch*) [2015.8] Schema DictItem required attribute fixes
- #26363: (*garethgreenaway*) Fixes to mount state 2015.8
- #26347: (*0xf10e*) Load `pkgng` as `pkg` on FreeBSD 9 when `providers:pkg == `pkgng``
- #26361: (*TronPaul*) sign security token
- #26346: (*TronPaul*) Fix s3 using IAM credentials
- #26331: (*mnalt*) fix bug in sysrc to allow for empty rc variables
- #26334: (*rallytime*) Call salt.utils.cloud.bootstrap in GCE Driver provisioning
- #26308: (*dmurphy18*) Support for environment overrides building packages
- #26279: (*TheScriptSage*) Merge changes for pull`#26083`\_ and pull`#25632`\_ into 2015.8
- #26224: (*cachedout*) Cleanup of a few cases to move to salt.utils.fopen
- #26260: (*nmadhok*) Correct spelling of integration in docs
- #26226: (*rallytime*) Fix ``#25463`_``
- #26248: (*nmadhok*) Initial commit of unit tests for vmware cloud driver
- #26228: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26244: (*nmadhok*) Backport additions to VMware cloud driver from develop to 2015.8 branch
- #26235: (*sjorge*) salt.utils.is\_smartos\_zone, inverse of is\_smartos\_globalzone
- #26221: (*sjorge*) SmartOS grain fixes
- #26218: (*terminalmage*) Add warning about file.recurse unicode errors with vim swap files.
- #26214: (*rallytime*) Back-port #24878 to 2015.8
- #26211: (*techhat*) Move SPM to its own directory
- #26197: (*TronPaul*) Fix GitFS when whitelisting base
- #26200: (*anlutro*) Make it possible to run salt-cloud as current user
- #26201: (*kev009*) Avoid VBox storage emulation bugs in FreeBSD disks grain
- #26188: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26194: (*basepi*) Allow virtual grains to be generated even if virt-what is not available
- #26176: (*rallytime*) Back-port #26165 to 2015.8
- #26169: (*terminalmage*) Fix attribute error in gitfs' find\_file functions
- #26170: (*nmadhok*) [Backport] Make sure variable is a dictionary before popping something from it.
- #26143: (*nmadhok*) VMware cloud driver fixes [forward port from 2015.5 into 2015.8]
- #26173: (*jacobhammons*) Updates to cloud docs for the provider > driver change
- #26125: (*evverx*) Use timedatectl set-timezone to tzsetting if available
- #26145: (*sjorge*) smartos\_imgadm cleanup
- #26148: (*terminalmage*) Refactor winrepo support
- #26128: (*sjorge*) imgadm.avail should return multiple results

- #26109: (*jfindlay*) fix quote indent
- #26089: (*anlutro*) User state/module: fix coercing of None into string ``None" in GECOS
- #26081: (*cachedout*) Move invocation routine up
- #26086: (*rallytime*) Back-port #26019 to 2015.8
- #26087: (*rallytime*) Back-port #26059 to 2015.8
- #26052: (*jtand*) Rh\_ip fix
- #26078: (*cachedout*) Fix missing key in error return
- #26074: (*basepi*) [2015.8] Re-apply #25358 in 2015.8
- #26069: (*jfindlay*) fix win\_firewall.delete\_rule
- #26066: (*s0undt3ch*) [2015.8] Update to latest bootstrap stable release v2015.06.08
- #26049: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #26026: (*anlutro*) Fix httppasswd result false positive in test mode
- #26037: (*rallytime*) Back-port #25489 to 2015.8
- #26004: (*techhat*) Allow updating a single SPM repo at a time
- #26012: (*cachedout*) Merge kwargs into opts for tcp client
- #26007: (*anlutro*) file.managed: wrap os.remove in if isfile, don't remove on success
- #26009: (*terminalmage*) Add winrepo and dockerng information to 2015.8.0 release notes
- #26006: (*basepi*) Revert #25727 in favor of #25645
- #26001: (*cachedout*) Fix failing tests
- #25978: (*anlutro*) Correct service state changes in test mode
- #25982: (*sjorge*) salt.modules.smartos\_\* limit to global zone only
- #25989: (*rallytime*) Back-port #25832 to 2015.8
- #25988: (*cachedout*) Move #25642 to 2015.8
- #25999: (*s0undt3ch*) Include subschema defaults
- #25997: (*s0undt3ch*) Allow getting a defaults dictionary from schema defaults
- #25979: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25902: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25956: (*anlutro*) Fix user argument to cron functions
- #25946: (*sjorge*) Fix for salt.utils.decorators under esky
- #25957: (*anlutro*) Remove temporary file after file.managed with checkcmd
- #25874: (*rallytime*) Back-port #25668 to 2015.8
- #25929: (*sjorge*) salt.module.pkgin's \_\_virtual\_\_() should not return None if pkg\_info is not present
- #25952: (*garthgreenaway*) Log when event.fire and event.fire\_master fail 2015.8
- #25944: (*sjorge*) Smartos libcrypto nonesky fix
- #25906: (*dmurphy18*) Cherry-pick of pkgbuild changes from develop branch
- #25925: (*sjorge*) Create default log location in smartos esky buildscript

- #25928: (*cachedout*) Fix stacktrace for non-existent states
- #25922: (*jacksonj*) Correct `max_wait` -> `max_auth_wait` in `MultiMinion`
- #25907: (*rallytime*) Back-port #25892 to 2015.8
- #25910: (*terminalmage*) Pass `osarch` to `check_32()`
- #25849: (*basepi*) Repress template error for GPG renderer (can't seek an `OrderedDict`)
- #25868: (*rallytime*) Back-port #25404 to 2015.8
- #25896: (*cachedout*) Lint
- #25876: (*jacksonj*) Fixes for 2015.8
- #25867: (*rallytime*) Back-port #25370 to 2015.8
- #25845: (*jacobhammons*) updated versionadded
- #25836: (*jacksonj*) Keep track of `SyncWrapper`'s `IOLoop` usage
- #25859: (*0xf10e*) `warn_until(Carbon,...)` instead of `Boron`
- #25505: (*0xf10e*) Glance state module for 2015.8 ``Beryllium''
- #25843: (*jtand*) Fixed a lint error in `parsers.py`
- #25835: (*techhat*) `spm update_repo` doesn't always require arguments
- #25837: (*jacobhammons*) regenerated man pages
- #25830: (*sjorge*) Loading of `libcrypto` on `smartos esky` fixed
- #25808: (*jfindlay*) add `highstate` opts to `config/__init__.py`, update docs
- #25820: (*sjorge*) Prerequisite to fix the `smartos libcrypto` loading
- #25781: (*anlutro*) Fix `iptables.build_rule`
- #25764: (*gtmanfred*) allow use of `cloudnetworks` in `ssh_interface`
- #25736: (*jfindlay*) insert explicit formatter number
- #25742: (*rallytime*) Back-port #25731 to 2015.8
- #25741: (*rallytime*) Back-port #25727 to 2015.8
- #25712: (*cachedout*) Fix `outputter` for `state.apply`
- #25698: (*rallytime*) Back-port #25659 to 2015.8
- #25690: (*anlutro*) Fix `highstate` duration alignment (again)
- #25684: (*davidjb*) Fix doc around `Include/Exclude` for states
- #25549: (*techhat*) Switch `Scaleway` to `salt.utils.cloud.bootstrap()`
- #25667: (*jfindlay*) add 2015.8.0rc2 autogenerated changelog
- #25653: (*anlutro*) Properly align `highstate` duration sum
- #25663: (*rallytime*) Back-port #25638 to 2015.8
- #25639: (*terminalmage*) Don't do pre-flight check on `git_pillar` if it is not configured
- #25587: (*cachedout*) Fix `prereq` in `salt.state`
- #25628: (*anlutro*) `Highstate` output: show duration in seconds instead of milliseconds when appropriate
- #25631: (*basepi*) Remove trailing whitespace

- #25627: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25626: (*basepi*) Fix the highstate outputter if `duration` is not present
- #25601: (*terminalmage*) Fix error message when local bin pkg path is not absolute
- #25595: (*terminalmage*) Bring git\_pillar up to feature parity with gitfs
- #25619: (*cachedout*) Lint stateconf changes
- #25578: (*davidjb*) Allow parent relative includes in state files
- #25610: (*s0undt3ch*) [2015.8] Update the bootstrap script to latest release v2015.07.22
- #25599: (*jfindlay*) fix transport settings in #25596
- #25596: (*jfindlay*) Tcp test
- #25591: (*garethgreenaway*) Return data for scheduled jobs in 2015.8 default to True.
- #25588: (*basepi*) Fix some of the retcode work from #23105
- #25583: (*jtand*) Fixed lint error where pprint wasn't imported.
- #25572: (*rallytime*) Back-port #25570 to 2015.8
- #25575: (*rallytime*) Make Sure Scaleway driver works with deprecation paths
- #25564: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25566: (*techhat*) Fix download process for SPM repo updates
- #25553: (*techhat*) Switch SoftLayer to salt.utils.cloud.bootstrap()
- #25552: (*techhat*) Update pricing for SoftlayerHW
- #25547: (*techhat*) Switch Parallels to salt.utils.cloud.bootstrap()
- #25548: (*techhat*) Switch Proxmox to salt.utils.cloud.bootstrap()
- #25543: (*techhat*) Switch GCE to salt.utils.cloud.bootstrap()
- #25546: (*techhat*) Switch CloudStack to salt.utils.cloud.bootstrap()
- #25558: (*cachedout*) Lint config\_test
- #25515: (*s0undt3ch*) salt.utils.schema fixes
- #25514: (*garethgreenaway*) fixes to schedule.add documentation in 2015.8
- #25508: (*s0undt3ch*) [2015.8] Update bootstrap script to latest stable release, v2015.07.17
- #25501: (*basepi*) Add optional job end time to the local\_cache returner
- #25491: (*s0undt3ch*) Let's call it for what it is!
- #25462: (*rallytime*) Wrap is\_profile\_configured calls in try/except block
- #25439: (*rallytime*) Reduce digital\_ocean API call frequency
- #25451: (*s0undt3ch*) Salt-SSH Scan roster bugfixes (And Py3 support)
- #25449: (*ruzarowski*) Exclude dotfiles and directories from minion key lists (Fixes `#25448`\_)
- #25421: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25412: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25415: (*bechtoldt*) [docs] declare YAML as code block
- #25407: (*rallytime*) Back-port #23236 to 2015.8

- #25409: (*rallytime*) Back-port #24422 to 2015.8
- #25394: (*rallytime*) Back-port #25355 to 2015.8
- #25393: (*rallytime*) Back-port #25289 to 2015.8
- #25387: (*cachedout*) Lint #25319
- #25319: (*ruzarowski*) [cloud:EC2] Move SourceDest logic to `_update_enis` and add alias for `delete_interface_on_terminate`
- #25310: (*anlutro*) Add an `is list` test to the jinja environment
- #25264: (*ruzarowski*) Fix AttributeError in fileserver `update_opts`
- #25372: (*rallytime*) Don't stacktrace when provisioning instances with `softlayer*` drivers
- #25315: (*ruzarowski*) [cloud:EC2] Move handling of `AssociatePublicIpAddress` to `associate_eip/allocate_new_eip` logic depending on value type
- #25312: (*ruzarowski*) [cloud:EC2] Introduce `eni Name` property to set name tag value after its creation
- #25311: (*ruzarowski*) [cloud:EC2] Add ability to attach an existing `eni`
- #25280: (*rallytime*) Remove deprecation warnings for Beryllium
- #25329: (*twangboy*) Fixed some documentation errors
- #25300: (*s0undt3ch*) Fix ordering issue & Added requirements support
- #25283: (*jfindlay*) ensure `ret` is always defined
- #25252: (*jfindlay*) make `args` optional with default values in `win_firewall.delete_rule`
- #25257: (*notpeter*) Document `SourceDestCheck` added in #25242.
- #25298: (*twangboy*) Continue if profile not found
- #25296: (*twangboy*) Fixed `file.comment` for windows
- #25254: (*rallytime*) Change `versionadded/changed` references from Beryllium to 2015.8.0
- #25285: (*thusoy*) Remove error logging of missing victorops keys
- #25266: (*ruzarowski*) `cloud: EC2 eni property SourceDestCheck` is a `AttributeBooleanValue`
- #25216: (*jfindlay*) replace shell code with native python code
- #25278: (*rallytime*) Don't require size for all cloud drivers when checking profile configs
- #25271: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25263: (*techhat*) Allow non-standard HTTP requests on tornado
- #25253: (*s0undt3ch*) Remove the deprecation warning. The driver has been renamed.
- #25248: (*techhat*) Do not resize while iterating
- #25244: (*rallytime*) Remove parted deprecations and fix failing tests
- #25242: (*ruzarowski*) Make `SourceDestCheck` flag available to network interface definition
- #25226: (*nmadhok*) Backporting fix for issue `'#25223'` on 2015.8 branch
- #25234: (*krak3n*) Fix: Bug in `boto_asg` state argument passing to `boto_asg` module
- #25222: (*rallytime*) Back-port #25219 to 2015.8
- #25188: (*rallytime*) Use `linode` status descriptions instead of `ints` when logging status to CLI
- #25203: (*s0undt3ch*) Added `DictConfig` with tests & More tests

- #25189: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- #25184: (*rallytime*) Back-port #25126 to 2015.8
- #25172: (*s0undt3ch*) Comment out imports while the YAML and RST rendering is not in-place.
- #25158: (*s0undt3ch*) Comment out not implemented code
- #25145: (*s0undt3ch*) Implement *oneOf*, *anyOf*, *allOf* and *not* with unit tests
- #25140: (*s0undt3ch*) Make the detection code work under Python 3.4
- #25131: (*s0undt3ch*) Array support in salt.utils.config
- #25130: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

The 2015.8.0 feature release of Salt contains several major new features. As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

### New SaltStack Installation Repositories

SaltStack now provides installation repositories for several platforms, with more to come. See the following links for instructions:

- *Red Hat / CentOS 5, 6, 7*
- *Debian 8*
- *Windows*
- *FreeBSD*

### Send Event on State Completion

A `fire_event` global state keyword argument was added that allows any state to send an event upon completion. Useful for custom progress bars and checking in on long state runs. See *fire\_event*.

### ZeroMQ socket monitoring

If `zmq_monitor` is enabled, log all ZMQ events for socket monitoring purposes. Verbose, but useful.

### SPM (Salt Package Manager)

Allows Salt formulas to be packaged for ease of deployment. See *spm*.

---

**Note:** The `spm` executable was not included in the Debian or Ubuntu packages for the 2015.8.0 or the 2015.8.1 releases. This executable will be included in an upcoming release. As a workaround, copy the SPM script from the salt library installation into `/usr/local/bin` or your local equivalent.

---

### Specify a Single Environment for Top Files

A new `default_top` option was added to load the state top file from a single, specific environment, rather than merging top data across all environments. Additionally, new `top_file_merge_strategy` and `env_order` options were added for more control over top file merging. See *The Top File*.

## Tornado TCP Transport

Implemented a pure-TCP transport, in addition to ZeroMQ and RAET. The new transport uses Tornado, which allows Salt to use a standardized set of libraries for asynchronous behavior, which should greatly improve reliability and performance.

---

**Note:** Tornado is considered experimental in this release. The following known issues were being investigated at the time of release:

- TCP tests show performance degradation over time ([issue 26051](#))
  - TCP transport stacktrace on windows minion: Future exception was never retrieved ([issue 25718](#))
  - [freebsd] TCP transport not working in 2015.8.0rc3 ([issue 26364](#))
- 

## Proxy Minion Enhancements

Proxy Minions have undergone a significant overhaul in 2015.8, see [Proxy Minion Enhancements](#).

## Engines

Salt engines are long-running, external processes that leverage Salt. See [Salt Engines](#).

## Core Changes

- Add system version info to `versions_report`, which appears in both `salt --versions-report` and `salt '*' test.versions_report`. Also added is an alias `test.versions` to `test.versions_report`. ([issue 21906](#))
- Add colorized console logging support. This is activated by using `%(colorlevel)s`, `%(colorname)s`, `%(colorprocess)s`, `%(colormsg)s` in `log_fmt_console` in the config file for any of `salt-master`, `salt-minion`, and `salt-cloud`.

## Git Pillar

The git external pillar has been rewritten to bring it up to feature parity with `gitfs`. Support for `pygit2` has been added, bringing with it the ability to access authenticated repositories.

Using the new features will require updates to the git ext\_pillar configuration, further details can be found in the [pillar.git\\_pillar](#) docs.

## Salt Cloud Improvements

- Pricing data from several cloud providers (GCE, DigitalOcean, SoftLayer\_HW, EC2)
- All cloud providers now use standardized bootstrapping code.
- Modified the Linode Salt Cloud driver to use Linode's native API instead of depending on `apache-libcloud` or `linode-python`.

## Salt Cloud Changes

- Changed the default behavior of `rename_on_destroy` to be set to `True` in the EC2 and AWS drivers.
- Changed the default behavior of the EC2 and AWS drivers to always check for duplicate names of VMs before trying to create a new VM. Will now throw an error similarly to other salt-cloud drivers when trying to create a VM of the same name, even if the VM is in the `terminated` state.
- When querying for VMs in `digital_ocean.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.Ocean.

## State and Execution Module Improvements

- New and improved Docker state and execution modules (*state* and *execution module*).

## Git State and Execution Modules Rewritten

The git state and execution modules have gone through an extensive overhaul.

### Changes in the `git.latest` State

- The `branch` argument has been added, allowing for a custom branch name to be used in the local checkout maintained by the `git.latest` state. This can be helpful in avoiding ambiguous refs in the local checkout when a tag is used as the `rev` argument. If no `branch` is specified, then the state uses the value of `rev` as the branch name.
- The `always_fetch` argument no longer has any effect, and will be removed in a future release. The state now detects whether or not a fetch is needed based on comparisons made between the local and remote repositories.
- The `force_fetch` argument has been added to force a fetch if the fetch is not a fast-forward (for instance, if someone has done a reset and force-pushed to the remote repository).
- The `remote_name` argument has been deprecated and renamed to `remote`.
- The `force` argument has been deprecated and renamed to `force_clone` to reduce ambiguity with the other `force` arguments.
- Using SHA1 hashes (full or shortened) in the `rev` argument is now properly supported.
- Non-fast-forward merges are now detected before the repository is updated, and the state will not update the repository if the change is not a fast-forward. Non-fast-forward updates must be overridden with the `force_reset` argument. If `force_reset` is set to `True`, the state will only reset the repository if it cannot be fast-forwarded. This is in contrast to the earlier behavior, in which a hard-reset would be performed every time the state was run if `force_reset` was set to `True`.
- A `git pull` is no longer performed by this state, dropped in favor of a fetch-and-merge (or fetch-and-reset) workflow.

**`git.config_unset` state added** This state allows for configuration values (or entire keys) to be unset. See [here](#) for more information and example SLS.

**git.config** State Renamed to **git.config\_set** To reduce confusion after the addition of *git.config\_unset*, the `git.config` state has been renamed to *git.config\_set*. The old `config.get` name will still work for a couple releases, allowing time for SLS files to be updated.

In addition, this state now supports managing multivar git configuration values. See [here](#) for more information and example SLS.

**Initial Support for Git Worktrees in Execution Module** Several functions have been added to the execution module to manage *worktrees* (a feature new to Git 2.5.0). State support does not exist yet, but will follow soon.

#### New Functions in Git Execution Module

- `git.config_get_regexp`
- `git.config_unset`
- `git.is_worktree`
- `git.list_branches`
- `git.list_tags`
- `git.list_worktrees`
- `git.merge_base`
- `git.merge_tree`
- `git.rev_parse`
- `git.version`
- `git.worktree_rm`
- `git.worktree_add`
- `git.worktree_prune`

#### Changes to Functions in Git Execution Module

##### **git.add**

- `--verbose` is now implied when running the `git add` command, to provide a list of the files added in the return data.

##### **git.archive**

- Now returns `True` when the `git archive` command was successful, and otherwise raises an error.
- The `overwrite` argument has been added to prevent an existing archive from being overwritten by this function.
- The `fmt` argument has been deprecated and renamed to `format`.
- Trailing slash no longer implied in `prefix` argument, must be included if this argument is passed.

##### **git.checkout**

- The `rev` argument is now optional when using `-b` or `-B` in `opts`, allowing for a branch to be created (or reset) using `HEAD` as the starting point.

### **git.clone**

- The `name` argument has been added to specify the name of the directory in which to clone the repository. If this option is specified, then the clone will be made within the directory specified by the `cwd`, instead of at that location.
- The `repository` argument has been deprecated and renamed to `url`.

### **git.config\_get**

- The `setting_name` argument has been deprecated and renamed to `key`.
- The `global` argument has been added, to query the global git configuration
- The `all` argument has been added to return a list of all values for the specified key, allowing for all values in a multivar to be returned.
- The `cwd` argument is now optional if `global` is set to `True`

### **git.config\_set**

- The value(s) of the key being set are now returned
- The `setting_name` argument has been deprecated and renamed to `key`.
- The `setting_value` argument has been deprecated and renamed to `value`.
- The `is_global` argument has been deprecated and renamed to `global`.
- The `multivar` argument has been added to specify a list of values to set for the specified key. The `value` argument is not compatible with `multivar`.
- The `add` argument has been added to add a value to a key (this essentially just adds an `--add` to the `git config` command that is run to set the value).

### **git.fetch**

- The `force` argument has been added to force the fetch when it is not a fast-forward. This could have been achieved in previous Salt versions by including `--force` in the `opts` argument, this argument is just for convenience and to match the usage of other functions with `force` arguments.
- The `refspecs` argument has been added to allow for one or more refspecs to be provided which override the one(s) specified by the `remote.remote_name.fetch` git configuration option.

### **git.ls\_remote**

- The `repository` argument has been deprecated and renamed to `remote`.
- The `branch` argument has been deprecated and renamed to `ref`.
- The `opts` argument has been added to allow for additional CLI options to be passed to the `git ls-remote` command.

### **git.merge**

- The `branch` argument has been deprecated and renamed to `rev`.

### **git.status**

- Return data has been changed from a list of lists to a dictionary containing lists of files in the modified, added, deleted, and untracked states.

### **git.submodule**

- Added the `command` argument to allow for operations other than `update` to be run on submodules, and deprecated the `init` argument. To do a submodule update with `init=True` moving forward, use `command=update opts='--init'`.
- OpenStack Glance API V2 execution module
- Amazon VPC state module
- RallyDev execution module
- BambooHR execution module
- Stormpath execution, state modules
- Remove unused argument `timeout` in `jboss7.status`.
- Deprecate `enabled` argument in `pkgrepo.managed` in favor of `disabled`.
- Archive module changes: In the `archive.tar` and `archive.cmd_unzip` module functions, remove the arbitrary prefixing of the options string with `-`. An options string beginning with a `--long-option`, would have uncharacteristically needed its first `-` removed under the former scheme. Also, `tar` will parse its options differently if short options are used with or without a preceding `-`, so it is better to not confuse the user into thinking they're using the non-`-` format, when really they are using the with-`-` format.
- Added `__states__` to state modules, for cross-calling states. This enables using existing states when writing custom states. See *cross calling states*.

## **Windows Improvements**

- Enhanced the windows minion silent installation with command line parameters to configure the salt master and minion name. See *Silent Installer Options*.
- Improved user management with additional capabilities in the user module for Windows.
- Improved patch management with a new module for managing windows updates (`win_wua`).
- Turned on multi-processing by default for windows in minion configuration.

## **Windows Software Repo Changes**

A next-generation (ng) windows software repo is available for 2015.8.0 and later minions. When using this new repository, the repo cache is compiled on the Salt Minion, which enables pillar, grains and other things to be available during compilation time.

See the *Windows Software Repository* documentation for more information.

**Changes to legacy Windows repository** If you have pre 2015.8 Windows minions connecting to your 2015.8 Salt master, you can continue to use the legacy Windows repository for these Salt minions.

If you were previously using this repository and have customized settings, be aware that several config options have been renamed to make their naming more consistent.

See the *Windows Software Repository* documentation for more information.

## Win System Module

The unit of the `timeout` parameter in the `system.halt`, `system.poweroff`, `system.reboot`, and `system.shutdown` functions has been changed from seconds to minutes in order to be consistent with the linux timeout setting. ([issue 24411](#)) Optionally, the unit can be reverted to seconds by specifying `in_seconds=True`.

## Other Improvements

- Sanitize sensitive fields in `http.query`
- Allow authorization to be read from Django and eauth
- Add templating to SMTP returner
- New REST module for SDB
- Added `rest_timeout` config option and `timeout` argument to jobs api call
- Provide config options for Raet lane and road buffer count. (Useful for BSD kernels)
- Implemented ZeroMQ socket monitor for master and minion
- Add end time to master job cache for jobs (optional, off by default)
- Tornado is now the default backend for `http.request`
- Support `pillarenv` selection as it's done for `saltenv`
- salt was updated to use `python-crypto` version 2.6.1, which removes the dependency on `python-m2crypto`.

## Deprecations

- The `digital_ocean.py` Salt Cloud driver was removed in favor of the `digital_ocean_v2.py` driver as DigitalOcean has removed support for APIv1. The `digital_ocean_v2.py` was renamed to `digital_ocean.py` and supports DigitalOcean's APIv2.
- The `vsphere.py` Salt Cloud driver has been deprecated in favor of the `vmware.py` driver.
- The `openstack.py` Salt Cloud driver has been deprecated in favor of the `nova.py` driver.
- The use of `provider` in Salt Cloud provider files to define cloud drivers has been deprecated in favor of using `driver`. Both terms will work until the Nitrogen release of Salt. Example provider file:

```
my-ec2-cloud-config:
  id: 'HJGRYCILJLKJYG'
  key: 'kdjgfgsm;woormgl/asorigjksjdhasdfgn'
  private_key: /etc/salt/my_test_key.pem
  keyname: my_test_key
  securitygroup: default
  driver: ec2
```

- The use of `lock` has been deprecated and from `salt.utils.fopen`. `salt.utils.flopen` should be used instead.
- The following args have been deprecated from the `rabbitmq_vhost.present` state: `user`, `owner`, `conf`, `write`, `read`, and `runas`.
- The use of `runas` has been deprecated from the `rabbitmq_vhost.absent` state.
- Support for output in `mine.get` was removed. `--out` should be used instead.

- The use of `delim` was removed from the following functions in the `match` execution module: `pillar_pcre`, `pillar`, `grain_pcre`,

## Security Fixes

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

## Major Bug Fixes

- Fixed minion failover to next master on DNS errors ([issue 21082](#))
- Fixed memory consumption in SaltEvents ([issue 25557](#))
- Don't lookup outside system path in `which()` util ([issue 24085](#))
- Fixed broken jobs rest api call ([issue 23408](#))
- Fixed stale grains data using in modules ([issue 24073](#))
- Added `ssh_identities_only` config flag for ssh-agent configured environments ([issue 24096](#))
- Fixed ```object has no attribute"` errors for Raet transport ([issue 21640](#))
- Flush event returners before master exit ([issue 22814](#))
- Fix `CommandExecutionError` in grains generation with `lspci` missing ([issue 23342](#))
- Fix salt-ssh against CentOS 7 when `python-zmq` not installed ([issue 23503](#))
- Fix salt-ssh issues related to out-of-date `six` module ([issue 20949](#))
- Fix salt-ssh thin generation after previous run was interrupted ([issue 24376](#))
- Use proper line endings on Windows with ```file.managed" w/contents` ([issue 25675](#))
- Fixed broken `comment/uncomment` functions in `file.py` ([issue 24620](#))
- Fixed problem with unicode when changing computer description ([issue 12255](#))
- Fixed problem with `chocolatey` module not loading ([issue 25717](#))
- Fixed problem adding users to groups with spaces in the name ([issue 25144](#))
- Fixed problem adding full name to user account ([issue 25206](#))
- Fixed `gem` module stack trace ([issue 21041](#))
- Fixed problem with `file.managed` when `test=True` ([issue 20441](#))
- Fixed problem with powershell hanging while waiting for user input ([issue 13943](#))
- Fixed problem where the salt-minion service would not consistently start ([issue 25272](#))
- Fixed problem where `pkg.refresh_db` would return `True` even when `winrepo.p` was not found ([issue 18919](#))
- Could someone please provide end to end example for Proxy Minion with REST ([issue 25500](#))
- Proxy minions stopped working between 2014.7 and 2015.5 ([issue 25053](#))
- Proxy minion documentation includes outdated code sample ([issue 24018](#))
- Proxy Minion documentation missing grains example ([issue 18273](#))

- Improve process management in proxy minion ([issue 12024](#))
- Proxy minion never comes up with message `I am XXX and I am not supposed to start any proxies!` ([issue 25908](#))
- Fixed an issue that caused an exception when using Salt mine from pillar. ([issue 11509](#))

### 37.2.2 Salt 2015.8.1 Release Notes

Version 2015.8.1 is a bugfix release for 2015.8.0.

#### Security Fixes

CVE-2015-6941 - `win_useradd` module and `salt-cloud` display passwords in debug log

Updated the `win_useradd` module return data to no longer include the password of the newly created user. The password is now replaced with the string `XXX-REDACTED-XXX`. Updated the Salt Cloud debug output to no longer display `win_password` and `sudo_password` authentication credentials. Also updated the Linode driver to no longer display authentication credentials in debug logs. These credentials are now replaced with `REDACTED` in the debug output.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with `REDACTED` in the debug output. Thanks to Andreas Stieger <[asteiger@suse.com](mailto:asteiger@suse.com)> for bringing this to our attention.

#### Major Bug Fixes

- Add support for `spm.d/*.conf` configuration of SPM ([issue 27010](#))
- Fix proxy grains breakage for non-proxy minions ([issue 27039](#))
- Fix global key management for git state
- Fix passing http auth to `util.http` from `state.file` ([issue 21917](#))
- Fix `multiprocessing: True` in windows (on by default)
- Add `pkg.info` to pkg modules
- Fix name of `serial` grain (this was accidentally renamed in 2015.8.0)
- Merge config values from `master.d/minion.d` conf files (rather than flat update)
- Clean grains cache on grains sync ([issue 19853](#))
- Remove streamed response for fileclient to avoid HTTP redirection problems ([issue 27093](#))
- Fixed incorrect warning about `osrelease` grain ([issue 27065](#))
- Fix authentication via Salt-API with tokens ([issue 27270](#))
- Fix winrepo downloads from https locations ([issue 27081](#))
- Fix potential error with salt-call as non-root user ([issue 26889](#))
- Fix global minion provider overrides ([issue 27209](#))
- Fix backward compatibility issues for pecl modules
- Fix Windows uninstaller to only remove `./bin, salt*, nssm.exe, uninst.exe` ([issue 27383](#))

- Fix misc issues with mongo returner.
- Add sudo option to cloud config files ([issue 27398](#))
- Fix regression in RunnerClient argument handling ([issue 25107](#))
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig ([issue 27265](#))
- Fix `dockerng.running` replacing creation hostconfig with runtime hostconfig ([issue 27265](#))
- Increased performance on boto asg/elb states due to `__states__` integration
- Windows minion no longer requires powershell to restart ([issue 26629](#))
- Fix x509 module to support recent versions of OpenSSL ([issue 27326](#))
- Some issues with proxy minions were corrected.

Known Issues:

- Proxy minions currently cannot execute a highstate because of the way the proxymodule is being loaded internally. This will be fixed in a future release.

### Changes for v2015.8.0..v2015.8.1

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2015-10-01T04:45:02Z

Total Merges: 200

Changes:

- **PR #27584:** (*jacobhammons*) added changes list to 2015.8.1 release notes
- **PR #27575:** (*rallytime*) Don't report existing instances as running only if they're actually terminated in EC2
- **PR #27573:** (*basepi*) [2015.8] Use the custom yaml serializer for minion\_opts for salt-ssh
- **PR #27514:** (*clinta*) Recent Versions of OpenSSL don't allow importing incomplete PEMs
- **PR #27564:** (*jacobhammons*) Man pages
- **PR #27522:** (*twangboy*) Removed dependency on powershell to restart salt-minion
- **PR #27550:** (*rallytime*) [2015.8] Clean up salt-cloud logging and make it more useful
- **PR #27517:** (*jacobhammons*) Updated install docs
- **PR #27526:** (*eliasp*) Add missing newlines before param listing to fix doc rendering
- **PR #27525:** (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- **PR #27513:** (*terminalmage*) Fix integration tests for worktree addition in git >= 2.6
- **PR #27510:** (*rallytime*) Merge #27475 with test fixes
- **PR #27451:** (*ticosax*) [dockerng] Enforce usage of host\_config and require docker-py>=1.4.0
- **PR #27461:** (*cachedout*) Only clean context if it exists
- **PR #27473:** (*terminalmage*) salt.utils.gitfs: Don't use close\_fds=True on Windows
- **PR #27496:** (*blueyed*) Fix version reporting of gitpython
- **PR #27502:** (*ticosax*) Add test to check we don't call inspect\_image on absent images.
- **PR #27497:** (*blueyed*) dockerng: fix image\_present for forced, non-existent image

- PR #27411: (*terminalmage*) Fix invocation of `git.config_get` and `git.config_set`
- PR #27477: (*terminalmage*) Don't append role to `hash_cachedir`
- PR #27474: (*whiteinge*) Add fake pymongo version attribute for the docs
- PR #27466: (*blueyed*) Fix version reporting of `python-gnupg` and `mysql-python`
- PR #27465: (*ticosax*) Fix usage of `dockerng ``cmd``` was #27459
- PR #27417: (*whiteinge*) Backport #25243 into 2015.8
- PR #27423: (*dmurphy18*) Changes to support configurable repository for Debian / Ubuntu
- PR #27428: (*rallytime*) Back-port #27398 to 2015.8
- PR #27429: (*rallytime*) Back-port #27344 to 2015.8
- PR #27450: (*ticosax*) [`dockerng`] Fix typo in docstring
- PR #27430: (*jacksonjtj*) Fix bug introduced in `eee0291ff8b65ff1e22f4dc2447a74aa28a3ce7f`
- PR #27418: (*terminalmage*) Don't always remove dest path in `salt.utils.files.rename()`
- PR #27383: (*twangboy*) Uninstaller only removes specific files and dirs
- PR #27416: (*rallytime*) Back-port #27399 to 2015.8
- PR #27394: (*jacksonjtj*) Remove streamed response for fileclient to avoid HTTP redirection problems
- PR #27415: (*ryan-lane*) Backwards compat fixes for `pecl` module
- PR #27407: (*meggiebot*) Adding stretch label definition
- PR #27388: (*basepi*) [2015.8] Fix global provider overrides
- PR #27386: (*rallytime*) Document `tty`: True usage in `salt-ssh` roster file
- PR #27380: (*jtand*) Skipping Async tests
- PR #27382: (*terminalmage*) Revert ``fixes `#27217` \_clear\_old\_remotes clears wrong directory (gitfs)``
- PR #27361: (*cro*) Correct some issues with proxy minions
- PR #27364: (*ruzarowski*) SaltCloud[EC2] Fix missing credentials in `modify_eni_properties` api call
- PR #27349: (*jfindlay*) add freebsd install docs to release notes
- PR #27343: (*cachedout*) Close io loop before deleting attribute
- PR #27337: (*rallytime*) [2015.8] Fixup salt-cloud logging
- PR #27332: (*terminalmage*) Adjust `dockerng/dockerio` docstrings
- PR #27353: (*cachedout*) Fix case where `var` not set in config
- PR #27350: (*rallytime*) Allow IP-forwarding in GCE driver
- PR #27305: (*cachedout*) Re-init logging system on Windows when using multiprocessing
- PR #27331: (*terminalmage*) `dockerng`: Allow both `cmd` and `command` to be used to specify command
- PR #27327: (*isbm*) Fix a typo in the RPM output
- PR #27312: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27303: (*jacobhammons*) Updated module doc index using <https://github.com/saltstack/salt/pull...>
- PR #27301: (*twangboy*) Pass `ca_bundle` for windows (fixes SSL Error)
- PR #27300: (*rallytime*) Back-port #27287 to 2015.8

- PR #27288: (*rallytime*) Filter on `name`, not `id`, when listing images
- PR #27283: (*jland*) `__grains__['osrelease']` returns a string
- PR #27276: (*rallytime*) Back-port #27218 to 2015.8
- PR #27275: (*rallytime*) Back-port #27213 to 2015.8
- PR #27274: (*rallytime*) Back-port #27272 to 2015.8
- PR #27271: (*isbm*) Bugfix: crash on token authentication via API
- PR #27251: (*rallytime*) Add support for `post_uri` in SoftLayer cloud drivers
- PR #27260: (*bechtoldt*) add missing module doc references
- PR #27254: (*jfindlay*) 2015.2,2015.8,Beryllium -> 2015.8.0
- PR #27245: (*rallytime*) If two ssh keynames are found in DigitalOcean, abort and warn the user.
- PR #27241: (*jfindlay*) `osrelease` is only an integer for fedora
- PR #27234: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27240: (*isbm*) Backport of the fix of ``pkg.info*'` for Beryllium
- PR #27223: (*pprkt*) Support firewalld per interface zone config on rh7 systems
- PR #27238: (*bechtoldt*) `salt.modules.disk.percent()` throws `KeyError` when partition doesn't exist
- PR #27232: (*basepi*) [2015.8] Add stub release notes for 2015.8.1
- PR #27199: (*rallytime*) Avoid `RunTimeError` (dictionary changed size during iteration) with `keys()`
- PR #27206: (*rallytime*) Don't repeat GCE setup instructions, and make the use of `.json` files clearer
- PR #27210: (*rallytime*) Refactor some digital ocean functions
- PR #27197: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27195: (*jacobhammons*) Fixed sphinx / latex build warnings and errors
- PR #27182: (*bernieke*) fix `restart_on_error`
- PR #27163: (*terminalmage*) Workaround upstream tornado bug affecting redirects
- PR #27177: (*rallytime*) Remove note - incorrect info
- PR #27173: (*rallytime*) Add the ability to specify multiple disks on the SoftLayer driver
- PR #27164: (*rallytime*) Make sure changes from #26824 to `digital_ocean_v2.py` driver make it to `digital_ocean.py` in 2015.8
- PR #27143: (*cachedout*) Clean grains cache on grains sync
- PR #27150: (*cachedout*) Merge config values from `master.d/minion.d` conf files
- PR #27137: (*jfindlay*) revert serial grain regression
- PR #27144: (*rallytime*) Don't stacktrace on `softlayer_hw.show_all_prices` if a code isn't supplied
- PR #27139: (*jacobhammons*) Updated key instruction on rhel7
- PR #27134: (*isbm*) Backport to 2015.8: ```pkg.info''`
- PR #27119: (*l2ol33rt*) Boto dynamodb module should be using layer 2 abstractions
- PR #27092: (*perfinion*) `salt/master: chdir` to root not `homedir`
- PR #27131: (*jacobhammons*) Install docs

- PR #27124: (*jfindlay*) Backport #27123
- PR #27111: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27122: (*terminalmage*) Fix broken link to git-config(1) docs
- PR #27115: (*jacobhammons*) Release docs
- PR #27110: (*rallytime*) Make sure -Q output is consistent across salt-cloud drivers
- PR #27050: (*twangboy*) Turned multiprocessing on
- PR #27086: (*techhat*) Document development of SPM loader modules
- PR #26941: (*mstead*) Make elasticsearch work as master job cache
- PR #27080: (*bechtoldt*) [Proposal] Add Github SPM label for issues
- PR #27064: (*twangboy*) Fixed user docs
- PR #27072: (*rallytime*) Back-port #26840 to 2015.8
- PR #27060: (*cro*) Fix grains breakage when hosts are not Linux, Windows, or SunOS
- PR #27051: (*rallytime*) Back-port #26953 to 2015.8
- PR #26864: (*terminalmage*) Only do git\_pillar preflight checks on new-style git\_pillar configs
- PR #26967: (*TheBigBear*) new URL for windows salt downloads
- PR #26921: (*terminalmage*) Get rid of error in legacy git pillar when using branch mapping notation
- PR #26923: (*rallytime*) Code clean up of cloud drivers and files
- PR #27010: (*rallytime*) Back-port #26988 to 2015.8
- PR #26985: (*rallytime*) Fix versionadded tag

### 37.2.3 Salt 2015.8.2 Release Notes

---

**Note:** A significant orchestrate issue #29110 was discovered during the release process of 2015.8.2, so it has not been officially released. Please use 2015.8.3 instead.

---

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2015-11-13T17:24:04Z

Total Merges: 378

Changes:

- PR #28730: (*garethgreenaway*) Fixes to how return\_job is handled in the scheduler for the salt master.
- PR #28848: (*cro*) Lint
- PR #28842: (*cachedout*) Add transport setting to shell test
- PR #28837: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28827: (*jackson tj*) Cleanup virtual\_timer in loader
- PR #28836: (*cachedout*) Cast to dict to fix wheel tests in tcp
- PR #28834: (*cachedout*) Fix breakage in tcp server
- PR #28804: (*cachedout*) TCP test fixes

- PR #28826: (*basepi*) [2015.8] Add new tornado deps to salt-ssh thin
- PR #28759: (*jfindlay*) simplify stdin use of stdin in at.present state
- PR #28824: (*rallytime*) Back-port #28778 and #28820 to 2015.8
- PR #28803: (*jfindlay*) decode strings to utf-8
- PR #28782: (*rallytime*) Fixes to rabbitmq user state
- PR #28789: (*nmadhok*) Provide ability to enable/disable customization for newly create VMs using VMware salt-cloud driver
- PR #28768: (*mrosedale*) 2015.8
- PR #28772: (*rallytime*) rabbitmq.list\_user\_permissions returns a dict, not a list. Don't expect a list.
- PR #28774: (*rallytime*) Back-port #28725 to 2015.8
- PR #28775: (*rallytime*) Back-port #28740 to 2015.8
- PR #28755: (*rallytime*) Move most vmware driver list\_\* functions to use salt.utils.vmware functions
- PR #28744: (*jfindlay*) import gate elementtree
- PR #28758: (*jfindlay*) remove redundant logic in useradd execution module
- PR #28757: (*mbarrien*) Bug fix: pip command to not quote spaces in cmd line args
- PR #28764: (*multani*) Various documentation fixes
- PR #28752: (*aboe76*) Update openSUSE grain for tumbleweed
- PR #28713: (*hexedpackets*) Rename consul.list to consul.list\_keys.
- PR #28719: (*jacobhammons*) removed dependencies info from docs
- PR #28709: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28710: (*rallytime*) Pass kwargs correctly to \_get\_group from get\_group\_id
- PR #28698: (*rallytime*) Back-port #28530 to 2015.8
- PR #28700: (*rallytime*) Back-port #28679 to 2015.8
- PR #28695: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.09
- PR #28656: (*clarkperkins*) `#28526`\_ fixed yumpkg module issue with pkg.installed
- PR #28672: (*jfindlay*) add OS grain support for SuSE Leap
- PR #28673: (*jfindlay*) add hidden\_opts to mount.mounted
- PR #28667: (*cro*) saltutil.sync\_all should sync proxymodules as well as the rest.
- PR #28665: (*jfindlay*) fixes to windows execution and state modules
- PR #28660: (*techhat*) Don't sign empty regions
- PR #28632: (*terminalmage*) Fixes/improvements to pkgbuild state/modules
- PR #28658: (*techhat*) Remove \_pkgdb\_fun() references
- PR #28653: (*rallytime*) Provide possible parameters for boto\_rds.present engine values
- PR #28649: (*bdrung*) Fix OS related grains on Debian
- PR #28646: (*rallytime*) Back-port #28614 to 2015.8
- PR #28647: (*rallytime*) Back-port #28624 to 2015.8

- PR #28648: (*rallytime*) Merge branch `2015.5` into `2015.8`
- PR #28638: (*anlutro*) Salt-SSH: Return more concise error when SSH command fails
- PR #28644: (*pass-by-value*) Make sure versionchanged is correct
- PR #28615: (*The-Loeki*) Fixes to FreeBSD pkg
- PR #28613: (*cachedout*) Add facility to deepcopy bound methods in Py2.6 and apply to grains
- PR #28612: (*rallytime*) Remove unsupported storage\_type argument for parity with boto\_rds module
- PR #28611: (*rallytime*) [2015.8] Be explicit about salt.utils.vmware function calls
- PR #28610: (*pass-by-value*) Lxc config additions
- PR #28602: (*nasenbaer13*) Allow setting of custom dimensions in asg alarm specification
- PR #28596: (*rallytime*) Merge branch `2015.5` into `2015.8`
- PR #28593: (*blueyed*) doc: fix typo with salt.states.file: s/preseve/preserve/
- PR #28578: (*twangboy*) Fixed the script... something got broke...
- PR #28579: (*jfindlay*) fix \_\_virtual\_\_ returns: tls,uptime mods
- PR #28584: (*rallytime*) If AssociatePublicIpAddress is set to True, don't auto-assign eip.
- PR #28576: (*jackson tj*) Only encode the zmq message once
- PR #28587: (*cachedout*) Reset yaml rendering hooks to avoid leaks
- PR #28581: (*basepi*) Revert b4875e585a165482c4c1ddc8987d76b0a71ef1b0
- PR #28573: (*jackson tj*) Add body to salt.utils.http.query returns
- PR #28564: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.04
- PR #28561: (*Oro*) Issue `#28527` \_ boto\_rds.create does not work
- PR #28560: (*bdrung*) Fix various typos
- PR #28550: (*jfindlay*) check timedatectl errno and return stdout on failure
- PR #28545: (*jfindlay*) pass on concurrent create of jid\_dir in local\_cache
- PR #28544: (*rallytime*) Start moving some vmware.py cloud funcs to utils/vmware.py
- PR #28543: (*gtmanfred*) clean up changes for pkg.uptodate and supervisord.dead
- PR #28538: (*jfindlay*) decode path and url to utf-8 in url.create
- PR #28533: (*jfindlay*) decode highstate error messages to utf-8
- PR #28547: (*nmadhok*) [Backport] [2015.8] Tasks can be in queued state instead of running
- PR #28535: (*techhat*) Fail gracefully if 169.254\* isn't available
- PR #28536: (*cro*) Default configuration file for proxy minions.
- PR #28534: (*rallytime*) Add versionadded directive for vpc\_name arg in boto\_secgroup.present
- PR #28516: (*rallytime*) Back-port #28489 to 2015.8
- PR #28506: (*basepi*) [2015.8] Log minion list for all rosters, at debug level
- PR #28514: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28502: (*cachedout*) Lint #28427
- PR #28464: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #28486: (*rallytime*) Back-port #26945 to 2015.8
- PR #28472: (*gtmanfred*) overwrite more than one value with names
- PR #28493: (*rallytime*) Back-port #28492 to 2015.8
- PR #28494: (*whiteinge*) Fix filter\_by passing incorrect parameters to match functions
- PR #28491: (*rallytime*) Back-port #28388 to 2015.8
- PR #28465: (*twangboy*) Fix `#12363`\_: Password Expiration in Windows
- PR #28485: (*nasenbaer13*) Fix invalid usage of `_get_conn` causing `#28484`\_
- PR #28454: (*sdm24*) Fixed nodegroup doc formatting to correctly link to pillar\_opts in the master config
- PR #28487: (*cachedout*) Lint 28456
- PR #28457: (*sdm24*) Clarified comments for grains/core.py for ip\_interfaces, ip4\_interfac...
- PR #28473: (*anlutro*) Show check\_cmd output on failure
- PR #28460: (*jtand*) Skipped wipefs test if wipefs does not exist on OS
- PR #28426: (*terminalmage*) pkgbuild.built: make template engine optional
- PR #28422: (*cachedout*) Handle windows logging on thread\_multi [WIP]
- PR #28425: (*twangboy*) Fix `#13513`\_ - Reflection
- PR #28417: (*rallytime*) Add note about azure sdk version to getting started docs
- PR #28410: (*jacksonjtj*) Add retries to the zeromq.AsyncReqMessageClient
- PR #28404: (*rallytime*) Back-port #28395 to 2015.8
- PR #28405: (*opdude*) Detect legacy versions of chocolatey correctly
- PR #28187: (*sjansen*) fix at.present
- PR #28375: (*merll*) Merge pillar includes correctly
- PR #28376: (*ryan-lane*) Support update of route53 records with multiple values
- PR #28377: (*terminalmage*) Deprecate `always` in favor of `force` in pkgbuild.built
- PR #28380: (*cro*) Add missing call for service provider
- PR #28348: (*jfindlay*) salt.utils.alias informs user they are using a renamed function
- PR #28364: (*jtand*) In CentOS 5 the `.split()` causes a stacktrace.
- PR #28361: (*rallytime*) Back-port #28087 to 2015.8
- PR #28360: (*multani*) Various documentation fixes
- PR #28370: (*rallytime*) Back-port #28276 to 2015.8
- PR #28353: (*merll*) Consider each pillar match only once.
- PR #28334: (*anlutro*) iptables needs -m comment for --comment to work
- PR #28340: (*jfindlay*) sdecode file and dir lists in fileclient
- PR #28344: (*ryan-lane*) Fix iptables state for non-filter tables
- PR #28343: (*rallytime*) Back-port #28342 to 2015.8
- PR #28330: (*rallytime*) Back-port #28305 to 2015.8
- PR #28270: (*rallytime*) Refactor RabbitMQ Plugin State to correctly use test=true and format errors

- PR #28269: (*rallytime*) Refactor rabbitmq\_user state to use test=True correctly
- PR #28299: (*rallytime*) Add test for availability\_zone check to boto\_vpc\_tests
- PR #28306: (*sdm24*) Updated the Nodegroup docs to include how to target nodegroups in SLS Jinja
- PR #28308: (*rallytime*) Firewalld state services should use --add-service, not --new-service
- PR #28302: (*DmitryKuzmenko*) Always close socket even if there is no stream.
- PR #28282: (*keesbos*) Fix for \_\_env\_\_ in legacy git\_pillar
- PR #28258: (*pass-by-value*) Add service module for ssh proxy example
- PR #28294: (*bechtoldt*) correct a bad default value in http utility
- PR #28185: (*jtand*) Added single package return for latest\_version, fixed other bug.
- PR #28297: (*cachedout*) Lint fix proxy junos
- PR #28210: (*terminalmage*) Fix for ext\_pillar being compiled twice in legacy git\_pillar code
- PR #28265: (*jfindlay*) fix blockdev execution and state modules
- PR #28266: (*rallytime*) Back-port #28260 to 2015.8
- PR #28253: (*rallytime*) Back-port #28063 to 2015.8
- PR #28231: (*rallytime*) Make sure we're comparing strings when getting images in the DO driver
- PR #28224: (*techhat*) Optimize create\_repo for large packages
- PR #28214: (*rallytime*) Don't stacktrace if invalid credentials are passed to boto\_route53 state
- PR #28228: (*rallytime*) Back-port #27562 to 2015.8
- PR #28232: (*rallytime*) Add documentation to supply the ssh\_username: freebsd config to DO docs
- PR #28198: (*jacobhammons*) Added note regarding missing spm exe on Debian/Ubuntu
- PR #28182: (*erchn*) Some fixes for nova driver for Rackspace
- PR #28181: (*rallytime*) Revamp firewalld state to be more stateful.
- PR #28176: (*cro*) Add ping function
- PR #28167: (*The-Loeki*) file.serialize needs to add a final newline to serialized files
- PR #28168: (*rallytime*) Make sure availability zone gets passed in boto\_vpc module when creating subnet
- PR #28148: (*basepi*) [2015.8] Only expand nodegroups to lists if there is a nested nodegroup
- PR #28155: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28149: (*pass-by-value*) Add clarification to cloud profile doc about host
- PR #28146: (*cachedout*) Lint dracr.py
- PR #28141: (*rallytime*) Don't use RAM for root disk size in linode.py
- PR #28143: (*jtand*) Removed blank line at end of chassis.py
- PR #28021: (*blueyed*) Handle includes in include\_config recursively
- PR #28095: (*rallytime*) Back-port #28001 to 2015.8
- PR #28096: (*rallytime*) Back-port #28061 to 2015.8
- PR #28139: (*rallytime*) Back-port #28103 to 2015.8
- PR #28098: (*jackson tj*) For all multi-part messages, check the headers. If the header is not ...

- PR #28134: (*bernieke*) fix unicode pillar values ``#3436`_`
- PR #28076: (*redmcg*) Replace option ``i`` with an explicit queryformat
- PR #28119: (*jacksonjtj*) Check if the remote exists before casting to a string.
- PR #28105: (*jfindlay*) add reason for not loading localemod
- PR #28108: (*cachedout*) Set logfile permissions correctly
- PR #27922: (*cro*) WIP States/Modules for managing Dell FX2 chassis via salt-proxy
- PR #28104: (*pass-by-value*) Add documentation for proxy minion ssh
- PR #28020: (*DmitryKuzmenko*) LazyLoader deepcopy fix.
- PR #27933: (*eliasp*) Provide all git pillar dirs in `opts[pillar_roots]`
- PR #28013: (*rallytime*) Back-port #27891 to 2015.8
- PR #28018: (*rallytime*) Add example to Writing Grains of how grains can be loaded twice
- PR #28084: (*cachedout*) #28069 with lint
- PR #28079: (*The-Loeki*) Fix for trace dump on failing imports for win32com & pythoncom 4 win\_task
- PR #28081: (*The-Loeki*) fix for glance state trace error on import failure
- PR #28066: (*jacksonjtj*) Use the generic `text` attribute, not `.body` of the handler
- PR #28019: (*rallytime*) Clean up version added and deprecated msgs to be accurate
- PR #28058: (*rallytime*) Back-port #28041 to 2015.8
- PR #28055: (*rallytime*) Back-port #28043 to 2015.8
- PR #28046: (*pass-by-value*) Add pkg install and remove functions
- PR #28050: (*ryan-lane*) Use a better method for checking dynamodb table existence
- PR #28042: (*jfindlay*) fix repo path in ubuntu installation documentation
- PR #28033: (*twangboy*) Fixed win\_useradd.py
- PR #28027: (*cro*) Make ssh conn persistent.
- PR #28029: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28022: (*jacobhammons*) Updated Debian and Ubuntu repo paths with new structure for 2015.8.1
- PR #27983: (*rallytime*) Pip state run result should be False, not None, if installation error occurs.
- PR #27991: (*twangboy*) Fix for ``#20678`_`
- PR #27997: (*rallytime*) Remove note about pip bug with pip v1 vs pip v2 return codes
- PR #27994: (*jtand*) Fix schedule\_test failure
- PR #27992: (*cachedout*) Make load beacon config into list
- PR #28003: (*twangboy*) Fix ``#26336`_`
- PR #27984: (*rallytime*) Versionadded for clean\_file option for pkgrepo
- PR #27989: (*ryan-lane*) Do not try to remove the main route table association
- PR #27982: (*pass-by-value*) Add example for salt-proxy over SSH
- PR #27985: (*jacobhammons*) Changed current release to 8.1 and added CVEs to release notes
- PR #27979: (*cachedout*) Fix regression with key whitespace

- PR #27977: (*cachedout*) Decode unicode names in fileclient/server
- PR #27981: (*jtand*) Fixed trailing whitespace lint
- PR #27969: (*jeffreycatang*) fix parse of { on next line
- PR #27978: (*terminalmage*) Add note about dockerng.inspect\_image usage
- PR #27955: (*pass-by-value*) Bp 27868
- PR #27953: (*The-Loeki*) Fix CloudStack cloud for new `driver` syntax
- PR #27965: (*ryan-lane*) Fail in boto\_asg.present if alarms fail
- PR #27958: (*twangboy*) Added new functionality to win\_task.py
- PR #27959: (*techhat*) Change \_\_opts\_\_ to self.opts
- PR #27943: (*rallytime*) Back-port #27910 to 2015.8
- PR #27944: (*rallytime*) Back-port #27909 to 2015.8
- PR #27946: (*jtand*) Changed grain to look at osmajorrelease instead of osrelease
- PR #27914: (*rallytime*) Use eipalloc instead of eni in EC2 interface properties example
- PR #27926: (*rallytime*) Back-port #27905 to 2015.8
- PR #27927: (*ryan-lane*) Do not manage ingress or egress rules if set to None
- PR #27928: (*rallytime*) Back-port #27908 to 2015.8
- PR #27676: (*ticosax*) [dockerng] WIP No more runtime args passed to docker.start()
- PR #27885: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27882: (*twangboy*) Created win\_task.py module
- PR #27802: (*terminalmage*) Correct warning logging when update lock is present for git\_pillar/winrepo, add runner function for clearing git\_pillar/winrepo locks
- PR #27886: (*rallytime*) Handle group lists as well as comma-separated group strings.
- PR #27746: (*anlutro*) timezone module: handle timedatectl errors
- PR #27816: (*anlutro*) Make system.reboot use *shutdown -r* when available
- PR #27874: (*rallytime*) Add mention of Periodic Table naming scheme to deprecation docs
- PR #27883: (*terminalmage*) Work around --is-ancestor not being present in git-merge-base before git 1.8.0
- PR #27877: (*rallytime*) Back-port #27774 to 2015.8
- PR #27878: (*rallytime*) Use apache2ctl binary on SUSE in apache module
- PR #27879: (*cro*) Add docs for 2015.8.2+ changes to proxies
- PR #27731: (*cro*) Add \_\_proxy\_\_ to replace opts['proxymodule']
- PR #27745: (*anlutro*) Add pip\_upgrade arg to virtualenv.managed state
- PR #27809: (*ticosax*) [dockerng] Remove dockerng.ps caching
- PR #27859: (*ticosax*) [dockerng] Clarify doc port bindings
- PR #27748: (*multani*) Fix ``#8646`_``
- PR #27850: (*rallytime*) Back-port #27722 to 2015.8
- PR #27851: (*rallytime*) Back-port #27771 to 2015.8

- PR #27833: (*jfindlay*) decode path before string ops in fileclient
- PR #27837: (*jfindlay*) reverse truth in python\_shell documentation
- PR #27860: (*flavio*) Fix OS related grains on openSUSE and SUSE Linux Enterprise
- PR #27768: (*rallytime*) Clean up bootstrap function to be slightly cleaner
- PR #27797: (*isbm*) Zypper module clusterfix
- PR #27849: (*rallytime*) Don't require a size parameter for proxmox profiles
- PR #27827: (*techhat*) Add additional error checking to SPM
- PR #27826: (*martinhoefling*) Fixes ``#27825`_`
- PR #27824: (*techhat*) Update Azure errors
- PR #27795: (*eguwen*) better change reporting for postgres\_user groups
- PR #27799: (*terminalmage*) Fix usage of identity file in git.latest
- PR #27717: (*pass-by-value*) Proxy beacon example
- PR #27793: (*anlutro*) update code that changes log level of salt-ssh shim command
- PR #27761: (*terminalmage*) Merge git pillar data instead of using dict.update()
- PR #27741: (*ticosax*) [dockerng] pass filters argument to dockerng.ps
- PR #27760: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27757: (*jfindlay*) fix virtual fcn return doc indentation
- PR #27754: (*rallytime*) Change test.nop version directive to 2015.8.1
- PR #27734: (*jacobhammons*) Updated saltstack2 theme to add SaltConf16 banner
- PR #27727: (*rallytime*) Merge #27719 w/pylint fix
- PR #27724: (*jfindlay*) update `__virtual__` return documentation
- PR #27725: (*basepi*) Fix global injection for state cross calls
- PR #27628: (*ticosax*) [dockerng] Add support of `labels` parameter for dockerng
- PR #27704: (*jacobhammons*) Update compound matcher docs to clarify the usage of alternate delimi...
- PR #27705: (*rallytime*) Merge #27602 with final pylint fix
- PR #27691: (*notpeter*) Faster timeout (3s vs 2min) for instance metadata lookups. ``#13850`_`
- PR #27696: (*blueyed*) loader.proxy: call `_modules_dirs` only once
- PR #27630: (*ticosax*) Expose `container_id` in `mine.get_docker`
- PR #27600: (*blueyed*) dockerng: use `docker.version=auto` by default
- PR #27689: (*rallytime*) Merge #27448 with test fixes
- PR #27693: (*jacobhammons*) initial engines topic, updates to windows repo docs
- PR #27601: (*blueyed*) dockerng: handle None in `container.Names`
- PR #27596: (*blueyed*) gitfs: fix `UnboundLocalError` for ``msg``
- PR #27651: (*eliasp*) Check for existence of ``subnetId`` key in subnet dict
- PR #27639: (*rallytime*) Docement version added for new artifactory options
- PR #27677: (*rallytime*) Back-port #27675 to 2015.8

- PR #27637: (*rallytime*) Back-port #27604 to 2015.8
- PR #27657: (*garethgreenaway*) Fix to pkg state module
- PR #27632: (*rallytime*) Back-port #27539 to 2015.8
- PR #27633: (*rallytime*) Back-port #27559 to 2015.8
- PR #27579: (*rallytime*) Change boto\_route53 region default to `universal` to avoid problems with boto library
- PR #27581: (*tkwilliams*) Add support for `vpc\_name` tag in boto\_secgroup module and state
- PR #27624: (*nasenbaer13*) Wait for sync is not passed to boto\_route53 state
- PR #27614: (*blueyed*) doc: minor fixes to doc and comments
- PR #27627: (*eyj*) Fix crash in boto\_asg.get\_instances if the requested attribute is None
- PR #27616: (*jacobhammons*) Updated windows software repository docs
- PR #27569: (*lomeroy*) boto\_vpc.get\_subnet\_association now returns a dict w/key of vpc\_id, a...
- PR #27567: (*whiteinge*) Use getattr to fetch psutil.version\_info
- PR #27583: (*tkwilliams*) Fixup zypper module
- PR #27597: (*blueyed*) gitfs: remove unused variable ``bad\_per\_remote\_conf``
- PR #27585: (*ryan-lane*) Fix undefined variable in cron state module

### 37.2.4 Salt 2015.8.3 Release Notes

#### Security Fix

CVE-2015-8034: Saving `state.sls` cache data to disk with insecure permissions

This affects users of the `state.sls` function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via jinja into the state SLS files. The permissions for this file are now being set correctly. Thanks to @zmalone for bringing this issue to our attention.

#### Changes

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2015-11-25T00:03:40Z

Merges: 452

Changes:

- PR #29172: (*basepi*) [2015.8] Backport new philips\_hue proxy features from develop
- PR #29167: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29141: (*optix2000*) Add test case for require: sls with only import statements
- PR #29072: (*terminalmage*) Several gitfs/git\_pillar fixes
- PR #29118: (*ticosax*) [dockerng] Add networking capabilities
- PR #29145: (*anlutro*) Remove duplicate import of salt.utils.s3
- PR #29148: (*lomeroy*) correcting parameter calls to boto get\_zone/create\_zone functions in ...
- PR #29108: (*lorengordon*) Enforce length as an int, fixes [`#29107`](#) \_

- PR #29125: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29126: (*fcrozat*) Fix deployment when umask is non-standard
- PR #29124: (*rallytime*) Back-port #28130 to 2015.8
- PR #29076: (*RealKelsar*) We can't query installed use flags for a non installed pkg
- PR #29097: (*rallytime*) Back-port #29070 to 2015.8
- PR #29090: (*gtmanfred*) clean up novaclient module
- PR #29095: (*terminalmage*) Add warning about pygit2 API instability
- PR #28919: (*cro*) Update Philips Hue proxy minion to support `__proxy__` instead of proxymodule stored in `__opts__`
- PR #29065: (*cachedout*) Handle failures inside python's inspect if a module is reloaded
- PR #29057: (*paulnivin*) Add local file support for file.managed source list
- PR #29017: (*jfindlay*) pagerduty runner: add missing salt.utils import
- PR #29039: (*anlutro*) Allow passing list of pip packages to virtualenv.managed
- PR #29047: (*schwing*) Fix salt.modules.gpg.import\_key exception: `GPG\_1\_3\_1` referenced before assignment'
- PR #29050: (*terminalmage*) Make git\_pillar global config option docs more prominent
- PR #29048: (*nmadhok*) Fix incorrect debug log statement
- PR #29024: (*jfindlay*) cache runner test: add new unit tests
- PR #28967: (*cro*) Fix some issues with password changes
- PR #29020: (*basepi*) [2015.8] Add special list-only nodegroup support to salt-ssh
- PR #28970: (*terminalmage*) Properly handle non-string saltenvs
- PR #28959: (*rallytime*) Add blade password example and make note of timeout
- PR #29000: (*kiorky*) [Mergeable] Fix up LXC
- PR #29014: (*jfindlay*) systemd module: remove unneeded col command
- PR #28983: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28969: (*rallytime*) Back-port #28825 to 2015.8
- PR #28787: (*chrigl*) closes ``#28784`_``
- PR #28944: (*rallytime*) The ret result must contain `name`, not `chassis\_name` for the state compiler.
- PR #28957: (*terminalmage*) Fix version number for new state option
- PR #28950: (*DmitryKuzmenko*) PR 28812 which test fix
- PR #28812: (*isbm*) Enhance `which` decorator reliability
- PR #28934: (*terminalmage*) git.latest: Add update\_head option to prevent local HEAD from being updated
- PR #28937: (*rallytime*) Update dellchassis state example to use correct jinja syntax
- PR #28889: (*jfindlay*) state compiler: relax aggregate conditional check
- PR #28921: (*rallytime*) Back-port #25470 to 2015.8
- PR #28922: (*rallytime*) Change 2015.8.2 release note title to reflect proper version
- PR #28891: (*jfindlay*) rh\_service module: fix logic in `_chkconfig_is_enabled`

- PR #28892: (*jfindlay*) grains.core: correctly identify SLES 11 distrib\_id
- PR #28910: (*lorengeordon*) Fix winrepo command in windows pkg mgmt doc
- PR #28896: (*rallytime*) Back-port #28855 to 2015.8
- PR #28895: (*rallytime*) Back-port #28823 to 2015.8
- PR #28885: (*kt97679*) fix for: service.enabled fails on xen server `#28754`\_
- PR #28880: (*terminalmage*) Add ``profile" loglevel
- PR #28882: (*basepi*) [2015.8] salt-ssh: Check return type to make sure it's an error
- PR #28867: (*rallytime*) [fx2 grains] Grains functions should return dictionaries
- PR #28863: (*mhoogendoorn*) Fix ebuild.install causing extra refresh\_db calls.
- PR #28865: (*jfindlay*) add 2015.8.2 release notes
- PR #28730: (*garethgreenaway*) Fixes to how return\_job is handled in the scheduler for the salt master.
- PR #28848: (*cro*) Lint
- PR #28842: (*cachedout*) Add transport setting to shell test
- PR #28837: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28827: (*jacksonjtj*) Cleanup virtual\_timer in loader
- PR #28836: (*cachedout*) Cast to dict to fix wheel tests in tcp
- PR #28834: (*cachedout*) Fix breakage in tcp server
- PR #28804: (*cachedout*) TCP test fixes
- PR #28826: (*basepi*) [2015.8] Add new tornado deps to salt-ssh thin
- PR #28759: (*jfindlay*) simplify stdin use of stdin in at.present state
- PR #28824: (*rallytime*) Back-port #28778 and #28820 to 2015.8
- PR #28803: (*jfindlay*) decode strings to utf-8
- PR #28782: (*rallytime*) Fixes to rabbitmq user state
- PR #28789: (*nmadhok*) Provide ability to enable/disable customization for newly create VMs using VMware salt-cloud driver
- PR #28768: (*mrosedale*) 2015.8
- PR #28772: (*rallytime*) rabbitmq.list\_user\_permissions returns a dict, not a list. Don't expect a list.
- PR #28774: (*rallytime*) Back-port #28725 to 2015.8
- PR #28775: (*rallytime*) Back-port #28740 to 2015.8
- PR #28755: (*rallytime*) Move most vmware driver list\_\* functions to use salt.utils.vmware functions
- PR #28744: (*jfindlay*) import gate elementtree
- PR #28758: (*jfindlay*) remove redundant logic in useradd execution module
- PR #28757: (*mbarrien*) Bug fix: pip command to not quote spaces in cmd line args
- PR #28764: (*multani*) Various documentation fixes
- PR #28752: (*aboe76*) Update openSUSE grain for tumbleweed
- PR #28713: (*hexedpackets*) Rename consul.list to consul.list\_keys.

- PR #28719: (*jacobhammons*) removed dependencies info from docs
- PR #28709: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28710: (*rallytime*) Pass kwargs correctly to `_get_group` from `get_group_id`
- PR #28698: (*rallytime*) Back-port #28530 to 2015.8
- PR #28700: (*rallytime*) Back-port #28679 to 2015.8
- PR #28695: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.09
- PR #28656: (*clarkperkins*) `#28526` \_ fixed yumpkg module issue with `pkg.installed`
- PR #28672: (*jfindlay*) add OS grain support for SuSE Leap
- PR #28673: (*jfindlay*) add `hidden_opts` to `mount.mounted`
- PR #28667: (*cro*) `saltutil.sync_all` should sync proxymodules as well as the rest.
- PR #28665: (*jfindlay*) fixes to windows execution and state modules
- PR #28660: (*techhat*) Don't sign empty regions
- PR #28632: (*terminalmage*) Fixes/improvements to `pkgbuild` state/modules
- PR #28658: (*techhat*) Remove `_pkgdb_fun()` references
- PR #28653: (*rallytime*) Provide possible parameters for `boto_rds.present` engine values
- PR #28649: (*bdrung*) Fix OS related grains on Debian
- PR #28646: (*rallytime*) Back-port #28614 to 2015.8
- PR #28647: (*rallytime*) Back-port #28624 to 2015.8
- PR #28648: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #28638: (*anlutro*) Salt-SSH: Return more concise error when SSH command fails
- PR #28644: (*pass-by-value*) Make sure `versionchanged` is correct
- PR #28615: (*The-Loeki*) Fixes to FreeBSD `pkg`
- PR #28613: (*cachedout*) Add facility to `deepcopy` bound methods in Py2.6 and apply to grains
- PR #28612: (*rallytime*) Remove unsupported `storage_type` argument for parity with `boto_rds` module
- PR #28611: (*rallytime*) [2015.8] Be explicit about `salt.utils.vmware` function calls
- PR #28610: (*pass-by-value*) Lxc config additions
- PR #28602: (*nasenbaer13*) Allow setting of custom dimensions in `asg` alarm specification
- PR #28596: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #28593: (*blueyed*) doc: fix typo with `salt.states.file: s/preserve/preserve/`
- PR #28578: (*twangboy*) Fixed the script... something got broke...
- PR #28579: (*jfindlay*) fix `__virtual__` returns: `tls,uptime` mods
- PR #28584: (*rallytime*) If `AssociatePublicIpAddress` is set to `True`, don't auto-assign eip.
- PR #28576: (*jackson tj*) Only encode the `zmq` message once
- PR #28587: (*cachedout*) Reset `yaml` rendering hooks to avoid leaks
- PR #28581: (*basepi*) Revert `b4875e585a165482c4c1ddc8987d76b0a71ef1b0`
- PR #28573: (*jackson tj*) Add `body` to `salt.utils.http.query` returns

- PR #28564: (*s0undt3ch*) [2015.8] Update to latest bootstrap script v2015.11.04
- PR #28561: (*Oro*) Issue [`#28527`](#) \_ boto\_rds.create does not work
- PR #28560: (*bdrung*) Fix various typos
- PR #28550: (*jfindlay*) check timedatectl errno and return stdout on failure
- PR #28545: (*jfindlay*) pass on concurrent create of jid\_dir in local\_cache
- PR #28544: (*rallytime*) Start moving some vmware.py cloud funcs to utils/vmware.py
- PR #28543: (*gtmanfred*) clean up changes for pkg.uptodate and supervisord.dead
- PR #28538: (*jfindlay*) decode path and url to utf-8 in url.create
- PR #28533: (*jfindlay*) decode highstate error messages to utf-8
- PR #28547: (*nmadhok*) [Backport] [2015.8] Tasks can be in queued state instead of running
- PR #28535: (*techhat*) Fail gracefully if 169.254\* isn't available
- PR #28536: (*cro*) Default configuration file for proxy minions.
- PR #28534: (*rallytime*) Add versionadded directive for vpc\_name arg in boto\_secgroup.present
- PR #28516: (*rallytime*) Back-port [#28489](#) to 2015.8
- PR #28506: (*basepi*) [2015.8] Log minion list for all rosters, at debug level
- PR #28514: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28502: (*cachedout*) Lint [#28427](#)
- PR #28464: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28486: (*rallytime*) Back-port [#26945](#) to 2015.8
- PR #28472: (*gtmanfred*) overwrite more than one value with names
- PR #28493: (*rallytime*) Back-port [#28492](#) to 2015.8
- PR #28494: (*whiteinge*) Fix filter\_by passing incorrect parameters to match functions
- PR #28491: (*rallytime*) Back-port [#28388](#) to 2015.8
- PR #28465: (*twangboy*) Fix [`#12363`](#)\_: Password Expiration in Windows
- PR #28485: (*nasenbaer13*) Fix invalid usage of \_get\_conn causing [`#28484`](#) \_
- PR #28454: (*sdm24*) Fixed nodegroup doc formatting to correctly link to pillar\_opts in the master config
- PR #28487: (*cachedout*) Lint 28456
- PR #28457: (*sdm24*) Clarified comments for grains/core.py for ip\_interfaces, ip4\_interfac...
- PR #28473: (*anlutro*) Show check\_cmd output on failure
- PR #28460: (*jtand*) Skipped wipefs test if wipefs does not exist on OS
- PR #28426: (*terminalmage*) pkgbuild.built: make template engine optional
- PR #28422: (*cachedout*) Handle windows logging on thread\_multi [WIP]
- PR #28425: (*twangboy*) Fix [`#13513`](#) \_ - Reflection
- PR #28417: (*rallytime*) Add note about azure sdk version to getting started docs
- PR #28410: (*jackson tj*) Add retries to the zeromq.AsyncReqMessageClient
- PR #28404: (*rallytime*) Back-port [#28395](#) to 2015.8

- PR #28405: (*opdude*) Detect legacy versions of chocolatey correctly
- PR #28187: (*sjansen*) fix at.present
- PR #28375: (*merll*) Merge pillar includes correctly
- PR #28376: (*ryan-lane*) Support update of route53 records with multiple values
- PR #28377: (*terminalmage*) Deprecate `always` in favor of `force` in pkgbuild.built
- PR #28380: (*cro*) Add missing call for service provider
- PR #28348: (*jfindlay*) salt.utils.alias informs user they are using a renamed function
- PR #28364: (*jtand*) In CentOS 5 the .split() causes a stacktrace.
- PR #28361: (*rallytime*) Back-port #28087 to 2015.8
- PR #28360: (*multani*) Various documentation fixes
- PR #28370: (*rallytime*) Back-port #28276 to 2015.8
- PR #28353: (*merll*) Consider each pillar match only once.
- PR #28334: (*anlutro*) iptables needs -m comment for --comment to work
- PR #28340: (*jfindlay*) sdecode file and dir lists in fileclient
- PR #28344: (*ryan-lane*) Fix iptables state for non-filter tables
- PR #28343: (*rallytime*) Back-port #28342 to 2015.8
- PR #28330: (*rallytime*) Back-port #28305 to 2015.8
- PR #28270: (*rallytime*) Refactor RabbitMQ Plugin State to correctly use test=true and format errors
- PR #28269: (*rallytime*) Refactor rabbitmq\_user state to use test=True correctly
- PR #28299: (*rallytime*) Add test for availability\_zone check to boto\_vpc\_tests
- PR #28306: (*sdm24*) Updated the Nodegroup docs to include how to target nodegroups in SLS Jinja
- PR #28308: (*rallytime*) Firewalld state services should use --add-service, not --new-service
- PR #28302: (*DmitryKuzmenko*) Always close socket even if there is no stream.
- PR #28282: (*keesbos*) Fix for \_\_env\_\_ in legacy git\_pillar
- PR #28258: (*pass-by-value*) Add service module for ssh proxy example
- PR #28294: (*bechtoldt*) correct a bad default value in http utility
- PR #28185: (*jtand*) Added single package return for latest\_version, fixed other bug.
- PR #28297: (*cachedout*) Lint fix proxy junos
- PR #28210: (*terminalmage*) Fix for ext\_pillar being compiled twice in legacy git\_pillar code
- PR #28265: (*jfindlay*) fix blockdev execution and state modules
- PR #28266: (*rallytime*) Back-port #28260 to 2015.8
- PR #28253: (*rallytime*) Back-port #28063 to 2015.8
- PR #28231: (*rallytime*) Make sure we're comparing strings when getting images in the DO driver
- PR #28224: (*techhat*) Optimize create\_repo for large packages
- PR #28214: (*rallytime*) Don't stacktrace if invalid credentials are passed to boto\_route53 state
- PR #28228: (*rallytime*) Back-port #27562 to 2015.8

- PR #28232: (*rallytime*) Add documentation to supply the `ssh_username`: `freebsd` config to DO docs
- PR #28198: (*jacobhammons*) Added note regarding missing `spm` exe on Debian/Ubuntu
- PR #28182: (*erchn*) Some fixes for nova driver for Rackspace
- PR #28181: (*rallytime*) Revamp `firewalld` state to be more stateful.
- PR #28176: (*cro*) Add ping function
- PR #28167: (*The-Loeki*) `file.serialize` needs to add a final newline to serialized files
- PR #28168: (*rallytime*) Make sure availability zone gets passed in `boto_vpc` module when creating subnet
- PR #28148: (*basepi*) [2015.8] Only expand nodegroups to lists if there is a nested nodegroup
- PR #28155: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #28149: (*pass-by-value*) Add clarification to cloud profile doc about host
- PR #28146: (*cachedout*) Lint `dracr.py`
- PR #28141: (*rallytime*) Don't use RAM for root disk size in `linode.py`
- PR #28143: (*jtand*) Removed blank line at end of `chassis.py`
- PR #28021: (*blueyed*) Handle includes in `include_config` recursively
- PR #28095: (*rallytime*) Back-port #28001 to 2015.8
- PR #28096: (*rallytime*) Back-port #28061 to 2015.8
- PR #28139: (*rallytime*) Back-port #28103 to 2015.8
- PR #28098: (*jackson tj*) For all multi-part messages, check the headers. If the header is not ...
- PR #28134: (*bernieke*) fix unicode pillar values ``#3436`_``
- PR #28076: (*redmcg*) Replace option ``i`` with an explicit `queryformat`
- PR #28119: (*jackson tj*) Check if the remote exists before casting to a string.
- PR #28105: (*jfindlay*) add reason for not loading `localemod`
- PR #28108: (*cachedout*) Set logfile permissions correctly
- PR #27922: (*cro*) WIP States/Modules for managing Dell FX2 chassis via salt-proxy
- PR #28104: (*pass-by-value*) Add documentation for proxy minion `ssh`
- PR #28020: (*DmitryKuzmenko*) LazyLoader deepcopy fix.
- PR #27933: (*eliasp*) Provide all git pillar dirs in `opts[pillar_roots]`
- PR #28013: (*rallytime*) Back-port #27891 to 2015.8
- PR #28018: (*rallytime*) Add example to Writing Grains of how grains can be loaded twice
- PR #28084: (*cachedout*) #28069 with lint
- PR #28079: (*The-Loeki*) Fix for trace dump on failing imports for `win32com` & `pythoncom` 4 `win_task`
- PR #28081: (*The-Loeki*) fix for glance state trace error on import failure
- PR #28066: (*jackson tj*) Use the generic `text` attribute, not `.body` of the handler
- PR #28019: (*rallytime*) Clean up version added and deprecated msgs to be accurate
- PR #28058: (*rallytime*) Back-port #28041 to 2015.8
- PR #28055: (*rallytime*) Back-port #28043 to 2015.8

- PR #28046: (*pass-by-value*) Add pkg install and remove functions
- PR #28050: (*ryan-lane*) Use a better method for checking dynamodb table existence
- PR #28042: (*jfindlay*) fix repo path in ubuntu installation documentation
- PR #28033: (*twangboy*) Fixed win\_useradd.py
- PR #28027: (*cro*) Make ssh conn persistent.
- PR #28029: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28022: (*jacobhammons*) Updated Debian and Ubuntu repo paths with new structure for 2015.8.1
- PR #27983: (*rallytime*) Pip state run result should be False, not None, if installation error occurs.
- PR #27991: (*twangboy*) Fix for ``#20678`_`
- PR #27997: (*rallytime*) Remove note about pip bug with pip v1 vs pip v2 return codes
- PR #27994: (*jtand*) Fix schedule\_test failure
- PR #27992: (*cachedout*) Make load beacon config into list
- PR #28003: (*twangboy*) Fix ``#26336`_`
- PR #27984: (*rallytime*) Versionadded for clean\_file option for pkgrepo
- PR #27989: (*ryan-lane*) Do not try to remove the main route table association
- PR #27982: (*pass-by-value*) Add example for salt-proxy over SSH
- PR #27985: (*jacobhammons*) Changed current release to 8.1 and added CVEs to release notes
- PR #27979: (*cachedout*) Fix regression with key whitespace
- PR #27977: (*cachedout*) Decode unicode names in fileclient/server
- PR #27981: (*jtand*) Fixed trailing whitespace lint
- PR #27969: (*jeffreycatang*) fix parse of { on next line
- PR #27978: (*terminalmage*) Add note about dockerng.inspect\_image usage
- PR #27955: (*pass-by-value*) Bp 27868
- PR #27953: (*The-Loeki*) Fix CloudStack cloud for new `driver' syntax
- PR #27965: (*ryan-lane*) Fail in boto\_asg.present if alarms fail
- PR #27958: (*twangboy*) Added new functionality to win\_task.py
- PR #27959: (*techhat*) Change `__opts__` to `self.opts`
- PR #27943: (*rallytime*) Back-port #27910 to 2015.8
- PR #27944: (*rallytime*) Back-port #27909 to 2015.8
- PR #27946: (*jtand*) Changed grain to look at osmajorrelease instead of osrelease
- PR #27914: (*rallytime*) Use eipalloc instead of eni in EC2 interface properties example
- PR #27926: (*rallytime*) Back-port #27905 to 2015.8
- PR #27927: (*ryan-lane*) Do not manage ingress or egress rules if set to None
- PR #27928: (*rallytime*) Back-port #27908 to 2015.8
- PR #27676: (*ticosax*) [dockerng] WIP No more runtime args passed to docker.start()
- PR #27885: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #27882: (*twangboy*) Created win\_task.py module
- PR #27802: (*terminalmage*) Correct warning logging when update lock is present for git\_pillar/winrepo, add runner function for clearing git\_pillar/winrepo locks
- PR #27886: (*rallytime*) Handle group lists as well as comma-separated group strings.
- PR #27746: (*anlutro*) timezone module: handle timedatectl errors
- PR #27816: (*anlutro*) Make system.reboot use *shutdown -r* when available
- PR #27874: (*rallytime*) Add mention of Periodic Table naming scheme to deprecation docs
- PR #27883: (*terminalmage*) Work around --is-ancestor not being present in git-merge-base before git 1.8.0
- PR #27877: (*rallytime*) Back-port #27774 to 2015.8
- PR #27878: (*rallytime*) Use apache2ctl binary on SUSE in apache module
- PR #27879: (*cro*) Add docs for 2015.8.2+ changes to proxies
- PR #27731: (*cro*) Add `__proxy__` to replace `opts['proxymodule']`
- PR #27745: (*anlutro*) Add `pip_upgrade` arg to `virtualenv.managed` state
- PR #27809: (*ticosax*) [dockerng] Remove `dockerng.ps` caching
- PR #27859: (*ticosax*) [dockerng] Clarify doc port bindings
- PR #27748: (*multani*) Fix ``#8646`_`
- PR #27850: (*rallytime*) Back-port #27722 to 2015.8
- PR #27851: (*rallytime*) Back-port #27771 to 2015.8
- PR #27833: (*jfindlay*) decode path before string ops in `fileclient`
- PR #27837: (*jfindlay*) reverse truth in `python_shell` documentation
- PR #27860: (*flavio*) Fix OS related grains on openSUSE and SUSE Linux Enterprise
- PR #27768: (*rallytime*) Clean up bootstrap function to be slightly cleaner
- PR #27797: (*isbm*) Zypper module clusterfix
- PR #27849: (*rallytime*) Don't require a size parameter for proxmox profiles
- PR #27827: (*techhat*) Add additional error checking to SPM
- PR #27826: (*martinhoefling*) Fixes ``#27825`_`
- PR #27824: (*techhat*) Update Azure errors
- PR #27795: (*eguyen*) better change reporting for `postgres_user` groups
- PR #27799: (*terminalmage*) Fix usage of identity file in `git.latest`
- PR #27717: (*pass-by-value*) Proxy beacon example
- PR #27793: (*anlutro*) update code that changes log level of salt-ssh shim command
- PR #27761: (*terminalmage*) Merge git pillar data instead of using `dict.update()`
- PR #27741: (*ticosax*) [dockerng] pass filters argument to `dockerng.ps`
- PR #27760: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #27757: (*jfindlay*) fix virtual fcn return doc indentation
- PR #27754: (*rallytime*) Change `test.nop` version directive to 2015.8.1

- PR #27734: (*jacobhammons*) Updated saltstack2 theme to add SaltConf16 banner
- PR #27727: (*rallytime*) Merge #27719 w/pylint fix
- PR #27724: (*jfindlay*) update `__virtual__` return documentation
- PR #27725: (*basepi*) Fix global injection for state cross calls
- PR #27628: (*ticosax*) [dockerng] Add support of *labels* parameter for dockerng
- PR #27704: (*jacobhammons*) Update compound matcher docs to clarify the usage of alternate delimi...
- PR #27705: (*rallytime*) Merge #27602 with final pylint fix
- PR #27691: (*notpeter*) Faster timeout (3s vs 2min) for instance metadata lookups. ``#13850`_.`
- PR #27696: (*blueyed*) loader.proxy: call `_modules_dirs` only once
- PR #27630: (*ticosax*) Expose `container_id` in `mine.get_docker`
- PR #27600: (*blueyed*) dockerng: use `docker.version=auto` by default
- PR #27689: (*rallytime*) Merge #27448 with test fixes
- PR #27693: (*jacobhammons*) initial engines topic, updates to windows repo docs
- PR #27601: (*blueyed*) dockerng: handle None in `container.Names`
- PR #27596: (*blueyed*) gitfs: fix `UnboundLocalError` for ``msg``
- PR #27651: (*eliasp*) Check for existence of ``subnetId`` key in `subnet dict`
- PR #27639: (*rallytime*) Docement version added for new artifactory options
- PR #27677: (*rallytime*) Back-port #27675 to 2015.8
- PR #27637: (*rallytime*) Back-port #27604 to 2015.8
- PR #27657: (*garethgreenaway*) Fix to `pkg state module`
- PR #27632: (*rallytime*) Back-port #27539 to 2015.8
- PR #27633: (*rallytime*) Back-port #27559 to 2015.8
- PR #27579: (*rallytime*) Change `boto_route53` region default to ``universal`` to avoid problems with boto library
- PR #27581: (*tkwilliams*) Add support for ``vpc_name`` tag in `boto_secgroup` module and state
- PR #27624: (*nasenbaer13*) Wait for sync is not passed to `boto_route53` state
- PR #27614: (*blueyed*) doc: minor fixes to doc and comments
- PR #27627: (*eyj*) Fix crash in `boto_asg.get_instances` if the requested attribute is None
- PR #27616: (*jacobhammons*) Updated windows software repository docs
- PR #27569: (*lomeroe*) `boto_vpc.get_subnet_association` now returns a dict w/key of `vpc_id`, a...
- PR #27567: (*whiteinge*) Use `getattr` to fetch `psutil.version_info`
- PR #27583: (*tkwilliams*) Fixup `zypper` module
- PR #27597: (*blueyed*) gitfs: remove unused variable ``bad_per_remote_conf``
- PR #27585: (*ryan-lane*) Fix undefined variable in `cron state module`

## 37.2.5 Salt 2015.8.4 Release Notes

### Known Issues

`in_` prerequisites (issue 30820)

This issue affects all users targeting an explicit `- name: <name>` with a `_in` requisite (such as `watch_in` or `require_in`). If you are not using explicit `- name: <name>` arguments, are targeting with the state ID instead of the name, or are not using `_in` requisites, then you should be safe to upgrade to 2015.8.4.

This issue is resolved in the 2015.8.5 release.

### Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Kraemer <kraemer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

### Core Changes

- **PR #28994:** *timcharper* Salt S3 module has learned how to assume IAM roles
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` (issue 30118 and issue 30189).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

### Changes for v2015.8.3..v2015.8.4

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Total Merges: 320

Changes:

- **PR #30613:** (*basepi*) Fix minion/syndic clearfunces
- **PR #30609:** (*seanjnkns*) Fix documentation for `pillar_merge_lists` which default is False, not ...
- **PR #30584:** (*julianbrost*) `file.line` state: add missing colon in docstring
- **PR #30589:** (*terminalmage*) Merge 2015.5 into 2015.8
- **PR #30599:** (*multani*) Documentation formatting fixes
- **PR #30554:** (*rallytime*) Make the salt-cloud actions output more verbose and helpful

- PR #30549: (*techhat*) Salt Virt cleanup
- PR #30553: (*techhat*) AWS: Support 17-character IDs
- PR #30532: (*whiteinge*) Add execution module for working in sls files
- PR #30529: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #30526: (*twangboy*) Added FlushKey to make sure it's changes are saved to disk
- PR #30521: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30485: (*jtand*) Updated pip\_state to work with pip 8.0 on 2015.8
- PR #30494: (*isbm*) Zypper: info\_installed – `errors` flag change to type `boolean`
- PR #30506: (*jackson tj*) Properly remove newlines after reading the file
- PR #30508: (*rallytime*) Fix Linode driver cloning functionality
- PR #30522: (*terminalmage*) Update git.list\_worktree tests to reflect new return data
- PR #30483: (*borgstrom*) Pyobjects recursive import support (for 2015.8)
- PR #30491: (*jackson tj*) Add multi-IP support to network state
- PR #30496: (*anlutro*) Fix KeyError when adding ignored pillars
- PR #30359: (*kingsquirrel152*) Removes suspected copy/paste error for zmq\_filtering functionailty
- PR #30448: (*cournape*) Fix osx scripts location
- PR #30457: (*rallytime*) Remove fsutils references from modules list
- PR #30453: (*rallytime*) Make sure private AND public IPs are listed for Linode driver
- PR #30458: (*rallytime*) Back-port #30062 to 2015.8
- PR #30468: (*timcharper*) make note of s3 role assumption in upcoming changelog
- PR #30470: (*whiteinge*) Add example of the match\_dict format to accept\_dict wheel function
- PR #30450: (*gtmanfred*) fix extension loading in novaclient
- PR #30212: (*abednarik*) Fix incorrect file permissions in file.line
- PR #29947: (*jfindlay*) fileclient: decode file list from master
- PR #30363: (*terminalmage*) Use native ``list" subcommand to list git worktrees
- PR #30445: (*jtand*) Boto uses False for is\_default instead of None
- PR #30406: (*frioux*) Add an example of how to use file.managed/check\_cmd
- PR #30424: (*isbm*) Check if byte strings are properly encoded in UTF-8
- PR #30405: (*jtand*) Updated glusterfs.py for python2.6 compatibility.
- PR #30396: (*pass-by-value*) Remove hardcoded val
- PR #30391: (*jtand*) Added else statements
- PR #30375: (*rallytime*) Wrap formatted log statements with six.u() in cloud/\_\_init\_\_.py
- PR #30384: (*isbm*) Bugfix: info\_available does not work correctly on SLE 11 series
- PR #30376: (*pritambaral*) Fix FLO\_DIR path in 2015.8
- PR #30389: (*jtand*) Older versions of ipset don't support comments
- PR #30373: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8

- PR #30372: (*jacobhammons*) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (*rallytime*) Remove incomplete function
- PR #30366: (*rallytime*) Back-port #28702 to 2015.8
- PR #30361: (*cro*) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
- PR #30267: (*isbm*) Fix RPM issues with the date/time and add package attributes filtering
- PR #30360: (*jfindlay*) file.remove, file.absent: mention recursive dir removal
- PR #30221: (*mbarrien*) No rolcatupdate for user\_exist in Postgres>=9.5 [`#26845`\\_](#)
- PR #30358: (*terminalmage*) Add libgit2 version to versions-report
- PR #30346: (*pass-by-value*) Prevent orphaned volumes
- PR #30349: (*rallytime*) Back-port #30347 to 2015.8
- PR #30354: (*anlutro*) Make sure all ignore\_missing SLses are caught
- PR #30356: (*nmadhok*) Adding code author
- PR #30340: (*jtand*) Updated seed\_test.py for changes made to seed module
- PR #30339: (*jfindlay*) Backport #26511
- PR #30343: (*rallytime*) Fix 2015.8 from incomplete back-port
- PR #30342: (*eliasp*) Correct whitespace placement in error message
- PR #30308: (*rallytime*) Back-port #30257 to 2015.8
- PR #30187: (*rallytime*) Back-port #27606 to 2015.8
- PR #30223: (*serge-p*) adding support for DragonFly BSD
- PR #30238: (*rallytime*) Reinit crypto before calling RSA.generate when generating keys.
- PR #30246: (*dmacvicar*) Add missing return data to scheduled jobs ([`#24237`\\_](#))
- PR #30292: (*thegoodduke*) ipset: fix test=true & add comment for every entry
- PR #30275: (*abednarik*) Add permanent argument in firewall.
- PR #30328: (*cachedout*) Fix file test
- PR #30310: (*pass-by-value*) Empty bucket fix
- PR #30211: (*techhat*) Execute choot on the correct path
- PR #30309: (*rallytime*) Back-port #30304 to 2015.8
- PR #30278: (*nmadhok*) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (*jacobhammons*) Changed examples to use the ``example.com" domain instead of ``mycompan...
- PR #30249: (*mpreziuso*) Fixes performance and timeout issues on win\_pkg.install
- PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
- PR #30268: (*terminalmage*) Optimize file\_tree ext\_pillar and update file.managed to allow for binary contents
- PR #30245: (*rallytime*) Boto secgroup/iam\_role: Add note stating us-east-1 is default region
- PR #30299: (*rallytime*) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (*opdude*) Fixed the periodic call to beacons
- PR #30303: (*jacobhammons*) Changed notes to indicate that functions are matched using regular ex...

- PR #30284: (*terminalmage*) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (*jfindlay*) add state mocking to release notes
- PR #30273: (*rallytime*) Back-port #30121 to 2015.8
- PR #30301: (*cachedout*) Accept whatever comes into hightstate mock for state tests
- PR #30282: (*cachedout*) Fix file.append logic
- PR #30289: (*cro*) Fix problems with targeting proxies by grains
- PR #30293: (*cro*) Ensure we don't log stuff we shouldn't
- PR #30279: (*cachedout*) Allow modules to be packed into boto utils
- PR #30186: (*rallytime*) Update CLI Examples in boto\_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (*abednarik*) Add option in file.append to ignore\_whitespace.
- PR #30189: (*rallytime*) Back-port #30185 to 2015.8
- PR #30215: (*jacobhammons*) Assorted doc bug fixes
- PR #30206: (*cachedout*) Revert ``Fix incorrect file permissions in file.line``
- PR #30190: (*jacobhammons*) Updated doc site banners
- PR #30180: (*jfindlay*) modules.x509.\_dec2hex: add fmt index for 2.6 compat
- PR #30179: (*terminalmage*) Backport #26962 to 2015.8 branch
- PR #29693: (*abednarik*) Handle missing source file in ssh\_auth.
- PR #30155: (*rallytime*) Update boto\_secgroup and boto\_iam\_role docs to only use region OR profile
- PR #30158: (*rallytime*) Move \_option(value) calls to \_\_salt\_\_[config.option] in boto utils
- PR #30160: (*dmurphy18*) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (*rallytime*) Update list\_present and append grains state function docs to be more clear.
- PR #30163: (*rallytime*) Add warning about using ``=`` in file.line function
- PR #30164: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (*abednarik*) Fix incorrect file permissions in file.line
- PR #30154: (*Oro*) Fix file serialize on windows
- PR #30144: (*rallytime*) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (*terminalmage*) Fix dockerng.push, and allow for multiple images
- PR #30075: (*joejulian*) Convert glusterfs module to use xml
- PR #30129: (*optix2000*) Clean up \_uptodate() in git state
- PR #30139: (*rallytime*) Back-port #29589 to 2015.8
- PR #30124: (*abednarik*) Update regex to detect ip alias in OpenBSD.
- PR #30133: (*stanislavb*) Fix typo in gpgkey URL
- PR #30126: (*stanislavb*) Log S3 API error message
- PR #30128: (*oeuftete*) Log retryable transport errors as warnings
- PR #30096: (*cachedout*) Add rm\_special to crontab module
- PR #30106: (*techhat*) Ensure last dir

- PR #30101: (*gtmanfred*) fix bug where nova driver exits with no adminPass
- PR #30090: (*techhat*) Add argument to isdir()
- PR #30094: (*rallytime*) Fix doc formatting for cloud.create example in module.py state
- PR #30095: (*rallytime*) Add the list\_nodes\_select function to linode driver
- PR #30082: (*abednarik*) Fixed saltversioninfo grain return
- PR #30084: (*rallytime*) Back-port #29987 to 2015.8
- PR #30071: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #30067: (*ryan-lane*) Pass in kwargs to boto\_secgroup.convert\_to\_group\_ids explicitly
- PR #30069: (*techhat*) Ensure that pki\_dir exists
- PR #30064: (*rallytime*) Add Syndic documentation to miscellaneous Salt Cloud config options
- PR #30049: (*rallytime*) Add some more unit tests for the vsphere execution module
- PR #30060: (*rallytime*) Back-port #27104 to 2015.8
- PR #30048: (*jacobhammons*) Remove internal APIs from rest\_cherry.py docs.
- PR #30043: (*rallytime*) Be explicit about importing from salt.utils.jinja to avoid circular imports
- PR #30038: (*rallytime*) Back-port #30017 to 2015.8
- PR #30036: (*rallytime*) Back-port #29995 to 2015.8
- PR #30035: (*rallytime*) Back-port #29895 to 2015.8
- PR #30034: (*rallytime*) Back-port #29893 to 2015.8
- PR #30033: (*rallytime*) Back-port #29876 to 2015.8
- PR #30029: (*terminalmage*) git.latest: Fix handling of nonexistent branches
- PR #30016: (*anlutro*) Properly normalize locales in locale.gen\_locale
- PR #30015: (*anlutro*) locale module: don't escape the slash in \n
- PR #30022: (*gqgunhed*) Two minor typos fixed
- PR #30026: (*anlutro*) states.at: fix wrong variable being used
- PR #29966: (*multani*) Fix bigip state/module documentation + serializers documentation
- PR #29904: (*twangboy*) Improvements to osx packaging scripts
- PR #29950: (*multani*) boto\_iam: fix deletion of IAM users when using delete\_keys=true
- PR #29937: (*multani*) Fix states.boto\_iam group users
- PR #29934: (*multani*) Fix state.boto\_iam virtual name
- PR #29943: (*cachedout*) Check args correctly in boto\_rds
- PR #29924: (*gqgunhed*) fixed: uptime now working on non-US Windows
- PR #29883: (*serge-p*) fix for nfs mounts in \_active\_mounts\_openbsd()
- PR #29894: (*techhat*) Support Saltfile in SPM
- PR #29856: (*rallytime*) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (*rallytime*) Back-port #29740 to 2015.8
- PR #29890: (*multani*) Various documentation fixes

- PR #29850: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29811: (*anlutro*) influxdb: add retention policy module functions
- PR #29814: (*basepi*) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (*rallytime*) Add esxi module and state to docs build
- PR #29832: (*jleimbach*) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29803: (*rallytime*) Add vSphere module to doc ref module tree
- PR #29767: (*abednarik*) Hosts file update in mod\_hostname.
- PR #29772: (*terminalmage*) pygit2: skip submodules when traversing tree
- PR #29765: (*gtmanfred*) allow nova driver to be boot from volume
- PR #29773: (*l2ol33rt*) Append missing wget in debian installation guide
- PR #29800: (*rallytime*) Back-port #29769 to 2015.8
- PR #29775: (*paulnivin*) Change listen requisite resolution from name to ID declaration
- PR #29754: (*rallytime*) Back-port #29719 to 2015.8
- PR #29713: (*The-Loeki*) Pillar-based cloud providers still forcing use of deprecated 'provider'
- PR #29729: (*rallytime*) Further clarifications on 'unless' and 'onlyif' requisites.
- PR #29737: (*akissa*) fix pillar sqlite3 documentation examples
- PR #29743: (*akissa*) fix pillar sqlite not honouring config options
- PR #29723: (*rallytime*) Clarify db\_user and db\_password kwargs for postgres\_user.present state function
- PR #29722: (*rallytime*) Link 'stateful' kwargs to definition of what 'stateful' means for cmd state.
- PR #29724: (*rallytime*) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (*cachedout*) Disable some boto tests per resolution of moto issue
- PR #29708: (*lagesag*) Fix test=True for file.directory with recurse ignore\_files/ignore\_dirs.
- PR #29642: (*cachedout*) Correctly restart daemonized minions on failure
- PR #29599: (*cachedout*) Clean up minion shutdown
- PR #29675: (*clinta*) allow returning all refs
- PR #29683: (*rallytime*) Catch more specific error to pass the error message through elegantly.
- PR #29687: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (*clinta*) fix bare/mirror in git.latest
- PR #29644: (*rallytime*) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (*rallytime*) Back-port #29558 to 2015.8
- PR #29632: (*jfindlay*) reduce severity of tls module \_\_virtual\_\_ logging
- PR #29606: (*abednarik*) Fixed duplicate mtu entry in RedHat 7 network configuration.
- PR #29613: (*rallytime*) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (*DmitryKuzmenko*) Don't create io\_loop before fork
- PR #29609: (*basepi*) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
- PR #29603: (*basepi*) Fix orchestration failure-checking

- PR #29597: (*terminalmage*) dockerng: Prevent exception when API response contains empty dictionary
- PR #29596: (*rallytime*) Back-port #29587 to 2015.8
- PR #29588: (*rallytime*) Added ESXi Proxy Minion Tutorial
- PR #29572: (*gtmanfred*) [nova] use old discover\_extensions if available
- PR #29545: (*terminalmage*) git.latest: init submodules if not yet initialized
- PR #29548: (*rallytime*) Back-port #29449 to 2015.8
- PR #29547: (*rallytime*) Refactored ESXCLI-based functions to accept a list of esxi\_hosts
- PR #29563: (*anlutro*) Fix a call to deprecated method in python-influxdb
- PR #29565: (*bdrung*) Fix typos and missing release note
- PR #29540: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29499: (*rallytime*) Initial commit of ESXi Proxy Minion
- PR #29526: (*jfindlay*) 2015.8.2 notes: add note about not being released
- PR #29531: (*jfindlay*) grains.core: handle undefined variable
- PR #29538: (*basepi*) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
- PR #29505: (*rallytime*) Update boto\_rds state docs to include funky yaml syntax for ``tags" option.
- PR #29513: (*bdrung*) Drop obsolete syslog.target from systemd services
- PR #29500: (*rallytime*) Back-port #29467 to 2015.8
- PR #29463: (*abednarik*) Add **\*\*kwargs** to debconf.set.
- PR #29399: (*jfindlay*) modules.status: add human\_readable option to uptime
- PR #29433: (*cro*) Files for building .pkg files for MacOS X
- PR #29455: (*jfindlay*) modules.nova.\_\_init\_\_: do not return None
- PR #29454: (*jfindlay*) rh\_service module \_\_virtual\_\_ return error messages
- PR #29476: (*tbaker57*) Doc fix - route\_table\_present needs subnet\_names (not subnets) as a key
- PR #29487: (*rallytime*) Back-port #29450 to 2015.8
- PR #29441: (*rallytime*) Make sure docs line up with blade\_idrac function specs
- PR #29440: (*rallytime*) Back-port #28925 to 2015.8
- PR #29435: (*gallet*) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (*rall0r*) Fix host.present state limitation
- PR #29417: (*jacobhammons*) Repo install updates
- PR #29402: (*techhat*) Add rate limiting to linode
- PR #29400: (*twangboy*) Fix #19332
- PR #29398: (*cachedout*) Lint 29288
- PR #29331: (*DmitryKuzmenko*) Bugfix - #29116 raet dns error
- PR #29390: (*jacobhammons*) updated version numbers in documentation
- PR #29381: (*nmadhok*) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (*cro*) Fix mis-setting chassis names

- PR #29334: (*rallytime*) Back-port #29237 to 2015.8
- PR #29300: (*ticosax*) [dockerng] Add support for volume management in dockerng
- PR #29218: (*clan*) check service enable state in test mode
- PR #29315: (*jfindlay*) dev tutorial doc: fix markup errors
- PR #29317: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (*clan*) handle `acl_type` `[[d]efault:][user|group|mask|other]`
- PR #29305: (*lorenegordon*) Add `'file'` as a `source_hash` proto
- PR #29272: (*jfindlay*) `win_status` module: handle 12 hour time in uptime
- PR #29289: (*terminalmage*) `file.managed`: Allow local file sources to use `source_hash`
- PR #29264: (*anlutro*) Prevent `ssh_auth.absent` from running when `test=True`
- PR #29277: (*terminalmage*) Update `git_pillar` runner to support new `git_ext_pillar` config schema
- PR #29283: (*cachedout*) Single-quotes and use format
- PR #29139: (*thomaso-mirodin*) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (*cachedout*) dev docs: add development tutorial
- PR #28994: (*timcharper*) add support to `s3` for aws role assumption
- PR #29278: (*techhat*) Add `verify_log` to SPM
- PR #29067: (*jacksonjtj*) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (*jfindlay*) do not shadow `ret` function argument
- PR #29215: (*rallytime*) Back-port #29192 to 2015.8
- PR #29217: (*clan*) show duration only if `state_output_profile` is `False`
- PR #29221: (*ticosax*) [dockerng] Docu network mode
- PR #29269: (*jfindlay*) `win_status` module: fix function names in docs
- PR #29213: (*rallytime*) Move `_wait_for_task` func from `vmware cloud` to `vmware utils`
- PR #29271: (*techhat*) Pass full path for `digest` (SPM)
- PR #29244: (*isbm*) List products consistently across all SLES systems
- PR #29255: (*garethgreenaway*) fixes to `consul` module
- PR #29208: (*whyte wolf*) Glance more profile errors
- PR #29200: (*jfindlay*) `mount state`: unmount by device is optional
- PR #29205: (*trevor-h*) Fixes #29187 - using `winrm` on EC2
- PR #29170: (*cachedout*) Migrate `pydsl` tests to integration test suite
- PR #29198: (*jfindlay*) `rh_ip` module: only set the `mtu` once
- PR #29135: (*jfindlay*) `ssh_known_hosts.present` state: catch not found exc
- PR #29196: (*s0undt3ch*) We need `novaclient` imported to compare versions
- PR #29059: (*terminalmage*) Work around upstream `pygit2` bug
- PR #29112: (*eliasp*) Prevent backtrace (`KeyError`) in `ssh_known_hosts.present` state
- PR #29178: (*whyte wolf*) Profile not being passed to `keystone.endpoint_get` in `_auth`. so if a p...

## 37.2.6 Salt 2015.8.5 Release Notes

### About this Release

Salt 2015.8.5 is identical to the 2015.8.4 release with the addition of a fix for [issue 30820](#), fixed by [PR #30833](#). For convenience, the content from the 2015.8.4 release notes is included below.

### Known Issue in `boto_*` execution modules

This release contains an issue that causes the `boto_*` execution modules to display a `__salt__ not defined` error ([issue 30300](#)). This issue will be fixed in an upcoming release, but can be manually resolved by completing the following:

1. Download the `boto_*` execution modules that you would like to update from the 2015.8 branch of Salt. A complete list of affected modules with the specific changes is available in [PR #30867](#).

A simple way to get the updated modules is to [download](#) a zip file of the 2015.8 branch from GitHub. The updated modules are in the `salt\modules` directory.

2. Copy the `boto_*` modules to the `\srv\salt\_modules` directory on your Salt master.
3. Run the following command to sync these modules to all Salt minions:

```
salt '*' saltutil.sync_modules
```

## 2015.8.4 Release Notes

### Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Kraemer <[kraemer@suse.com](mailto:kraemer@suse.com)> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

### Core Changes

- [PR #28994](#): *timcharper* Salt S3 module has learned how to assume IAM roles
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` ([issue 30118](#) and [issue 30189](#)).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

Changes for v2015.8.3..v2015.8.4

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Total Merges: 320

Changes:

- PR #30613: (*basepi*) Fix minion/syndic clearfuncs
- PR #30609: (*seanjnkns*) Fix documentation for pillar\_merge\_lists which default is False, not ...
- PR #30584: (*julianbrost*) file.line state: add missing colon in docstring
- PR #30589: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #30599: (*multani*) Documentation formatting fixes
- PR #30554: (*rallytime*) Make the salt-cloud actions output more verbose and helpful
- PR #30549: (*techhat*) Salt Virt cleanup
- PR #30553: (*techhat*) AWS: Support 17-character IDs
- PR #30532: (*whiteinge*) Add execution module for working in sls files
- PR #30529: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #30526: (*twangboy*) Added FlushKey to make sure it's changes are saved to disk
- PR #30521: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30485: (*jtand*) Updated pip\_state to work with pip 8.0 on 2015.8
- PR #30494: (*isbm*) Zypper: info\_installed — `errors` flag change to type `boolean`
- PR #30506: (*jackson tj*) Properly remove newlines after reading the file
- PR #30508: (*rallytime*) Fix Linode driver cloning functionality
- PR #30522: (*terminalmage*) Update git.list\_worktree tests to reflect new return data
- PR #30483: (*borgstrom*) Pyobjects recursive import support (for 2015.8)
- PR #30491: (*jackson tj*) Add multi-IP support to network state
- PR #30496: (*anlutro*) Fix KeyError when adding ignored pillars
- PR #30359: (*kingsquirrel152*) Removes suspected copy/paste error for zmq\_filtering functionailty
- PR #30448: (*cournape*) Fix osx scripts location
- PR #30457: (*rallytime*) Remove fsutils references from modules list
- PR #30453: (*rallytime*) Make sure private AND public IPs are listed for Linode driver
- PR #30458: (*rallytime*) Back-port #30062 to 2015.8
- PR #30468: (*timcharper*) make note of s3 role assumption in upcoming changelog
- PR #30470: (*whiteinge*) Add example of the match\_dict format to accept\_dict wheel function
- PR #30450: (*gtmanfred*) fix extension loading in novaclient
- PR #30212: (*abednarik*) Fix incorrect file permissions in file.line
- PR #29947: (*jfindlay*) fileclient: decode file list from master
- PR #30363: (*terminalmage*) Use native ``list`` subcommand to list git worktrees

- PR #30445: (*jtand*) Boto uses False for `is_default` instead of None
- PR #30406: (*frioux*) Add an example of how to use `file.managed/check_cmd`
- PR #30424: (*isbm*) Check if byte strings are properly encoded in UTF-8
- PR #30405: (*jtand*) Updated `glusterfs.py` for python2.6 compatibility.
- PR #30396: (*pass-by-value*) Remove hardcoded `val`
- PR #30391: (*jtand*) Added else statements
- PR #30375: (*rallytime*) Wrap formatted log statements with `six.u()` in `cloud/__init__.py`
- PR #30384: (*isbm*) Bugfix: `info_available` does not work correctly on SLE 11 series
- PR #30376: (*pritambaral*) Fix `FLO_DIR` path in 2015.8
- PR #30389: (*jtand*) Older versions of `ipset` don't support comments
- PR #30373: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30372: (*jacobhammons*) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (*rallytime*) Remove incomplete function
- PR #30366: (*rallytime*) Back-port #28702 to 2015.8
- PR #30361: (*cro*) Flip the sense of the test for `proxymodule` imports, add more fns for `esxi proxy`
- PR #30267: (*isbm*) Fix RPM issues with the `date/time` and add package attributes filtering
- PR #30360: (*jfindlay*) `file.remove`, `file.absent`: mention recursive dir removal
- PR #30221: (*mbarrien*) No `rolcatupdate` for `user_exist` in `Postgres` >= 9.5 [`#26845`\\_](#)
- PR #30358: (*terminalmage*) Add `libgit2` version to `versions-report`
- PR #30346: (*pass-by-value*) Prevent orphaned volumes
- PR #30349: (*rallytime*) Back-port #30347 to 2015.8
- PR #30354: (*anlutro*) Make sure all `ignore_missing` SLses are caught
- PR #30356: (*nmadhok*) Adding code author
- PR #30340: (*jtand*) Updated `seed_test.py` for changes made to `seed` module
- PR #30339: (*jfindlay*) Backport #26511
- PR #30343: (*rallytime*) Fix 2015.8 from incomplete back-port
- PR #30342: (*eliasp*) Correct whitespace placement in error message
- PR #30308: (*rallytime*) Back-port #30257 to 2015.8
- PR #30187: (*rallytime*) Back-port #27606 to 2015.8
- PR #30223: (*serge-p*) adding support for DragonFly BSD
- PR #30238: (*rallytime*) Reinit `crypto` before calling `RSA.generate` when generating keys.
- PR #30246: (*dmacvicar*) Add missing return data to scheduled jobs ([`#24237`\\_](#))
- PR #30292: (*thegoodduke*) `ipset`: fix `test=true` & add comment for every entry
- PR #30275: (*abednarik*) Add permanent argument in `firewalld`.
- PR #30328: (*cachedout*) Fix file test
- PR #30310: (*pass-by-value*) Empty bucket fix

- PR #30211: (*techhat*) Execute choot on the correct path
- PR #30309: (*rallytime*) Back-port #30304 to 2015.8
- PR #30278: (*nmadhok*) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (*jacobhammons*) Changed examples to use the ``example.com" domain instead of ``mycompan...
- PR #30249: (*mpreziuso*) Fixes performance and timeout issues on win\_pkg.install
- PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
- PR #30268: (*terminalmage*) Optimize file\_tree ext\_pillar and update file.managed to allow for binary contents
- PR #30245: (*rallytime*) Boto secgroup/iam\_role: Add note stating us-east-1 is default region
- PR #30299: (*rallytime*) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (*opdude*) Fixed the periodic call to beacons
- PR #30303: (*jacobhammons*) Changed notes to indicate that functions are matched using regular ex...
- PR #30284: (*terminalmage*) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (*jfindlay*) add state mocking to release notes
- PR #30273: (*rallytime*) Back-port #30121 to 2015.8
- PR #30301: (*cachedout*) Accept whatever comes into hightstate mock for state tests
- PR #30282: (*cachedout*) Fix file.append logic
- PR #30289: (*cro*) Fix problems with targeting proxies by grains
- PR #30293: (*cro*) Ensure we don't log stuff we shouldn't
- PR #30279: (*cachedout*) Allow modules to be packed into boto utils
- PR #30186: (*rallytime*) Update CLI Examples in boto\_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (*abednarik*) Add option in file.append to ignore\_whitespace.
- PR #30189: (*rallytime*) Back-port #30185 to 2015.8
- PR #30215: (*jacobhammons*) Assorted doc bug fixes
- PR #30206: (*cachedout*) Revert ``Fix incorrect file permissions in file.line"
- PR #30190: (*jacobhammons*) Updated doc site banners
- PR #30180: (*jfindlay*) modules.x509.\_dec2hex: add fmt index for 2.6 compat
- PR #30179: (*terminalmage*) Backport #26962 to 2015.8 branch
- PR #29693: (*abednarik*) Handle missing source file in ssh\_auth.
- PR #30155: (*rallytime*) Update boto\_secgroup and boto\_iam\_role docs to only use region OR profile
- PR #30158: (*rallytime*) Move \_option(value) calls to \_\_salt\_\_['config.option'] in boto utils
- PR #30160: (*dmurphy18*) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (*rallytime*) Update list\_present and append grains state function docs to be more clear.
- PR #30163: (*rallytime*) Add warning about using ``=' in file.line function
- PR #30164: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (*abednarik*) Fix incorrect file permissions in file.line
- PR #30154: (*Oro*) Fix file serialize on windows

- PR #30144: (*rallytime*) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (*terminalmage*) Fix dockerng.push, and allow for multiple images
- PR #30075: (*joejulian*) Convert glusterfs module to use xml
- PR #30129: (*optix2000*) Clean up \_update() in git state
- PR #30139: (*rallytime*) Back-port #29589 to 2015.8
- PR #30124: (*abednarik*) Update regex to detect ip alias in OpenBSD.
- PR #30133: (*stanislavb*) Fix typo in gpgkey URL
- PR #30126: (*stanislavb*) Log S3 API error message
- PR #30128: (*oeuftete*) Log retryable transport errors as warnings
- PR #30096: (*cachedout*) Add rm\_special to crontab module
- PR #30106: (*techhat*) Ensure last dir
- PR #30101: (*gtmanfred*) fix bug where nova driver exits with no adminPass
- PR #30090: (*techhat*) Add argument to isdir()
- PR #30094: (*rallytime*) Fix doc formatting for cloud.create example in module.py state
- PR #30095: (*rallytime*) Add the list\_nodes\_select function to linode driver
- PR #30082: (*abednarik*) Fixed saltversioninfo grain return
- PR #30084: (*rallytime*) Back-port #29987 to 2015.8
- PR #30071: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #30067: (*ryan-lane*) Pass in kwargs to boto\_secgroup.convert\_to\_group\_ids explicitly
- PR #30069: (*techhat*) Ensure that pki\_dir exists
- PR #30064: (*rallytime*) Add Syndic documentation to miscellaneous Salt Cloud config options
- PR #30049: (*rallytime*) Add some more unit tests for the vsphere execution module
- PR #30060: (*rallytime*) Back-port #27104 to 2015.8
- PR #30048: (*jacobhammons*) Remove internal APIs from rest\_cherry.py docs.
- PR #30043: (*rallytime*) Be explicit about importing from salt.utils.jinja to avoid circular imports
- PR #30038: (*rallytime*) Back-port #30017 to 2015.8
- PR #30036: (*rallytime*) Back-port #29995 to 2015.8
- PR #30035: (*rallytime*) Back-port #29895 to 2015.8
- PR #30034: (*rallytime*) Back-port #29893 to 2015.8
- PR #30033: (*rallytime*) Back-port #29876 to 2015.8
- PR #30029: (*terminalmage*) git.latest: Fix handling of nonexistent branches
- PR #30016: (*anlutro*) Properly normalize locales in locale.gen\_locale
- PR #30015: (*anlutro*) locale module: don't escape the slash in \n
- PR #30022: (*gqgunhed*) Two minor typos fixed
- PR #30026: (*anlutro*) states.at: fix wrong variable being used
- PR #29966: (*multani*) Fix bigip state/module documentation + serializers documentation

- PR #29904: (*twangboy*) Improvements to osx packaging scripts
- PR #29950: (*multani*) boto\_iam: fix deletion of IAM users when using delete\_keys=true
- PR #29937: (*multani*) Fix states.boto\_iam group users
- PR #29934: (*multani*) Fix state.boto\_iam virtual name
- PR #29943: (*cachedout*) Check args correctly in boto\_rds
- PR #29924: (*gqgunhed*) fixed: uptime now working on non-US Windows
- PR #29883: (*serge-p*) fix for nfs mounts in \_active\_mounts\_openbsd()
- PR #29894: (*techhat*) Support Saltfile in SPM
- PR #29856: (*rallytime*) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (*rallytime*) Back-port #29740 to 2015.8
- PR #29890: (*multani*) Various documentation fixes
- PR #29850: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29811: (*anlutro*) influxdb: add retention policy module functions
- PR #29814: (*basepi*) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (*rallytime*) Add esxi module and state to docs build
- PR #29832: (*jleimbach*) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29803: (*rallytime*) Add vSphere module to doc ref module tree
- PR #29767: (*abednarik*) Hosts file update in mod\_hostname.
- PR #29772: (*terminalmage*) pygit2: skip submodules when traversing tree
- PR #29765: (*gtmanfred*) allow nova driver to be boot from volume
- PR #29773: (*l2ol33rt*) Append missing wget in debian installation guide
- PR #29800: (*rallytime*) Back-port #29769 to 2015.8
- PR #29775: (*paulnivin*) Change listen requisite resolution from name to ID declaration
- PR #29754: (*rallytime*) Back-port #29719 to 2015.8
- PR #29713: (*The-Loeki*) Pillar-based cloud providers still forcing use of deprecated 'provider'
- PR #29729: (*rallytime*) Further clarifications on 'unless' and 'onlyif' requisites.
- PR #29737: (*akissa*) fix pillar sqlite3 documentation examples
- PR #29743: (*akissa*) fix pillar sqlite not honouring config options
- PR #29723: (*rallytime*) Clarify db\_user and db\_password kwargs for postgres\_user.present state function
- PR #29722: (*rallytime*) Link 'stateful' kwargs to definition of what 'stateful' means for cmd state.
- PR #29724: (*rallytime*) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (*cachedout*) Disable some boto tests per resolution of moto issue
- PR #29708: (*lagesag*) Fix test=True for file.directory with recurse ignore\_files/ignore\_dirs.
- PR #29642: (*cachedout*) Correctly restart daemonized minions on failure
- PR #29599: (*cachedout*) Clean up minion shutdown
- PR #29675: (*clinta*) allow returning all refs

- PR #29683: (*rallytime*) Catch more specific error to pass the error message through elegantly.
- PR #29687: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (*clinta*) fix bare/mirror in git.latest
- PR #29644: (*rallytime*) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (*rallytime*) Back-port #29558 to 2015.8
- PR #29632: (*jfindlay*) reduce severity of tls module `__virtual__` logging
- PR #29606: (*abednarik*) Fixed duplicate mtu entry in RedHat 7 network configuration.
- PR #29613: (*rallytime*) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (*DmitryKuzmenko*) Don't create `io_loop` before fork
- PR #29609: (*basepi*) [2015.8][salt-ssh] Add ability to set salt-ssh command umask in roster
- PR #29603: (*basepi*) Fix orchestration failure-checking
- PR #29597: (*terminalmage*) dockerng: Prevent exception when API response contains empty dictionary
- PR #29596: (*rallytime*) Back-port #29587 to 2015.8
- PR #29588: (*rallytime*) Added ESXi Proxy Minion Tutorial
- PR #29572: (*gtmanfred*) [nova] use old discover\_extensions if available
- PR #29545: (*terminalmage*) git.latest: init submodules if not yet initialized
- PR #29548: (*rallytime*) Back-port #29449 to 2015.8
- PR #29547: (*rallytime*) Refactored ESXCLI-based functions to accept a list of `esxi_hosts`
- PR #29563: (*anlutro*) Fix a call to deprecated method in python-influxdb
- PR #29565: (*bdrung*) Fix typos and missing release note
- PR #29540: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29499: (*rallytime*) Initial commit of ESXi Proxy Minion
- PR #29526: (*jfindlay*) 2015.8.2 notes: add note about not being released
- PR #29531: (*jfindlay*) grains.core: handle undefined variable
- PR #29538: (*basepi*) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
- PR #29505: (*rallytime*) Update boto\_rds state docs to include funky yaml syntax for ```tags``` option.
- PR #29513: (*bdrung*) Drop obsolete `syslog.target` from systemd services
- PR #29500: (*rallytime*) Back-port #29467 to 2015.8
- PR #29463: (*abednarik*) Add `**kwargs` to `debconf.set`.
- PR #29399: (*jfindlay*) modules.status: add `human_readable` option to uptime
- PR #29433: (*cro*) Files for building .pkg files for MacOS X
- PR #29455: (*jfindlay*) modules.nova.\_\_init\_\_: do not return None
- PR #29454: (*jfindlay*) rh\_service module `__virtual__` return error messages
- PR #29476: (*tbaker57*) Doc fix - `route_table_present` needs `subnet_names` (not `subnets`) as a key
- PR #29487: (*rallytime*) Back-port #29450 to 2015.8
- PR #29441: (*rallytime*) Make sure docs line up with `blade_idrac` function specs

- PR #29440: (*rallytime*) Back-port #28925 to 2015.8
- PR #29435: (*gallet*) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (*rall0r*) Fix host.present state limitation
- PR #29417: (*jacobhammons*) Repo install updates
- PR #29402: (*techhat*) Add rate limiting to linode
- PR #29400: (*twangboy*) Fix #19332
- PR #29398: (*cachedout*) Lint 29288
- PR #29331: (*DmitryKuzmenko*) Bugfix - #29116 raet dns error
- PR #29390: (*jacobhammons*) updated version numbers in documentation
- PR #29381: (*nmadhok*) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (*cro*) Fix mis-setting chassis names
- PR #29334: (*rallytime*) Back-port #29237 to 2015.8
- PR #29300: (*ticosax*) [dockerng] Add support for volume management in dockerng
- PR #29218: (*clan*) check service enable state in test mode
- PR #29315: (*jfindlay*) dev tutorial doc: fix markup errors
- PR #29317: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (*clan*) handle acl\_type [[d]efault:][user|group|mask|other]
- PR #29305: (*lorenghordon*) Add `file` as a source\_hash proto
- PR #29272: (*jfindlay*) win\_status module: handle 12 hour time in uptime
- PR #29289: (*terminalmage*) file.managed: Allow local file sources to use source\_hash
- PR #29264: (*anlutro*) Prevent ssh\_auth.absent from running when test=True
- PR #29277: (*terminalmage*) Update git\_pillar runner to support new git\_ext\_pillar config schema
- PR #29283: (*cachedout*) Single-quotes and use format
- PR #29139: (*thomaso-mirodin*) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (*cachedout*) dev docs: add development tutorial
- PR #28994: (*timcharper*) add support to s3 for aws role assumption
- PR #29278: (*techhat*) Add verify\_log to SPM
- PR #29067: (*jacksonjtj*) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (*jfindlay*) do not shadow ret function argument
- PR #29215: (*rallytime*) Back-port #29192 to 2015.8
- PR #29217: (*clan*) show duration only if state\_output\_profile is False
- PR #29221: (*ticosax*) [dokcerng] Docu network mode
- PR #29269: (*jfindlay*) win\_status module: fix function names in docs
- PR #29213: (*rallytime*) Move \_wait\_for\_task func from vmware cloud to vmware utils
- PR #29271: (*techhat*) Pass full path for digest (SPM)
- PR #29244: (*isbm*) List products consistently across all SLES systems

- PR #29255: (*garethgreenaway*) fixes to consul module
- PR #29208: (*whytewolf*) Glance more profile errors
- PR #29200: (*jfindlay*) mount state: unmount by device is optional
- PR #29205: (*trevor-h*) Fixes #29187 - using winrm on EC2
- PR #29170: (*cachedout*) Migrate pydsl tests to integration test suite
- PR #29198: (*jfindlay*) rh\_ip module: only set the mtu once
- PR #29135: (*jfindlay*) ssh\_known\_hosts.present state: catch not found exc
- PR #29196: (*s0undt3ch*) We need novaclient imported to compare versions
- PR #29059: (*terminalmage*) Work around upstream pygit2 bug
- PR #29112: (*eliasp*) Prevent backtrace (KeyError) in *ssh\_known\_hosts.present* state
- PR #29178: (*whytewolf*) Profile not being passed to *keystone.endpoint\_get* in *\_auth*. so if a p...

### 37.2.7 Salt 2015.8.7 Release Notes

---

**Note:** Salt 2015.8.4, 2015.8.5, and 2015.8.7 were all released within a short period due to regressions found soon after the releases of 2015.8.4 and 2015.8.5. These release notes contain all of the changes since 2015.8.3 to make it easier to see everything that has changed recently.

---

#### Changes for v2015.8.4..v2015.8.7

For *pkg.installed* states, on Linux distributions which use yum/dnf, packages which have a non-zero epoch in the version number now require this epoch to be included when specifying an exact version for a package. For example:

```
vim-enhanced:
  pkg.installed:
    - version: 2:7.4.160-1.el7
```

The *pkg.latest\_version* and *pkg.list\_repo\_pkgs* functions can be used to get the correct version string to use, as they will now contain the epoch when it is non-zero.

Changes:

- PR #31111: (*jtand*) Fixes failing npm test on arch. @ 2016-02-10T21:51:47Z
  - 8d84c63 Merge pull request #31111 from jtand/8\_4\_npm\_fix
  - b0a48e5 Fixes failing npm test on arch.

- 733c6ab Some 3rd-party modules (e.g. gnupg) define custom log levels that emit at INFO level and above. This patch sets the color data lookups to default to TextFormat('reset') rather than producing a stack trace every time a log message is generated from an affected module.
  - 3f71fd0 Revert #30217
    - \* PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
  - PR #31092: (*terminalmage*) Apply PR #31031 to 2015.8.4.follow\_up @ 2016-02-10T20:54:37Z
    - 5a6a93e Merge pull request #31092 from terminalmage/issue31014-2015.8.4.follow\_up \* 2767a4e Don't handle epoch specially for dnf
      - \* e5dfcc0 More efficient way to add the epoch before version number
      - \* ed74627 include possible epoch in version for rpm
    - 6c6b66a Comment multiprocessing line in minion config
    - 1f7dfef Set multiprocessing to true in config.py
    - 433c645 Fix remove placeholder files
    - 7103756 Remove placeholder files
    - 20b381f Set overwrite to off
    - ca50f56 Fix boto\_secgroup
    - fd571d2 Fix boto test failures
    - cfb6588 Fix regression when contents\_pillar/contents\_grains is a list.
    - 881d866 utils.aws: use time lib to convert to epoch seconds
    - 3141292 The call to cp.get\_url needs the saltenv, if you're using environments other than base, it will fail.
    - a869401 Fix regression in git\_pillar when multiple remotes are configured
    - 2243f25 Properly set the default value for pillar\_merge\_lists
    - c7472ff Lint
    - d868711 Fix failing boto\_vpc module unit tests
    - ed09516 Fix failing state module tests
    - fd0e940 Pylint fix
    - bc780a7 Don't use pack=pack. Just pass in pack=\_\_salt\_\_ always.
    - 1ae022d Pass in `pack` variable to utils.boto.assign\_funcs function from ALL boto modules.
    - 1efaff1 Remove bad symlinks in osx pkg dirs
    - c7db435 Fix regression in scanning for state with `name` param
- 

### Security Fix

CVE-2016-1866: Improper handling of clear messages on the minion, which could result in executing commands not sent by the master.

This issue affects only the 2015.8.x releases of Salt. In order for an attacker to use this attack vector, they would have to execute a successful attack on an existing TCP connection between minion and master on the pub port. It

does not allow an external attacker to obtain the shared secret or decrypt any encrypted traffic between minion and master. Thank you to Sebastian Kraemer <kraemer@suse.com> for bringing this issue to our attention.

We recommend everyone upgrade to 2015.8.4 as soon as possible.

### Core Changes

- **PR #28994:** *timcharper* Salt S3 module has learned how to assume IAM roles
- Added option `mock=True` for `state.sls` and `state.highstate`. This allows the salt state compiler to process sls data in a state run without actually calling the state functions, thus providing feedback on the validity of the arguments used for the functions beyond the preprocessing validation provided by `state.show_sls` ([issue 30118](#) and [issue 30189](#)).

```
salt '*' state.sls core,edit.vim mock=True
salt '*' state.highstate mock=True
salt '*' state.apply edit.vim mock=True
```

### Changes for v2015.8.3..v2015.8.4

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-01-25T17:48:35Z

Total Merges: 320

Changes:

- **PR #30613:** (*basepi*) Fix minion/syndic clearfuncs
- **PR #30609:** (*seanjnkns*) Fix documentation for `pillar_merge_lists` which default is False, not ...
- **PR #30584:** (*julianbrost*) `file.line` state: add missing colon in docstring
- **PR #30589:** (*terminalmage*) Merge 2015.5 into 2015.8
- **PR #30599:** (*multani*) Documentation formatting fixes
- **PR #30554:** (*rallytime*) Make the salt-cloud actions output more verbose and helpful
- **PR #30549:** (*techhat*) Salt Virt cleanup
- **PR #30553:** (*techhat*) AWS: Support 17-character IDs
- **PR #30532:** (*whiteinge*) Add execution module for working in sls files
- **PR #30529:** (*terminalmage*) Merge 2015.5 into 2015.8
- **PR #30526:** (*twangboy*) Added `FlushKey` to make sure it's changes are saved to disk
- **PR #30521:** (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- **PR #30485:** (*jtand*) Updated `pip_state` to work with pip 8.0 on 2015.8
- **PR #30494:** (*isbm*) Zypper: `info_installed` — `errors` flag change to type `boolean`
- **PR #30506:** (*jacksonj*) Properly remove newlines after reading the file
- **PR #30508:** (*rallytime*) Fix Linode driver cloning functionality
- **PR #30522:** (*terminalmage*) Update `git.list_worktree` tests to reflect new return data
- **PR #30483:** (*borgstrom*) Pyobjects recursive import support (for 2015.8)

- PR #30491: (*jacksonj*) Add multi-IP support to network state
- PR #30496: (*anlutro*) Fix KeyError when adding ignored pillars
- PR #30359: (*kingsquirrel152*) Removes suspected copy/paste error for zmq\_filtering functionailty
- PR #30448: (*cournape*) Fix osx scripts location
- PR #30457: (*rallytime*) Remove fsutils references from modules list
- PR #30453: (*rallytime*) Make sure private AND public IPs are listed for Linode driver
- PR #30458: (*rallytime*) Back-port #30062 to 2015.8
- PR #30468: (*timcharper*) make note of s3 role assumption in upcoming changelog
- PR #30470: (*whiteinge*) Add example of the match\_dict format to accept\_dict wheel function
- PR #30450: (*gtmanfred*) fix extension loading in novaclient
- PR #30212: (*abednarik*) Fix incorrect file permissions in file.line
- PR #29947: (*jfindlay*) fileclient: decode file list from master
- PR #30363: (*terminalmage*) Use native ``list'' subcommand to list git worktrees
- PR #30445: (*jtand*) Boto uses False for is\_default instead of None
- PR #30406: (*frioux*) Add an example of how to use file.managed/check\_cmd
- PR #30424: (*isbm*) Check if byte strings are properly encoded in UTF-8
- PR #30405: (*jtand*) Updated glusterfs.py for python2.6 compatibility.
- PR #30396: (*pass-by-value*) Remove hardcoded val
- PR #30391: (*jtand*) Added else statements
- PR #30375: (*rallytime*) Wrap formatted log statements with six.u() in cloud/\_\_init\_\_.py
- PR #30384: (*isbm*) Bugfix: info\_available does not work correctly on SLE 11 series
- PR #30376: (*pritambaral*) Fix FLO\_DIR path in 2015.8
- PR #30389: (*jtand*) Older versions of ipset don't support comments
- PR #30373: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30372: (*jacobhammons*) Updated man pages for 2015.8.4, updated copyright to 2016
- PR #30370: (*rallytime*) Remove incomplete function
- PR #30366: (*rallytime*) Back-port #28702 to 2015.8
- PR #30361: (*cro*) Flip the sense of the test for proxymodule imports, add more fns for esxi proxy
- PR #30267: (*isbm*) Fix RPM issues with the date/time and add package attributes filtering
- PR #30360: (*jfindlay*) file.remove, file.absent: mention recursive dir removal
- PR #30221: (*mbarrien*) No rolcatupdate for user\_exist in Postgres>=9.5 [`#26845`\\_](#)
- PR #30358: (*terminalmage*) Add libgit2 version to versions-report
- PR #30346: (*pass-by-value*) Prevent orphaned volumes
- PR #30349: (*rallytime*) Back-port #30347 to 2015.8
- PR #30354: (*anlutro*) Make sure all ignore\_missing SLses are caught
- PR #30356: (*nmadhok*) Adding code author

- PR #30340: (*jtand*) Updated seed\_test.py for changes made to seed module
- PR #30339: (*jfindlay*) Backport #26511
- PR #30343: (*rallytime*) Fix 2015.8 from incomplete back-port
- PR #30342: (*eliasp*) Correct whitespace placement in error message
- PR #30308: (*rallytime*) Back-port #30257 to 2015.8
- PR #30187: (*rallytime*) Back-port #27606 to 2015.8
- PR #30223: (*serge-p*) adding support for DragonFly BSD
- PR #30238: (*rallytime*) Reinit crypto before calling RSA.generate when generating keys.
- PR #30246: (*dmacvicar*) Add missing return data to scheduled jobs ([`#24237`\\_](#))
- PR #30292: (*thegoodduke*) ipset: fix test=true & add comment for every entry
- PR #30275: (*abednarik*) Add permanent argument in firewall.
- PR #30328: (*cachedout*) Fix file test
- PR #30310: (*pass-by-value*) Empty bucket fix
- PR #30211: (*techhat*) Execute choot on the correct path
- PR #30309: (*rallytime*) Back-port #30304 to 2015.8
- PR #30278: (*nmadhok*) If datacenter is specified in the config, then look for managed objects under it
- PR #30305: (*jacobhammons*) Changed examples to use the ``example.com" domain instead of ``mycompan...
- PR #30249: (*mpreziuso*) Fixes performance and timeout issues on win\_pkg.install
- PR #30217: (*pass-by-value*) Make sure cloud actions can be called via salt run
- PR #30268: (*terminalmage*) Optimize file\_tree ext\_pillar and update file.managed to allow for binary contents
- PR #30245: (*rallytime*) Boto secgroup/iam\_role: Add note stating us-east-1 is default region
- PR #30299: (*rallytime*) ESXi Proxy minions states are located at salt.states.esxi, not vsphere.
- PR #30202: (*opdude*) Fixed the periodic call to beacons
- PR #30303: (*jacobhammons*) Changed notes to indicate that functions are matched using regular ex...
- PR #30284: (*terminalmage*) salt.utils.gitfs: Fix Dulwich env detection and submodule handling
- PR #30280: (*jfindlay*) add state mocking to release notes
- PR #30273: (*rallytime*) Back-port #30121 to 2015.8
- PR #30301: (*cachedout*) Accept whatever comes into hightstate mock for state tests
- PR #30282: (*cachedout*) Fix file.append logic
- PR #30289: (*cro*) Fix problems with targeting proxies by grains
- PR #30293: (*cro*) Ensure we don't log stuff we shouldn't
- PR #30279: (*cachedout*) Allow modules to be packed into boto utils
- PR #30186: (*rallytime*) Update CLI Examples in boto\_ec2 module to reflect correct arg/kwarg positioning
- PR #30156: (*abednarik*) Add option in file.append to ignore\_whitespace.
- PR #30189: (*rallytime*) Back-port #30185 to 2015.8
- PR #30215: (*jacobhammons*) Assorted doc bug fixes

- PR #30206: (*cachedout*) Revert ``Fix incorrect file permissions in file.line``
- PR #30190: (*jacobhammons*) Updated doc site banners
- PR #30180: (*jfindlay*) modules.x509.\_dec2hex: add fmt index for 2.6 compat
- PR #30179: (*terminalmage*) Backport #26962 to 2015.8 branch
- PR #29693: (*abednarik*) Handle missing source file in ssh\_auth.
- PR #30155: (*rallytime*) Update boto\_secgroup and boto\_iam\_role docs to only use region OR profile
- PR #30158: (*rallytime*) Move \_option(value) calls to \_\_salt\_\_[config.option] in boto utils
- PR #30160: (*dmurphy18*) Fix parsing disk usage for line with no number and AIX values in Kilos
- PR #30162: (*rallytime*) Update list\_present and append grains state function docs to be more clear.
- PR #30163: (*rallytime*) Add warning about using ``=` in file.line function
- PR #30164: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30168: (*abednarik*) Fix incorrect file permissions in file.line
- PR #30154: (*Oro*) Fix file serialize on windows
- PR #30144: (*rallytime*) Added generic ESXCLI command ability to ESXi Proxy Minion
- PR #30142: (*terminalmage*) Fix dockerng.push, and allow for multiple images
- PR #30075: (*joejulian*) Convert glusterfs module to use xml
- PR #30129: (*optix2000*) Clean up \_uptodate() in git state
- PR #30139: (*rallytime*) Back-port #29589 to 2015.8
- PR #30124: (*abednarik*) Update regex to detect ip alias in OpenBSD.
- PR #30133: (*stanislavb*) Fix typo in gpgkey URL
- PR #30126: (*stanislavb*) Log S3 API error message
- PR #30128: (*oeuftete*) Log retryable transport errors as warnings
- PR #30096: (*cachedout*) Add rm\_special to crontab module
- PR #30106: (*techhat*) Ensure last dir
- PR #30101: (*gtmanfred*) fix bug where nova driver exits with no adminPass
- PR #30090: (*techhat*) Add argument to isdir()
- PR #30094: (*rallytime*) Fix doc formatting for cloud.create example in module.py state
- PR #30095: (*rallytime*) Add the list\_nodes\_select function to linode driver
- PR #30082: (*abednarik*) Fixed saltversioninfo grain return
- PR #30084: (*rallytime*) Back-port #29987 to 2015.8
- PR #30071: (*rallytime*) Merge branch `2015.5' into `2015.8'
- PR #30067: (*ryan-lane*) Pass in kwargs to boto\_secgroup.convert\_to\_group\_ids explicitly
- PR #30069: (*techhat*) Ensure that pki\_dir exists
- PR #30064: (*rallytime*) Add Syndic documentation to miscellaneous Salt Cloud config options
- PR #30049: (*rallytime*) Add some more unit tests for the vsphere execution module
- PR #30060: (*rallytime*) Back-port #27104 to 2015.8

- PR #30048: (*jacobhammons*) Remove internal APIs from rest\_cherrypy docs.
- PR #30043: (*rallytime*) Be explicit about importing from salt.utils.jinja to avoid circular imports
- PR #30038: (*rallytime*) Back-port #30017 to 2015.8
- PR #30036: (*rallytime*) Back-port #29995 to 2015.8
- PR #30035: (*rallytime*) Back-port #29895 to 2015.8
- PR #30034: (*rallytime*) Back-port #29893 to 2015.8
- PR #30033: (*rallytime*) Back-port #29876 to 2015.8
- PR #30029: (*terminalmage*) git.latest: Fix handling of nonexistent branches
- PR #30016: (*anlutro*) Properly normalize locales in locale.gen\_locale
- PR #30015: (*anlutro*) locale module: don't escape the slash in \n
- PR #30022: (*gqgunhed*) Two minor typos fixed
- PR #30026: (*anlutro*) states.at: fix wrong variable being used
- PR #29966: (*multani*) Fix bigip state/module documentation + serializers documentation
- PR #29904: (*twangboy*) Improvements to osx packaging scripts
- PR #29950: (*multani*) boto\_iam: fix deletion of IAM users when using delete\_keys=true
- PR #29937: (*multani*) Fix states.boto\_iam group users
- PR #29934: (*multani*) Fix state.boto\_iam virtual name
- PR #29943: (*cachedout*) Check args correctly in boto\_rds
- PR #29924: (*gqgunhed*) fixed: uptime now working on non-US Windows
- PR #29883: (*serge-p*) fix for nfs mounts in \_active\_mounts\_openbsd()
- PR #29894: (*techhat*) Support Saltfile in SPM
- PR #29856: (*rallytime*) Added some initial unit tests for the salt.modules.vsphere.py file
- PR #29855: (*rallytime*) Back-port #29740 to 2015.8
- PR #29890: (*multani*) Various documentation fixes
- PR #29850: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29811: (*anlutro*) influxdb: add retention policy module functions
- PR #29814: (*basepi*) [2015.8][Windows] Fix multi-master on windows
- PR #29819: (*rallytime*) Add esxi module and state to docs build
- PR #29832: (*jleimbach*) Fixed typo in order to use the keyboard module for RHEL without systemd
- PR #29803: (*rallytime*) Add vSphere module to doc ref module tree
- PR #29767: (*abednarik*) Hosts file update in mod\_hostname.
- PR #29772: (*terminalmage*) pygit2: skip submodules when traversing tree
- PR #29765: (*gtmanfred*) allow nova driver to be boot from volume
- PR #29773: (*l2ol33rt*) Append missing wget in debian installation guide
- PR #29800: (*rallytime*) Back-port #29769 to 2015.8
- PR #29775: (*paulnivin*) Change listen requisite resolution from name to ID declaration

- PR #29754: (*rallytime*) Back-port #29719 to 2015.8
- PR #29713: (*The-Loeki*) Pillar-based cloud providers still forcing use of deprecated `'provider'`
- PR #29729: (*rallytime*) Further clarifications on `'unless'` and `'onlyif'` requisites.
- PR #29737: (*akissa*) fix pillar sqlite3 documentation examples
- PR #29743: (*akissa*) fix pillar sqlite not honouring config options
- PR #29723: (*rallytime*) Clarify `db_user` and `db_password` kwargs for `postgres_user.present` state function
- PR #29722: (*rallytime*) Link `'stateful'` kwargs to definition of what `'stateful'` means for `cmd` state.
- PR #29724: (*rallytime*) Add examples of using multiple matching levels to Pillar docs
- PR #29726: (*cachedout*) Disable some boto tests per resolution of moto issue
- PR #29708: (*lagesag*) Fix `test=True` for `file.directory` with `recurse ignore_files/ignore_dirs`.
- PR #29642: (*cachedout*) Correctly restart daemonized minions on failure
- PR #29599: (*cachedout*) Clean up minion shutdown
- PR #29675: (*clinta*) allow returning all refs
- PR #29683: (*rallytime*) Catch more specific error to pass the error message through elegantly.
- PR #29687: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29681: (*clinta*) fix bare/mirror in `git.latest`
- PR #29644: (*rallytime*) Fixed a couple more ESXi proxy minion bugs
- PR #29645: (*rallytime*) Back-port #29558 to 2015.8
- PR #29632: (*jfindlay*) reduce severity of `tls` module `__virtual__` logging
- PR #29606: (*abednarik*) Fixed duplicate `mtu` entry in RedHat 7 network configuration.
- PR #29613: (*rallytime*) Various ESXi Proxy Minion Bug Fixes
- PR #29628: (*DmitryKuzmenko*) Don't create `io_loop` before fork
- PR #29609: (*basepi*) [2015.8][salt-ssh] Add ability to set salt-ssh command `umask` in roster
- PR #29603: (*basepi*) Fix orchestration failure-checking
- PR #29597: (*terminalmage*) `dockerng`: Prevent exception when API response contains empty dictionary
- PR #29596: (*rallytime*) Back-port #29587 to 2015.8
- PR #29588: (*rallytime*) Added ESXi Proxy Minion Tutorial
- PR #29572: (*gtmanfred*) [nova] use old `discover_extensions` if available
- PR #29545: (*terminalmage*) `git.latest`: `init` submodules if not yet initialized
- PR #29548: (*rallytime*) Back-port #29449 to 2015.8
- PR #29547: (*rallytime*) Refactored ESXCLI-based functions to accept a list of `esxi_hosts`
- PR #29563: (*anlutro*) Fix a call to deprecated method in `python-influxdb`
- PR #29565: (*bdrung*) Fix typos and missing release note
- PR #29540: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29499: (*rallytime*) Initial commit of ESXi Proxy Minion
- PR #29526: (*jfindlay*) 2015.8.2 notes: add note about not being released

- PR #29531: (*jfindlay*) grains.core: handle undefined variable
- PR #29538: (*basepi*) [2015.8] [salt-ssh] Remove umask around actual execution for salt-ssh
- PR #29505: (*rallytime*) Update boto\_rds state docs to include funky yaml syntax for ``tags" option.
- PR #29513: (*bdrung*) Drop obsolete syslog.target from systemd services
- PR #29500: (*rallytime*) Back-port #29467 to 2015.8
- PR #29463: (*abednarik*) Add **\*\*kwargs** to debconf.set.
- PR #29399: (*jfindlay*) modules.status: add human\_readable option to uptime
- PR #29433: (*cro*) Files for building .pkg files for MacOS X
- PR #29455: (*jfindlay*) modules.nova.\_\_init\_\_: do not return None
- PR #29454: (*jfindlay*) rh\_service module \_\_virtual\_\_ return error messages
- PR #29476: (*tbaker57*) Doc fix - route\_table\_present needs subnet\_names (not subnets) as a key
- PR #29487: (*rallytime*) Back-port #29450 to 2015.8
- PR #29441: (*rallytime*) Make sure docs line up with blade\_idrac function specs
- PR #29440: (*rallytime*) Back-port #28925 to 2015.8
- PR #29435: (*gallet*) Grains return wrong OS version and other OS related values for Oracle Linux
- PR #29430: (*rall0r*) Fix host.present state limitation
- PR #29417: (*jacobhammons*) Repo install updates
- PR #29402: (*techhat*) Add rate limiting to linode
- PR #29400: (*twangboy*) Fix #19332
- PR #29398: (*cachedout*) Lint 29288
- PR #29331: (*DmitryKuzmenko*) Bugfix - #29116 raet dns error
- PR #29390: (*jacobhammons*) updated version numbers in documentation
- PR #29381: (*nmadhok*) No need to deepcopy since six.iterkeys() creates a copy
- PR #29349: (*cro*) Fix mis-setting chassis names
- PR #29334: (*rallytime*) Back-port #29237 to 2015.8
- PR #29300: (*ticosax*) [dockerng] Add support for volume management in dockerng
- PR #29218: (*clan*) check service enable state in test mode
- PR #29315: (*jfindlay*) dev tutorial doc: fix markup errors
- PR #29317: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #29240: (*clan*) handle acl\_type [[d]efault:][user|group|mask|other]
- PR #29305: (*loregordon*) Add `file' as a source\_hash proto
- PR #29272: (*jfindlay*) win\_status module: handle 12 hour time in uptime
- PR #29289: (*terminalmage*) file.managed: Allow local file sources to use source\_hash
- PR #29264: (*anlutro*) Prevent ssh\_auth.absent from running when test=True
- PR #29277: (*terminalmage*) Update git\_pillar runner to support new git\_ext\_pillar config schema
- PR #29283: (*cachedout*) Single-quotes and use format

- PR #29139: (*thomaso-mirodin*) [salt-ssh] Add a range roster and range targeting options for the flat roster
- PR #29282: (*cachedout*) dev docs: add development tutorial
- PR #28994: (*timcharper*) add support to s3 for aws role assumption
- PR #29278: (*techhat*) Add verify\_log to SPM
- PR #29067: (*jacksonjtj*) Fix infinite recursion in state compiler for prereq of SLSs
- PR #29207: (*jfindlay*) do not shadow ret function argument
- PR #29215: (*rallytime*) Back-port #29192 to 2015.8
- PR #29217: (*clan*) show duration only if state\_output\_profile is False
- PR #29221: (*ticosax*) [dokcerng] Docu network mode
- PR #29269: (*jfindlay*) win\_status module: fix function names in docs
- PR #29213: (*rallytime*) Move \_wait\_for\_task func from vmware cloud to vmware utils
- PR #29271: (*techhat*) Pass full path for digest (SPM)
- PR #29244: (*isbm*) List products consistently across all SLES systems
- PR #29255: (*garethgreenaway*) fixes to consul module
- PR #29208: (*whyte wolf*) Glance more profile errors
- PR #29200: (*jfindlay*) mount state: unmount by device is optional
- PR #29205: (*trevor-h*) Fixes #29187 - using winrm on EC2
- PR #29170: (*cachedout*) Migrate pydsl tests to integration test suite
- PR #29198: (*jfindlay*) rh\_ip module: only set the mtu once
- PR #29135: (*jfindlay*) ssh\_known\_hosts.present state: catch not found exc
- PR #29196: (*s0undt3ch*) We need novaclient imported to compare versions
- PR #29059: (*terminalmage*) Work around upstream pygit2 bug
- PR #29112: (*eliasp*) Prevent backtrace (KeyError) in *ssh\_known\_hosts.present* state
- PR #29178: (*whyte wolf*) Profile not being passed to keystone.endpoint\_get in \_auth. so if a p...

### 37.2.8 Salt 2015.8.8 Release Notes

---

**Important:** 2015.8.8.2 was released shortly after 2015.8.8 to fix several known issues. If you installed 2015.8.8 before 03/30/2016, you likely have installed 2015.8.8 and can optionally upgrade (find out which version you have installed using `salt --version`. The latest version is 2015.8.8.2).

---

#### Salt 2015.8.8.2

Salt 2015.8.8.2 includes fixes for the following known issues in 2015.8.8:

- [issue 32044](#): Key master with value [...] has an invalid type of list Error
- [issue 32004](#): Failed to import module win\_dacl Error
- [issue 32114](#): Wrong validation type for file\_ignore\_glob key
- [issue 31969](#): Fix file.managed for windows

## Salt 2015.8.8

### Security Fix

CVE-2016-3176: Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM *external authentication* is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to *LocalClient*, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM `eAuth service` that users authenticate against in the Salt Master configuration.

### Read Before Upgrading Debian 7 (Wheezy) from 2015.8.7 to 2015.8.8

Before you upgrade from 2015.8.7 on Debian 7, you must run the following commands to remove previous packages:

```
sudo apt-get remove python-pycrypto
sudo apt-get remove python-apache-libcloud
```

Note that `python-pycrypto` will likely remove `python-apache-libcloud`, so the second command might not be necessary. These have been replaced by `python-crypto` and `python-libcloud` with `~bpo70+1` moniker.

### Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.8.4

Salt `systemd` service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

### Changes for v2015.8.7..v2015.8.8

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-03-17T21:03:44Z

Total Merges: 312

Changes:

- **PR #31947:** (*cro*) Move proxymodule assignment earlier in proxy minion init
- **PR #31948:** (*rallytime*) Revert ``not not'' deletion and add comment as to why that is there
- **PR #31952:** (*rallytime*) Fix lint for 2015.8 branch
- **PR #31933:** (*rallytime*) Fix linking syntax in testing docs
- **PR #31930:** (*cro*) Backport changes from 2016.3
- **PR #31924:** (*jfindlay*) update 2015.8.8 release notes
- **PR #31922:** (*cachedout*) For 2015.8 head

- PR #31904: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31906: (*sbreidba*) Win\_dacl module: fix FULLCONTROL / FILE\_ALL\_ACCESS definition
- PR #31745: (*isbm*) Fix the always-false behavior on checking state
- PR #31911: (*rallytime*) Merge #31903 with pylint fix
- PR #31883: (*paiou*) Fix scaleway cloud provider and manage x86 servers
- PR #31903: (*terminalmage*) Use remote\_ref instead of local\_ref to see if checkout is necessary
- PR #31845: (*sakateka*) Now a check\_file\_meta deletes temporary files when test=True
- PR #31901: (*rallytime*) Back-port #31846 to 2015.8
- PR #31905: (*terminalmage*) Update versionadded directive
- PR #31902: (*rallytime*) Update versionadded tag for new funcs
- PR #31888: (*terminalmage*) Fix salt.utils.decorators.Depends
- PR #31857: (*sjorge*) gen\_password and del\_password missing from solaris\_shadow
- PR #31879: (*cro*) Clarify some comments
- PR #31815: (*dr4Ke*) Fix template on contents 2015.8
- PR #31818: (*anlutro*) Prevent event logs from writing huge amounts of data
- PR #31836: (*terminalmage*) Fix git\_pillar race condition
- PR #31824: (*rallytime*) Back-port #31819 to 2015.8
- PR #31856: (*szeestraten*) Adds missing docs for Virtual Network and Subnet options in salt-cloud Azure cloud profile
- PR #31839: (*jfindlay*) add 2015.8.8 release notes
- PR #31828: (*gtmanfred*) Remove ability of authenticating user to specify pam service
- PR #31787: (*anlutro*) Fix user\_create and db\_create for new versions of influxdb
- PR #31800: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31797: (*Ch3LL*) Change pkg name to less for suse pkg.info\_installed test
- PR #31793: (*xopher-mc*) fixing init system detection on sles 11, refs [`#31617`](#)
- PR #31786: (*isbm*) Bugfix: zypper doesn't detect base product on SLE11 series
- PR #31780: (*gtmanfred*) use already created vsphere connection
- PR #31779: (*sbreidba*) win\_dacl state & module: return comment field as strings, not lists.
- PR #31723: (*sjorge*) file\_ignore\_regex is a list, not bool
- PR #31747: (*techhat*) Use get\_local\_client with MASTER opts, not MINION
- PR #31688: (*whiteinge*) Various SMTP returner fixes
- PR #31752: (*rallytime*) Back-port #31686 to 2015.8
- PR #31733: (*jacobhammons*) docs to clarify cloud configuration
- PR #31775: (*techhat*) Show correct provider/driver name
- PR #31754: (*techhat*) Check all providers, not just the current one
- PR #31735: (*rallytime*) Add reboot, start, and stop actions to digital ocean driver

- PR #31770: (*anlutro*) Fix influxdb user functionality for version 0.9+
- PR #31743: (*Talkless*) Fix parentheses mismatch in documentation
- PR #31162: (*isbm*) Remove MD5 digest from everywhere and default to SHA256
- PR #31670: (*terminalmage*) Write lists of minions targeted by syndic masters to job cache
- PR #31711: (*ticosax*) [dockerng] Port and Volume comparison should consider Dockerfile
- PR #31719: (*techhat*) Don't worry about KeyErrors if the node is already removed
- PR #31713: (*ticosax*) [dockerng] Fix dockerng.network\_present when container is given by name
- PR #31705: (*peripatetic-sojourner*) Foreman pillar
- PR #31702: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31700: (*s0undt3ch*) It's a function!
- PR #31679: (*cro*) Fix bad link to the sample REST endpoint in salt-contrib.
- PR #31668: (*rallytime*) Some more testing documentation improvements
- PR #31653: (*DmitryKuzmenko*) Don't attempt to verify token if it wasn't sent to master.
- PR #31629: (*darix*) Fix services on sles
- PR #31641: (*rallytime*) Improve Salt Testing tutorial to be a more comprehensive intro
- PR #31651: (*dr4Ke*) test case: test\_list\_present\_nested\_already
- PR #31643: (*opdude*) Make sure we are really updating the mercurial repository
- PR #31598: (*terminalmage*) Remove limitations on validation types for eauth targets
- PR #31627: (*jakehilton*) Handling error from using gevent 1.1.
- PR #31630: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31594: (*rallytime*) Back-port #31589 to 2015.8
- PR #31604: (*joejulian*) Workaround for non-xml output from gluster cli when not tty
- PR #31583: (*vutny*) Remove trailing white spaces
- PR #31592: (*rallytime*) Back-port #31546 to 2015.8
- PR #31593: (*rallytime*) Back-port #31570 to 2015.8
- PR #31567: (*cachedout*) Restore FIPS compliance when using master\_finger
- PR #31568: (*twangboy*) Grant permissions using SID instead of name
- PR #31561: (*jtand*) Skipped test
- PR #31550: (*rallytime*) Correct versionadded tag for win\_service.config
- PR #31549: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31544: (*DmitryKuzmenko*) Protect getattr from recursion
- PR #31525: (*DmitryKuzmenko*) Issues/30643 merge forward fixes
- PR #31536: (*virtualguy*) Remove debian repo from raspbian installation
- PR #31528: (*vutny*) Correct Salt Cloud documentation about updating Salt Bootstrap script
- PR #31539: (*DmitryKuzmenko*) Added temporary workaround for CentOS 7 os-release id bug.
- PR #31508: (*mcalmer*) Zypper correct exit code checking

- PR #31510: (*vutny*) Add installation guide for Raspbian (Debian on Raspberry Pi)
- PR #31498: (*Ch3LL*) rename methods in pkg states test
- PR #31471: (*cachedout*) Correct issue where duplicate items in grains list during state run will result in duplicate grains
- PR #31455: (*ticosax*) [dockerng] Disable notset check
- PR #31488: (*isbm*) Unit Test for Zypper's ``remove" and ``purge"
- PR #31485: (*jacobhammons*) Fixed transport description in minion / master config
- PR #31411: (*jtand*) Added some beacons execution module integration tests
- PR #31475: (*jacobhammons*) Assorted doc issues
- PR #31477: (*vutny*) Correct installation documentation for Ubuntu
- PR #31479: (*isbm*) Zypper unit tests & fixes
- PR #31445: (*rallytime*) Only use LONGSIZE in rpm.info if available. Otherwise, use SIZE.
- PR #31464: (*Ch3LL*) integartion test: ensure decorator only runs on one method and not class
- PR #31458: (*vutny*) Correct installation documentation for Debian
- PR #31457: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31439: (*rallytime*) Fix lowpkg.info function for Ubuntu 12 - make sure we have a pkg name
- PR #31456: (*RabidCicada*) Clarified the form of requisite targets/requisite-references
- PR #31453: (*DmitryKuzmenko*) Backport cp\_geturl fix for large files into 2015.8
- PR #31444: (*jacobhammons*) Documentation updates - ddns state, file.line state/exe function, installation dependencies
- PR #31341: (*twangboy*) Clarification on Windows Package Manager docs
- PR #31380: (*kiorky*) Bring up ext\_pillar rendering errors as well
- PR #31418: (*terminalmage*) Fix core grains when Debian OS detected as `Debian GNU/Linux`
- PR #31429: (*mcalmer*) fix argument handling for pkg.download
- PR #31432: (*ticosax*) [dockerng] Hotfix docker 1.10.2
- PR #31420: (*twangboy*) Handle Unversioned Packages
- PR #31417: (*jacobhammons*) ddns state docs updated with notes regarding the name, zone, and keyfile.
- PR #31391: (*redmcg*) Added sanity check: is `pillar` in self.opts
- PR #31376: (*cro*) Some distros don't have a /lib/systemd
- PR #31352: (*ticosax*) [dockerng] Pull missing images when calling dockerng.running
- PR #31378: (*mcalmer*) Zypper refresh handling
- PR #31373: (*terminalmage*) Use --set-upstream instead of --track to set upstream on older git
- PR #31390: (*abednarik*) Fix Logrotate module.
- PR #31354: (*ticosax*) [dockerng] Don't require auth for all registries
- PR #31368: (*whiteinge*) Update list of netapi clients for autotest
- PR #31367: (*techhat*) Add docs on how to actually use SDB
- PR #31357: (*ticosax*) [dockerng] Support docker inconsistencies

- PR #31353: (*ticosax*) [dockerng] Fix when ports are integers
- PR #31346: (*ticosax*) Backport #31130 to 2015.8
- PR #31332: (*terminalmage*) Clarify documentation for gitfs/hgfs/svnfs mountpoint and root options
- PR #31305: (*mcalmer*) call zypper with option --non-interactive everywhere
- PR #31337: (*jacobhammons*) Release notes and versioning for 2015.8.7
- PR #31326: (*ticosax*) [dockerng ] Detect settings removal
- PR #31292: (*twangboy*) Fix dunder virtual to check for Remote Administration Tools
- PR #31287: (*joejulian*) Rework tests and fix reverse peering with gluster 3.7
- PR #31196: (*sakateka*) Here are a few fixes utils.network
- PR #31299: (*rallytime*) Allow state-output and state-verbose default settings to be set from CLI
- PR #31317: (*terminalmage*) Fix versionadded directive
- PR #31301: (*terminalmage*) Corrected fix for `#30999`\_
- PR #31302: (*terminalmage*) Audit CLI opts used in git states
- PR #31312: (*terminalmage*) Merge 2015.5 into 2015.8
- PR #31225: (*pprince*) Fix in file\_tree pillar (Fixes `#31223`\_.)
- PR #31233: (*mcalmer*) implement version\_cmp for zypper
- PR #31273: (*rallytime*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #31253: (*gtmanfred*) allow for nova servers to be built with premade volumes
- PR #31271: (*rallytime*) Back-port #30689 to 2015.8
- PR #31255: (*jacobhammons*) Fixes `#30461`\_
- PR #31189: (*dmacvicar*) Fix crash with scheduler and runners (`#31106`\_)
- PR #31201: (*The-Loeki*) Utilize prepared grains var in master-side ipcidr matching
- PR #31239: (*terminalmage*) Improve logging when master cannot decode a payload
- PR #31190: (*twangboy*) Clear minion cache before caching from master
- PR #31226: (*pprince*) Minor docs fix: file\_tree pillar (Fixes #31124)
- PR #31234: (*mcalmer*) improve doc for list\_pkgs
- PR #31237: (*mcalmer*) add handling for OEM products
- PR #31182: (*rallytime*) Back-port #31172 to 2015.8
- PR #31191: (*rallytime*) Make sure doc example matches kwarg
- PR #31171: (*Ch3LL*) added logic to check for installed package
- PR #31177: (*Ch3LL*) add integration test for issue `#30934`\_
- PR #31181: (*cachedout*) Lint 2015.8 branch
- PR #31169: (*rallytime*) Back-port #29718 to 2015.8
- PR #31170: (*rallytime*) Back-port #31157 to 2015.8
- PR #31147: (*cro*) Documentation clarifications.
- PR #31153: (*edencrane*) Fixed invalid host causing `reference to variable before assignment`

- PR #31152: (*garethgreenaway*) fixes to beacon module, state module and friends
- PR #31149: (*jfindlay*) add 2015.8.7 release notes
- PR #31134: (*isbm*) Fix types in the output data and return just a list of products
- PR #31120: (*gtmanfred*) Clean up some bugs in the nova driver
- PR #31132: (*rallytime*) Make sure required profile configurations passed in a map file work
- PR #31131: (*Ch3LL*) integration test for issue [`#31014`\\_](#)
- PR #31133: (*cachedout*) Fixup 31121
- PR #31125: (*isbm*) Force-kill websocket's child processes faster than default two minutes.
- PR #31119: (*sakateka*) fixes for ipv6-only multi-master failover
- PR #31107: (*techhat*) Don't try to add a non-existent IP address
- PR #31108: (*jtand*) Changed npm integration test to install request.

- PR #31026: (*terminalmage*) Fix regression when contents\_pillar/contents\_grains is a list.
- PR #30978: (*garethgreenaway*) fixes to state.py in 2015.8
- PR #30893: (*bdrung*) Make build reproducible
- PR #30945: (*cachedout*) Note that pillar cli args are sent via pub

- PR #31002: (*rmtmckenzie*) Fix lxc cloud provided minion reporting present
- PR #31007: (*jtand*) Fixed rabbitmq\_vhost test failure.
- PR #31004: (*rallytime*) Remove overstate docs and a few references.
- PR #30965: (*anlutro*) Fix rabbitmq\_vhost.present result when test=True
- PR #30955: (*Ch3LL*) docs: add clarification when source is not defined
- PR #30941: (*rallytime*) Back-port #30879 to 2015.8
- PR #30940: (*twangboy*) Fix Build Process for OSX
- PR #30944: (*jacobhammons*) 2015.8.5 release notes linking and clean up
- PR #30905: (*joejulian*) Add realpath to lvm.pvdisplay and use it in vg\_present
- PR #30924: (*youngnick*) Fix small bug with starting volumes after creation.
- PR #30910: (*cro*) fix iDRAC state
- PR #30919: (*garethgreenaway*) Fixes to ssh\_auth state module
- PR #30920: (*jacobhammons*) Versioned to 2015.8.5, added known issue ``#30300`_` to release notes
- PR #30894: (*terminalmage*) git module/state: Handle identity files more gracefully
- PR #30750: (*jfindlay*) extract whole war version
- PR #30884: (*rallytime*) Move checks for private\_key file existence and permissions to create function
- PR #30888: (*ticosax*) Backport #30797 to 2015.8
- PR #30895: (*bdrung*) Fix various typos
- PR #30889: (*anlutro*) Make msgpack an optional dependency in salt.utils.cache
- PR #30896: (*vutny*) Update nodegroups parameter examples in master config example and docs
- PR #30898: (*abednarik*) Fix pkg install with version.
- PR #30867: (*rallytime*) Pass in ``pack`` variable to `utils.boto.assign_funcs` function from ALL boto modules
- PR #30849: (*jfindlay*) `utils.aws`: use time lib to convert to epoch seconds
- PR #30874: (*terminalmage*) Fix regression in `git_pillar` when multiple remotes are configured
- PR #30850: (*jfindlay*) `modules.dpkg._get_pkg_info`: allow for ubuntu 12.04
- PR #30852: (*replicant0wnz*) Added more descriptive error message
- PR #30847: (*terminalmage*) Backport #30844 to 2015.8 branch
- PR #30860: (*vutny*) Correct installation documentation for RHEL-based distributions
- PR #30841: (*jacobhammons*) Release notes for 2015.8.5
- PR #30835: (*terminalmage*) Integration test for ``#30820`_`
- PR #30837: (*jacobhammons*) Added known issue ``#30820`_` to release notes
- PR #30832: (*rallytime*) Add grains modules to salt modindex
- PR #30822: (*rallytime*) Make sure setting `list_user_permissions` to `['', '', '']` doesn't stacktrace
- PR #30833: (*terminalmage*) Fix regression in scanning for state with ``name`` param
- PR #30823: (*yannis666*) Fix for mine to merge configuration on update.
- PR #30827: (*jacobhammons*) Version to 2015.8.4, added CVE 2016-1866 to release notes

- PR #30813: (*anlutro*) Properly set the default value for `pillar_merge_lists`
- PR #30826: (*cachedout*) Fix 30682
- PR #30818: (*rallytime*) Back-port #30790 to 2015.8
- PR #30815: (*vutny*) Pick right user argument for updating reactor function's low data
- PR #30747: (*jfindlay*) `modules.lxc.running_systemd`: use `command -v` not `which`
- PR #30800: (*twangboy*) Ability to handle special case installations
- PR #30794: (*rallytime*) A spelling fix and some spacing fixes for the `boto_ec2` module docs
- PR #30756: (*basepi*) [2015.8] Fix two error conditions in the highstate outputter
- PR #30788: (*rallytime*) Fix incorrect doc example for `dellchassis blade_idrac` state
- PR #30791: (*Ch3LL*) do not shadow `ret` function argument for `salt.function`
- PR #30726: (*sjmh*) Fix improper use of `yield` in generator
- PR #30752: (*terminalmage*) Backport `systemd` and `yum/dnf` optimizations from `develop` into 2015.8
- PR #30759: (*thusoy*) Allow managing empty files
- PR #30758: (*thusoy*) Support mounting labelled volumes with multiple drives
- PR #30686: (*cachedout*) Master-side pillar caching
- PR #30675: (*jfindlay*) handle non-ascii minion IDs
- PR #30691: (*rallytime*) Make sure we use the ```instance''` kwarg in `cloud.action`.
- PR #30713: (*rallytime*) Fix-up autodoc proxy modules for consistency
- PR #30741: (*jfindlay*) `states.locale.__virtual__`: return `exec mod load err`
- PR #30751: (*basepi*) [2015.8] Merge forward from 2015.5 to 2015.8
- PR #30720: (*clinta*) `x509.pem_managed` does not return changes dict
- PR #30687: (*clarkperkins*) Setting ``del_root_vol_on_destroy'` changes the root volume type to ``standard'`
- PR #30673: (*terminalmage*) Properly derive the `git_pillar cachedir` from the `id` instead of the URL
- PR #30666: (*cachedout*) Fix grains cache
- PR #30623: (*twangboy*) Added `service.config` function
- PR #30678: (*rallytime*) Back-port #30668 to 2015.8
- PR #30677: (*clarkperkins*) Fix EC2 volume creation logic
- PR #30680: (*cro*) Merge forward from 2015.5, primarily for #30671
- PR #30663: (*isbm*) Zypper: latest version bugfix and epoch support feature
- PR #30652: (*mew1033*) Fix sh beacon
- PR #30657: (*jfindlay*) [2015.8] Backport #30378 and #29650
- PR #30656: (*rallytime*) [2015.8] Merge 2015.5 into 2015.8
- PR #30644: (*tbaker57*) Another go at fixing 30573
- PR #30611: (*isbm*) Bugfix: Zypper `pkg.latest` crash fix
- PR #30631: (*rallytime*) Refactor `rabbitmq_cluster` states to use `test=true` functionality correctly
- PR #30628: (*rallytime*) Refactor `rabbitmq_policy` states to use `test=true` functionality correctly

- PR #30624: (*cro*) Remove bad symlinks from osx pkg dir
- PR #30622: (*rallytime*) Add glance state to list of state modules
- PR #30618: (*rallytime*) Back-port #30591 to 2015.8
- PR #30625: (*jfindlay*) doc.topics.eauth: clarify client\_acl vs eauth

### 37.2.9 Salt 2015.8.9 Release Notes (In Progress)

In progress, not yet released.

### 37.2.10 Salt 2015.5.0 Release Notes - Codename Lithium

The 2015.5.0 feature release of Salt is focused on hardening Salt and mostly on improving existing systems. A few major additions are present, primarily the new Beacon system. Most enhancements have been focused around improving existing features and interfaces.

As usual the release notes are not exhaustive and primarily include the most notable additions and improvements. Hundreds of bugs have been fixed and many modules have been substantially updated and added.

**Warning:** In order to fix potential shell injection vulnerabilities in salt modules, a change has been made to the various `cmd` module functions. These functions now default to `python_shell=False`, which means that the commands will not be sent to an actual shell.

The largest side effect of this change is that `shellisms`, such as pipes, will not work by default. The modules shipped with salt have been audited to fix any issues that might have arisen from this change. Additionally, the `cmd` state module has been unaffected, and use of `cmd.run` in jinja is also unaffected. `cmd.run` calls on the CLI will also allow shellisms.

However, custom execution modules which use shellisms in `cmd` calls will break, unless you pass `python_shell=True` to these calls.

As a temporary workaround, you can set `cmd_safe: False` in your minion and master configs. This will revert the default, but is also less secure, as it will allow shell injection vulnerabilities to be written in custom code. We recommend you only set this setting for as long as it takes to resolve these issues in your custom code, then remove the override.

---

**Note:** Starting in this version of salt, `pillar_opts` defaults to `False` instead of `True`. This means that master opts will not be present in minion pillar, and as a result, `config.get` calls will not include master opts.

We recommend pillar is used for configuration options which need to make it to the minion.

---

#### Beacons

The beacon system allows the minion to hook into system processes and continually translate external events into the salt event bus. The primary example of this is the `inotify` beacon. This beacon uses `inotify` to watch configured files or directories on the minion for changes, creation, deletion etc.

This allows for the changes to be sent up to the master where the reactor can respond to changes.

#### Sudo Minion Settings

It is now possible to run the minion as a non-root user and for the minion to execute commands via `sudo`. Simply add `sudo_user: root` to the minion config, run the minion as a non-root user and grant that user `sudo` rights to execute salt-call.

## Lazy Loader

The Lazy Loader is a significant overhaul of Salt's module loader system. The Lazy Loader will lazily load modules on access instead of all on start. In addition to a major performance improvement, this "sandboxes" modules so a bad/broken import of a single module will only affect jobs that require accessing the broken module. (:issue: 20274)

## Enhanced Active Directory Support

The eauth system for LDAP has been extended to support Microsoft Active Directory out of the box. This includes Active Directory and LDAP group support for eauth.

## Salt LXC Enhancements

The LXC systems have been overhauled to be more consistent and to fix many bugs.

This overhaul makes using LXC with Salt much easier and substantially improves the underlying capabilities of Salt's LXC integration.

## Salt SSH

- Additional configuration options and command line flags have been added to configure the scan roster on the fly
- Added support for `state.single` in `salt-ssh`
- Added support for `publish.publish`, `publish.full_data`, and `publish.runner` in `salt-ssh`
- Added support for `mine.get` in `salt-ssh`

## New Windows Installer

The new Windows installer changes how Salt is installed on Windows. The old installer used bbfreeze to create an isolated python environment to execute in. This made adding modules and python libraries difficult. The new installer sets up a more flexible python environment making it easy to manage the python install and add python modules.

Instead of frozen packages, a full python implementation resides in the bin directory (`C:\salt\bin`). By executing pip or easy\_install from within the Scripts directory (`C:\salt\bin\Scripts`) you can install any additional python modules you may need for your custom environment.

The .exe's that once resided at the root of the salt directory (`C:\salt`) have been replaced by .bat files and should function the same way as the .exe's in previous versions.

The new Windows Installer will not replace the minion config file and key if they already exist on the target system. Only the salt program files will be replaced. `C:\salt\conf` and `C:\salt\var` will remain unchanged.

## Removed Requests Dependency

The hard dependency on the requests library has been removed. Requests is still required by a number of cloud modules but is no longer required for normal Salt operations.

This removal fixes issues that were introduced with requests and salt-ssh, as well as issues users experienced from the many different packaging methods used by requests package maintainers.

## Python 3 Updates

While Salt does not YET run on Python 3 it has been updated to INSTALL on Python 3, taking us one step closer. What remains is getting the test suite to the point where it can run on Python 3 so that we can verify compatibility.

## RAET Additions

The RAET support continues to improve. RAET now supports multi-master and many bugs and performance issues have been fixed. RAET is much closer to being a first class citizen.

## Modified File Detection

A number of functions have been added to the RPM-based package managers to detect and diff files that are modified from the original package installs. This can be found in the new `pkg.modified` functions.

## Reactor Update

Fix an infinite recursion problem for runner/wheel reactor jobs by passing a ``user" (Reactor) to all jobs that the reactor starts. The reactor skips all events created by that username -- thereby only reacting to events not caused by itself. Because of this, runner and wheel executions from the runner will have user ``Reactor" in the job cache.

## Misc Fixes/Additions

- SDB driver for etcd. (:issue: 22043)
- Add `only_upgrade` argument to `apt-based pkg.install` to only install a package version if the package is already installed. (Great for security updates!)
- Joyent now requires a `keyname` to be specified in the provider configuration. This change was necessitated upstream by the 7.0+ API.
- Add `args` argument to `cmd.script_retcode` to match `cmd.script` in the `cmd` module. (:issue: 21122)
- Fixed bug where TCP keepalive was not being sent on the defined interval on the return port (4506) from minion to master. (:issue: 21465)
- `LocalClient` may now optionally raise `SaltClientError` exceptions. If using this class directly, checking for and handling this exception is recommended. (:issue: 21501)
- The `SAuth` object is now a singleton, meaning authentication state is global (per master) on each minion. This reduces sign-ins of minions from 3->1 per startup.
- Nested outputter has been optimized, it is now much faster.
- Extensive fileserver backend updates.

## Deprecations

- Removed `parameter` keyword argument from `eselect.exec_action` execution module.
- Removed `runas` parameter from the following `pip` execution module functions: install, uninstall, freeze, list_, list_upgrades, upgrade_available, upgrade. Please migrate to user.`

- Removed `runas` parameter from the following `pip` state module functions: `installed`, `removed`, `update`. Please migrate to `user`.
- Removed `quiet` option from all functions in `cmdmod` execution module. Please use `output_loglevel=quiet` instead.
- Removed `parameter` argument from `eselect.set_state`. Please migrate to `module_parameter` or `action_parameter`.
- The `salt_events` table schema has changed to include an additional field called `master_id` to distinguish between events flowing into a database from multiple masters. If `event_return` is enabled in the master config, the database schema must first be updated to add the `master_id` field. This alteration can be accomplished as follows:

```
ALTER TABLE salt_events ADD master_id VARCHAR(255) NOT NULL;
```

### Known Issues

- In multi-master mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting `'auth_timeout'` and `'auth_tries'` down to shorter periods.

### 37.2.11 Salt 2015.5.1 Release Notes

`release` 2015-05-20

Version 2015.5.1 is a bugfix release for 2015.5.0.

Changes:

- `salt.runners.cloud.action()` has changed the `fun` keyword argument to `func`. Please update any calls to this function in the cloud runner.

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

  - PR #23908: (*nleib*) fix connection function to mongo | refs: #23932
  - ee4c01b Merge pull request #23932 from rallytime/bp-23908
  - 5d520c9 fix connection function to mongo
- PR #23931: (*rallytime*) Backport #23880 to 2015.5 @ 2015-05-19T21:41:18Z
  - PR #23880: (*bastiaanb*) if setting client\_config\_dir to '~', expand path | refs: #23931
  - 70bd407 Merge pull request #23931 from rallytime/bp-23880
  - 8ce59a2 if setting client\_config\_dir to '~', expand path
- PR #23898: (*kiorky*) Lxc profiles | refs: #23897 @ 2015-05-19T21:08:28Z
  - ISSUE #23847: (*kiorky*) lxc: systemd containers cant be seeded | refs: #23806 #23898 #23897 #23808
  - ISSUE #23833: (*kiorky*) lxc.set\_dns fails intermittently | refs: #23898 #23807 #23897 #23808
  - ISSUE #23772: (*cheuschober*) lxc.init fails to bootstrap container | refs: #23806 #23898 #23807 #23897 #23808
  - ISSUE #23658: (*arthurlogilab*) [salt-cloud lxc] too verbose, shows host: True multiple times when starting | refs: #23898 #23897
  - ISSUE #23657: (*arthurlogilab*) [salt-cloud lxc] NameError: global name '\_\_salt\_\_' is not defined | refs: #23727 #23898 #23897
  - PR #23897: (*kiorky*) Lxc seed and prof ports | refs: #23898
  - PR #23808: (*kiorky*) Lxc seed and prof ports | refs: #23807 #23897
  - PR #23807: (*kiorky*) Lxc profiles | refs: #23898
  - PR #23806: (*kiorky*) Lxc seeding | refs: #23807
  - 5bdbf0a Merge pull request #23898 from makinacorp/lxc\_profiles
  - d9051a0 lxc: systemd support
  - e8d674f lxc: chroot fallback toggle
  - e2887a0 lxc: sync func name with develop
  - e96e345 lxc more fixes (lxc.set\_dns)
  - fdb6424 lxc: Fix salt config (no more a kwarg)
  - 63e63fa repair salt cloud lxc api on develop
  - 80eabe2 lxc salt cloud doc
  - 73f229d lxc: unificate saltconfig/master/master\_port
  - 0bc1f08 lxc: refactor a bit saltcloud/lxc interface
  - 7a80370 lxc: get networkprofile from saltcloud
  - 47acb2e lxc: default net profile has now correct options
  - 7eadf48 lxc: select the appropriate default bridge

- **PR #23922:** (*garethgreenaway*) Fixes to `debian_ip.py` @ 2015-05-19T18:50:53Z
  - **ISSUE #23900:** (*hashi825*) salt ubuntu network building issue 2015.5.0 | refs: #23922
  - b818f72 Merge pull request #23922 from garethgreenaway/23900\_2015\_5\_bonding\_interface\_fixes
  - 0bba536 Fixing issue reported when using bonded interfaces on Ubuntu. Attributes should be `bond-`, but the code was attempting to split just on `bond_`. Fix accounts for both, but the `debian_ip.py` module will write out bond attributes with `bond-`
- **PR #23925:** (*jplic*) Fixed wrong path in LXC cloud documentation @ 2015-05-19T18:23:56Z
  - **PR #23924:** (*jplic*) Fixed wrong path in LXC cloud documentation | refs: #23925
  - b1c98a3 Merge pull request #23925 from jplic/fix/wrong\_lxc\_path
  - a4bcd75 Fixed wrong path in LXC cloud documentation
- **PR #23894:** (*whiteinge*) Add `__all__` attribute to Mock class for docs @ 2015-05-19T17:17:35Z
  - 7f6a716 Merge pull request #23894 from whiteinge/doc-mock\_\_all\_\_
  - 6eeca46 Add `__all__` attribute to Mock class for docs
- **PR #23884:** (*jfindlay*) Fix `locale.set_locale` on debian @ 2015-05-19T15:51:22Z
  - **ISSUE #23767:** (*chrimi*) Salt system.locale fails on non existent default locale | refs: #23884
  - 8108a9b Merge pull request #23884 from jfindlay/fix\_locale
  - 91c2d51 use `append_if_not_found` in `locale.set_locale`
  - e632603 (re)generate `/etc/default/locale`
- **PR #23866:** (*jfindlay*) backport #23834, change `portage.dep.strip_empty` to list comprehension @ 2015-05-19T15:50:43Z
  - **PR #23834:** (*Arabus*) Avoid deprecation warning from `portage.dep.strip_empty()` | refs: #23866
  - 6bae12f Merge pull request #23866 from jfindlay/flag\_strip
  - aa032cc replace `portage.dep.strip_empty()` with list comprehension
  - 7576872 Proper replacement for `portage.dep.strip_empty()` with list comprehension, pep8fix
  - 2851a5c Switch `portage.dep.strip_empty(...)` to `filter(None,...)` to avoid deprecation warning and do essentially the same
- **PR #23917:** (*corywright*) Split debian bonding options on dash instead of underscore @ 2015-05-19T15:44:35Z
  - **ISSUE #23904:** (*mbrgm*) Network config bonding section cannot be parsed when attribute names use dashes | refs: #23917
  - a67a008 Merge pull request #23917 from corywright/issue23904
  - c06f8cf Split debian bonding options on dash instead of underscore
- **PR #23909:** (*jayeshka*) ``str` object has no attribute `capitalized`` @ 2015-05-19T15:41:53Z
  - e8fcd09 Merge pull request #23909 from jayeshka/file-exe-module
  - e422d9d ``str` object has no attribute `capitalized``
- **PR #23903:** (*garethgreenaway*) Adding docs for missing schedule state module parameters. @ 2015-05-19T06:29:34Z
  - c73bf38 Merge pull request #23903 from garethgreenaway/missing\_docs\_schedule\_state
  - acd8ab9 Adding docs for missing schedule state module parameters.

- f7eb70c changed previous release to 2014.7.6
- 608059f Merge branch `2015.5' of <https://github.com/jacobhammons/salt> into 2015.5

    - \* 0616fb7 Fix virtualport section of virt.get\_nics loop
  - 188f03f Merge pull request #23823 from gtmanfred/2014.7
    - \* 5ef006d add link local for ipv6
  - f3ca682 Merge pull request #23802 from gtmanfred/2014.7
    - \* 2da98b5 if it is ipv6 ip\_to\_int will fail
- **PR #23863:** (*rahulhan*) Adding states/timezone.py unit test @ 2015-05-18T17:02:19Z
  - 433f873 Merge pull request #23863 from rahulhan/states\_timezone\_unit\_test
  - 72fcabc Adding states/timezone.py unit test
- **PR #23862:** (*rahulhan*) Adding states/tomcat.py unit tests @ 2015-05-18T17:02:10Z
  - 37b3ee5 Merge pull request #23862 from rahulhan/states\_tomcat\_unit\_test

- 65d7752 Adding states/tomcat.py unit tests
- **PR #23860:** (*rahulhan*) Adding states/test.py unit tests @ 2015-05-18T17:01:49Z
  - dde7207 Merge pull request #23860 from rahulhan/states\_test\_unit\_test
  - 1f4cf86 Adding states/test.py unit tests
- **PR #23859:** (*rahulhan*) Adding states/sysrc.py unit tests @ 2015-05-18T17:01:46Z
  - 3c9b813 Merge pull request #23859 from rahulhan/states\_sysrc\_unit\_test
  - 6a903b0 Adding states/sysrc.py unit tests
- **PR #23812:** (*rallytime*) Backport #23790 to 2015.5 @ 2015-05-18T15:30:34Z
  - **PR #23790:** (*aboe76*) updated suse spec file to version 2015.5.0 | refs: #23812
  - 4cf30a7 Merge pull request #23812 from rallytime/bp-23790
  - 3f65631 updated suse spec file to version 2015.5.0
- **PR #23811:** (*rallytime*) Backport #23786 to 2015.5 @ 2015-05-18T15:30:27Z
  - **PR #23786:** (*kaithar*) Log the error generated that causes returns.mysql.returner to except. | refs: #23811
  - c6f939a Merge pull request #23811 from rallytime/bp-23786
  - 346f30b Log the error generated that causes returns.mysql.returner to except.
- **PR #23850:** (*jayeshka*) adding sysbench unit test case @ 2015-05-18T15:28:04Z
  - ce60582 Merge pull request #23850 from jayeshka/sysbench-unit-test
  - 280abde adding sysbench unit test case
- **PR #23843:** (*The-Loeki*) Fix erroneous virtual:physical core grain detection @ 2015-05-18T15:24:22Z
  - 060902f Merge pull request #23843 from The-Loeki/patch-1
  - 9e2cf60 Fix erroneous virtual:physical core grain detection
- **PR #23816:** (*Snergster*) Doc for #23685 Added prereq, caution, and additional mask information @ 2015-05-18T15:18:03Z
  - **ISSUE #23815:** (*Snergster*) [beacons] inotify errors on subdir creation | refs: #23816
  - 3257a9b Merge pull request #23816 from Snergster/23685-doc-fix
  - 0fca49d Added prereq, caution, and additional mask information
- **PR #23832:** (*ahus1*) make saltify provider use standard bootstrap procedure @ 2015-05-18T02:18:29Z
  - **PR #23829:** (*ahus1*) make saltify provider use standard bootstrap procedure | refs: #23832
  - 3df3b85 Merge pull request #23832 from ahus1/ahus1\_saltify\_bootstrap\_2015.5
  - f5b1734 fixing problem in unit test
  - cba47f6 make saltify to use standard bootstrap procedure, therefore providing all options like master\_sign\_pub\_file
- **PR #23791:** (*optix2000*) Psutil compat @ 2015-05-16T04:05:54Z
  - 8ec4fb2 Merge pull request #23791 from optix2000/psutil\_compat
  - 5470cf5 Fix pylint errors and sloppy inline comments
  - 64634b6 Update psutil.pid\_list to use psutil.pids
  - 5dd6d69 Fix imports that aren't in \_\_all\_\_

- 8a1da33 Fix test cases by mocking psutil\_compat
- 558798d Fix net\_io\_counters deprecation issue
- 8140f92 Override unnecessary pylint errors
- 7d02ad4 Fix some of the mock names for the new API
- 9b3023e Fix overloaded getters/setters. Fix line lengths
- 180eb87 Fix whitespace
- f8edf72 Use new psutil API in ps module
- e48982f Fix version checking in psutil\_compat
- 93ee411 Create compatibility psutil. psutil 3.0 drops 1.0 API, but we still support old psutil versions.
- **PR #23782:** (*terminalmage*) Replace ``command -v" with ``which" and get rid of spurious log messages @ 2015-05-16T04:03:10Z
  - 405517b Merge pull request #23782 from terminalmage/issue23772
  - 0f6f239 More ignore\_retcode to suppress spurious log msgs
  - b4c48e6 Ignore return code in lxc.attachable
  - 08658c0 Replace ``command -v" with ``which"
- **PR #23783:** (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-15T21:38:51Z
  - **ISSUE #22959:** (*highlyunavailable*) Windows Salt hangs if file.directory is trying to write to a drive that doesn't exist
  - **ISSUE #22332:** (*rallytime*) [salt-ssh] Add a check for host in /etc/salt/roster | refs: #23748
  - **ISSUE #16424:** (*stanvit*) salt-run cloud.create fails with saltify
  - **PR #23748:** (*basepi*) [2014.7] Log salt-ssh roster render errors more assertively and verbosely
  - **PR #23731:** (*twangboy*) Fixes #22959: Trying to add a directory to an unmapped drive in windows
  - **PR #23730:** (*rallytime*) Backport #23729 to 2014.7
  - **PR #23729:** (*rallytime*) Partially merge #23437 (grains fix) | refs: #23730
  - **PR #23688:** (*twangboy*) Added inet\_pton to utils/validate/net.py for ip.set\_static\_ip in windows
  - **PR #23488:** (*cellscape*) LXC cloud fixes
  - **PR #23437:** (*cedwards*) Grains item patch | refs: #23729
  - cb2eb40 Merge pull request #23783 from basepi/merge-forward-2015.5
  - 9df51ca \_\_opts\_\_.get
  - 51d23ed Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
    - \* d9af0c3 Merge pull request #23488 from cellscape/lxc-cloud-fixes
      - 64250a6 Remove profile from opts after creating LXC container
      - c4047d2 Set destroy=True in opts when destroying cloud instance
      - 9e1311a Store instance names in opts when performing cloud action
      - 934bc57 Correctly pass custom env to lxc-attach
      - 7fb85f7 Preserve test=True option in cloud states
      - 9771b5a Fix detection of absent LXC container in cloud state

- fb24f0c Report failure when failed to create/clone LXC container
- 2d9aa2b Avoid shadowing variables in lxc module
- 792e102 Allow overriding profile options in lxc.cloud\_init\_interface
- 42bd64b Return changes on successful lxc.create from salt-cloud
- 4409eab Return correct result when creating cloud LXC container
- 377015c Issue #16424: List all providers when creating salt-cloud instance without profile
- \* 808bbe1 Merge pull request #23748 from basepi/salt-ssh.roster.host.check
  - bc53e04 Log entire exception for render errors in roster
  - 753de6a Log render errors in roster to error level
  - e01a7a9 Always let the real YAML error through
- \* 72cf360 Merge pull request #23731 from twangboy/fix\_22959
  - 88e5495 Fixes #22959: Trying to add a directory to an unmapped drive in windows
- \* 2610195 Merge pull request #23730 from rallytime/bp-23729
  - 1877cae adding support for nested grains to grains.item
- \* 3e9df88 Merge pull request #23688 from twangboy/fix\_23415
  - 6a91169 Fixed unused-import pylint error
  - 5e25b3f fixed pylint errors
  - 1a96766 Added inet\_pton to utils/validate/net.py for ip.set\_static\_ip in windows
- **PR #23781:** (*jfindlay*) fix unit test mock errors on arch @ 2015-05-15T19:40:07Z
  - 982f873 Merge pull request #23781 from jfindlay/fix\_locale\_tests
  - 14c711e fix unit test mock errors on arch
- **PR #23740:** (*jfindlay*) Binary write @ 2015-05-15T18:10:44Z
  - **ISSUE #23566:** (*rks2286*) Salt-cp corrupting the file after transfer to minion | refs: #23740
  - 916b1c4 Merge pull request #23740 from jfindlay/binary\_write
  - 626930a update incorrect comment wording
  - a978f5c always use binary file write mode on windows
- **PR #23736:** (*jfindlay*) always load pip execution module @ 2015-05-15T18:10:16Z
  - **ISSUE #23682:** (*chrish42*) Pip module requires system pip, even when not used (with env\_bin) | refs: #23736
  - 348645e Merge pull request #23736 from jfindlay/fix\_pip
  - b8867a8 update pip tests
  - 040bbc4 only check pip version in one place
  - 6c453a5 check for executable status of bin\_env
  - 3337257 always load the pip module as pip could be anywhere
- **PR #23770:** (*cellscape*) Fix cloud LXC container destruction @ 2015-05-15T17:38:59Z
  - 10cedfb Merge pull request #23770 from cellscape/fix-cloud-lxc-destruction

- 4f6021c Fix cloud LXC container destruction
- **PR #23759:** (*lisa2lisa*) fixed the problem for not beable to revoke ., for more detail <https://github.com/saltstack/salt/issues/23201>, fixed mysql cannot create user with pure digit password, for more info <https://github.com/saltstack/salt/issues/23664>
  - ddea822 Merge pull request #23759 from lisa2lisa/iss23664
  - a29f161 fixed the problem for not beable to revoke ., for more detail <https://github.com/saltstack/salt/issues/23201>, fixed mysql cannot create user with pure digit password, for more info <https://github.com/saltstack/salt/issues/23664>
- **PR #23769:** (*cellscape*) Fix file\_roots CA lookup in salt.utils.http.get\_ca\_bundle @ 2015-05-15T16:21:49Z
  - 10615ff Merge pull request #23769 from cellscape/utlils-http-ca-file-roots
  - 8e90f32 Fix file\_roots CA lookup in salt.utils.http.get\_ca\_bundle
- **PR #23765:** (*jayeshka*) adding states/makeconf unit test case @ 2015-05-15T14:29:43Z
  - fd8a1b7 Merge pull request #23765 from jayeshka/makeconf\_states-unit-test
  - 26e31af adding states/makeconf unit test case
- **PR #23760:** (*ticosax*) [doc] document refresh argument @ 2015-05-15T14:23:47Z
  - ee13b08 Merge pull request #23760 from ticosax/2015.5
  - e3ca859 document refresh argument
- **PR #23766:** (*jayeshka*) adding svn unit test case @ 2015-05-15T14:23:18Z
  - a017f72 Merge pull request #23766 from jayeshka/svn-unit-test
  - 19939cf adding svn unit test case
- **PR #23751:** (*rallytime*) Backport #23737 to 2015.5 @ 2015-05-15T03:58:37Z
  - **ISSUE #23734:** (*bradthurber*) 2015.5.0 modules/archive.py ZipFile instance has no attribute `\_\_exit\_\_` - only python 2.6? | refs: #23737
  - **PR #23737:** (*bradthurber*) fix for 2015.5.0 modules/archive.py ZipFile instance has no attribute... | refs: #23751
  - 0ed9d45 Merge pull request #23751 from rallytime/bp-23737
  - 8d1eb32 fix for 2015.5.0 modules/archive.py ZipFile instance has no attribute `\_\_exit\_\_` - only python 2.6? #23734
- **PR #23710:** (*kiorky*) Get more useful output from stateful commands @ 2015-05-14T21:58:10Z
  - **ISSUE #23709:** (*kiorky*) cmdmod: enhancement is really needed for stateful commands | refs: #23710
  - d73984e Merge pull request #23710 from makinacorp/i23709
  - c706909 Get more useful output from stateful commands
- **PR #23724:** (*rallytime*) Backport #23609 to 2015.5 @ 2015-05-14T19:34:22Z
  - **PR #23609:** (*kaidokert*) file\_map: chown created directories if not root #23608 | refs: #23724
  - cdf421b Merge pull request #23724 from rallytime/bp-23609
  - fe3a762 file\_map: chmod created directories if not root
- **PR #23723:** (*rallytime*) Backport #23568 to 2015.5 @ 2015-05-14T19:34:11Z
  - **PR #23568:** (*techhat*) Allow Salt Cloud to use either SCP or SFTP, as configured | refs: #23723
  - 94f9099 Merge pull request #23723 from rallytime/bp-23568

- bbec34a Allow Salt Cloud to use either SCP or SFTP, as configured
- PR #23725: (*rallytime*) Backport #23691 to 2015.5 @ 2015-05-14T19:32:30Z
  - PR #23691: (*dennisjac*) add initial configuration documentation for varstack pillar | refs: #23725
  - 137e5ee Merge pull request #23725 from rallytime/bp-23691
  - 28a846e add initial configuration documentation for varstack pillar
- PR #23722: (*rallytime*) Backport #23472 to 2015.5 @ 2015-05-14T19:31:52Z
  - PR #23472: (*techhat*) Allow neutron network list to be used as pillar data | refs: #23722
  - 0c00995 Merge pull request #23722 from rallytime/bp-23472
  - c3d0f39 Change versionadded tag for backport
  - 023e88f Allow neutron network list to be used as pillar data
- PR #23727: (*jfindlay*) fix npm execution module stacktrace @ 2015-05-14T18:14:12Z
  - ISSUE #23657: (*arthurlogilab*) [salt-cloud lxc] NameError: global name `\_\_salt\_\_` is not defined | refs: #23727 #23898 #23897
  - cbf4ca8 Merge pull request #23727 from jfindlay/npm\_salt
  - 05392f2 fix npm execution module stacktrace
- PR #23718: (*rahulhan*) Adding states/user.py unit tests @ 2015-05-14T17:15:38Z
  - ef536d5 Merge pull request #23718 from rahulhan/states\_user\_unit\_tests
  - aad27db Adding states/user.py unit tests
- PR #23720: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-14T17:13:02Z
  - ISSUE #23604: (*Azidburn*) service.dead on systemd Minion create an Error Message | refs: #23607
  - ISSUE #23548: (*kkaig*) grains.list\_present produces incorrect (?) output | refs: #23674
  - ISSUE #23403: (*iamfil*) salt.runners.cloud.action fun parameter is replaced | refs: #23680
  - PR #23680: (*cachedout*) Rename kwarg in cloud runner
  - PR #23674: (*cachedout*) Handle lists correctly in grains.list\_prsent
  - PR #23672: (*twangboy*) Fix user present
  - PR #23670: (*rallytime*) Backport #23607 to 2014.7
  - PR #23607: (*Azidburn*) Fix for #23604. No error reporting. Exitcode !=0 are ok | refs: #23670
  - a529d74 Merge pull request #23720 from basepi/merge-forward-2015.5
  - 06a3ebd Merge remote-tracking branch `upstream/2014.7` into merge-forward-2015.5
  - 1b86460 Merge pull request #23680 from cachedout/issue\_23403
    - \* d5986c2 Rename kwarg in cloud runner
  - cd64af0 Merge pull request #23674 from cachedout/issue\_23548
    - \* da8a2f5 Handle lists correctly in grains.list\_prsent
  - d322a19 Merge pull request #23672 from twangboy/fix\_user\_present
    - \* 731e7af Merge branch `2014.7` of <https://github.com/saltstack/salt> into fix\_user\_present
    - \* d6f70a4 Fixed user.present to create password in windows

- 43f7025 Merge pull request #23670 from rallytime/bp-23607
  - \* ed30dc4 Fix for #23604. No error reporting. Exitcode !=0 are ok
- PR #23704: (*jayeshka*) adding states/lvs\_server unit test case @ 2015-05-14T14:22:10Z
  - 13facbf Merge pull request #23704 from jayeshka/lvs\_server\_states-unit-test
  - da323da adding states/lvs\_server unit test case
- PR #23703: (*jayeshka*) adding states/lvs\_service unit test case @ 2015-05-14T14:21:23Z
  - f95ca31 Merge pull request #23703 from jayeshka/lvs\_service\_states-unit-test
  - 66717c8 adding states/lvs\_service unit test case
- PR #23702: (*jayeshka*) Remove superfluous return statement. @ 2015-05-14T14:20:42Z
  - 07e987e Merge pull request #23702 from jayeshka/fix\_lvs\_service
  - ecff218 fix lvs\_service
- PR #23686: (*jfindlay*) remove superfluous return statement @ 2015-05-14T14:20:18Z
  - 39973d4 Merge pull request #23686 from jfindlay/fix\_lvs\_server
  - 5aaeb73 remove superfluous return statement
- PR #23690: (*rallytime*) Backport #23424 to 2015.5 @ 2015-05-13T23:04:36Z
  - PR #23424: (*jtand*) Added python\_shell=True for refresh\_db in pacman.py | refs: #23690
  - be7c7ef Merge pull request #23690 from rallytime/bp-23424
  - 94574b7 Added python\_shell=True for refresh\_db in pacman.py
- PR #23681: (*cachedout*) Start on 2015.5.1 release notes @ 2015-05-13T19:44:22Z
  - 1a0db43 Merge pull request #23681 from cachedout/2015\_5\_1\_release\_notes
  - bdbbfa6 Start on 2015.5.1 release notes
- PR #23679: (*jfindlay*) Merge #23616 @ 2015-05-13T19:03:53Z
  - PR #23616: (*Snergster*) virtual returning none warning fixed in dev but missed in 2015.5 | refs: #23679
  - b54075a Merge pull request #23679 from jfindlay/merge\_23616
  - 6e15e19 appease pylint's blank line strictures
  - 8750680 virtual returning none warning fixed in dev but missed in 2015.5
- PR #23675: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-13T18:35:54Z
  - ISSUE #23611: (*hubez*) master\_type set to `failover` but `master` is not of type list but of type <type `str`> | refs: #23637

  - 97ae514 aptpkg.upgrade should default to upgrade instead of dist\_upgrade.
- PR #23550: (*jfindlay*) additional mock for rh\_ip\_test test\_build\_bond @ 2015-05-12T15:17:16Z
  - ISSUE #23473: (*terminalmage*) unit.modules.rh\_ip\_test.RhipTestCase.test\_build\_bond is not properly mocked | refs: #23550
  - c1157cd Merge pull request #23550 from jfindlay/fix\_rh\_ip\_test
  - e9b94d3 additional mock for rh\_ip\_test test\_build\_bond
- PR #23552: (*garethgreenaway*) Fix for an issue caused by a previous pull request @ 2015-05-11T21:54:59Z
  - b593328 Merge pull request #23552 from garethgreenaway/2015\_5\_returner\_fix\_broken\_previous\_pr
  - 7d70e2b Passed argumentes in the call \_fetch\_profile\_opts to were in the wrong order
- PR #23547: (*slinu3d*) Added AWS v4 signature support for 2015.5 @ 2015-05-11T21:52:24Z
  - d0f9682 Merge pull request #23547 from slinu3d/2015.5
  - f3bfbdb5 Fixed urlparse and urlencode calls

- 802dbdb Added AWS v4 signature support for 2015.5
- **PR #23544:** (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-11T18:02:06Z
  - **ISSUE #23159:** (*aneeshusa*) Unused validator
  - **ISSUE #20518:** (*ekle*) module s3.get does not support eu-central-1 | refs: #23467
  - **ISSUE #563:** (*chutz*) pidfile support for minion and master daemons | refs: #23460 #23461
  - **PR #23538:** (*cro*) Update date in LICENSE file
  - **PR #23505:** (*aneeshusa*) Remove unused ssh config validator. Fixes #23159.
  - **PR #23467:** (*slinu3d*) Added AWS v4 signature support
  - **PR #23460:** (*s0undt3ch*) [2014.7] Update to latest stable bootstrap script v2015.05.07
  - **PR #23444:** (*techhat*) Add create\_attach\_volume to nova driver
  - **PR #23439:** (*techhat*) Add wait\_for\_passwd\_maxtries variable
  - 06c6a1f Merge pull request #23544 from basepi/merge-forward-2015.5
  - f8a36bc Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
    - \* b79fed3 Merge pull request #23538 from cro/licupdate
      - 345efe2 Update date in LICENSE file
    - \* a123a36 Merge pull request #23505 from aneeshusa/remove-unused-ssh-config-validator
      - 90af167 Remove unused ssh config validator. Fixes #23159.
    - \* ca2c21a Merge pull request #23467 from slinu3d/2014.7
      - 0b4081d Fixed pylint error at line 363
      - 5be5eb5 Fixed pylint errors
      - e64f374 Fixed lint errors
      - b9d1ac4 Added AWS v4 signature support
    - \* e6f9eec Merge pull request #23444 from techhat/novacreateattach
      - ebdb7ea Add create\_attach\_volume to nova driver
    - \* e331463 Merge pull request #23460 from s0undt3ch/hotfix/bootstrap-script-2014.7
      - edcd0c4 Update to latest stable bootstrap script v2015.05.07
    - \* 7a8ce1a Merge pull request #23439 from techhat/maxtries
      - 0ad3ff2 Add wait\_for\_passwd\_maxtries variable
- **PR #23470:** (*twangboy*) Fixed service.restart for salt-minion @ 2015-05-11T17:54:47Z
  - **ISSUE #23426:** (*twangboy*) Can't restart salt-minion on 64 bit windows (2015.5.0) | refs: #23470
  - aa5b896 Merge pull request #23470 from twangboy/fix\_svc\_restart
  - b3f284c Fixed tests
  - ad44d79 Fixed service.restart for salt-minion
- **PR #23539:** (*rahulhan*) Adding states/virtualenv\_mod.py unit tests @ 2015-05-11T17:02:31Z
  - 67988b2 Merge pull request #23539 from rahulhan/states\_virtualenv\_mod\_unit\_test
  - 750bb07 Adding states/virtualenv\_mod.py unit tests

- 6f0cf2e Merge remote-tracking branch `upstream/2015.2' into 2015.5
  - ISSUE #23244: (*freimer*) Caller not available in reactors | refs: #23245
  - PR #23509: (*keesbos*) Catch the unset (empty/None) environment case
  - PR #23423: (*cachedout*) Remove jid\_event from state.orch
  - PR #23245: (*freimer*) Add Caller functionality to reactors.

  - f9da6db adding riak unit test case

### 37.2.12 Salt 2015.5.10 Release Notes

#### Security Fix

CVE-2016-3176: Insecure configuration of PAM external authentication service

This issue affects all Salt versions prior to 2015.8.8/2015.5.10 when PAM *external authentication* is enabled. This issue involves passing an alternative PAM authentication service with a command that is sent to *LocalClient*, enabling the attacker to bypass the configured authentication service. Thank you to Dylan Frese <dmfrese@gmail.com> for bringing this issue to our attention.

This update defines the PAM `eAuth service` that users authenticate against in the Salt Master configuration.

(No additional fixes are contained in this release).

#### Read Before Upgrading Debian 8 (Jessie) from Salt Versions Earlier than 2015.5.9

Salt `systemd` service files are missing the following statement in these versions:

```
[Service]
KillMode=process
```

This statement must be added to successfully upgrade on these earlier versions of Salt.

### 37.2.13 Salt 2015.5.11 Release Notes (In Progress)

In progress, not yet released.

### 37.2.14 Salt 2015.5.2 Release Notes

release 2015-06-10

Version 2015.5.2 is a bugfix release for 2015.5.0.

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

**PR #24346: (rallytime) Backport #24271 to 2015.5 @ 2015-06-03T18:44:31Z**

**PR #24271: (randybias) Fixed the setup instructions**

refs: #24346

- 76927c9 Merge pull request #24346 from rallytime/bp-24271
- 04067b6 Fixed the setup instructions

**PR #24345: (rallytime) Backport #24013 to 2015.5 @ 2015-06-03T18:39:41Z**

**ISSUE #24012: (jbq) Enabling a service does not create the appropriate rc.d symlinks on Ubuntu**

refs: #24013

**PR #24013: (jbq) Fix enabling a service on Ubuntu #24012**

refs: #24345

- 4afa03d Merge pull request #24345 from rallytime/bp-24013
- 16e0732 Fix enabling a service on Ubuntu #24012

**PR #24365: (jacobhammons) Fixes for PDF build errors @ 2015-06-03T17:50:02Z**

- c3392c2 Merge pull request #24365 from jacobhammons/DocFixes
- 0fc1902 Fixes for PDF build errors

**PR #24313: (nicholascapo) Fix #22991 Correctly set result when test=True @ 2015-06-03T14:49:18Z**

**ISSUE #22991: (nicholascapo) npm.installed ignores test=True \* ae681a4 Merge pull request #24313 from nicholascapo/fix-22991-npm.installed-test-true \* ac9644c Fix #22991 npm.installed correctly set result on test=True**

**PR #24312: (nicholascapo) Fix #18966: file.serialize supports test=True @ 2015-06-03T14:49:06Z**

**ISSUE #18966: (bechtoldt) file.serialize ignores test=True \* d57a9a2 Merge pull request #24312 from nicholascapo/fix-18966-file.serialize-test-true \* e7328e7 Fix #18966 file.serialize correctly set result on test=True**

**PR #24302: (jfindlay) fix pkg hold/unhold integration test @ 2015-06-03T03:27:43Z**

- 6b694e3 Merge pull request #24302 from jfindlay/pkg\_tests
- c2db0b1 fix pkg hold/unhold integration test

**PR #24349: (rallytime) Remove references to mount\_points in ec2 docs @ 2015-06-03T01:54:09Z**

**ISSUE #14021: (mathrawka) EC2 doc mentions mount\_point, but unable to use properly**

refs: #24349

- aca8447 Merge pull request #24349 from rallytime/fix-14021
- a235b11 Remove references to mount\_points in ec2 docs

**PR #24328: (dr4Ke) Fix state grains silently fails 2015.5 @ 2015-06-02T15:18:46Z**

**ISSUE #24319: (dr4Ke) grains state shouldn't fail silently \* 88a997e Merge pull request #24328 from dr4Ke/fix\_state\_grains\_silently\_fails\_2015.5 \* 8a63d1e fix state grains silently fails #24319**

- ca1af20 grains state: add some tests

PR #24310: (**techhat**) Add warning about destroying maps @ 2015-06-02T03:01:28Z

ISSUE #24036: (**arthurlogilab**) [salt-cloud] Protect against passing command line arguments as names for the --destroy co

refs: #24310

ISSUE #9772: (**s0undt3ch**) Delete VM's in a map does not delete them all

refs: #24310

- 7dcd9bb Merge pull request #24310 from techhat/mapwarning
- ca535a6 Add warning about destroying maps

PR #24281: (**steverweber**) Ipmi docfix @ 2015-06-01T17:45:36Z

- 02bf25 Merge pull request #24281 from steverweber/ipmi\_docfix
- dd36f2c yaml formatting
- f6deef3 include api\_kg kwarg in ipmi state
- a7d4e97 doc cleanup
- 0ded2fd save more cleanup to doc
- 08872f2 fix name api\_key to api\_kg
- 165a387 doc fix add api\_kg kwargs
- 1ec7888 cleanup docs

PR #24287: (**jfindlay**) fix pkg test on ubuntu 12.04 for realz @ 2015-06-01T14:16:37Z

- 73cd2cb Merge pull request #24287 from jfindlay/pkg\_test
- 98944d8 fix pkg test on ubuntu 12.04 for realz

PR #24279: (**rallytime**) Backport #24263 to 2015.5 @ 2015-06-01T04:29:34Z

PR #24263: (**cdarwin**) Correct usage of import\_yaml in formula documentation

refs: #24279

- 02017a0 Merge pull request #24279 from rallytime/bp-24263
- beff7c7 Correct usage of import\_yaml in formula documentation

PR #24277: (**rallytime**) Put a space between after\_jump commands @ 2015-06-01T04:28:26Z

ISSUE #24226: (**c4urselF**) iptables state needs to keep ordering of flags

refs: #24277

- 2ba696d Merge pull request #24277 from rallytime/fix\_iptables\_jump
- e2d1606 Move after\_jump split out of loop
- d14f130 Remove extra loop
- 42ed532 Put a space between after\_jump commands

PR #24262: (**basepi**) More dictupdate after #24142 @ 2015-05-31T04:09:37Z

PR #24142: (**basepi**) Optimize dictupdate.update and add #24097 functionality

refs: #24262

**PR #24097: (kiorky) Optimize dictupdate**

refs: #24142 #24142

- 113eba3 Merge pull request #24262 from basepi/dictupdatefix
- 0c4832c Raise a typeerror if non-dict types
- be21aaa Pylint
- bb8a6c6 More optimization
- c933249 py3 compat
- ff6b2a7 Further optimize dictupdate.update()
- c73f5ba Remove unused valtype

**PR #24269: (kiorky) zfs: Fix spurious retcode hijacking in virtual @ 2015-05-30T17:47:49Z**

- 785d5a1 Merge pull request #24269 from makinacorpuz/zfs
- 0bf23ce zfs: Fix spurious retcode hijacking in virtual

**PR #24257: (jfindlay) fix pkg mod integration test on ubuntu 12.04 @ 2015-05-29T23:09:00Z**

- 3d885c0 Merge pull request #24257 from jfindlay/pkg\_tests
- 9508924 fix pkg mod integration test on ubuntu 12.04

**PR #24260: (basepi) Fix some typos from #24080 @ 2015-05-29T22:54:58Z**

ISSUE #23657: (arthurlogilab) [salt-cloud lxc] NameError: global name `\_\_salt\_\_' is not defined

refs: #24080 #23982

**PR #24080: (kiorky) Lxc consistency2**

refs: #24260 #23982 #24066

**PR #24066: (kiorky) Merge forward 2015.5 -> develop**

refs: #23982

**PR #24065: (kiorky) continue to fix #23883**

refs: #24080 #24066

**PR #23982: (kiorky) lxc: path support**

refs: #24080

- 08a1075 Merge pull request #24260 from basepi/lxctypos24080
- 0fa1ad3 Fix another lxc typo
- 669938f s/you ll/you'll/

**PR #24080: (kiorky) Lxc consistency2**

refs: #24260 #23982 #24066

@ 2015-05-29T22:51:54Z

ISSUE #23657: (arthurlogilab) [salt-cloud lxc] NameError: global name `\_\_salt\_\_' is not defined

refs: #24080 #23982

**PR #24066: (kiorky) Merge forward 2015.5 -> develop**

refs: #23982

**PR #24065: (*kiorky*) continue to fix #23883**

refs: #24080 #24066

**PR #23982: (*kiorky*) lxc: path support**

refs: #24080

- 75590cf Merge pull request #24080 from makinacorp/lxc\_consistency2
- 81f8067 lxc: fix old lxc test
- 458f506 seed: lint
- 96b8d55 Fix seed.mkconfig yamldump
- 76ddb68 lxc/applynet: conservative
- ce7096f variable collision
- 8a8b28d lxc: lint
- 458b18b more lxc docs
- ef1f952 lxc docs: typos
- d67a43d more lxc docs
- 608da5e modules/lxc: merge resolution
- 27c4689 modules/lxc: more consistent comparison
- 07c365a lxc: merge conflict spotted
- 9993915 modules/lxc: rework settings for consistency
- ce11d83 lxc: Global doc refresh
- 61ed2f5 clouds/lxc: profile key is conflicting

**PR #24247: (*rallytime*) Backport #24220 to 2015.5 @ 2015-05-29T21:40:01Z**

**ISSUE #24210: (*damonnk*) salt-cloud vsphere.py should allow key\_filename param**

refs: #24220

**PR #24220: (*djcrabhat*) adding key\_filename param to vsphere provider**

refs: #24247

- da14f3b Merge pull request #24247 from rallytime/bp-24220
- 0b1041d adding key\_filename param to vsphere provider

**PR #24254: (*rallytime*) Add deprecation warning to Digital Ocean v1 Driver @ 2015-05-29T21:39:25Z**

**PR #22731: (*dmyerscough*) Decommission DigitalOcean APIv1 and have users use the new DigitalOcean APIv2**

refs: #24254

- 21d6126 Merge pull request #24254 from rallytime/add\_deprecation\_warning\_digitalocean
- cafe37b Add note to docs about deprecation
- ea0f1e0 Add deprecation warning to digital ocean driver to move to digital\_ocean\_v2

**PR #24252: (*aboe76*) Updated suse spec to 2015.5.1 @ 2015-05-29T21:38:45Z**

- dac055d Merge pull request #24252 from aboe76/opensuse\_package

- 0ad617d Updated suse spec to 2015.5.1

**PR #24251: (garethgreenaway) Returners broken in 2015.5 @ 2015-05-29T21:37:52Z**

- 49e7fe8 Merge pull request #24251 from garethgreenaway/2015\_5\_returner\_brokenness
- 5df6b52 The code calling cfg as a function vs treating it as a dictionary and using get is currently backwards causing returners to fail when used from the CLI and in scheduled jobs.

**PR #24255: (rallytime) Clarify digital ocean documentation and mention v1 driver deprecation @ 2015-05-29T21:37:07Z**

**ISSUE #21498: (rallytime) Clarify Digital Ocean Documentation**

refs: #24255

- bfb9461 Merge pull request #24255 from rallytime/clarify\_digital\_ocean\_driver\_docs
- 8d51f75 Clarify digital ocean documentation and mention v1 driver deprecation

**PR #24232: (rallytime) Backport #23308 to 2015.5 @ 2015-05-29T21:36:46Z**

**PR #23308: (thusoy) Don't merge: Add missing jump arguments to iptables module**

refs: #24232

- 41f5756 Merge pull request #24232 from rallytime/bp-23308
- 2733f66 Import string
- 9097cca Add missing jump arguments to iptables module

**PR #24245: (Sacro) Unset PYTHONHOME when starting the service @ 2015-05-29T20:00:31Z**

- a95982c Merge pull request #24245 from Sacro/patch-2
- 6632d06 Unset PYTHONHOME when starting the service

**PR #24121: (hvnsweeting) deprecate setting user permission in rabbitmq\_vhost.present @ 2015-05-29T15:55:40Z**

- 1504c76 Merge pull request #24121 from hvnsweeting/rabbitmq-host-deprecate-set-permission
- 2223158 deprecate setting user permission in rabbitmq\_host.present

**PR #24179: (merll) Changing user and group only possible for existing ids. @ 2015-05-29T15:52:43Z**

**PR #24169: (merll) Changing user and group only possible for existing ids.**

refs: #24179

- ba02f65 Merge pull request #24179 from Precis/fix-file-uid-gid-2015.0
- ee4c9d5 Use ids if user or group is not present.

**PR #24229: (msteed) Fix auth failure on syndic with external\_auth @ 2015-05-29T15:04:06Z**

**ISSUE #24147: (paclat) Syndication issues when using authentication on master of masters.**

refs: #24229

- 9bfb066 Merge pull request #24229 from msteed/issue-24147
- 482d1cf Fix auth failure on syndic with external\_auth

**PR #24234: (jayeshka) adding states/quota unit test case. @ 2015-05-29T14:14:27Z**

- 19fa43c Merge pull request #24234 from jayeshka/quota-states-unit-test
- c233565 adding states/quota unit test case.

**PR #24217: (jfindlay) disable intermittently failing tests @ 2015-05-29T03:08:39Z**

**ISSUE #40: (thatch45) Clean up timeouts**

refs: #22857

**PR #23623: (jfindlay) Fix /jobs endpoint's return**

refs: #24217

**PR #22857: (jacksontj) Fix /jobs endpoint's return**

refs: #23623

- e15142c Merge pull request #24217 from jfindlay/disable\_bad\_tests
- 6b62804 disable intermittently failing tests

**PR #24199: (ryan-lane) Various fixes for boto\_route53 and boto\_elb @ 2015-05-29T03:02:41Z**

- ce8e43b Merge pull request #24199 from lyft/route53-fix-elb
- d8dc9a7 Better unit tests for boto\_elb state
- 62f214b Remove cnames\_present test
- 7b9ae82 Lint fix
- b74b0d1 Various fixes for boto\_route53 and boto\_elb

**PR #24142: (basepi) Optimize dictupdate.update and add #24097 functionality**

refs: #24262

@ 2015-05-29T03:00:56Z

**PR #24097: (kiorky) Optimize dictupdate**

refs: #24142 #24142

**PR #21968: (ryanwohara) Verifying the key has a value before using it. \* a43465d Merge pull request #24142 from basepi/dictupdate24097 \* 5c6e210 Deepcopy on merge\_recurse**

- a13c84a Fix None check from #21968
- 9ef2c64 Add docstring
- 8579429 Add in recursive\_update from #24097
- 8599143 if key not in dest, don't recurse
- d8a84b3 Rename klass to valtype

**PR #24208: (jayeshka) adding states/ports unit test case. @ 2015-05-28T23:06:33Z**

- 526698b Merge pull request #24208 from jayeshka/ports-states-unit-test
- 657b709 adding states/ports unit test case.

**PR #24219: (jfindlay) find zfs without modinfo @ 2015-05-28T21:07:26Z**

**ISSUE #20635: (dennisjac) 2015.2.0rc1: zfs errors in log after update**

refs: #24219

- d00945f Merge pull request #24219 from jfindlay/zfs\_check
- 15d4019 use the salt loader in the zfs mod
- 5599b67 try to search for zfs if modinfo is unavailable

**PR #24190: (msteed)** Fix issue 23815 @ 2015-05-28T20:10:34Z

ISSUE #23815: (Snergster) [beacons] inotify errors on subdir creation \* 3dc4b85 Merge pull request #24190 from msteed/issue-23815 \* 086a1a9 lint

- 65de62f fix #23815
- d04e916 spelling
- db9f682 add inotify beacon unit tests

**PR #24211: (rallytime)** Backport #24205 to 2015.5 @ 2015-05-28T18:28:15Z

**PR #24205: (hazelesque)** Docstring fix in salt.modules.yumpkg.hold

refs: #24211

- 436634b Merge pull request #24211 from rallytime/bp-24205
- 23284b5 Docstring fix in salt.modules.yumpkg.hold

**PR #24212: (terminalmage)** Clarify error in rendering template for top file @ 2015-05-28T18:26:20Z

- cc58624 Merge pull request #24212 from terminalmage/clarify-error-msg
- ca807fb Clarify error in rendering template for top file

**PR #24213: (The-Loeki)** ShouldFix \_- troubles in debian\_ip @ 2015-05-28T18:24:39Z

ISSUE #23904: (mbrgm) Network config bonding section cannot be parsed when attribute names use dashes

refs: #23917

ISSUE #23900: (hashi825) salt ubuntu network building issue 2015.5.0

refs: #23922

**PR #23922: (garethgreenaway)** Fixes to debian\_ip.py

refs: #24213

**PR #23917: (corywright)** Split debian bonding options on dash instead of underscore

refs: #24213

- 9825160 Merge pull request #24213 from The-Loeki/patch-3
- a68d515 ShouldFix \_- troubles in debian\_ip

**PR #24214: (basepi)** 2015.5.1release @ 2015-05-28T16:23:57Z

- 071751d Merge pull request #24214 from basepi/2015.5.1release
- e5ba31b 2015.5.1 release date
- 768494c Update latest release in docs

**PR #24202: (rallytime)** Backport #24186 to 2015.5 @ 2015-05-28T05:16:48Z

**PR #24186: (thcipriani)** Update salt vagrant provisioner info

refs: #24202

- c2f1fdb Merge pull request #24202 from rallytime/bp-24186
- db793dd Update salt vagrant provisioner info

**PR #24192: (rallytime)** Backport #20474 to 2015.5 @ 2015-05-28T05:16:18Z

**PR #20474: (*djcrabhat*)** add sudo, sudo\_password params to vsphere deploy to allow for non-root deploys

refs: #24192

- 8a085a2 Merge pull request #24192 from rallytime/bp-20474
- fd3c783 add sudo, sudo\_password params to deploy to allow for non-root deploys

**PR #24184: (*rallytime*)** Backport #24129 to 2015.5 @ 2015-05-28T05:15:08Z

**PR #24129: (*pengyao*)** Wheel client doc

refs: #24184

- 7cc535b Merge pull request #24184 from rallytime/bp-24129
- 722a662 fixed a typo
- 565eb46 Add cmd doc for WheelClient

**PR #24183: (*rallytime*)** Backport #19320 to 2015.5 @ 2015-05-28T05:14:36Z

**PR #19320: (*clan*)** add `state\_output\_profile` option for profile output

refs: #24183

- eb0af70 Merge pull request #24183 from rallytime/bp-19320
- 55db1bf sate\_output\_profile default to True
- 9919227 fix type: statei -> state
- 0549ca6 add `state\_output\_profile` option for profile output

**PR #24201: (*whiteinge*)** Add list of client libraries for the rest\_cherrypy module to the top-level documentation @ 2015-05-28T02:12:09Z

- 1b5bf23 Merge pull request #24201 from whiteinge/rest\_cherrypy-client-libs
- 5f71802 Add list of client libraries for the rest\_cherrypy module
- 28fc77f Fix rest\_cherrypy config example indentation

**PR #24195: (*rallytime*)** Merge #24185 with a couple of fixes @ 2015-05-27T22:18:37Z

**PR #24185: (*jacobhammons*)** Fixes for doc build errors

refs: #24195

- 3307ec2 Merge pull request #24195 from rallytime/merge-24185
- d8daa9d Merge #24185 with a couple of fixes
- 634d56b Fixed pylon error
- 0689815 Fixes for doc build errors

**PR #24166: (*jayeshka*)** adding states/pkgng unit test case. @ 2015-05-27T20:27:49Z

- 7e400bc Merge pull request #24166 from jayeshka/pkgng-states-unit-test
- 2234bb0 adding states/pkgng unit test case.

**PR #24189: (*basepi*)** [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-27T20:26:31Z

**PR #24178: (*rallytime*)** Backport #24118 to 2014.7, too. **PR #24159: (*rallytime*)** Fill out modules/keystone.py CLI Examples **PR #24158: (*rallytime*)** Fix test\_valid\_docs test for tls module **PR #24118: (*trevor-h*)** removed deprecated pymongo usage

refs: #24139 #24178

- 9fcd479 Merge pull request #24189 from basepi/merge-forward-2015.5
- 8839e9c Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
- 9d7331c Merge pull request #24178 from rallytime/bp-24118
  - e2217a0 removed deprecated pymongo usage as no longer functional with pymongo > 3.x
- 4e8c503 Merge pull request #24159 from rallytime/keystone\_doc\_examples
  - dadac8d Fill out modules/keystone.py CLI Examples
- fc10ee8 Merge pull request #24158 from rallytime/fix\_doc\_error
  - 49a517e Fix test\_valid\_docs test for tls module

**PR #24181: (jtand) Fixed error where file was evaluated as a symlink in test\_absent @ 2015-05-27T18:26:28Z**

- 2303dec Merge pull request #24181 from jtand/file\_test
- 5f0e601 Fixed error where file was evaluated as a symlink in test\_absent

**PR #24180: (terminalmage) Skip libvirt tests if not running as root @ 2015-05-27T18:18:47Z**

- a162768 Merge pull request #24180 from terminalmage/fix-libvirt-test
- 72e7416 Skip libvirt tests if not running as root

**PR #24165: (jayeshka) adding states/portage\_config unit test case. @ 2015-05-27T17:15:08Z**

- 1fbc5b2 Merge pull request #24165 from jayeshka/portage\_config-states-unit-test
- 8cf1505 adding states/portage\_config unit test case.

**PR #24164: (jayeshka) adding states/pecl unit test case. @ 2015-05-27T17:14:26Z**

- 4747856 Merge pull request #24164 from jayeshka/pecl-states-unit-test
- 563a5b3 adding states/pecl unit test case.

**PR #24160: (The-Loeki) small enhancement to data module; pop() @ 2015-05-27T17:03:10Z**

- cdaaa19 Merge pull request #24160 from The-Loeki/patch-1
- 2175ff3 doc & merge fix
- eba382c small enhancement to data module; pop()

**PR #24153: (techhat) Batch mode sometimes improperly builds lists of minions to process @ 2015-05-27T16:21:53Z**

- 4a8dbc7 Merge pull request #24153 from techhat/batchlist
- 467ba64 Make sure that minion IDs are strings

**PR #24167: (jayeshka) adding states/pagerduty unit test case. @ 2015-05-27T16:14:01Z**

- ed8ccf5 Merge pull request #24167 from jayeshka/pagerduty-states-unit-test
- 1af8c83 adding states/pagerduty unit test case.

**PR #24156: (basepi) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-05-27T15:05:01Z**

**ISSUE #23464: (tibold) cmd\_iter\_no\_block() blocks**

refs: #24093

PR #24125: (*hvnsweeting*) Fix rabbitmq test mode PR #24093: (*msteed*) Make LocalClient.cmd\_iter\_no\_block() not block PR #24008: (*davidjb*) Correct reST formatting for states.cmd documentation PR #23933: (*jacobhammons*) sphinx saltstack2 doc theme \* b9507d1 Merge pull request #24156 from basepi/merge-forward-2015.5 \* e52b5ab Remove stray >>>>>

- 7dfbd92 Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
  - c0d32e0 Merge pull request #24125 from hvnsweeting/fix-rabbitmq-test-mode
    - \* 71862c6 enhance log
    - \* 28e2594 change according to new output of rabbitmq module functions
    - \* cd0212e processes and returns better output for rabbitmq module
  - 39a8f30 Merge pull request #24093 from msteed/issue-23464
    - \* fd35903 Fix failing test
    - \* 41b344c Make LocalClient.cmd\_iter\_no\_block() not block
  - 5bff30 Merge pull request #24008 from davidjb/2014.7
    - \* 8b8d029 Correct reST formatting for documentation
  - 1aa0420 Merge pull request #23933 from jacobhammons/2014.7
  - a3613e6 removed numbering from doc TOC
  - 78b737c removed 2015.\* release from release notes, updated index page to remove PDF/epub links
  - e867f7d Changed build settings to use saltstack2 theme and update release versions.
  - 81ed9c9 sphinx saltstack2 doc theme

PR #24145: (*jfindlay*) attempt to decode win update package @ 2015-05-26T23:20:20Z

ISSUE #24102: (*bormotov*) win\_update encondig problems

refs: #24145

- 05745fa Merge pull request #24145 from jfindlay/win\_update\_encoding
- cc5e17e attempt to decode win update package

PR #24123: (*kiorky*) fix service enable/disable change @ 2015-05-26T21:24:19Z

ISSUE #24122: (*kiorky*) service.dead is no more stateful: services does not handle correctly enable/disable change state

refs: #24123

- 7024789 Merge pull request #24123 from makinacorpuss/ss
- 2e2e1d2 fix service enable/disable change

PR #24146: (*rallytime*) Fixes the boto\_vpc\_test failure on CentOS 5 tests @ 2015-05-26T20:15:19Z

- 51c3cec Merge pull request #24146 from rallytime/fix\_centos\_boto\_failure
- ac0f97d Fixes the boto\_vpc\_test failure on CentOS 5 tests

PR #24144: (*twangboy*) Compare Keys ignores all newlines and carriage returns @ 2015-05-26T19:25:48Z

ISSUE #24052: (*twangboy*) v2015.5.1 Changes the way it interprets the minion\_master.pub file

refs: #24089 #24144

ISSUE #23566: (*rks2286*) Salt-cp corrupting the file after transfer to minion

refs: #24144 #23740

**PR #23740: (*jfindlay*) Binary write**

refs: #24144

- 1c91a21 Merge pull request #24144 from twangboy/fix\_24052
- c197b41 Compare Keys removing all newlines and carriage returns

**PR #24139: (*rallytime*) Backport #24118 to 2015.5 @ 2015-05-26T18:24:27Z**

**PR #24118: (*trevor-h*) removed deprecated pymongo usage**

refs: #24139 #24178

- 0841667 Merge pull request #24139 from rallytime/bp-24118
- 4bb519b removed deprecated pymongo usage as no longer functional with pymongo > 3.x

**PR #24138: (*rallytime*) Backport #24116 to 2015.5 @ 2015-05-26T18:23:51Z**

**PR #24116: (*awdrius*) Fixed typo in chown username (ending dot) that fails the command.**

refs: #24138

- 742eca2 Merge pull request #24138 from rallytime/bp-24116
- 7f08641 Fixed typo in chown username (ending dot) that fails the command.

**PR #24137: (*rallytime*) Backport #24105 to 2015.5 @ 2015-05-26T18:23:40Z**

**PR #24105: (*cedwards*) Updated some beacon-specific documentation formatting**

refs: #24137

- e01536d Merge pull request #24137 from rallytime/bp-24105
- f0778a0 Updated some beacon-specific documentation formatting

**PR #24136: (*rallytime*) Backport #24104 to 2015.5 @ 2015-05-26T15:58:47Z**

**ISSUE #23364: (*pruiz*) Unable to destroy host using proxmox cloud: There was an error destroying machines: 501 Server Error: Method `DELETE /nodes/pmx1/openvz/openvz/100' not implemented** **PR #24104: (*pruiz*) Only try to stop a VM if it's not already stopped. (fixes #23364)**

refs: #24136

- 89cdf97 Merge pull request #24136 from rallytime/bp-24104
- c538884 Only try to stop a VM if it's not already stopped. (fixes #23364)

**PR #24135: (*rallytime*) Backport #24083 to 2015.5 @ 2015-05-26T15:58:27Z**

**PR #24083: (*swdream*) fix code block syntax**

refs: #24135

- 67c4373 Merge pull request #24135 from rallytime/bp-24083
- e1d06f9 fix code block syntax

**PR #24131: (*jayeshka*) adding states/mysql\_user unit test case @ 2015-05-26T15:58:10Z**

- a83371e Merge pull request #24131 from jayeshka/mysql\_user-states-unit-test
- ed1ef69 adding states/mysql\_user unit test case

**PR #24130: (*jayeshka*) adding states/ntp unit test case @ 2015-05-26T15:57:29Z**

- 1dc1d2a Merge pull request #24130 from jayeshka/ntp-states-unit-test

- ede4a9f adding states/ntp unit test case

**PR #24128: (jayeshka) adding states/openstack\_config unit test case @ 2015-05-26T15:56:08Z**

- 3943417 Merge pull request #24128 from jayeshka/openstack\_config-states-unit-test
- ca09e0f adding states/openstack\_config unit test case

**PR #24127: (jayeshka) adding states/npm unit test case @ 2015-05-26T15:55:18Z**

- 23f25c4 Merge pull request #24127 from jayeshka/npm-states-unit-test
- c3ecabb adding states/npm unit test case

**PR #24077: (anlutro) Change how state\_verbose output is filtered @ 2015-05-26T15:41:11Z**

**ISSUE #24009: (hvnsweeting) state\_verbose False summary is wrong**

refs: #24077

- 07488a4 Merge pull request #24077 from alprs/fix-outputter\_highstate\_nonverbose\_count
- 7790408 Change how state\_verbose output is filtered

**PR #24119: (jfindlay) Update contrib docs @ 2015-05-26T15:37:01Z**

- 224820f Merge pull request #24119 from jfindlay/update\_contrib\_docs
- fa2d411 update example release branch in contrib docs
- a0b76b5 clarify git rebase instructions
- 3517e00 fix contribution docs link typos
- 651629c backport dev contrib doc updates to 2015.5

**PR #23928: (joejulian) Add the ability to replace existing certificates @ 2015-05-25T19:47:26Z**

- 5488c4a Merge pull request #23928 from joejulian/2015.5\_tls\_module\_replace\_existing
- 4a4cbdd Add the ability to replace existing certificates

**PR #24078: (jfindlay) if a charmap is not supplied, set it to the codeset @ 2015-05-25T19:39:19Z**

**ISSUE #23221: (Reiner030) Debian Jessie: locale.present not working again**

refs: #24078

- dd90ef0 Merge pull request #24078 from jfindlay/locale\_charmap
- 5eb97f0 if a charmap is not supplied, set it to the codeset

**PR #24088: (jfindlay) pkg module integration tests @ 2015-05-25T19:39:02Z**

- 9cec5d3 Merge pull request #24088 from jfindlay/pkg\_tests
- f1bd5ec adding pkg module integration tests
- 739b2ef rework yumpkg refresh\_db so args are not mandatory

**PR #24089: (jfindlay) allow override of binary file mode on windows @ 2015-05-25T19:38:44Z**

**ISSUE #24052: (twangboy) v2015.5.1 Changes the way it interprets the minion\_master.pub file**

refs: #24089 #24144

- 517552c Merge pull request #24089 from jfindlay/binary\_write
- b2259a6 allow override of binary file mode on windows

**PR #24092: (jfindlay) collect scattered contents edits, ensure it's a str @ 2015-05-25T19:38:10Z**

ISSUE #23973: (*mschiff*) state file.managed: setting contents\_pillar to a pillar which is a list throws exception instead giving

refs: #24092

- 121ab9f Merge pull request #24092 from jfindlay/file\_state
- cfa0f13 collect scattered contents edits, ensure it's a str

PR #24112: (*The-Loeki*) thin\_gen breaks when thinver doesn't exist @ 2015-05-25T19:37:47Z

- 84e65de Merge pull request #24112 from The-Loeki/patch-1
- 34646ea thin\_gen breaks when thinver doesn't exist

PR #24108: (*jayeshka*) adding states/mysql\_query unit test case @ 2015-05-25T12:30:48Z

- ec509ed Merge pull request #24108 from jayeshka/mysql\_query-states-unit-test
- ec50450 adding states/mysql\_query unit test case

PR #24110: (*jayeshka*) adding varnish unit test case @ 2015-05-25T12:30:21Z

- f2e5d6c Merge pull request #24110 from jayeshka/varnish-unit-test
- e119889 adding varnish unit test case

PR #24109: (*jayeshka*) adding states/mysql\_grants unit test case @ 2015-05-25T12:29:53Z

- 4fca2b4 Merge pull request #24109 from jayeshka/mysql\_grants-states-unit-test
- 11a93cb adding states/mysql\_grants unit test case

PR #24028: (*nleib*) send a disable message to disable puppet @ 2015-05-25T04:02:11Z

- 6b43c9a Merge pull request #24028 from nleib/2015.5
- 15f24b4 update format of string in disabled msg
- 7690e5b remove trailing whitespaces
- 56a9720 Update puppet.py
- 9686391 Update puppet.py
- 33f3d68 send a disable message to disable puppet

PR #24100: (*jfindlay*) adding states/file unit test case @ 2015-05-24T05:17:54Z

PR #23963: (*jayeshka*) adding states/file unit test case

refs: #24100

- 52c9aca Merge pull request #24100 from jfindlay/merge\_23963
- 7d59deb adding states/file unit test case

PR #24098: (*galet*) Systemd not recognized properly on Oracle Linux 7 @ 2015-05-24T04:07:31Z

ISSUE #21446: (*dpheasant*) check for systemd on Oracle Linux

refs: #24098

- 0eb9f15 Merge pull request #24098 from galet/2015.5
- 4d6ab21 Systemd not recognized properly on Oracle Linux 7

PR #24090: (*jfindlay*) adding states/mount unit test case @ 2015-05-22T23:02:57Z

PR #24062: (*jayeshka*) adding states/mount unit test case

refs: #24090

- 8e04db7 Merge pull request #24090 from jfindlay/merge\_24062
- a81a922 adding states/mount unit test case

**PR #24086: (*rallytime*) Backport #22806 to 2015.5 @ 2015-05-22T21:18:20Z**

**ISSUE #22574: (*unicole*) error when which is not available**

refs: #22806

**PR #22806: (*jfindlay*) use cmd.run\_all instead of cmd.run\_stdout**

refs: #24086

- c0079f5 Merge pull request #24086 from rallytime/bp-22806
- f728f55 use cmd.run\_all instead of cmd.run\_stdout

**PR #24024: (*jayeshka*) adding states/mongodb\_user unit test case @ 2015-05-22T20:53:19Z**

- 09de253 Merge pull request #24024 from jayeshka/mongodb\_user-states-unit-test
- f31dc92 resolved errors
- d038b1f adding states/mongodb\_user unit test case

**PR #24065: (*kiorky*) continue to fix #23883**

refs: #24080 #24066

@ 2015-05-22T18:59:21Z

**ISSUE #23883: (*kaithar*) max\_event\_size seems broken \* bfd812c Merge pull request #24065 from makinacorp/real23883 \* 028282e continue to fix #23883**

**PR #24029: (*kiorky*) Fix providers handling @ 2015-05-22T16:56:06Z**

**ISSUE #24017: (*arthurlogilab*) [salt-cloud openstack] TypeError: unhashable type: 'dict' on map creation**

refs: #24029

- 429adfe Merge pull request #24029 from makinacorp/fixproviders
- 412b39b Fix providers handling

**PR #23936: (*jfindlay*) remove unreachable returns in file state @ 2015-05-22T16:26:49Z**

- a42cccc Merge pull request #23936 from jfindlay/file\_state
- ac29c0c also validate file.recurse source parameter
- 57f7388 remove unreachable returns in file state

**PR #24063: (*jayeshka*) removed tuple index error @ 2015-05-22T14:58:20Z**

- 8b69b41 Merge pull request #24063 from jayeshka/mount-states-module
- b9745d5 removed tuple index error

**PR #24057: (*rallytime*) Backport #22572 to 2015.5 @ 2015-05-22T05:36:25Z**

**PR #22572: (*The-Loeki*) Small docfix for GitPillar**

refs: #24057

- 02ac4aa Merge pull request #24057 from rallytime/bp-22572
- 49aad84 Small docfix for GitPillar

**PR #24040: (rallytime) Backport #24027 to 2015.5 @ 2015-05-21T23:43:54Z**

ISSUE #23088: (wfhg) Segfault when adding a Zypper repo on SLES 11.3

refs: #24027

**PR #24027: (wfhg) Add baseurl to salt.modules.zypper.mod\_repo**

refs: #24040

- 82de059 Merge pull request #24040 from rallytime/bp-24027
- 37d25d8 Added baseurl as alias for url and mirrorlist in salt.modules.zypper.mod\_repo.

**PR #24039: (rallytime) Backport #24015 to 2015.5 @ 2015-05-21T23:43:25Z**

**PR #24015: (YanChii) minor improvement of solarisips docs & fix typos**

refs: #24039

- d909781 Merge pull request #24039 from rallytime/bp-24015
- 6bfaa94 minor improvement of solarisips docs & fix typos

**PR #24038: (rallytime) Backport #19599 to 2015.5 @ 2015-05-21T23:43:10Z**

ISSUE #19598: (fayatted) ssh\_auth.present test=true incorrectly reports changes will be made

refs: #19599

**PR #19599: (fayatted) Fix ssh\_auth test mode, compare lines not just key**

refs: #24038

- 4a0f254 Merge pull request #24038 from rallytime/bp-19599
- ea00d3e Fix ssh\_auth test mode, compare lines not just key

**PR #24046: (rallytime) Remove key management test from digital ocean cloud tests @ 2015-05-21T22:32:04Z**

- 42b87f1 Merge pull request #24046 from rallytime/remove\_key\_test
- 1d031ca Remove key management test from digital ocean cloud tests

**PR #24044: (cro) Remove spurious log message, fix typo in doc @ 2015-05-21T22:31:49Z**

- eff54b1 Merge pull request #24044 from cro/pgjsonb
- de06633 Remove spurious log message, fix typo in doc

**PR #24001: (msteed) issue #23883 @ 2015-05-21T20:32:30Z**

ISSUE #23883: (kaithar) max\_event\_size seems broken \* ac32000 Merge pull request #24001 from msteed/issue-23883 \* bea97a8 issue #23883

**PR #23995: (kiorky) Lxc path pre @ 2015-05-21T17:26:03Z**

- f7fae26 Merge pull request #23995 from makinacorpus/lxc\_path\_pre
- 319282a lint
- 1dc67e5 lxc: versionadded
- fca7cb lxc: states improvements
- 644bd72 lxc: more consistence for profiles
- 139372c lxc: remove merge cruft
- 725b046 lxc: Repair merge

PR #24032: (*kartiksubbarao*) Update `augeas_cfg.py` @ 2015-05-21T17:03:42Z

ISSUE #16383: (*interjection*) `salt.states.augeas.change` example from docs fails with exception

refs: #24032

- 26d6851 Merge pull request #24032 from kartiksubbarao/augeas\_insert\_16383
- 3686dcd Update `augeas_cfg.py`

PR #24025: (*jayeshka*) adding `timezone` unit test case @ 2015-05-21T16:50:53Z

- 55c9245 Merge pull request #24025 from jayeshka/timezone-unit-test
- 1ec33e2 removed assertion error
- 16ecb28 adding `timezone` unit test case

PR #24023: (*jayeshka*) adding `states/mongodb_database` unit test case @ 2015-05-21T16:49:17Z

- e243617 Merge pull request #24023 from jayeshka/mongodb\_database-states-unit-test
- 5a9ac7e adding `states/mongodb_database` unit test case

PR #24022: (*jayeshka*) adding `states/modjk_worker` unit test case @ 2015-05-21T16:48:29Z

- b377bd9 Merge pull request #24022 from jayeshka/modjk\_worker-states-unit-test
- 05c0a98 adding `states/modjk_worker` unit test case

PR #24005: (*msteed*) issue #23776 @ 2015-05-21T01:55:34Z

ISSUE #23776: (*enblde*) Presence change events constantly reporting all minions as new in 2015.5 \* 701c51b  
Merge pull request #24005 from msteed/issue-23776 \* 62e67d8 issue #23776

PR #23996: (*neogenix*) `iptables` state generates a 0 position which is invalid in `iptables cli` #23950 @ 2015-05-20T22:44:27Z

ISSUE #23950: (*neogenix*) `iptables` state generates a 0 position which is invalid in `iptables cli`

refs: #23996

- 17b7c0b Merge pull request #23996 from neogenix/2015.5-23950
- ad417a5 fix for #23950

PR #23994: (*rallytime*) Skip the `gpoadder pkgrepo` test for Ubuntu 15 - they don't have `vivid ppa` up yet @ 2015-05-20T21:18:21Z

- 4cb8773 Merge pull request #23994 from rallytime/skip\_test\_ubuntu\_15
- 9e0ec07 Skip the `gpoadder pkgrepo` test - they don't have `vivid ppa` up yet

### 37.2.15 Salt 2015.5.3 Release Notes

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Changes:

- **PR #25096:** (*jfindlay*) Postgres group test @ 2015-07-01T18:48:26Z
  - **PR #24330:** (*jayeshka*) adding states/postgres\_group unit test case. | refs: #25096
  - 21709aa Merge pull request #25096 from jfindlay/postgres\_group\_test
  - 3c379dc decllobber postgres state unit test mocking
  - a162ffa adding states/postgres\_group unit test case.
- **PR #25085:** (*jfindlay*) accept all sources in the file state @ 2015-07-01T18:23:45Z
  - **ISSUE #25041:** (*wt*) REGRESSION: pillar.get of integer fails to render in sls | refs: #25085
  - 0a84640 Merge pull request #25085 from jfindlay/fix\_file
  - 937a252 remove unnecessary file state tests
  - 6f238e9 integration test file.managed sources
  - a5978d3 iterate an iterable source othwerise list+str it
- **PR #25095:** (*jfindlay*) Win groupadd unit tests @ 2015-07-01T18:18:53Z
  - **PR #24207:** (*jayeshka*) adding win\_groupadd unit test case. | refs: #25095
  - a983942 Merge pull request #25095 from jfindlay/win\_groupadd\_test
  - 564dff9 depend on win libs rather than mocking them
  - 9b9aeb8 resolved all errors.
  - aaf8935 adding win\_groupadd unit test case.
- **PR #25089:** (*jfindlay*) fix minion sudo @ 2015-07-01T15:53:16Z
  - **ISSUE #21520:** (*jfindlay*) sudo.salt\_call is broken | refs: #25089
  - **PR #20226:** (*thatch45*) Allow sudo priv escalation | refs: #25089
  - 7c8d2a8 Merge pull request #25089 from jfindlay/fix\_sudo
  - d8f91d4 add some apprehension to the sudo exec module
  - a9269c0 adding sudo exec module docs
  - e4a40b7 comment whitespace in minion config
  - 44cb167 adding sudo\_user minion config docs
  - d461060 adding sudo\_user minion config to default
- **PR #25099:** (*driskell*) Fix broken batch results @ 2015-07-01T15:51:29Z
  - **ISSUE #24875:** (*ahammond*) ValueError: list.remove(x): x not in list in File ``/usr/lib/python2.6/site-packages/salt/cli/batch.py``, line 179, in run active.remove(minion) | refs: #25099
  - 4d6078e Merge pull request #25099 from driskell/patch-1
  - 59b23e5 Fix broken batch results
- **PR #25083:** (*steverweber*) ipmi: get\_sensor\_data would always fail @ 2015-06-30T20:57:21Z
  - 4635079 Merge pull request #25083 from steverweber/fix\_ipmi\_stat
  - 836f48c include \_ in IpmiCommand
  - 817e434 get\_sensor\_data would always fail
- **PR #25067:** (*The-Loeki*) Fix for maxdepth=0 in find @ 2015-06-30T20:54:06Z

- 15f2a40 Merge pull request #25067 from The-Loeki/patch-1
- 61edad3 Fix for maxdepth=0 in find
- PR #25078: (*terminalmage*) Use smaller number for upper limit of mac\_user's \_first\_avail\_uid helper function @ 2015-06-30T20:53:24Z
  - 58d933c Merge pull request #25078 from terminalmage/fix-mac-uid
  - df2ab7e Use smaller number for upper limit of mac\_user's \_first\_avail\_uid helper function
- PR #25045: (*garethgreenaway*) Fixes to debian\_ip.py in 2015.5 @ 2015-06-30T17:36:43Z
  - ISSUE #24521: (*multani*) State network.managed fails on Debian (Jessie) | refs: #25045
  - ebd6cdc Merge pull request #25045 from garethgreenaway/24521\_debian\_networking
  - 6f2a6c9 having proto default to static since it's needed to build the template.
- PR #25065: (*loregordon*) Add download links for 2015.5.1-3 and 2015.5.2 Windows installers @ 2015-06-30T15:29:31Z
  - ISSUE #25057: (*TheBigBear*) why is there still no newer salt-minion for windows than ver. 2015.5.0-2? no 2015.5.1 or 2015.5.2?
  - ae31b27 Merge pull request #25065 from loregordon/update-windows-installer-links
  - 40a0c13 Add download links for 2015.5.1-3 and 2015.5.2, Fixes #25057
- PR #25052: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-30T01:05:00Z
  - ISSUE #15209: (*hubez*) file.manage: source\_hash not working with s3:// (2014.7.0rc1) | refs: #25011
  - PR #25011: (*notpeter*) Add s3 to protocols for remote source\_hash (2014.7 backport)
  - ddaeb0f Merge pull request #25052 from basepi/merge-forward-2015.5
  - 2c5e664 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
  - a7154e7 Merge pull request #25011 from notpeter/s3\_2014.7\_backport
    - \* 8b8af64 Add s3 to protocols for remote source\_hash
- PR #25038: (*jfindlay*) versionadded @ 2015-06-29T19:49:27Z
  - PR #24747: (*msciciel*) add get\_route function to network module | refs: #25038
  - c7003d4 Merge pull request #25038 from jfindlay/versionadded
  - d6dc6f9 versionadded
- PR #24747: (*msciciel*) add get\_route function to network module | refs: #25038 @ 2015-06-29T16:51:43Z
  - 28c87ca Merge pull request #24747 from msciciel/2015.5
  - 79b4ec2 network module lint fix
  - 0b6ef78 network module: fix for ipv6
  - f3d184c add get\_route function to network module
- PR #24975: (*ryan-lane*) Fix update of undefined env var in npm module @ 2015-06-29T16:45:05Z
  - 46a9677 Merge pull request #24975 from lyft/npm-module-fix
  - 6fde581 Try byte literals rather than unicode strings in the env
  - c8514de Fix update of undefined env var in npm module
- PR #24986: (*heewa*) Don't modify empty change @ 2015-06-29T16:44:17Z

- 9cf8550 Merge pull request #24986 from heewa/fix-pkg-hold-when-errored
- d47a448 Don't modify empty change
- PR #24999: (*rallytime*) Provide a less confusing error when cloud provider is misconfigured @ 2015-06-29T16:43:31Z
  - ISSUE #24969: (*bradthurber*) salt-cloud 2015.5.0: missing azure dependency results in misleading error | refs: #24999
  - ece897d Merge pull request #24999 from rallytime/cloud\_error\_help
  - 1e81a88 Clean up
  - be19a67 Provide a less confusing error when cloud provider is misconfigured
- PR #24987: (*heewa*) Don't try to cache a template when it's not a file @ 2015-06-29T14:02:59Z
  - 4af15cf Merge pull request #24987 from heewa/fix-trying-to-cache-no-file
  - 9ae0c78 Don't try to cache a template when it's not a file
- PR #25022: (*jfindlay*) revise label and milestone documentation @ 2015-06-29T13:51:24Z
  - 8eeaddb Merge pull request #25022 from jfindlay/label\_docs
  - 8575192 revise label and milestone documentation
- PR #25029: (*jayeshka*) adding redismod unit test case. @ 2015-06-29T13:50:33Z
  - 89c2e01 Merge pull request #25029 from jayeshka/redismod-unit-test
  - e3045be adding redismod unit test case.
- PR #24995: (*rallytime*) Fix deprecated pymongo usage causing errors in latest pymongo @ 2015-06-27T22:28:56Z
  - PR #24175: (*trevor-h*) fix deprecated pymongo usage causing errors in latest pymongo | refs: #24995
  - 6425252 Merge pull request #24995 from rallytime/tops\_mongo
  - a3c1063 fix deprecated pymongo usage causing errors in latest pymongo
- PR #24994: (*garethgreenaway*) Another Fix to gpg.py in 2015.5 @ 2015-06-27T22:28:15Z
  - ISSUE #24862: (*dkatsanikakis*) gpg.import\_key returns error after successfully completed | refs: #24966 #24994
  - e9aaa11 Merge pull request #24994 from garethgreenaway/2015\_5\_24862\_gpg\_import\_key
  - d2f0d8f variable was referenced before assignment. Just removing the variable and checking the return from distutils.version.LooseVersion directly.
- PR #24988: (*jayeshka*) adding states/supervisord unit test case. @ 2015-06-27T22:24:42Z
  - ebd666e Merge pull request #24988 from jayeshka/supervisord-states-unit-test
  - bb0a6d5 adding states/supervisord unit test case.
- PR #25007: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-26T21:28:57Z
  - ISSUE #24915: (*jtand*) Salt-cloud not working in 2014.7.6 | refs: #24944
  - PR #24944: (*techhat*) Double-check main\_cloud\_config
  - PR #24936: (*jtand*) Fixed ps module to not use deprecated psutil commands
  - 0487c3c Merge pull request #25007 from basepi/merge-forward-2015.5
  - 4980fd5 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5

- a11e4c6 Merge pull request #24944 from techhat/issue24915
  - \* 59c3081 Double-check main\_cloud\_config
- d26a544 Merge pull request #24936 from jtand/psutil
  - \* bdb7a19 Fixed ps module to not use deprecated psutil commands
- PR #25003: (*jacobhammons*) Updated man pages @ 2015-06-26T19:13:41Z
  - 91a60e1 Merge pull request #25003 from jacobhammons/man-pages
  - cf97a4a Updated man pages
- PR #25002: (*jacobhammons*) sphinx html theme updates @ 2015-06-26T18:39:14Z
  - a60a2c4 Merge pull request #25002 from jacobhammons/doc-announcements
  - f88f344 sphinx html theme updates
- PR #24977: (*rallytime*) Only warn about digital ocean deprecation if digital ocean is configured @ 2015-06-25T23:54:46Z
  - a791b23 Merge pull request #24977 from rallytime/do\_move\_warning
  - 6b54422 Only warn about digital ocean deprecation if digital ocean is configured
- PR #24966: (*garethgreenaway*) Fixes to gpg.py in 2015.5 @ 2015-06-25T19:58:49Z
  - ISSUE #24862: (*dkatsanikakis*) gpg.import\_key returns error after successfully completed | refs: #24966 #24994
  - a71c1b7 Merge pull request #24966 from garethgreenaway/2015\_5\_24862\_gpg\_import\_key
  - 55eb73b fixing unit tests.
  - 80c24be Fixing an issue with the import\_key method. Different results depending on which gnupg python module is installed.
- PR #24965: (*jacksontj*) Fix memory leak in saltnado @ 2015-06-25T18:48:03Z

  - PR #24769: (*msteed*) Fix stacktrace in get\_cli\_returns()
  - PR #24690: (*twangboy*) Report powershell output instead of error
  - ae05e70 Merge pull request #24802 from basepi/merge-forward-2015.5
  - 5b7a65d Merge pull request #19 from twangboy/merge-forward-fixes
    - \* 98e7e90 Fixed test failures for Colton
  - b949856 Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
    - \* 4281dff Merge pull request #24780 from nmadhok/backport-2014.7-24777
      - c53b0d9 Backporting PR #24777 to 2014.7 branch
    - \* f3c5cb2 Merge pull request #24769 from msteed/issue-21318
      - f40a9d5 Fix stacktrace in get\_cli\_returns()
    - \* 59db246 Merge pull request #24690 from twangboy/fix\_17041
      - 7a01538 Added additional reporting
      - d84ad5d Fixed capitalization... Failed and Already
      - e955245 Merge branch `2014.7' of <https://github.com/saltstack/salt> into fix\_17041
      - 144bff2 Report powershell output instead of error
- PR #24798: (*jtand*) Revert ``adding states/postgres\_database unit test case." @ 2015-06-18T17:56:17Z
  - PR #24329: (*jayeshka*) adding states/postgres\_database unit test case. | refs: #24798
  - daa76c3 Merge pull request #24798 from saltstack/revert-24329-postgres\_database-states-unit-test
  - 179ce03 Revert ``adding states/postgres\_database unit test case."
- PR #24791: (*rallytime*) Back-port #24749 to 2015.5 @ 2015-06-18T17:43:15Z
  - PR #24749: (*obestwalter*) add windows specific default for multiprocessing | refs: #24791

- 7073a9f Merge pull request #24791 from rallytime/bp-24749
- be43b2b add windows specific default for multiprocessing
- PR #24792: (*rallytime*) Back-port #24757 to 2015.5 @ 2015-06-18T15:58:35Z
  - PR #24757: (*cachedout*) Fix loader call in pyobjects | refs: #24792
  - PR #24668: (*grischa*) enable virtual package names in pyobjects renderer | refs: #24721 #24757
  - 1a158e8 Merge pull request #24792 from rallytime/bp-24757
  - 6c804f0 Fix loader call in pyobjects
- PR #24768: (*jfindlay*) fix yum versionlock on RHEL/CentOS 5, disable corresponding test @ 2015-06-18T15:13:12Z
  - 0f92982 Merge pull request #24768 from jfindlay/pkg\_mod
  - 7a26c2b disable pkg.hold test for RHEL/CentOS 5
  - 4caed93 use correct yum versionlock pkg name on centos 5
- PR #24778: (*nmadhok*) Backporting PR #24777 to 2015.2 branch | refs: #24777 @ 2015-06-18T14:53:04Z
  - ISSUE #24776: (*nmadhok*) --static option in salt raises ValueError and has been broken for a very long time | refs: #24777
  - PR #24779: (*nmadhok*) Backporting Changes to 2014.7 branch | refs: #24777
  - PR #24777: (*nmadhok*) Fixing issue where --static option fails with ValueError Fixes #24776 | refs: #24778 #24780
  - 39f088a Merge pull request #24778 from nmadhok/backport-2015.2-24777
  - ae3701f Backporting PR #24777 to 2015.2 branch
- PR #24774: (*zefrog*) Fix lxc lvname parameter command @ 2015-06-18T14:49:06Z
  - 2a4f65f Merge pull request #24774 from zefrog/fix-lxc-lvname-param
  - 21e0cd4 Fixed typo in lxc module: lvname parameter typo
  - 283d86e Fixed bug in lxc module: lvname using wrong parameter in cmd
- PR #24782: (*jayeshka*) adding states/slack unit test case. @ 2015-06-18T14:33:55Z
  - fd73390 Merge pull request #24782 from jayeshka/slack-states-unit-test
  - e2b6214 adding states/slack unit test case.
- PR #24771: (*jacksontj*) Always extend requisites, instead of replacing them @ 2015-06-18T14:29:09Z
  - ISSUE #24770: (*jacksontj*) *Requisite* and *Requisite\_in* don't play nice together | refs: #24771
  - c9c90af Merge pull request #24771 from jacksontj/2015.5
  - b1211c5 Re-enable tests for complex prereq and prereq\_in
  - 378f6bf Only merge when the merge is of requisites
- PR #24766: (*msteed*) Remove doc references to obsolete minion opt @ 2015-06-17T21:36:55Z
  - 5fe4de8 Merge pull request #24766 from msteed/undoc-dns\_check
  - f92a769 Remove doc references to obsolete minion opt
- PR #24329: (*jayeshka*) adding states/postgres\_database unit test case. | refs: #24798 @ 2015-06-17T19:11:02Z
  - a407ab7 Merge pull request #24329 from jayeshka/postgres\_database-states-unit-test

- ee06f1a adding states/postgres\_database unit test case.
- **PR #24632:** (*jacobhammons*) Doc bug fixes @ 2015-06-17T18:40:02Z
  - **ISSUE #24560:** (*hydrosine*) Documentation missing on parameter | refs: #24632
  - **ISSUE #24547:** (*dragonpaw*) Artifactory docs say module is `jboss7`. | refs: #24632
  - **ISSUE #24375:** (*companykitchen-dev*) Custom grain won't sync under any circumstances | refs: #24632
  - **ISSUE #24275:** (*kartiksubbarao*) augeas issue with apache and recognizing changes that have been already made | refs: #24632
  - **ISSUE #24163:** (*tbaker57*) enable\_gpu\_grains default value confusion | refs: #24632
  - 3ff6eff Merge pull request #24632 from jacobhammons/bug-fixes
  - 7c52012 Fixed typos
  - c7cdd41 Doc bug fixes Refs #24547 Refs #24275 Refs #24375 Refs #24560 Refs #24163
- **PR #24607:** (*garethgreenaway*) fixes to minion.py @ 2015-06-17T18:16:42Z
  - **ISSUE #24198:** (*ahammond*) salt-call event.send doesn't send events from minion | refs: #24607
  - 9995f64 Merge pull request #24607 from garethgreenaway/2015\_5\_sending\_events\_multi\_master
  - 8abd3f0 A fix if you have multiple masters configured and try to fire events to the minion. Currently they fail silently. Might be the cause of #24198.
- **PR #24755:** (*rallytime*) Remove SALT\_CLOUD\_REQS from setup.py @ 2015-06-17T17:42:25Z
  - bf2dd94 Merge pull request #24755 from rallytime/fix\_setup\_15
  - 48769a5 Remove SALT\_CLOUD\_REQS from setup.py
- **PR #24740:** (*rallytime*) Backport #24720 to 2015.5 @ 2015-06-17T16:43:37Z
  - **PR #24720:** (*TheScriptSage*) Issue 24621 - AD/LDAP Group Auth Issue | refs: #24740
  - 3d53d79 Merge pull request #24740 from rallytime/bp-24720
  - a9bcdb5 Updating master.py to properly check against groups when user is only authed against group. Tested against unit.auth\_test.
- **PR #24723:** (*rallytime*) Back-port #20124 to 2015.5 @ 2015-06-17T16:43:20Z
  - **PR #20124:** (*cgtx*) add init system to default grains | refs: #24723
  - ac2851b Merge pull request #24723 from rallytime/bp-20124
  - 4d0061b fix infinite loop introduced by #20124 when the init system is not in the supported\_inits list
  - 0c7fa0f Optimizations for #20124
  - f353454 add init system to default grains (resolve #20124)
- **PR #24754:** (*anlutro*) salt-cloud documentation - Add information about linode location @ 2015-06-17T16:04:48Z
  - 78cd09b Merge pull request #24754 from alprs/docs-add\_linode\_location\_option
  - d88e071 add information about linode location
- **PR #24748:** (*jayeshka*) adding states/serverdensity\_device unit test case. @ 2015-06-17T15:39:07Z
  - d5554f7 Merge pull request #24748 from jayeshka/serverdensity\_device-states-unit-test
  - 1a4c241 adding states/serverdensity\_device unit test case.

- **PR #24739:** (*rallytime*) Back-port #24735 to 2015.5 @ 2015-06-17T15:16:47Z
  - **PR #24735:** (*notpeter*) Add 2015.5 codename to version numbers docs | refs: #24739
  - 0b7e7ef Merge pull request #24739 from rallytime/bp-24735
  - 64c565d Add .0 to version number
  - 5ed801b Add codenames for 2015.5 and future versions. Trailing newline.
- **PR #24732:** (*msteed*) Fix stacktrace when `--summary` is used @ 2015-06-17T03:27:57Z
  - **ISSUE #24111:** (*yermulnik*) cli option `--summary` got broken after upgrade to 2015.5.1 | refs: #24732
  - c8713f2 Merge pull request #24732 from msteed/issue-24111
  - 54b33dd Fix stacktrace when `--summary` is used
- **PR #24721:** (*rallytime*) Back-port #24668 to 2015.5 @ 2015-06-17T03:23:47Z
  - **PR #24668:** (*grischa*) enable virtual package names in pyobjects renderer | refs: #24721 #24757
  - 70d3781 Merge pull request #24721 from rallytime/bp-24668
  - 68fb5af fixing other test
  - ba4f262 fixing text for virtual support in pyobjects
  - b349d91 enable virtual package names in pyobjects renderer
- **PR #24718:** (*rallytime*) Added some missing config documentation to the vsphere driver @ 2015-06-17T03:19:35Z
  - **ISSUE #21923:** (*Fluro*) Salt cloud not running provisioning script as root | refs: #24718
  - **ISSUE #17241:** (*hasues*) Salt-Cloud for vSphere needs additional documentation | refs: #24718
  - 1b9d689 Merge pull request #24718 from rallytime/update\_vsphere\_docs
  - bfdebb6 Added some missing config documentation to the vsphere driver
- **PR #24714:** (*rallytime*) Remove cloud-requirements.txt @ 2015-06-17T03:17:04Z
  - 64857c7 Merge pull request #24714 from rallytime/remove\_cloud\_reqs\_15
  - 67b796d Remove cloud-requirements.txt
- **PR #24733:** (*msteed*) Include Tornado in versions report @ 2015-06-17T03:13:53Z
  - **ISSUE #24439:** (*bechtoldt*) Add tornado version to versions report | refs: #24733
  - f96b1d6 Merge pull request #24733 from msteed/issue-24439
  - 76cfef0 Include Tornado in versions report
- **PR #24737:** (*jacksonjtj*) Move AES command logging to trace @ 2015-06-17T01:48:11Z
  - a861fe0 Merge pull request #24737 from jacksonjtj/2015.5
  - a4ed41a Move AES command logging to trace
- **PR #24724:** (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-16T22:46:27Z
  - **ISSUE #24196:** (*johnccfm*) Exception when using `user.present` with Windows | refs: #24646
  - **PR #24646:** (*twangboy*) Fixed `user.present` on existing user
  - 0d2dc46 Merge pull request #24724 from basepi/merge-forward-2015.5
  - 4641028 Merge remote-tracking branch `'upstream/2014.7'` into merge-forward-2015.5

- a18dada Merge pull request #24646 from twangboy/fix\_24196
  - \* a208e1d Fixed user.present on existing user
- PR #24701: (jayeshka) adding states/selinux unit test case. @ 2015-06-16T15:27:29Z
  - 3d33fe7 Merge pull request #24701 from jayeshka/selinux-states-unit-test
  - 0c136fd adding states/selinux unit test case.
- PR #24687: (cachedout) Note about minimum worker\_threads @ 2015-06-15T20:46:23Z
  - 2e287a9 Merge pull request #24687 from cachedout/min\_worker\_threads
  - b7bb7ea Note about minimum worker\_threads
- PR #24688: (cachedout) Update AUTHORS @ 2015-06-15T20:46:03Z
  - 432478c Merge pull request #24688 from cachedout/update\_authors
  - 3f6880e Better email
  - 6c7b773 Update AUTHORS
- PR #24649: (cachedout) Improved error reporting for failed states @ 2015-06-15T16:04:20Z
  - ISSUE #22385: (cachedout) States which require unavailable modules should display the reason | refs: #24649
  - 9a2b50d Merge pull request #24649 from cachedout/issue\_22385
  - b9fe792 States will now return the reason behind failure if a module could not be loaded
- PR #24673: (jayeshka) adding states/schedule unit test case. @ 2015-06-15T15:24:52Z
  - 66e9e16 Merge pull request #24673 from jayeshka/schedule-states-unit-test
  - 54aaaa5 adding states/schedule unit test case.
- PR #24663: (kartiksubbarao) Update augeas\_cfg.py @ 2015-06-15T15:18:48Z
  - ISSUE #24661: (kartiksubbarao) augeas.change doesn't support setting empty values | refs: #24663
  - 5eb19c4 Merge pull request #24663 from kartiksubbarao/patch-2
  - e18db50 Update augeas\_cfg.py
- PR #24667: (dkiser) fix for #24583 clouds/openstack.py keyring first time succeeds @ 2015-06-14T21:58:58Z
  - ISSUE #24583: (dkiser) salt-cloud keyring password referenced before assignment | refs: #24667
  - 4450432 Merge pull request #24667 from dkiser/fix-cloud-keyring
  - c92c05f fix for #24583 clouds/openstack.py keyring first time succeeds
- PR #24659: (kartiksubbarao) Update aliases.py @ 2015-06-13T17:31:42Z
  - ISSUE #24537: (kartiksubbarao) alias.present doesn't update alias values that are substrings of the existing value | refs: #24659
  - 4c64ee9 Merge pull request #24659 from kartiksubbarao/patch-1
  - d683474 Update aliases.py
- PR #24644: (cro) Merge forward 2014.7->2015.5 @ 2015-06-12T21:31:41Z
  - PR #24643: (cro) Add reference to salt-announce mailing list
  - PR #24620: (twangboy) Fixed comment and uncomment functions in file.py
  - 89eb616 Merge pull request #24644 from cro/2014.7-2015.5-20150612

- 4136dc3 Merge forward from 2014.7 to 2015.5
- b99484f Merge pull request #24643 from cro/saltannounce
  - \* ecb0623 Add salt-announce mailing list.
- 635121e Merge pull request #24620 from twangboy/fix\_24215
  - \* d7a9999 Fixed comment and uncomment functions in file.py
- PR #24642: (*basepi*) Revert ``fix target rule, remove unneeded quotation mark" @ 2015-06-12T20:14:26Z
  - PR #24595: (*tankywoo*) fix target rule, remove unneeded quotation mark | refs: #24642
  - b896a0d Merge pull request #24642 from saltstack/revert-24595-fix-iptables-target
  - 5ff3224 Revert ``fix target rule, remove unneeded quotation mark"
- PR #24628: (*jayeshka*) adding states/reg unit test case. @ 2015-06-12T17:29:11Z
  - 01092c2 Merge pull request #24628 from jayeshka/reg\_states-unit-test
  - af1bd8f adding states/reg unit test case.
- PR #24631: (*rallytime*) Back-port #24591 to 2015.5 @ 2015-06-12T16:54:32Z
  - ISSUE #24494: (*arnoutpierre*) Computed comments in jinja states | refs: #24591
  - ISSUE #24073: (*primechuck*) State.highstate uses stale grain data. | refs: #24492
  - ISSUE #23359: (*BalintSzigeti*) init.sls parsing issue | refs: #24591
  - ISSUE #21217: (*Colstuwjx*) Maybe a bug for jinja render? | refs: #24591
  - PR #24591: (*tbaker57*) Add some documentation surrounding Jinja vs yaml comments - | refs: #24631
  - PR #24492: (*DmitryKuzmenko*) Don't remove grains from opts
  - 5f491f9 Merge pull request #24631 from rallytime/bp-24591
  - f13cd41 Add extra clarification why jinja comments are needed.
  - 2374971 Fix typo
  - 6a91747 Add some documentation surrounding Jinja comments - refs #24492, #21217, #23359
- PR #24616: (*garethgreenaway*) additional logging in state.py module @ 2015-06-12T16:25:39Z
  - f23f99e Merge pull request #24616 from garethgreenaway/2015\_5\_logging\_disabled\_states
  - 4dbf0ef Adding some logging statement to give feedback when states, including highstate, are disabled. Useful when running from scheduler.
- PR #24595: (*tankywoo*) fix target rule, remove unneeded quotation mark | refs: #24642 @ 2015-06-12T16:23:22Z
  - 6dccbb0 Merge pull request #24595 from tankywoo/fix-iptables-target
  - 10a5160 fix target rule, remove unneeded quotation mark
- PR #24604: (*jfindlay*) fix pkg module integration tests @ 2015-06-12T16:04:26Z
  - 8ac3d94 Merge pull request #24604 from jfindlay/pkg\_tests
  - d88fb22 fix pkg module integration tests on CentOS 5
  - fb91b40 fix pkg module integration tests on ubuntu 12
- PR #24600: (*basepi*) [2015.5] Remove \_\_kwarg\_\_ from salt-ssh keyword args @ 2015-06-12T04:21:29Z
  - 0ff545c Merge pull request #24600 from basepi/salt-ssh.orchestrate.20615

- 9b55683 Remove `__kwarg__` from salt-ssh keyword args
- **PR #24608:** (*basepi*) [2015.5] Normalize salt-ssh flat roster minion IDs to strings @ 2015-06-11T21:35:07Z
  - **ISSUE #22843:** (*Xiol*) salt-ssh roster doesn't support integers as host keys | refs: #24608
  - 832916f Merge pull request #24608 from basepi/salt-ssh.flat.roster.integers.22843
  - 381820f Normalize salt-ssh flat roster minion IDs to strings
- **PR #24605:** (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-11T19:15:21Z
  - **PR #24589:** (*BretFisher*) Fixed Mine example for jinja code block
  - 4eb5bb2 Merge pull request #24605 from basepi/merge-forward-2015.5
  - f96c502 Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
  - d83928a Merge pull request #24589 from BretFisher/patch-1
    - \* 65a1133 Fixed Mine example for jinja code block
- **PR #24598:** (*jacobhammons*) 2015.5.2 release changes @ 2015-06-11T17:24:11Z
  - **ISSUE #24457:** (*ryan-lane*) When selecting the version of docs on the docs site, it brings you to the homepage | refs: #24598
  - **ISSUE #24250:** (*jfindlay*) have version links on docs page link to that version of the current page | refs: #24598
  - e0bb177 Merge pull request #24598 from jacobhammons/doc-fixes
  - f3f34dd 2015.5.2 release changes Refs #24250 Refs #24457
- **PR #24588:** (*basepi*) Fixes for saltmod.function for salt-ssh @ 2015-06-11T16:15:21Z
  - **ISSUE #20615:** (*aurynn*) 2014.7.1: salt/states/saltmod using incorrect return dict for orchestrate | refs: #24588
  - 26930b4 Merge pull request #24588 from basepi/salt-ssh.orchestrate.20615
  - 826936c Move documentation into docstring instead of comments
  - de052e7 Assign 'return' to 'ret' if necessary in saltmod.function
  - 34ff989 Convert keyword args to key=value strings in salt-ssh
- **PR #24593:** (*jayeshka*) adding states/redismod unit test case. @ 2015-06-11T15:55:27Z
  - 5a21ad1 Merge pull request #24593 from jayeshka/redismod\_states-unit-test
  - 3b95744 adding states/redismod unit test case.
- **PR #24581:** (*rallytime*) Disabled some flaky tests until we can figure out how to make them more reliable @ 2015-06-11T15:51:41Z
  - **ISSUE #40:** (*thatch45*) Clean up timeouts | refs: #22857
  - **PR #24217:** (*jfindlay*) disable intermittently failing tests | refs: #24581
  - **PR #23623:** (*jfindlay*) Fix /jobs endpoint's return | refs: #24217
  - **PR #22857:** (*jacksontj*) Fix /jobs endpoint's return | refs: #23623
  - 8ffb86e Merge pull request #24581 from rallytime/disable\_some\_flaky\_tests
  - c82f135 Disabled some flaky tests until we can figure out how to make them more reliable
- **PR #24566:** (*jayeshka*) adding states/rdp unit test case. @ 2015-06-11T02:14:39Z

- a570d7f Merge pull request #24566 from jayeshka/rdp\_states-unit-test
- 273b994 adding states/rdp unit test case.
- PR #24551: (*joejulian*) 2015.5 don't pollute environment @ 2015-06-11T02:13:06Z
  - ISSUE #24480: (*kiorky*) [CRITICAL] [2015.5] tls breaks tzinfo | refs: #24551
  - 20ada1f Merge pull request #24551 from joejulian/2015.5\_dont\_pollute\_environment
  - cfc3b43 Don't pollute the TZ environment variable
  - cba8d3f pep8
  - 9cb7015 Mark keyword version adds
  - 76e2583 Merge tls changes from develop
- PR #24574: (*jacobhammons*) Refs #19901 @ 2015-06-10T20:09:23Z
  - ISSUE #19901: (*clinta*) State cache is not documented | refs: #24468

  - e2a2946 Refs #19901
- PR #24577: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-10T19:46:22Z
  - ISSUE #24427: (*fayatted*) 2015.5.1-3 Windows 64Bit Minion fails to start after install | refs: #24530
  - PR #24530: (*twangboy*) Start Minion Service on Silent Install
  - b03166c Merge pull request #24577 from basepi/merge-forward-2015.5
  - e1d45cc Merge remote-tracking branch 'upstream/2014.7' into merge-forward-2015.5
  - d376390 Merge pull request #24530 from twangboy/fix\_24427
    - \* 673e1d8 Added missing panel.bmp for installer
    - \* cc50218 Start Minion Service on Silent Install
- PR #24571: (*jacobhammons*) Refs #24235 @ 2015-06-10T17:02:18Z
  - ISSUE #24235: (*tomasfejfar*) Difference between running from minion and from master | refs: #24468
  - 3ec457b Merge pull request #24571 from jacobhammons/24235
  - 8df5d53 Refs #24235
- PR #24565: (*pille*) fix backtrace, when listing plugins @ 2015-06-10T16:33:11Z
  - fe07eb5 Merge pull request #24565 from pille/munin-ignore-broken-symlinks
  - 8511a6c fix backtrace, when listing plugins
- PR #24554: (*ryan-lane*) Fix yes usage for pecl defaults @ 2015-06-09T23:59:49Z
  - 251c8f9 Merge pull request #24554 from lyft/pecl-module-fix
  - 56a9cfc Fix yes usage for pecl defaults
- PR #24535: (*rallytime*) Back-port #24518 to 2015.5 @ 2015-06-09T20:06:18Z
  - PR #24518: (*rallytime*) Merge #24448 with Pylint Fixes | refs: #24535
  - PR #24448: (*codertux*) Update modules path for operating systems using systemd | refs: #24518
  - dbd49b4 Merge pull request #24535 from rallytime/bp-24518
  - fc75197 Pylint fix

- 3e08840 Update modules path for operating systems using systemd
- PR #24538: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-06-09T17:27:20Z
  - PR #24513: (*jquast*) bugfix use of `iteritem` in 2014.7 branch
  - PR #24511: (*jquast*) bugfix: trailing "...done" in rabbitmq output | refs: #24513
  - 485ed3c Merge pull request #24538 from basepi/merge-forward-2015.5
  - 6a8039d Merge remote-tracking branch `upstream/2014.7' into merge-forward-2015.5
  - 6ebc476 Merge pull request #24513 from jquast/2014.7-bugfix-iteritem
    - \* 2be0180 bugfix use of `iteritem` in 2014.7 branch
- PR #24495: (*jayeshka*) adding states/rabbitmq\_vhost unit test case. @ 2015-06-09T15:33:23Z
  - 73e6388 Merge pull request #24495 from jayeshka/rabbitmq\_vhost\_states-unit-test
  - 31889e3 cosmetic change.
  - cf501cf resolved error.
  - 4bb6087 Merge branch `2015.5' of <https://github.com/saltstack/salt> into rabbitmq\_vhost\_states-unit-test
  - 3ad7714 adding states/rabbitmq\_vhost unit test case.
- PR #24445: (*jayeshka*) adding states/pyrax\_queues unit test case. @ 2015-06-09T15:28:45Z
  - bf1abcc Merge pull request #24445 from jayeshka/pyrax\_queues\_states-unit-test
  - ea27cef adding states/pyrax\_queues unit test case.
- PR #24490: (*aneeshusa*) Fix pacman.list\_upgrades for new python\_shell default. @ 2015-06-09T15:13:16Z
  - 0247e8d Merge pull request #24490 from aneeshusa/fix-pacman-list-upgrades
  - 980e1cb Lint fix.
  - dca33f1 Fix pacman.list\_upgrades for new python\_shell default.
- PR #24517: (*steverweber*) small fixes to the ipmi docs @ 2015-06-09T15:10:14Z
  - 6268ddb Merge pull request #24517 from steverweber/ipmi\_doc
  - 6413712 lint
  - e78aea9 more small fixes to the ipmi docs
- PR #24524: (*jayeshka*) any() takes list oy tuple. @ 2015-06-09T13:49:42Z
  - 3728b3f Merge pull request #24524 from jayeshka/rabbitmq\_vhost\_states-module
  - 01c99ad any() takes list oy tuple.
- PR #24482: (*eliasp*) `docker.running` needs now the `image` param. @ 2015-06-09T04:43:04Z
  - dd23de8 Merge pull request #24482 from eliasp/2015.5-states.dockerio-docker.running-doc
  - 5de741d `docker.running` needs now the `image` param.
- PR #24515: (*basepi*) [2015.5] Add xml library to the salt-thin @ 2015-06-09T04:10:06Z
  - ISSUE #23503: (*jfindlay*) salt-ssh fails on CentOS 7 when python-zmq is not installed | refs: #24515
  - 2a727c3 Merge pull request #24515 from basepi/susexml23503
  - 078b33e Add xml library to the thin
- PR #24497: (*jayeshka*) adding states/rbenv unit test case. @ 2015-06-09T03:56:10Z

- fce998a Merge pull request #24497 from jayeshka/rbenv\_states-unit-test
- 79d343a adding states/rbenv unit test case.
- PR #24496: (*jayeshka*) adding states/rabbitmq\_user unit test case. @ 2015-06-09T03:55:23Z
  - 2bcb4b1 Merge pull request #24496 from jayeshka/rabbitmq\_user\_states-unit-test
  - 7d96f27 adding states/rabbitmq\_user unit test case.
- PR #24481: (*eliasp*) Fix typo (licnese → license). @ 2015-06-09T03:30:25Z
  - 02a597b Merge pull request #24481 from eliasp/2015.5-salt.states.powerpath-license\_typo
  - 1280054 Fix typo (licnese → license).
- PR #24467: (*thenewwazoo*) Fix dockerio bound volumes @ 2015-06-09T01:40:23Z
  - 5ad3db5 Merge pull request #24467 from thenewwazoo/fix-dockerio-bound-volumes
  - db4e3dc Let's raise an exception if create fails
  - d1d85dd Add logging
  - ddc63f0 Fix volume handling when creating containers
- PR #24504: (*rallytime*) Move vsphere deprecation to 2015.5 @ 2015-06-08T22:43:05Z
  - PR #24487: (*nmadhok*) Deprecating vsphere cloud driver in favor of vmware cloud driver | refs: #24504
  - d236fbd Merge pull request #24504 from rallytime/move\_vsphere\_deprecation\_2015.5
  - d876535 Add Getting Started with VSphere doc to 2015.5
  - b685ebc Add vSphere deprecation warnings to 2015.5
- PR #24506: (*rallytime*) Backport #24450 to 2015.5 @ 2015-06-08T22:42:14Z
  - PR #24450: (*ruzarowski*) Fix salt cli runs with batch-size set | refs: #24506
  - cb55460 Merge pull request #24506 from rallytime/bp-24450
  - 1c0fca2 Backport #24450 to 2015.5
- PR #24498: (*rallytime*) Added ``CLI Example" to make failing test happy on 2015.5 @ 2015-06-08T15:48:40Z
  - 3173fd1 Merge pull request #24498 from rallytime/fix\_doc\_failure\_fifteen
  - d992ef4 Added ``CLI Example" to make failing test happy on 2015.5
- PR #24471: (*anlutro*) Set up salt-ssh file logging @ 2015-06-08T15:26:49Z
  - 3639e41 Merge pull request #24471 from alprs/fix-salt\_ssh\_logging
  - 6a11ec8 set up salt-ssh file logging
- PR #24469: (*jfindlay*) correctly handle user environment info for npm @ 2015-06-08T15:26:02Z
  - ISSUE #24231: (*tarwich*) npm.bootstrap | refs: #24469
  - 551e70f Merge pull request #24469 from jfindlay/npm\_env
  - 8140c96 update npm's user info envs
  - cb572f8 add env parameter to npm.uninstall
- PR #24468: (*jacobhammons*) Bug fixes and build errors @ 2015-06-08T15:25:40Z
  - ISSUE #24268: (*tkent-xetus*) Ability to specify revision for win\_gitrepos undocumented | refs: #24468
  - ISSUE #24235: (*tomasfejfar*) Difference between running from minion and from master | refs: #24468

- ISSUE #24193: (*abng88*) Update ext\_pillar docs to mention that this feature is supported masterless as well | refs: #24468
- ISSUE #24172: (*zhujinhe*) Can lists be passed in the pillar on the command line on version 2015.5.0? | refs: #24468

  - a6a1f87 Merge pull request #24380 from rallytime/bp-24357
  - f08c875 fix invoke issues of Jinja Macros example
- PR #24388: (*pengyao*) fixes #24358 @ 2015-06-04T20:07:40Z
  - ISSUE #24358: (*pengyao*) Netapi SSH client don't support ssh\_user and ssh\_passwd arguments | refs: #24388
  - 86ce9db Merge pull request #24388 from pengyao/sshclient-kwarg
  - 5c08ca4 fixes #24358
- PR #24367: (*terminalmage*) Improve error message when module does not exist @ 2015-06-04T20:07:12Z
  - ISSUE #22958: (*highlyunavailable*) Weird error when typoing a command | refs: #24367
  - 72d2eae Merge pull request #24367 from terminalmage/issue22958
  - d0d7a54 Improve error message when module does not exist
- PR #24412: (*jfindlay*) backport #23387 @ 2015-06-04T20:06:03Z
  - ISSUE #23101: (*gravyboat*) Create a docs page for labels | refs: #23387
  - PR #23387: (*rallytime*) Add some ``What are all these labels for?" documentation | refs: #24412
  - a628778 Merge pull request #24412 from jfindlay/bp-23387
  - bf85772 Make sure the parameters are in the correct order
  - 9f53809 Add ``\* Change" label parameters
  - b27a15e Remove ``workaround" wording
  - 9ff35a Some small fixes
  - 54a7089 Link the new labels doc in contributing and hacking docs

- 375695e Add pull request label definitions
- de94563 Add Feature Request label definition
- 684f291 Add issue definition and augment functional areas section
- 2da13dd Start a ``what are all of these labels for?" doc
- PR #24336: (*twangboy*) Added line to give more descriptive error @ 2015-06-04T19:56:00Z
  - ISSUE #24154: (*ssgward*) Exception when running cp.get\_url | refs: #24336
  - 485116c Merge pull request #24336 from twangboy/fix\_cp\_get\_url
  - 37b11f9 Added line to give more descriptive error
- PR #24413: (*techhat*) Add more namespaced functions to GoGrid driver @ 2015-06-04T19:51:22Z
  - b3d39cc Merge pull request #24413 from techhat/gogridnamespace
  - 1b397cb Adding blank line
  - da08cc9 Add more namespaced functions to GoGrid driver
- PR #24399: (*kiorky*) Versionvirtual | refs: #24398 @ 2015-06-04T18:02:22Z
  - ISSUE #24397: (*kiorky*) on debian: states.apt should use virtualname as it shadows system apt module | refs: #24398 #24398 #24399 #24399 #24400
  - PR #24398: (*kiorky*) VirtualName for states.apt | refs: #24399
  - 27f109b Merge pull request #24399 from makinacorp/versiovirtual
  - 235c78d Use apt\_pkg.version\_compare if available
  - 1c0cd45 reindent block to isolate conflict on merge forward
  - 699ecea use var to isolate conflict on merge forward
- PR #24371: (*joejulian*) 2015.5 tls module tests @ 2015-06-04T15:20:16Z
  - deaee68 Merge pull request #24371 from joejulian/2015.5\_tls\_module\_tests
  - 4c5dee1 Add @destructiveTest decorator to destructive tests
  - 274bbd4 Accept results from older pyOpenSSL
  - 161f913 All cert info should be in UTC always
  - 9affcca See the whole diff if dict compare fails
  - 94f6208 Ignore extensions for now. Resolve this as part of fixing issue 24338.
  - 84904d3 Mask lint warning for unused imported module
  - 5675b78 Do not test if PyOpenSSL is not installed
  - 563cc66 Add tls tests
- PR #24403: (*jayeshka*) adding states/process unit test case. @ 2015-06-04T15:19:01Z
  - 84686ee Merge pull request #24403 from jayeshka/process\_states-unit-test
  - fcb71fb adding states/process unit test case.
- PR #24402: (*jayeshka*) adding states/pyenv unit test case. @ 2015-06-04T15:18:11Z
  - 35de8d7 Merge pull request #24402 from jayeshka/pyenv\_states-unit-test
  - 5f263ab adding states/pyenc unit test case.

- **PR #24401:** (*jayeshka*) adding states/powerpath unit test case. @ 2015-06-04T15:17:46Z
  - 632f838 Merge pull request #24401 from jayeshka/powerpath-states-unit-test
  - 49ff927 adding states/powerpath unit test case.
- **PR #24400:** (*kiorky*) Aptversion @ 2015-06-04T15:17:19Z
  - **ISSUE #24397:** (*kiorky*) on debian: states.apt should use virtualname as it shadows system apt module | refs: #24398 #24398 #24399 #24399 #24400
  - 0a6e5e0 Merge pull request #24400 from makinacorpus/aptversion
  - e15cb93 Use apt\_pkg.version\_compare if available
  - 953725a Fix too much quoting in apt.version\_cmp
- **PR #24385:** (*jeanpralo*) Fix salt.modules.dockerio.start method @ 2015-06-04T15:00:22Z
  - a904055 Merge pull request #24385 from jeanpralo/Fix-binds-dockerio.start
  - a0fed31 binds dict if not specified should remain to none otherwise docker-py will try to create a new host config and all volume and ports binds are lost. config should be done at the creation of the container not when we start it
- **PR #24381:** (*jtand*) Disabled flaky test to review later @ 2015-06-04T14:57:43Z
  - 9890bc4 Merge pull request #24381 from jtand/seed\_test
  - 7570ae9 Disabled flaky test to review later
- **PR #24382:** (*basepi*) [2015.5] Handle CommandExecutionError in grains commands, Fixes #23342 @ 2015-06-04T12:44:04Z
  - **ISSUE #23342:** (*philipsd6*) salt-ssh 2015.2.0rc2 fails when target doesn't have lspci available | refs: #24382
  - b3fa8fe Merge pull request #24382 from basepi/grainscommandnotfound23342
  - 85b91d6 Handle CommandExecutionError in grains commands
- **PR #24379:** (*Starblade42*) Fixes an issue where Pagerduty states/modules couldn't find their profile in the Pillar @ 2015-06-04T12:41:13Z
  - 52587a4 Merge pull request #24379 from Starblade42/2015.5
  - b93dc5e Linting!
  - 2dd5904 Fixes an issue where Pagerduty states/modules couldn't find it's profile in the Pillar
- **PR #24366:** (*terminalmage*) Use yes \$'\n' instead of printf '\n' for pecl commands @ 2015-06-03T21:28:58Z
  - 3ca35d1 Merge pull request #24366 from terminalmage/pecl-yes
  - dcd9ad8 Use yes \$'\n' instead of printf '\n' for pecl commands
- **PR #24348:** (*kiorky*) Try to close input pipes before calling lxc-start @ 2015-06-03T19:38:07Z
  - **ISSUE #24284:** (*kiorky*) systemd lxc containers need use\_vt=True at lxc-start stage | refs: #24348
  - **PR #548:** (*Lanzaa*) Salt is now platform dependent. Use get\_python\_lib(1) | refs: #24348
  - 86a3b31 Merge pull request #24348 from makinacorpus/lxcpre
  - 0cb11a2 lxc: typo
  - d71efa6 Try to close input pipes before calling lxc-start

### 37.2.16 Salt 2015.5.4 Release Notes

Version 2015.5.4 is a bugfix release for 2015.5.0.

Changes:

- The `cron.present` state now correctly defaults to state ID as identifier.
- When querying for VMs in `digital_ocean_v2.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The `vmware` Salt-Cloud driver was back-ported from the `develop` branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

#### Changes for v2015.5.3..v2015.5.4

Changes:

- **PR #26292:** (*jqkast*) Rabbitmq 3.2.4 on Ubuntu has "...done.", not "...done" @ 2015-08-13T19:53:29Z
- **PR #26296:** (*jqkast*) bugfix missing `'runas=None'` for `rabbitmqctl` cmds (backport to 2015.5) @ 2015-08-13T19:52:40Z
- **PR #26293:** (*jfindlay*) Fix #26268 @ 2015-08-13T19:48:06Z
  - **ISSUE #25618:** (*twangboy*) Fix `reg.py` to work with the registry properly | refs: #26268
  - **PR #26268:** (*twangboy*) Multiple improvements to `reg` executionmod and `state` mod | refs: #26293
- **PR #26290:** (*rallytime*) Only call `convert_to_arn` when action name is provided @ 2015-08-13T18:48:58Z
  - **ISSUE #25192:** (*deuscapturus*) 2015.5.2 `boto_cloudwatch_alarm.present` not working. | refs: #26290
- **PR #26288:** (*bbinet*) allow deleting grains which value is `False` @ 2015-08-13T18:24:36Z
- **PR #26263:** (*rallytime*) Don't make changes when `test=True` for `openstack` `present/absent` funcs @ 2015-08-13T16:30:31Z
  - **ISSUE #24882:** (*nmadhok*) `salt.states.openstack_config.present` and `salt.states.openstack_config.absent` make changes when `test=True` | refs: #26263
- **PR #26265:** (*rallytime*) Don't stacktrace on query return in `ec2.create_snapshot` @ 2015-08-13T16:28:48Z
  - **ISSUE #24484:** (*codehotter*) `clouds/ec2.py: create_snapshot` throws exception | refs: #26265
- **PR #26285:** (*stanislavb*) Remove explicit version from instance identity URL @ 2015-08-13T16:25:32Z
- **PR #26275:** (*cachedout*) Re-init modules on multi-master reconnect @ 2015-08-13T15:52:50Z
- **PR #26273:** (*garethgreenaway*) Fixes to `schedule` module in 2015.5 @ 2015-08-13T15:34:43Z
- **PR #26271:** (*rallytime*) Fix `del_root_vol_on_destroy` and `del_all_vols_on_destroy` functionality on `ec2` @ 2015-08-12T23:22:47Z

- ISSUE #24483: (*codehotter*) `clouds/ec2.py: del_root_vol_on_destroy` and `del_all_vols_on_destroy` not working | refs: #26271
- PR #26219: (*anlutro*) cron: make identifier default to state ID @ 2015-08-12T18:42:33Z
  - ISSUE #25958: (*anlutro*) Cron identifier does not default to state ID as documented | refs: #26219
- PR #26257: (*rallytime*) Back-port #26237 to 2015.5 @ 2015-08-12T18:40:35Z
  - ISSUE #26207: (*fullermd*) group members setting fails with obscure error message on FreeBSD | refs: #26237
  - PR #26237: (*silenius*) fix issue #26207 | refs: #26257
- PR #26258: (*nmadhok*) Fix permission on `tests/runtests.py` on 2015.5 branch @ 2015-08-12T18:40:04Z
- PR #26261: (*nmadhok*) Correct spelling of integration in docs @ 2015-08-12T18:14:48Z
  - PR #2015: (*thekuffs*) Esky / bbfreeze support
- PR #26247: (*nmadhok*) Initial commit of unit tests for vmware cloud driver @ 2015-08-12T16:58:24Z
- PR #26246: (*nmadhok*) Backport additions to VMware cloud driver from develop to 2015.5 branch @ 2015-08-12T15:11:26Z
- PR #26239: (*opdude*) Fixed documentation to match function name @ 2015-08-12T14:48:52Z
- PR #26232: (*garethgreenaway*) Fix to `trust_key` in `gpg` module for 2015.5. @ 2015-08-12T04:48:27Z
- PR #26084: (*twangboy*) Added `python_shell=True`, quoted user input @ 2015-08-10T21:29:35Z
  - ISSUE #25802: (*jefftucker*) Running module ``npm.list`` fails on Windows for masterless minion | refs: #26084
- PR #26183: (*cro*) Fix LDAP configuration issue. @ 2015-08-10T19:09:41Z
- PR #26186: (*jacobhammons*) regenerated man pages @ 2015-08-10T19:07:44Z
- PR #26182: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-10T19:00:10Z
  - ISSUE #25961: (*getabc*) [2015.5.3-2] `salt-winrepo.git/salt-minion.sls` fails certificate ``*.wpengine.com`` or ``wpengine.com`` | refs: #26047
  - ISSUE #25751: (*basepi*) Document `master_finger` more prominently | refs: #26088
  - PR #26116: (*corux*) `file.replace` fails if `repl` string is an invalid regex and `append/prepend` is used
  - PR #26088: (*jacobhammons*) Master finger
  - PR #26047: (*jacobhammons*) Updated windows download links in the docs to <https://repo.saltstack.com>
- PR #26000: (*driskell*) Implement full event caching for subscribed tags @ 2015-08-10T18:57:17Z
  - ISSUE #25998: (*driskell*) Event subsystem discarding required events during `--batch` breaking it for slow running commands | refs: #26000
- PR #26175: (*rallytime*) Back-port #26153 to 2015.5 @ 2015-08-10T18:22:32Z
  - PR #26153: (*loa*) Fix `dockerio` state documentation typo | refs: #26175
- PR #26177: (*rallytime*) Back-port #26147 to 2015.5 @ 2015-08-10T18:22:01Z
  - ISSUE #26024: (*jpgic*) `lxc_conf_unset` in `cloud.profile` is ignored
  - PR #26147: (*martinhoefling*) Fixes #26024 | refs: #26177
- PR #26179: (*rallytime*) Back-port #25404 to 2015.5 @ 2015-08-10T18:21:50Z
  - ISSUE #21082: (*clinta*) `master_type` failover does not failover on DNS errors | refs: #25404

- PR #25404: (*DmitryKuzmenko*) Fixed minion failover to next master on DNS errors. | refs: #26179
- PR #26180: (*jfindlay*) fix processing of state.template @ 2015-08-10T18:21:38Z
  - ISSUE #26112: (*wt*) state.template fails with unclear error with template with only an include | refs: #26180
- PR #26172: (*nmadhok*) [Backport] Make sure variable is a dictionary before popping something from it. @ 2015-08-10T16:42:50Z
  - ISSUE #26162: (*nmadhok*) VMware cloud driver create function failing with traceback on latest develop | refs: #26163 #26172
  - PR #26163: (*nmadhok*) Make sure variable is a dictionary before popping something from it.
- PR #26168: (*cachedout*) Fix slack docs @ 2015-08-10T14:57:18Z
  - ISSUE #26098: (*rdinoff*) SALT.STATES.SLACK Doc update | refs: #26168
- PR #26127: (*garethgreenaway*) Fixes to salt.utils.http related to cp.get\_file\_str bug. @ 2015-08-10T14:38:25Z
  - ISSUE #24106: (*nvx*) fileclient.py#get\_url ignores HTTP Auth again (2015.5 regression) | refs: #26127
- PR #26140: (*nmadhok*) VMware cloud driver fixes @ 2015-08-10T13:15:58Z
  - ISSUE #26141: (*nmadhok*) salt-cloud VMware driver fails with error in parsing configuration file | refs: #26140
  - ISSUE #25809: (*o-sleep*) vmware cloud module error message | refs: #26140
  - ISSUE #25625: (*steverweber*) cloud vmware driver does not provide mac\_address unless vmware tools is running | refs: #26137 #26140
- PR #26137: (*steverweber*) use device mac address if vmttools not active @ 2015-08-09T03:05:36Z
  - ISSUE #25625: (*steverweber*) cloud vmware driver does not provide mac\_address unless vmware tools is running | refs: #26137 #26140
- PR #26119: (*jodv*) Backport eauth bugfix to 2015.5 @ 2015-08-09T02:19:52Z
- PR #26135: (*cro*) Fix proxy minions in 2015.5 and significantly update documentation. @ 2015-08-09T02:19:21Z
- PR #26132: (*TheBigBear*) minor edit @ 2015-08-08T21:05:34Z
- PR #26133: (*amontalban*) Fixed #25915 in salt/modules/pkgng.py and salt/states/pkg.py @ 2015-08-08T21:05:05Z
  - ISSUE #25915: (*ari*) FreeBSD pkg install fails
- PR #26111: (*anlutro*) Better error messages when virtualenv creation fails @ 2015-08-07T21:42:09Z
- PR #26110: (*jfindlay*) check for sources before adding them to cmd str @ 2015-08-07T21:33:23Z
  - ISSUE #26093: (*freedba*) archive.tar bug | refs: #26110
- PR #26106: (*vr-jack*) Update \_\_init\_\_.py @ 2015-08-07T21:15:55Z
- PR #26101: (*rallytime*) Back-port #25984 to 2015.5 @ 2015-08-07T18:56:26Z
  - ISSUE #25983: (*jmdcal*) Trying to get md5 of local zip | refs: #25984
  - PR #25984: (*jmdcal*) Support local files without md5sum | refs: #26101
- PR #26080: (*techhat*) Fix string checking in s3fs @ 2015-08-06T23:36:09Z
- PR #26079: (*cachedout*) Update docs to remove state.over @ 2015-08-06T23:35:26Z
  - ISSUE #26039: (*basepi*) Update scheduler docs to use orchestrate instead of overstate | refs: #26079

- PR #26058: (*opdude*) Fix choco version on chocolatey versions below 0.9.9 @ 2015-08-06T18:50:10Z
- PR #26068: (*jfindlay*) fix autoruns.list looking in wrong directory @ 2015-08-06T18:49:48Z
- PR #26065: (*s0undt3ch*) [2015.5] Update to latest bootstrap stable release v2015.06.08 @ 2015-08-06T17:09:35Z
  - ISSUE #634: (*loupgaroublond*) /srv/salt/\_grains/ not documented | refs: #26065
  - ISSUE #631: (*fatbox*) Can't extend the same item multiple times | refs: #26065
  - ISSUE #625: (*whiteinge*) `cmd.run` state `user` flag is not working | refs: #25506 #632
  - PR #640: (*terminalmage*) fix syntax errors introduced in 0f776c13 | refs: #26065
  - PR #638: (*blast-hardcheese*) Tightened up configuration documentation | refs: #26065
  - PR #633: (*epoelke*) Bug fix to salt-key | refs: #26065
  - PR #632: (*whiteinge*) Change the `cmd.run` state to use the new `runas` arg | refs: #26065
- PR #26061: (*gmcwhistler*) Patch for issue #25994 @ 2015-08-06T17:07:34Z
  - ISSUE #25994: (*gmcwhistler*) `module.ilo` tempfile creation in `__execute_cmd` results in `TypeError: cannot concatenate 'str' and 'int' objects`
- PR #26064: (*s0undt3ch*) Don't stacktrace when trying to get the default locale. @ 2015-08-06T16:11:05Z
  - ISSUE #26063: (*saltstack-bot*) not working with salt-cloud shows unknown locale error | refs: #26064
- PR #26048: (*jacobhammons*) Updated windows download links in the docs to <https://repo.saltstack.com> @ 2015-08-05T22:59:50Z
- PR #26044: (*rallytime*) Make sure the key we're comparing is also lowercase @ 2015-08-05T19:23:54Z
  - ISSUE #25616: (*rallytime*) [2015.5] Provisioning Linodes Stacktraces | refs: #26044
- PR #26042: (*jfindlay*) fix test mode logic in state docs @ 2015-08-05T19:23:07Z
- PR #26036: (*nicholascapo*) survey.hash: Remove manually printed text @ 2015-08-05T19:21:59Z
  - ISSUE #24460: (*nicholascapo*) Survey runner does not follow `--out` flag | refs: #26036
- PR #26030: (*opdude*) Fix a bug in choco version that returned odd data @ 2015-08-05T16:30:25Z
- PR #26032: (*jfindlay*) add test logic to state reult doc @ 2015-08-05T16:28:32Z
- PR #26031: (*alekti*) Revert ``Add file as supported protocol for file source\_hash. Fixes #23764" @ 2015-08-05T15:32:01Z
  - ISSUE #23764: (*es1o*) `source_hash` from local file is not supported. | refs: #25750
- PR #26021: (*anlutro*) Documentation: Specify versionadded for `git.present` shared argument @ 2015-08-05T14:17:38Z
- PR #26020: (*alekti*) Correctly resolve conflict merging pull 25750 to 2015.5 @ 2015-08-05T14:16:58Z
  - ISSUE #23764: (*es1o*) `source_hash` from local file is not supported. | refs: #25750
  - PR #25750: (*alekti*) Add file as supported protocol for file `source_hash`. Fixes #25701. | refs: #26020
- PR #26016: (*basepi*) Revert ``Deep merge of pillar lists" @ 2015-08-05T04:59:52Z
  - ISSUE #22241: (*masterkorp*) Salt master not properly generating the map | refs: #25358
  - PR #25358: (*dkiser*) Deep merge of pillar lists | refs: #26016
- PR #25992: (*twangboy*) Refactor `win_system.py` @ 2015-08-05T04:54:18Z
  - ISSUE #12255: (*eliasp*) `'system.set_computer_desc'` fails with non-ASCII chars | refs: #25992

- ISSUE #3: (*thatch45*) libvirt module
- PR #26002: (*twangboy*) Fixed regex to account for comment character followed by whitespace @ 2015-08-04T22:28:11Z
  - ISSUE #25948: (*twangboy*) Fix uncomment function to handle spaces | refs: #26002
- PR #25970: (*jfindlay*) accept addition of layman overlay @ 2015-08-04T15:42:28Z
  - ISSUE #25949: (*godlike64*) layman.add does not work with unofficial overlays | refs: #25970
- PR #25971: (*basepi*) [2015.5] salt.modules.reg Add spaces for strings split across multiple lines @ 2015-08-04T15:39:48Z
- PR #25990: (*rallytime*) Back-port #25976 to 2015.5 @ 2015-08-04T14:36:53Z
  - PR #25976: (*fleaflicker*) Typo in help output | refs: #25990
- PR #25996: (*attiasr*) fix msiexec package remove @ 2015-08-04T14:36:31Z
- PR #25966: (*rallytime*) Back-port #25864 to 2015.5 @ 2015-08-03T18:48:26Z
  - ISSUE #25863: (*peterdemin*) pkg.installed fails on already installed package if it is in versionlock.list | refs: #25864
  - PR #25864: (*peterdemin*) #25863 state.pkg.installed fix | refs: #25966
- PR #25967: (*rallytime*) Back-port #25917 to 2015.5 @ 2015-08-03T18:48:02Z
  - PR #25917: (*jmdcal*) adding missing format string | refs: #25967
- PR #25895: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-03T17:12:37Z
  - ISSUE #23764: (*es1o*) source\_hash from local file is not supported. | refs: #25750
  - PR #25750: (*alekti*) Add file as supported protocol for file source\_hash. Fixes #25701. | refs: #26020
  - PR #25704: (*cachedout*) Ensure prior alignment with master\_type in 2014.7
  - PR #25657: (*MrCitron*) Add the ability to specify a base pattern for carbon returner
  - PR #25633: (*AkhterAli*) Update loader.py
- PR #25941: (*jfindlay*) add timelib to dependency versions @ 2015-08-03T12:23:42Z
  - ISSUE #25850: (*ssguard*) Need to add packages to --versions-report | refs: #25941
- PR #25951: (*garthgreenaway*) Log when event.fire and event.fire\_master fail. @ 2015-08-03T00:19:45Z
- PR #25942: (*jfindlay*) typo in minion doc @ 2015-07-31T23:34:55Z
  - ISSUE #25838: (*grep4linux*) docs disable\_modules documentation typo | refs: #25942

### 37.2.17 Salt 2015.5.5 Release Notes

Version 2015.5.5 is a bugfix release for 2015.5.0.

Changes:

- The `cron.present` state now correctly defaults to state ID as identifier.
- When querying for VMs in `digital_ocean_v2.py`, the number of VMs to include in a page was changed from 20 (default) to 200 to reduce the number of API calls to Digital Ocean.
- The `vmware` Salt-Cloud driver was back-ported from the `develop` branch in order for installations of Salt that are older than 2015.8.0 to be able to use the `vmware` driver without stack-tracing on various deprecation paths that were implemented in the 2015.8.0 release.

#### Changes for v2015.5.3..v2015.5.5

Changes:

- **PR #26292:** (*jqkast*) Rabbitmq 3.2.4 on Ubuntu has "...done.", not "...done" @ 2015-08-13T19:53:29Z
- **PR #26296:** (*jqkast*) bugfix missing `'runas=None'` for `rabbitmqctl` cmds (backport to 2015.5) @ 2015-08-13T19:52:40Z
- **PR #26293:** (*jfindlay*) Fix #26268 @ 2015-08-13T19:48:06Z
  - **ISSUE #25618:** (*twangboy*) Fix `reg.py` to work with the registry properly | refs: #26268
  - **PR #26268:** (*twangboy*) Multiple improvements to `reg` executionmod and `state` mod | refs: #26293
- **PR #26290:** (*rallytime*) Only call `convert_to_arn` when action name is provided @ 2015-08-13T18:48:58Z
  - **ISSUE #25192:** (*deuscapturus*) 2015.5.2 `boto_cloudwatch_alarm.present` not working. | refs: #26290
- **PR #26288:** (*bbinet*) allow deleting grains which value is `False` @ 2015-08-13T18:24:36Z
- **PR #26263:** (*rallytime*) Don't make changes when `test=True` for `openstack` `present/absent` funcs @ 2015-08-13T16:30:31Z
  - **ISSUE #24882:** (*nmadhok*) `salt.states.openstack_config.present` and `salt.states.openstack_config.absent` make changes when `test=True` | refs: #26263
- **PR #26265:** (*rallytime*) Don't stacktrace on query return in `ec2.create_snapshot` @ 2015-08-13T16:28:48Z
  - **ISSUE #24484:** (*codehotter*) `clouds/ec2.py: create_snapshot` throws exception | refs: #26265
- **PR #26285:** (*stanislavb*) Remove explicit version from instance identity URL @ 2015-08-13T16:25:32Z
- **PR #26275:** (*cachedout*) Re-init modules on multi-master reconnect @ 2015-08-13T15:52:50Z
- **PR #26273:** (*garethgreenaway*) Fixes to `schedule` module in 2015.5 @ 2015-08-13T15:34:43Z
- **PR #26271:** (*rallytime*) Fix `del_root_vol_on_destroy` and `del_all_vols_on_destroy` functionality on `ec2` @ 2015-08-12T23:22:47Z

- ISSUE #24483: (*codehotter*) `clouds/ec2.py: del_root_vol_on_destroy` and `del_all_vols_on_destroy` not working | refs: #26271
- PR #26219: (*anlutro*) `cron: make identifier default to state ID` @ 2015-08-12T18:42:33Z
  - ISSUE #25958: (*anlutro*) Cron identifier does not default to state ID as documented | refs: #26219
- PR #26257: (*rallytime*) Back-port #26237 to 2015.5 @ 2015-08-12T18:40:35Z
  - ISSUE #26207: (*fullermd*) group members setting fails with obscure error message on FreeBSD | refs: #26237
  - PR #26237: (*silenius*) fix issue #26207 | refs: #26257
- PR #26258: (*nmadhok*) Fix permission on `tests/runtests.py` on 2015.5 branch @ 2015-08-12T18:40:04Z
- PR #26261: (*nmadhok*) Correct spelling of integration in docs @ 2015-08-12T18:14:48Z
  - PR #2015: (*thekuffs*) Esky / bbfreeze support
- PR #26247: (*nmadhok*) Initial commit of unit tests for vmware cloud driver @ 2015-08-12T16:58:24Z
- PR #26246: (*nmadhok*) Backport additions to VMware cloud driver from develop to 2015.5 branch @ 2015-08-12T15:11:26Z
- PR #26239: (*opdude*) Fixed documentation to match function name @ 2015-08-12T14:48:52Z
- PR #26232: (*garethgreenaway*) Fix to `trust_key` in `gpg` module for 2015.5. @ 2015-08-12T04:48:27Z
- PR #26084: (*twangboy*) Added `python_shell=True`, quoted user input @ 2015-08-10T21:29:35Z
  - ISSUE #25802: (*jefftucker*) Running module ``npm.list`` fails on Windows for masterless minion | refs: #26084
- PR #26183: (*cro*) Fix LDAP configuration issue. @ 2015-08-10T19:09:41Z
- PR #26186: (*jacobhammons*) regenerated man pages @ 2015-08-10T19:07:44Z
- PR #26182: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5 @ 2015-08-10T19:00:10Z
  - ISSUE #25961: (*getabc*) [2015.5.3-2] `salt-winrepo.git/salt-minion.sls` fails certificate ``*.wpengine.com`` or ``wpengine.com`` | refs: #26047
  - ISSUE #25751: (*basepi*) Document `master_finger` more prominently | refs: #26088
  - PR #26116: (*corux*) `file.replace` fails if repl string is an invalid regex and `append/prepend` is used
  - PR #26088: (*jacobhammons*) Master finger
  - PR #26047: (*jacobhammons*) Updated windows download links in the docs to <https://repo.saltstack.com>
- PR #26000: (*driskell*) Implement full event caching for subscribed tags @ 2015-08-10T18:57:17Z
  - ISSUE #25998: (*driskell*) Event subsystem discarding required events during `--batch` breaking it for slow running commands | refs: #26000
- PR #26175: (*rallytime*) Back-port #26153 to 2015.5 @ 2015-08-10T18:22:32Z
  - PR #26153: (*loa*) Fix `dockerio` state documentation typo | refs: #26175
- PR #26177: (*rallytime*) Back-port #26147 to 2015.5 @ 2015-08-10T18:22:01Z
  - ISSUE #26024: (*jpgic*) `lxc_conf_unset` in `cloud.profile` is ignored
  - PR #26147: (*martinhoefling*) Fixes #26024 | refs: #26177
- PR #26179: (*rallytime*) Back-port #25404 to 2015.5 @ 2015-08-10T18:21:50Z
  - ISSUE #21082: (*clinta*) `master_type` failover does not failover on DNS errors | refs: #25404

- PR #25404: (*DmitryKuzmenko*) Fixed minion failover to next master on DNS errors. | refs: #26179
- PR #26180: (*jfindlay*) fix processing of state.template @ 2015-08-10T18:21:38Z
  - ISSUE #26112: (*wt*) state.template fails with unclear error with template with only an include | refs: #26180
- PR #26172: (*nmadhok*) [Backport] Make sure variable is a dictionary before popping something from it. @ 2015-08-10T16:42:50Z
  - ISSUE #26162: (*nmadhok*) VMware cloud driver create function failing with traceback on latest develop | refs: #26163 #26172
  - PR #26163: (*nmadhok*) Make sure variable is a dictionary before popping something from it.
- PR #26168: (*cachedout*) Fix slack docs @ 2015-08-10T14:57:18Z
  - ISSUE #26098: (*rdinoff*) SALT.STATES.SLACK Doc update | refs: #26168
- PR #26127: (*garethgreenaway*) Fixes to salt.utils.http related to cp.get\_file\_str bug. @ 2015-08-10T14:38:25Z
  - ISSUE #24106: (*nvx*) fileclient.py#get\_url ignores HTTP Auth again (2015.5 regression) | refs: #26127
- PR #26140: (*nmadhok*) VMware cloud driver fixes @ 2015-08-10T13:15:58Z
  - ISSUE #26141: (*nmadhok*) salt-cloud VMware driver fails with error in parsing configuration file | refs: #26140
  - ISSUE #25809: (*o-sleep*) vmware cloud module error message | refs: #26140
  - ISSUE #25625: (*steverweber*) cloud vmware driver does not provide mac\_address unless vmware tools is running | refs: #26137 #26140
- PR #26137: (*steverweber*) use device mac address if vmtools not active @ 2015-08-09T03:05:36Z
  - ISSUE #25625: (*steverweber*) cloud vmware driver does not provide mac\_address unless vmware tools is running | refs: #26137 #26140
- PR #26119: (*jodv*) Backport eauth bugfix to 2015.5 @ 2015-08-09T02:19:52Z
- PR #26135: (*cro*) Fix proxy minions in 2015.5 and significantly update documentation. @ 2015-08-09T02:19:21Z
- PR #26132: (*TheBigBear*) minor edit @ 2015-08-08T21:05:34Z
- PR #26133: (*amontalban*) Fixed #25915 in salt/modules/pkgng.py and salt/states/pkg.py @ 2015-08-08T21:05:05Z
  - ISSUE #25915: (*ari*) FreeBSD pkg install fails
- PR #26111: (*anlutro*) Better error messages when virtualenv creation fails @ 2015-08-07T21:42:09Z
- PR #26110: (*jfindlay*) check for sources before adding them to cmd str @ 2015-08-07T21:33:23Z
  - ISSUE #26093: (*freedba*) archive.tar bug | refs: #26110
- PR #26106: (*vr-jack*) Update \_\_init\_\_.py @ 2015-08-07T21:15:55Z
- PR #26101: (*rallytime*) Back-port #25984 to 2015.5 @ 2015-08-07T18:56:26Z
  - ISSUE #25983: (*jmdcal*) Trying to get md5 of local zip | refs: #25984
  - PR #25984: (*jmdcal*) Support local files without md5sum | refs: #26101
- PR #26080: (*techhat*) Fix string checking in s3fs @ 2015-08-06T23:36:09Z
- PR #26079: (*cachedout*) Update docs to remove state.over @ 2015-08-06T23:35:26Z
  - ISSUE #26039: (*basepi*) Update scheduler docs to use orchestrate instead of overstate | refs: #26079

- PR #26058: (*opdude*) Fix choco version on chocolatey versions below 0.9.9 @ 2015-08-06T18:50:10Z
- PR #26068: (*jfindlay*) fix autoruns.list looking in wrong directory @ 2015-08-06T18:49:48Z
- PR #26065: (*s0undt3ch*) [2015.5] Update to latest bootstrap stable release v2015.06.08 @ 2015-08-06T17:09:35Z
  - ISSUE #634: (*loupgaroublond*) /srv/salt/\_grains/ not documented | refs: #26065
  - ISSUE #631: (*fatbox*) Can't extend the same item multiple times | refs: #26065
  - ISSUE #625: (*whiteinge*) `cmd.run` state `user` flag is not working | refs: #25506 #632
  - PR #640: (*terminalmage*) fix syntax errors introduced in 0f776c13 | refs: #26065
  - PR #638: (*blast-hardcheese*) Tightened up configuration documentation | refs: #26065
  - PR #633: (*epoelke*) Bug fix to salt-key | refs: #26065
  - PR #632: (*whiteinge*) Change the `cmd.run` state to use the new `runas` arg | refs: #26065
- PR #26061: (*gmcwhistler*) Patch for issue #25994 @ 2015-08-06T17:07:34Z
  - ISSUE #25994: (*gmcwhistler*) `module.ilo` tempfile creation in `__execute_cmd` results in `TypeError: cannot concatenate 'str' and 'int' objects`
- PR #26064: (*s0undt3ch*) Don't stacktrace when trying to get the default locale. @ 2015-08-06T16:11:05Z
  - ISSUE #26063: (*saltstack-bot*) not working with salt-cloud shows unknown locale error | refs: #26064
- PR #26048: (*jacobhammons*) Updated windows download links in the docs to <https://repo.saltstack.com> @ 2015-08-05T22:59:50Z
- PR #26044: (*rallytime*) Make sure the key we're comparing is also lowercase @ 2015-08-05T19:23:54Z
  - ISSUE #25616: (*rallytime*) [2015.5] Provisioning Linodes Stacktraces | refs: #26044
- PR #26042: (*jfindlay*) fix test mode logic in state docs @ 2015-08-05T19:23:07Z
- PR #26036: (*nicholascapo*) survey.hash: Remove manually printed text @ 2015-08-05T19:21:59Z
  - ISSUE #24460: (*nicholascapo*) Survey runner does not follow `--out` flag | refs: #26036
- PR #26030: (*opdude*) Fix a bug in choco version that returned odd data @ 2015-08-05T16:30:25Z
- PR #26032: (*jfindlay*) add test logic to state reult doc @ 2015-08-05T16:28:32Z
- PR #26031: (*alekti*) Revert ``Add file as supported protocol for file source\_hash. Fixes #23764" @ 2015-08-05T15:32:01Z
  - ISSUE #23764: (*es1o*) `source_hash` from local file is not supported. | refs: #25750
- PR #26021: (*anlutro*) Documentation: Specify versionadded for `git.present` shared argument @ 2015-08-05T14:17:38Z
- PR #26020: (*alekti*) Correctly resolve conflict merging pull 25750 to 2015.5 @ 2015-08-05T14:16:58Z
  - ISSUE #23764: (*es1o*) `source_hash` from local file is not supported. | refs: #25750
  - PR #25750: (*alekti*) Add file as supported protocol for file `source_hash`. Fixes #25701. | refs: #26020
- PR #26016: (*basepi*) Revert ``Deep merge of pillar lists" @ 2015-08-05T04:59:52Z
  - ISSUE #22241: (*masterkorp*) Salt master not properly generating the map | refs: #25358
  - PR #25358: (*dkiser*) Deep merge of pillar lists | refs: #26016

  - PR #26353: (*sixinety-nine*) fixed a typo in setup.py | refs: #26379
- PR #26277: (*rallytime*) Handle exception when user is not found in keystone.user\_get @ 2015-08-14T19:41:59Z
  - ISSUE #26240: (*0xf10e*) keystone.user\_get raises exception when user is not found | refs: #26277
- PR #26326: (*rallytime*) Make ec2.create\_snapshot return less unweildly and more relevant @ 2015-08-14T19:40:47Z
  - ISSUE #24484: (*codehotter*) clouds/ec2.py: create\_snapshot throws exception | refs: #26326

- **PR #26306:** (*rallytime*) Move VM creation details dict to log.trace @ 2015-08-14T17:39:52Z
  - **ISSUE #16179:** (*UtahDave*) Salt Cloud -l debug includes the entire bootstrap script twice in its output | refs: #26306

### 37.2.18 Salt 2015.5.6 Release Notes

Version 2015.5.6 is a bugfix release for 2015.5.0.

#### Security Fixes

CVE-2015-6941 - win\_useradd module and salt-cloud display passwords in debug log

Updated the win\_useradd module return data to no longer include the password of the newly created user. The password is now replaced with the string XXX-REDACTED-XXX. Updated the Salt Cloud debug output to no longer display win\_password and sudo\_password authentication credentials.

CVE-2015-6918 - Git modules leaking HTTPS auth credentials to debug log

Updated the Git state and execution modules to no longer display HTTPS basic authentication credentials in loglevel debug output on the Salt master. These credentials are now replaced with REDACTED in the debug output. Thanks to Andreas Stieger <asteiger@suse.com> for bringing this to our attention.

#### Changes for v2015.5.5..v2015.5.6

Changes:

- **PR #27557:** (*jfindlay*) add doc motivating mine vs grains
- **PR #27515:** (*jfindlay*) save iptables rules on SuSE
- **PR #27509:** (*jfindlay*) tell the user why the gluster module does not work
- **PR #27379:** (*jfindlay*) document and check dict type for pip env\_vars
- **PR #27516:** (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- **PR #27472:** (*cachedout*) Change recommended schema for data field in mysql event table
- **PR #27468:** (*cachedout*) Fix 27351
- **PR #27479:** (*aboe76*) fix locale on opensuse and suse **#27438`\_`**
- **PR #27483:** (*rallytime*) Outputters should sync to output, not outputters, on the minion.
- **PR #27484:** (*rallytime*) Back-port #27434 and #27470 to 2015.5
- **PR #27469:** (*twangboy*) Added quotes to version numbers example
- **PR #27467:** (*cachedout*) file.managed: check contents\_{pillar|grain} result
- **PR #27419:** (*rallytime*) Amend error log to include multiple tips for troubleshooting.
- **PR #27426:** (*rallytime*) Don't stacktrace if there are conflicting id errors in highstate
- **PR #27408:** (*rallytime*) Fix avail\_locations function for the softlayer\_hw driver in 2015.5

- PR #27410: (*jacobhammons*) Fix css layout Refs ``#27389`_`
- PR #27336: (*rallytime*) [2015.5] Fixup salt-cloud logging
- PR #27358: (*loregordon*) Escape search replacement text, fixes ``#27356`_`
- PR #27345: (*rallytime*) Allow use of rst header links by separating options out from yaml example
- PR #26903: (*bersace*) Review defaults.get
- PR #27317: (*efficks*) State unzip should use unzip command instead of unzip\_cmd.
- PR #27309: (*rallytime*) Change a value list to a comma-separated string in boto\_route53.present
- PR #27311: (*jfindlay*) discuss replacement occurrences in file doc
- PR #27310: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27308: (*terminalmage*) Fix refresh\_db regression in yumpkg.py
- PR #27286: (*terminalmage*) Add a configurable timer for minion return retries
- PR #27278: (*rallytime*) Back-port #27256 to 2015.5
- PR #27277: (*rallytime*) Back-port #27230 to 2015.5
- PR #27253: (*jfindlay*) 2015.5 -> 2015.5.0
- PR #27244: (*garthgreenaway*) Exception in cloud.ec2.create\_snapshot
- PR #27231: (*jfindlay*) only write cron file if it is changed
- PR #27233: (*basepi*) [2015.5] Add stub release notes for 2015.5.6
- PR #27208: (*basepi*) [2015.5] Add test.nop state
- PR #27201: (*jfindlay*) rename hash\_hostname to hash\_known\_hosts
- PR #27214: (*jackson tj*) Correctly support https, port 443 is not a requirement
- PR #27172: (*rallytime*) Back-port #27150 to 2015.5
- PR #27194: (*rallytime*) Back-port #27180 to 2015.5
- PR #27176: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27170: (*rallytime*) Update Getting Started with GCE docs to use cloud.profiles or cloud.profiles.d examples
- PR #27167: (*rallytime*) Back-port #27148 to 2015.5
- PR #27168: (*techhat*) Add further gating of impacket library
- PR #27166: (*rallytime*) Allow a full-query for EC2, even if there are no profiles defined
- PR #27162: (*rallytime*) Be explicit in using ``SoftLayer`` for service queries in SoftLayer drivers
- PR #27149: (*twangboy*) Fixed problem with add/remove path
- PR #27147: (*rallytime*) Enforce bounds in the GCE Regex
- PR #27128: (*eguyen*) don't show diff for test run if show\_diff=False
- PR #27116: (*jacobhammons*) Update latest to 2015.8, 2015.5 is now previous
- PR #27033: (*jfindlay*) Merge #27019
- PR #26942: (*Arabus*) Fix docker.run
- PR #26977: (*abh*) Add support for PEERNTTP network interface configuration
- PR #27023: (*jfindlay*) add test support for htpasswd state mod

- PR #27074: (*twangboy*) Replaced password with redacted when displayed
- PR #27073: (*rallytime*) Remove ``use develop branch" warning from LXC tutorial
- PR #27054: (*rallytime*) Back-port #27029 to 2015.5
- PR #27053: (*rallytime*) Back-port #26992 to 2015.5
- PR #27052: (*rallytime*) Back-port #26930 to 2015.5
- PR #27049: (*johanek*) Run repoquery less
- PR #27070: (*stanislavb*) Deprecate salt.utils.iam in Carbon
- PR #27030: (*jfindlay*) Backport #26938
- PR #27025: (*cachedout*) Better try and error handling for prep\_jid
- PR #27035: (*terminalmage*) useradd.py: Use contextmanager to prevent leaked filehandles
- PR #27034: (*rallytime*) Update softlayer docs for where to find apikey
- PR #27024: (*rallytime*) Back-port #27004 to 2015.5
- PR #27027: (*rallytime*) Back-port #27013 to 2015.5
- PR #27026: (*rallytime*) Back-port #27011 to 2015.5
- PR #26972: (*twangboy*) Catch the 404 error from fileclient
- PR #26951: (*terminalmage*) Fix timezone module for CentOS
- PR #26875: (*marccardinal*) LXC gateway provisioned only when IP is provided
- PR #26997: (*twangboy*) Fixed symlinks for windows (don't use user root)
- PR #27001: (*twangboy*) Added CLI Example for reg.delete\_key\_recursive
- PR #26996: (*jacobhammons*) Beacon doc updates
- PR #26868: (*joejulian*) Use the actual device name when checking vgdisplay
- PR #26955: (*dsumsky*) S3 ext\_pillar module has broken caching mechanism (backport to 2015.5)
- PR #26987: (*rallytime*) Back-port #26966 to 2015.5
- PR #26915: (*rallytime*) Update Joyent Cloud Tests
- PR #26971: (*rallytime*) Fix a couple of typos in reactor docs
- PR #26976: (*thatch45*) Revert ``file.symlink gets windows account instead of root"
- PR #26975: (*whiteinge*) Remove mocks from rest\_cherryypy integration tests; fix groups check bug
- PR #26899: (*twangboy*) file.symlink gets windows account instead of root
- PR #26960: (*rallytime*) Fix bash code block formatting in CherryPy netapi docs
- PR #26940: (*rallytime*) Fix minor doc typo in client api
- PR #26871: (*rallytime*) Back-port #26852 to 2015.5
- PR #26851: (*jacobhammons*) states/pkgrepo examples, suse installation updates
- PR #26817: (*jfindlay*) modify groupadd for rhel 5
- PR #26824: (*pravka*) [salt-cloud] Fix creating droplet from snapshot in digital\_ocean provider
- PR #26823: (*joejulian*) use dbus instead of localectl
- PR #26820: (*jfindlay*) add default param in \_parse\_localectl in locale mod

- PR #26821: (*twangboy*) Fixed user.rename function in windows
- PR #26803: (*twangboy*) Added check for PyMySQL if MySQLdb import fails
- PR #26815: (*jfindlay*) stringify linode id before performing str actions
- PR #26800: (*jacobhammons*) Doc bug fixes
- PR #26793: (*rallytime*) Don't stacktrace if ``name" is specified as a minion id in a map file
- PR #26790: (*rallytime*) Update Saltify docs to be more accurate and helpful
- PR #26787: (*jfindlay*) merge #26775
- PR #26759: (*terminalmage*) Backport PR #26726 to 2015.5 branch
- PR #26768: (*garthgreenaway*) Fixes to ipset in 2015.5 for `#26628`\_
- PR #26753: (*jfindlay*) import elementree from \_compat in ilo exec mod
- PR #26736: (*twangboy*) Changed import from smbconnection to smb3
- PR #26714: (*jfindlay*) add exception placeholder for older msgpacks
- PR #26710: (*rallytime*) Update GCE driver to return True, False or a new name in \_\_virtual\_\_()
- PR #26709: (*rallytime*) Ensure VM name is valid before trying to create Linode VM
- PR #26617: (*terminalmage*) Fix Windows failures in pip module due to raw string formatting
- PR #26700: (*kev009*) Ignore the first element of kern.disks split, which is the sysctl name
- PR #26695: (*terminalmage*) Better HTTPS basic auth redaction for 2015.5 branch
- PR #26694: (*terminalmage*) Backport #26693 to 2015.5
- PR #26681: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #26676: (*rallytime*) Back-port #26648 to 2015.5
- PR #26677: (*rallytime*) Back-port #26653 to 2015.5
- PR #26675: (*rallytime*) Back-port #26631 to 2015.5
- PR #26655: (*cheng0919*) Update win\_dns\_client.py
- PR #26662: (*jacobhammons*) update version to 2015.5
- PR #26651: (*jfindlay*) add 2015.5.4 notes to 2015.5.5 notes
- PR #26525: (*jfindlay*) document check\_file\_meta args, remove unused arg
- PR #26561: (*stanislavb*) Leave salt.utils.s3 location fallback to salt.utils.aws
- PR #26573: (*rallytime*) Don't stacktrace if using private\_ips and delete\_sshkeys together
- PR #26563: (*rallytime*) Fix error detection when salt-cloud config is missing a master's address
- PR #26641: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #26620: (*rallytime*) Also add -Z to script args for cloud tests
- PR #26618: (*rallytime*) Add script\_args: '-P' to Ubuntu 14 profiles for nightly cloud tests
- PR #26612: (*rallytime*) Use an available image to test against
- PR #26576: (*rallytime*) Ensure GCE and EC2 configuration checks are correct
- PR #26580: (*rallytime*) Avoid race condition when assigning floating IPs to new VMs
- PR #26581: (*terminalmage*) Skip tests that don't work with older mock

- PR #26591: (*rallytime*) Back-port #26554 to 2015.5
- PR #26565: (*cachedout*) Fix many errors with `__virtual__` in tests
- PR #26553: (*rallytime*) Back-port #26548 to 2015.5
- PR #26552: (*rallytime*) Back-port #26542 to 2015.5
- PR #26551: (*rallytime*) Back-port #26539 to 2015.5
- PR #26549: (*rallytime*) Back-port #26524 to 2015.5
- PR #26527: (*jfindlay*) check exists and values in boto\_elb listeners
- PR #26446: (*stanislavb*) Fetch AWS region from EC2 instance metadata
- PR #26546: (*nmadhok*) Do not raise KeyError when calling avail\_images if VM/template is in disconnected state
- PR #26537: (*jfindlay*) Merge #26481
- PR #26528: (*zmalone*) Fixing encrypt to instructions in the 2015.5 branch

### 37.2.19 Salt 2015.5.7 Release Notes

---

**Note:** A significant orchestrate issue #29110 was discovered during the release process of 2015.5.7, so it has not been officially released. Please use 2015.5.8 instead.

---

Generated at: 2015-11-13T17:11:14Z

Total Merges: 102

Changes:

- PR #28731: (*garthgreenaway*) Fixes to salt scheduler in 2015.5, ensuring that return\_job is only used on minion scheduler
- PR #28857: (*rallytime*) Back-port #28851 to 2015.5
- PR #28856: (*rallytime*) Back-port #28853 to 2015.5
- PR #28832: (*basepi*) [2015.5] Backport #28826
- PR #28833: (*basepi*) [2015.5] Increase the default gather\_job\_timeout
- PR #28829: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28756: (*MrCitron*) Fix ``#25775`_`
- PR #28786: (*chrigl*) closes ``#28783`_`
- PR #28776: (*rallytime*) Back-port #28740 to 2015.5
- PR #28760: (*dmyerscough*) Fixing CherryPy key bug
- PR #28746: (*rallytime*) Back-port #28718 to 2015.5
- PR #28705: (*cachedout*) Account for new headers class in tornado 4.3
- PR #28699: (*rallytime*) Back-port #28670 to 2015.5
- PR #28703: (*rallytime*) Back-port #28690 to 2015.5
- PR #28694: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.09

- PR #28669: (*rallytime*) Use the `-q` argument to strip extraneous messages from `rabbitmq`
- PR #28645: (*jacksonjtj*) Rework minion `return_retry_timer`
- PR #28668: (*twangboy*) Fixed `join_domain` and `unjoin_domain` for Windows
- PR #28666: (*jfindlay*) define `r_data` before using it in `file` module
- PR #28662: (*cachedout*) Add note about disabling `master_alive_interval`
- PR #28627: (*twangboy*) Backport `win_useradd`
- PR #28617: (*cachedout*) Set restrictive `umask` on `module sync`
- PR #28622: (*gravyboat*) Update `puppet` module wording
- PR #28563: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.04
- PR #28541: (*twangboy*) Fixed problem with `system.set_computer_name`
- PR #28537: (*jfindlay*) decode filename to utf-8 in `file.recurse` state
- PR #28529: (*rallytime*) Update contributing and documentation pages to recommend submitting against branches
- PR #28548: (*nmadhok*) [Backport] [2015.5] Tasks can be in `queued` state instead of `running`
- PR #28531: (*rallytime*) Add `versionadded` directives to `virtualenv_mod` state/module
- PR #28508: (*twangboy*) Fixed windows tests
- PR #28525: (*rallytime*) Fix spacing in doc examples for `boto_route53` state and module
- PR #28517: (*rallytime*) Add `state_auto_order` defaults to `True` note to ordering docs
- PR #28512: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28448: (*gwaters*) added a note to the tutorial for redhat derivatives
- PR #28406: (*rallytime*) Back-port #28381 to 2015.5
- PR #28413: (*rallytime*) Back-port #28400 to 2015.5
- PR #28366: (*erchn*) mark repo not enabled when `pkgrepo` state passes in `disable: True`
- PR #28373: (*beverlcl*) Fixing bug ``#28372`_` for `use_carrier` option on bonding network interfaces.
- PR #28359: (*rallytime*) Back-port #28358 to 2015.5
- PR #28346: (*twangboy*) Fix installer
- PR #28315: (*gwaters*) Adding a working example of setting pillar data on the cli
- PR #28211: (*terminalmage*) Fix for `ext_pillar` being compiled twice in legacy `git_pillar` code (2015.5 branch)
- PR #28263: (*cachedout*) New channel for `event.send`
- PR #28293: (*cachedout*) Minor grammar changes
- PR #28271: (*gwaters*) Update tutorial documentation
- PR #28280: (*0xf10e*) Correct Jinja function `load_*` to `import_*`
- PR #28255: (*cachedout*) Add `__cli` opt
- PR #28213: (*rallytime*) If record returned `None`, don't continue with the state. Something went wrong
- PR #28238: (*basepi*) [2015.5] Fix `schedule.present` always diffing
- PR #28174: (*lorenegordon*) Add support for multiline regex in `file.replace`

- PR #28175: (*twangboy*) Fixes ``#19673`_`
- PR #28140: (*rallytime*) Add OpenBSD installation documentation to 2015.5 branch
- PR #28138: (*rallytime*) Back-port #28130 EC2 Sizes Only portion to 2015.5
- PR #28097: (*jacksonj*) For all multi-part messages, check the headers. If the header is not ...
- PR #28117: (*rallytime*) Clean up stacktrace when master can't be reached in lxc cloud driver
- PR #28110: (*terminalmage*) Add explanation of file\_client: local setting masterless mode
- PR #28109: (*rallytime*) Add created reactor event to lxc cloud driver
- PR #27996: (*rallytime*) Don't fail if pip package is already present and pip1 is installed
- PR #28056: (*rallytime*) Back-port #28033 to 2015.5
- PR #28059: (*rallytime*) Back-port #28040 to 2015.5
- PR #28047: (*cachedout*) Restore FTP functionality to file client
- PR #28032: (*twangboy*) Fixed win\_path.py
- PR #28037: (*rallytime*) Back-port #28003 to 2015.5
- PR #28031: (*jacobhammons*) Updated release notes with additional CVE information
- PR #28008: (*jfindlay*) platform independent line endings in hosts mod
- PR #28012: (*rallytime*) Clean up stack trace when something goes wrong with minion output
- PR #27995: (*jacobhammons*) added link to grains security FAQ to targeting and pillar topics.
- PR #27986: (*jacobhammons*) Changed current release to 5.6 and added CVE to release notes
- PR #27913: (*pass-by-value*) Set default
- PR #27876: (*terminalmage*) 2015.5 branch: Fix traceback when 2015.8 git ext\_pillar config schema used
- PR #27726: (*jfindlay*) deprecate hash\_hostname in favor of hash\_known\_hosts
- PR #27776: (*jfindlay*) return message when local jobs\_cache not found
- PR #27766: (*jfindlay*) better check for debian userdel error
- PR #27758: (*iggy*) Remove redundant text from syslog returner
- PR #27841: (*terminalmage*) Detect Manjaro Linux as Arch derivative
- PR #27852: (*rallytime*) Back-port #27806 to 2015.5
- PR #27838: (*basepi*) [2015.5] Fix highstate outputter for jobs.lookup\_jid
- PR #27791: (*eguyen*) 2015.5 postgres\_user groups backport
- PR #27759: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #27732: (*jacobhammons*) update docs for `__virtual__` and `__virtualname__`
- PR #27747: (*Sacro*) Chocolatey doesn't have a help command.
- PR #27733: (*jacobhammons*) hardening topic - updates to docs.saltstack.com theme
- PR #27706: (*jacobhammons*) Assorted doc bugs
- PR #27695: (*rallytime*) Back-port #27671 to 2015.5
- PR #27524: (*jfindlay*) parse pkgng output in quiet mode for `>= 1.6.1`
- PR #27686: (*rallytime*) Back-port #27476 to 2015.5

- PR #27684: (*rallytime*) Back-port #27656 to 2015.5
- PR #27683: (*rallytime*) Back-port #27659 to 2015.5
- PR #27682: (*rallytime*) Back-port #27566 to 2015.5
- PR #27681: (*rallytime*) Back-port #25928 to 2015.5
- PR #27680: (*rallytime*) Back-port #27535 to 2015.5
- PR #27442: (*JaseFace*) Ensure we pass on the enable setting if present, or use the default of True if not in `build_schedule_item()`
- PR #27641: (*rallytime*) Gate the `psutil` import and add depends doc for `diskusage` beacon
- PR #27644: (*rallytime*) Back-port #27640 to 2015.5
- PR #27612: (*rallytime*) Fix GCE `external_ip` stacktraces in 2015.5
- PR #27568: (*jacobhammons*) regenerated man pages

### 37.2.20 Salt 2015.5.8 Release Notes

#### Security Fix

CVE-2015-8034: Saving `state.sls` cache data to disk with insecure permissions

This affects users of the `state.sls` function. The state run cache on the minion was being created with incorrect permissions. This file could potentially contain sensitive data that was inserted via `jinja` into the state SLS files. The permissions for this file are now being set correctly. Thanks to [@zmalone](#) for bringing this issue to our attention.

#### Changes

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

*Generated at: 2015-11-23T23:16:23Z*

Total Merges: 118

Changes:

- PR #29128: (*cachedout*) Set a safer default value for `ret` in `saltmod`
- PR #29122: (*cachedout*) Fix broken state orchestration
- PR #29096: (*rallytime*) Back-port #29093 to 2015.5
- PR #29084: (*rallytime*) Back-port #29055 to 2015.5
- PR #29083: (*rallytime*) Back-port #29053 to 2015.5
- PR #28932: (*twangboy*) Fixed `user.present` / `user.absent` in windows
- PR #29011: (*rallytime*) Back-port #28630 to 2015.5
- PR #28982: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28949: (*whiteinge*) Add `sync_sdb` execution function
- PR #28930: (*twangboy*) Added missing import `mmap` required by `file.py`
- PR #28908: (*rallytime*) A couple of spelling fixes for doc conventions page.
- PR #28902: (*whiteinge*) Fix missing JSON support for `/keys` endpoint

- PR #28897: (*rallytime*) Back-port #28873 to 2015.5
- PR #28871: (*basepi*) [2015.5] Fix command generation for `mdadm.assemble`
- PR #28864: (*jfindlay*) add 2015.5.7 release notes
- PR #28731: (*garethgreenaway*) Fixes to salt scheduler in 2015.5, ensuring that `return_job` is only used on minion scheduler
- PR #28857: (*rallytime*) Back-port #28851 to 2015.5
- PR #28856: (*rallytime*) Back-port #28853 to 2015.5
- PR #28832: (*basepi*) [2015.5] Backport #28826
- PR #28833: (*basepi*) [2015.5] Increase the default `gather_job_timeout`
- PR #28829: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28756: (*MrCitron*) Fix ``#25775`_`
- PR #28786: (*chrigl*) closes ``#28783`_`
- PR #28776: (*rallytime*) Back-port #28740 to 2015.5
- PR #28760: (*dmyerscough*) Fixing CherryPy key bug
- PR #28746: (*rallytime*) Back-port #28718 to 2015.5
- PR #28705: (*cachedout*) Account for new headers class in tornado 4.3
- PR #28699: (*rallytime*) Back-port #28670 to 2015.5
- PR #28703: (*rallytime*) Back-port #28690 to 2015.5
- PR #28694: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.09
- PR #28669: (*rallytime*) Use the `-q` argument to strip extraneous messages from `rabbitmq`
- PR #28645: (*jacksonj*) Rework minion `return_retry_timer`
- PR #28668: (*twangboy*) Fixed `join_domain` and `unjoin_domain` for Windows
- PR #28666: (*jfindlay*) define `r_data` before using it in file module
- PR #28662: (*cachedout*) Add note about disabling `master_alive_interval`
- PR #28627: (*twangboy*) Backport `win_useradd`
- PR #28617: (*cachedout*) Set restrictive `umask` on module `sync`
- PR #28622: (*gravyboat*) Update puppet module wording
- PR #28563: (*s0undt3ch*) [2015.5] Update to latest bootstrap script v2015.11.04
- PR #28541: (*twangboy*) Fixed problem with `system.set_computer_name`
- PR #28537: (*jfindlay*) decode filename to utf-8 in `file.recurse` state
- PR #28529: (*rallytime*) Update contributing and documentation pages to recommend submitting against branches
- PR #28548: (*nmadhok*) [Backport] [2015.5] Tasks can be in `queued` state instead of `running`
- PR #28531: (*rallytime*) Add `versionadded` directives to `virtualenv_mod` state/module
- PR #28508: (*twangboy*) Fixed windows tests
- PR #28525: (*rallytime*) Fix spacing in doc examples for `boto_route53` state and module
- PR #28517: (*rallytime*) Add `state_auto_order` defaults to `True` note to ordering docs

- PR #28512: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #28448: (*gwaters*) added a note to the tutorial for redhat derivatives
- PR #28406: (*rallytime*) Back-port #28381 to 2015.5
- PR #28413: (*rallytime*) Back-port #28400 to 2015.5
- PR #28366: (*erchn*) mark repo not enabled when pkgrepo state passes in disable: True
- PR #28373: (*beverlcl*) Fixing bug `#28372`\_ for use\_carrier option on bonding network interfaces.
- PR #28359: (*rallytime*) Back-port #28358 to 2015.5
- PR #28346: (*twangboy*) Fix installer
- PR #28315: (*gwaters*) Adding a working example of setting pillar data on the cli
- PR #28211: (*terminalmage*) Fix for ext\_pillar being compiled twice in legacy git\_pillar code (2015.5 branch)
- PR #28263: (*cachedout*) New channel for event.send
- PR #28293: (*cachedout*) Minor grammar changes
- PR #28271: (*gwaters*) Update tutorial documentation
- PR #28280: (*0xf10e*) Correct Jinja function load\_\* to import\_\*
- PR #28255: (*cachedout*) Add \_\_cli opt
- PR #28213: (*rallytime*) If record returned None, don't continue with the state. Something went wrong
- PR #28238: (*basepi*) [2015.5] Fix schedule.present always diffing
- PR #28174: (*lorenegordon*) Add support for multiline regex in file.replace
- PR #28175: (*twangboy*) Fixes `#19673`\_
- PR #28140: (*rallytime*) Add OpenBSD installation documentation to 2015.5 branch
- PR #28138: (*rallytime*) Back-port #28130 EC2 Sizes Only portion to 2015.5
- PR #28097: (*jacksonjtj*) For all multi-part messages, check the headers. If the header is not ...

- PR #27682: (*rallytime*) Back-port #27566 to 2015.5
- PR #27681: (*rallytime*) Back-port #25928 to 2015.5
- PR #27680: (*rallytime*) Back-port #27535 to 2015.5
- PR #27442: (*JaseFace*) Ensure we pass on the enable setting if present, or use the default of True if not in build\_schedule\_item()
- PR #27641: (*rallytime*) Gate the psutil import and add depends doc for diskusage beacon
- PR #27644: (*rallytime*) Back-port #27640 to 2015.5
- PR #27612: (*rallytime*) Fix GCE external\_ip stacktraces in 2015.5
- PR #27568: (*jacobhammons*) regenerated man pages

### 37.2.21 Salt 2015.5.9 Release Notes

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-01-08T23:02:31Z

Total Merges: 44

Changes:

- PR #30237: (*jacobhammons*) Updated man pages and doc version for 2015.5.9

- PR #30207: (*rallytime*) Use correct spacing in rabbitmq state examples
- PR #30191: (*jacobhammons*) Updated doc site banners
- PR #30125: (*abednarik*) Update user home event when createhome is set to False
- PR #30127: (*jsutton*) Updating documentation and example minion config for random\_master/master\_shuffle.
- PR #30110: (*markckimball*) Fixed flag sent to salt.utils.http in order for verify\_ssl to work correctly
- PR #30093: (*zmalone*) Noting that file\_roots and ``state tree" should both be avoided
- PR #30097: (*cachedout*) Note concern about cleartext password in docs for shadow.gen\_password
- PR #30089: (*mpreziuso*) Fixes terminology and adds more accurate details about the algorithms
- PR #30086: (*cachedout*) Document that gitfs needs recent libs
- PR #30070: (*cachedout*) Add documentation on debugging salt-ssh
- PR #30059: (*mpreziuso*) Fixes wrong function scope
- PR #30025: (*jtand*) Skipping some Boto tests until resolved moto issue
- PR #29949: (*aletourneau*) Enhanced netcaler docstring
- PR #29941: (*cachedout*) Fix spelling error in boto\_vpc
- PR #29908: (*cachedout*) Allow kwargs to be passed to pacman provide for update func
- PR #29909: (*abednarik*) FreeBSD pkgng fix for non-interactive install.
- PR #29730: (*rallytime*) Update docker-py version requirement to 0.6.0 for dockerio.py files
- PR #29715: (*rallytime*) Install correct package version, if provided, for npm state.
- PR #29721: (*terminalmage*) Fix display of multiline strings when iterating over a list
- PR #29646: (*rallytime*) Don't stacktrace on kwargs.get if kwargs=None
- PR #29673: (*rallytime*) Default value should be False and not `False'
- PR #29527: (*jfindlay*) 2015.5.7 notes: add note about not being released
- PR #29539: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #29504: (*rallytime*) Document userdata\_file option for EC2 driver
- PR #29507: (*rallytime*) Switch volumes and del\_\*\_on\_destroy example ordering
- PR #29469: (*abednarik*) Added Documentation note in salt cloud.
- PR #29461: (*dmyerscough*) Fix resource limits, systemd sets the default too small
- PR #29439: (*rallytime*) Back-port #28656 to 2015.5
- PR #29418: (*jacobhammons*) Added CVE 2015-8034 to 2015.5.8 release notes
- PR #29389: (*jacobhammons*) updated version numbers in documentation
- PR #28501: (*twangboy*) Requested fixes for 26898
- PR #29348: (*jtand*) Fixes an file.search on python2.6
- PR #29336: (*rallytime*) Back-port #29276 to 2015.5
- PR #29333: (*rallytime*) Back-port #29280 to 2015.5
- PR #29316: (*basepi*) [2015.5] Merge forward from 2014.7 to 2015.5
- PR #29216: (*clan*) size is 0 doesn't mean no data, e.g. /proc/version

- [PR #29261](#): (*attiasr*) fix incorrect reinstallation of windows pkg
- [PR #29214](#): (*cro*) Doc for salt.utils.http should say verify\_ssl not ssl\_verify.
- [PR #29204](#): (*lorenegordon*) Use os.path.join to return full path to ca bundle

### 37.2.22 Salt 2014.7.0 Release Notes - Codename Helium

This release is the largest Salt release ever, with more features and commits than any previous release of Salt. Everything from the new RAET transport to major updates in Salt Cloud and the merging of Salt API into the main project.

---

**Important:** The Fedora/RHEL/CentOS `salt-master` package has been modified for this release. The following components of Salt have been broken out and placed into their own packages:

- salt-syndic
- salt-cloud
- salt-ssh

When the `salt-master` package is upgraded, these components will be removed, and they will need to be manually installed.

---

**Important:** Compound/pillar matching have been temporarily disabled for the `mine` and `publish` modules for this release due to the possibility of inferring pillar data using pillar glob matching. A proper fix is now in the 2014.7 branch and scheduled for the 2014.7.1 release, and compound matching and non-globbering pillar matching will be re-enabled at that point.

Compound and pillar matching for normal salt commands are unaffected.

---

### New Transport!

#### RAET Transport Option

This has been a HUGE amount of work, but the beta release of Salt with RAET is ready to go. RAET is a reliable queuing transport system that has been developed in partnership with a number of large enterprises to give Salt an alternative to ZeroMQ and a way to get Salt to scale well beyond tens of thousands of servers. Unlike ZeroMQ, RAET is completely asynchronous in every aspect of its operation and has been developed using the flow programming paradigm. This allows for many new capabilities to be added to Salt in the upcoming releases.

Please keep in mind that this is a beta release of RAET and we hope for bugs to be worked out, performance to be better realized and more in the 2015.5.0 release.

Simply stated, users running Salt with RAET should expect some hiccups as we hammer out the update. This is a BETA release of Salt RAET.

For information about how to use Salt with RAET please see the [tutorial](#).

#### Salt SSH Enhancements

Salt SSH has just entered a new league, with substantial updates and improvements to make salt-ssh more reliable and easier than ever! From new features like the `ansible` roster and `fileserver` backends to the new `pypi` salt-ssh installer to lowered deps and a swath of bugfixes, salt-ssh is basically reborn!

### Install salt-ssh Using pip

Salt-ssh is now pip-installable!

<https://pypi.python.org/pypi/salt-ssh/>

Pip will bring in all of the required deps, and while some deps are compiled, they all include pure python implementations, meaning that any compile errors which may be seen can be safely ignored.

```
pip install salt-ssh
```

### Fileserver Backends

Salt-ssh can now use the salt fileserver backend system. This allows for the gitfs, hgfs, s3, and many more ways to centrally store states to be easily used with salt-ssh. This also allows for a distributed team to easily use a centralized source.

### Saltfile Support

The new saltfile system makes it easy to have a user specific custom extended configuration.

### Ext Pillar

Salt-ssh can now use the external pillar system. Making it easier then ever to use salt-ssh with teams.

### No More sshpass

Thanks to the enhancements in the salt vt system, salt-ssh no longer requires sshpass to send passwords to ssh. This also makes the manipulation of ssh calls substantially more flexible, allowing for intercepting ssh calls in a much more fluid way.

### Pure Python Shim

The salt-ssh call originally used a shell script to discover what version of python to execute with and determine the state of the ssh code deployment. This shell script has been replaced with a pure python version making it easy to increase the capability of the code deployment without causing platform inconsistency issues with different shell interpreters.

### Custom Module Delivery

Custom modules are now seamlessly delivered. This makes the deployment of custom grains, states, execution modules and returners a seamless process.

### CP Module Support

Salt-ssh now makes simple file transfers easier then ever! The *cp* module allows for files to be conveniently sent from the salt fileserver system down to systems.

### More Thin Directory Options

Salt ssh functions by copying a subset of the salt code, or *salt thin* down to the target system. In the past this was always transferred to `/tmp/.salt` and cached there for subsequent commands.

Now, salt thin can be sent to a random directory and removed when the call is complete with the `-W` option. The new `-W` option still uses a static location but will clean up that location when finished.

The default *salt thin* location is now user defined, allowing multiple users to cleanly access the same systems.

### State System Enhancements

#### New Imperative State Keyword `listen`

The new `listen` and `listen_in` keywords allow for completely imperative states by calling the `mod_watch()` routine after all states have run instead of re-ordering the states.

#### Mod Aggregate Runtime Manipulator

The new `mod_aggregate` system allows for the state system to rewrite the state data during execution. This allows for state definitions to be aggregated dynamically at runtime.

The best example is found in the *pkg* state. If `mod_aggregate` is turned on, then when the first `pkg` state is reached, the state system will scan all of the other running states for `pkg` states and take all other packages set for `install` and install them all at once in the first `pkg` state.

These runtime modifications make it easy to run groups of states together. In future versions, we hope to fill out the `mod_aggregate` system to build in more and more optimizations.

For more documentation on `mod_aggregate`, see [the documentation](#).

#### New Requisites: `onchanges` and `onfail`

The new `onchanges` and `onchanges_in` requisites make a state apply only if there are changes in the required state. This is useful to execute post hooks after changes occur on a system.

The other new requisites, `onfail`, and `onfail_in`, allow for a state to run in reaction to the failure of another state.

For more information about these new requisites, see [the requisites documentation](#).

#### Global `onlyif` and `unless`

The `onlyif` and `unless` options can now be used for any state declaration.

#### Use `names` to expand and override values

The *names declaration* in Salt's state system can now override or add values to the expanded data structure. For example:

```
my_users:
  user.present:
    - names:
      - larry
      - curly
      - moe:
        - shell: /bin/zsh
        - groups:
          - wheel
    - shell: /bin/bash
```

## Major Features

### Scheduler Additions

The Salt scheduler system has received MAJOR enhancements, allowing for cron-like scheduling and much more granular timing routines. See [here](#) for more info.

### Red Hat 7 Family Support

All the needed additions have been made to run Salt on RHEL 7 and derived OSes like CentOS and Scientific.

### Fileserver Backends in salt-call

Fileserver backends like gitfs can now be used without a salt master! Just add the fileserver backend configuration to the minion config and execute salt-call. This has been a much-requested feature and we are happy to finally bring it to our users.

### Amazon Execution Modules

An entire family of execution modules further enhancing Salt's Amazon Cloud support. They include the following:

- *Autoscale Groups* (includes *state support*) -- related: *Launch Control* states
- *Cloud Watch* (includes *state support*)
- *Elastic Cache* (includes *state support*)
- *Elastic Load Balancer* (includes *state support*)
- *IAM Identity and Access Management* (includes *state support*)
- *Route53 DNS* (includes *state support*)
- *Security Groups* (includes *state support*)
- *Simple Queue Service* (includes *state support*)

### LXC Runner Enhancements

BETA The Salt LXC management system has received a number of enhancements which make running an LXC cloud entirely from Salt an easy proposition.

### Next Gen Docker Management

The Docker support in Salt has been increased at least ten fold. The Docker API is now completely exposed and Salt ships with Docker data tracking systems which make automating Docker deployments very easy.

### Peer System Performance Improvements

The peer system communication routines have been refined to make the peer system substantially faster.

### SDB

Encryption at rest for configs

### GPG Renderer

Encrypted pillar at rest

### OpenStack Expansion

Lots of new OpenStack stuff

### Queues System

Ran change external queue systems into Salt events

### Multi Master Failover Additions

Connecting to multiple masters is more dynamic then ever

### Chef Execution Module

Managing Chef with Salt just got even easier!

### salt-api Project Merge

The `salt-api` project has been merged into Salt core and is now available as part of the regular `salt-master` package install. No API changes were made, the **salt-api** script and init scripts remain intact.

`salt-api` has always provided Yet Another Pluggable Interface to Salt (TM) in the form of `netapi` modules. These are modules that bind to a port and start a service. Like many of Salt's other module types, `netapi` modules often have library and configuration dependencies. See the documentation for each module for instructions.

See also:

*The full list of netapi modules.*

**Synchronous and Asynchronous Execution of Runner and Wheel Modules** `salt.runner.RunnerClient` and `salt.wheel.WheelClient` have both gained complimentary `cmd_sync` and `cmd_async` methods allowing for synchronous and asynchronous execution of any Runner or Wheel module function, all protected using Salt's *external authentication* system. `salt-api` benefits from this addition as well.

**rest\_cherry.py Additions** The `rest_cherry.py` netapi module provides the main REST API for Salt.

**Web Hooks** This release of course includes the Web Hook additions from the most recent `salt-api` release, which allows external services to signal actions within a Salt infrastructure. External services such as Amazon SNS, Travis-CI, or GitHub, as well as internal services that cannot or should not run a Salt minion daemon can be used as first-class components in Salt's rich orchestration capabilities.

The raw HTTP request body is now available in the event data. This is sometimes required information for checking an HMAC signature in order to verify a HTTP request. As an example, Amazon or GitHub requests are signed this way.

**Generating and Accepting Minion Keys** The `/key` convenience URL generates a public and private key for a minion, automatically pre-accepts the public key on the Salt Master, and returns both keys as a tarball for download.

This allows for easily bootstrapping the key on a new minion with a single HTTP call, such as with a Kickstart script, all using regular shell tools.

```
curl -sS http://salt-api.example.com:8000/keys \
    -d mid=jerry \
    -d username=kickstart \
    -d password=kickstart \
    -d eauth=pam \
    -o jerry-salt-keys.tar
```

### Fileserver Backend Enhancements

All of the fileserver backends have been overhauled to be faster, lighter, and more reliable. The VCS backends (`gitfs`, `hgfs`, and `svnfs`) have also received a **lot** of new features.

Additionally, most config parameters for the VCS backends can now be configured on a per-remote basis, allowing for global config parameters to be overridden for a specific `gitfs`/`hgfs`/`svnfs` remote.

### New `gitfs` Features

**Pygit2 and Dulwich** In addition to supporting GitPython, support for `pygit2` (0.20.3 and newer) and `dulwich` have been added. Provided a compatible version of `pygit2` is installed, it will now be the default provider. The config parameter `gitfs_provider` has been added to allow one to choose a specific provider for `gitfs`.

**Mountpoints** Prior to this release, to serve a file from `gitfs` at a salt fileserver URL of `salt://foo/bar/baz.txt`, it was necessary to ensure that the parent directories existed in the repository. A new config parameter `gitfs_mountpoint` allows `gitfs` remotes to be exposed starting at a user-defined `salt://` URL.

**Environment Whitelisting/Blacklisting** By default, gitfs will expose all branches and tags as Salt fileserver environments. Two new config parameters, *gitfs\_env\_whitelist*, and *gitfs\_env\_blacklist*, allow more control over which branches and tags are exposed. More detailed information on how these two options work can be found in the *Gitfs Walkthrough*.

**Expanded Authentication Support** As of *pygit2* 0.20.3, both http(s) and SSH key authentication are supported, and Salt now also supports both authentication methods when using *pygit2*. Keep in mind that *pygit2* 0.20.3 is not yet available on many platforms, so those who had been using authenticated git repositories with a passphraseless key should stick to GitPython if a new enough *pygit2* is not yet available for the platform on which the master is running.

A full explanation of how to use authentication can be found in the *Gitfs Walkthrough*.

### New **hgfs** Features

**Mountpoints** This feature works exactly like its *gitfs counterpart*. The new config parameter is called *hgfs\_mountpoint*.

**Environment Whitelisting/Blacklisting** This feature works exactly like its *gitfs counterpart*. The new config parameters are called *hgfs\_env\_whitelist* and *hgfs\_env\_blacklist*.

### New **svnfs** Features

**Mountpoints** This feature works exactly like its *gitfs counterpart*. The new config parameter is called *svnfs\_mountpoint*.

**Environment Whitelisting/Blacklisting** This feature works exactly like its *gitfs counterpart*. The new config parameters are called *svnfs\_env\_whitelist* and *svnfs\_env\_blacklist*.

**Configurable Trunk/Branches/Tags Paths** Prior to this release, the paths where trunk, branches, and tags were located could only be in directories named ``trunk``, ``branches``, and ``tags`` directly under the root of the repository. Three new config parameters (*svnfs\_trunk*, *svnfs\_branches*, and *svnfs\_tags*) allow SVN repositories which are laid out differently to be used with svnfs.

### New **minionfs** Features

**Mountpoint** This feature works exactly like its *gitfs counterpart*. The new config parameter is called *minionfs\_mountpoint*. The one major difference is that, as minionfs doesn't use multiple remotes (it just serves up files pushed to the master using *cp.push*) there is no such thing as a per-remote configuration for *minionfs\_mountpoint*.

**Changing the Saltenv from Which Files are Served** A new config parameter (*minionfs\_env*) allows minionfs files to be served from a Salt fileserver environment other than base.

**Minion Whitelisting/Blacklisting** By default, minionfs will expose the pushed files from all minions. Two new config parameters, *minionfs\_whitelist*, and *minionfs\_blacklist*, allow minionfs to be restricted to serve files from only the desired minions.

## Pyobjects Renderer

Salt now ships with with the *Pyobjects Renderer* that allows for construction of States using pure Python with an idiomatic object interface.

## New Modules

In addition to the Amazon modules mentioned above, there are also several other new execution modules:

- *Oracle*
- *Random*
- *Redis*
- *Amazon Simple Queue Service*
- *Block Device Management*
- *CoreOS etcd*
- *Genesis*
- *InfluxDB*
- *Server Density*
- *Twilio Notifications*
- *Varnish*
- *ZNC IRC Bouncer*
- *SMTP*

## New Runners

- *Map/Reduce Style*
- *Queue*

## New External Pillars

- *CoreOS etcd*

## New Salt-Cloud Providers

- *Aliyun ECS Cloud*
- *LXC Containers*
- *Proxmox (OpenVZ containers & KVM)*

## Salt Call Change

When used with a returner, salt-call now contacts a master if `--local` is not specified.

## Deprecations

### `salt.modules.virtualenv_mod`

- Removed deprecated `memoize` function from `salt/utils/__init__.py` (deprecated)
- Removed deprecated `no_site_packages` argument from `create` function (deprecated)
- Removed deprecated `check_dns` argument from `minion_config` and `apply_minion_config` functions (deprecated)
- Removed deprecated `OutputOptionsWithTextMixin` class from `salt/utils/parsers.py` (deprecated)
- Removed the following deprecated functions from `salt/modules/ps.py`:
  - `physical_memory_usage` (deprecated)
  - `virtual_memory_usage` (deprecated)
  - `cached_physical_memory` (deprecated)
  - `physical_memory_buffers` (deprecated)
- Removed deprecated `cloud` arguments from `cloud_config` function in `salt/config.py`:
  - `vm_config` (deprecated)
  - `vm_config_path` (deprecated)
- Removed deprecated `libcloud_version` function from `salt/cloud/libcloudfuncs.py` (deprecated)
- Removed deprecated `CloudConfigMixin` class from `salt/utils/parsers.py` (deprecated)

### 37.2.23 Salt 2014.7.1 Release Notes

`release` 2015-01-12

Version 2014.7.1 is a bugfix release for 2014.7.0. The changes include:

- Fixed gitfs serving symlinks in `file.recurse` states ([issue 17700](#))
- Fixed holding of multiple packages (YUM) when combined with version pinning ([issue 18468](#))
- Fixed use of Jinja templates in masterless mode with non-roots files server backend ([issue 17963](#))
- Re-enabled pillar and compound matching for mine and publish calls. Note that pillar globbing is still disabled for those modes, for security reasons. ([issue 17194](#))
- Fix for `tty: True` in salt-ssh ([issue 16847](#))
- Fix for supervisor states when supervisor not installed to system python ([issue 18044](#))
- Fix for logging when `log_level='quiet'` for `cmd.run` ([issue 19479](#))

### 37.2.24 Salt 2014.7.2 Release Notes

`release` 2015-02-09

Version 2014.7.2 is a bugfix release for 2014.7.0. The changes include:

- Fix erroneous warnings for systemd service enabled check ([issue 19606](#))
- Fix FreeBSD kernel module loading, listing, and persistence `kmod` ([issue 197151](#), [issue 19682](#))
- Allow case-sensitive npm package names in the `npm state`. This may break behavior for people expecting the state to lowercase their npm package names for them. The `npm module` was never affected by mandatory lowercasing. ([issue 20329](#))

- Deprecate the `activate` parameter for `pip.install` for both the `module` and the `state`. If `bin_env` is given and points to a virtualenv, there is no need to activate that virtualenv in a shell for pip to install to the virtualenv.
- Fix a file-locking bug in gitfs ([issue 18839](#))
- Deprecated `archive_user` in favor of standardized `user` parameter in `state` and added `group` parameter.

### 37.2.25 Salt 2014.7.3 Release Notes

`release` TBA

Version 2014.7.3 is a bugfix release for 2014.7.0.

Changes:

- Multi-master minions mode no longer route fileclient operations asymmetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
- Fix bug wherein `network.iface` could produce stack traces.
- `net.arp` will no longer be made available unless `arp` is installed on the system.
- Major performance improvements to Saltnado
- Allow KVM module to operate under KVM itself or VMWare Fusion
- Various fixes to the Windows installation scripts
- Fix issue where the syndic would not correctly propagate loads to the master job cache.
- Improve error handling on invalid `/etc/network/interfaces` file in salt networking modules
- Fix bug where a response status was not checked for in `fileclient.get_url`
- Enable `eauth` when running salt in batch mode
- Increase timeout in Boto Route53 module
- Fix bugs with Salt's `'tar'` module option parsing
- Fix parsing of NTP servers on Windows
- Fix issue with `blockdev` tuning not reporting changes correctly
- Update to the latest Salt bootstrap script
- Update Linode salt-cloud driver to use either `linode-python` or `apache-libcloud`
- Fix for `s3.query` function to return correct headers
- Fix for `s3.head` returning `None` for files that exist
- Fix the `disable` function in `win_service` module so that the service is disabled correctly
- Fix race condition between master and minion when making a directory when both daemons are on the same host
- Fix an issue where `file.recurse` would fail at the root of an `svn` repo when the repo has a mountpoint
- Fix an issue where `file.recurse` would fail at the root of an `hgfs` repo when the repo has a mountpoint
- Fix an issue where `file.recurse` would fail at the root of an `gitfs` repo when the repo has a mountpoint
- Add `status.master` capability for Windows.
- Various fixes to `ssh_known_hosts`

- Various fixes to states.network bonding for Debian
- The debian\_ip.get\_interfaces module no longer removes nameservers.
- Better integration between grains.virtual and systemd-detect-virt and virt-what
- Fix traceback in sysctl.present state output
- Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
- Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
- Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if *backup* is False, and if a pre-existing file exists with extension *.bak*, then that backup file will be overwritten. This backup behavior is a result of how *fileinput* works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting *file.replace* so it doesn't use *fileinput*
- VCS filreserver fixes/optimizations
- Catch fileserver configuration errors on master start
- Raise errors on invalid gitfs configurations
- set\_locale when locale file does not exist (Redhat family)
- Fix to correctly count active devices when created mdadm array with spares
- Fix to correctly target minions in batch mode
- Support ssh:// urls using the gitfs dulwich backend
- New fileserver runner
- Fix various bugs with argument parsing to the publish module.
- Fix disk.usage for Synology OS
- Fix issue with tags occurring twice with docker.pulled
- Fix incorrect key error in SMTP returner
- Fix condition which would remount loopback filesystems on every state run
- Remove reqsites from listens after they are called in the state system
- Make system implementation of service.running aware of legacy service calls
- Fix issue where publish.publish would not handle duplicate responses gracefully.
- Accept Kali Linux for aptpkg salt execution module
- Fix bug where cmd.which could not handle a dirname as an argument
- Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:

- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout`` and ``auth_tries`` down to shorter periods.

### 37.2.26 Salt 2014.7.4 Release Notes

release 2015-03-30

Version 2014.7.4 is a bugfix release for [2014.7.0](#).

This is a security release. The security issues fixed have only been present since 2014.7.0, and only users of the two listed modules are vulnerable. The following CVEs have been resolved:

- CVE-2015-1838 SaltStack: insecure /tmp file handling in salt/modules/serverdensity\_device.py
- CVE-2015-1839 SaltStack: insecure /tmp file handling in salt/modules/chef.py

Changes:

- Multi-master minions mode no longer route fileclient operations asymmetrically. This fixes the source of many multi-master bugs where the minion would become unresponsive from one or more masters.
- Fix bug wherein network.iface could produce stack traces.
- net.arp will no longer be made available unless arp is installed on the system.
- Major performance improvements to Saltnado
- Allow KVM module to operate under KVM itself or VMWare Fusion
- Various fixes to the Windows installation scripts
- Fix issue where the syndic would not correctly propagate loads to the master job cache.
- Improve error handling on invalid /etc/network/interfaces file in salt networking modules
- Fix bug where a response status was not checked for in fileclient.get\_url
- Enable eauth when running salt in batch mode
- Increase timeout in Boto Route53 module
- Fix bugs with Salt's 'tar' module option parsing
- Fix parsing of NTP servers on Windows
- Fix issue with blockdev tuning not reporting changes correctly
- Update to the latest Salt bootstrap script
- Update Linode salt-cloud driver to use either linode-python or apache-libcloud
- Fix for s3.query function to return correct headers
- Fix for s3.head returning None for files that exist
- Fix the disable function in win\_service module so that the service is disabled correctly
- Fix race condition between master and minion when making a directory when both daemons are on the same host
- Fix an issue where file.recurse would fail at the root of an svn repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an hgfs repo when the repo has a mountpoint
- Fix an issue where file.recurse would fail at the root of an gitfs repo when the repo has a mountpoint
- Add status.master capability for Windows.
- Various fixes to ssh\_known\_hosts
- Various fixes to states.network bonding for Debian
- The debian\_ip.get\_interfaces module no longer removes nameservers.
- Better integration between grains.virtual and systemd-detect-virt and virt-what
- Fix traceback in sysctl.present state output

- Fix for issue where mount.mounted would fail when superopts were not a part of mount.active (extended=True). Also mount.mounted various fixes for Solaris and FreeBSD.
- Fix error where datetimes were not correctly safeguarded before being passed into msgpack.
- Fix file.replace regressions. If the pattern is not found, and if dry run is False, and if *backup* is False, and if a pre-existing file exists with extension *.bak*, then that backup file will be overwritten. This backup behavior is a result of how *fileinput* works. Fixing it requires either passing through the file twice (the first time only to search for content and set a flag), or rewriting *file.replace* so it doesn't use *fileinput*
- VCS filreserver fixes/optimizations
- Catch fileserver configuration errors on master start
- Raise errors on invalid gitfs configurations
- set\_locale when locale file does not exist (Redhat family)
- Fix to correctly count active devices when created mdadm array with spares
- Fix to correctly target minions in batch mode
- Support ssh:// urls using the gitfs dulwich backend
- New fileserver runner
- Fix various bugs with argument parsing to the publish module.
- Fix disk.usage for Synology OS
- Fix issue with tags occurring twice with docker.pulled
- Fix incorrect key error in SMTP returner
- Fix condition which would remount loopback filesystems on every state run
- Remove reqsites from listens after they are called in the state system
- Make system implementation of service.running aware of legacy service calls
- Fix issue where publish.publish would not handle duplicate responses gracefully.
- Accept Kali Linux for aptpkg salt execution module
- Fix bug where cmd.which could not handle a dirname as an argument
- Fix issue in ps.pgrep where exceptions were thrown on Windows.

Known issues:

- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout`` and ``auth_tries`` down to shorter periods.
- There are known issues with batch mode operating on the incorrect number of minions. This bug can be patched with the change in [Pull Request #22464](#).
- The *fun*, *state*, and *unless* keywords are missing from the state internals, which can cause problems running some states. This bug can be patched with the change in [Pull Request #22365](#).

### 37.2.27 Salt 2014.7.5 Release Notes

release 2015-04-16

Version 2014.7.5 is a bugfix release for 2014.7.0.

Changes:

- Fixed a key error bug in salt-cloud
- Updated man pages to better match documentation
- Fixed bug concerning high CPU usage with salt-ssh
- Fixed bugs with remounting cvfs and fuse filesystems
- Fixed bug with allowing requisite tracking of entire sls files
- Fixed bug with aptpkg.mod\_repo returning OK even if apt-add-repository fails
- Increased frequency of ssh terminal output checking
- Fixed malformed locale string in localmod module
- Fixed checking of available version of package when accept\_keywords were changed
- Fixed bug to make git.latest work with empty repositories
- Added `**kwargs` to `service.mod_watch` which removes warnings about `enable` and `__reqs__` not being supported by the function
- Improved state comments to not grow so quickly on failed requisites
- Added force argument to service to trigger `force_reload`
- Fixed bug to andle `pkgrepo` keyids that have been converted to int
- Fixed module.portage\_config bug with appending `accept_keywords`
- Fixed bug to correctly report disk usage on windows minion
- Added the ability to specify key prefix for S3 `ext_pillar`
- Fixed issues with batch mode operating on the incorrect number of minions
- Fixed a bug with the proxmox cloud provider stacktracing on disk definition
- Fixed a bug with the changes dictionary in the file state
- Fixed the TCP keep alive settings to work better with SREQ caching
- Fixed many bugs within the iptables state and module
- Fixed bug with states by adding `fun`, `state`, and `unless` to the state runtime internal keywords listing
- Added ability to eAuth against Active Directory
- Fixed some salt-ssh issues when running on Fedora 21
- Fixed `grains.get_or_set_hash` to work with multiple entries under same key
- Added better explanations and more examples of how the Reactor calls functions to docs
- Fixed bug to not pass `ex_config_drive` to libcloud unless it's explicitly enabled
- Fixed bug with `pip.install` on windows
- Fixed bug where `puppet.run` always returns a 0 retcode
- Fixed race condition bug with minion scheduling via pillar
- Made efficiency improvements and bug fixes to the windows installer
- Updated environment variables to fix bug with `pygit2` when running salt as non-root user
- Fixed cas behavior on data module -- `data.cas` was not saving changes
- Fixed GPG rendering error

- Fixed strace error in virt.query
- Fixed stacktrace when running chef-solo command
- Fixed possible bug wherein uncaught exceptions seem to make zmq3 tip over when threading is involved
- Fixed argument passing to the reactor
- Fixed glibc caching to prevent bug where salt-minion getaddrinfo in dns\_check() never got updated name-servers

Known issues:

- In multimaster mode, a minion may become temporarily unresponsive if modules or pillars are refreshed at the same time that one or more masters are down. This can be worked around by setting ``auth_timeout`` and ``auth_tries`` down to shorter periods.

### 37.2.28 Salt 2014.7.6 Release Notes

release 2015-05-18

Version 2014.7.6 is a bugfix release for 2014.7.0.

This release is a security release. A minor issue was found, as cited below:

- CVE-2015-4017 -- Certificates are not verified when connecting to server in the Aliyun and Proxmox modules

Only users of the Aliyun or Proxmox cloud modules are at risk. The vulnerability does not exist in the latest 2015.5.0 release of Salt.

Changes:

- salt.runners.cloud.action() has changed the *fun* keyword argument to *func*. Please update any calls to this function in the cloud runner.

Extended Changelog Courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

- **PR #23810:** (*rallytime*) Backport #23757 to 2014.7 @ 2015-05-18T15:30:21Z
  - **PR #23757:** (*clan*) use abspath, do not eliminating symlinks | refs: #23810
  - aee00c8 Merge pull request #23810 from rallytime/bp-23757
  - fb32c32 use abspath, do not eliminating symlinks
- **PR #23809:** (*rallytime*) Fix virtualport section of virt.get\_nics loop @ 2015-05-18T15:30:09Z
  - **ISSUE #20198:** (*jcftang*) virt.get\_graphics, virt.get\_nics are broken, in turn breaking other things | refs: #23809
  - **PR #21487:** (*rallytime*) Backport #21469 to 2014.7 | refs: #23809
  - **PR #21469:** (*vdesjardins*) fixes #20198: virt.get\_graphics and virt.get\_nics calls in module virt | refs: #21487
  - 6b3352b Merge pull request #23809 from rallytime/virt\_get\_nics\_fix
  - 0616fb7 Fix virtualport section of virt.get\_nics loop
- **PR #23823:** (*gtmanfred*) add link local for ipv6 @ 2015-05-17T12:48:25Z
  - 188f03f Merge pull request #23823 from gtmanfred/2014.7
  - 5ef006d add link local for ipv6
- **PR #23802:** (*gtmanfred*) if it is ipv6 ip\_to\_int will fail @ 2015-05-16T04:06:59Z

- PR #23573: (*techhat*) Scan all available networks for public and private IPs | refs: #23802
- f3ca682 Merge pull request #23802 from gtmanfred/2014.7
- 2da98b5 if it is ipv6 ip\_to\_int will fail
- PR #23488: (*cellscape*) LXC cloud fixes @ 2015-05-15T18:09:35Z
  - ISSUE #16424: (*stanvit*) salt-run cloud.create fails with saltify
  - d9af0c3 Merge pull request #23488 from cellscape/lxc-cloud-fixes
  - 64250a6 Remove profile from opts after creating LXC container
  - c4047d2 Set destroy=True in opts when destroying cloud instance
  - 9e1311a Store instance names in opts when performing cloud action
  - 934bc57 Correctly pass custom env to lxc-attach
  - 7fb85f7 Preserve test=True option in cloud states
  - 9771b5a Fix detection of absent LXC container in cloud state
  - fb24f0c Report failure when failed to create/clone LXC container
  - 2d9aa2b Avoid shadowing variables in lxc module
  - 792e102 Allow overriding profile options in lxc.cloud\_init\_interface
  - 42bd64b Return changes on successful lxc.create from salt-cloud
  - 4409eab Return correct result when creating cloud LXC container
  - 377015c Issue #16424: List all providers when creating salt-cloud instance without profile
- PR #23748: (*basepi*) [2014.7] Log salt-ssh roster render errors more assertively and verbosely @ 2015-05-14T22:38:10Z
  - ISSUE #22332: (*rallytime*) [salt-ssh] Add a check for host in /etc/salt/roster | refs: #23748
  - 808bbe1 Merge pull request #23748 from basepi/salt-ssh.roster.host.check
  - bc53e04 Log entire exception for render errors in roster
  - 753de6a Log render errors in roster to error level
  - e01a7a9 Always let the real YAML error through
- PR #23731: (*twangboy*) Fixes #22959: Trying to add a directory to an unmapped drive in windows @ 2015-05-14T21:59:14Z
  - ISSUE #22959: (*highlyunavailable*) Windows Salt hangs if file.directory is trying to write to a drive that doesn't exist
  - 72cf360 Merge pull request #23731 from twangboy/fix\_22959
  - 88e5495 Fixes #22959: Trying to add a directory to an unmapped drive in windows
- PR #23730: (*rallytime*) Backport #23729 to 2014.7 @ 2015-05-14T21:58:34Z
  - PR #23729: (*rallytime*) Partially merge #23437 (grains fix) | refs: #23730
  - PR #23437: (*cedwards*) Grains item patch | refs: #23729
  - 2610195 Merge pull request #23730 from rallytime/bp-23729
  - 1877cae adding support for nested grains to grains.item

- **PR #23688:** (*twangboy*) Added `inet_pton` to `utils/validate/net.py` for `ip.set_static_ip` in windows @ 2015-05-14T16:15:56Z
  - 3e9df88 Merge pull request #23688 from twangboy/fix\_23415
  - 6a91169 Fixed unused-import pylint error
  - 5e25b3f fixed pylint errors
  - 1a96766 Added `inet_pton` to `utils/validate/net.py` for `ip.set_static_ip` in windows
- **PR #23680:** (*cachedout*) Rename `kwarg` in cloud runner @ 2015-05-13T19:44:02Z
  - ISSUE #23403: (*iamfil*) `salt.runners.cloud.action` fun parameter is replaced | refs: #23680
  - 1b86460 Merge pull request #23680 from cachedout/issue\_23403
  - d5986c2 Rename `kwarg` in cloud runner
- **PR #23674:** (*cachedout*) Handle lists correctly in `grains.list_prsresent` @ 2015-05-13T18:34:58Z
  - ISSUE #23548: (*kkaig*) `grains.list_present` produces incorrect (?) output | refs: #23674
  - cd64af0 Merge pull request #23674 from cachedout/issue\_23548
  - da8a2f5 Handle lists correctly in `grains.list_prsresent`
- **PR #23672:** (*twangboy*) Fix user present @ 2015-05-13T18:30:09Z
  - d322a19 Merge pull request #23672 from twangboy/fix\_user\_present
  - 731e7af Merge branch '2014.7' of <https://github.com/saltstack/salt> into `fix_user_present`
  - d6f70a4 Fixed `user.present` to create password in windows
- **PR #23670:** (*rallytime*) Backport #23607 to 2014.7 @ 2015-05-13T18:27:17Z
  - ISSUE #23604: (*Azidburn*) `service.dead` on `systemd` Minion create an Error Message | refs: #23607
  - PR #23607: (*Azidburn*) Fix for #23604. No error reporting. Exitcode !=0 are ok | refs: #23670
  - 43f7025 Merge pull request #23670 from rallytime/bp-23607
  - ed30dc4 Fix for #23604. No error reporting. Exitcode !=0 are ok
- **PR #23661:** (*rallytime*) Merge #23640 with whitespace fix @ 2015-05-13T15:47:30Z
  - ISSUE #22141: (*Deshke*) `grains.get_or_set_hash` render error if hash begins with ``%" | refs: #23640
  - PR #23640: (*cachedout*) Add warning to `get_or_set_hash` about reserved chars | refs: #23661
  - 0f006ac Merge pull request #23661 from rallytime/merge-23640
  - 4427f42 Whitespace fix
  - dd91154 Add warning to `get_or_set_hash` about reserved chars
- **PR #23639:** (*cachedout*) Handle exceptions raised by `__virtual__` @ 2015-05-13T15:11:12Z
  - ISSUE #23452: (*michaelforge*) minion crashed with empty grain | refs: #23639
  - 84e2ef8 Merge pull request #23639 from cachedout/issue\_23452
  - d418b49 Syntax error!
  - 45b4015 Handle exceptions raised by `__virtual__`
- **PR #23637:** (*cachedout*) Convert `str` master to list @ 2015-05-13T15:08:19Z
  - ISSUE #23611: (*hubez*) `master_type` set to 'failover' but 'master' is not of type list but of type <type 'str'> | refs: #23637

- bd9b94b Merge pull request #23637 from cachedout/issue\_23611
- 56cb1f5 Fix typo
- f6fcf19 Convert str master to list
- PR #23595: (*rallytime*) Backport #23549 to 2014.7 @ 2015-05-12T21:19:40Z
  - PR #23549: (*vr-jack*) Update `__init__.py` | refs: #23595
  - f20c0e4 Merge pull request #23595 from rallytime/bp-23549
  - 6efcac0 Update `__init__.py`
- PR #23594: (*rallytime*) Backport #23496 to 2014.7 @ 2015-05-12T21:19:34Z
  - ISSUE #23110: (*martinhoefling*) Copying files from gitfs in file.recurse state fails
  - PR #23496: (*martinhoefling*) Fix for issue #23110 | refs: #23594
  - 1acaf86 Merge pull request #23594 from rallytime/bp-23496
  - d5ae1d2 Fix for issue #23110 This resolves issues when the freshly created directory is removed by file-server.update.
- PR #23593: (*rallytime*) Backport #23442 to 2014.7 @ 2015-05-12T21:19:26Z
  - PR #23442: (*clan*) add directory itself to keep list | refs: #23593
  - 2c221c7 Merge pull request #23593 from rallytime/bp-23442
  - 39869a1 check w/ low['name'] only
  - 304cc49 another fix for file defined w/ id, but require name
  - 8814d41 add directory itself to keep list
- PR #23606: (*twangboy*) Fixed checkbox for starting service and actually starting it @ 2015-05-12T21:18:50Z
  - fadd1ef Merge pull request #23606 from twangboy/fix\_installer
  - 038331e Fixed checkbox for starting service and actually starting it
- PR #23592: (*rallytime*) Backport #23389 to 2014.7 @ 2015-05-12T16:44:42Z
  - ISSUE #22908: (*karanjad*) Add failhard option to salt orchestration | refs: #23389
  - PR #23389: (*cachedout*) Correct fail\_hard typo | refs: #23592
  - 10b3f0f Merge pull request #23592 from rallytime/bp-23389
  - 734cc43 Correct fail\_hard typo
- PR #23573: (*techhat*) Scan all available networks for public and private IPs | refs: #23802 @ 2015-05-12T15:22:22Z
  - cd34b9b Merge pull request #23573 from techhat/novaquery
  - f92db5e Linting
  - 26e00d3 Scan all available networks for public and private IPs
- PR #23558: (*jfindlay*) reorder emerge command line @ 2015-05-12T15:17:46Z
  - ISSUE #23479: (*danielmorlock*) Typo in pkg.removed for Gentoo? | refs: #23558
  - 2a72cd7 Merge pull request #23558 from jfindlay/fix\_ebuild
  - 45404fb reorder emerge command line
- PR #23530: (*dr4Ke*) salt-ssh state: fix including all salt:// references @ 2015-05-12T15:13:43Z

- ISSUE #23355: (*dr4Ke*) salt-ssh: `sources: salt://` files from `pkg` state are not included in salt\_state.tgz | refs: #23530
- a664a3c Merge pull request #23530 from dr4Ke/fix\_salt-ssh\_to\_include\_pkg\_sources
- 5df6a80 fix pylint warning
- d0549e5 salt-ssh state: fix including all salt:// references
- PR #23433: (*twangboy*) Obtain all software from the registry @ 2015-05-11T22:47:52Z
  - ISSUE #23004: (*b18*) 2014.7.5 - Windows - pkg.list\_pkgs - ``nxlog`` never shows up in output. | refs: #23433
  - 55c3869 Merge pull request #23433 from twangboy/list\_pkgs\_fix
  - 8ab5b1b Fix pylint error
  - 2d11d65 Obtain all software from the registry
- PR #23554: (*jleroy*) Debian: Hostname always updated @ 2015-05-11T21:57:00Z
  - 755bed0 Merge pull request #23554 from jleroy/debian-hostname-fix
  - 5ff749e Debian: Hostname always updated
- PR #23551: (*dr4Ke*) grains.append unit tests, related to #23474 @ 2015-05-11T21:54:25Z
  - 6ec87ce Merge pull request #23551 from dr4Ke/grains.append\_unit\_tests
  - ebf9df fix pylint errors
  - c495404 unit tests for grains.append module function
  - 0c9a323 use MagicMock
  - c838a22 unit tests for grains.append module function
- PR #23474: (*dr4Ke*) Fix grains.append in nested dictionary grains #23411 @ 2015-05-11T18:00:21Z
  - ISSUE #23411: (*dr4Ke*) grains.append should work at any level of a grain | refs: #23440
  - PR #23440: (*dr4Ke*) fix grains.append in nested dictionary grains #23411 | refs: #23474
  - e96c5c5 Merge pull request #23474 from dr4Ke/fix\_grains.append\_nested
  - a01a5bb grains.get, parameter delimititer, versionadded: 2014.7.6
  - b39f504 remove debugging output
  - b6e15e2 fix grains.append in nested dictionary grains #23411
- PR #23537: (*t0rrant*) Update changelog @ 2015-05-11T17:02:16Z
  - ab7e1ae Merge pull request #23537 from t0rrant/patch-1
  - 8e03cc9 Update changelog
- PR #23538: (*cro*) Update date in LICENSE file @ 2015-05-11T15:19:25Z
  - b79fed3 Merge pull request #23538 from cro/licupdate
  - 345efe2 Update date in LICENSE file
- PR #23505: (*aneeshusa*) Remove unused ssh config validator. Fixes #23159. @ 2015-05-09T13:24:15Z
  - ISSUE #23159: (*aneeshusa*) Unused validator
  - a123a36 Merge pull request #23505 from aneeshusa/remove-unused-ssh-config-validator
  - 90af167 Remove unused ssh config validator. Fixes #23159.

- **PR #23467:** (*slinu3d*) Added AWS v4 signature support @ 2015-05-08T14:36:19Z
  - **ISSUE #20518:** (*ekle*) module s3.get does not support eu-central-1 | refs: #23467
  - ca2c21a Merge pull request #23467 from slinu3d/2014.7
  - 0b4081d Fixed pylint error at line 363
  - 5be5eb5 Fixed pylink errors
  - e64f374 Fixed lint errors
  - b9d1ac4 Added AWS v4 signature support
- **PR #23444:** (*techhat*) Add create\_attach\_volume to nova driver @ 2015-05-07T19:51:32Z
  - e6f9eec Merge pull request #23444 from techhat/novacreateattach
  - ebdb7ea Add create\_attach\_volume to nova driver
- **PR #23460:** (*s0undt3ch*) [2014.7] Update to latest stable bootstrap script v2015.05.07 @ 2015-05-07T19:10:54Z
  - **ISSUE #563:** (*chutz*) pidfile support for minion and master daemons | refs: #23460
  - e331463 Merge pull request #23460 from s0undt3ch/hotfix/bootstrap-script-2014.7
  - edcd0c4 Update to latest stable bootstrap script v2015.05.07
- **PR #23439:** (*techhat*) Add wait\_for\_passwd\_maxtries variable @ 2015-05-07T07:28:56Z
  - 7a8ce1a Merge pull request #23439 from techhat/maxtries
  - 0ad3ff2 Add wait\_for\_passwd\_maxtries variable
- **PR #23422:** (*cro*) \$HOME should not be used, some shells don't set it. @ 2015-05-06T21:02:36Z
  - 644eb75 Merge pull request #23422 from cro/gce\_sh\_home
  - 4ef9e6b Don't use \$HOME to find user's directory, some shells don't set it
- **PR #23425:** (*basepi*) [2014.7] Fix typo in FunctionWrapper @ 2015-05-06T20:38:03Z
  - ef17ab4 Merge pull request #23425 from basepi/functionwrapper\_typo
  - c390737 Fix typo in FunctionWrapper
- **PR #23385:** (*rallytime*) Backport #23346 to 2014.7 @ 2015-05-06T20:12:29Z
  - **PR #23346:** (*ericfode*) Allow file\_map in salt-cloud to handle folders. | refs: #23385
  - 1b13ec0 Merge pull request #23385 from rallytime/bp-23346
  - 9efc13c more linting fixes
  - cf131c9 cleaned up some pylint errors
  - f981699 added logic to sftp\_file and file\_map to allow folder uploads using file\_map
- **PR #23414:** (*jfindlay*) 2015.2 -> 2015.5 @ 2015-05-06T20:04:02Z
  - f8c7a62 Merge pull request #23414 from jfindlay/update\_branch
  - 8074d16 2015.2 -> 2015.5
- **PR #23404:** (*hvnsweeting*) saltapi cherry-py: initialize var when POST body is empty @ 2015-05-06T17:35:56Z
  - 54b3bd4 Merge pull request #23404 from hvnsweeting/cherry-py-post-emptybody-fix
  - f85f8f9 initialize var when POST body is empty
- **PR #23409:** (*terminalmage*) Update Lithium docstrings in 2014.7 branch @ 2015-05-06T16:20:46Z

- 160f703 Merge pull request #23409 from terminalmage/update-lithium-docstrings-2014.7
- bc97d01 Fix sphinx typo
- 20006b0 Update Lithium docstrings in 2014.7 branch
- PR #23397: (*jfindlay*) add more flexible whitespace to locale\_gen search @ 2015-05-06T03:44:11Z
  - ISSUE #17245: (*tomashavlas*) localemod does not generate locale for Arch | refs: #23307 #23397
  - aa5fb0a Merge pull request #23397 from jfindlay/fix\_locale\_gen
  - 0941fef add more flexible whitespace to locale\_gen search
- PR #23368: (*kaithar*) Backport #23367 to 2014.7 @ 2015-05-05T21:42:26Z
  - PR #23367: (*kaithar*) Put the sed insert statement back in to the output. | refs: #23368
  - PR #18368: (*basepi*) Merge forward from 2014.7 to develop | refs: #23367 #23368
  - 0c76dd4 Merge pull request #23368 from kaithar/bp-23367
  - 577f419 Pylint fix
  - 8d9acd1 Put the sed insert statement back in to the output.
- PR #23350: (*loregordon*) Append/prepend: search for full line @ 2015-05-05T21:42:11Z
  - ISSUE #23294: (*variia*) file.replace fails to append if repl string partially available | refs: #23350
  - 3493cc1 Merge pull request #23350 from lorengordon/file.replace\_assume\_line
  - b60e224 Append/prepend: search for full line
- PR #23341: (*cachedout*) Fix syndic pid and logfile path @ 2015-05-05T21:29:10Z
  - ISSUE #23026: (*adelcast*) Incorrect salt-syndic logfile and pidfile locations | refs: #23341
  - 7be5c48 Merge pull request #23341 from cachedout/issue\_23026
  - e98e65e Fix tests
  - 6011b43 Fix syndic pid and logfile path
- PR #23272: (*basepi*) [2014.7] Allow salt-ssh minion config overrides via master config and roster | refs: #23347 @ \*\*
  - ISSUE #19114: (*pykler*) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
  - PR #23188: (*basepi*) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272
  - ea61abf Merge pull request #23272 from basepi/salt-ssh.minion.config.19114
  - c223309 Add versionadded
  - be7407f Lint
  - c2c3375 Missing comma
  - 8e3e8e0 Pass the minion\_opts through the FunctionWrapper
  - cb69cd0 Match the master config template in the master config reference
  - 87fc316 Add Salt-SSH section to master config template
  - 91dd9dc Add ssh\_minion\_opts to master config ref
  - c273ea1 Add minion config to salt-ssh doc
  - a0b6b76 Add minion\_opts to roster docs

- 5212c35 Accept minion\_opts from the target information
- e2099b6 Process ssh\_minion\_opts from master config
- 3b64214 Revert ``Work around bug in salt-ssh in config.get for gpg renderer''
- 494953a Remove the strip (embracing multi-line YAML dump)
- fe87f0f Dump multi-line yaml into the SHIM
- b751a72 Inject local minion config into shim if available
- PR #23347: (*basepi*) [2014.7] Salt-SSH Backport FunctionWrapper.\_\_contains\_\_ @ 2015-05-05T14:13:21Z
  - ISSUE #19114: (*pykler*) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347
  - PR #23272: (*basepi*) [2014.7] Allow salt-ssh minion config overrides via master config and roster | refs: #23347
  - PR #23188: (*basepi*) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272
  - 4f760dd Merge pull request #23347 from basepi/salt-ssh.functionwrapper.contains.19114
  - 30595e3 Backport FunctionWrapper.\_\_contains\_\_
- PR #23344: (*cachedout*) Explicitly set file\_client on master @ 2015-05-04T23:21:48Z
  - ISSUE #22742: (*hvnswearing*) salt-master says: ``This master address: `salt` was previously resolvable but now fails to resolve!'' | refs: #23344
  - 02658b1 Merge pull request #23344 from cachedout/issue\_22742
  - 5adc96c Explicitly set file\_client on master
- PR #23318: (*cellscape*) Honor seed argument in LXC container initializaton @ 2015-05-04T20:58:12Z
  - PR #23311: (*cellscape*) Fix new container initialization in LXC runner | refs: #23318
  - ba7605d Merge pull request #23318 from cellscape/honor-seed-argument
  - 228b1be Honor seed argument in LXC container initializaton
- PR #23307: (*jfindlay*) check for /etc/locale.gen @ 2015-05-04T20:56:32Z
  - ISSUE #17245: (*tomashavlas*) localemod does not generate locale for Arch | refs: #23307 #23397
  - 4ac4509 Merge pull request #23307 from jfindlay/fix\_locale\_gen
  - 101199a check for /etc/locale.gen
- PR #23324: (*s0undt3ch*) [2014.7] Update to the latest stable release of the bootstrap script v2015.05.04 @ 2015-05-04T16:28:30Z
  - ISSUE #580: (*thatch45*) recursive watch not being caught | refs: #23324
  - ISSUE #552: (*jhutchins*) Support require and watch under the same state dec | refs: #23324
  - PR #589: (*epoelke*) add --quiet and --outfile options to saltkey | refs: #23324
  - PR #567: (*bastichelaar*) Added upstart module | refs: #23324
  - PR #560: (*UtahDave*) The runas feature that was added in 93423aa2e5e4b7de6452090b0039560d2b13... | refs: #23324
  - PR #504: (*SEJeff*) File state goodies | refs: #23324
  - f790f42 Merge pull request #23324 from s0undt3ch/hotfix/bootstrap-script-2014.7
  - 6643e47 Update to the latest stable release of the bootstrap script v2015.05.04

- **PR #23329:** (*cro*) Require requests to verify cert when talking to aliyun and proxmox cloud providers @ 2015-05-04T16:18:17Z
  - 5487367 Merge pull request #23329 from cro/cloud\_verify\_cert
  - 860d4b7 Turn on ssl verify for requests.
- **PR #23311:** (*cellscape*) Fix new container initialization in LXC runner | refs: #23318 @ 2015-05-04T09:55:29Z
  - ea20176 Merge pull request #23311 from cellscape/fix-salt-cloud-lxc-init
  - 76fbb34 Fix new container initialization in LXC runner
- **PR #23298:** (*chris-prince*) Fixed issue #18880 in 2014.7 branch @ 2015-05-03T15:49:41Z
  - **ISSUE #18880:** (*johtso*) npm installed breaks when a module is missing
  - c399b8f Merge pull request #23298 from chris-prince/2014.7
  - 0fa25db Fixed issue #18880 in 2014.7 branch
- **PR #23292:** (*rallytime*) Merge #23151 with pylint fixes @ 2015-05-02T03:54:12Z
  - **ISSUE #23148:** (*cr1st1p*) virt - error handling bogus if machine image location is wrong
  - **PR #23151:** (*cr1st1p*) Fixes #23148 | refs: #23292
  - 16ecefcd Merge pull request #23292 from rallytime/merge-23151
  - 8ff852a Merge #23151 with pylint fixes
  - 8ffa12e Fixes #23148
- **PR #23274:** (*basepi*) [2014.7] Reduce salt-ssh debug log verbosity @ 2015-05-01T20:19:23Z
  - ce24315 Merge pull request #23274 from basepi/salt-ssh.debug.verbosity
  - ecee6c6 Log stdout and stderr to trace
  - 08f54d7 Log stdout and stderr to trace as well
  - 9b9c30f Reduce salt-ssh debug log verbosity
- **PR #23261:** (*rallytime*) Fix tornado websocket event handler registration @ 2015-05-01T18:20:31Z
  - **ISSUE #22605:** (*mavenAtHouzz*) Tornado websockets event Handlers registration are incorrect | refs: #23261
  - 7b55e43 Merge pull request #23261 from rallytime/fix-22605
  - 4950fbf Fix tornado websocket event handler registration
- **PR #23258:** (*teizz*) TCP keepalives on the ret side, Revisited. @ 2015-05-01T16:13:49Z
  - 83ef7cb Merge pull request #23258 from teizz/i»;ret\_keepalive\_2014\_7\_5
  - 0b9fb6f The fixes by i»;cachedout which were backported into 2015\_2 were missing a single parameter thus not setting up the TCP keepalive for the ZeroMQ Channel by default.
- **PR #23241:** (*techhat*) Move iptables log options after the jump @ 2015-05-01T01:31:59Z
  - **ISSUE #23224:** (*twellspring*) iptables.append --log parameters must be after --jump LOG | refs: #23241
  - 8de3c83 Merge pull request #23241 from techhat/issue23224
  - 87f7948 Move iptables log options after the jump
- **PR #23228:** (*rallytime*) Backport #23171 to 2014.7 @ 2015-04-30T21:09:45Z
  - **PR #23171:** (*skizunov*) Bugfix: `clean\_proc\_dir` is broken | refs: #23228

- f20210e Merge pull request #23228 from rallytime/bp-23171
- e670e99 Bugfix: `clean\_proc\_dir` is broken
- PR #23227: (*rallytime*) Backport #22808 to 2014.7 @ 2015-04-30T21:09:14Z
  - ISSUE #22703: (*Xiol*) salt-ssh does not work with list matcher | refs: #22808
  - PR #22808: (*basepi*) [2015.2] Add list targeting to salt-ssh flat roster | refs: #23227
  - 721cc28 Merge pull request #23227 from rallytime/bp-22808
  - d208a00 Dict, not list
  - a3f529e It's already been converted to a list
  - dd57f2d Add list targeting to salt-ssh flat roster
- PR #22823: (*hvnsweeting*) 22822 file directory clean @ 2015-04-30T15:25:51Z
  - 82c22af Merge pull request #22823 from hvnsweeting/22822-file-directory-clean
  - c749c27 fix lint - remove unnecessary parenthesis
  - cb3dfec refactor
  - 8924b5a refactor: use relpath instead of do it manually
  - d3060a5 refactor
  - 5759a0e bugfix: fix file.directory clean=True when it require parent dir
- PR #22977: (*bersace*) Fix fileserver backends \_\_opts\_\_ overwritten by \_pillar @ 2015-04-30T15:24:56Z
  - ISSUE #22941: (*bersace*) \_pillar func breaks fileserver globals | refs: #22977 #22942
  - PR #22942: (*bersace*) Fix fileserver backends global overwritten by \_pillar | refs: #22977
  - f6c0728 Merge pull request #22977 from bersace/fix-fileserver-backends-pillar-side-effect
  - 5f451f6 Fix fileserver backends \_\_opts\_\_ overwritten by \_pillar
- PR #23180: (*jfindlay*) fix typos from 36841bdd in masterapi.py @ 2015-04-30T15:22:41Z
  - ISSUE #23166: (*claudiupopescu*) ``Error in function \_minion\_event" resulting in modules not loaded | refs: #23180
  - 34206f7 Merge pull request #23180 from jfindlay/remote\_event
  - 72066e1 fix typos from 36841bdd in masterapi.py
- PR #23176: (*jfindlay*) copy standard cmd.run\* kwargs into cmd.run\_chroot @ 2015-04-30T15:22:12Z
  - ISSUE #23153: (*cr1st1p*) cmdmod : run\_chroot - broken in 2014.7.5 - missing kwargs | refs: #23176
  - b6b8216 Merge pull request #23176 from jfindlay/run\_chroot
  - 7dc3417 copy standard cmd.run\* kwargs into cmd.run\_chroot
- PR #23193: (*joejulian*) supervisord.mod\_watch should accept sfun @ 2015-04-30T04:34:21Z
  - ISSUE #23192: (*joejulian*) supervisord mod\_watch does not accept sfun | refs: #23193
  - effacbe Merge pull request #23193 from joejulian/2014.7\_supervisord\_accept\_sfun
  - efb59f9 supervisord.mod\_watch should accept sfun
- PR #23188: (*basepi*) [2014.7] Work around bug in salt-ssh in config.get for gpg renderer | refs: #23272 @ 2015-04-30T04:34:10Z
  - ISSUE #19114: (*pykler*) salt-ssh and gpg pillar renderer | refs: #23188 #23272 #23347

- 72fe88e Merge pull request #23188 from basepi/salt-ssh.function.wrapper.gpg.19114
- d73979e Work around bug in salt-ssh in config.get for gpg renderer
- PR #23154: (*cachedout*) Re-establish channel on interruption in fileclient @ 2015-04-29T16:18:59Z
  - ISSUE #21480: (*msciciel*) TypeError: string indices must be integers, not str | refs: #23154
  - 168508e Merge pull request #23154 from cachedout/refresh\_channel
  - 9f8dd80 Re-establish channel on interruption in fileclient
- PR #23146: (*rallytime*) Backport #20779 to 2014.7 @ 2015-04-28T20:45:06Z
  - ISSUE #20647: (*ryan-lane*) file.serialize fails to serialize due to ordered dicts | refs: #20779
  - PR #20779: (*cachedout*) Use declared yaml options | refs: #23146
  - 3b53e04 Merge pull request #23146 from rallytime/bp-20779
  - ffd1849 compare OrderedDicts in serializer unit test
  - a221706 Just change serialize
  - a111798 Use declared yaml options
- PR #23145: (*rallytime*) Backport #23089 to 2014.7 @ 2015-04-28T20:44:56Z
  - PR #23089: (*cachedout*) Stringify version number before lstrip | refs: #23145
  - 8bb4664 Merge pull request #23145 from rallytime/bp-23089
  - 93c41af Stringify version number before lstrip
- PR #23144: (*rallytime*) Backport #23124 to 2014.7 @ 2015-04-28T20:44:46Z
  - ISSUE #16188: (*drawks*) salt.modules.parted has various functions with bogus input validation. | refs: #23124
  - PR #23124: (*ether42*) fix parsing the output of parted in parted.list\_() | refs: #23144
  - c85d36f Merge pull request #23144 from rallytime/bp-23124-2014-7
  - 6b64da7 fix parsing the output of parted
- PR #23120: (*terminalmage*) Don't run os.path.relpath() if repo doesn't have a ``root" param set @ 2015-04-28T15:46:54Z
  - a27b158 Merge pull request #23120 from terminalmage/fix-gitfs-relpath
  - 1860fff Don't run os.path.relpath() if repo doesn't have a ``root" param set
- PR #23132: (*clinta*) Backport b27c176 @ 2015-04-28T15:00:30Z
  - fcba607 Merge pull request #23132 from clinta/patch-2
  - a824d72 Backport b27c176
- PR #23114: (*rallytime*) Adjust ZeroMQ 4 docs to reflect changes to Ubuntu 12 packages @ 2015-04-28T03:59:24Z
  - ISSUE #18476: (*Auha*) Upgrading salt on my master caused dependency issues | refs: #23114 #18610
  - PR #18610: (*rallytime*) Make ZMQ 4 installation docs for ubuntu more clear | refs: #23114
  - b0f4b28 Merge pull request #23114 from rallytime/remove\_ubuntu\_zmq4\_docs
  - f6cc7c8 Adjust ZeroMQ 4 docs to reflect changes to Ubuntu 12 packages
- PR #23108: (*rallytime*) Backport #23097 to 2014.7 @ 2015-04-28T03:58:05Z
  - ISSUE #23085: (*xenophonf*) Use ``s3fs" (not ``s3") in fileserver\_roots | refs: #23097

- PR #23097: (*rallytime*) Change s3 to s3fs in fileserver\_roots docs example | refs: #23108
- 399857f Merge pull request #23108 from rallytime/bp-23097
- fa88984 Change s3 to s3fs in fileserver\_roots docs example
- PR #23112: (*basepi*) [2014.7] Backport #22199 to fix mysql returner save\_load errors @ 2015-04-28T03:55:44Z
  - ISSUE #22171: (*basepi*) We should only call returner.save\_load once per jid | refs: #22199
  - PR #22199: (*basepi*) [2015.2] Put a bandaid on the save\_load duplicate issue (mysql returner) | refs: #23112
  - 5541537 Merge pull request #23112 from basepi/mysql\_returner\_save\_load
  - 0127012 Put a bandaid on the save\_load duplicate issue
- PR #23113: (*rallytime*) Revert ``Backport #22895 to 2014.7" @ 2015-04-28T03:27:29Z
  - PR #22925: (*rallytime*) Backport #22895 to 2014.7 | refs: #23113
  - PR #22895: (*aletourneau*) pam\_tally counter was not reset to 0 after a succesfull login | refs: #22925
  - dfe2066 Merge pull request #23113 from saltstack/revert-22925-bp-22895
  - b957ea8 Revert ``Backport #22895 to 2014.7"
- PR #23094: (*terminalmage*) pygit2: disable cleaning of stale refs for authenticated remotes @ 2015-04-27T20:51:28Z
  - ISSUE #23013: (*markusr815*) gitfs regression with authenticated repos | refs: #23094
  - 21515f3 Merge pull request #23094 from terminalmage/issue23013
  - aaf7b04 pygit2: disable cleaning of stale refs for authenticated remotes
- PR #23048: (*jfindlay*) py-2.6 compat for utils/boto.py ElementTree exception @ 2015-04-25T16:56:45Z
  - d45aa21 Merge pull request #23048 from jfindlay/ET\_error
  - 64c42cc py-2.6 compat for utils/boto.py ElementTree exception
- PR #23025: (*jfindlay*) catch exceptions on bad system locales/encodings @ 2015-04-25T16:56:30Z
  - ISSUE #22981: (*syphernl*) Locale state throwing traceback when generating not (yet) existing locale | refs: #23025
  - d25a5c1 Merge pull request #23025 from jfindlay/fix\_sys\_locale
  - 9c4d62b catch exceptions on bad system locales/encodings
- PR #22932: (*hvnsweeting*) bugfix: also manipulate dir\_mode when source not defined @ 2015-04-25T16:54:58Z
  - 5e44b59 Merge pull request #22932 from hvnsweeting/file-append-bugfix
  - 3f368de do not use assert in execution module
  - 9d4fd4a bugfix: also manipulate dir\_mode when source not defined
- PR #23055: (*jfindlay*) prevent ps module errors on accessing dead procs @ 2015-04-24T22:39:49Z
  - ISSUE #23021: (*ether42*) ps.pgrep raises NoSuchProcess | refs: #23055
  - c2416a4 Merge pull request #23055 from jfindlay/fix\_ps
  - c2dc7ad prevent ps module errors on accessing dead procs
- PR #23031: (*jfindlay*) convert exception e.message to just e @ 2015-04-24T18:38:13Z
  - bfd9158 Merge pull request #23031 from jfindlay/exception
  - 856bad1 convert exception e.message to just e

- **PR #23015:** (*hvnsweeting*) if status of service is stop, there is not an error with it @ 2015-04-24T14:35:10Z
  - 7747f33 Merge pull request #23015 from hvnsweeting/set-non-error-lvl-for-service-status-log
  - 92ea163 if status of service is stop, there is not an error with it
- **PR #23000:** (*jfindlay*) set systemd service killMode to process for minion @ 2015-04-24T03:42:39Z
  - **ISSUE #22993:** (*jetpak*) salt-minion restart causes all spawned daemons to die on centos7 (systemd) | refs: #23000
  - 2e09789 Merge pull request #23000 from jfindlay/systemd\_kill
  - 3d575e2 set systemd service killMode to process for minion
- **PR #22999:** (*jtand*) Added retry\_dns to minion doc. @ 2015-04-24T03:30:24Z
  - **ISSUE #22707:** (*arthurlogilab*) retry\_dns of master configuration is missing from the documentation | refs: #22999
  - b5c059a Merge pull request #22999 from jtand/fix\_22707
  - 8486e17 Added retry\_dns to minion doc.
- **PR #22990:** (*techhat*) Use the proper cloud conf variable @ 2015-04-23T17:48:07Z
  - 27dc877 Merge pull request #22990 from techhat/2014.7
  - d33bcbc Use the proper cloud conf variable
- **PR #22976:** (*multani*) Improve state\_output documentation @ 2015-04-23T12:24:22Z
  - 13dff65 Merge pull request #22976 from multani/fix/state-output-doc
  - 19efd41 Improve state\_output documentation
- **PR #22955:** (*terminalmage*) Fix regression introduced yesterday in dockerio module @ 2015-04-22T18:56:39Z
  - 89fa185 Merge pull request #22955 from terminalmage/dockerio-run-fix
  - b4472ad Fix regression introduced yesterday in dockerio module
- **PR #22954:** (*rallytime*) Backport #22909 to 2014.7 @ 2015-04-22T18:56:20Z
  - **PR #22909:** (*mguegan*) Fix compatibility with pkgin > 0.7 | refs: #22954
  - 46ef227 Merge pull request #22954 from rallytime/bp-22909
  - 70c1cd3 Fix compatibility with pkgin > 0.7
- **PR #22856:** (*jfindlay*) increase timeout and decrease tries for route53 records @ 2015-04-22T16:47:01Z
  - **ISSUE #18720:** (*Reiner030*) timeouts when setting Route53 records | refs: #22856
  - c9ae593 Merge pull request #22856 from jfindlay/route53\_timeout
  - ba4a786 add route53 record sync wait, default=False
  - ea2fd50 increase timeout and tries for route53 records
- **PR #22946:** (*s0undt3ch*) Test with a more recent pip version to avoid a traceback @ 2015-04-22T16:25:17Z
  - a178d44 Merge pull request #22946 from s0undt3ch/2014.7
  - bc87749 Test with a more recent pip version to avoid a traceback
- **PR #22945:** (*garethgreenaway*) Fixes to scheduler @ 2015-04-22T16:25:00Z
  - **ISSUE #22571:** (*BoomerB*) same error message as on issue #18504 | refs: #22945
  - de339be Merge pull request #22945 from garethgreenaway/22571\_2014\_7\_schedule\_pillar\_refresh\_seconds\_exceptions

- bfa6d25 Fixing a reported issue when using a scheduled job from pillar with splay. `_seconds` element that acted as a backup of the actual seconds was being removed when pillar was refreshed and causing exceptions. This fix moves some splay related code out of the if else condition so it's checked whether the job is in the job queue or not.
- **PR #22887:** (*hvnsweeting*) fix #18843 @ 2015-04-22T15:47:05Z
  - **ISSUE #18843:** (*calvinhp*) State `user.present` will fail to create home if user exists and `homedir` doesn't
  - 12d2b91 Merge pull request #22887 from hvnsweeting/18843-fix-user-present-home
  - 7fe7b08 run `user.chhome` once to avoid any side-effect when run it twice
  - 19de995 clarify the usage of `home` arg
  - d6dc09a enhance doc, as `usermod` on ubuntu 12.04 will not CREATE home
  - 0ce4d7f refactor: force to use boolean
  - 849d19e log debug the creating dir process
  - c4e95b9 fix #18843: `usermod` won't create a dir if old home does not exist
- **PR #22930:** (*jfindlay*) `localemod.gen_locale` now always returns a boolean @ 2015-04-22T15:37:39Z
  - **ISSUE #21140:** (*holms*) `locale.present` state executed successfully, although originally fails | refs: #22930 #22829
  - **ISSUE #2417:** (*ffa*) Module standards | refs: #22829
  - **PR #22829:** (*F30*) Always return a boolean in `gen_locale()` | refs: #22930
  - b7de7bd Merge pull request #22930 from jfindlay/localegen\_bool
  - 399399f `localemod.gen_locale` now always returns a boolean
- **PR #22933:** (*hvnsweeting*) add test for #18843 @ 2015-04-22T15:27:18Z
  - **ISSUE #18843:** (*calvinhp*) State `user.present` will fail to create home if user exists and `homedir` doesn't
  - 11bcf14 Merge pull request #22933 from hvnsweeting/18843-test
  - b13db32 add test for #18843
- **PR #22925:** (*rallytime*) Backport #22895 to 2014.7 | refs: #23113 @ 2015-04-22T02:30:26Z
  - **PR #22895:** (*aletourneau*) `pam_tally` counter was not reset to 0 after a succesfull login | refs: #22925
  - 6890752 Merge pull request #22925 from rallytime/bp-22895
  - 3852d96 Pylint fix
  - 90f7829 Fixed pylint issues
  - 5ebf159 Cleaned up pull request
  - a08ac47 `pam_tally` counter was not reset to 0 after a succesfull login
- **PR #22914:** (*cachedout*) Call proper returner function in `jobs.list_jobs` @ 2015-04-22T00:49:01Z
  - **ISSUE #22790:** (*whiteinge*) `jobs.list_jobs` runner tracebacks on `'missing'` argument | refs: #22914
  - eca37eb Merge pull request #22914 from cachedout/issue\_22790
  - d828d6f Call proper returner function in `jobs.list_jobs`
- **PR #22918:** (*JaseFace*) Add a note to the `git_pillar` docs stating that `GitPython` is the only currently supported provider @ 2015-04-22T00:48:26Z
  - 44f3409 Merge pull request #22918 from JaseFace/git-pillar-provider-doc-note

- 0aee5c2 Add a note to the git\_pillar docs stating that GitPython is the only currently supported provider
- PR #22907: (*techhat*) Properly merge cloud configs to create profiles @ 2015-04-21T22:02:44Z
  - 31c461f Merge pull request #22907 from techhat/cloudconfig
  - 3bf4e66 Properly merge cloud configs to create profiles
- PR #22894: (*0xf10e*) Fix issue #22782 @ 2015-04-21T18:55:18Z
  - f093975 Merge pull request #22894 from 0xf10e/2014.7
  - 58fa24c Clarify doc on kwarg `roles' for user\_present().
  - f0ae2eb Improve readability by renaming tenant\_role
- PR #22902: (*rallytime*) Change state example to use proper kwarg @ 2015-04-21T18:50:47Z
  - ISSUE #12003: (*MarkusMuellerAU*) [state.dockerio] docker.run TypeError: run() argument after \*\* must be a mapping, not str | refs: #22902
  - c802ba7 Merge pull request #22902 from rallytime/docker\_doc\_fix
  - 8f70346 Change state example to use proper kwarg
- PR #22898: (*terminalmage*) dockerio: better error message for native exec driver @ 2015-04-21T18:02:58Z
  - 81771a7 Merge pull request #22898 from terminalmage/issue12003
  - c375309 dockerio: better error message for native exec driver
- PR #22897: (*rallytime*) Add param documentation for file.replace state @ 2015-04-21T17:31:04Z
  - ISSUE #22825: (*paolodina*) Issue using file.replace in state file | refs: #22897
  - e2ec4ec Merge pull request #22897 from rallytime/fix-22825
  - 9c51630 Add param documentation for file.replace state
- PR #22850: (*bersace*) Fix pillar and salt fileserver mixed @ 2015-04-21T17:04:33Z
  - ISSUE #22844: (*bersace*) LocalClient file cache confuse pillar and state files | refs: #22850
  - fd53889 Merge pull request #22850 from bersace/fix-pillar-salt-mixed
  - 31b98e7 Initialize state file client after pillar loading
  - f6bebb7 Use saltenv
- PR #22818: (*twangboy*) Added documentation regarding pip in windows @ 2015-04-21T03:58:59Z
  - 1380fec Merge pull request #22818 from twangboy/upd\_pip\_docs
  - cb999c7 Update pip.py
  - 3cc5c97 Added documentation regarding pip in windows

  - 20d3f2b Merge pull request #22760 from thatch45/syndic\_fix
  - e2db624 Fix issues with the syndic not resolving the master when the interface is set
- PR #22762: (*twangboy*) Fixed version not showing in Add/Remove Programs @ 2015-04-17T04:29:46Z
  - 54c4584 Merge pull request #22762 from twangboy/fix\_installer
  - 4d25af8 Fixed version not showing in Add/Remove Programs

### 37.2.29 Salt 2014.7.8 Release Notes

#### Changes for v2014.7.7..v2014.7.8

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-03-11T21:18:48Z

Statistics:

- Total Merges: 7
- Total Issue references: 3
- Total PR references: 10

Changes:

- PR #28839: (*cachedout*) Revert #28740 @ 2015-11-12T22:54:28Z
  - PR #28740: (*MasterNayru*) Add missing S3 module import | refs: #28777
  - 4b8bdd0 Merge pull request #28839 from cachedout/revert\_28740
  - 215b26c Revert #28740

- **PR #28777:** (*rallytime*) Back-port #28740 to 2014.7 @ 2015-11-11T18:00:00Z
  - **PR #28740:** (*MasterNayru*) Add missing S3 module import | refs: #28777
  - 76e69b4 Merge pull request #28777 from rallytime/bp-28740-2014.7
  - da5fac2 Back-port #28740 to 2014.7
- **PR #28716:** (*rallytime*) Back-port #28705 to 2014.7 @ 2015-11-10T16:15:03Z
  - **PR #28705:** (*cachedout*) Account for new headers class in tornado 4.3 | refs: #28716
  - 45c73eb Merge pull request #28716 from rallytime/bp-28705
  - 32e7bd3 Account for new headers class in tornado 4.3
- **PR #28717:** (*cachedout*) Add note about recommended umask @ 2015-11-09T23:26:20Z
  - **ISSUE #28199:** (*felskrone*) Non-standard umasks might break the master | refs: #28717
  - f4fe921 Merge pull request #28717 from cachedout/umask\_note
  - 1874300 Add note about recommended umask
- **PR #28461:** (*cachedout*) Wrap all cache calls in state.sls in correct umask @ 2015-11-02T17:11:02Z
  - **ISSUE #28455:** (*zmalone*) highstate.cache is world readable, and contains secrets | refs: #28461
  - 4bf56ca Merge pull request #28461 from cachedout/issue\_28455
  - 097838e Wrap all cache calls in state.sls in correct umask
- **PR #28407:** (*DmitryKuzmenko*) Don't request creds if auth with key. @ 2015-10-29T16:12:30Z
  - **ISSUE #24910:** (*bocig*) -T, --make-token flag does NOT work- LDAP Groups | refs: #28407
  - f3e61db Merge pull request #28407 from DSRCCompany/issues/24910\_token\_auth\_fix\_2014
  - b7b5bec Don't request creds if auth with key.
- **PR #27390:** (*JaseFace*) Ensure we pass on the enable setting if present, or use the default of True if not in build\_schedule\_item() @ 2015-10-05T18:09:33Z
  - d284eb1 Merge pull request #27390 from JaseFace/schedule-missing-enabled
  - 563db71 Ensure we pass on the enable setting if present, or use the default of True if not in build\_schedule\_item() Prior to this, when schedule.present compares the existing schedule to the one crafted by this function, enabled will actually be removed at each run. schedule.present sees a modification needs to be made, and invokes schedule.modify, which does so with enabled: True, creating and endless loop of an `enabled` removal and addition.

### 37.2.30 Salt 2014.7.9 Release Notes

#### Changes for v2014.7.8..v2014.7.9

Extended changelog courtesy of Todd Stansell (<https://github.com/tjstansell/salt-changelogs>):

Generated at: 2016-03-11T20:58:58Z

Statistics:

  - c5e7c03 Merge pull request #31826 from gtmanfred/2014.7
  - d73f70e Remove ability of authenticating user to specify pam service
- **PR #29392:** (*jacobhammons*) updated version number to not reference a specific build from the lat... @ 2015-12-03T15:54:31Z
  - 85aa70a Merge pull request #29392 from jacobhammons/2014.7
  - d7f0db1 updated version number to not reference a specific build from the latest branch
- **PR #29296:** (*douardda*) Use process KillMode on Debian systems also @ 2015-12-01T16:00:16Z
  - **ISSUE #29295:** (*douardda*) systemd's service file should use the `process` KillMode option on Debian also | refs: #29296
  - d2fb210 Merge pull request #29296 from douardda/patch-3
  - d288539 Use process KillMode on Debian systems also

### 37.2.31 Salt 2014.1.0 Release Notes - Codename Hydrogen

---

**Note:** Due to a change in master to minion communication, 2014.1.0 minions are not compatible with older-version masters. Please upgrade masters first. More info on backwards-compatibility policy [here](#), under the ``Upgrading Salt'' subheading.

---

**Note:** A change in the grammar in the state compiler makes `module.run` in requisites illegal syntax. Its use is replaced simply with the word `module`. In other words you will need to change requisites like this:

```
require:
  module.run: some_module_name
```

to:

```
require:
  module: some_module_name
```

This is a breaking change. We apologize for the inconvenience, we needed to do this to remove some ambiguity in parsing requisites.

---

**release** 2014-02-24

The 2014.1.0 release of Salt is a major release which not only increases stability but also brings new capabilities in virtualization, cloud integration, and more. This release brings a great focus on the expansion of testing making roughly double the coverage in the Salt tests, and comes with many new features.

2014.1.0 is the first release to follow the new date-based release naming system. See the `version numbers` page for more details.

## Major Features

### Salt Cloud Merged into Salt

Salt Cloud is a tool for provisioning salted minions across various cloud providers. Prior to this release, Salt Cloud was a separate project but this marks its full integration with the Salt distribution. A Getting Started guide and additional documentation for Salt Cloud can be found [here](#):

### Google Compute Engine

Alongside Salt Cloud comes new support for the Google Compute Engine. Salt Stack can now deploy and control GCE virtual machines and the application stacks that they run.

For more information on Salt Stack and GCE, please see [this blog post](#).

Documentation for Salt and GCE can be found [here](#).

### Salt Virt

Salt Virt is a cloud controller that supports virtual machine deployment, inspection, migration, and integration with many aspects of Salt.

Salt Virt has undergone a major overhaul with this release and now supports many more features and includes a number of critical improvements.

### Docker Integration

Salt now ships with *states* and an *execution module* to manage Docker containers.

### Substantial Testing Expansion

Salt continues to increase its unit/regression test coverage. This release includes over 300 new tests.

### BSD Package Management

BSD package management has been entirely rewritten. FreeBSD 9 and older now default to using `pkg_add`, while FreeBSD 10 and newer will use `pkgng`. FreeBSD 9 can be forced to use `pkgng`, however, by specifying the following option in the minion config file:

```
providers:
  pkg: pkgng
```

In addition, support for installing software from the ports tree has been added. See the documentation for the *state* and *execution module* for more information.

### Network Management for Debian/Ubuntu

Initial support for management of network interfaces on Debian-based distros has been added. See the documentation for the *network state* and the *debian\_ip* for more information.

### IPv6 Support for iptables State/Module

The iptables *state* and *module* now have IPv6 support. A new parameter family has been added to the states and execution functions, to distinguish between IPv4 and IPv6. The default value for this parameter is `ipv4`, specifying `ipv6` will use `ip6tables` to manage firewall rules.

### GitFS Improvements

Several performance improvements have been made to the *Git filesERVER backend*. Additionally, file states can now use any any SHA1 commit hash as a filesERVER environment:

```
/etc/httpd/httpd.conf:
  file.managed:
    - source: salt://webserver/files/httpd.conf
    - saltenv: 45af879
```

This applies to the functions in the *cp module* as well:

```
salt '*' cp.get_file salt://readme.txt /tmp/readme.txt saltenv=45af879
```

### MinionFS

This new filesERVER backend allows files which have been pushed from the minion to the master (using *cp.push*) to be served up from the salt filesERVER. The path for these files takes the following format:

```
salt://minion-id/path/to/file
```

`minion-id` is the id of the ``source" minion, the one from which the files were pushed to the master. `/path/to/file` is the full path of the file.

The [MinionFS Walkthrough](#) contains a more thorough example of how to use this backend.

### saltenv

To distinguish between filesERVER environments and execution functions which deal with environment variables, filesERVER environments are now specified using the `saltenv` parameter. `env` will continue to work, but is deprecated and will be removed in a future release.

### Grains Caching

A caching layer has been added to the Grains system, which can help speed up minion startup. Disabled by default, it can be enabled by setting the minion config option `grains_cache`:

```
grains_cache: True

# Seconds before grains cache is considered to be stale.
grains_cache_expiration: 300
```

If set to `True`, the grains loader will read from/write to a msgpack-serialized file containing the grains data.

Additional command-line parameters have been added to salt-call, mainly for testing purposes:

- `--skip-grains` will completely bypass the grains loader when salt-call is invoked.
- `--refresh-grains-cache` will force the grains loader to bypass the grains cache and refresh the grains, writing a new grains cache file.

### Improved Command Logging Control

When using the `cmd module`, either on the CLI or when developing Salt execution modules, a new keyword argument `output_loglevel` allows for greater control over how (or even if) the command and its output are logged. For example:

```
salt '*' cmd.run 'tail /var/log/messages' output_loglevel=debug
```

The package management modules (`apt`, `yumpkg`, etc.) have been updated to log the copious output generated from these commands at loglevel debug.

---

**Note:** To keep a command from being logged, `output_loglevel=quiet` can be used.

Prior to this release, this could be done using `quiet=True`. This argument is still supported, but will be removed in a future Salt release.

---

### PagerDuty Support

Initial support for firing events via `PagerDuty` has been added. See the documentation for the `pagerduty` module.

### Virtual Terminal

Sometimes the subprocess module is not good enough, and, in fact, not even `askpass` is. This virtual terminal is still in it's infant childhood, needs quite some love, and was originally created to replace `askpass`, but, while developing it, it immediately proved that it could do so much more. It's currently used by salt-cloud when bootstrapping salt on clouds which require the use of a password.

### Proxy Minions

Initial basic support for Proxy Minions is in this release. Documentation can be found [here](#).

Proxy minions are a developing feature in Salt that enables control of devices that cannot run a minion. Examples include network gear like switches and routers that run a proprietary OS but offer an API, or "dumb" devices that just don't have the horsepower or ability to handle a Python VM.

Proxy minions can be difficult to write, so a simple REST-based example proxy is included. A Python bottle-based webservice can be found at <https://github.com/cro/salt-proxy-rest> as an endpoint for this proxy.

This is an ALPHA-quality feature. There are a number of issues with it currently, mostly centering around process control, logging, and inability to work in a masterless configuration.

### Additional Bugfixes (Release Candidate Period)

Below are many of the fixes that were implemented in salt during the release candidate phase.

- Fix `mount.mounted` leaving conflicting entries in `fstab` ([issue 7079](#))

- Fix mysql returner serialization to use json ([issue 9590](#))
- Fix ZMQError: Operation cannot be accomplished in current state errors ([issue 6306](#))
- Rbenv and ruby improvements
- Fix quoting issues with mysql port ([issue 9568](#))
- Update mount module/state to support multiple swap partitions ([issue 9520](#))
- Fix archive state to work with bsdtar
- Clarify logs for minion ID caching
- Add numeric revision support to git state ([issue 9718](#))
- Update master\_uri with master\_ip ([issue 9694](#))
- Add comment to Debian mod\_repo ([issue 9923](#))
- Fix potential undefined loop variable in rabbitmq state ([issue 8703](#))
- Fix for salt-virt runner to delete key on VM deletion
- Fix for salt-run -d to limit results to specific runner or function ([issue 9975](#))
- Add tracebacks to jinja renderer when applicable ([issue 10010](#))
- Fix parsing in monit module ([issue 10041](#))
- Fix highstate output from syndic minions ([issue 9732](#))
- Quiet logging when dealing with passwords/hashes ([issue 10000](#))
- Fix for multiple remotes in git\_pillar ([issue 9932](#))
- Fix npm installed command ([issue 10109](#))
- Add safeguards for utf8 errors in zcbuildout module
- Fix compound commands ([issue 9746](#))
- Add systemd notification when master is started
- Many doc improvements

### 37.2.32 Salt 2014.1.1 Release Notes

release 2014-03-18

Version 2014.1.1 is a bugfix release for 2014.1.0. The changes include:

- Various doc fixes, including up-to-date Salt Cloud installation documentation.
- Renamed state.sls runner to state.orchestrate, to reduce confusion with the `state.sls` execution function
- Fix various bugs in the dig module ([issue 10367](#))
- Add retry for query on certain EC2 status codes ([issue 10154](#))
- Fix various bugs in mongodb\_user state module ([issue 10430](#))
- Fix permissions on `~/ .salt_token` ([issue 10422](#))
- Add PyObjects support
- Fix launchctl module crash with missing files
- Fix `saltutil.find_job` for Windows ([issue 10581](#))

- Fix OS detection for OpenSolaris ([issue 10601](#))
- Fix broken salt-ssh key\_deploy
- Add support for multiline cron comments ([issue 10721](#))
- Fix timezone module for Arch ([issue 10789](#))
- Fix symlink support for `file.recurse` ([issue 10809](#))
- Fix multi-master bugs ([issue 10732](#) and [issue 10969](#))
- Fix `file.patch` to error when source file is unavailable ([issue 10380](#))
- Fix pkg to handle packages set as purge in `pkg.installed` ([issue 10719](#))
- Add `zmqversion` grain
- Fix highstate summary for masterless minions ([issue 10945](#))
- Fix `saltutil.find_job` for 2014.1 masters talking to 0.17 minions ([issue 11020](#))
- Fix `file.recurse` states with trailing slashes in source ([issue 11002](#))
- Fix `pkg.states` to allow `pkghname.x86_64` ([issue 7306](#))
- Make `iptables.states` set a default table for flush ([issue 11037](#))
- Added `iptables --reject-with` after final `iptables` call in `iptables.states` ([issue:10757](#))
- Fix improper passing of “family” in `iptables.states` ([issue 10774](#))
- Fix traceback in `iptables.insert` states ([issue 10988](#))
- Fix zombie processes ([issue 10867](#) and others)
- Fix batch mode to obey `--return` settings ([issue 9146](#))
- Fix localclient issue that was causing batch mode breakage ([issue 11094](#), [issue 10470](#), and others)
- Multiple salt-ssh fixes
- FreeBSD: look in `/usr/local/etc/salt` for configuration by default, if installed using `pip --editable`.
- Add a `skip_suggestions` parameter to `pkg.installed` states which allows pre-flight check to be skipped ([issue 11106](#))
- Fixed tag-based gitfs fileserver environments regression ([issue 10956](#))
- Yum: fix cache of available pkgs not cleared when repos are changed ([issue 11001](#))
- Yum: fix for plugin-provided repositories (i.e. RHN/Spacewalk) ([issue 11145](#))
- Fix regression in `chocolatey.bootstrap` ([issue 10541](#))
- Fix fail on unknown target in `jobs.runner` ([issue 11151](#))
- Don't log errors for commands which are expected to sometimes exit with non-zero exit status ([issue 11154](#), [issue 11090](#))
- Fix `test=True` CLI override of config option ([issue 10877](#))
- Log `sysctl` key listing at loglevel TRACE ([issue 10931](#))

### 37.2.33 Salt 2014.1.10 Release Notes

release 2014-08-01

---

**Note:** Version 2014.1.9 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.9.

---

Version 2014.1.10 is another bugfix release for 2014.1.0. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

Salt 2014.1.10 fixes security issues documented by CVE-2014-3563: ``Insecure tmp-file creation in seed.py, salt-ssh, and salt-cloud." Upgrading is recommended.

### 37.2.34 Salt 2014.1.11 Release Notes

release 2014-08-29

Version 2014.1.11 is another bugfix release for 2014.1.0. Changes include:

- Fix for minion\_id with byte-order mark (BOM) ([issue 12296](#))
- Fix runas deprecation in `at` module
- Fix trailing slash behavior for `file.makedirs_` ([issue 14019](#))
- Fix chocolatey path ([issue 13870](#))
- Fix git\_pillar infinite loop issues ([issue 14671](#))
- Fix json outputter null case
- Fix for minion error if one of multiple masters are down ([issue 14099](#))

### 37.2.35 Salt 2014.1.12 Release Notes

release 2014-10-08

Version 2014.1.12 is another bugfix release for 2014.1.0. Changes include:

- Fix `scp_file` always failing (which broke salt-cloud) ([issue 16437](#))
- Fix regression in pillar in masterless ([issue 16210](#), [issue 16416](#), [issue 16428](#))

### 37.2.36 Salt 2014.1.13 Release Notes

release 2014-10-14

Version 2014.1.13 is another bugfix release for 2014.1.0. Changes include:

- Fix `sftp_file` by checking the exit status code of scp (which broke salt-cloud) ([issue 16599](#))

### 37.2.37 Salt 2014.1.2 Release Notes

`release` 2014-04-15

Version 2014.1.2 is another bugfix release for 2014.1.0. The changes include:

- Fix username detection when su'ed to root on FreeBSD ([issue 11628](#))
- Fix minionfs backend for file.recurse states
- Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS ([issue 11822](#))
- Fix bug with specifying alternate home dir on user creation (FreeBSD) ([issue 11790](#))
- Don't reload `s_i_t_e` module on module refresh for MacOS
- Fix regression with running execution functions in Pillar SLS ([issue 11453](#))
- Fix some modules missing from Windows installer
- Don't log an error for yum commands that return nonzero exit status on non-failure ([issue 11645](#))
- Fix bug in rabbitmq state ([issue 8703](#))
- Fix missing ssh config options ([issue 10604](#))
- Fix top.sls ordering ([issue 10810](#) and [issue 11691](#))
- Fix `salt-key --list all` ([issue 10982](#))
- Fix `win_servermanager` install/remove function ([issue 11038](#))
- Fix interaction with tokens when running commands as root ([issue 11223](#))
- Fix overstate bug with `find_job` and `**kwargs` ([issue 10503](#))
- Fix `saltenv` for `aptpkg.mod_repo` from `pkgrepo` state
- Fix environment issue causing file caching problems ([issue 11189](#))
- Fix bug in `__parse_key` in registry state ([issue 11408](#))
- Add minion auth retry on rejection ([issue 10763](#))
- Fix `publish_session` updating the encryption key ([issue 11493](#))
- Fix for bad `AssertionError` raised by GitPython ([issue 11473](#))
- Fix `debian_ip` to allow disabling and enabling networking on Ubuntu ([issue 11164](#))
- Fix potential memory leak caused by saved (and unused) events ([issue 11582](#))
- Fix exception handling in the MySQL module ([issue 11616](#))
- Fix environment-related error ([issue 11534](#))
- Include `psutil` on Windows
- Add `file.replace` and `file.search` to Windows ([issue 11471](#))
- Add additional `file` module helpers to Windows ([issue 11235](#))
- Add `pid` to netstat output on Windows ([issue 10782](#))
- Fix Windows not caching new versions of installers in `winrepo` ([issue 10597](#))
- Fix hardcoded md5 hashing
- Fix `kwargs` in `salt-ssh` ([issue 11609](#))
- Fix file backup timestamps ([issue 11745](#))

- Fix `stacktrace` on `sys.doc` with invalid `eauth` ([issue 11293](#))
- Fix `git.latest` with `test=True` ([issue 11595](#))
- Fix `file.check_perms` hardcoded `follow_symlinks` ([issue 11387](#))
- Fix certain `pkg` states for RHEL5/Cent5 machines ([issue 11719](#))

### 37.2.38 Salt 2014.1.3 Release Notes

`release` 2014-04-15

Version 2014.1.3 is another bugfix release for 2014.1.0. It was created as a hotfix for a regression found in 2014.1.2, which was not distributed. The only change made was as follows:

- Fix regression that caused `saltutil.find_job` to fail, causing premature terminations of salt CLI commands.

Changes in the not-distributed 2014.1.2, also included in 2014.1.3:

- Fix username detection when `su`'ed to root on FreeBSD ([issue 11628](#))
- Fix minionfs backend for `file.recurse` states
- Fix 32-bit packages of different arches than the CPU arch, on 32-bit RHEL/CentOS ([issue 11822](#))
- Fix bug with specifying alternate home dir on user creation (FreeBSD) ([issue 11790](#))
- Don't reload `site` module on module refresh for MacOS
- Fix regression with running execution functions in Pillar SLS ([issue 11453](#))
- Fix some modules missing from Windows installer
- Don't log an error for `yum` commands that return nonzero exit status on non-failure ([issue 11645](#))
- Fix bug in `rabbitmq` state ([issue 8703](#))
- Fix missing `ssh` config options ([issue 10604](#))
- Fix `top.sls` ordering ([issue 10810](#) and [issue 11691](#))
- Fix `salt-key --list all` ([issue 10982](#))
- Fix `win_servermanager` install/remove function ([issue 11038](#))
- Fix interaction with tokens when running commands as root ([issue 11223](#))
- Fix overstate bug with `find_job` and `**kwargs` ([issue 10503](#))
- Fix `saltenv` for `aptpkg.mod_repo` from `pkgrepo` state
- Fix environment issue causing file caching problems ([issue 11189](#))
- Fix bug in `__parse_key` in registry state ([issue 11408](#))
- Add minion auth retry on rejection ([issue 10763](#))
- Fix `publish_session` updating the encryption key ([issue 11493](#))
- Fix for bad `AssertionError` raised by `GitPython` ([issue 11473](#))
- Fix `debian_ip` to allow disabling and enabling networking on Ubuntu ([issue 11164](#))
- Fix potential memory leak caused by saved (and unused) events ([issue 11582](#))
- Fix exception handling in the MySQL module ([issue 11616](#))
- Fix environment-related error ([issue 11534](#))

- Include `psutil` on Windows
- Add `file.replace` and `file.search` to Windows (issue 11471)
- Add additional `file` module helpers to Windows (issue 11235)
- Add `pid` to `netstat` output on Windows (issue 10782)
- Fix Windows not caching new versions of installers in `winrepo` (issue 10597)
- Fix hardcoded md5 hashing
- Fix `kwargs` in `salt-ssh` (issue 11609)
- Fix file backup timestamps (issue 11745)
- Fix `stacktrace` on `sys.doc` with invalid `eauth` (issue 11293)
- Fix `git.latest` with `test=True` (issue 11595)
- Fix `file.check_perms` hardcoded `follow_symlinks` (issue 11387)
- Fix certain `pkg` states for RHEL5/Cent5 machines (issue 11719)

### 37.2.39 Salt 2014.1.4 Release Notes

`release` 2014-05-05

Version 2014.1.4 is another bugfix release for 2014.1.0. Changes include:

- Fix `setup.py` dependency issue (issue 12031)
- Fix handling for `IOErrors` under certain circumstances (issue 11783 and issue 11853)
- Fix fatal exception when `/proc/1/cgroup` is not readable (issue 11619)
- Fix `os` grains for OpenSolaris (issue 11907)
- Fix `lvs.zero` module argument pass-through (issue 9001)
- Fix bug in `debian_ip` interaction with `network.system` state (issue 11164)
- Remove bad binary package verification code (issue 12177)
- Fix traceback in `solaris` package installation (issue 12237)
- Fix `file.directory` state symlink handling (issue 12209)
- Remove `external_ip` grain
- Fix `file.managed` `makedirs` issues (issue 10446)
- Fix hang on non-existent Windows drive letter for `file` module (issue 9880)
- Fix salt minion caching all users on the server (issue 9743)
- Add `strftime` formatting for `ps.boot_time` (issue 12428)

### 37.2.40 Salt 2014.1.5 Release Notes

`release` 2014-06-11

Version 2014.1.5 is another bugfix release for 2014.1.0. Changes include:

- Add function for finding cached job on the minion
- Fix `iptables` save file location for Debian (issue 11730)

- Fix for minion caching jobs when master is down
- Bump default `syndic_wait` to 5 to fix syndic-related problems ([issue 12262](#))
- Add OpenBSD, FreeBSD, and NetBSD support for `network.netstat` ([issue 12121](#))
- Fix false positive error in logs for `makeconf` state ([issue 9762](#))
- Fix for `yum fromrepo` package installs when repo is disabled by default ([issue 12466](#))
- Fix for extra blank lines in `file.blockreplace` ([issue 12422](#))
- Fix grain detection for OpenVZ guests ([issue 11877](#))
- Fix `get_dns_servers` function for Windows `win_dns_client`
- Use system locale for ports package installations
- Use correct stop/restart procedure for Debian networking in `debian_ip` ([issue 12614](#))
- Fix for `cmd_iter/cmd_iter_no_block` blocking issues ([issue 12617](#))
- Fix traceback when syncing custom types ([issue 12883](#))
- Fix cleaning directory symlinks in `file.directory`
- Add performance optimizations for `saltutil.sync_all` and `state.highstate`
- Fix possible error in `saltutil.running`
- Fix for `kmod` modules with dashes ([issue 13239](#))
- Fix possible race condition for Windows minions in state module reloading ([issue 12370](#))
- Fix bug with roster for `passwd` option that is loaded as a non-string object ([issue 13249](#))
- Keep duplicate version numbers from showing up in `pkg.list_pkgs` output
- Fixes for Jinja renderer, timezone `module/state` ([issue 12724](#))
- Fix `timedatectl` parsing for `systemd>=210` ([issue 12728](#))
- Fix `saltenv` being written to YUM repo config files ([issue 12887](#))
- Removed the deprecated external nodes classifier (originally accessible by setting a value for `external_nodes` in the master configuration file). Note that this functionality has been marked deprecated for some time and was replaced by the more general `master tops` system.
- More robust escaping of ldap filter strings.
- Fix trailing slash in `gitfs_root` causing files not to be available ([issue 13185](#))

### 37.2.41 Salt 2014.1.6 Release Notes

release 2014-07-08

Version 2014.1.6 is another bugfix release for 2014.1.0. Changes include:

- Fix extra `iptables --help` output (Sorry!) ([issue 13648](#), [issue 13507](#), [issue 13527](#), [issue 13607](#))
- Fix `mount.active` for Solaris
- Fix support for `allow-hotplug` statement in `debian_ip` network module
- Add `sqlite3` to esky builds
- Fix `jobs.active` output ([issue 9526](#))
- Fix the `virtual` grain for Xen ([issue 13534](#))

- Fix `_ext_nodes` unavailable on master (issue 13535)
- Fix `eauth` for batch mode (issue 9605)
- Fix force-related issues with `tomcat` support (issue 12889)
- Fix `KeyError` when cloud mapping
- Fix salt-minion restart loop in Windows (issue 12086)
- Fix detection of `service` virtual module on Fedora minions
- Fix traceback with missing `ipv4` grain (issue 13838)
- Fix issue in roots backend with invalid data in `mtime_map` (issue 13836)
- Fix traceback in `jobs.active` (issue 11151)
- Fix `master_tops` and `_ext_nodes` issue (issue 13535, issue 13673)

### 37.2.42 Salt 2014.1.7 Release Notes

`release` 2014-07-09

Version 2014.1.7 is another bugfix release for 2014.1.0. Changes include:

- Fix batch mode regression (issue 14046)

This release was a hotfix release for the regression listed above which was present in the 2014.1.6 release. The changes included in 2014.1.6 are listed below:

- Fix extra `iptables --help` output (Sorry!) (issue 13648, issue 13507, issue 13527, issue 13607)
- Fix `mount.active` for Solaris
- Fix support for `allow-hotplug` statement in `debian_ip` network module
- Add `sqlite3` to esky builds
- Fix `jobs.active` output (issue 9526)
- Fix the `virtual` grain for Xen (issue 13534)
- Fix `eauth` for batch mode (issue 9605)
- Fix force-related issues with `tomcat` support (issue 12889)
- Fix `KeyError` when cloud mapping
- Fix salt-minion restart loop in Windows (issue 12086)
- Fix detection of `service` virtual module on Fedora minions
- Fix traceback with missing `ipv4` grain (issue 13838)
- Fix issue in roots backend with invalid data in `mtime_map` (issue 13836)
- Fix traceback in `jobs.active` (issue 11151)
- Fix `master_tops` and `_ext_nodes` issue (issue 13535, issue 13673)

### 37.2.43 Salt 2014.1.8 Release Notes

release 2014-07-30

---

**Note:** This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

---

Version 2014.1.8 is another bugfix release for 2014.1.0. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

### 37.2.44 Salt 2014.1.9 Release Notes

release 2014-07-31

---

**Note:** This release contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. Please use version 2014.1.10 instead.

---

---

**Note:** Version 2014.1.8 contained a regression which caused inaccurate Salt version detection, and thus was never packaged for general release. This version contains the version detection fix, but is otherwise identical to 2014.1.8.

---

Version 2014.1.9 is another bugfix release for 2014.1.0. Changes include:

- Ensure salt-ssh will not continue if permissions on a temporary directory are not correct.
- Use the bootstrap script distributed with Salt instead of relying on an external resource
- Remove unused testing code
- Ensure salt states are placed into the `.salt` directory in salt-ssh
- Use a randomized path for temporary files in a salt-cloud deployment
- Clean any stale directories to ensure a fresh copy of salt-ssh during a deployment

### 37.2.45 Salt 0.10.0 Release Notes

release 2012-06-16

0.10.0 has arrived! This release comes with MANY bug fixes, and new capabilities which greatly enhance performance and reliability. This release is primarily a bug fix release with many new tests and many repaired bugs. This release also introduces a few new key features which were brought in primarily to repair bugs and some limitations found in some of the components of the original architecture.

## Major Features

### Event System

The Salt Master now comes equipped with a new event system. This event system has replaced some of the back end of the Salt client and offers the beginning of a system which will make plugging external applications into Salt. The event system relies on a local ZeroMQ publish socket and other processes can connect to this socket and listen for events. The new events can be easily managed via Salt's event library.

### Unprivileged User Updates

Some enhancements have been added to Salt for running as a user other than root. These new additions should make switching the user that the Salt Master is running as very painless, simply change the `user` option in the master configuration and restart the master, Salt will take care of all of the particulars for you.

### Peer Runner Execution

Salt has long had the peer communication system used to allow minions to send commands via the salt master. 0.10.0 adds a new capability here, now the master can be configured to allow for minions to execute Salt runners via the `peer_run` option in the salt master configuration.

### YAML Parsing Updates

In the past the YAML parser for sls files would return the incorrect numbers when the file mode was set with a preceding 0. The YAML parser used in Salt has been modified to no longer convert these number into octal but to keep them as the correct value so that sls files can be a little cleaner to write.

### State Call Data Files

It was requested that the minion keep a local cache of the most recent executed state run. This has been added and now with state runs the data is stored in a msgpack file in the minion's cachedir.

### Turning Off the Job Cache

A new option has been added to the master configuration file. In previous releases the Salt client would look over the Salt job cache to read in the minion return data. With the addition of the event system the Salt client can now watch for events directly from the master worker processes.

This means that the job cache is no longer a hard requirement. Keep in mind though, that turning off the job cache means that historic job execution data cannot be retrieved.

### Test Updates

#### Minion Swarms Are Faster

To continue our efforts with testing Salt's ability to scale the minionswarm script has been updated. The minionswarm can now start up minions much faster than it could before and comes with a new feature allowing modules to be disabled, thus lowering the minion's footprint when making a swarm. These new updates have allows us to test

```
# python minionswarm.py -m 20 --master salt-master
```

## Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.0, this is a very substantial update:

<https://github.com/saltstack/salt/issues?milestone=12&state=closed>

## Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.0 comes with a number of fixes for the minions and master greatly improving Salt stability.

### 37.2.46 Salt 0.10.1 Release Notes

release 2012-06-19

### 37.2.47 Salt 0.10.2 Release Notes

release 2012-07-30

0.10.2 is out! This release comes with enhancements to the pillar interface, cleaner ways to access the salt-call capabilities in the API, minion data caching and the event system has been added to salt minions.

There have also been updates to the ZeroMQ functions, many more tests (thanks to sponsors, the code sprint and many contributors) and a swath of bug fixes.

## Major Features

### Ext Pillar Modules

The ranks of available Salt modules directories sees a new member in 0.10.2. With the popularity of pillar a higher demand has arisen for `ext_pillar` interfaces to be more like regular Salt module additions. Now `ext_pillar` interfaces can be added in the same way as other modules, just drop it into the pillar directory in the salt source.

### Minion Events

In 0.10.0 an event system was added to the Salt master. 0.10.2 adds the event system to the minions as well. Now event can be published on a local minion as well.

The minions can also send events back up to the master. This means that Salt is able to communicate individual events from the minions back up to the Master which are not associated with command.

### Minion Data Caching

When pillar was introduced the landscape for available data was greatly enhanced. The minion's began sending grain data back to the master on a regular basis.

The new config option on the master called `minion_data_cache` instructs the Salt master to maintain a cache of the minion's grains and pillar data in the `cachedir`. This option is turned off by default to avoid hitting the disk more, but when enabled the cache is used to make grain matching from the salt command more powerful, since the minions that will match can be predetermined.

### Backup Files

By default all files replaced by the `file.managed` and `file.recurse` states were simply deleted. 0.10.2 adds a new option. By setting the `backup` option to `minion` the files are backed up before they are replaced.

The backed up files are located in the `cachedir` under the `file_backup` directory. On a default system this will be at: `/var/cache/salt/file_backup`

### Configuration files

`salt-master` and `salt-minion` automatically load additional configuration files from `master.d/*.conf` respective `minion.d/*.conf` where `master.d/minion.d` is a directory in the same directory as the main configuration file.

### Salt Key Verification

A number of users complained that they had inadvertently deleted the wrong salt authentication keys. 0.10.2 now displays what keys are going to be deleted and verifies that they are the keys that are intended for deletion.

### Key auto-signing

If `autosign_file` is specified in the configuration file incoming keys will be compared to the list of keynames in `autosign_file`. Regular expressions as well as globbing is supported.

The file must only be writable by the user otherwise the file will be ignored. To relax the permission and allow group write access set the `permissive_pki_access` option.

### Module changes

**Improved OpenBSD support** New modules for managing services and packages were provided by Joshua Elsasser to further improve the support for OpenBSD.

Existing modules like the `disk` module were also improved to support OpenBSD.

**SQL Modules** The MySQL and PostgreSQL modules have both received a number of additions thanks to the work of Avi Marcus and Roman Imankulov.

**ZFS Support on FreeBSD** A new ZFS module has been added by Kurtis Velarde for FreeBSD supporting various ZFS operations like creating, extending or removing zpools.

**Augeas** A new Augeas module by Ulrich Dangel for editing and verifying config files.

**Native Debian Service module** The support for the Debian was further improved with an new service module for Debian by Ahmad Khayyat supporting *disable* and *enable*.

**Cassandra** Cassandra support has been added by Adam Garside. Currently only status and diagnostic information are supported.

**Networking** The networking support for *RHEL* has been improved and supports bonding support as well as zero-conf configuration.

**Monit** Basic monit support by Kurtis Velarde to control services via monit.

**nzbget** Basic support for controlling nzbget by Joseph Hall

**Bluetooth** Baise *bluez* support for managing and controlling Bluetooth devices. Supports scanning as well as pairing/unpairing by Joseph Hall.

## Test Updates

### Consistency Testing

Another testing script has been added. A bug was found in pillar when many minions generated pillar data at the same time. The new `consistent.py` script in the `tests` directory was created to reproduce bugs where data should always be consistent.

### Many Fixes

To get a good idea for the number of bugfixes this release offers take a look at the closed tickets for 0.10.2, this is a very substantial update:

<https://github.com/saltstack/salt/issues?milestone=24&page=1&state=closed>

### Master and Minion Stability Fixes

As Salt deployments grow new ways to break Salt are discovered. 0.10.2 comes with a number of fixes for the minions and master greatly improving Salt stability.

## 37.2.48 Salt 0.10.3 Release Notes

**release** 2012-09-30

The latest taste of Salt has come, this release has many fixes and feature additions. Modifications have been made to make ZeroMQ connections more reliable, the beginning of the ACL system is in place, a new command line parsing system has been added, dynamic module distribution has become more environment aware, the new *master\_finger* option and many more!

## Major Features

### ACL System

The new ACL system has been introduced. The ACL system allows for system users other than root to execute salt commands. Users can be allowed to execute specific commands in the same way that minions are opened up to the peer system.

The configuration value to open up the ACL system is called `client_acl` and is configured like so:

```
client_acl:
  fred:
    - test.*
    - pkg.list_pkgs
```

Where *fred* is allowed access to functions in the test module and to the `pkg.list_pkgs` function.

### Master Finger Option

The *master\_finger* option has been added to improve the security of minion provisioning. The *master\_finger* option allows for the fingerprint of the master public key to be set in the configuration file to double verify that the master is valid. This option was added in response to a motivation to pre-authenticate the master when provisioning new minions to help prevent man in the middle attacks in some situations.

### Salt Key Fingerprint Generation

The ability to generate fingerprints of keys used by Salt has been added to `salt-key`. The new option *finger* accepts the name of the key to generate and display a fingerprint for.

```
salt-key -F master
```

Will display the fingerprints for the master public and private keys.

### Parsing System

Pedro Algavio, aka s0undt3ch, has added a substantial update to the command line parsing system that makes the help message output much cleaner and easier to search through. Salt parsers now have *--versions-report* besides usual *--version* info which you can provide when reporting any issues found.

### Key Generation

We have reduced the requirements needed for *salt-key* to generate minion keys. You're no longer required to have salt configured and it's common directories created just to generate keys. This might prove useful if you're batch creating keys to pre-load on minions.

### Startup States

A few configuration options have been added which allow for states to be run when the minion daemon starts. This can be a great advantage when deploying with Salt because the minion can apply states right when it first runs. To use startup states set the `startup_states` configuration option on the minion to *highstate*.

### New Exclude Declaration

Some users have asked about adding the ability to ensure that other sls files or ids are excluded from a state run. The exclude statement will delete all of the data loaded from the specified sls file or will delete the specified id:

```
exclude:
- sls: http
- id: /etc/vimrc
```

### Max Open Files

While we're currently unable to properly handle ZeroMQ's abort signals when the max open files is reached, due to the way that's handled on ZeroMQ's, we have minimized the chances of this happening without at least warning the user.

### More State Output Options

Some major changes have been made to the state output system. In the past state return data was printed in a very verbose fashion and only states that failed or made changes were printed by default. Now two options can be passed to the master and minion configuration files to change the behavior of the state output. State output can be set to verbose (default) or non-verbose with the `state_verbose` option:

```
state_verbose: False
```

It is noteworthy that the `state_verbose` option used to be set to *False* by default but has been changed to *True* by default in 0.10.3 due to many requests for the change.

The next option to be aware of new and called `state_output`. This option allows for the state output to be set to *full* (default) or *terse*.

The *full* output is the standard state output, but the new *terse* output will print only one line per state making the output much easier to follow when executing a large state system.

```
state_output: terse
```

### *state.file.append* Improvements

The salt state `file.append()` tries *not* to append existing text. Previously the matching check was being made line by line. While this kind of check might be enough for most cases, if the text being appended was multi-line, the check would not work properly. This issue is now properly handled, the match is done as a whole ignoring any white space addition or removal except inside commas. For those thinking that, in order to properly match over multiple lines, salt will load the whole file into memory, that's not true. For most cases this is not important but an erroneous order to read a 4GB file, if not properly handled, like salt does, could make salt chew that amount of memory. Salt has a buffered file reader which will keep in memory a maximum of 256KB and iterates over the file in chunks of 32KB to test for the match, more than enough, if not, explain your usage on a ticket. With this change, also `salt.modules.file.contains()`, `salt.modules.file.contains_regex()`, `salt.modules.file.contains_glob()` and `salt.utils.find` now do the searching and/or matching using the buffered chunks approach explained above.

Two new keyword arguments were also added, `makedirs`, and `source`. The first, `makedirs` will create the necessary directories in order to append to the specified file, of course, it only applies if we're trying to append to a non-existing file on a non-existing directory:

```
/tmp/salttest/file-append-makedirs:
  file.append:
    text: foo
    makedirs: True
```

The second, *source*, allows one to append the contents of a file instead of specifying the text.

```
/tmp/salttest/file-append-source:
file.append:
  - source: salt://testfile
```

### Security Fix

A timing vulnerability was uncovered in the code which decrypts the AES messages sent over the network. This has been fixed and upgrading is strongly recommended.

## 37.2.49 Salt 0.10.4 Release Notes

**release** 2012-10-23

Salt 0.10.4 is a monumental release for the Salt team, with two new module systems, many additions to allow granular access to Salt, improved platform support and much more.

This release is also exciting because we have been able to shorten the release cycle back to under a month. We are working hard to keep up the aggressive pace and look forward to having releases happen more frequently!

This release also includes a serious security fix and all users are very strongly recommended to upgrade. As usual, upgrade the master first, and then the minion to ensure that the process is smooth.

### Major Features

#### External Authentication System

The new external authentication system allows for Salt to pass through authentication to any authentication system to determine if a user has permission to execute a Salt command. The Unix PAM system is the first supported system with more to come!

The external authentication system allows for specific users to be granted access to execute specific functions on specific minions. Access is configured in the master configuration file, and uses the new access control system:

```
external_auth:
  pam:
    thatch:
      - 'web*':
      - test.*
      - network.*
```

The configuration above allows the user *thatch* to execute functions in the test and network modules on minions that match the web\* target.

### Access Control System

All Salt systems can now be configured to grant access to non-administrative users in a granular way. The old configuration continues to work. Specific functions can be opened up to specific minions from specific users in the case of external auth and client ACLs, and for specific minions in the case of the peer system.

Access controls are configured like this:

```
client_acl:
  fred:
    - web\*:
      - pkg.list_pkgs
      - test.*
      - apache.*
```

### Target by Network

A new matcher has been added to the system which allows for minions to be targeted by network. This new matcher can be called with the `-S` flag on the command line and is available in all places that the matcher system is available. Using it is simple:

```
$ salt -S '192.168.1.0/24' test.ping
$ salt -S '192.168.1.100' test.ping
```

### Nodegroup Nesting

Previously a nodegroup was limited by not being able to include another nodegroup, this restraint has been lifted and now nodegroups will be expanded within other nodegroups with the `N@` classifier.

### Salt Key Delete by Glob

The ability to delete minion keys by glob has been added to `salt-key`. To delete all minion keys whose minion name starts with ``web``:

```
$ salt-key -d 'web*'
```

### Master Tops System

The `external_nodes` system has been upgraded to allow for modular subsystems to be used to generate the top file data for a highstate run.

The `external_nodes` option still works but will be deprecated in the future in favor of the new `master_tops` option.

Example of using `master_tops`:

```
master_tops:
  ext_nodes: cobbler-external-nodes
```

## Next Level Solaris Support

A lot of work has been put into improved Solaris support by Romeo Theriault. Packaging modules (`pkgadd/pkgrm` and `pkgutil`) and states, cron support and user and group management have all been added and improved upon. These additions along with SMF (Service Management Facility) service support and improved Solaris grain detection in 0.10.3 add up to Salt becoming a great tool to manage Solaris servers with.

## Security

A vulnerability in the security handshake was found and has been repaired, old minions should be able to connect to a new master, so as usual, the master should be updated first and then the minions.

## Pillar Updates

The pillar communication has been updated to add some extra levels of verification so that the intended minion is the only one allowed to gather the data. Once all minions and the master are updated to salt 0.10.4 please activate pillar 2 by changing the `pillar_version` in the master config to 2. This will be set to 2 by default in a future release.

## 37.2.50 Salt 0.10.5 Release Notes

release 2012-11-15

Salt 0.10.5 is ready, and comes with some great new features. A few more interfaces have been modularized, like the outputter system. The job cache system has been made more powerful and can now store and retrieve jobs archived in external databases. The returner system has been extended to allow minions to easily retrieve data from a returner interface.

As usual, this is an exciting release, with many noteworthy additions!

### Major Features

#### External Job Cache

The external job cache is a system which allows for a returner interface to also act as a job cache. This system is intended to allow users to store job information in a central location for longer periods of time and to make the act of looking up information from jobs executed on other minions easier.

Currently the external job cache is supported via the mongo and redis returners:

```
ext_job_cache: redis
redis.host: salt
```

Once the external job cache is turned on the new `ret` module can be used on the minions to retrieve return information from the job cache. This can be a great way for minions to respond and react to other minions.

#### OpenStack Additions

OpenStack integration with Salt has been moving forward at a blistering pace. The new `nova`, `glance`, and `keystone` modules represent the beginning of ongoing OpenStack integration.

The Salt team has had many conversations with core OpenStack developers and is working on linking to OpenStack in powerful new ways.

### Wheel System

A new API was added to the Salt Master which allows the master to be managed via an external API. This new system allows Salt API to easily hook into the Salt Master and manage configs, modify the state tree, manage the pillar and more. The main motivation for the wheel system is to enable features needed in the upcoming web UI so users can manage the master just as easily as they manage minions.

The wheel system has also been hooked into the external auth system. This allows specific users to have granular access to manage components of the Salt Master.

### Render Pipes

Jack Kuan has added a substantial new feature. The render pipes system allows Salt to treat the render system like unix pipes. This new system enables sls files to be passed through specific render engines. While the default renderer is still recommended, different engines can now be more easily merged. So to pipe the output of Mako used in YAML use this shebang line:

```
#!/mako|yaml
```

### Salt Key Overhaul

The Salt Key system was originally developed as only a CLI interface, but as time went on it was pressed into becoming a clumsy API. This release marks a complete overhaul of Salt Key. Salt Key has been rewritten to function purely from an API and to use the outputter system. The benefit here is that the outputter system works much more cleanly with Salt Key now, and the internals of Salt Key can be used much more cleanly.

### Modular Outputters

The outputter system is now loaded in a modular way. This means that output systems can be more easily added by dropping a python file down on the master that contains the function *output*.

### Gzip from Fileserver

Gzip compression has been added as an option to the `cp.get_file` and `cp.get_dir` commands. This will make file transfers more efficient and faster, especially over slower network links.

### Unified Module Configuration

In past releases of Salt, the minions needed to be configured for certain modules to function. This was difficult because it required pre-configuring the minions. 0.10.5 changes this by making all module configs on minions search the master config file for values.

Now if a single database server is needed, then it can be defined in the master config and all minions will become aware of the configuration value.

### Salt Call Enhancements

The `salt-call` command has been updated in a few ways. Now, `salt-call` can take the `--return` option to send the data to a returner. Also, `salt-call` now reports executions in the minion proc system, this allows the master to be aware of the operation `salt-call` is running.

### Death to `pub_refresh` and `sub_timeout`

The old configuration values `pub_refresh` and `sub_timeout` have been removed. These options were in place to alleviate problems found in earlier versions of ZeroMQ which have since been fixed. The continued use of these options has proven to cause problems with message passing and have been completely removed.

### Git Revision Versions

When running Salt directly from git (for testing or development, of course) it has been difficult to know exactly what code is being executed. The new versioning system will detect the git revision when building and how many commits have been made since the last release. A release from git will look like this:

```
0.10.4-736-gec74d69
```

### Svn Module Addition

Anthony Cornehl (twinshadow) contributed a module that adds Subversion support to Salt. This great addition helps round out Salt's VCS support.

### Noteworthy Changes

#### Arch Linux Defaults to Systemd

Arch Linux recently changed to use systemd by default and discontinued support for init scripts. Salt has followed suit and defaults to systemd now for managing services in Arch.

#### Salt, Salt Cloud and Openstack

With the releases of Salt 0.10.5 and Salt Cloud 0.8.2, OpenStack becomes the first (non-OS) piece of software to include support both on the user level (with Salt Cloud) and the admin level (with Salt). We are excited to continue to extend support of other platforms at this level.

## 37.2.51 Salt 0.11.0 Release Notes

**release** 2012-12-14

Salt 0.11.0 is here, with some highly sought after and exciting features. These features include the new overstate system, the reactor system, a new state run scope component called `__context__`, the beginning of the search system (still needs a great deal of work), multiple package states, the MySQL returner and a better system to arbitrarily reference outputters.

It is also noteworthy that we are changing how we mark release numbers. For the life of the project we have been pushing every release with features and fixes as point releases. We will now be releasing point releases for only bug fixes on a more regular basis and major feature releases on a slightly less regular basis. This means that the next release will be a bugfix only release with a version number of 0.11.1. The next feature release will be named 0.12.0 and will mark the end of life for the 0.11 series.

## Major Features

### OverState

The overstate system is a simple way to manage rolling state executions across many minions. The overstate allows for a state to depend on the successful completion of another state.

### Reactor System

The new reactor system allows for a reactive logic engine to be created which can respond to events within a salted environment. The reactor system uses sls files to match events fired on the master with actions, enabling Salt to react to problems in an infrastructure.

Your load-balanced group of webservers is under extra load? Spin up a new VM and add it to the group. Your fileserver is filling up? Send a notification to your sysadmin on call. The possibilities are endless!

### Module Context

A new component has been added to the module loader system. The module context is a data structure that can hold objects for a given scope within the module.

This allows for components that are initialized to be stored in a persistent context which can greatly speed up ongoing connections. Right now the best example can be found in the *cp* execution module.

### Multiple Package Management

A long desired feature has been added to package management. By definition Salt States have always installed packages one at a time. On most platforms this is not the fastest way to install packages. Erik Johnson, aka terminalmage, has modified the package modules for many providers and added new capabilities to install groups of packages. These package groups can be defined as a list of packages available in repository servers:

```
python_pkgs:
  pkg.installed:
    - pkgs:
      - python-mako
      - whoosh
      - python-git
```

or specify based on the location of specific packages:

```
python_pkgs:
  pkg.installed:
    - sources:
      - python-mako: http://some-rpms.org/python-mako.rpm
      - whoosh: salt://whoosh/whoosh.rpm
      - python-git: ftp://companyserver.net/python-git.rpm
```

### Search System

The bones to the search system have been added. This is a very basic interface that allows for search backends to be added as search modules. The first supported search module is the whoosh search backend. Right now only the

basic paths for the search system are in place, making this very experimental. Further development will involve improving the search routines and index routines for whoosh and other search backends.

The search system has been made to allow for searching through all of the state and pillar files, configuration files and all return data from minion executions.

### Notable Changes

All previous versions of Salt have shared many directories between the master and minion. The default locations for keys, cached data and sockets has been shared by master and minion. This has created serious problems with running a master and a minion on the same systems. 0.11.0 changes the defaults to be separate directories. Salt will also attempt to migrate all of the old key data into the correct new directories, but if it is not successful it may need to be done manually. If your keys exhibit issues after updating make sure that they have been moved from `/etc/salt/pki` to `/etc/salt/pki/{master,minion}`.

The old setup will look like this:

```

/etc/salt/pki
|-- master.pem
|-- master.pub
|-- minions
|   |-- ragnarok.saltstack.net
|-- minions_pre
|-- minion.pem
|-- minion.pub
|-- minion_master.pub
|-- minions_pre
`-- minions_rejected

```

With the accepted minion keys in `/etc/salt/pki/minions`, the new setup places the accepted minion keys in `/etc/salt/pki/master/minions`.

```

/etc/salt/pki
|-- master
|   |-- master.pem
|   |-- master.pub
|   |-- minions
|   |   |-- ragnarok.saltstack.net
|   |-- minions_pre
|   |-- minions_rejected
|-- minion
|   |-- minion.pem
|   |-- minion.pub
|   |-- minion_master.pub

```

## 37.2.52 Salt 0.11.1 Release Notes

release 2012-12-19

### 37.2.53 Salt 0.12.0 Release Notes

release 2013-01-15

Another feature release of Salt is here! Some exciting additions are included with more ways to make salt modular and even easier management of the salt file server.

#### Major Features

##### Modular Fileserver Backend

The new modular fileserver backend allows for any external system to be used as a salt file server. The main benefit here is that it is now possible to tell the master to directly use a git remote location, or many git remote locations, automatically mapping git branches and tags to salt environments.

##### Windows is First Class!

A new Salt Windows installer is now available! Much work has been put in to improve Windows support. With this much easier method of getting Salt on your Windows machines, we hope even more development and progress will occur. Please file bug reports on the Salt GitHub repo issue tracker so we can continue improving.

One thing that is missing on Windows that Salt uses extensively is a software package manager and a software package repository. The Salt pkg state allows sys admins to install software across their infrastructure and across operating systems. Software on Windows can now be managed in the same way. The SaltStack team built a package manager that interfaces with the standard Salt pkg module to allow for installing and removing software on Windows. In addition, a software package repository has been built on top of the Salt fileserver. A small YAML file provides the information necessary for the package manager to install and remove software.

An interesting feature of the new Salt Windows software package repository is that one or more remote git repositories can supplement the master's local repository. The repository can point to software on the master's fileserver or on an HTTP, HTTPS, or ftp server.

##### New Default Outputter

Salt displays data to the terminal via the outputter system. For a long time the default outputter for Salt has been the python pretty print library. While this has been a generally reasonable outputter, it did have many failings. The new default outputter is called ``nested'', it recursively scans return data structures and prints them out cleanly.

If the result of the new nested outputter is not desired any other outputter can be used via the --out option, or the output option can be set in the master and minion configs to change the default outputter.

##### Internal Scheduler

The internal Salt scheduler is a new capability which allows for functions to be executed at given intervals on the minion, and for runners to be executed at given intervals on the master. The scheduler allows for sequences such as executing state runs (locally on the minion or remotely via an overstate) or continually gathering system data to be run at given intervals.

The configuration is simple, add the schedule option to the master or minion config and specify jobs to run, this in the master config will execute the state.over runner every 60 minutes:

```

schedule:
  overstate:
    function: state.over
    minutes: 60

```

This example for the minion configuration will execute a highstate every 30 minutes:

```

schedule:
  highstate:
    function: state.highstate
    minutes: 30

```

### Optional DSL for SLS Formulas

Jack Kuan, our renderer expert, has created something that is astonishing. Salt, now comes with an optional Python based DSL, this is a very powerful interface that makes writing SLS files in pure python easier than it was with the raw py renderer. As usual this can be used with the renderer shebang line, so a single sls can be written with the DSL if pure python power is needed while keeping other sls files simple with YAML.

### Set Grains Remotely

A new execution function and state module have been added that allows for grains to be set on the minion. Now grains can be set via a remote execution or via states. Use the *grains.present* state or the *grains.setval* execution functions.

### Gentoo Additions

Major additions to Gentoo specific components have been made. The encompasses executions modules and states ranging from supporting the make.conf file to tools like layman.

### 37.2.54 Salt 0.12.1 Release Notes

release 2013-01-21

### 37.2.55 Salt 0.13.0 Release Notes

release 2013-02-12

The lucky number 13 has turned the corner! From CLI notifications when quitting a salt command, to substantial improvements on Windows, Salt 0.13.0 has arrived!

## Major Features

### Improved file.recurse Performance

The file.recurse system has been deployed and used in a vast array of situations. Fixes to the file state and module have led towards opening up new ways of running file.recurse to make it faster. Now the file.recurse state will download fewer files and will run substantially faster.

### Windows Improvements

Minion stability on Windows has improved. Many file operations, including `file.recurse`, have been fixed and improved. The network module works better, to include `network.interfaces`. Both 32bit and 64bit installers are now available.

### Nodegroup Targeting in Peer System

In the past, nodegroups were not available for targeting via the peer system. This has been fixed, allowing the new nodegroup `expr_form` argument for the `publish.publish` function:

```
salt-call publish.publish group1 test.ping expr_form=nodegroup
```

### Blacklist Additions

Additions allowing more granular blacklisting are available in 0.13.0. The ability to blacklist users and functions in `client_acl` have been added, as well as the ability to exclude state formulas from the command line.

### Command Line Pillar Embedding

Pillar data can now be embedded on the command line when calling `state.sls` and `state.highstate`. This allows for on the fly changes or settings to pillar and makes parameterizing state formulas even easier. This is done via the `keyword` argument:

```
salt '*' state.highstate pillar='{"cheese": "spam"}'
```

The above example will extend the existing pillar to hold the `cheese` key with a value of `spam`. If the `cheese` key is already specified in the minion's pillar then it will be overwritten.

### CLI Notifications

In the past hitting `ctrl-C` and quitting from the `salt` command would just drop to a shell prompt, this caused confusion with users who expected the remote executions to also quit. Now a message is displayed showing what command can be used to track the execution and what the job id is for the execution.

### Version Specification in Multiple-Package States

Versions can now be specified within multiple-package `pkg.installed` states. An example can be found below:

```
mypkgs:
  pkg.installed:
    - pkgs:
      - foo
      - bar: 1.2.3-4
      - baz
```

## Noteworthy Changes

The configuration subsystem in Salt has been overhauled to make the `opts` dict used by Salt applications more portable, the problem is that this is an incompatible change with salt-cloud, and salt-cloud will need to be updated to the latest git to work with Salt 0.13.0. Salt Cloud 0.8.5 will also require Salt 0.13.0 or later to function.

The SaltStack team is sorry for the inconvenience here, we work hard to make sure these sorts of things do not happen, but sometimes hard changes get in.

### 37.2.56 Salt 0.13.1 Release Notes

release 2013-02-15

### 37.2.57 Salt 0.13.2 Release Notes

release 2013-03-13

### 37.2.58 Salt 0.13.3 Release Notes

release 2013-03-18

### 37.2.59 Salt 0.14.0 Release Notes

release 2013-03-23

Salt 0.14.0 is here! This release was held up primarily by PyCon, Scale, and illness, but has arrived! 0.14.0 comes with many new features and is breaking ground for Salt in the area of cloud management with the introduction of Salt providing basic cloud controller functionality.

## Major Features

### Salt - As a Cloud Controller

This is the first primitive inroad to using Salt as a cloud controller is available in 0.14.0. Be advised that this is alpha, only tested in a few very small environments.

The cloud controller is built using `kvm` and `libvirt` for the hypervisors. Hypervisors are autodetected as minions and only need to have `libvirt` running and `kvm` installed to function. The features of the Salt cloud controller are as follows:

- Basic vm discovery and reporting
- Creation of new virtual machines
- Seeding virtual machines with Salt via `qemu-nbd` or `libguestfs`
- Live migration (shared and non shared storage)
- Delete existing VMs

It is noteworthy that this feature is still Alpha, meaning that all rights are reserved to change the interface if needs be in future releases!

### Libvirt State

One of the problems with libvirt is management of certificates needed for live migration and cross communication between hypervisors. The new `libvirt` state makes the Salt Master hold a CA and manage the signing and distribution of keys onto hypervisors, just add a call to the `libvirt` state in the `sls` formulas used to set up a hypervisor:

```
libvirt_keys:
  libvirt.keys
```

### New get Functions

An easier way to manage data has been introduced. The `pillar`, `grains`, and `config` execution modules have been extended with the new `get` function. This function works much in the same way as the `get` method in a python dict, but with an enhancement, nested dict components can be extracted using a `:` delimiter.

If a structure like this is in `pillar`:

```
foo:
  bar:
    baz: quo
```

Extracting it from the raw `pillar` in an `sls` formula or file template is done this way:

```
{{ pillar['foo']['bar']['baz'] }}
```

Now with the new `get` function the data can be safely gathered and a default can be set allowing the template to fall back if the value is not available:

```
{{ salt['pillar.get']('foo:bar:baz', 'qux') }}
```

This makes handling nested structures much easier, and defaults can be cleanly set. This new function is being used extensively in the new formulae repository of salt `sls` formulas.

## 37.2.60 Salt 0.14.1 Release Notes

release 2013-04-13

## 37.2.61 Salt 0.15.0 Release Notes

release 2013-05-03

The many new features of Salt 0.15.0 have arrived! Salt 0.15.0 comes with many smaller features and a few larger ones.

These features range from better debugging tools to the new Salt Mine system.

## Major Features

### The Salt Mine

First there was the peer system, allowing for commands to be executed from a minion to other minions to gather data live. Then there was the external job cache for storing and accessing long term data. Now the middle ground is being filled in with the Salt Mine. The Salt Mine is a system used to execute functions on a regular basis on minions and then store only the most recent data from the functions on the master, then the data is looked up via targets.

The mine caches data that is public to all minions, so when a minion posts data to the mine all other minions can see it.

### IPV6 Support

0.13.0 saw the addition of initial IPV6 support but errors were encountered and it needed to be stripped out. This time the code covers more cases and must be explicitly enabled. But the support is much more extensive than before.

### Copy Files From Minions to the Master

Minions have long been able to copy files down from the master file server, but until now files could not be easily copied from the minion up to the master.

A new function called `cp.push` can push files from the minions up to the master server. The uploaded files are then cached on the master in the `master_cachedir` for each minion.

### Better Template Debugging

Template errors have long been a burden when writing states and pillar. 0.15.0 will now send the compiled template data to the debug log, this makes tracking down the intermittent stage templates much easier. So running `state.sls` or `state.highstate` with `-l debug` will now print out the rendered templates in the debug information.

### State Event Firing

The state system is now more closely tied to the master's event bus. Now when a state fails the failure will be fired on the master event bus so that the reactor can respond to it.

### Major Syndic Updates

The Syndic system has been basically re-written. Now it runs in a completely asynchronous way and functions primarily as an event broker. This means that the events fired on the syndic are now pushed up to the higher level master instead of the old method used which waited for the client libraries to return.

This makes the syndic much more accurate and powerful, it also means that all events fired on the syndic master make it up the pipe as well making a reactor on the higher level master able to react to minions further downstream.

### Peer System Updates

The Peer System has been updated to run using the client libraries instead of firing directly over the publish bus. This makes the peer system much more consistent and reliable.

### Minion Key Revocation

In the past when a minion was decommissioned the key needed to be manually deleted on the master, but now a function on the minion can be used to revoke the calling minion's key:

```
$ salt-call saltutil.revoke_auth
```

### Function Return Codes

Functions can now be assigned numeric return codes to determine if the function executed successfully. While not all functions have been given return codes, many have and it is an ongoing effort to fill out all functions that might return a non-zero return code.

### Functions in Overstate

The overstate system was originally created to just manage the execution of states, but with the addition of return codes to functions, requisite logic can now be used with respect to the overstate. This means that an overstate stage can now run single functions instead of just state executions.

### Pillar Error Reporting

Previously if errors surfaced in pillar, then the pillar would consist of only an empty dict. Now all data that was successfully rendered stays in pillar and the render error is also made available. If errors are found in the pillar, states will refuse to run.

### Using Cached State Data

Sometimes states are executed purely to maintain a specific state rather than to update states with new configs. This is grounds for the new cached state system. By adding `cache=True` to a state call the state will not be generated fresh from the master but the last state data to be generated will be used. If no previous state data is available then fresh data will be generated.

### Monitoring States

The new monitoring states system has been started. This is very young but allows for states to be used to configure monitoring routines. So far only one monitoring state is available, the `disk.status` state. As more capabilities are added to Salt UI the monitoring capabilities of Salt will continue to be expanded.

## 37.2.62 Salt 0.15.1 Release Notes

release 2013-05-08

The 0.15.1 release has been posted, this release includes fixes to a number of bugs in 0.15.1 and a three security patches.

### Security Updates

A number of security issues have been resolved via the 0.15.1 release.

### Path Injection in Minion IDs

Salt masters did not properly validate the id of a connecting minion. This can lead to an attacker uploading files to the master in arbitrary locations. In particular this can be used to bypass the manual validation of new unknown minions. Exploiting this vulnerability does not require authentication.

This issue affects all known versions of Salt.

This issue was reported by Ronald Volgers.

**Patch** The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:

<https://github.com/saltstack/salt/commit/5427b9438e452a5a8910d9128c6aafb45d8fd5d3>

<https://github.com/saltstack/salt/commit/7560908ee62351769c3cd43b03d74c1ca772cc52>

<https://github.com/saltstack/salt/commit/e200b8a7ff53780124e08d2bdefde7587e52bfca>

### RSA Key Generation Fault

RSA key generation was done incorrectly, leading to very insecure keys. It is recommended to regenerate all RSA keys.

This issue can be used to impersonate Salt masters or minions, or decrypt any transferred data.

This issue can only be exploited by attackers who are able to observe or modify traffic between Salt minions and the legitimate Salt master.

A tool was included in 0.15.1 to assist in mass key regeneration, the `manage.regen_keys` runner.

This issue affects all known versions of Salt.

This issue was reported by Ronald Volgers.

**Patch** The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:

<https://github.com/saltstack/salt/commit/5dd304276ba5745ec21fc1e6686a0b28da29e6fc>

### Command Injection Via `ext_pillar`

Arbitrary shell commands could be executed on the master by an authenticated minion through options passed when requesting a pillar.

Ext pillar options have been restricted to only allow safe external pillars to be called when prompted by the minion.

This issue affects Salt versions from 0.14.0 to 0.15.0.

This issue was reported by Ronald Volgers.

**Patch** The issue is fixed in Salt 0.15.1. Updated packages are available in the usual locations.

Specific commits:

<https://github.com/saltstack/salt/commit/43d8c16bd26159d827d1a945c83ac28159ec5865>

### 37.2.63 Salt 0.15.2 Release Notes

release 2013-05-29

### 37.2.64 Salt 0.15.3 Release Notes

release 2013-06-01

### 37.2.65 Salt 0.16.0 Release Notes

release 2013-07-01

The 0.16.0 release is an exciting one, with new features in master redundancy, and a new, powerful requisite.

#### Major Features

##### Multi-Master

This new capability allows for a minion to be actively connected to multiple salt masters at the same time. This allows for multiple masters to send out commands to minions and for minions to automatically reconnect to masters that have gone down. A tutorial is available to help get started here:

[Multi Master Tutorial](#)

##### Prereq, the New Requisite

The new *prereq* requisite is very powerful! It allows for states to execute based on a state that is expected to make changes in the future. This allows for a change on the system to be preempted by another execution. A good example is needing to shut down a service before modifying files associated with it, allowing, for instance, a webserver to be shut down allowing a load balancer to stop sending requests while server side code is updated. In this case, the *prereq* will only run if changes are expected to happen in the prerequired state, and the prerequired state will always run after the *prereq* state and only if the *prereq* state succeeds.

##### Peer System Improvements

The peer system has been revamped to make it more reliable, faster, and like the rest of Salt, async. The peer calls when an updated minion and master are used together will be much faster!

##### Relative Includes

The ability to include an sls relative to the defined sls has been added, the new syntax is documented here:

[Includes](#)

##### More State Output Options

The `state_output` option in the past only supported *full* and *terse*, 0.16.0 add the *mixed* and *changes* modes further refining how states are sent to users' eyes.

## Improved Windows Support

Support for Salt on Windows continues to improve. Software management on Windows has become more seamless with Linux/UNIX/BSD software management. Installed software is now recognized by the short names defined in the [repository SLS](#). This makes it possible to run `salt '*' pkg.version firefox` and get back results from Windows and non-Windows minions alike.

When templating files on Windows, Salt will now correctly use Windows appropriate line endings. This makes it much easier to edit and consume files on Windows.

When using the `cmd` state the `shell` option now allows for specifying Windows Powershell as an alternate shell to execute `cmd.run` and `cmd.script`. This opens up Salt to all the power of Windows Powershell and its advanced Windows management capabilities.

Several fixes and optimizations were added for the Windows networking modules, especially when working with IPv6.

A system module was added that makes it easy to restart and shutdown Windows minions.

The Salt Minion will now look for its config file in `c:\salt\conf` by default. This means that it's no longer necessary to specify the `-C` option to specify the location of the config file when starting the Salt Minion on Windows in a terminal.

## Multiple Targets for `pkg.removed`, `pkg.purged` States

Both `pkg.removed` and `pkg.purged` now support the `pkgs` argument, which allow for multiple packages to be targeted in a single state. This, as in `pkg.installed`, helps speed up these states by reducing the number of times that the package management tools (`apt`, `yum`, etc.) need to be run.

## Random Times in Cron States

The temporal parameters in `cron.present` states (minute, hour, etc.) can now be randomized by using `random` instead of a specific value. For example, by using the `random` keyword in the `minute` parameter of a cron state, the same cron job can be pushed to hundreds or thousands of hosts, and they would each use a randomly-generated minute. This can be helpful when the cron job accesses a network resource, and it is not desirable for all hosts to run the job concurrently.

```
/path/to/cron/script:
  cron.present:
    - user: root
    - minute: random
    - hour: 2
```

Since Salt assumes a value of `*` for unspecified temporal parameters, adding a parameter to the state and setting it to `random` will change that value from `*` to a randomized numeric value. However, if that field in the cron entry on the minion already contains a numeric value, then using the `random` keyword will not modify it.

## Confirmation Prompt on Key Acceptance

When accepting new keys with `salt-key -a minion-id` or `salt-key -A`, there is now a prompt that will show the affected keys and ask for confirmation before proceeding. This prompt can be bypassed using the `-y` or `--yes` command line argument, as with other `salt-key` commands.

### Support for Setting Password Hashes on BSD Minions

FreeBSD, NetBSD, and OpenBSD all now support setting passwords in *user.present* states.

### 37.2.66 Salt 0.16.1 Release Notes

release 2013-07-29

### 37.2.67 Salt 0.16.2 Release Notes

release 2013-08-01

Version 0.16.2 is a bugfix release for 0.16.0, and contains a number of fixes.

#### Windows

- Only allow Administrator's group and SYSTEM user access to C:\salt. This eliminates a race condition where a non-admin user could modify a template or managed file before it is executed by the minion (which is running as an elevated user), thus avoiding a potential escalation of privileges. (issue 6361)

#### Grains

- Fixed detection of `virtual` grain on OpenVZ hardware nodes
- Gracefully handle `lsb_release` data when it is enclosed in quotes
- LSB grains are now prefixed with `lsb_distrib_` instead of simply `lsb_`. The old naming is not preserved, so SLS may be affected.
- Improved grains detection on MacOS

#### Pillar

- Don't try to load `git_pillar` if not enabled in master config (issue 6052)
- Functions `pillar.item` and `pillar.items` added for parity with `grains.item/grains.items`. The old function `pillar.data` is preserved for backwards compatibility.
- Fixed minion traceback when Pillar SLS is malformed (issue 5910)

#### Peer Publishing

- More gracefully handle improperly quoted publish commands (issue 5958)
- Fixed traceback when timeout specified via the CLI fo `publish.publish`, `publish.full_data` (issue 5959)
- Fixed unintended change in output of `publish.publish` (issue 5928)

## Minion

- Fixed salt-key usage in minionswarm script
- Quieted warning about `SALT_MINION_CONFIG` environment variable on minion startup and for CLI commands run via `salt-call` ([issue 5956](#))
- Added minion config parameter `random_reauth_delay` to stagger re-auth attempts when the minion is waiting for the master to approve its public key. This helps prevent SYN flooding in larger environments.

## User/Group Management

- Implement previously-ignored `unique` option for `user.present` states in FreeBSD
- Report in state output when a `group.present` state attempts to use a gid in use by another group
- Fixed regression that prevents a `user.present` state to set the password hash to the system default (i.e. an unset password)
- Fixed multiple `group.present` states with the same group ([issue 6439](#))

## File Management

- Fixed file.mkdir setting incorrect permissions ([issue 6033](#))
- Fixed cleanup of source files for templates when `/tmp` is in `file_roots` ([issue 6118](#))
- Fixed caching of zero-byte files when a non-empty file was previously cached at the same path
- Added HTTP authentication support to the cp module ([issue 5641](#))
- Diffs are now suppressed when binary files are changed

## Package/Repository Management

- Fixed traceback when there is only one target for `pkg.latest` states
- Fixed regression in detection of virtual packages (apt)
- Limit number of pkg database refreshes to once per `state.sls/state.highstate`
- YUM: Allow 32-bit packages with arches other than i686 to be managed on 64-bit systems ([issue 6299](#))
- Fixed incorrect reporting in pkgrepo.managed states ([issue 5517](#))
- Fixed 32-bit binary package installs on 64-bit RHEL-based distros, and added proper support for 32-bit packages on 64-bit Debian-based distros ([issue 6303](#))
- Fixed issue where requisites were inadvertently being put into YUM repo files ([issue 6471](#))

## Service Management

- Fixed inaccurate reporting of results in `service.running` states when the service fails to start ([issue 5894](#))
- Fixed handling of custom initscripts in RHEL-based distros so that they are immediately available, negating the need for a second state run to manage the service that the initscript controls

## Networking

- Function `network.hwaddr` renamed to `network.hw_addr` to match `network.ip_addrs` and `network.ip_addrs6`. All three functions also now work without the underscore in the name, as well.
- Fixed traceback in `bridge.show` when interface is not present (issue 6326)

## SSH

- Fixed incorrect result reporting for some `ssh_known_hosts.present` states
- Fixed inaccurate reporting when `ssh_auth.present` states are run with `test=True`, when `rsa/dss` is used for the `enc` param instead of `ssh-rsa/ssh-dss` (issue 5374)

## pip

- Properly handle `-f` lines in pip freeze output
- Fixed regression in `pip.installed` states with specifying a requirements file (issue 6003)
- Fixed use of `editable` argument in `pip.installed` states (issue 6025)
- Deprecated `runas` parameter in execution function calls, in favor of `user`

## MySQL

- Allow specification of MySQL connection arguments via the CLI, overriding/bypassing minion config params
- Allow `mysql_user.present` states to set a passwordless login (issue 5550)
- Fixed endless loop when `mysql.processlist` is run (issue 6297)

## PostgreSQL

- Fixed traceback in `postgres.user_list` (issue 6352)

## Miscellaneous

- Don't allow `npm states` to be used if `npm module` is not available
- Fixed `alternatives.install` states for which the target is a symlink (issue 6162)
- Fixed traceback in `sysbench` module (issue 6175)
- Fixed traceback in job cache
- Fixed tempfile cleanup for windows
- Fixed issue where SLS files using the `pydsl renderer` were not being run
- Fixed issue where returners were being passed incorrect information (issue 5518)
- Fixed traceback when numeric args are passed to `cmd.script` states
- Fixed bug causing `cp.get_dir` to return more directories than expected (issue 6048)
- Fixed traceback when `supervisord.running` states are run with `test=True` (issue 6053)
- Fixed tracebacks when Salt encounters problems running `rbenv` (issue 5888)

- Only make the `monit` module available if `monit` binary is present (issue 5871)
- Fixed incorrect behavior of `img.mount_image`
- Fixed traceback in `tomcat.deploy_war` in Windows
- Don't re-write `/etc/fstab` if mount fails
- Fixed tracebacks when Salt encounters problems running `gem` (issue 5886)
- Fixed incorrect behavior of `selinux.boolean` states (issue 5912)
- `RabbitMQ`: Quote passwords to avoid symbols being interpolated by the shell (issue 6338)
- Fixed tracebacks in `extfs.mkfs` and `extfs.tune` (issue 6462)
- Fixed a regression with the `module.run` state where the `m_name` and `m_fun` arguments were being ignored (issue 6464)

### 37.2.68 Salt 0.16.3 Release Notes

release 2013-08-09

Version 0.16.3 is another bugfix release for 0.16.0. The changes include:

- Various documentation fixes
- Fix `proc` directory regression (issue 6502)
- Properly detect `Linaro` Linux (issue 6496)
- Fix regressions in `mount.mounted` (issue 6522, issue 6545)
- Skip malformed state requisites (issue 6521)
- Fix regression in `gitfs` from bad import
- Fix for watching `prereq` states (including recursive requisite error) (issue 6057)
- Fix `mod_watch` not overriding `prereq` (issue 6520)
- Don't allow functions which compile states to be called within states (issue 5623)
- Return error for malformed `top.sls` (issue 6544)
- Fix traceback in `mysql.query`
- Fix regression in binary package installation for 64-bit packages on Debian-based Linux distros (issue 6563)
- Fix traceback caused by running `cp.push` without having set `file_recv` in the master config file
- Fix scheduler configuration in `pillar` (issue 6201)

### 37.2.69 Salt 0.16.4 Release Notes

release 2013-09-07

Version 0.16.4 is another bugfix release for 0.16.0, likely to be the last before 0.17.0 is released. The changes include:

- Multiple documentation improvements/additions
- Added the `osfinger` and `osarch` grains
- Properly handle 32-bit packages for `debian32` on `x86_64` (issue 6607)
- Fix regression in `yum` package installation in CentOS 5 (issue 6677)

- Fix bug in *hg.latest* state that would erroneously delete directories (issue 6661)
- Fix bug related to pid not existing for *ps.top* (issue 6679)
- Fix regression in *MySQL returner* (issue 6695)
- Fix IP addresses grains (*ip4* and *ip6*) to include all addresses (issue 6656)
- Fix regression preventing authenticated FTP (issue 6733)
- Fix setting password for windows users (issue 6824)
- Fix *file.contains* on values YAML parses as non-string (issue 6817)
- Fix *file.get\_gid*, *file.get\_uid*, and *file.chown* for broken symlinks (issue 6826)
- Fix comment for service reloads in service state (issue 6851)

### 37.2.70 Salt 0.17.0 Release Notes

release 2013-09-26

The 0.17.0 release is a very exciting release of Salt, this brings to Salt some very powerful new features and advances. The advances range from the state system to the test suite, covering new transport capabilities and making states easier and more powerful, to extending Salt Virt and much more!

The 0.17.0 release will also be the last release of Salt to follow the old 0.XX.X numbering system, the next release of Salt will change the numbering to be date based following this format:

<Year>.<Month>.<Minor>

So if the release happens in November of 2013 the number will be 13.11.0, the first bugfix release will be 13.11.1 and so forth.

#### Major Features

##### Halite

The new Halite web GUI is now available on PyPI. A great deal of work has been put into Halite to make it fully event driven and amazingly fast. The Halite UI can be started from within the Salt Master (after being installed from PyPI), or standalone, and does not require an external database to run. It is very lightweight!

This initial release of Halite is primarily the framework for the UI and the communication systems, making it easy to extend and build the UI up. It presently supports watching the event bus and firing commands over Salt.

At this time, Halite is not available as a package, but installation documentation is available at: <http://docs.saltstack.com/topics/tutorials/halite.html>

Halite is, like the rest of Salt, Open Source!

Much more will be coming in the future of Halite!

##### Salt SSH

The new `salt-ssh` command has been added to Salt. This system allows for remote execution and states to be run over ssh. The benefit here being, that salt can run relying only on the ssh agent, rather than requiring a minion to be deployed.

The `salt-ssh` system runs states in a compatible way as Salt and states created and run with salt-ssh can be moved over to a standard salt deployment without modification.

Since this is the initial release of salt-ssh, there is plenty of room for improvement, but it is fully operational, not just a bootstrap tool.

### Rosters

Salt is designed to have the minions be aware of the master and the master does not need to be aware of the location of the minions. The new salt roster system was created and designed to facilitate listing the targets for salt-ssh.

The roster system, like most of Salt, is a plugin system, allowing for the list of systems to target to be derived from any pluggable backend. The rosters shipping with 0.17.0 are flat and scan. Flat is a file which is read in via the salt render system and the scan roster does simple network scanning to discover ssh servers.

### State Auto Order

This is a major change in how states are evaluated in Salt. State Auto Order is a new feature that makes states get evaluated and executed in the order in which they are defined in the sls file. This feature makes it very easy to see the finite order in which things will be executed, making Salt now, fully imperative AND fully declarative.

The requisite system still takes precedence over the order in which states are defined, so no existing states should break with this change. But this new feature can be turned off by setting `state_auto_order: False` in the master config, thus reverting to the old lexicographical order.

### state.sls Runner

The `state.sls` runner has been created to allow for a more powerful system for orchestrating state runs and function calls across the salt minions. This new system uses the state system for organizing executions.

This allows for states to be defined that are executed on the master to call states on minions via `salt-run state.sls`.

### Salt Thin

Salt Thin is an exciting new component of Salt, this is the ability to execute Salt routines without any transport mechanisms installed, it is a pure python subset of Salt.

Salt Thin does not have any networking capability, but can be dropped into any system with Python installed and then `salt-call` can be called directly. The Salt Thin system, is used by the `salt-ssh` command, but can still be used to just drop salt somewhere for easy use.

### Event Namespacing

Events have been updated to be much more flexible. The tags in events have all been namespaced allowing easier tracking of event names.

### Mercurial Fileserver Backend

The popular git fileserver backend has been joined by the mercurial fileserver backend, allowing the state tree to be managed entirely via mercurial.

### External Logging Handlers

The external logging handler system allows for Salt to directly hook into any external logging system. Currently supported are sentry and logstash.

### Jenkins Testing

The testing systems in Salt have been greatly enhanced, tests for salt are now executed, via jenkins.saltstack.com, across many supported platforms. Jenkins calls out to salt-cloud to create virtual machines on Rackspace, then the minion on the virtual machine checks into the master running on Jenkins where a state run is executed that sets up the minion to run tests and executes the test suite.

This now automates the sequence of running platform tests and allows for continuous destructive tests to be run.

### Salt Testing Project

The testing libraries for salt have been moved out of the main salt code base and into a standalone codebase. This has been done to ease the use of the testing systems being used in salt based projects other than Salt itself.

### StormPath External Authentication

The external auth system now supports the fantastic Stormpath cloud based authentication system.

### LXC Support

Extensive additions have been added to Salt for LXC support. This included the backend libs for managing LXC containers. Addition into the salt-virt system is still in the works.

### Mac OS X User/Group Support

Salt is now able to manage users and groups on Minions running Mac OS X. However, at this time user passwords cannot be managed.

### Django ORM External Pillar

Pillar data can now be derived from Django managed databases.

### Fixes from RC to release

- Multiple documentation fixes
- Add multiple source files + templating for *file.append* (issue 6905)
- Support sysctl configuration files in systemd<=207 (issue 7351)
- Add *file.search* and *file.replace*
- Fix cross-calling execution functions in provider overrides
- Fix locale override for postgres (issue 4543)

- Fix Raspbian identification for service/pkg support (issue 7371)
- Fix `cp.push` file corruption (issue 6495)
- Fix ALT Linux password hash specification (issue 3474)
- Multiple salt-ssh-related fixes and improvements

### 37.2.71 Salt 0.17.1 Release Notes

release 2013-10-17

---

**Note:** THIS RELEASE IS NOT COMPATIBLE WITH PREVIOUS VERSIONS. If you update your master to 0.17.1, you must update your minions as well. Sorry for the inconvenience -- this is a result of one of the security fixes listed below.

---

The 0.17.1 release comes with a number of improvements to salt-ssh, many bugfixes, and a number of security updates.

Salt SSH has been improved to be faster, more featureful and more secure. Since the original release of Salt SSH was primarily a proof of concept, it has been very exciting to see its rapid adoption. We appreciate the willingness of security experts to review Salt SSH and help discover oversights and ensure that security issues only exist for such a tiny window of time.

#### SSH Enhancements

##### Shell Improvements

Improvements to Salt SSH's communication have been added that improve routine execution regardless of the target system's login shell.

##### Performance

Deployment of routines is now faster and takes fewer commands to execute.

#### Security Updates

Be advised that these security issues all apply to a small subset of Salt users and mostly apply to Salt SSH.

##### Insufficient Argument Validation

This issue allowed for a user with limited privileges to embed executions inside of routines to execute routines that should be restricted. This applies to users using external auth or client ACL and opening up specific routines.

Be advised that these patches address the direct issue. Additional commits have been applied to help mitigate this issue from resurfacing.

CVE CVE-2013-4435

#### Affected Versions

0.15.0 - 0.17.0

**Patches** <https://github.com/saltstack/salt/commit/6d8ef68b605fd63c36bb8ed96122a75ad2e80269>

#### MITM SSH attack in salt-ssh

SSH host keys were being accepted by default and not enforced on future SSH connections. These patches set SSH host key checking by default and can be overridden by passing the `-i` flag to `salt-ssh`.

**CVE** CVE-2013-4436

**Affected Versions** 0.17.0

**Found By** Michael Scherer, Red Hat

#### Insecure Usage of /tmp in salt-ssh

The initial release of salt-ssh used the `/tmp` directory in an insecure way. These patches not only secure usage of files under `/tmp` in salt-ssh, but also add checksum validation for all packages sent into the now secure locations on target systems.

**CVE** CVE-2013-4438

**Affected Versions** 0.17.0

**Patches** <https://github.com/saltstack/salt/commit/aa4bb77ef230758cad84381dde0ec660d2dc340a>  
<https://github.com/saltstack/salt/commit/8f92b6b2cb2e4ec3af8783eb6bf4ff06f5a352cf>

**Found By** Michael Scherer, Red Hat

#### YAML Calling Unsafe Loading Routine

It has been argued that this is not a valid security issue, as the YAML loading that was happening was only being called after an initial gateway filter in Salt has already safely loaded the YAML and would fail if non-safe routines were embedded. Nonetheless, the CVE was filed and patches applied.

**CVE** CVE-2013-4438

#### Patches

<https://github.com/saltstack/salt/commit/339b0a51befae6b6b218ebcb55daa9cd3329a1c5>

**Found By** Michael Scherer, Red Hat

#### Failure to Drop Supplementary Group on Salt Master

If a salt master was started as a non-root user by the root user, root's groups would still be applied to the running process. This fix changes the process to have only the groups of the running user.

**CVE** CVE not considered necessary by submitter.

**Affected Versions** 0.11.0 - 0.17.0

**Patches** <https://github.com/saltstack/salt/commit/b89fa9135822d029795ab1eecd68cce2d1ced715>

**Found By** Michael Scherer, Red Hat

#### Failure to Validate Minions Posting Data

This issue allowed a minion to pose as another authorized minion when posting data such as the mine data. All minions now pass through the id challenge before posting such data.

**CVE** CVE-2013-4439

**Affected Versions** 0.15.0 - 0.17.0

#### Patches

<https://github.com/saltstack/salt/commit/7b850ff3d07ef6782888914ac4556c01e8a1c482>  
<https://github.com/saltstack/salt/commit/151759b2a1e1c6ce29277aa81b054219147f80fd>

**Found By** David Anderson

## Fix Reference

Version 0.17.1 is the first bugfix release for 0.17.0. The changes include:

- Fix symbolic links in thin.tgz (issue 7482)
- Pass env through to file.patch state (issue 7452)
- Service provider fixes and reporting improvements (issue 7361)
- Add `--priv` option for specifying salt-ssh private key
- Fix salt-thin's salt-call on setup tools installations (issue 7516)
- Fix salt-ssh to support passwords with spaces (issue 7480)
- Fix regression in wildcard includes (issue 7455)
- Fix salt-call outputter regression (issue 7456)
- Fix custom returner support for startup states (issue 7540)
- Fix value handling in augeas (issue 7605)
- Fix regression in apt (issue 7624)
- Fix minion ID guessing to use `socket.getfqdn()` first (issue 7558)
- Add minion ID caching (issue 7558)
- Fix salt-key race condition (issue 7304)
- Add `--include-all` flag to salt-key (issue 7399)
- Fix custom grains in pillar (part of issue 5716, issue 6083)
- Fix race condition in salt-key (issue 7304)
- Fix regression in minion ID guessing, prioritize `socket.getfqdn()` (issue 7558)
- Cache minion ID on first guess (issue 7558)
- Allow trailing slash in `file.directory` state
- Fix reporting of `file_roots` in pillar return (issue 5449 and issue 5951)
- Remove pillar matching for `mine.get` (issue 7197)
- Sanitize args for multiple execution modules
- Fix `yumpkg mod_repo` functions to filter hidden args (issue 7656)
- Fix conflicting IDs in state includes (issue 7526)
- Fix `mysql_grants.absent` string formatting issue (issue 7827)
- Fix `postgres.version` so it won't return None (issue 7695)
- Fix for trailing slashes in `mount.mounted` state
- Fix rogue `AttributErrors` in the outputter system (issue 7845)
- Fix for incorrect ssh key encodings resulting in incorrect key added (issue 7718)
- Fix for pillar/grains naming regression in python renderer (issue 7693)
- Fix args/kwargs handling in the scheduler (issue 7422)
- Fix logfile handling for `file://`, `tcp://`, and `udp://` (issue 7754)
- Fix error handling in config file parsing (issue 6714)

- Fix RVM using sudo when running as non-root user ([issue 2193](#))
- Fix client ACL and underlying logging bugs ([issue 7706](#))
- Fix scheduler bug with returner ([issue 7367](#))
- Fix user management bug related to default groups ([issue 7690](#))
- Fix various salt-ssh bugs ([issue 7528](#))
- Many various documentation fixes

### 37.2.72 Salt 0.17.2 Release Notes

`release` 2013-11-14

Version 0.17.2 is another bugfix release for 0.17.0. The changes include:

- Add ability to delete key with `grains.delval` ([issue 7872](#))
- Fix possible state compiler stack trace ([issue 5767](#))
- Fix architecture regression in `yumpkg` ([issue 7813](#))
- Use correct `ps` on Debian to prevent truncating ([issue 5646](#))
- Fix grains targeting for new grains ([issue 5737](#))
- Fix bug with merging in `git_pillar` ([issue 6992](#))
- Fix `print_jobs` duplicate results
- Fix apt version specification for `pkg.install`
- Fix possible `KeyError` from `ext_job_cache` missing option
- Fix `auto_order` for `- names` states ([issue 7649](#))
- Fix regression in new `gitfs` installs (directory not found error)
- Fix escape pipe issue on Windows for `file.recurse` ([issue 7967](#))
- Fix fileclient in case of master restart ([issue 7987](#))
- Try to output warning if CLI command malformed ([issue 6538](#))
- Fix `--out=quiet` to actually be quiet ([issue 8000](#))
- Fix for `state.sls` in `salt-ssh` ([issue 7991](#))
- Fix for MySQL grants ordering issue ([issue 5817](#))
- Fix traceback for certain missing CLI args ([issue 8016](#))
- Add ability to disable `lspci` queries on master ([issue 4906](#))
- Fail if `sls` defined in `topfile` does not exist ([issue 5998](#))
- Add ability to downgrade MySQL grants ([issue 6606](#))
- Fix `ssh_auth.absent` traceback ([issue 8043](#))
- Add upstart detection for Debian/Raspbian ([issue 8039](#))
- Fix ID-related issues ([issue 8052](#), [issue 8050](#), and others)
- Fix for jinja rendering issues ([issue 8066](#) and [issue 8079](#))
- Fix argument parsing in `salt-ssh` ([issue 7928](#))

- Fix some GPU detection instances ([issue 6945](#))
- Fix bug preventing includes from other environments in SLS files
- Fix for kwargs with dashes ([issue 8102](#))
- Fix salt.utils.which for windows '.exe' ([issue 7904](#))
- Fix apache.adduser without apachectl ([issue 8123](#))
- Fix issue with evaluating test kwarg in states ([issue 7788](#))
- Fix regression in salt.client.Caller() ([issue 8078](#))
- Fix apt-key silent failure
- Fix bug where cmd.script would try to run even if caching failed ([issue 7601](#))
- Fix apt pkg.latest regression ([issue 8067](#))
- Fix for mine data not being updated ([issue 8144](#))
- Fix for noarch packages in yum
- Fix a Xen detection edge case ([issue 7839](#))
- Fix windows \_\_opts\_\_ dictionary persistence ([issue 7714](#))
- Fix version generation for when it's part of another git repo ([issue 8090](#))
- Fix \_handle\_iorder stacktrace so that the real syntax error is shown ([issue 8114](#) and [issue 7905](#))
- Fix git.latest state when a commit SHA is used ([issue 8163](#))
- Fix various small bugs in yumpkg.py ([issue 8201](#))
- Fix for specifying identify file in git.latest ([issue 8094](#))
- Fix for --output-file CLI arg ([issue 8205](#))
- Add ability to specify shutdown time for system.shutdown ([issue 7833](#))
- Fix for salt version using non-salt git repo info ([issue 8266](#))
- Add additional hints at impact of pkgrepo states when test=True ([issue 8247](#))
- Fix for salt-ssh files not being owned by root ([issue 8216](#))
- Fix retry logic and error handling in fileserver (related to [issue 7755](#))
- Fix file.replace with test=True ([issue 8279](#))
- Add flag for limiting file traversal in fileserver ([issue 6928](#))
- Fix for extra mine processes ([issue 5729](#))
- Fix for unloading custom modules ([issue 7691](#))
- Fix for salt-ssh opts ([issue 8005](#) and [issue 8271](#))
- Fix compound matcher for grains ([issue 7944](#))
- Improve error reporting in ebuild module (related to [issue 5393](#))
- Add dir\_mode to file.managed ([issue 7860](#))
- Improve traceroute support for FreeBSD and OS X ([issue 4927](#))
- Fix for matching minions under syndics ([issue 7671](#))
- Improve exception handling for missing ID ([issue 8259](#))

- Fix grain mismatch for ScientificLinux ([issue 8338](#))
- Add configuration option for `minion_id_caching`
- Fix open mode auth errors ([issue 8402](#))

### 37.2.73 Salt 0.17.3 Release Notes

release 2013-12-08

---

**Note:** 0.17.3 had some regressions which were promptly fixed in the 0.17.4 release. Please use 0.17.4 instead.

---

Version 0.17.3 is another bugfix release for 0.17.0. The changes include:

- Fix some jinja render errors ([issue 8418](#))
- Fix `file.replace` state changing file ownership ([issue 8399](#))
- Fix state ordering with the PyDSL renderer ([issue 8446](#))
- Fix for new npm version ([issue 8517](#))
- Fix for pip state requiring `name` even with requirements file ([issue 8519](#))
- Fix yum logging to open terminals ([issue 3855](#))
- Add sane maxrunning defaults for scheduler ([issue 8563](#))
- Fix states duplicate key detection ([issue 8053](#))
- Fix SUSE patch level reporting ([issue 8428](#))
- Fix managed file creation umask ([issue 8590](#))
- Fix logstash exception ([issue 8635](#))
- Improve argument exception handling for salt command ([issue 8016](#))
- Fix pecl success reporting ([issue 8750](#))
- Fix launchctl module exceptions ([issue 8759](#))
- Fix argument order in `pw_user` module
- Add warnings for failing grains ([issue 8690](#))
- Fix hgfs problems caused by connections left open ([issue 8811](#) and [issue 8810](#))
- Add Debian iptables default for iptables-persistent package ([issue 8889](#))
- Fix installation of packages with dots in pkg name ([issue 8614](#))
- Fix noarch package installation on CentOS 6 ([issue 8945](#))
- Fix `portage_config.enforce_nice_config` ([issue 8252](#))
- Fix `salt.util.copyfile` umask usage ([issue 8590](#))
- Fix rescheduling of failed jobs ([issue 8941](#))
- Fix pkg on Amazon Linux (uses `yumpkg5` now) ([issue 8226](#))
- Fix conflicting options in postgres module ([issue 8717](#))
- Fix ps modules for `psutil`  $\geq 0.3.0$  ([issue 7432](#))
- Fix postgres module to return False on failure ([issue 8778](#))

- Fix argument passing for args with pound signs ([issue 8585](#))
- Fix pid of salt CLI command showing in status.pid output ([issue 8720](#))
- Fix rvm to run gem as the correct user ([issue 8951](#))
- Fix namespace issue in win\_file module ([issue 9060](#))
- Fix masterless state paths on windows ([issue 9021](#))
- Fix timeout option in master config ([issue 9040](#))

### 37.2.74 Salt 0.17.4 Release Notes

release 2013-12-10

Version 0.17.4 is another bugfix release for 0.17.0. The changes include:

- Fix file.replace bug when replacement str is numeric ([issue 9101](#))
- Fix regression in file.managed ([issue 9131](#))
- Prevent traceback when job is None. ([issue 9145](#))

### 37.2.75 Salt 0.17.5 Release Notes

release 2014-01-27

Version 0.17.5 is another bugfix release for 0.17.0. The changes include:

- Fix user.present states with non-string fullname ([issue 9085](#))
- Fix virt.init return value on failure ([issue 6870](#))
- Fix reporting of file.blockreplace state when test=True
- Fix network.interfaces when used in cron ([issue 7990](#))
- Fix bug in pkgrepo when switching to/from mirrorlist-based repo def ([issue 9121](#))
- Fix infinite recursion when cache file is corrupted
- Add checking for rev and mirror/bare args in git.latest ([issue 9107](#))
- Add cmd.watch alias (points to cmd.wait) ([issue 8612](#))
- Fix stacktrace when prereq is not formed as a list ([issue 8235](#))
- Fix stdin issue with lvsdisplay command ([issue 9128](#))
- Add pre-check function for range matcher ([issue 9236](#))
- Add exception handling for psutil for processes that go missing ([issue 9274](#))
- Allow \_in requisites to match both on ID and name ([issue 9061](#))
- Fix multiple client timeout issues ([issue 7157](#) and [issue 9302](#), probably others)
- Fix ZMQError: Operation cannot be accomplished in current state errors ([issue 6306](#))
- Multiple optimization in minion auth routines
- Clarify logs for minion ID caching

### 37.2.76 Salt 0.6.0 release notes

The Salt remote execution manager has reached initial functionality! Salt is a management application which can be used to execute commands on remote sets of servers.

The whole idea behind Salt is to create a system where a group of servers can be remotely controlled from a single master, not only can commands be executed on remote systems, but salt can also be used to gather information about your server environment.

Unlike similar systems, like Func and MCollective, Salt is extremely simple to setup and use, the entire application is contained in a single package, and the master and minion daemons require no running dependencies in the way that Func requires Certmaster and MCollective requires activeMQ.

Salt also manages authentication and encryption. Rather than using SSL for encryption, salt manages encryption on a payload level, so the data sent across the network is encrypted with fast AES encryption, and authentication uses RSA keys. This means that Salt is fast, secure, and very efficient.

Messaging in Salt is executed with ZeroMQ, so the message passing interface is built into salt and does not require an external ZeroMQ server. This also adds speed to Salt since there is no additional bloat on the networking layer, and ZeroMQ has already proven itself as a very fast networking system.

The remote execution in Salt is "Lazy Execution", in that once the command is sent the requesting network connection is closed. This makes it easier to detach the execution from the calling process on the master, it also means that replies are cached, so that information gathered from historic commands can be queried in the future.

Salt also allows users to make execution modules in Python. Writers of these modules should also be pleased to know that they have access to the impressive information gathered from PuppetLabs' Factor application, making Salt module more flexible. In the future I hope to also allow Salt to group servers based on Factor information as well.

All in all Salt is fast, efficient, and clean, can be used from a simple command line client or through an API, uses message queue technology to make network execution extremely fast, and encryption is handled in a very fast and efficient manner. Salt is also VERY easy to use and VERY easy to extend.

You can find the source code for Salt on my GitHub page, I have also set up a few wiki pages explaining how to use and set up Salt. If you are using Arch Linux there is a package available in the Arch Linux AUR.

Salt 0.6.0 Source: <https://cloud.github.com/downloads/saltstack/salt/salt-0.6.0.tar.gz>

GitHub page: <https://github.com/saltstack/salt>

Wiki: <https://github.com/saltstack/salt/wiki>

Arch Linux Package: <https://aur.archlinux.org/packages/salt-git/>

I am very open to contributions, for instance I need packages for more Linux distributions as well as BSD packages and testers.

Give Salt a try, this is the initial release and is not a 1.0 quality release, but it has been working well for me! I am eager to get your feedback!

### 37.2.77 Salt 0.7.0 release notes

I am pleased to announce the release of Salt 0.7.0!

This release marks what is the first stable release of salt, 0.7.0 should be suitable for general use.

0.7.0 Brings the following new features to Salt:

- Integration with Factor data from puppet labs
- Allow for matching minions from the salt client via Factor information

- Minion job threading, many jobs can be executed from the master at once
- Preview of master clustering support - Still experimental
- Introduce new minion modules for stats, virtualization, service management and more
- Add extensive logging to the master and minion daemons
- Add `sys.reload_functions` for dynamic function reloading
- Greatly improve authentication
- Introduce the `saltkey` command for managing public keys
- Begin backend development preparatory to introducing butter
- Addition of man pages for the core commands
- Extended and cleaned configuration

0.7.0 Fixes the following major bugs:

- Fix crash in minions when matching failed
- Fix configuration file lookups for the local client
- Repair communication bugs in encryption
- Numerous fixes in the minion modules

The next release of Salt should see the following features:

- Stabilize the cluster support
- Introduce a remote client for salt command tiers
- salt-ftp system for distributed file copies
- Initial support for ``butter''

Coming up next is a higher level management framework for salt called Butter. I want salt to stay as a simple and effective communication framework, and allow for more complicated executions to be managed via Butter.

Right now Butter is being developed to act as a cloud controller using salt as the communication layer, but features like system monitoring and advanced configuration control (a puppet manager) are also in the pipe.

Special thanks to Joseph Hall for the status and network modules, and thanks to Matthias Teege for tracking down some configuration bugs!

Salt can be downloaded from the following locations;

Source Tarball:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.7.0.tar.gz>

Arch Linux Package:

<https://aur.archlinux.org/packages/salt-git/>

Please enjoy the latest Salt release!

### 37.2.78 Salt 0.8.0 release notes

Salt 0.8.0 is ready for general consumption! The source tarball is available on GitHub for download:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.8.0.tar.gz>

A lot of work has gone into salt since the last release just 2 weeks ago, and salt has improved a great deal. A swath of new features are here along with performance and threading improvements!

The main new features of salt 0.8.0 are:

Salt-cp

Cython minion modules

Dynamic returners

Faster return handling

Lowered required Python version to 2.6

Advanced minion threading

Configurable minion modules

### **Salt-cp**

The salt-cp command introduces the ability to copy simple files via salt to targeted servers. Using salt-cp is very simple, just call salt-cp with a target specification, the source file(s) and where to copy the files on the minions. For instance:

```
# salt-cp "*" /etc/hosts /etc/hosts
```

Will copy the local /etc/hosts file to all of the minions.

Salt-cp is very young, in the future more advanced features will be added, and the functionality will much more closely resemble the cp command.

### **Cython minion modules**

Cython is an amazing tool used to compile Python modules down to c. This is arguably the fastest way to run Python code, and since pyzmq requires cython, adding support to salt for cython adds no new dependencies.

Cython minion modules allow minion modules to be written in cython and therefore executed in compiled c. Simply write the salt module in cython and use the file extension “.pyx” and the minion module will be compiled when the minion is started. An example cython module is included in the main distribution called cytest.pyx:

<https://github.com/saltstack/salt/blob/develop/salt/modules/cytest.pyx>

### **Dynamic Returners**

By default salt returns command data back to the salt master, but now salt can return command data to any system. This is enabled via the new returners modules feature for salt. The returners modules take the return data and sends it to a specific module. The returner modules work like minion modules, so any returner can be added to the minions.

This means that a custom data returner can be added to communicate the return data so anything from MySQL, Redis, MongoDB, and more!

There are 2 simple stock returners in the returners directory:

<https://github.com/saltstack/salt/blob/develop/salt/returners>

The documentation on writing returners will be added to the wiki shortly, and returners can be written in pure Python, or in cython.

## Configurable Minion Modules

Minion modules may need to be configured, now the options passed to the minion configuration file can be accessed inside of the minion modules via the `__opt__` dict.

Information on how to use this simple addition has been added to the wiki: [Writing modules](#)

The test module has an example of using the `__opts__` dict, and how to set default options:

<https://github.com/saltstack/salt/blob/develop/salt/modules/test.py>

## Advanced Minion Threading

In 0.7.0 the minion would block after receiving a command from the master, now the minion will spawn a thread or multiprocessing. By default Python threads are used because for general use they have proved to be faster, but the minion can now be configured to use the Python multiprocessing module instead. Using multiprocessing will cause executions that are CPU bound or would otherwise exploit the negative aspects of the Python GIL to run faster and more reliably, but simple calls will still be faster with Python threading. The configuration option can be found in the minion configuration file:

<https://github.com/saltstack/salt/blob/develop/conf/minion>

## Lowered Supported Python to 2.6

The requirement for Python 2.7 has been removed to support Python 2.6. I have received requests to take the minimum Python version back to 2.4, but unfortunately this will not be possible, since the ZeroMQ Python bindings do not support Python 2.4.

Salt 0.8.0 is a very major update, it also changes the network protocol slightly which makes communication with older salt daemons impossible, your master and minions need to be upgraded together!

I could use some help bringing salt to the people! Right now I only have packages for Arch Linux, Fedora 14 and Gentoo. We need packages for Debian and people willing to help test on more platforms. We also need help writing more minion modules and returner modules. If you want to contribute to salt please hop on the mailing list and send in patches, make a fork on GitHub and send in pull requests! If you want to help but are not sure where you can, please email me directly or post to the mailing list!

I hope you enjoy salt, while it is not yet 1.0 salt is completely viable and usable!

-Thomas S. Hatch

## 37.2.79 Salt 0.8.7 release notes

It has been a month since salt 0.8.0, and it has been a long month! But Salt is still coming along strong. 0.8.7 has a lot of changes and a lot of updates. This update makes Salt's ZeroMQ back end better, strips Factor from the dependencies, and introduces interfaces to handle more capabilities.

Many of the major updates are in the background, but the changes should shine through to the surface. A number of the new features are still a little thin, but the back end to support expansion is in place.

I also recently gave a presentation to the Utah Python users group in Salt Lake City, the slides from this presentation are available here: <https://cloud.github.com/downloads/saltstack/salt/Salt.pdf>

The video from this presentation will be available shortly.

The major new features and changes in Salt 0.8.7 are:

- Revamp ZeroMQ topology on the master for better scalability

- State enforcement
- Dynamic state enforcement managers
- Extract the module loader into salt.loader
- Make Job ids more granular
- Replace Facter functionality with the new salt grains interface
- Support for “virtual” salt modules
- Introduce the salt-call command
- Better debugging for minion modules

The new ZeroMQ topology allows for better scalability, this will be required by the need to execute massive file transfers to multiple machines in parallel and state management. The new ZeroMQ topology is available in the aforementioned presentation.

0.8.7 introduces the capability to declare states, this is similar to the capabilities of Puppet. States in salt are declared via state data structures. This system is very young, but the core feature set is available. Salt states work around rendering files which represent Salt high data. More on the Salt state system will be documented in the near future.

The system for loading salt modules has been pulled out of the minion class to be a standalone module, this has enabled more dynamic loading of Salt modules and enables many of the updates in 0.8.7 –

<https://github.com/saltstack/salt/blob/develop/salt/loader.py>

Salt Job ids are now microsecond precise, this was needed to repair a race condition unveiled by the speed improvements in the new ZeroMQ topology.

The new grains interface replaces the functionality of Facter, the idea behind grains differs from Facter in that the grains are only used for static system data, dynamic data needs to be derived from a call to a salt module. This makes grains much faster to use, since the grains data is generated when the minion starts.

Virtual salt modules allows for a salt module to be presented as something other than its module name. The idea here is that based on information from the minion decisions about which module should be presented can be made. The best example is the pacman module. The pacman module will only load on Arch Linux minions, and will be called pkg. Similarly the yum module will be presented as pkg when the minion starts on a Fedora/RedHat system.

The new salt-call command allows for minion modules to be executed from the minion. This means that on the minion a salt module can be executed, this is a great tool for testing Salt modules. The salt-call command can also be used to view the grains data.

In previous releases when a minion module threw an exception very little data was returned to the master. Now the stack trace from the failure is returned making debugging of minion modules MUCH easier.

Salt is nearing the goal of 1.0, where the core feature set and capability is complete!

Salt 0.8.7 can be downloaded from GitHub here: <https://cloud.github.com/downloads/saltstack/salt/salt-0.8.7.tar.gz>

-Thomas S Hatch

### 37.2.80 Salt 0.8.8 release notes

Salt 0.8.8 is here! This release adds a great deal of code and some serious new features. The latest release can be downloaded here: <https://cloud.github.com/downloads/saltstack/salt/salt-0.8.8.tar.gz>

Improved Documentation has been set up for salt using sphinx thanks to the efforts of Seth House. This new documentation system will act as the back end to the salt website which is still under heavy development. The new sphinx documentation system has also been used to greatly clean up the salt manpages. The salt 7 manpage in particular now contains extensive information which was previously only in the wiki. The new documentation can be

found at: <http://docs.saltstack.com/> We still have a lot to add, and when the domain is set up I will post another announcement.

More additions have been made to the ZeroMQ setup, particularly in the realm of file transfers. Salt 0.8.8 introduces a built in, stateless, encrypted file server which allows salt minions to download files from the salt master using the same encryption system used for all other salt communications. The main motivation for the salt file server has been to facilitate the new salt state system.

Much of the salt code has been cleaned up and a new cleaner logging system has been introduced thanks to the efforts of Pedro Algarvio. These additions will allow for much more flexible logging to be executed by salt, and fixed a great deal of my poor spelling in the salt docstrings! Pedro Algarvio has also cleaned up the API, making it easier to embed salt into another application.

The biggest addition to salt found in 0.8.8 is the new state system. The salt module system has received a new front end which allows salt to be used as a configuration management system. The configuration management system allows for system configuration to be defined in data structures. The configuration management system, or as it is called in salt, the “salt state system” supports many of the features found in other configuration managers, but allows for system states to be written in a far simpler format, executes at blazing speeds, and operates via the salt minion matching system. The state system also operates within the normal scope of salt, and requires no additional configuration to use.

The salt state system can enforce the following states with many more to come: Packages Files Services Executing commands Hosts

The system used to define the salt states is based on a data structure, the data structure used to define the salt states has been made to be as easy to use as possible. The data structure is defined by default using a YAML file rendered via a Jinja template. This means that the state definition language supports all of the data structures that YAML supports, and all of the programming constructs and logic that Jinja supports. If the user does not like YAML or Jinja the states can be defined in yamll-mako, json-jinja, or json-mako. The system used to render the states is completely dynamic, and any rendering system can be added to the capabilities of Salt, this means that a rendering system that renders XML data in a cheetah template, or whatever you can imagine, can be easily added to the capabilities of salt.

The salt state system also supports isolated environments, as well as matching code from several environments to a single salt minion.

The feature base for Salt has grown quite a bit since my last serious documentation push. As we approach 0.9.0 the goals are becoming very clear, and the documentation needs a lot of work. The main goals for 0.9.0 are to further refine the state system, fix any bugs we find, get Salt running on as many platforms as we can, and get the documentation filled out. There is a lot more to come as Salt moves forward to encapsulate a much larger scope, while maintaining supreme usability and simplicity.

If you would like a more complete overview of Salt please watch the Salt presentation: Slides: <https://cloud.github.com/downloads/saltstack/salt/Salt.pdf>

-Thomas S Hatch

### 37.2.81 Salt 0.8.9 Release Notes

Salt 0.8.9 has finally arrived! Unfortunately this is much later than I had hoped to release 0.8.9, life has been very crazy over the last month. But despite challenges, Salt has moved forward!

This release, as expected, adds few new features and many refinements. One of the most exciting aspect of this release is that the development community for salt has grown a great deal and much of the code is from contributors.

Also, I have filled out the documentation a great deal. So information on States is properly documented, and much of the documentation that was out of date has been filled in.

## Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.8.9.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.8.9.tar.gz>

Here s the md5sum:

```
7d5aca4633bc22f59045f59e82f43b56
```

For instructions on how to set up Salt please see the *Installation* instructions.

## New Features

### Salt Run

A big feature is the addition of Salt run, the `salt-run` command allows for master side execution modules to be made that gather specific information or execute custom routines from the master.

Documentation for salt-run can be found [here](#)

### Refined Outputters

One problem often complained about in salt was the fact that the output was so messy. Thanks to help from Jeff Schroeder a cleaner interface for the command output for the Salt CLI has been made. This new interface makes adding new printout formats easy and additions to the capabilities of minion modules makes it possible to set the printout mode or `outputter` for functions in minion modules.

### Cross Calling Salt Modules

Salt modules can now call each other, the `__salt__` dict has been added to the predefined references in minion modules. This new feature is documented in the [modules documentation](#).

### Watch Option Added to Salt State System

Now in Salt states you can set the watch option, this will allow watch enabled states to change based on a change in the other defined states. This is similar to subscribe and notify statements in puppet.

### Root Dir Option

Travis Cline has added the ability to define the option `root_dir` which allows the salt minion to operate in a subdir. This is a strong move in supporting the minion running as an unprivileged user

### Config Files Defined in Variables

Thanks again to Travis Cline, the master and minion configuration file locations can be defined in environment variables now.

## New Modules

Quite a few new modules, states, returners, and runners have been made.

### New Minion Modules

**apt** Support for apt-get has been added, this adds greatly improved Debian and Ubuntu support to Salt!

**useradd and groupadd** Support for manipulating users and groups on Unix-like systems.

**moosefs** Initial support for reporting on aspects of the distributed file system, MooseFS. For more information on MooseFS please see: <http://www.moosefs.org>

Thanks to Joseph Hall for his work on MooseFS support.

**mount** Manage mounts and the fstab.

**puppet** Execute puppet on remote systems.

**shadow** Manipulate and manage the user password file.

**ssh** Interact with ssh keys.

### New States

**user and group** Support for managing users and groups in Salt States.

**mount** Enforce mounts and the fstab.

### New Returners

**mongo\_return** Send the return information to a MongoDB server.

### New Runners

**manage** Display minions that are up or down.

## 37.2.82 Salt 0.9.0 Release Notes

**release** 2011-08-27

Salt 0.9.0 is here. This is an exciting release, 0.9.0 includes the new network topology features allowing peer salt commands and masters of masters via the syndic interface.

0.9.0 also introduces many more modules, improvements to the API and improvements to the ZeroMQ systems.

## Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.0.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.0.tar.gz>

Here is the md5sum:

```
9a925da04981e65a0f237f2e77ddab37
```

For instructions on how to set up Salt please see the *Installation* instructions.

## New Features

### Salt Syndic

The new *Syndic interface* allows a master to be commanded via another higher level salt master. This is a powerful solution allowing a master control structure to exist, allowing salt to scale to much larger levels than before.

### Peer Communication

0.9.0 introduces the capability for a minion to call a publication on the master and receive the return from another set of minions. This allows salt to act as a communication channel between minions and as a general infrastructure message bus.

Peer communication is turned off by default but can be enabled via the `peer` option in the master configuration file. Documentation on the new *Peer interface*.

### Easily Extensible API

The minion and master classes have been redesigned to allow for specialized minion and master servers to be easily created. An example on how this is done for the master can be found in the `master.py` salt module:

<https://github.com/saltstack/salt/blob/develop/salt/master.py>

The `Master` class extends the `SMaster` class and set up the main master server.

The minion functions can now also be easily added to another application via the `SMinion` class, this class can be found in the `minion.py` module:

<https://github.com/saltstack/salt/blob/develop/salt/minion.py>

### Cleaner Key Management

This release changes some of the key naming to allow for multiple master keys to be held based on the type of minion gathering the master key.

The `-d` option has also been added to the `salt-key` command allowing for easy removal of accepted public keys.

The `--gen-keys` option is now available as well for `salt-key`, this allows for a salt specific RSA key pair to be easily generated from the command line.

### Improved 0MQ Master Workers

The 0MQ worker system has been further refined to be faster and more robust. This new system has been able to handle a much larger load than the previous setup. The new system uses the IPC protocol in 0MQ instead of TCP.

### New Modules

Quite a few new modules have been made.

#### New Minion Modules

**apache** Work directly with apache servers, great for managing balanced web servers

**cron** Read out the contents of a systems crontabs

**mdadm** Module to manage raid devices in Linux, appears as the `raid` module

**mysql** Gather simple data from MySQL databases

**ps** Extensive utilities for managing processes

**publish** Used by the peer interface to allow minions to make publications

### 37.2.83 Salt 0.9.1 Release Notes

**release** 2011-08-29

### 37.2.84 Salt 0.9.2 Release Notes

**release** 2011-09-17

Salt 0.9.2 has arrived! 0.9.2 is primarily a bugfix release, the exciting component in 0.9.2 is greatly improved support for salt states. All of the salt states interfaces have been more thoroughly tested and the new salt-states git repo is growing with example of how to use states.

This release introduces salt states for early developers and testers to start helping us clean up the states interface and make it ready for the world!

0.9.2 also fixes a number of bugs found on Python 2.6.

#### Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.2.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.2.tar.gz>

For instructions on how to set up Salt please see the *Installation* instructions.

## New Features

### Salt-Call Additions

The salt-call command has received an overhaul, it now hooks into the outputter system so command output looks clean, and the logging system has been hooked into salt-call, so the `-l` option allows the logging output from salt minion functions to be displayed.

The end result is that the salt-call command can execute the state system and return clean output:

```
# salt-call state.highstate
```

### State System Fixes

The state system has been tested and better refined. As of this release the state system is ready for early testers to start playing with. If you are interested in working with the state system please check out the (still very small) salt-states GitHub repo:

<https://github.com/saltstack/salt-states>

This git repo is the active development branch for determining how a clean salt-state database should look and act. Since the salt state system is still very young a lot of help is still needed here. Please fork the salt-states repo and help us develop a truly large and scalable system for configuration management!

## Notable Bug Fixes

### Python 2.6 String Formatting

Python 2.6 does not support format strings without an index identifier, all of them have been repaired.

### Cython Loading Disabled by Default

Cython loading requires a development tool chain to be installed on the minion, requiring this by default can cause problems for most Salt deployments. If Cython auto loading is desired it will need to be turned on in the minion config.

## 37.2.85 Salt 0.9.3 Release Notes

release 2011-11-05

Salt 0.9.3 is finally arrived. This is another big step forward for Salt, new features range from proper FreeBSD support to fixing issues seen when attaching a minion to a master over the Internet.

The biggest improvements in 0.9.3 though can be found in the state system, it has progressed from something ready for early testers to a system ready to compete with platforms such as Puppet and Chef. The backbone of the state system has been greatly refined and many new features are available.

### Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.3.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.3.tar.gz>

For instructions on how to set up Salt please see the *Installation* instructions.

### New Features

#### WAN Support

Recently more people have been testing Salt minions connecting to Salt Masters over the Internet. It was found that Minions would commonly loose their connection to the master when working over the internet. The minions can now detect if the connection has been lost and reconnect to the master, making WAN connections much more reliable.

#### State System Fixes

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been founds and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

#### Extend Declaration

The Salt States have also gained the `extend` declaration. This declaration allows for states to be cleanly modified in a post environment. Simply said, if there is an `apache.sls` file that declares the `apache` service, then another `sls` can include `apache` and then extend it:

```
include:
  - apache

extend:
  apache:
    service:
      - require:
        - pkg: mod_python

mod_python:
  pkg:
    - installed
```

The notable behavior with the `extend` functionality is that it literally extends or overwrites a declaration set up in another `sls` module. This means that Salt will behave as though the modifications were made directly to the `apache.sls`. This ensures that the `apache` service in this example is directly tied to all requirements.

## Highstate Structure Specification

This release comes with a clear specification of the Highstate data structure that is used to declare Salt States. This specification explains everything that can be declared in the Salt SLS modules.

The specification is extremely simple, and illustrates how Salt has been able to fulfill the requirements of a central configuration manager within a simple and easy to understand format and specification.

## SheBang Renderer Switch

It came to our attention that having many renderers means that there may be a situation where more than one State Renderer should be available within a single State Tree.

The method chosen to accomplish this was something already familiar to developers and systems administrators, a SheBang. The Python State Renderer displays this new capability.

## Python State Renderer

Until now Salt States could only be declared in yaml or json using Jinja or Mako. A new, very powerful, renderer has been added, making it possible to write Salt States in pure Python:

```
#!/py
def run():
    '''
    Install the python-mako package
    '''
    return {'include': ['python'],
           'python-mako': {'pkg': ['installed']}}
```

This renderer is used by making a run function that returns the Highstate data structure. Any capabilities of Python can be used in pure Python sls modules.

This example of a pure Python sls module is the same as this example in yaml:

```
include:
  - python

python-mako:
  pkg:
    - installed
```

## FreeBSD Support

Additional support has been added for FreeBSD, this is Salt's first branch out of the Linux world and proves the viability of Salt on non-Linux platforms.

Salt remote execution already worked on FreeBSD, and should work without issue on any Unix-like platform. But this support comes in the form of package management and user support, so Salt States also work on FreeBSD now.

The new freedbpdkg module provides package management support for FreeBSD and the new pw\_user and pw\_group provide user and group management.

## Module and State Additions

### Cron Support

Support for managing the system crontab has been added, declaring a cron state can be done easily:

```
date > /tmp/datestamp:
cron:
  - present
  - user: fred
  - minute: 5
  - hour: 3
```

### File State Additions

The file state has been given a number of new features, primarily the directory, recurse, symlink, and absent functions.

**file.directory** Make sure that a directory exists and has the right permissions.

```
/srv/foo:
file:
  - directory
  - user: root
  - group: root
  - mode: 1755
```

**file.symlink** Make a symlink.

```
/var/lib/www:
file:
  - symlink
  - target: /srv/www
  - force: True
```

**file.recurse** The recurse state function will recursively download a directory on the master file server and place it on the minion. Any change in the files on the master will be pushed to the minion. The recurse function is very powerful and has been tested by pushing out the full Linux kernel source.

```
/opt/code:
file:
  - recurse
  - source: salt://linux
```

**file.absent** Make sure that the file is not on the system, recursively deletes directories, files, and symlinks.

```
/etc/httpd/conf.d/somebogusfile.conf:
file:
  - absent
```

### Sysctl Module and State

The sysctl module and state allows for sysctl components in the kernel to be managed easily. the sysctl module contains the following functions:

**sysctl.show** Return a list of sysctl parameters for this minion

**sysctl.get** Return a single sysctl parameter for this minion

**sysctl.assign** Assign a single sysctl parameter for this minion

**sysctl.persist** Assign and persist a simple sysctl parameter for this minion

The sysctl state allows for sysctl parameters to be assigned:

```
vm.swappiness:
  sysctl:
    - present
    - value: 20
```

### Kernel Module Management

A module for managing Linux kernel modules has been added. The new functions are as follows:

**kmod.available** Return a list of all available kernel modules

**kmod.check\_available** Check to see if the specified kernel module is available

**kmod.lsmmod** Return a dict containing information about currently loaded modules

**kmod.load** Load the specified kernel module

**kmod.remove** Unload the specified kernel module

The kmod state can enforce modules be either present or absent:

```
kvm_intel:
  kmod:
    - present
```

### Ssh Authorized Keys

The ssh\_auth state can distribute ssh authorized keys out to minions. Ssh authorized keys can be present or absent.

```
AAAAB3NzaC1kc3MAAACBAL0sQ9fJ5bYTEyYvLRBsJdD0o49CNfhLWHXQRquL6rwL4KIuPrhY7hBw0tV7UNC7J9IZRN04iGod9C+
ssh_auth:
  - present
  - user: frank
  - enc: dsa
  - comment: 'Frank's key'
```

## 37.2.86 Salt 0.9.4 Release Notes

release 2011-11-27

Salt 0.9.4 has arrived. This is a critical update that repairs a number of key bugs found in 0.9.3. But this update is not without feature additions as well! 0.9.4 adds support for Gentoo portage to the pkg module and state system. Also there are 2 major new state additions, the failhard option and the ability to set up finite state ordering with the order option.

This release also sees our largest increase in community contributions. These contributors have and continue to be the life blood of the Salt project, and the team continues to grow. I want to put out a big thanks to our new and existing contributors.

### Download!

The Salt source can be downloaded from the salt GitHub site:

<https://cloud.github.com/downloads/saltstack/salt/salt-0.9.4.tar.gz>

Or from PyPI:

<https://pypi.python.org/packages/source/s/salt/salt-0.9.4.tar.gz>

For instructions on how to set up Salt please see the *Installation* instructions.

### New Features

#### Failhard State Option

Normally, when a state fails Salt continues to execute the remainder of the defined states and will only refuse to execute states that require the failed state.

But the situation may exist, where you would want all state execution to stop if a single state execution fails. The capability to do this is called *failing hard*.

**State Level Failhard** A single state can have a failhard set, this means that if this individual state fails that all state execution will immediately stop. This is a great thing to do if there is a state that sets up a critical config file and setting a require for each state that reads the config would be cumbersome. A good example of this would be setting up a package manager early on:

```
/etc/yum.repos.d/company.repo:
file:
- managed
- source: salt://company/yumrepo.conf
- user: root
- group: root
- mode: 644
- order: 1
- failhard: True
```

In this situation, the yum repo is going to be configured before other states, and if it fails to lay down the config file, than no other states will be executed.

**Global Failhard** It may be desired to have failhard be applied to every state that is executed, if this is the case, then failhard can be set in the master configuration file. Setting failhard in the master configuration file will result in failing hard when any minion gathering states from the master have a state fail.

This is NOT the default behavior, normally Salt will only fail states that require a failed state.

Using the global failhard is generally not recommended, since it can result in states not being executed or even checked. It can also be confusing to see states failhard if an admin is not actively aware that the failhard has been set.

To use the global failhard set failhard: True in the master configuration

### Finite Ordering of State Execution

When creating salt sls files, it is often important to ensure that they run in a specific order. While states will always execute in the same order, that order is not necessarily defined the way you want it.

A few tools exist in Salt to set up the correct state ordering, these tools consist of requisite declarations and order options.

**The Order Option** Before using the order option, remember that the majority of state ordering should be done with requisite statements, and that a requisite statement will override an order option.

The order option is used by adding an order number to a state declaration with the option *order*:

```
vim:
  pkg:
    - installed
    - order: 1
```

By adding the order option to *1* this ensures that the vim package will be installed in tandem with any other state declaration set to the order *1*.

Any state declared without an order option will be executed after all states with order options are executed.

But this construct can only handle ordering states from the beginning. Sometimes you may want to send a state to the end of the line, to do this set the order to last:

```
vim:
  pkg:
    - installed
    - order: last
```

Substantial testing has gone into the state system and it is ready for real world usage. A great deal has been added to the documentation for states and the modules and functions available to states have been cleanly documented.

A number of State System bugs have also been found and repaired, the output from the state system has also been refined to be extremely clear and concise.

Error reporting has also been introduced, issues found in sls files will now be clearly reported when executing Salt States.

### Gentoo Support

Additional experimental support has been added for Gentoo. This is found in the contribution from Doug Renn, aka nestegg.

## 37.2.87 Salt 0.9.5 Release Notes

release 2012-01-15

Salt 0.9.5 is one of the largest steps forward in the development of Salt.

0.9.5 comes with many milestones, this release has seen the community of developers grow out to an international team of 46 code contributors and has many feature additions, feature enhancements, bug fixes and speed improvements.

**Warning:** Be sure to *read the upgrade instructions* about the switch to msgpack before upgrading!

### Community

Nothing has proven to have more value to the development of Salt than the outstanding community that has been growing at such a great pace around Salt. This has proven not only that Salt has great value, but also the expandability of Salt is as exponential as I originally intended.

0.9.5 has received over 600 additional commits since 0.9.4 with a swath of new committers. The following individuals have contributed to the development of 0.9.5:

- Aaron Bull Schaefer
- Antti Kaihola
- Bas Tichelaar
- Brad Barden
- Brian Wagner
- Byron Clark
- Chris Scheller
- Christer Edwards
- Clint Savage
- Corey Quinn
- David Boucha
- Eivind Uggedal
- Eric Poelke
- Evan Borgstrom
- Jed Glazner
- Jeff Schroeder
- Jeffrey C. Ollie
- Jonas Buckner
- Kent Tenney
- Martin Schnabel
- Maxim Burgerhout
- Mitch Anderson

- Nathaniel Whiteinge
- Seth House
- Thomas S Hatch
- Thomas Schreiber
- Tor Hveem
- lzyeval
- syphernl

This makes 21 new developers since 0.9.4 was released!

To keep up with the growing community follow Salt on Ohloh (<http://www.ohloh.net/p/salt>), to join the Salt development community, fork Salt on GitHub, and get coding (<https://github.com/saltstack/salt>)!

## Major Features

### SPEED! Pickle to msgpack

For a few months now we have been talking about moving away from Python pickles for network serialization, but a preferred serialization format had not yet been found. After an extensive performance testing period involving everything from JSON to protocol buffers, a clear winner emerged. Message Pack (<http://msgpack.org/>) proved to not only be the fastest and most compact, but also the most "salt like". Message Pack is simple, and the code involved is very small. The msgpack library for Python has been added directly to Salt.

This move introduces a few changes to Salt. First off, Salt is no longer a "noarch" package, since the msgpack lib is written in C. Salt 0.9.5 will also have compatibility issues with 0.9.4 with the default configuration.

We have gone through great lengths to avoid backwards compatibility issues with Salt, but changing the serialization medium was going to create issues regardless. Salt 0.9.5 is somewhat backwards compatible with earlier minions. A 0.9.5 master can command older minions, but only if the `serial` config value in the master is set to `pickle`. This will tell the master to publish messages in pickle format and will allow the master to receive messages in both msgpack and pickle formats.

Therefore **the suggested methods for upgrading** are either to just upgrade everything at once, or:

1. Upgrade the master to 0.9.5
2. Set `serial` to `pickle` in the master config
3. Upgrade the minions
4. Remove the `serial` option from the master config

Since pickles can be used as a security exploit the ability for a master to accept pickles from minions at all will be removed in a future release.

### C Bindings for YAML

All of the YAML rendering is now done with the YAML C bindings. This speeds up all of the sls files when running states.

### Experimental Windows Support

David Boucha has worked tirelessly to bring initial support to Salt for Microsoft Windows operating systems. Right now the Salt Minion can run as a native Windows service and accept commands.

In the weeks and months to come Windows will receive the full treatment and will have support for Salt States and more robust support for managing Windows systems. This is a big step forward for Salt to move entirely outside of the Unix world, and proves Salt is a viable cross platform solution. Big Thanks to Dave for his contribution here!

### Dynamic Module Distribution

Many Salt users have expressed the desire to have Salt distribute in-house modules, states, renderers, returners, and grains. This support has been added in a number of ways:

**Modules via States** Now when salt modules are deployed to a minion via the state system as a file, then the modules will be automatically loaded into the active running minion - no restart required - and into the active running state. So custom state modules can be deployed and used in the same state run.

**Modules via Module Environment Directories** Under the `file_roots` each environment can now have directories that are used to deploy large groups of modules. These directories sync modules at the beginning of a state run on the minion, or can be manually synced via the Salt module `salt.modules.saltutil.sync_all`.

The directories are named:

- `_modules`
- `_states`
- `_grains`
- `_renderers`
- `_returners`

The modules are pushed to their respective scopes on the minions.

### Module Reloading

Modules can now be reloaded without restarting the minion, this is done by calling the `salt.modules.sys.reload_modules` function.

But wait, there's more! Now when a salt module of any type is added via states the modules will be automatically reloaded, allowing for modules to be laid down with states and then immediately used.

Finally, all modules are reloaded when modules are dynamically distributed from the salt master.

### Enable / Disable Added to Service

A great deal of demand has existed for adding the capability to set services to be started at boot in the service module. This feature also comes with an overhaul of the service modules and initial systemd support.

This means that the `service state` can now accept - `enable: True` to make sure a service is enabled at boot, and - `enable: False` to make sure it is disabled.

## Compound Target

A new target type has been added to the lineup, the compound target. In previous versions the desired minions could only be targeted via a single specific target type, but now many target specifications can be declared.

These targets can also be separated by and/or operators, so certain properties can be used to omit a node:

```
salt -C 'webserv* and G@os:Debian or E@db.*' test.ping
```

will match all minions with ids starting with webserv via a glob and minions matching the `os:Debian` grain. Or minions that match the `db.*` regular expression.

## Node Groups

Often the convenience of having a predefined group of minions to execute targets on is desired. This can be accomplished with the new nodegroups feature. Nodegroups allow for predefined compound targets to be declared in the master configuration file:

```
nodegroups:
  group1: 'L@foo.domain.com,bar.domain.com,baz.domain.com and bl*.domain.com'
  group2: 'G@os:Debian and foo.domain.com'
```

And then used via the `-N` option:

```
salt -N group1 test.ping
```

## Minion Side Data Store

The data module introduces the initial approach into storing persistent data on the minions, specific to the minions. This allows for data to be stored on minions that can be accessed from the master or from the minion.

The Minion datastore is young, and will eventually provide an interface similar to a more mature key/value pair server.

## Major Grains Improvement

The Salt grains have been overhauled to include a massive amount of extra data. this includes hardware data, os data and salt specific data.

## Salt -Q is Useful Now

In the past the salt query system, which would display the data from recent executions would be displayed in pure Python, and it was unreadable.

0.9.5 has added the outputter system to the `-Q` option, thus enabling the salt query system to return readable output.

## Packaging Updates

Huge strides have been made in packaging Salt for distributions. These additions are thanks to our wonderful community where the work to set up packages has proceeded tirelessly.

## **FreeBSD**

Salt on FreeBSD? There a port for that:

<http://svnweb.freebsd.org/ports/head/sysutils/py-salt/>

This port was developed and added by Christer Edwards. This also marks the first time Salt has been included in an upstream packaging system!

## **Fedora and Red Hat Enterprise**

Salt packages have been prepared for inclusion in the Fedora Project and in EPEL for Red Hat Enterprise 5 and 6. These packages are the result of the efforts made by Clint Savage (herlo).

## **Debian/Ubuntu**

A team of many contributors have assisted in developing packages for Debian and Ubuntu. Salt is still actively seeking inclusion in upstream Debian and Ubuntu and the package data that has been prepared is being pushed through the needed channels for inclusion.

These packages have been prepared with the help of:

- Corey
- Aaron Toponce
- and`

## **More to Come**

We are actively seeking inclusion in more distributions. Primarily getting Salt into Gentoo, SUSE, OpenBSD, and preparing Solaris support are all turning into higher priorities.

## **Refinement**

Salt continues to be refined into a faster, more stable and more usable application. 0.9.5 comes with more debug logging, more bug fixes and more complete support.

## **More Testing, More BugFixes**

0.9.5 comes with more bugfixes due to more testing than any previous release. The growing community and the introduction a a dedicated QA environment have unearthed many issues that were hiding under the covers. This has further refined and cleaned the state interface, taking care of things from minor visual issues to repairing misleading data.

## **Custom Exceptions**

A custom exception module has been added to throw salt specific exceptions. This allows Salt to give much more granular error information.

## New Modules

**data** The new data module manages a persistent datastore on the minion. Big thanks to bastichelaar for his help refining this module

**frebsdckmod** FreeBSD kernel modules can now be managed in the same way Salt handles Linux kernel modules. This module was contributed thanks to the efforts of Christer Edwards

**gentoo\_service** Support has been added for managing services in Gentoo. Now Gentoo services can be started, stopped, restarted, enabled, disabled, and viewed.

**pip** The pip module introduces management for pip installed applications. Thanks goes to whitinge for the addition of the pip module

**rh\_service** The rh\_service module enables Red Hat and Fedora specific service management. Now Red Hat like systems come with extensive management of the classic init system used by Red Hat

**saltutil** The saltutil module has been added as a place to hold functions used in the maintenance and management of salt itself. Saltutil is used to salt the salt minion. The saltutil module is presently used only to sync extension modules from the master server.

**systemd** Systemd support has been added to Salt, now systems using this next generation init system are supported on systems running systemd.

**virtualenv** The virtualenv module has been added to allow salt to create virtual Python environments. Thanks goes to whitinge for the addition of the virtualenv module

**win\_disk** Support for gathering disk information on Microsoft Windows minions The windows modules come courtesy of Utah\_Dave

**win\_service** The win\_service module adds service support to Salt for Microsoft Windows services

**win\_useradd** Salt can now manage local users on Microsoft Windows Systems

**yumpkg5** The yumpkg module introduces in 0.9.4 uses the yum API to interact with the yum package manager. Unfortunately, on Red Hat 5 systems salt does not have access to the yum API because the yum API is running under Python 2.4 and Salt needs to run under Python 2.6.

The yumpkg5 module bypasses this issue by shelling out to yum on systems where the yum API is not available.

## New States

**mysql\_database** The new mysql\_database state adds the ability to systems running a mysql server to manage the existence of mysql databases.

The mysql states are thanks to syphernl

**mysql\_user** The `mysql_user` state enables mysql user management.

**virtualenv** The `virtualenv` state can manage the state of Python virtual environments. Thanks to Whitinge for the `virtualenv` state

#### New Returners

**cassandra\_returner** A returner allowing Salt to send data to a cassandra server. Thanks to Byron Clark for contributing this returner

## 37.2.88 Salt 0.9.6 Release Notes

**release** 2012-01-21

Salt 0.9.6 is a release targeting a few bugs and changes. This is primarily targeting an issue found in the names declaration in the state system. But a few other bugs were also repaired, like missing support for grains in `extmods`.

Due to a conflict in distribution packaging `msgpack` will no longer be bundled with Salt, and is required as a dependency.

#### New Features

##### HTTP and ftp support in `files.managed`

Now under the `source` option in the `file.managed` state a HTTP or ftp address can be used instead of a file located on the salt master.

##### Allow Multiple Returners

Now the returner interface can define multiple returners, and will also return data back to the master, making the process less ambiguous.

##### Minion Memory Improvements

A number of modules have been taken out of the minion if the underlying systems required by said modules are not present on the minion system. A number of other modules need to be stripped out in this same way which should continue to make the minion more efficient.

##### Minions Can Locally Cache Return Data

A new option, `cache_jobs`, has been added to the minion to allow for all of the historically run jobs to cache on the minion, allowing for looking up historic returns. By default `cache_jobs` is set to `False`.

##### Pure Python Template Support For `file.managed`

Templates in the `file.managed` state can now be defined in a Python script. This script needs to have a `run` function that returns the string that needs to be in the named file.

## 37.2.89 Salt 0.9.7 Release Notes

**release** 2012-02-15

Salt 0.9.7 is here! The latest iteration of Salt brings more features and many fixes. This release is a great refinement over 0.9.6, adding many conveniences under the hood, as well as some features that make working with Salt much better.

A few highlights include the new Job system, refinements to the requisite system in states, the `mod_init` interface for states, external node classification, search path to managed files in the file state, and refinements and additions to dynamic module loading.

0.9.7 also introduces the long developed (and oft changed) unit test framework and the initial unit tests.

### Major Features

#### Salt Jobs Interface

The new jobs interface makes the management of running executions much cleaner and more transparent. Building on the existing execution framework the jobs system allows clear introspection into the active running state of the running Salt interface.

The Jobs interface is centered in the new minion side proc system. The minions now store msgpack serialized files under `/var/cache/salt/proc`. These files keep track of the active state of processes on the minion.

**Functions in the saltutil Module** A number of functions have been added to the saltutil module to manage and view the jobs:

`running` - Returns the data of all running jobs that are found in the proc directory.

`find_job` - Returns specific data about a certain job based on job id.

`signal_job` - Allows for a given jid to be sent a signal.

`term_job` - Sends a termination signal (SIGTERM, 15) to the process controlling the specified job.

`kill_job` Sends a kill signal (SIGKILL, 9) to the process controlling the specified job.

#### The jobs Runner

A convenience runner front end and reporting system has been added as well. The jobs runner contains functions to make viewing data easier and cleaner.

The jobs runner contains a number of functions...

**active** The active function runs `saltutil.running` on all minions and formats the return data about all running jobs in a much more usable and compact format. The active function will also compare jobs that have returned and jobs that are still running, making it easier to see what systems have completed a job and what systems are still being waited on.

**lookup\_jid** When jobs are executed the return data is sent back to the master and cached. By default is is cached for 24 hours, but this can be configured via the `keep_jobs` option in the master configuration.

Using the `lookup_jid` runner will display the same return data that the initial job invocation with the salt command would display.

`list_jobs` Before finding a historic job, it may be required to find the job id. `list_jobs` will parse the cached execution data and display all of the job data for jobs that have already, or partially returned.

### External Node Classification

Salt can now use external node classifiers like Cobbler's `cobbler-ext-nodes`.

Salt uses specific data from the external node classifier. In particular the `classes` value denotes which sls modules to run, and the `environment` value sets to another environment.

An external node classification can be set in the master configuration file via the `external_nodes` option: <http://salt.readthedocs.org/en/latest/ref/configuration/master.html#external-nodes>

External nodes are loaded in addition to the top files. If it is intended to only use external nodes, do not deploy any top files.

### State Mod Init System

An issue arose with the `pkg` state. Every time a package was run Salt would need to refresh the package database. This made systems with slower package metadata refresh speeds much slower to work with. To alleviate this issue the `mod_init` interface has been added to salt states.

The `mod_init` interface is a function that can be added to a state file. This function is called with the first state called. In the case of the `pkg` state, the `mod_init` function sets up a tag which makes the package database only refresh on the first attempt to install a package.

In a nutshell, the `mod_init` interface allows a state to run any command that only needs to be run once, or can be used to set up an environment for working with the state.

### Source File Search Path

The file state continues to be refined, adding speed and capabilities. This release adds the ability to pass a list to the `source` option. This list is then iterated over until the source file is found, and the first found file is used.

The new syntax looks like this:

```
/etc/httpd/conf/httpd.conf:
  file:
    - managed
    - source:
      - salt://httpd/httpd.conf
      - http://myserver/httpd.conf: md5=8c1fe119e6f1fd96bc06614473509bf1
```

The `source` option can take sources in the list from the salt file server as well as an arbitrary web source. If using an arbitrary web source the checksum needs to be passed as well for file verification.

### Refinements to the Requisite System

A few discrepancies were still lingering in the requisite system, in particular, it was not possible to have a `require` and a `watch` requisite declared in the same state declaration.

This issue has been alleviated, as well as making the requisite system run more quickly.

### Initial Unit Testing Framework

Because of the module system, and the need to test real scenarios, the development of a viable unit testing system has been difficult, but unit testing has finally arrived. Only a small amount of unit testing coverage has been developed, much more coverage will be in place soon.

A huge thanks goes out to those who have helped with unit testing, and the contributions that have been made to get us where we are. Without these contributions unit tests would still be in the dark.

### Compound Targets Expanded

Originally only support for `and` and `or` were available in the compound target. 0.9.7 adds the capability to negate compound targets with `not`.

### Nodegroups in the Top File

Previously the nodegroups defined in the master configuration file could not be used to match nodes for states. The nodegroups support has been expanded and the nodegroups defined in the master configuration can now be used to match minions in the top file.

## 37.2.90 Salt 0.9.8 Release Notes

`release` 2012-03-21

Salt 0.9.8 is a big step forward, with many additions and enhancements, as well as a number of precursors to advanced future developments.

This version of Salt adds much more power to the command line, making the old hard timeout issues a thing of the past and adds keyword argument support. These additions are also available in the salt client API, making the available API tools much more powerful.

The new pillar system allows for data to be stored on the master and assigned to minions in a granular way similar to the state system. It also allows flexibility for users who want to keep data out of their state tree similar to 'external lookup' functionality in other tools.

A new way to extend requisites was added, the ``requisite in" statement. This makes adding requires or watch statements to external state decs much easier.

Additions to requisites making them much more powerful have been added as well as improved error checking for sls files in the state system. A new provider system has been added to allow for redirecting what modules run in the background for individual states.

Support for OpenSUSE has been added and support for Solaris has begun serious development. Windows support has been significantly enhanced as well.

The matcher and target systems have received a great deal of attention. The default behavior of grain matching has changed slightly to reflect the rest of salt and the compound matcher system has been refined.

A number of impressive features with keyword arguments have been added to both the CLI and to the state system. This makes states much more powerful and flexible while maintaining the simple configuration everyone loves.

The new batch size capability allows for executions to be rolled through a group of targeted minions a percentage or specific number at a time. This was added to prevent the ``thundering herd" problem when targeting large numbers of minions for things like service restarts or file downloads.

## Upgrade Considerations

### Upgrade Issues

There was a previously missed oversight which could cause a newer minion to crash an older master. That oversight has been resolved so the version incompatibility issue will no longer occur. When upgrading to 0.9.8 make sure to upgrade the master first, followed by the minions.

### Debian/Ubuntu Packages

The original Debian/Ubuntu packages were called salt and included all salt applications. New packages in the ppa are split by function. If an old salt package is installed then it should be manually removed and the new split packages need to be freshly installed.

On the master:

```
# apt-get purge salt
# apt-get install salt-{master,minion}
```

On the minions:

```
# apt-get purge salt
# apt-get install salt-minion
```

And on any Syndics:

```
# apt-get install salt-syndic
```

The official Salt PPA for Ubuntu is located at: <https://launchpad.net/~saltstack/+archive/salt>

## Major Features

### Pillar

**Pillar** offers an interface to declare variable data on the master that is then assigned to the minions. The pillar data is made available to all modules, states, sls files etc. It is compiled on the master and is declared using the existing renderer system. This means that learning pillar should be fairly trivial to those already familiar with salt states.

### CLI Additions

The `salt` command has received a serious overhaul and is more powerful than ever. Data is returned to the terminal as it is received, and the salt command will now wait for all running minions to return data before stopping. This makes adding very large `--timeout` arguments completely unnecessary and gets rid of long running operations returning empty `{}` when the timeout is exceeded.

When calling salt via sudo, the user originally running salt is saved to the log for auditing purposes. This makes it easy to see who ran what by just looking through the minion logs.

The `salt-key` command gained the `-D` and `--delete-all` arguments for removing all keys. Be careful with this one!

## Running States Without a Master

The addition of running states without a salt-master has been added to 0.9.8. This feature allows for the unmodified salt state tree to be read locally from a minion. The result is that the UNMODIFIED state tree has just become portable, allowing minions to have a local copy of states or to manage states without a master entirely.

This is accomplished via the new file client interface in Salt that allows for the `salt://` URI to be redirected to custom interfaces. This means that there are now two interfaces for the salt file server, calling the master or looking in a local, minion defined `file_roots`.

This new feature can be used by modifying the minion config to point to a local `file_roots` and setting the `file_client` option to `local`.

## Keyword Arguments and States

State modules now accept the `**kwargs` argument. This results in all data in a sls file assigned to a state being made available to the state function.

This passes data in a transparent way back to the modules executing the logic. In particular, this allows adding arguments to the `pkg.install` module that enable more advanced and granular controls with respect to what the state is capable of.

An example of this along with the new `debconf` module for installing ldap client packages on Debian:

```
ldap-client-packages:
  pkg:
    - debconf: salt://debconf/ldap-client.ans
    - installed
    - names:
      - nslcd
      - libpam-ldapd
      - libnss-ldapd
```

## Keyword Arguments and the CLI

In the past it was required that all arguments be passed in the proper order to the `salt` and `salt-call` commands. As of 0.9.8, keyword arguments can be passed in the form of `kwarg=argument`.

```
# salt -G 'type:dev' git.clone \
  repository=https://github.com/saltstack/salt.git cwd=/tmp/salt user=jeff
```

## Matcher Refinements and Changes

A number of fixes and changes have been applied to the Matcher system. The most noteworthy is the change in the grain matcher. The grain matcher used to use a regular expression to match the passed data to a grain, but now defaults to a shell glob like the majority of match interfaces in Salt. A new option is available that still uses the old style regex matching to grain data called `grain-pcre`. To use regex matching in compound matches use the letter `P`.

For example, this would match any ArchLinux or Fedora minions:

```
# salt --grain-pcre 'os:(Arch:Fed).*' test.ping
```

And the associated compound matcher suitable for `top.sls` is *P*:

```
P@os: (Arch|Fed) .*
```

**NOTE:** Changing the grains matcher from `pcre` to `glob` is backwards incompatible.

Support has been added for matching minions with Yahoo's range library. This is handled by passing range syntax with `-R` or `--range` arguments to salt.

More information at: <https://github.com/ytoolshed/range/wiki/%22yamlfile%22-module-file-spec>

### Requisite `in`

A new means to updating requisite statements has been added to make adding watchers and requires to external states easier. Before 0.9.8 the only way to extend the states that were watched by a state outside of the sls was to use an `extend` statement:

```
include:
  - http
extend:
  apache:
    service:
      - watch:
        - pkg: tomcat
tomcat:
  pkg:
    - installed
```

But the new `Requisite in` statement allows for easier extends for requisites:

```
include:
  - http

tomcat:
  pkg:
    - installed
    - watch_in:
      - service: apache
```

`Requisite in` is part of the `extend` system, so still remember to always include the sls that is being extended!

### Providers

Salt predetermines what modules should be mapped to what uses based on the properties of a system. These determinations are generally made for modules that provide things like package and service management. The `apt` module maps to `pkg` on Debian and the `yum` module maps to `pkg` on Fedora for instance.

Sometimes in states, it may be necessary for a non-default module to be used for the desired functionality. For instance, an Arch Linux system may have been set up with `systemd` support. Instead of using the default `service` module detected for Arch Linux, the `systemd` module can be used:

```
http:
  service:
    - running
```

```
- enable: True
- provider: systemd
```

Default providers can also be defined in the minion config file:

```
providers:
  service: systemd
```

When default providers are passed in the minion config, then those providers will be applied to all functionality in Salt, this means that the functions called by the minion will use these modules, as well as states.

### Requisite Glob Matching

Requisites can now be defined with glob expansion. This means that if there are many requisites, they can be defined on a single line.

To watch all files in a directory:

```
http:
  service:
    - running
    - enable: True
    - watch:
      - file: /etc/http/conf.d/*
```

This example will watch all defined files that match the glob `/etc/http/conf.d/*`

### Batch Size

The new batch size option allows commands to be executed while maintaining that only so many hosts are executing the command at one time. This option can take a percentage or a finite number:

```
salt '*' -b 10 test.ping

salt -G 'os:RedHat' --batch-size 25% apache.signal restart
```

This will only run `test.ping` on 10 of the targeted minions at a time and then restart `apache` on 25% of the minions matching `os:RedHat` at a time and work through them all until the task is complete. This makes jobs like rolling web server restarts behind a load balancer or doing maintenance on BSD firewalls using `carp` much easier with salt.

### Module Updates

This is a list of notable, but non-exhaustive updates with new and existing modules.

Windows support has seen a flurry of support this release cycle. We've gained all new `file`, `network`, and `shadow` modules. Please note that these are still a work in progress.

For our ruby users, new `rvm` and `gem` modules have been added along with the associated states

The `virt` module gained basic Xen support.

The `yum` module gained Scientific Linux support.

The `pkg` module on Debian, Ubuntu, and derivatives force `apt` to run in a non-interactive mode. This prevents issues when package installation waits for confirmation.

A `pkg` module for OpenSUSE's zypper was added.

The `service` module on Ubuntu natively supports `upstart`.

A new `debconf` module was contributed by our community for more advanced control over deb package deployments on Debian based distributions.

The `mysql.user` state and `mysql` module gained a `password_hash` argument.

The `cmd` module and state gained a `shell` keyword argument for specifying a shell other than `/bin/sh` on Linux / Unix systems.

New `git` and `mercurial` modules have been added for fans of distributed version control.

## In Progress Development

### Master Side State Compiling

While we feel strongly that the advantages gained with minion side state compiling are very critical, it does prevent certain features that may be desired. 0.9.8 has support for initial master side state compiling, but many more components still need to be developed, it is hoped that these can be finished for 0.9.9.

The goal is that states can be compiled on both the master and the minion allowing for compilation to be split between master and minion. Why will this be great? It will allow storing sensitive data on the master and sending it to some minions without all minions having access to it. This will be good for handling ssl certificates on front-end web servers for instance.

### Solaris Support

Salt 0.9.8 sees the introduction of basic Solaris support. The daemon runs well, but grains and more of the modules need updating and testing.

### Windows Support

Salt states on windows are now much more viable thanks to contributions from our community! States for file, service, local user, and local group management are more fully fleshed out along with network and disk modules. Windows users can also now manage registry entries using the new `reg` module.

## 37.2.91 Salt 0.9.9 Release Notes

**release** 2012-04-27

0.9.9 is out and comes with some serious bug fixes and even more serious features. This release is the last major feature release before 1.0.0 and could be considered the 1.0.0 release candidate.

A few updates include more advanced kwargs support, the ability for salt states to more safely configure a running salt minion, better job directory management and the new state test interface.

Many new tests have been added as well, including the new minion swarm test that allows for easier testing of Salt working with large groups of minions. This means that if you have experienced stability issues with Salt before, particularly in larger deployments, that these bugs have been tested for, found, and killed.

## Major Features

### State Test Interface

Until 0.9.9 the only option when running states to see what was going to be changed was to print out the highstate with `state.show_highstate` and manually look it over. But now states can be run to discover what is going to be changed.

Passing the option `test=True` to many of the state functions will now cause the salt state system to only check for what is going to be changed and report on those changes.

```
salt '*' state.highstate test=True
```

Now states that would have made changes report them back in yellow.

### State Syntax Update

A shorthand syntax has been added to sls files, and it will be the default syntax in documentation going forward. The old syntax is still fully supported and will not be deprecated, but it is recommended to move to the new syntax in the future. This change moves the state function up into the state name using a dot notation. This is in-line with how state functions are generally referred to as well:

The new way:

```
/etc/sudoers:
  file.present:
    - source: salt://sudo/sudoers
    - user: root
    - mode: 400
```

### Use and Use\_in Requisites

Two new requisite statements are available in 0.9.9. The `use` and `use_in` requisite and `requisite-in` allow for the transparent duplication of data between states. When a state ``uses" another state it copies the other state's arguments as defaults. This was created in direct response to the new network state, and allows for many network interfaces to be configured in the same way easily. A simple example:

```
root_file:
  file.absent:
    - name: /tmp/nothing
    - user: root
    - mode: 644
    - group: root
    - use_in:
      - file: /etc/vimrc

fred_file:
  file.absent:
    - name: /tmp/nothing
    - user: fred
    - group: marketing
    - mode: 660

/files/marketing/district7.rst:
```

```

file.present:
  - source: salt://marketing/district7.rst
  - template: jinja
  - use:
    - file: fred_file

/etc/vimrc:
  file.present:
    - source: salt://edit/vimrc

```

This makes the 2 lower state decs inherit the options from their respectively ``used" state decs.

### Network State

The new network state allows for the configuration of network devices via salt states and the ip salt module. This addition has been given to the project by Jeff Hutchins and Bret Palsson from Jive Communications.

Currently the only network configuration backend available is for Red Hat based systems, like Red Hat Enterprise, CentOS, and Fedora.

### Exponential Jobs

Originally the jobs executed were stored on the master in the format: <cachedir>/jobs/jid/{minion ids} But this format restricted the number of jobs in the cache to the number of subdirectories allowed on the filesystem. Ext3 for instance limits subdirectories to 32000. To combat this the new format for 0.9.9 is: <cachedir>/jobs/jid\_hash[:2]/jid\_hash[2:]/{minion ids} So that now the number of maximum jobs that can be run before the cleanup cycle hits the job directory is substantially higher.

### ssh\_auth Additions

The original ssh\_auth state was limited to accepting only arguments to apply to a public key, and the key itself. This was restrictive due to the way the we learned that many people were using the state, so the key section has been expanded to accept options and arguments to the key that over ride arguments passed in the state. This gives substantial power to using ssh\_auth with names:

```

sshkeys:
  ssh_auth:
    - present
    - user: backup
    - enc: ssh-dss
    - options:
      - option1="value1"
      - option2="value2 flag2"
    - comment: backup
    - names:
      - AAAAB3NzaC1yc2EAAAABIwAAAQEAlY26SMFFVY5YJvnL7AF5CRTPtAigSW1U887ASfBt6FDa7Qr1Yd05ochiLoz8aSi
      - AAAAB3NzaC1yc2EAAAABIwAAAQEAlY26SMFFVY5YJvnL7AF5CRTPtAigSW1U887ASfBt6FDa7Qr1Yd05ochiLoz8aSi
      - ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAlY26SMFFVY5YJvnL7AF5CRTPtAigSW1U887ASfBt6FDa7Qr1Yd05och
      - ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAlY26SMFFVY5YJvnL7AF5CRTPtAigSW1U887ASfBt6FDa7Qr1Yd05och
      - option3="value3",option4="value4 flag4" ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAlY26SMFFVY5YJvnL
      - option3="value3" ssh-rsa AAAAB3NzaC1yc2EAAAABIwAAAQEAlY26SMFFVY5YJvnL7AF5CRTPtAigSW1U887ASf

```

### LocalClient Additions

To follow up the recent additions in 0.9.8 of additional kwargs support, 0.9.9 also adds the capability to send kwargs into commands via a dict. This addition to the LocalClient api can be used like so:

```
import salt.client

client = salt.client.LocalClient('/etc/salt/master')
ret = client.cmd('*', 'cmd.run', ['ls -l'], kwarg={'cwd': '/etc'})
```

This update has been added to all cmd methods in the LocalClient class.

### Better Self Salting

One problem faced with running Salt states, is that it has been difficult to manage the Salt minion via states, this is due to the fact that if the minion is called to restart while a state run is happening then the state run would be killed. 0.9.9 slightly changes the process scope of the state runs, so now when salt is executing states it can safely restart the salt-minion daemon.

In addition to daemonizing the state run, the apt module also daemonizes. This update makes it possible to cleanly update the salt-minion package on Debian/Ubuntu systems without leaving apt in an inconsistent state or killing the active minion process mid-execution.

### Wildcards for SLS Modules

Now, when including sls modules in include statements or in the top file, shell globs can be used. This can greatly simplify listing matched sls modules in the top file and include statements:

```
base:
  '*':
    - files*
    - core*
```

```
include:
  - users.dev.*
  - apache.ser*
```

### External Pillar

Since the pillar data is just, data, it does not need to come expressly from the pillar interface. The external pillar system allows for hooks to be added making it possible to extract pillar data from any arbitrary external interface. The external pillar interface is configured via the `ext_pillar` option. Currently interfaces exist to gather external pillar data via hiera or via a shell command that sends yaml data to the terminal:

```
ext_pillar:
  - cmd_yaml: cat /etc/salt/ext.yaml
  - hiera: /etc/hiera.yaml
```

The initial external pillar interfaces and extra interfaces can be added to the file `salt/pillar.py`, it is planned to add more external pillar interfaces. If the need arises a new module loader interface will be created in the future to manage external pillar interfaces.

### Single State Executions

The new `state.single` function allows for single states to be cleanly executed. This is a great tool for setting up a small group of states on a system or for testing out the behavior of single states:

```
salt '*' state.single user.present name=wade uid=2000
```

The test interface functions here as well, so changes can also be tested against as:

```
salt '*' state.single user.present name=wade uid=2000 test=True
```

### New Tests

A few exciting new test interfaces have been added, the minion swarm allows not only testing of larger loads, but also allows users to see how Salt behaves with large groups of minions without having to create a large deployment.

### Minion Swarm

The minion swarm test system allows for large groups of minions to be tested against easily without requiring large numbers of servers or virtual machines. The minion swarm creates as many minions as a system can handle and roots them in the `/tmp` directory and connects them to a master.

The benefit here is that we were able to replicate issues that happen only when there are large numbers of minions. A number of elusive bugs which were causing stability issues in masters and minions have since been hunted down. Bugs that used to take careful watch by users over several days can now be reliably replicated in minutes, and fixed in minutes.

Using the swarm is easy, make sure a master is up for the swarm to connect to, and then use the `minionswarm.py` script in the `tests` directory to spin up as many minions as you want. Remember, this is a fork bomb, don't spin up more than your hardware can handle!

```
python minionswarm.py -m 20 --master salt-master
```

### Shell Tests

The new Shell testing system allows us to test the behavior of commands executed from a high level. This allows for the high level testing of salt runners and commands like `salt-key`.

### Client Tests

Tests have been added to test the aspects of the client APIs and ensure that the client calls work, and that they manage passed data, in a desirable way.

---

## Salt Based Projects

---

A number of unofficial open source projects, based on Salt, or written to enhance Salt have been created.

### 38.1 Salt Sandbox

Created by Aaron Bull Schaefer, aka ``elasticdog".

<https://github.com/elasticdog/salt-sandbox>

Salt Sandbox is a multi-VM Vagrant-based Salt development environment used for creating and testing new Salt state modules outside of your production environment. It's also a great way to learn firsthand about Salt and its remote execution capabilities.

Salt Sandbox will set up three separate virtual machines:

- salt.example.com - the Salt master server
- minion1.example.com - the first Salt minion machine
- minion2.example.com - the second Salt minion machine

These VMs can be used in conjunction to segregate and test your modules based on node groups, top file environments, grain values, etc. You can even test modules on different Linux distributions or release versions to better match your production infrastructure.

-----END PGP PUBLIC KEY BLOCK-----

```

The SaltStack Security Team is available at [security@saltstack.com](mailto:security@saltstack.com) for security-related bug reports or questions.

We request the disclosure of any security-related bugs or issues be reported non-publicly until such time as the issue can be resolved and a security-fix release can be prepared. At that time we will release the fix and make a public announcement with upgrade instructions and download locations.

## 39.1 Security response procedure

SaltStack takes security and the trust of our customers and users very seriously. Our disclosure policy is intended to resolve security issues as quickly and safely as is possible.

1. A security report sent to [security@saltstack.com](mailto:security@saltstack.com) is assigned to a team member. This person is the primary contact for questions and will coordinate the fix, release, and announcement.
2. The reported issue is reproduced and confirmed. A list of affected projects and releases is made.
3. Fixes are implemented for all affected projects and releases that are actively supported. Back-ports of the fix are made to any old releases that are actively supported.
4. Packagers are notified via the [salt-packagers](#) mailing list that an issue was reported and resolved, and that an announcement is incoming.
5. A new release is created and pushed to all affected repositories. The release documentation provides a full description of the issue, plus any upgrade instructions or other relevant details.
6. An announcement is made to the [salt-users](#) and [salt-announce](#) mailing lists. The announcement contains a description of the issue and a link to the full release documentation and download locations.

## 39.2 Receiving security announcements

The fastest place to receive security announcements is via the [salt-announce](#) mailing list. This list is low-traffic.

## Frequently Asked Questions

---

### FAQ

- *Frequently Asked Questions*
  - *Is Salt open-core?*
  - *I think I found a bug! What should I do?*
  - *What ports should I open on my firewall?*
  - *I'm seeing weird behavior (including but not limited to packages not installing their users properly)*
  - *My script runs every time I run a state.apply. Why?*
  - *When I run test.ping, why don't the Minions that aren't responding return anything? Returning False would be helpful.*
  - *How does Salt determine the Minion's id?*
  - *I'm trying to manage packages/services but I get an error saying that the state is not available. Why?*
  - *Why aren't my custom modules/states/etc. available on my Minions?*
  - *Module X isn't available, even though the shell command it uses is installed. Why?*
  - *Can I run different versions of Salt on my Master and Minion?*
  - *Does Salt support backing up managed files?*
  - *Is it possible to deploy a file to a specific minion, without other minions having access to it?*
  - *What is the best way to restart a Salt daemon using Salt?*
    - \* *Linux/Unix*
    - \* *Windows*
  - *Salting the Salt Master*
  - *Is Targeting using Grain Data Secure?*

### 40.1 Is Salt open-core?

No. Salt is 100% committed to being open-source, including all of our APIs. It is developed under the Apache 2.0 license, allowing it to be used in both open and proprietary projects.

To expand on this a little:

There is much argument over the actual definition of "open core". From our standpoint, Salt is open source because

1. It is a standalone product that anyone is free to use.
2. It is developed in the open with contributions accepted from the community for the good of the project.
3. There are no features of Salt itself that are restricted to separate proprietary products distributed by SaltStack, Inc.

4. Because of our Apache 2.0 license, Salt can be used as the foundation for a project or even a proprietary tool.
5. Our APIs are open and documented (any lack of documentation is an oversight as opposed to an intentional decision by SaltStack the company) and available for use by anyone.

SaltStack the company does make proprietary products which use Salt and its libraries, like company is free to do, but we do so via the APIs, NOT by forking Salt and creating a different, closed-source version of it for paying customers.

## 40.2 I think I found a bug! What should I do?

The salt-users mailing list as well as the salt IRC channel can both be helpful resources to confirm if others are seeing the issue and to assist with immediate debugging.

To report a bug to the Salt project, please follow the instructions in [reporting a bug](#).

## 40.3 What ports should I open on my firewall?

Minions need to be able to connect to the Master on TCP ports 4505 and 4506. Minions do not need any inbound ports open. More detailed information on firewall settings can be found [here](#).

## 40.4 I'm seeing weird behavior (including but not limited to packages not installing their users properly)

This is often caused by SELinux. Try disabling SELinux or putting it in permissive mode and see if the weird behavior goes away.

## 40.5 My script runs every time I run a *state.apply*. Why?

You are probably using *cmd.run* rather than *cmd.wait*. A *cmd.wait* state will only run when there has been a change in a state that it is watching.

A *cmd.run* state will run the corresponding command *every time* (unless it is prevented from running by the *unless* or *onlyif* arguments).

More details can be found in the documentation for the *cmd* states.

## 40.6 When I run *test.ping*, why don't the Minions that aren't responding return anything? Returning **False** would be helpful.

When you run *test.ping* the Master tells Minions to run commands/functions, and listens for the return data, printing it to the screen when it is received. If it doesn't receive anything back, it doesn't have anything to display for that Minion.

There are a couple options for getting information on Minions that are not responding. One is to use the verbose (*-v*) option when you run salt commands, as it will display ``Minion did not return" for any Minions which time out.

```
salt -v '*' pkg.install zsh
```

Another option is to use the *manage.down* runner:

```
salt-run manage.down
```

Also, if the Master is under heavy load, it is possible that the CLI will exit without displaying return data for all targeted Minions. However, this doesn't mean that the Minions did not return; this only means that the Salt CLI timed out waiting for a response. Minions will still send their return data back to the Master once the job completes. If any expected Minions are missing from the CLI output, the *jobs.list\_jobs* runner can be used to show the job IDs of the jobs that have been run, and the *jobs.lookup\_jid* runner can be used to get the return data for that job.

```
salt-run jobs.list_jobs
salt-run jobs.lookup_jid 20130916125524463507
```

If you find that you are often missing Minion return data on the CLI, only to find it with the jobs runners, then this may be a sign that the *worker\_threads* value may need to be increased in the master config file. Additionally, running your Salt CLI commands with the *-t* option will make Salt wait longer for the return data before the CLI command exits. For instance, the below command will wait up to 60 seconds for the Minions to return:

```
salt -t 60 '*' test.ping
```

## 40.7 How does Salt determine the Minion's id?

If the Minion id is not configured explicitly (using the *id* parameter), Salt will determine the id based on the host-name. Exactly how this is determined varies a little between operating systems and is described in detail [here](#).

## 40.8 I'm trying to manage packages/services but I get an error saying that the state is not available. Why?

Salt detects the Minion's operating system and assigns the correct package or service management module based on what is detected. However, for certain custom spins and OS derivatives this detection fails. In cases like this, an issue should be opened on our [tracker](#), with the following information:

1. The output of the following command:

```
salt <minion_id> grains.items | grep os
```

2. The contents of */etc/lsb-release*, if present on the Minion.

## 40.9 Why aren't my custom modules/states/etc. available on my Minions?

Custom modules are only synced to Minions when *state.apply*, *saltutil.sync\_modules*, or *saltutil.sync\_all* is run. Similarly, custom states are only synced to Minions when *state.apply*, *saltutil.sync\_states*, or *saltutil.sync\_all* is run.

Other custom types (renderers, outputters, etc.) have similar behavior, see the documentation for the *saltutil* module for more information.

## 40.10 Module X isn't available, even though the shell command it uses is installed. Why?

This is most likely a PATH issue. Did you custom-compile the software which the module requires? RHEL/CentOS/etc. in particular override the root user's path in `/etc/init.d/functions`, setting it to `/sbin:/usr/sbin:/bin:/usr/bin`, making software installed into `/usr/local/bin` unavailable to Salt when the Minion is started using the initscript. In version 2014.1.0, Salt will have a better solution for these sort of PATH-related issues, but recompiling the software to install it into a location within the PATH should resolve the issue in the meantime. Alternatively, you can create a symbolic link within the PATH using a *file.symlink* state.

```
/usr/bin/foo:
  file.symlink:
    - target: /usr/local/bin/foo
```

## 40.11 Can I run different versions of Salt on my Master and Minion?

This depends on the versions. In general, it is recommended that Master and Minion versions match.

When upgrading Salt, the master(s) should always be upgraded first. Backwards compatibility for minions running newer versions of salt than their masters is not guaranteed.

Whenever possible, backwards compatibility between new masters and old minions will be preserved. Generally, the only exception to this policy is in case of a security vulnerability.

Recent examples of backwards compatibility breakage include the 0.17.1 release (where all backwards compatibility was broken due to a security fix), and the 2014.1.0 release (which retained compatibility between 2014.1.0 masters and 0.17 minions, but broke compatibility for 2014.1.0 minions and older masters).

## 40.12 Does Salt support backing up managed files?

Yes. Salt provides an easy to use addition to your `file.managed` states that allow you to back up files via `backup_mode`, `backup_mode` can be configured on a per state basis, or in the minion config (note that if set in the minion config this would simply be the default method to use, you still need to specify that the file should be backed up!).

## 40.13 Is it possible to deploy a file to a specific minion, without other minions having access to it?

The Salt fileserver does not yet support access control, but it is still possible to do this. As of Salt 2015.5.0, the *file\_tree* external pillar is available, and allows the contents of a file to be loaded as Pillar data. This external pillar is capable of assigning Pillar values both to individual minions, and to *nodegroups*. See the *documentation* for details on how to set this up.

Once the external pillar has been set up, the data can be pushed to a minion via a *file.managed* state, using the `contents_pillar` argument:

```

/etc/my_super_secret_file:
  file.managed:
    - user: secret
    - group: secret
    - mode: 600
    - contents_pillar: secret_files:my_super_secret_file

```

In this example, the source file would be located in a directory called `secret_files` underneath the `file_tree` path for the minion. The syntax for specifying the pillar variable is the same one used for `pillar.get`, with a colon representing a nested dictionary.

**Warning:** Deploying binary contents using the `file.managed` state is only supported in Salt 2015.8.4 and newer.

## 40.14 What is the best way to restart a Salt daemon using Salt?

Updating the salt-minion package requires a restart of the salt-minion service. But restarting the service while in the middle of a state run interrupts the process of the minion running states and sending results back to the master. It's a tricky problem to solve, and we're working on it, but in the meantime one way of handling this (on Linux and UNIX-based operating systems) is to use `at` (a job scheduler which predates cron) to schedule a restart of the service. `at` is not installed by default on most distros, and requires a service to be running (usually called `atd`) in order to schedule jobs. Here's an example of how to upgrade the salt-minion package at the end of a Salt run, and schedule a service restart for one minute after the package update completes.

### 40.14.1 Linux/Unix

```

salt-minion:
  pkg.installed:
    - name: salt-minion
    - version: 2014.1.7-3.el6
    - order: last
  service.running:
    - name: salt-minion
    - require:
      - pkg: salt-minion
  cmd.wait:
    - name: echo service salt-minion restart | at now + 1 minute
    - watch:
      - pkg: salt-minion

```

To ensure that `at` is installed and `atd` is running, the following states can be used (be sure to double-check the package name and service name for the distro the minion is running, in case they differ from the example below).

```

at:
  pkg.installed:
    - name: at
  service.running:
    - name: atd
    - enable: True

```

An alternative to using the `atd` daemon is to fork and disown the process.

```
restart_minion:
  cmd.run:
    - name: |
      exec 0>&- # close stdin
      exec 1>&- # close stdout
      exec 2>&- # close stderr
      nohup /bin/sh -c 'sleep 10 && salt-call --local service.restart salt-minion' &
    - python_shell: True
    - order: last
```

### 40.14.2 Windows

For Windows machines, restarting the minion at can be accomplished by adding the following state:

```
schedule-start:
  cmd.run:
    - name: 'start powershell "Restart-Service -Name salt-minion"'
    - order: last
```

or running immediately from the command line:

```
salt -G kernel:Windows cmd.run 'start powershell "Restart-Service -Name salt-minion"'
```

## 40.15 Salting the Salt Master

In order to configure a master server via states, the Salt master can also be ``salted`` in order to enforce state on the Salt master as well as the Salt minions. Salting the Salt master requires a Salt minion to be installed on the same machine as the Salt master. Once the Salt minion is installed, the minion configuration file must be pointed to the local Salt master:

```
master: 127.0.0.1
```

Once the Salt master has been ``salted`` with a Salt minion, it can be targeted just like any other minion. If the minion on the salted master is running, the minion can be targeted via any usual `salt` command. Additionally, the `salt-call` command can execute operations to enforce state on the salted master without requiring the minion to be running.

More information about salting the Salt master can be found in the salt-formula for salt itself:

<https://github.com/saltstack-formulas/salt-formula>

## 40.16 Is Targeting using Grain Data Secure?

Because grains can be set by users that have access to the minion configuration files on the local system, grains are considered less secure than other identifiers in Salt. Use caution when targeting sensitive operations or setting pillar values based on grain data.

When possible, you should target sensitive operations and data using the Minion ID. If the Minion ID of a system changes, the Salt Minion's public key must be re-accepted by an administrator on the Salt Master, making it less vulnerable to impersonation attacks.

---

## Glossary

---

- Auto-Order** The evaluation of states in the order that they are defined in a SLS file. *See also: [ordering](#).*
- Bootstrap** A stand-alone Salt project which can download and install a Salt master and/or a Salt minion onto a host. *See also: [salt-bootstrap](#).*
- Compound Matcher** A combination of many target definitions that can be combined with boolean operators. *See also: [targeting](#).*
- EAuth** Shorthand for 'external authentication'. A system for calling to a system outside of Salt in order to authenticate users and determine if they are allowed to issue particular commands to Salt. *See also: [external auth](#).*
- Environment** A directory tree containing state files which can be applied to minions. *See also: [top file](#).*
- Execution Function** A Python function inside an Execution Module that may take arguments and performs specific system-management tasks. *See also: the list of execution modules.*
- External Job Cache** An external data-store that can archive information about jobs that have been run. A default returner. *See also: [ext\\_job\\_cache](#), [the list of returners](#).*
- Execution Module** A Python module that contains execution functions which directly perform various system-management tasks on a server. Salt ships with a number of execution modules but users can also write their own execution modules to perform specialized tasks. *See also: the list of execution modules.*
- External Pillar** A module that accepts arbitrary arguments and returns a dictionary. The dictionary is automatically added to a pillar for a minion.
- Event** A notice emitted onto an event bus. Events are often driven by requests for actions to occur on a minion or master and the results of those actions. *See also: [Salt Reactor](#).*
- File Server** A local or remote location for storing both Salt-specific files such as top files or SLS files as well as files that can be distributed to minions, such as system configuration files. *See also: [Salt's file server](#).*
- Grain** A key-value pair which contains a fact about a system, such as its hostname, network addresses. *See also: [targeting with grains](#).*
- Highdata** The data structure in a SLS file the represents a set of state declarations. *See also: [state layers](#).*
- Highstate** The collection of states to be applied to a system. *See also: [state layers](#).*
- Jinja** A templating language which allows variables and simple logic to be dynamically inserted into static text files when they are rendered. *See also: [Salt's Jinja documentation](#).*
- Job** The complete set of tasks to be performed by the execution of a Salt command are a single job. *See also: [jobs runner](#).*

- Job Cache** A storage location for job results, which may then be queried by a salt runner or an external system. May be local to a salt master or stored externally.
- Job ID** A unique identifier to represent a given *job*.
- Low State** The collection of processed states after requisites and order are evaluated. *See also: state layers.*
- Master** A central Salt daemon which from which commands can be issued to listening minions.
- Masterless** A minion which does not require a Salt master to operate. All configuration is local. *See also: file\_client.*
- Master Tops** A system for the master that allows hooks into external systems to generate top file data.
- Mine** A facility to collect arbitrary data from minions and store that data on the master. This data is then available to all other minions. [Sometimes referred to as Salt Mine.] *See also: Salt Mine.*
- Minion** A server running a Salt minion daemon which can listen to commands from a master and perform the requested tasks. Generally, minions are servers which are to be controlled using Salt.
- Minion ID** A globally unique identifier for a minion. *See also: id.*
- Multi-Master** The ability for a minion to be actively connected to multiple Salt masters at the same time in high-availability environments.
- Node Group** A pre-defined group of minions declared in the master configuration file. *See also: targeting.*
- Outputter** A formatter for defining the characteristics of output data from a Salt command. *See also: list of outputters.*
- Peer Communication** The ability for minions to communicate directly with other minions instead of brokering commands through the Salt master. *See also: peer communication.*
- Pillar** A simple key-value store for user-defined data to be made available to a minion. Often used to store and distribute sensitive data to minions. *See also: Pillar, list of Pillar modules.*
- Proxy Minion** A minion which can control devices that are unable to run a Salt minion locally, such as routers and switches.
- PyDSL** A Pythonic domain-specific-language used as a Salt renderer. PyDSL can be used in cases where adding pure Python into SLS files is beneficial. *See also: PyDSL.*
- Reactor** An interface for listening to events and defining actions that Salt should taken upon receipt of given events. *See also: Reactor.*
- Render Pipe** Allows SLS files to be rendered by multiple renderers, with each renderer receiving the output of the previous. *See also: composing renderers.*
- Renderer** Responsible for translating a given data serialization format such as YAML or JSON into a Python data structure that can be consumed by Salt. *See also: list of renderers.*
- Returner** Allows for the results of a Salt command to be sent to a given data-store such as a database or log file for archival. *See also: list of returners.*
- Roster** A flat-file list of target hosts. (Currently only used by salt-ssh.)
- Runner Module** A module containing a set of runner functions. *See also: list of runner modules.*
- Runner Function** A function which is called by the **salt-run** command and executes on the master instead of on a minion. *See also: Runner Module.*
- Salt Cloud** A suite of tools used to create and deploy systems on many hosted cloud providers. *See also: salt-cloud.*
- Salt SSH** A configuration management and remote orchestration system that does not require that any software besides SSH be installed on systems to be controlled.

**Salt Thin** A subset of the normal Salt distribution that does not include any transport routines. A Salt Thin bundle can be dropped onto a host and used directly without any requirement that the host be connected to a network. Used by Salt SSH. *See also: [thin runner](#).*

**Salt Virt** Used to manage the creation and deployment of virtual machines onto a set of host machines. Often used to create and deploy private clouds. *See also: [virt runner](#).*

**SLS Module** Contains a set of *state declarations*.

**State Compiler** Translates *highdata* into lowdata.

**State Declaration** A data structure which contains a unique ID and describes one or more states of a system such as ensuring that a package is installed or a user is defined. *See also: [highstate structure](#).*

**State Function** A function contained inside a *state module* which can manages the application of a particular state to a system. State functions frequently call out to one or more *execution modules* to perform a given task.

**State Module** A module which contains a set of state functions. *See also: [list of state modules](#).*

**State Run** The application of a set of states on a set of systems.

**Syndic** A forwarder which can relay messages between tiered masters. **See also:** *[Syndic](#)*.

**Target** Minion(s) to which a given salt command will apply. *See also: [targeting](#).*

**Top File** Determines which SLS files should be applied to various systems and organizes those groups of systems into environments. *See also: [top file](#), [list of master top modules](#).*

**\_\_virtual\_\_** A function in a module that is called on module load to determine whether or not the module should be available to a minion. This function commonly contains logic to determine if all requirements for a module are available, such as external libraries.

**Worker** A master process which can send notices and receive replies from minions. *See also: [worker\\_threads](#).*
